THE SPECIFICATIONS AND INFORMATION REGARDING THE PRODUCTS IN THIS MANUAL ARE SUBJECT TO CHANGE WITHOUT NOTICE. ALL STATEMENTS, INFORMATION, AND RECOMMENDATIONS IN THIS MANUAL ARE BELIEVED TO BE ACCURATE BUT ARE PRESENTED WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED. USERS MUST TAKE FULL RESPONSIBILITY FOR THEIR APPLICATION OF ANY PRODUCTS.

THE SOFTWARE LICENSE AND LIMITED WARRANTY FOR THE ACCOMPANYING PRODUCT ARE SET FORTH IN THE INFORMATION PACKET THAT SHIPPED WITH THE PRODUCT AND ARE INCORPORATED HEREIN BY THIS REFERENCE. IF YOU ARE UNABLE TO LOCATE THE SOFTWARE LICENSE OR LIMITED WARRANTY, CONTACT YOUR CISCO REPRESENTATIVE FOR A COPY.

The following information is for FCC compliance of Class A devices: This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio-frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case users will be required to correct the interference at their own expense.

The following information is for FCC compliance of Class B devices: This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If the equipment causes interference to radio or television reception, which can be determined by turning the equipment off and on, users are encouraged to try to correct the interference by using one or more of the following measures:

Reorient or relocate the receiving antenna.

Increase the separation between the equipment and receiver.

Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.

Consult the dealer or an experienced radio/TV technician for help.

Modifications to this product not authorized by Cisco could void the FCC approval and negate your authority to operate the product.

The Cisco implementation of TCP header compression is an adaptation of a program developed by the University of California, Berkeley (UCB) as part of UCB's public domain version of the UNIX operating system. All rights reserved. Copyright © 1981, Regents of the University of California.

NOTWITHSTANDING ANY OTHER WARRANTY HEREIN, ALL DOCUMENT FILES AND SOFTWARE OF THESE SUPPLIERS ARE PROVIDED "AS IS" WITH ALL FAULTS. CISCO AND THE ABOVE-NAMED SUPPLIERS DISCLAIM ALL WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING, WITHOUT LIMITATION, THOSE OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT OR ARISING FROM A COURSE OF DEALING, USAGE, OR TRADE PRACTICE.

IN NO EVENT SHALL CISCO OR ITS SUPPLIERS BE LIABLE FOR ANY INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES, INCLUDING, WITHOUT LIMITATION, LOST PROFITS OR LOSS OR DAMAGE TO DATA ARISING OUT OF THE USE OR INABILITY TO USE THIS MANUAL, EVEN IF CISCO OR ITS SUPPLIERS HAVE BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Cisco and the Cisco Logo are trademarks of Cisco Systems, Inc. and/or its affiliates in the U.S. and other countries. A listing of Cisco's trademarks can be found at www.cisco.com/go/trademarks. Third party trademarks mentioned are the property of their respective owners. The use of the word partner does not imply a partnership relationship between Cisco and any other company.

Any Internet Protocol (IP) addresses and phone numbers used in this document are not intended to be actual addresses and phone numbers. Any examples, command display output, network topology diagrams, and other figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses or phone numbers in illustrative content is unintentional and coincidental.

About this Guide

This document pertains to features and functionality that run on and/or that are related to the Cisco® ASR 5000 Chassis, formerly the Starent Networks ST40.

Conventions Used

The following tables describe the conventions used throughout this documentation.

Icon	Notice Type	Description
	Information Note	Provides information about important features or instructions.
	Caution	Alerts you of potential damage to a program, device, or system.
	Warning	Alerts you of potential personal injury or fatality. May also alert you of potential electrical hazards.
	Electro-Static Discharge (ESD)	Alerts you to take proper grounding precautions before handling a product.

Typeface Conventions	Description
Text represented as a `screen display`	This typeface represents displays that appear on your terminal screen, for example: `Login:`
Text represented as **`commands`**	This typeface represents commands that you enter, for example: **`show ip access-list`** This document always gives the full form of a command in lowercase letters. Commands are not case sensitive.
Text represented as a **`command`** *`variable`*	This typeface represents a variable that is part of a command, for example: **`show card`** *`slot_number`* slot_number is a variable representing the desired chassis slot number.
Text represented as menu or sub-menu names	This typeface represents menus and sub-menus that you access within a software application, for example: Click the **File** menu, then click **New**

Command Syntax Conventions	Description
{ **`keyword`** or *`variable`* }	Required keywords and variables are surrounded by grouped brackets. Required keywords and variables are those components that are required to be entered as part of the command syntax.

Command Syntax Conventions	Description
[**keyword** or *variable*]	Optional keywords or variables, or those that a user may or may not choose to use, are surrounded by square brackets.
|	With some commands there may be a group of variables from which the user chooses one. These are called alternative variables and are documented by separating each variable with a vertical bar (also known as a pipe filter). Pipe filters can be used in conjunction with required or optional keywords or variables. For example: **{ nonce | timestamp }** OR [**count** *number_of_packets* | **size** *number_of_bytes*]

Contacting Customer Support

Use the information in this section to contact customer support.

For New Customers: Refer to the support area of http://www.cisco.com for up-to-date product documentation or to submit a service request. A valid username and password is required to this site. Please contact your local sales or service representative for additional information.

For Existing Customers with support contracts through Starent Networks: Refer to the support area of https://support.starentnetworks.com/ for up-to-date product documentation or to submit a service request. A valid username and password is required to this site. Please contact your local sales or service representative for additional information.

Important: For warranty and repair information, please be sure to include the Return Material Authorization (RMA) tracking number on the outside of the package.

Chapter 1
Command Line Interface Overview

This chapter describes the numerous features in the command line interface (CLI). Included is information about the architecture of the CLI, its command modes and user privileges, how to obtain help within the CLI, and other key items.

The operating system provides the software that controls the overall system logic, control processes, and the CLI. The CLI is a multi-threaded user interface that allows you to manipulate, configure, control, and query the hardware and software components that make up the system and its hosted services. In addition, the CLI can host multiple instances of management and service configuration sessions. This allows multiple users to simultaneously access and manage multiple hosted services.

This section provides the following information about the CLI:

- CLI Structure
- CLI Command Modes
- CLI Administrative Users
- CLI Contexts
- Understanding the CLI Command Prompt
- CLI Command Syntax
- Entering and Viewing CLI Commands
- Obtaining CLI Help
- Exiting the CLI and CLI Command Modes
- Accessing the CLI

CLI Structure

CLI commands are strings of commands or keywords and user-specified arguments that set or modify specific parameters of the system. Commands are grouped by function and the various command modes with which they are associated.

The structure of the CLI is hierarchical. All users begin at a specific entry point into the system, called the Exec (Execute) Mode, and then navigate through the CLI according to their defined user privileges (access level) by using other command modes.

CLI Command Modes

There are two primary CLI command modes:

- **Exec (Execute) Mode:** The Exec mode is the lowest level in the CLI. The Exec mode is where you execute basic commands such as show, and ping. When you log into the CLI, you are placed in this mode by default.
- **Config (Configuration) Mode:** The Config mode is accessible only by users with administrator and security administrator privileges. If you are an administrative user, in this mode you can add and configure contexts and access the configuration sub-modes to configure protocols, interfaces, ports, services, subscribers, and other service-related items.

As explained above, the entry point into the CLI is called Exec Mode. In the initial CLI login, all users are placed into the default local context, which is the CLI's default management context. From this context, administrative users can access the Config Mode and define multiple service contexts.

Refer to the mode entry-path diagrams at the beginning of each mode chapter in the *Command Line Interface Reference*.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

CLI Administrative Users

This section contains information on the administrative user types and privileges supported by the system.

Administrative User Types

There are two types of administrative users supported by the system:

- **Context-level administrative users:** This user type is configured at the context-level and relies on the AAA subsystems for validating usernames and passwords during login. This is true for both administrative user accounts configured locally through a configuration file or on an external RADIUS server. Passwords for these user types are assigned once and are accessible in the configuration file.
- **Local-users:** This user type provides support for ANSI T1.276-2003 password security protection. Local-user account information, such as passwords, password history, and lockout states, is maintained in non-volatile memory on the CompactFlash module and in the Shared Configuration Task (SCT). This information is maintained in a separate file, not in configuration files used by the system. As such, the configured local-user accounts are not visible with the rest of the system configuration.

Local-user and context-level administrative accounts can be used in parallel. However, a mechanism is provided to de-activate context-level administrative user accounts thereby providing access only to local-user accounts.

Authenticating Administrative Users with RADIUS

To authorize users via RADIUS, you must include two RADIUS attributes in the RADIUS Access-Accept message:

- RFC 2865 standard Service-Type
- Starent Vendor-Specific Attribute (VSA) SN1-Admin-Permission.

The default permission is none (0), meaning that service is refused even if properly authenticated via RADIUS.

RADIUS Mapping System

RADIUS server configuration depends on the type of server used and the instructions distributed by the server manufacturer. The following table shows the attribute/value mapping system that is constant, regardless of server manufacturer or model:

Table 1. RADIUS Attribute/Value Mapping System

Attribute	Value

Attribute	Value
Login (Operator)	1
Framed	2
Callback_Login	3
Callback_Framed	4
Outbound	5
Administrative (Administrator)	6
NAS_Prompt	7
Authenticate_Only	8
Callback_NAS_Prompt	9
Call_Check	10
Callback_Administrative	11
Voice	12
Fax	13
Modem_Relay	14
IAPP_Register	15
IAPP_AP_Check	16
Authorize_Only	17
Inspector	19650516
Security_Admin	19660618

RADIUS Privileges

There are four RADIUS privilege roles. The following table shows the relationship between the privilege roles in the CLI configuration and RADIUS Service-Type.

Table 2. CLI Privilege Roles and RADIUS Service Types

CLI Configuration Parameter	RADIUS Service Type	Show Admin Type
administrator	Security_Admin (19660618)	admin
config_administrator	Administrative (6)	cfgadm
operator	NAS_Prompt (7)	oper
inspector	Inspector (19650516)	inspect

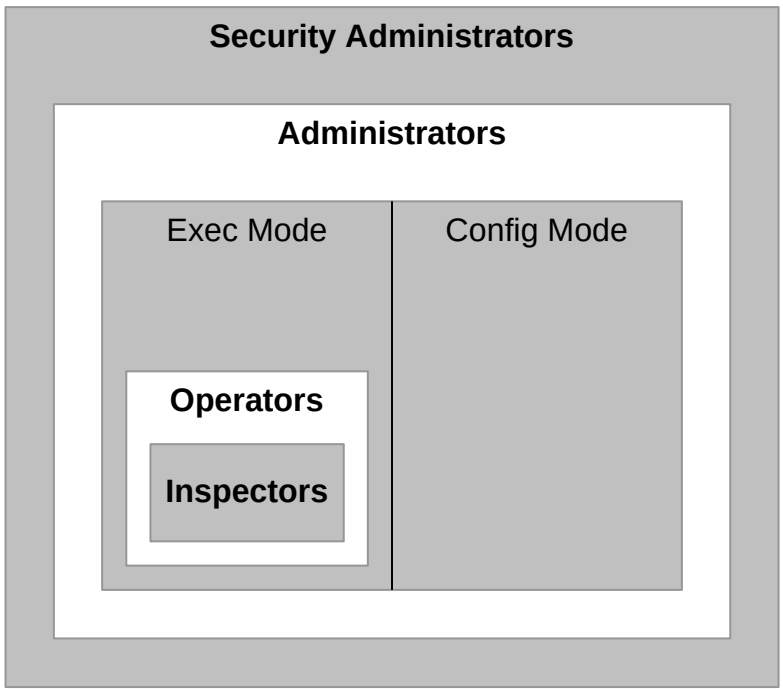
Administrative User Privileges

Regardless of the administrative user type, the system supports four user privilege levels:

- **Inspector**: Inspectors are limited to a small number of read-only Exec Mode commands. The bulk of these are show commands for viewing a variety of statistics and conditions. The Inspector cannot execute show configuration commands and does not have the privilege to enter the Config Mode.
- **Operator**: Operators have read-only privileges to a larger subset of the Exec Mode commands. They can execute all commands that are part of the inspector mode, plus some system monitoring, statistic, and fault management functions. Operators do not have the ability to enter the Config Mode.
- **Administrator**: Administrators have read-write privileges and can execute any command in the CLI except for a few security-related commands that can only be configured by Security Administrators. Administrators can configure or modify system settings and can execute all system commands, including those available to the Operators and Inspectors.
- **Security Administrator**: Security Administrators have read-write privileges and can execute all CLI commands, including those available to Administrators, Operators, and Inspectors.

The following figure represents how user privileges are defined in the CLI configuration modes.

Figure 1. User Privileges



Though the privilege levels are the same regardless of user type, the corresponding user type names differ slightly. The following table displays the privilege level to administrative user type mappings:

Table 3. User Privilege to User Type Mapping

User Type as Defined by T1.276-2003	Local-User Level User	Context-Level User
System Security Administrator	Security Administrator	Administrator
Application Security Administrator	Security Administrator	Administrator
System Administrator	Administrator	Config-Administrator
Application Administrator	Administrator	Config-Administrator
Application User/Operator	Operator	Operator
not applicable	Inspector	Inspector

Configure context-level administrative users in the Context Configuration Mode with the **`administrator`**, **`config-administrator`**, **`operator`**, and **`inspector`** commands.

Configure local-user administrative users at the Global Configuration Mode with the **`local-user username`** command.

You can further refine administrative levels to include access to certain features with the following feature-use administrative user options:

- **Lawful Intercept (LI) Administrative User:** To configure and manage LI-related issues, configure at least one administrative user account with LI functionality privileges.

Important: This privilege is available only for context-level administrative users. In addition, to ensure security in accordance with the standards, LI administrative users must access the system through the Secure Shell Protocol (SSH).

- **Enhanced Charging Service (ECS) Administrative User:** To log in and execute ECS-related commands, configure at least one administrative user account with ECS functionality privileges.

All system users can be configured within any context. However, it is recommended that you configure users in the system's management context called local. Refer to sections later in this chapter for additional information about contexts.

Allowed Commands per User Type

With the exception of security administrators, all other management users are limited to a subset of the entire command list as described in the *Command Line Interface Reference*. This section defines the commands allowed for each management user type. As stated previously, inspectors and operators are limited to only a subset of the Exec Mode commands.

Inspector Mode Commands

In the Exec mode, system inspectors can access the following commands:

- abort
- autoconfirm
- context
- crypto-group
- default terminal
- exit
- help
- logs checkpoint
- monitor subscriber
- no logging active
- no logging trace
- no reveal disabled commands
- no timestamps
- no autoconfirm
- ping
- reveal disabled commands
- show (except show snmp communities and show snmp transports)
- sleep
- start crypto security-association
- terminal length
- terminal width
- timestamps
- traceroute

Operator Mode Commands

In the Exec mode, system operators can access all inspector mode commands plus the following commands:

- aaa test
- alarm cutoff
- bulkstats force
- card
- clear (a subset of all clear command variations)

- debug
- dhcp test
- gtpc test
- gtpp interim
- gtpp test
- gtpu test
- gtpv0 test
- host
- logging active
- logging filter
- logging trace
- newcall
- no card
- no debug
- no newcall policy
- port
- ppp echo-test
- radius interim accounting
- radius test
- rlogin
- show access-group
- show access-list
- show access-flow
- show access statistics
- show configuration
- show snmp transports
- ssh
- telnet
- test alarm

Administrator Mode Commands

Administrators can access all system commands except:

Context Config Mode

- config-administrator
- operator

- inspector
- administrator

Global Config Mode

- snmp community
- snmp user
- local-user
- suspend local-user

Exec Mode

- show snmp communities
- clear (all clear command variations)
- show local-user
- password change local-user

Security Administrator Mode Commands

Security administrators can access all system commands.

CLI Contexts

A context is a group of configuration parameters that apply to the ports, interfaces, and protocols supported by the system. You can configure multiple contexts on the system, each of which resides as a separate, logically independent instance on the same physical device. The CLI can host multiple contexts within a single physical device. This allows wireless service providers to use the same system to support:

- Different levels of service
- Multiple wholesale or enterprise customers or customer groups
- Different classes of customers based on defined Class of Service (CoS) parameters
- IP address pools across multiple contexts, thus saving IP address allocation
- Enhanced security

Each defined context operates independently from any other context(s) in the system. Each context contains its own CLI instance, IP routing tables, access filters, compression methods, and other configured data.

By default, a single system-wide context called local, is used exclusively for the management of the system. Think of the local context as the root directory of the system, since you can define and access all other contexts from this point. You cannot delete the local context. From this location in the CLI, you can:

- Create and configure other service contexts that contain different service configurations
- Configure system-wide services such as CORBA and SNMP management interfaces, physical management ports, system messages, and others

Important: The system requires that you define at least one context in addition to the Local context. This isolates system management functions from application or service functions.

Administrative users add contexts through the Global Configuration Mode. A substantial advantage of configuring numerous service contexts is that it allows operators to broadly distribute different subscribers across the system. This greatly enhances the performance of the system and minimizes the loss of sessions should a failure occur.

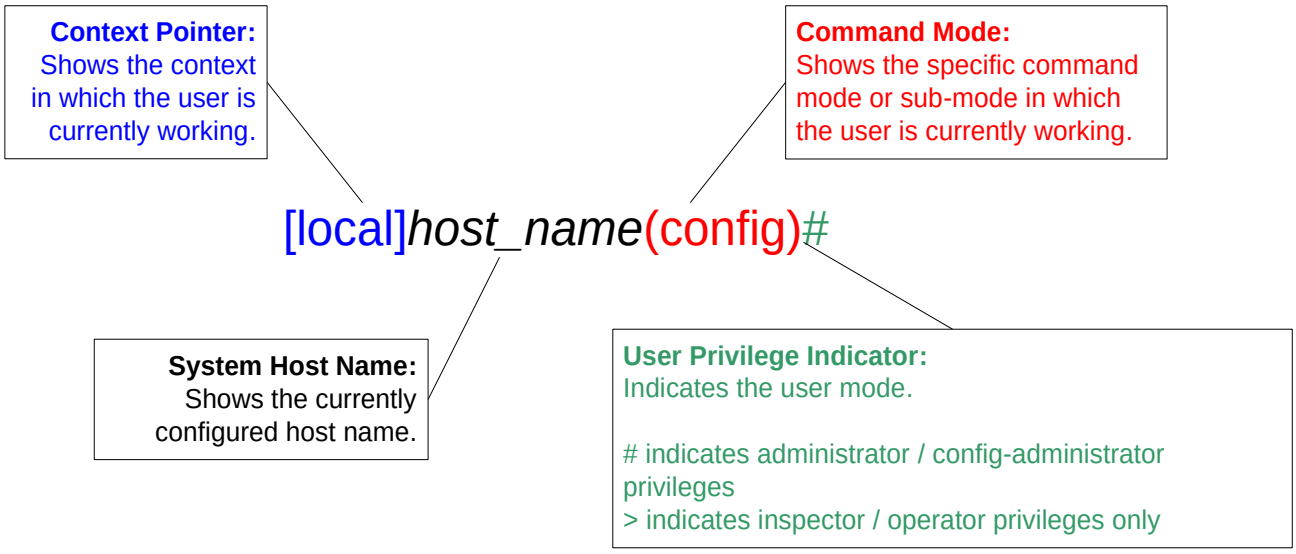
Understanding the CLI Command Prompt

The CLI provides an intuitive command prompt that informs you of:

- Exactly where you are located within the CLI
- The command mode you are using
- Your user privilege level.

The following figure shows the various components of the command prompt.

Figure 2. CLI Command Prompt



CLI Command Syntax

This section describes the components of the CLI command syntax that you should be familiar with prior to using the CLI. These include:

- **Commands**: Specific words that precede, or initiate, a specific function.
- **Keywords**: Specific words that follow a command to more clearly dictate the command's function.
- **Variables**: Alpha, numeric, or alphanumeric values that are user-supplied as part of the command syntax. Sometimes referred to as arguments, these terms further specify the command function.
- **Repetitive keywords (+)**: Specific keyword, that when followed by a plus (+) sign, indicates that more than one of the keywords can be entered within a single command.

Example
In the following example, *slot_number* is the command variable for the **info** keyword:

```
show slot infoslot_number
```

slot_number is a variable representing a particular slot (1 through 48).

Entering and Viewing CLI Commands

This section describes various methods for entering commands into the CLI.

Typing each command keyword, argument, and variable can be time-consuming and increase your chance of making mistakes. The CLI therefore, supports the following features to assist you in entering commands quickly and more accurately. Other features allow you to view the display and review previously entered commands.

Entering Partial CLI Commands

In all of the modes, the CLI recognizes partially-typed commands and keywords, as long as you enter enough characters for the command to be unambiguously recognized by the system. If you do not enter enough characters for the system to recognize a unique command or keyword, it returns a message listing all possible matches for the partial entry.

Example

If you enter the partial command **conf** and press <**Enter**>, you enter the Global Configuration Mode. If you were to enter only **co**, the system would respond with the message:

```
Ambiguous Command
```

CLI Command Auto-completion

Use the command auto-completion feature to automatically complete unique CLI commands. Press the <**Tab**> key after entering enough characters to enable this feature.

Example

[local]*host_name*# sho<Tab>
[local]*host_name*# show

If you do not enter enough characters to allow the CLI to determine the appropriate command to use, the CLI displays all commands that match the characters you entered with auto-completion:

Example

```
[local]host_name# sh<Tab>

show     shutdown

[local]host_name#
```

Enter a question mark (?) after a partial command to display all of the possible matching commands, and their related help text.

Example

```
[local]host_name# sh?

show - Displays information based on a specified argument
```

```
shutdown - Terminates execution of all tasks within the entire chassis

[local]host_name#
```

Using CLI Auto-Pagination

When you enter commands whose expected results exceed the terminal window's vertical display, the auto-pagination function pauses the display each time the terminal window reaches its display limit. Press any key to display the next screen of results.

By default, auto-pagination functionality is disabled. To enable auto-pagination, type the pipe command: **| more**

```
[local]host_name# show configuration | more
```

Important: When auto-pagination is enabled, if a command's output exceeds the terminal window's vertical display parameters, you can exit by entering "**q**". This returns you to the CLI prompt.

Using CLI Autoconfirmation

By default, the system is configured to prompt all administrative users with a confirmation prior to executing certain commands. This functionality serves two purposes:

- Helps ensure that you do not execute an unwanted configuration change.

Example
Saving a configuration:

```
[local]host_name# save configuration

Are you sure ? [Yes | No]:
```

- Indicates potential misspellings of names during configuration. The first time you configure an element name (context, subscribers, services, etc.), the prompt is displayed. The prompt is not displayed for subsequent entries of the name. Therefore, if you see the confirmation prompt after entering the name of a previously configured element, it is likely that you misspelled the name.

Examples
You create context named "newcontext":

```
[local]host_name(config)# context newcontext

Are you sure ? [Yes | No]: yes

[newcontext]host_name(config-ctx)#
```

You revisit the context named “newcontext”:

```
[local]host_name(config)# context newcontext

[newcontext]host_name(config-ctx)#
```

On another occasion, you misspell the context named “newcontext”:

```
[local]host_name(config)# context mewcontext

Are you sure ? [Yes | No]:n

Action aborted

[local]host_name(config)#
```

After aborting the above action, you can again revisit “newcontext”:

```
[local]host_name(config)# context newcontext

[newcontext]host_name(config-ctx)#
```

You can control CLI autoconfirmation at the following levels:

- **Specific administrative user sessions:** To enable or disable autoconfirmation, use the [no] autoconfirm commands while in the Exec mode.
- **All Future Sessions:** To disable or re-enable autoconfirmation for all future sessions, use the [no]autoconfirm commands while in the Global Config mode.
- **For specific commands:** Disable autoconfirmation for various commands that support the -noconfirm keyword, such as the save configuration or card reboot commands.

Regulating the Command Output

For many CLI commands, you can use **| grep** and/or **| more** keywords to regulate or control the command’s output.

Use the | grep keyword to filter through a command’s output for certain expressions or patterns. Only those portions of the output that contain or exclude the pattern are displayed. The | grep has the following syntax:

| grep [-i | -v | --ignore-case | --invert-match] *expression*

Table 4. grep Keywords

Alternative Keyword	Description
-i	Specifies the filtering of the command’s output for a particular expression while ignoring case. Lower case matches the same as upper case.
-v	Specifies the filtering of the command’s output for everything excluding a particular expression.
--ignore-case	The long form of the **-i** option.

Alternative Keyword	Description
--invert-match	The long form of the **-v** option.
expression	Specifies the character pattern to find in the command's output.

Use the **| more** keyword to pause the terminal each time the terminal window reaches its display limit. Press any key to display the next screen. The function of this keyword is identical to the **autoless** command, except that you must manually enter it on a command-by-command basis.

Viewing Command History

To view a history of all commands line by line, simply scroll up or down with the <**up arrow**> and <**down arrow**> cursor keys on the keyboard.

The operating system supports EMACS-style text editing commands. This standard UNIX text editor format allows you to use keyboard-based shortcut keys for maneuvering around the CLI. The following table lists these available shortcut keys.

Table 5. EMACS Shortcut Keystrokes

Shortcut Keys	Description
<Ctrl + p> and <up arrow>	Recalls previous command in the command history
<Ctrl + n> and <down arrow>	Recalls next command in the command history
<Ctrl + f> and <right arrow>	Moves cursor forward by one character in command line
<Ctrl + b> and <left arrow>	Moves cursor backward by one character in command line
<Esc> + <f>	Moves cursor forward by one word in command line
<Esc> + <b>	Moves cursor backward by one word in command line
<Ctrl> + <a>	Moves cursor to the beginning of the command line
<Ctrl> + <e>	Moves cursor to the end of the command line
<Ctrl> + <k>	Deletes the current command line from the insertion point to the end of the line
<Ctrl> + <u>	Deletes the current command line from the insertion point to the beginning of the line
<Ctrl> + <d>	Deletes a single character in the current command line
<Esc> + <d>	Deletes a word in the current command line
<Ctrl> + <c>	Quits editing the current line
<Ctrl> + <l>	Refreshes the display
<Ctrl> + <t>	Transposes (or switches) the two characters surrounding the insertion point

Obtaining CLI Help

The CLI provides context-sensitive help for every command token and keyword available to you. To obtain, use one of these methods:

- **Command Help:** Command help provides assistance for a specific command. Type a question mark (?) at the end of the specific command to accesses help.

Example

```
[local]host_name# test?

test - Performs test on followed mechanism
```

- **Keyword Help:** Keyword help provides assistance in determining the next keyword, argument, or option to use in the command syntax. Enter the command keyword, enter a space, and then type a question mark (?).

Example

```
[local]host_name# test alarm ?

audible - Tests internal audible alarm buzzer on SPC

central-office - Tests specified central office alarm relays on SPIO card

<cr> - newline
```

- **Variable Help:** Variable help provides the correct format, value, or information type for each variable that is part of the command syntax. For commands with variables, enter the command keyword, enter a space, and then type a question mark (?).

Example

```
[local]host_name# show card info ?

<Enter card number as an integer ranging 1 to 48> | - Pipeline <cr> -
Carriage Return or <Enter> key
```

Exiting the CLI and CLI Command Modes

A CLI session is defined as the successful login into the CLI. When you establish a CLI session, you are placed into the system's Exec Mode. Depending upon your user privilege level, you can:

- Use the *local* context to perform system management functions
- Move to an assigned context and work in Exec Mode
- Move to an assigned context as an administrative user and work in Global Configuration Mode or other configuration sub-mode

This section addresses how to properly exit the various modes and the CLI.

Exiting Configuration Sub-modes

To exit a configuration sub-mode and return to the next highest configuration sub-mode or Global Configuration Mode, type the exit command at the system prompt.

Example

```
[context_name]host_name(config-ctx)# exit

[local]host_name(config)#
```

Important: The CLI supports implicit mode-exits when using configuration files. Therefore, configuration files do not have to contain all of the required exit commands for you to leave various sub-config modes.

To exit a sub-mode and return to the Exec Mode, enter the **end** command.

Example

```
[local]host_name(config-ctx)# end

[local]host_name#
```

Exiting Global Configuration Mode

To exit Global Configuration Mode, and return to the Exec Mode prompt, type the **exit** command at the prompt.

Ending a CLI Session

To end a CLI session and exit the CLI, type the **exit** command at the *local* Exec Mode prompt.

Accessing the CLI

Access the CLI through the following methods:

- Local login through a Console port using the RS-232 serial cable supplied with the card
- Remote login using Telnet and Secure Shell (SSH) access to the CLI through any IP interface on the system.

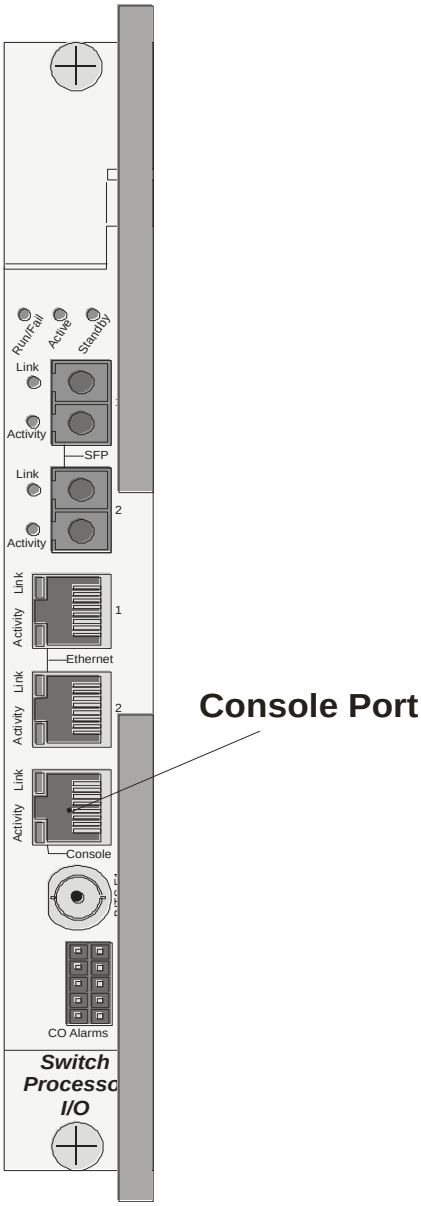
Important: Even though you can access the CLI remotely through any available IP interface, it is recommended that management traffic be isolated from network traffic by using one of the SPIO card management interfaces. You can use remote login methods only after the system has been configured to support the various access methods.

Important: Multiple CLI sessions are supported, but the number of sessions is dependent on the amount of available memory. The Resource Manager reserves enough resources so that as a minimum, 15 CLI sessions are assured. One of the CLI sessions is always reserved for use exclusively by a CLI session on an SPIO console interface. Additional CLI sessions beyond the pre-reserved set are permitted if sufficient SMC resources are available. If the Resource Manager is unable to reserve additional resources, you are prompted whether to allow the system to create the new CLI session, even without the reserved resources.

Accessing the CLI Locally Using the Console Port

This section provides instructions for accessing the CLI locally through the console port.

Figure 3. Console Port



Access the console port with the RJ-45-to-DB-9 serial (EIA-232) cable that is shipped with the Switch Processor Input/Output (SPIO)Connect to a workstation that has a communications application that accesses the workstation's serial port, such as Minicom for Linux or HyperTerminal® for MicroSoft Windows®.

Each of the two SPIO Line Cards installed in the system provides a console port for accessing the CLI. The CLI is only accessible from the SPIO that is active—typically the SPIO installed in chassis slot 24.

For normal operation, the SMC in chassis slot 8 serves as the active processing card for the system. The SPIO that corresponds to this SMC is installed in slot 24. For the processing card in chassis slot 9, the corresponding SPIO is installed in slot 25.

Important: In the event of aSMC switchover, in which processes are switched from the processing card in slot 8 that was previously active to the redundant processing card in slot 9, the SPIO in slot 24 continues to serve as the active SPIO. Therefore, the console port is still accessible through that SPIO.

Follow the instructions below to connect to the console port.

1. Connect the RJ-45 end of the cable to the port labeled *Console*.
2. Connect the DB-9 end of the cable to the serial port on the workstation.
3. Configure the communications application to support the following:

Parameter	Setting
Baud Rate	115,200 bps
Data Bits	8
Parity	None
Stop Bits	1
Flow Control	None

Important: To change the configuration defined in the table above, modify the **`terminal`** command located in the Global configuration mode.

4. At the terminal window, press **Enter**.
5. If no configuration file is present (that is, this is the first time the system is powered), the CLI prompts you as to whether or not you want to use the Quick Setup Wizard. If the system was configured previously, you are prompted to enter a username and password.

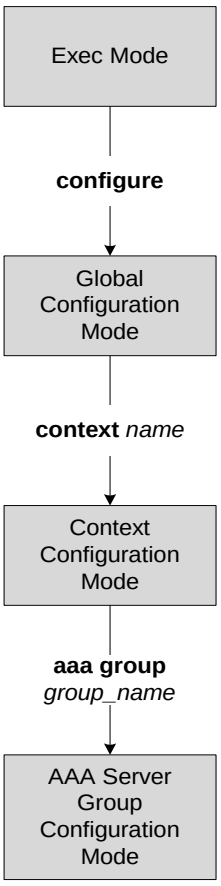
Remotely Accessing the CLI

To remotely access the CLI through a defined management interface, you must first configure the remote access method (such as Telnet or SSH).

You can find examples of how to configure this in the *Getting Started* chapter.

Chapter 2
AAA Server Group Configuration Mode Commands

The AAA Server Group Configuration Mode is used to create and manage the Diameter/RADIUS server groups within the context or system. AAA server group facilitates management of group (list) of servers at per subscriber/APN/realm level for AAA functionality.



diameter accounting

This command configures Diameter accounting parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter accounting { dictionary { aaa-custom1 | aaa-custom10 | aaa-custom2 | aaa-custom3 | aaa-custom4 | aaa-custom5 | aaa-custom6 | aaa-custom7 | aaa-custom8 | aaa-custom9 | nasreq | rf-plus } | endpoint *endpoint_name* **| hd-mode fall-back-to-local | hd-storage-policy** *hd_policy* **| max-retries** *tries* **| max-transmissions** *transmissions* **| request-timeout** *duration* **| server** *host_name* **priority** *priority* **}**

default diameter accounting { dictionary | hd-mode | max-retries | max-transmissions | request-timeout }

no diameter accounting { endpoint | hd-mode | hd-storage-policy | max-retries | max-transmissions | server *host_name* **}**

---

no diameter accounting { endpoint | hd-mode | hd-storage-policy | max-retries | max-transmissions | server *host_name* **}**

endpoint: Removes the configured accounting endpoint, and the default accounting server configured in the default AAA group will be used.
hd-mode: Sends records to the Diameter server, if all Diameter servers are down or unreachable, then copies records to the local HDD and periodically retries the Diameter server.
hd-storage-policy: Disables use of the specified HD storage policy.
max-retries: Disables the configured retry attempts for Diameter accounting in the current AAA group.
max-transmissions: Disables the configured maximum transmission attempts for Diameter accounting in the current AAA group.
server *host_name*: Removes the configured Diameter host *host_name* from this AAA server group for Diameter accounting.

---

default diameter accounting { dictionary | hd-mode| max-retries | max-transmissions | request-timeout }

dictionary: Sets the context's dictionary as the system default.
hd-mode: Sends records to the Diameter server, if all Diameter servers are down or unreachable, then copies records to the local HDD and periodically retries the Diameter server.
max-retries: Sets the retry attempts for Diameter accounting in the current AAA group to default 0 (disable).
max-transmissions: Sets the configured maximum transmission attempts for Diameter accounting in the current AAA group to default 0 (disable).
request-timeout: Sets the timeout duration, in seconds, for Diameter accounting requests in the current AAA group to default 20.

dictionary { aaa-custom1 | aaa-custom10 | aaa-custom2 | aaa-custom3 | aaa-custom4 | aaa-custom5 | aaa-custom6 | aaa-custom7 | aaa-custom8 | aaa-custom9 | nasreq | rf-plus }

Specifies the Diameter accounting dictionary.
aaa-custom1 ... aaa-custom10: The custom dictionaries. Even though the CLI syntax supports several custom dictionaries, not necessarily all of them have been defined. If a custom dictionary that has not been implemented is selected, the default dictionary will be used.
nasreq: nasreq dictionary—the dictionary defined by RFC 4005.
rf-plus: RF Plus dictionary.

endpoint *endpoint_name*

Enables Diameter to be used for accounting, and specifies which Diameter endpoint to use.
endpoint_name must be a string of 1 through 63 characters in length.

hd-mode fall-back-to-local

Specifies that records be copied to the local HDD if the diameter server is down or unreachable. CDF/CGF will pull the records through SFTP.

hd-storage-policy *hd_policy*

Associates the specified HD Storage policy with the AAA group.
hd_policy must be the name of a configured HD Storage policy, and must be a string of 1 through 63 alpha and/or numeric characters in length.
HD Storage policies are configured through the Global Configuration Mode.
This and the **hd-mode** command are used to enable the storage of Rf Diameter Messages to HDD in case all Diameter Servers are down or unreachable.

max-retries *tries*

Specifies how many times a Diameter request should be retried with the same server, if the server fails to respond to a request.
tries specifies the maximum number of retry attempts, and must be an integer from 1 through 1000.
Default: 0

max-transmissions *transmissions*

Specifies the maximum number of transmission attempts for a Diameter request. Use this in conjunction with the **max-retries** *tries* option to control how many servers will be attempted to communicate with.
transmissions must be an integer from 1 through 1000.
Default: 0

request-timeout *duration*

Specifies the number of seconds the system will wait for a response from a Diameter server before re-transmitting the request.
duration specifies the number of seconds, and must be an integer from 1 through 3600.
Default: 20

server *host_name* **priority** *priority*

Specifies the current context Diameter accounting server's host name and priority.
host_name specifies the Diameter host name, and must be a string of 1 through 63 characters in length.

priority specifies the relative priority of this Diameter host. The priority is used in server selection. The priority must be an integer from 1 through 1000.

Usage

Use this command to manage the Diameter accounting options according to the Diameter server used for the context.

Example

The following command configures the Diameter accounting dictionary:

```
diameter accounting dictionary <dictionary>
```

The following command configures the Diameter endpoint:

```
diameter accounting endpoint <endpoint_name>
```

The following commands configure Diameter accounting options:

```
diameter accounting max-retries <tries>
```

```
diameter accounting max-transmissions <transmissions>
```

```
diameter accounting request-timeout <duration>
```

```
diameter accounting server <host_name> priority <priority>
```

The following commands disable/clear the options:

```
no diameter accounting endpoint
```

```
no diameter accounting server <host_name>
```

diameter authentication

This command configures Diameter authentication parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter authentication { dictionary { aaa-custom1 | aaa-custom10 | aaa-custom11 | aaa-custom12 | aaa-custom13 | aaa-custom14 | aaa-custom15 | aaa-custom16 | aaa-custom17 | aaa-custom18 | aaa-custom19 | aaa-custom2 | aaa-custom20 | aaa-custom3 | aaa-custom4 | aaa-custom5 | aaa-custom6 | aaa-custom7 | aaa-custom8 | aaa-custom9 | nasreq } | endpoint *endpoint_name* **| max-retries** *tries* **| max-transmissions** *transmissions* **| redirect-host-avp { just-primary | primary-then-secondary } | request-timeout** *duration* **| server** *host_name* **priority** *priority* **}**

default diameter authentication { dictionary | max-retries | max-transmissions | redirect-host-avp | request-timeout }

no diameter authentication { endpoint | max-retries | max-transmissions | server *host_name* **}**

---

no diameter authentication { endpoint | max-retries | max-transmissions | server }*host_name*

dictionary: Sets the context's dictionary as the system default.
endpoint: Removes the configured authentication endpoint, and the default server configured in default AAA group will be used.
max-retries: Disables the configured retry attempts for Diameter authentication in the current AAA group.
max-transmissions: Disables the configured maximum transmission attempts for Diameter authentication in the current AAA group.
server *host_name*: Removes the configured Diameter host *host_name* from this AAA server group for Diameter authentication.

---

default diameter authentication { dictionary | max-retries | max-transmissions | redirect-host-avp | request-timeout }

max-retries: Sets the retry attempts for Diameter authentication requests in the current AAA group to default 0 (disable).
max-transmissions: Sets the configured maximum transmission attempts for Diameter authentication in the current AAA group to default 0 (disable).
redirect-host-avp: Sets the redirect choice to default (just-primary).
request-timeout: Sets the timeout duration, in seconds, for Diameter authentication requests in the current AAA group to default 20.

---

dictionary { aaa-custom1 | aaa-custom10 | aaa-custom11 | aaa-custom12 | aaa-custom13 | aaa-custom14 | aaa-custom15 | aaa-custom16 | aaa-custom17 | aaa-custom18 | aaa-custom19 | aaa-custom2 | aaa-custom20 | aaa-custom3

| aaa-custom4 | aaa-custom5 | aaa-custom6 | aaa-custom7 |aaa-custom8 | aaa-custom9 | nasreq }

Specifies the Diameter authentication dictionary.
aaa-custom1 ... aaa-custom20: The custom dictionaries. Even though the CLI syntax supports several custom dictionaries, not necessarily all of them have been defined. If a custom dictionary that has not been implemented is selected, the default dictionary will be used.

Important: **aaa-custom11** dictionary is only available in StarOS 8.1 and later releases. **aaa-custom12** to **aaa-custom20** dictionaries are only available in StarOS 9.0 and later releases.

nasreq: nasreq dictionary—the dictionary defined by RFC 4005.

endpoint *endpoint_name*

Enables Diameter to be used for authentication, and specifies which Diameter endpoint to use.
endpoint_name must be a string of 1 through 63 characters in length.

max-retries *tries*

Specifies how many times a Diameter authentication request should be retried with the same server, if the server fails to respond to a request.
tries specifies the maximum number of retry attempts, and must be an integer from1 through 1000.
Default: 0

max-transmissions *transmissions*

Specifies the maximum number of transmission attempts for a Diameter authentication request. Use this in conjunction with the "**max-retries** *tries*" option to control how many servers will be attempted to communicate with.
transmissions specifies the maximum number of transmission attempts, and must be an integer from 1 through 1000.
Default: 0

diameter authentication redirect-host-avp { just-primary | primary-then-secondary }

Specifies whether to use just one returned AVP, or use the first returned AVP as selecting the primary host and the second returned AVP as selecting the secondary host.
just-primary: Redirect only to primary host.
primary-then-secondary: Redirect to primary host, if fails then redirect to the secondary host.
Default: just-primary

request-timeout *duration*

Specifies how long the system will wait for a response from a Diameter server before re-transmitting the request.
duration specifies the number of seconds the system will wait for a response from a Diameter server before re-transmitting the request, and must be an integer from 1 through 3600.
Default: 20 seconds

server *host_name* **priority** *priority*

Specifies the current context Diameter authentication server's host name and priority.

host_name specifies the Diameter authentication server's host name, and must be a string of 1 through 63 characters in length.
priority specifies the relative priority of this Diameter host. The priority is used in server selection. The priority must be an integer from 1 through 1000.

Usage

Use this command to manage the Diameter authentication options according to the Diameter server used for the context.

Example

The following command configures the Diameter authentication dictionary:

```
diameter authentication dictionary <dictionary>
```

The following command configures the Diameter endpoint:

```
diameter authentication endpoint <endpoint_name>
```

The following commands configure Diameter authentication options:

```
diameter authentication max-retries <tries>
```

```
diameter authentication max-transmissions <transmissions>
```

```
diameter authentication redirect-host-avp primary-then-secondary
```

```
diameter authentication server <host_name> priority <priority>
```

```
diameter authentication request-timeout <duration>
```

The following commands disable/clear the options:

```
no diameter authentication endpoint
```

```
no diameter authentication server <host_name>
```

diameter authentication failure-handling

This command configures the failure handling for Diameter authentication requests and Diameter EAP requests.

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter authentication failure-handling { authorization-request | eap-request | eap-termination-request } { request-timeout action { continue | retry-and-terminate | terminate } | result-code *start_result_code* **{ [to** *end_result_code* **] action { continue | retry-and-terminate | terminate } } }**

no diameter authentication failure-handling { authorization-request | eap-request | eap-termination-request } result-code *start_result_code* **[to** *end_result_code* **]**

default diameter authentication failure-handling { authorization-request | eap-request | eap-termination-request } request-timeout action

no

Disables Diameter authentication failure handling.

default

Configures the default Diameter authentication failure handling setting.

authorization-request

Specifies that failure handling must be performed on Diameter authorization request (AAR/AAA) messages.

eap-request

Specifies configuring failure handling for EAP requests.

eap-termination-request

Specifies configuring failure handling for EAP termination requests.

request-timeout action { continue | retry-and-terminate | terminate }

Specifies the action to be taken for failures:

- **continue**: Continues session
- **retry-and-terminate**: First retries, if it fails then terminates the session
- **terminate**: Terminates session

result-code *start_result_code* **[to** *end_result_code* **] action { continue | retry-and-terminate | terminate }**

start_result_code: Specifies the result code number, must be an integer from 1 through 65535.
to *end_result_code*: Specifies the upper limit of a range of result codes. **to** *end_result_code* must be greater than *start_result_code*.
action { continue | retry-and-terminate | terminate }: Specifies action to be taken for failures:

- **continue**: Continues
- **retry-and-terminate**: First retries, if it fails then terminates
- **terminate**: Terminates

Usage

Use this command to configure error handling for Diameter EAP, EAP-termination, and authorization requests. Specific actions (continue, retry-and-terminate, or terminate) can be associated with each possible result-code. Ranges of result codes can be defined with the same action, or actions can be specific on a per-result code basis.

Example

The following commands configure result codes *5001, 5002, 5004,* and *5005* to use "action continue" and result code *5003* to use "action terminate":

```
diameter authentication failure-handling eap-request result-code 5001 to 5005 action continue

diameter authentication failure-handling eap-request result-code 5003 action terminate
```

diameter dictionary

This command is deprecated and is replaced by the **diameter accounting dictionary** and **diameter authentication dictionary** commands. See the diameter accounting and diameter authentication commands respectively.

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

radius ip vrf

This command associates the specific AAA group with a Virtual Routing and Forwarding (VRF) Context instance for GRE tunnel interface configuration. By default the VRF is NULL, which means that AAA group is associated with global routing table.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius ip vrf *vrf_name*

no radius ip vrf

no

Removes/disassociates configured IP Virtual Routing and Forwarding (VRF) context instance.

vrf_name

Specifies the name of a pre-configured VRF context instance.
vrf_name is name of a pre-configured virtual routing and forwarding (VRF) context configured in Context configuration mode through **ip vrf** command.

Usage

Use this command to associate/disassociate a pre-configured VRF context for a GRE tunnel interface.
By default the VRF is NULL, which means that AAA group is associated with global routing table.

Example

The following command associates VRF context instance *GRE_vrf1* with this AAA group:

radius ip vrf *GRE_vrf1*

radius

This command configures basic RADIUS options.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius { deadtime minutes | detect-dead-server { consecutive-failures count |
response-timeout seconds } | dictionary dictionary | max-outstanding messages |
max-retries tries | max-transmissions transmissions | strip-domain {
authentication-only | accounting-only } | timeout idle_seconds }

default radius { deadtime | detect-dead-server | dictionary | max-outstanding |
max-retries | max-transmissions | timeout }

no radius { detect-dead-server | max-transmissions | strip-domain }
```

no

Removes configuration for the specified keyword.

default

Configures default setting for the specified keyword.

dictionary *dictionary*

Specifies which dictionary to use. The following table describes possible values for *dictionary*:

Dictionary	Description
custom*XX*	These are dictionaries that can be customized to fit your needs. Customization information can be attained by contacting your local service representative. *XX* is the integer value of the custom dictionary.
standard	This dictionary consists only of the attributes specified in RFC 2865, RFC 2866, and RFC 2869.
3gpp	This dictionary consists not only of all of the attributes in the standard dictionary, but also all of the attributes specified in 3GPP 32.015.
3gpp2	This dictionary consists not only of all of the attributes in the standard dictionary, but also all of the attributes specified in IS-835-A.
3gpp2-835	This dictionary consists not only of all of the attributes in the standard dictionary, but also all of the attributes specified in IS-835.
starent-vsa1	This dictionary consists not only of the 3GPP2 dictionary, but also includes Starent Networks vendor-specific attributes (VSAs) as well. The VSAs in this dictionary support a one-byte wide VSA Type field in order to support certain RADIUS applications. The one-byte limit allows support for only 256 VSAs (0 - 255). This is the default dictionary.

Dictionary	Description
starent-vsa1-835	This dictionary consists not only of the 3gpp2-835 dictionary, but also includes Starent Networks vendor-specific attributes (VSAs) as well. The VSAs in this dictionary support a one-byte wide VSA Type field in order to support certain RADIUS applications. The one-byte limit allows support for only 256 VSAs (0 - 255). This is the default dictionary.
starent	This dictionary consists of all of the attributes in the starent-vsa1 dictionary and incorporates additional Starent Networks VSAs by using a two-byte VSA Type field. This dictionary is the master-set of all of the attributes in all of the dictionaries supported by the system.
starent-835	This dictionary consists of all of the attributes in the starent-vsa1-835 dictionary and incorporates additional Starent Networks VSAs by using a two-byte VSA Type field. This dictionary is the master-set of all of the attributes in all of the -835 dictionaries supported by the system.

deadtime *minutes*

Default: 10
Specifies the number of minutes to wait before changing the state of a RADIUS server from "Down" to "Active". *minutes* must be an integer from 0 through 65535.

Important: This parameter should be set to allow enough time to remedy the issue that originally caused the server's state to be changed to "Down". After the deadtime timer expires, the system returns the server's state to "Active" regardless of whether or not the issue has been fixed.

Important: For a complete explanation of RADIUS server states, refer to the *RADIUS Server State Behavior* appendix in the *AAA Interface Administration and Reference*.

detect-dead-server { consecutive-failures *count* **| keepalive | response-timeout** *seconds* **}**

consecutive-failures *count*: Specifies the number of consecutive failures, for any AAA Manager, before a server's state is changed from "Active" to "Down". *count* must be an integer from 1 through 1000. Default: 4.
keepalive: Enables the AAA server alive-dead detect mechanism based on sending keepalive authentication messages to all authentication servers. Default is disabled.
response-timeout *seconds*: Specifies the number of seconds, for any AAA Manager, to wait for a response to any message before a server's state is changed from "Active" to "Down". *seconds* must be an integer from 1 through 65535.

Important: If both **consecutive-failures** and **response-timeout** are configured, then both parameters must be met before a server's state is changed to "Down".

Important: The "Active" or "Down" state of a RADIUS server as defined by the system, is based on accessibility and connectivity. For example, if the server is functional but the system has placed it into a "Down" state, it could be the result of a connectivity problem. When a RADIUS server's state is changed to "Down", a trap is sent to the management station and the **deadtime** timer is started.

max-outstanding *messages*

Default: 256
Specifies the maximum number of outstanding messages a single AAA Manager instance will queue.
messages must be an integer from 1 through 4000.

max-retries *tries*

Default: 5
Specifies the maximum number of times communication with a AAA server will be attempted before it is marked as "Not Responding", and the detect dead server's consecutive failures count is incremented.
tries must be an integer from 0 through 65535.

max-transmissions *transmissions*

Default: Disabled
Sets the maximum number of re-transmissions for RADIUS authentication requests. This limit is used in conjunction with **max-retries** parameter for each server.
When failing to communicate with a RADIUS sever, the subscriber is failed once all of the configured RADIUS servers have been exhausted, or once the configured number of maximum transmissions is reached. For example, if three servers are configured and if the configured max-retries is 3 and max-transmissions is 12, then the primary server is tried four times (once plus three retries), the secondary server is tried four times, and then a third server is tried four times. If there is a fourth server, it is not tried because the maximum number of transmissions (12) has been reached.
transmissions must be an integer from 1 through 65535.

strip-domain { authentication-only | accounting-only }

Specifies that the domain must be stripped from the user name prior to authentication or accounting.
By default, strip-domain configuration will be applied to both authentication and accounting messages, if configured.
When the argument **authentication-only** or **accounting-only** is present, **strip-domain** is applied only to the specified RADIUS message types.

timeout *idle_seconds*

Default: 3
Specifies the number of seconds to wait for a response from the RADIUS server before re-sending the messages.
idle_seconds must be an integer from 1 through 65535.

Usage

Use this command to configure the basic RADIUS parameters according to the RADIUS server used for the context.

Example

```
radius detect-dead-server consecutive-failures 6

radius dictionary 3gpp2

radius timeout 300
```

```
radius strip-domain authentication-only
```

radius accounting

This command configures the current context's RADIUS accounting parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius accounting { archive [stop-only] | deadtime *minutes* **| detect-dead-server { consecutive-failures** *count* **| keepalive | response-timeout** *seconds* **} | interim interval** *seconds* **| max-outstanding** *messages* **| max-pdu-size** *octets* **| max-retries** *tries* **| max-transmissions** *transmissions* **| timeout** *idle_seconds***}**

default radius accounting { deadtime | detect-dead-server | max-outstanding | max-pdu-size | max-retries | max-transmissions | timeout }

no radius accounting { archive | detect-dead-server | interim interval | max-transmissions }

no

Removes configuration for the specified keyword.

default

Configures the default setting for the specified keyword.

archive [stop-only]

Default: enabled
Enables archiving of RADIUS accounting messages in the system after the accounting message has exhausted retries to all available RADIUS accounting servers. All RADIUS accounting messages generated by a session are delivered to the RADIUS accounting server in serial. That is, previous RADIUS accounting messages from the same call must be delivered and acknowledged by the RADIUS accounting server before the next RADIUS accounting message is sent to the RADIUS accounting server.
stop-only specifies archiving of only STOP accounting messages.

deadtime *minutes*

Default: 10 minutes
Specifies the number of minutes to wait before changing the state of a RADIUS server from "Down" to "Active".
minutes must be an integer from 0 through 65535.

Important: This parameter should be set to allow enough time to remedy the issue that originally caused the server's state to be changed to "Down". After the deadtime timer expires, the system returns the server's state to "Active" regardless of whether or not the issue has been fixed.

Important: For a complete explanation of RADIUS server states, refer to the *RADIUS Server State Behavior* Appendix in the *AAA Interface Administration and Reference*.

detect-dead-server { consecutive-failures *count* **| keepalive | response-timeout** *seconds* **}**

consecutive-failures *count*: Specifies the number of consecutive failures, for any AAA Manager, before a server's state is changed from "Active" to "Down". *count* must be an integer from 1 through 1000. Default: 4
keepalive: Enables the AAA server alive-dead detect mechanism based on sending keepalive authentication messages to all authentication servers. Default: disabled
response-timeout *seconds*: Specifies the number of seconds, for any AAA Manager, to wait for a response to any message before a server's state is changed from "Active" to "Down". *seconds* must be an integer from 1 through 65535.

Important: If both **consecutive-failures** and **response-timeout** are configured, then both parameters must be met before a server's state is changed to "Down".

Important: The "Active" or "Down" state of a RADIUS server as defined by the system, is based on accessibility and connectivity. For example, if the server is functional but the system has placed it into a "Down" state, it could be the result of a connectivity problem. When a RADIUS server's state is changed to "Down", a trap is sent to the management station and the deadtime timer is started.

Important: For a complete explanation of RADIUS server states, refer to the *RADIUS Server State Behavior* Appendix in the *AAA Interface Administration and Reference*.

interim interval *seconds*

Default: Disabled
Specifies the time interval, in seconds, for sending accounting INTERIM-UPDATE records. *seconds* must be an integer from 50 through 40000000.

Important: If RADIUS is used as the accounting protocol for the GGSN product, other commands are used to trigger periodic accounting updates. However, these commands would cause RADIUS STOP/START packets to be sent as opposed to INTERIM-UPDATE packets. Also, note that accounting interim interval settings received from a RADIUS server take precedence over those configured on the system.

max-outstanding *messages*

Default: 256
Specifies the maximum number of outstanding messages a single AAA Manager instance will queue. *messages* must be an integer from 1 through 4000.

max-pdu-size *octets*

Default: 2048
Specifies the maximum sized packet data unit which can be accepted/generated, in bytes (octets). *octets* must be an integer from 512 through 2048.

max-retries *tries*

Default: 5
Specifies the maximum number of times communication with a AAA server will be attempted before it is marked as "Not Responding" and the detect dead server consecutive failures count is incremented.
tries must be an integer from 0 through 65535.
Once the maximum number of retries is reached this is considered a single failure for the consecutive failures count for detecting dead servers.

max-transmissions *transmissions*

Default: Disabled
Sets the maximum number of transmissions for a RADIUS accounting message before the message is declared as failed.
transmissions must be an integer from 1 through 65535.

timeout *seconds*

Default: 3
Specifies the amount of time to wait for a response from a RADIUS server before retransmitting a request.
seconds must be an integer from 1 through 65535.

Usage

Use this command to configure RADIUS accounting options according to the RADIUS server used for the context.

Example

The following command configures the accounting timeout parameter to 16 seconds.

```
radius accounting timeout 16
```

radius accounting apn-to-be-included

This command specifies the APN name inclusion for RADIUS accounting.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
radius accounting apn-to-be-included { gi | gn }

default radius accounting apn-to-be-included
```

default

Configures the default setting.

gi

Specifies the use of Gi APN name in RADIUS accounting request. Gi APN represents the APN received in the Create PDP context request message from SGSN.

gn

Specifies the use of Gn APN name in RADIUS accounting request. Gn APN represents the APN selected by the GGSN.

Usage

Use this command to specify the APN name to be included for RADIUS accounting.

Example

The following command configures the gn APN name to be included for RADIUS accounting:

```
radius accounting apn-to-be-included gn
```

radius accounting algorithm

This command specifies the fail-over/load-balancing algorithm to select the RADIUS accounting server(s) to which accounting data must be sent.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius accounting algorithm { first-n *n* **| first-server | round-robin }**

default radius accounting algorithm

default

Configures the default setting.
Default: **first-server**

first-n *n*

Default: 1 (Disabled)
Specifies that the AGW must send accounting data to *n* (more than one) AAA servers based on their priority. The full set of accounting data is sent to each of the *n* AAA servers. Response from any one of the servers would suffice to proceed with the call. On receiving an ACK from any one of the servers, all retries are stopped.
n is the number of AAA servers to which accounting data will be sent, and must be an integer from 2 through 128.

first-server

Specifies that the context must send accounting data to the RADIUS server with the highest configured priority. In the event that this server becomes unreachable, accounting data is sent to the server with the next-highest configured priority. This is the default algorithm.

round-robin

Specifies that the context must load balance sending accounting data among all of the defined RADIUS servers. Accounting data is sent in a circular queue fashion on a per Session Manager task basis, where data is sent to the next available server and restarts at the beginning of the list of configured servers. The order of the list is based upon the configured relative priority of the servers.

Usage

Use this command to specify the algorithm to select the RADIUS accounting server(s) to which accounting data must be sent.

Example

The following command configures to use the round-robin algorithm for RADIUS accounting server selection:

```
radius accounting algorithm round-robin
```

radius accounting billing-version

This command configures billing-system version of RADIUS accounting servers.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius accounting billing-version *version*

default radius accounting billing-version

default

Configures the default setting.
Default: 0

version

Specifies the billing-system version, and must be an integer from 0 through 4294967295.

Usage

Use this command to configure the billing-system version of RADIUS accounting servers.

Example

The following command configures the billing-system version of RADIUS accounting servers as 10:

radius accounting billing-version *10*

radius accounting gtp trigger-policy

This command configures the RADIUS accounting trigger policy for GTP messages.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
radius accounting gtp trigger-policy [ standard | ggsn-preservation-mode ]

default radius accounting gtp trigger-policy
```

default

Resets the RADIUS accounting trigger policy to standard behavior for GTP session.

standard

This keyword sets the RADIUS accounting trigger policy to standard behavior which is configured for GTP session for GGSN service.

ggsn-preservation-mode

This keyword sends RADIUS Accounting Start when the GTP message with private extension of preservation mode is received from SGSN.

Important: This is a customer-specific keyword and needs customer-specific license to use this feature. For more information on GGSN preservation mode, refer GGSN Service Mode Commands chapter.

Usage

Use this command to set the trigger policy for the AAA accounting for a GTP session.

Example

The following command sets the RADIUS accounting trigger policy for GTP session to standard:

```
default radius accounting gtp trigger-policy
```

radius accounting ha policy

Configures the RADIUS accounting policy for HA sessions.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
radius accounting ha policy { custom1-aaa-res-mgmt | session-start-stop }

default radius accounting ha policy
```

default

Configures the default setting.

session-start-stop

Specifies sending Accounting Start when the Session is connected, and sending Accounting Stop when the session is disconnected. This is the default behavior.

custom1-aaa-res-mgmt

Accounting Start/Stop messages are generated to assist special resource management done by AAA servers. It is similar to the session-start-stop accounting policy, except for the following differences:

- Accounting Start is also generated during MIP session handoffs.
- No Accounting stop is generated when an existing session is overwritten and the new session continues to use the IP address assigned for the old session.
- Accounting Start is generated when a new call overwrites an existing session.

Usage

Use this command to configure the AAA accounting behavior for an HA session.

Example

The following command configures the HA accounting policy to *custom1-aaa-res-mgmt*:

```
radius accounting ha policy custom1-aaa-res-mgmt
```

radius accounting interim

This command configures the volume of uplink and downlink volume octet counts that trigger RADIUS interim accounting, and configures the time period between the sending of interim accounting records.

Product

GGSN, PDSN, HA, HSGW

Privilege

Security Administrator, Administrator

Syntax

radius accounting interim { interval *seconds* **| volume { downlink** *bytes* **uplink** *bytes* **| total** *bytes* **| uplink** *bytes* **downlink** *bytes* **} }**

no radius accounting interim volume

no

Disables RADIUS interim accounting.

interval *seconds*

Specifies the time interval, in seconds, between sending interim accounting records. *seconds* must be an integer from 50 through 40,000,000.

volume { downlink *bytes* **uplink** *bytes* **| total** *bytes* **| uplink** *bytes* **downlink** *bytes* **}**

downlink *bytes* **uplink** *bytes*: Specifies the downlink to uplink volume limit, in bytes, for RADIUS Interim accounting. *bytes* must be an integer from 100,000 through 4,000,000,000.
total *bytes*: Specifies the total volume limit, in bytes, for RADIUS interim accounting. *bytes* must be an integer from 100,000 through 4,000,000,000.
uplink *bytes* **downlink** *bytes*: Specifies the uplink to downlink volume limit, in bytes, for RADIUS interim accounting. *bytes* must be an integer from 100,000 through 4,000,000,000.

Usage

Use this command to trigger RADIUS interim accounting based on the volume of uplink and downlink bytes and/or to configure the time interval between the sending of interim accounting records.

Example

The following command triggers RADIUS interim accounting when the total volume of uplink and downlink bytes reaches *110000*:

radius accounting interim volume total *110000*

The following command sets the interval between sending interim accounting records to 3 minutes (180 seconds):

radius accounting interim interval *180*

radius accounting ip remote-address

This command configures IP remote address-based RADIUS accounting parameters.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

`[ no ] radius accounting ip remote-address { collection | list` *`list_id`* **`}`**

`no`

Removes configuration for the specified keyword.

`collection`

Enables collecting and reporting Remote-Address-Based accounting in RADIUS Accounting. This should be enabled in the AAA Context. It is disabled by default.

`list` *`list_id`*

Enters the Remote Address List Configuration mode. This mode configures a list of remote addresses that can be referenced by the subscriber's profile.
`list_id` must be an integer from 1 through 65535.

Usage

This command is used as part of the Remote Address-based Accounting feature to both configure remote IP address lists and enable the collection of accounting data for the addresses in those lists on a per-subscriber basis.
Individual subscriber can be associated to remote IP address lists through the configuration/specification of an attribute in their local or RADIUS profile. (Refer to the **`radius accounting`** command in the Subscriber Configuration mode.) When configured/specified, accounting data is collected pertaining to the subscriber's communication with any of the remote addresses specified in the list.
Once this functionality is configured on the system and in the subscriber profiles, it must be enabled by executing this command with the collection keyword.

Example

```
radius accounting ip remote-address collection
```

radius accounting keepalive

Configures the keepalive authentication parameters for the RADIUS accounting server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] radius accounting keepalive { calling-station-id id |
consecutive-response number | framed-ip-address ip_address | interval seconds |
retries number | timeout seconds | username name }
```

no

Removes configuration for the specified keyword.

default

Configures the default setting for the specified keyword.

calling-station-id *id*

Configures the Calling-Station-Id to be used for the keepalive authentication.
id must be an alpha and/or numeric string of 1 through 15 characters in length.
Default: 000000000000000

consecutive-response *number*

Configures the number of consecutive authentication response after which the server is marked as reachable.
number must be an integer from 1 through 10.
Default: 1

framed-ip-address *ip_address*

Configures the framed-ip-address to be used for the keepalive accounting.
ip_address must be specified using the standard IPv4 dotted decimal notation.

interval *seconds*

Configures the time interval between the two keepalive access requests.
Default: 30 seconds

retries *number*

Configures the number of times the keepalive access request to be sent before marking the server as unreachable.
number must be an integer from 3 through 10.
Default: 3

timeout *seconds*

Configures the time interval between each keepalive access request retries.
seconds must be an integer from 1 through 30.
Default: 3 seconds

username *name*

Configures the user name to be used for authentication.
name must be an alpha and/or numeric string of 1 through 127 characters in length.
Default: Test-Username

Usage

Use this command to configure the keepalive authentication parameters for the RADIUS accounting server.

Example

The following command sets the user name for RADIUS keepalive access requests to *Test-Username2*:

```
radius accounting keepalive username Test-Username2
```

The following command sets the number of RADIUS accounting keepalive retries to *4*.

```
radius accounting keepalive retries 4
```

radius accounting pdif trigger-policy

Configures the policy for generating START/STOP pairs in overflow condition.

Product

PDIF

Privilege

Administrator, Security Administrator

Syntax

```
[ default ] radius accounting pdif trigger-policy { standard | counter-rollover
}
```

default

The default option configures the “standard” policy.

standard

Applies a policy as defined by the standards.

counter-rollover

If the counter-rollover option is enabled, the system generates a STOP/START pair before input/output data octet counts (or input/output data packet counts) become larger than (2^32 - 1) in value. This setting is used to guarantee that a 32-bit octet count in any STOP message has not wrapped to larger than 2^32 thus ensuring the accuracy of the count. The system may, at its discretion, send the STOP/START pair at any time, so long as it does so before the 32-bit counter has wrapped.

Usage

Used to define the policy for dealing with overflow packet counts.

Example

Use the following example to set the default policy to *standard*.

```
default radius accounting pdif trigger-policy
```

radius accounting rp

Configures the RADIUS accounting R-P originated call options.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

radius accounting rp { handoff-stop { immediate | wait-active-stop } | tod *minute hour* **| trigger-event { active-handoff | active-start-param-change | active-stop } | trigger-policy { airlink-usage [counter-rollover] | custom [active-handoff | active-start-param-change | active-stop] | standard } | trigger-stop-start }**

no radius accounting rp { tod *minute hour* **| trigger-event { active-handoff | active-start-param-change | active-stop } | trigger-stop-start }**

default radius accounting rp { handoff-stop | trigger-policy }

---

no

Removes earlier configuration for the specified keyword.

---

default

Sets the default configuration for the specified keyword.

---

handoff-stop { immediate | wait-active-stop }

Default: **wait-active-stop**
Specifies the behavior of generating accounting STOP when handoff occurs.

- **immediate**: Indicates that accounting STOP should be generated immediately on handoff, i.e. not to wait active-stop from the old PCF.
- **wait-active-stop**: Indicates that accounting STOP is generated only when active-stop received from the old PCF when handoff occurs.

---

tod *minute hour*

Specifies the time of day a RADIUS event is to be generated for accounting. Up to four different times of the day may be specified through individual commands.
minute must be an integer from 0 through 59.
hour must be an integer from 0 through 23.

---

trigger-event { active-handoff | active-start-param-change | active-stop }

Default: **active-handoff**: Disabled
active-start-param-change: Enabled
active-stop: Disabled
Configures the events for which a RADIUS event is generated for accounting as one of the following:

- **active-handoff**: Disables a single R-P event (and therefore a RADIUS accounting event) when an Active PCF-to-PFC Handoff occurs. Instead, two R-P events occur (one for the Connection Setup, and the second for the Active-Start)
- **active-start-param-change**: Disables an R-P event (and therefore a RADIUS accounting event) when an Active-Start is received from the PCF and there has been a parameter change.
- **active-stop**: Disables an R-P event (and therefore a RADIUS accounting event) when an Active-Stop is received from the PCF.

Important: This keyword has been obsoleted by the **trigger-policy** keyword. Note that if this command is used, if the context configuration is displayed, radius accounting rp configuration is represented in terms of the trigger-policy.

trigger-policy { airlink-usage [counter-rollover] | custom [active-handoff | active-start-param-change | active-stop] | standard }

Default: **airlink-usage**: Disabled
custom:
active-handoff = Disabled
active-start-param-change = Disabled
active-stop = Disabled
standard: Enabled
Configures the overall accounting policy for R-P sessions as one of the following:

- **airlink-usage [counter-rollover]**: Specifies the use of Airlink-Usage RADIUS accounting policy for R-P, which generates a start on Active-Starts, and a stop on Active-Stops.
- If the **counter-rollover** option is enabled, the system generates a STOP/START pair before input/output data octet counts (or input/output data packet counts) become larger than (2^32 - 1) in value. This setting is used to guarantee that a 32-bit octet count in any STOP message has not wrapped to larger than 2^32 thus ensuring the accuracy of the count. The system, may, at its discretion, send the STOP/START pair at any time, so long as it does so before the 32-bit counter has wrapped. Note that a STOP/START pair is never generated unless the subscriber RP session is in the Active state, since octet/packet counts are not accumulated when in the Dormant state.
- **custom** : Specifies the use of custom RADIUS accounting policy for R-P. The custom policy can consist of the following:
- **active-handoff**: Enables a single R-P event (and therefore a RADIUS accounting event) when an Active PCF-to-PFC Handoff occurs. Normally two R-P events will occur (one for the Connection Setup, and the second for the Active-Start)
- **active-start-param-change**: Enables an R-P event (and therefore a RADIUS accounting event) when an Active-Start is received from the PCF and there has been a parameter change.

  Important: Note that a custom trigger policy with only **active-start-param-change** enabled is identical to the **standard** trigger-policy.

- **active-stop**: Enables an R-P event (and therefore a RADIUS accounting event) when an Active-Stop is received from the PCF.

Important: If the **radius accounting rp trigger-policy custom** command is executed without any of the optional keywords, all custom options are disabled.

- **standard**: Specifies the use of Standard RADIUS accounting policy for R-P in accordance with IS-835B.

trigger-stop-start

Specifies that a stop/start RADIUS accounting pair should be sent to the RADIUS server when an applicable R-P event occurs.

Usage

Use this command to configure the events for which a RADIUS event is sent to the server when the accounting procedures vary between servers.

Example

The following command enables an R-P event (and therefore a RADIUS accounting event) when an Active-Stop is received from the PCF:

```
radius accounting rp trigger-event active-stop
```

The following command generates the STOP only when active-stop received from the old PCF when handoff occurs:

```
default radius accounting rp handoff-stop
```

radius accounting server

For accounting, this command configures the RADIUS accounting server(s) in the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius [mediation-device] accounting server *ip_address* **[encrypted] key** *value* **[acct-on { enable | disable }] [acct-off { enable | disable }] [max** *messages* **] [oldports] [port** *port_number* **] [priority** *priority* **] [type standard] [admin-status { enable | disable }] [-noconfirm]**

no radius [mediation-device] accounting server *ip_address* **[oldports | port** *port_number* **]**

no

Removes the server or server port(s) specified from the list of configured servers.

mediation-device

Enables mediation-device specific AAA transactions use to communicate with this RADIUS server.

Important: If this option is not used, by default the system enables standard AAA transactions.

ip_address **[port** *port_number* **]**

Specifies the IP address of the accounting server. *ip_address* must be specified using the standard IPv4 dotted decimal notation or colon notation for IPv6. A maximum of 1600 RADIUS servers per context/system and 128 servers per server group can be configured. This limit includes accounting and authentication servers.
port *port_number* specifies the port number to use for communications. *port_number* must be an integer from 0 through 65535. Default is 1813.

Important: Same RADIUS server IP address and port can be configured in multiple RADIUS server group within a context.

[encrypted] key *value*

Specifies the shared secret key used to authenticate the client to the servers. The **encrypted** keyword indicates the key specified is encrypted. The key *value* must be an alpha and/or numeric string of 1 through 15 characters, or when encrypted an alpha and/or numeric string of 1 through 30 characters.
The **encrypted** keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **key** keyword is the encrypted version of the plaint text key. Only the encrypted key is saved as part of the configuration file.

acct-on { enable | disable }

Default: disable
Enables and disables sending of the Accounting-On message when a new RADIUS server is added to the configuration.
When this is enabled, the Accounting-On message is sent when a new RADIUS server is added in the configuration. However, if for some reason the Accounting-On message cannot be sent at the time of server configuration (for example; if the interface is down), then the message is sent as soon as possible. Once the Accounting-On message is sent, if it is not responded to after the configured RADIUS accounting timeout, the message is retried the configured number of RADIUS accounting retries. Once all retries have been exhausted, the system no longer attempts to send the Accounting-On message for this server.

acct-off { enable | disable }

Default: enable
Disables and enables the sending of the Accounting-Off message when a RADIUS server is removed from the configuration.
The Accounting-Off message is sent when a RADIUS server is removed from the configuration, or when there is an orderly shutdown. However, if for some reason the Accounting-On message cannot be sent at this time, it is never sent. The Accounting-Off message is sent only once, regardless of how many accounting retries are enabled.

max *messages*

Default: 0
Specifies the maximum number of outstanding messages that may be allowed to the server.
messages must be an integer from 1 through 256.

oldports

Sets the UDP communication port to the out of date standardized default for RADIUS communications to 1646.

priority *priority*

Default: 1000
Specifies the relative priority of this accounting server. The priority is used in server selection for determining which server to send accounting data to.
priority must be an integer from 1 through 1000, where 1 is the highest priority. When configuring two or more servers with the same priority you will be asked to confirm that you want to do this. If you use the **-noconfirm** option, you are not asked for confirmation and multiple servers could be assigned the same priority.

type { mediation-device | standard }

Default: **standard**
mediation-device: Obsolete keyword.
Specifies the type of AAA transactions to use to communicate with this RADIUS server.
standard: Use standard AAA transactions.

admin-status { enable | disable }

Configures the admin-status for the RADIUS accounting server.
enable: Enables the RADIUS accounting server.
disable: Disables the RADIUS accounting server.

-noconfirm

Specifies that the command must execute without any prompts and confirmation from the user.

Usage

Use this command to configure the RADIUS accounting servers with which the system must communicate for accounting.
Up to 1600 RADIUS servers per context/system and 128 servers per server group can be configured. The servers can be configured as Accounting, Authentication, Charging servers, or any combination thereof.

Example

The following command sets the accounting server with mediation device transaction for AAA server *1.2.3.4*:

radius mediation-device accounting server *1.2.3.4* **key** *sharedKey* **port** *1024* **max** *127*

radius algorithm

This command configures the RADIUS authentication server selection algorithm for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius algorithm { first-server | round-robin }

default radius algorithm
```

default

Configures the default setting.
Default: **first-server**

first-server

Accounting data is sent to the first available server based upon the relative priority of each configured server.

round-robin

Accounting data is sent in a circular queue fashion on a per Session Manager task basis where data is sent to the next available server and restarts at the beginning of the list of configured servers. The order of the list is based upon the configure relative priority of the servers.

Usage

Use this command to configure the context's RADIUS server selection algorithm to ensure proper load distribution amongst the available servers.

Example

```
radius algorithm first-server

radius algorithm round-robin
```

radius allow

This command configures the system behavior for allowing subscriber sessions when RADIUS accounting and/or authentication is unavailable.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] radius allow { authentication-down | accounting-down }
```

no

Specifies that the specified option is to be disabled.

authentication-down

Default: Disabled
Allows sessions while authentication is not available (down).

accounting-down

Default: Enabled
Allows sessions while accounting is unavailable (down).

Usage

Allow sessions during system troubles when the risk of IP address and/or subscriber spoofing is minimal. The denial of sessions may cause dissatisfaction with subscribers at the cost/expense of verification and/or accounting data.

Example

```
radius allow authentication-down

no radius allow authentication-down

radius allow accounting-down

no radius allow accounting-down
```

radius attribute

Configures the system's RADIUS identification parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius attribute { nas-identifier id | nas-ip-address address primary_address [
backup secondary_address ] [ nexthop-forwarding-address nexthop_address ] [ vlan
vlan_id ] [ mpls-label input input output output [ integer_value ] ] }

no radius attribute { nas-identifier | nas-ip-address }

default radius attribute nas-identifier
```

no

Removes configuration for the specified keyword.

default

Configures the default setting.

nas-identifier *id*

Specifies the attribute name by which the system will be identified in Access-Request messages. *id* must be a case-sensitive alpha and/or numeric string of 1 through 32 characters in length.

nas-ip-address address *primary_address*

Specifies the AAA interface IP address(es) used to identify the system. Up to two addresses can be configured.
primary_address: The IP address of the primary interface to use in the current context. This must be specified using the standard IPv4 dotted decimal notation.

backup *secondary_address*

backup: The IP address of the secondary interface to use in the current context. This must be specified using the standard IPv4 dotted decimal notation.

nexthop-forwarding-address *nexthop_address*

Configures next hop IP address for this NAS IP address. It optionally sets the RADIUS client to provide VLAN ID and nexthop forwarding address to system when running in single nexthop gateway mode. *nexthop_address* must be specified using the standard IPv4 dotted decimal notation.

Important: To define more than one NAS IP address per context, in Global Configuration Mode use the **aaa large-configuration** command. If enabled, for a PDSN a maximum of 400 and for a GGSN a maximum of 800 NAS IP addresses/NAS identifiers (1 primary and 1 secondary per Server group) can be configured per context.

mpls-label input *in_label_value* **output** *out_label_value1* **[** *out_label_value2* **]**

Configures the traffic from the specified RADIUS client NAS IP address to use the specified MPLS labels.

- *in_label_value* is the MPLS label that will identify inbound traffic destined for the configured NAS IP address.
- *out_label_value1* and *out_label_value2* identify the MPLS labels to be added to packets sent from the specified NAS IP address.
- *out_label_value1* is the inner output label.
- *out_label_value2* is the outer output label.

MPLS label values must be an integer from 16 to 1048575.

vlan *vlan_id*

This optional keyword sets the RADIUS client to provide VLAN ID with nexthop forwarding address to system when running in single nexthop gateway mode.
vlan_id must be a pre-configured VLAN ID and must be an integer from 1 through 4096. It is the VLAN ID to be provided to the system in RADIUS attributes.
This option is available only when nexthop-forwarding gateway is also configured with nexthop-forwarding-address *nexthop_address* keyword and **aaa-large configuration** is enabled at Global Configuration level.

Usage

This is necessary for NetWare Access Server usage such as the system must be identified to the NAS.
The system supports the concept of the active nas-ip-address. The active nas-ip-address is defined as the current source ip address for RADIUS messages being used by the system. This is the content of the nas-ip-address attribute in each RADIUS message.
The system will always have exactly one active nas-ip-address. The active nas-ip-address will start as the primary nas-ip-address. However, the active nas-ip-address may switch from the primary to the backup, or the backup to the primary. The following events will occur when the active nas-ip-address is switched:

- All current in-process RADIUS accounting messages from the entire system are cancelled. The accounting message is re-sent, with retries preserved, using the ne w active nas-ip-address. Acct-Delay-Time, however, is updated to reflect the time that has occurred since the accounting event. The value of Event-Timestamp is preserved.
- All current in-process RADIUS authentication messages from the entire system are cancelled. The authentication message is re-sent, with retries preserved, using the new active nas-ip-address. The value of Event-Timestamp is preserved.
- All subsequent in-process RADIUS requests uses the new active nas-ip-address.

The system uses a revertive algorithm when transitioning active NAS IP addresses as described below:

- If the configured primary nas-ip-address transitions from UP to DOWN, and the backup nas-ip-address is UP, then the active nas-ip-address switches from the primary to the backup nas-ip-address.

- If the backup nas-ip-address is active, and the primary nas-ip-address transitions from DOWN to UP, then the active nas-ip-address switches from the backup to the primary nas-ip-address.

Example

```
radius attribute nas-ip-address 1.2.3.4
```

```
no radius attribute nas-identifier sampleID
```

radius authenticate

This command configures RADIUS authentication related parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius authenticate { apn-to-be-included { gi | gn } | null-username }

default radius authenticate { apn-to-be-included | null-username }

no radius authenticate null-username
```

default

Configures the default setting.

no radius authenticate null-username

Disables sending an Access-Request message to the AAA server for user names (NAI) that are blank.

apn-to-be-included

Specifies the APN name to be included for RADIUS authentication:
gi: Specifies the usage of Gi APN name in RADIUS authentication request. Gi APN represents the APN received in the Create PDP Context request message from SGSN.
gn: Specifies the usage of Gn APN name in RADIUS authentication request. Gn APN represents the APN selected by the GGSN.

null-username

Specifies attempting RADIUS authentication even if the provided user name is NULL (empty).
Default: Enables authenticating, sending Access-Request messages to the AAA server, all user names, including NULL user names.

Usage

Use this command to disable, or re-enable, sending Access-Request messages to the AAA server for usernames (NAI) that are blank (NULL).

Example

To disable sending Access-Request messages for user names (NAI) that are blank, enter the following command:

```
no radius authenticate null-username
```

To re-enable sending Access-Request messages for user names (NAI) that are blank, enter the following command:

```
radius authenticate null-username
```

radius authenticator-validation

This command enables (allows) and disables (prevents) the MD5 authentication of RADIUS user. MD5 authentication is enabled by default.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] radius authenticator-validation
```

no

Disables MD5 authentication validation for an Access-Request message to the AAA server.

Usage

Use this command to disable or re-enable, sending Access-Request messages to the AAA server for MD5 validation.

Example

To disable MD5 authentication validation for Access-Request messages for usernames (NAI), enter the following command:

```
no radius authenticator-validation
```

To enable MD5 authentication validation for Access-Request messages for user names (NAI), enter the following command:

```
radius authenticator-validation
```

radius charging

This command configures basic RADIUS options for Active Charging Service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no | default] radius charging { deadtime *dead_minutes* **| detect-dead-server { consecutive-failures** *count* **| response-timeout** *seconds* **} | max-outstanding** *messages* **| max-retries** *tries* **| max-transmissions** *transmissions* **| timeout** *idle_seconds* **}**

no

Removes configuration for the specified keyword.

default

Configures the default setting for the specified keyword.

deadtime *dead_minutes*

Specifies the number of minutes to wait before attempting to communicate with a server that has been marked as unreachable.
dead_minutes must be an integer from 0 through 65535.
Default: 10

detect-dead-server { consecutive-failures *count* **| response-timeout** *seconds* **}**

consecutive-failures *count*: Specifies the number of consecutive failures, for each AAA Manager, before a server is marked as unreachable.
count must be an integer from 1 through 1000.
Default: 4
response-timeout *seconds*: Specifies the number of seconds for each AAA Manager to wait for a response to any message before a server is detected as failed, or in a down state.
seconds must be an integer from 1 through 65535.

max-outstanding *messages*

Specifies the maximum number of outstanding messages a single AAA Manager instance will queue.
messages must be an integer from 1 through 4000.
Default: 256

max-retries *tries*

Specifies the maximum number of times communication with a AAA server will be attempted before it is marked as unreachable, and the detect dead servers consecutive failures count is incremented.
tries must be an integer from 0 through 65535.

Default: 5

max-transmissions *transmissions*

Sets the maximum number of re-transmissions for RADIUS authentication requests. This limit is used in conjunction with the **max-retries** parameter for each server.
When failing to communicate with a RADIUS sever, the subscriber is failed once all of the configured RADIUS servers have been exhausted or once the configured number of maximum transmissions is reached. For example, if three servers are configured and if the configured max-retries is 3 and max-transmissions is 12, then the primary server is tried four times (once plus three retries), the secondary server is tried four times, and then a third server is tried four times. If there is a fourth server, it is not tried because the maximum number of transmissions (12) has been reached.
transmissions must be an integer from 1 through 65535.
Default: Disabled

timeout *idle_seconds*

Specifies the number of seconds to wait for a response from the RADIUS server before re-sending the messages.
idle_seconds must be an integer from 1 through 65535.
Default: 3

Usage

Use this command to manage the basic Charging Service RADIUS options according to the RADIUS server used for the context.

Example

```
radius charging detect-dead-server consecutive-failures 6

radius charging timeout 300
```

radius charging accounting algorithm

This command specifies the fail-over/load-balancing algorithm to be used for selecting RADIUS servers for charging services.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

radius charging accounting algorithm { first-n *n* **| first-server | round-robin }**

first-n *n*

Default: 1 (Disabled)
Specifies that the AGW must send accounting data to *n* (more than one) AAA servers based on their priority. Response from any one of the *n* AAA servers would suffice to proceed with the call. The full set of accounting data is sent to each of the *n* AAA servers.
n is the number of AAA servers to which accounting data will be sent, and must be an integer from 2 through 128.

first-server

Specifies that the context must send accounting data to the RADIUS server with the highest configured priority. In the event that this server becomes unreachable, accounting data is sent to the server with the next-highest configured priority. This is the default algorithm.

round-robin

Specifies that the context must load balance sending accounting data among all of the defined RADIUS servers. Accounting data is sent in a circular queue fashion on a per Session Manager task basis, where data is sent to the next available server and restarts at the beginning of the list of configured servers. The order of the list is based upon the configured relative priority of the servers.

Usage

Use this command to specify the accounting algorithm to use to select RADIUS servers for charging services configured in the current context.

Example

The following command configures to use the round-robin algorithm for RADIUS server selection:

```
radius charging accounting algorithm round-robin
```

radius charging accounting server

Configures RADIUS charging accounting servers in the current context for Active Charging Service Prepaid Accounting.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius charging accounting server *ip_address* **[encrypted] key** *value* **[max** *messages* **] [oldports] [port** *port_number* **] [priority** *priority* **] [admin-status { enable | disable }] [-noconfirm]**

no radius charging accounting server *ip_address* **[oldports | port** *port_number* **]**

no

Removes the server or server port(s) specified from the list of configured servers.

ip_address

Specifies the IP address of the accounting server. *ip_address* must be specified using the standard IPv4 dotted decimal notation. A maximum of 128 RADIUS servers can be configured per context. This limit includes accounting and authentication servers.

[encrypted] key *value*

Specifies the shared secret key used to authenticate the client to the servers. The **encrypted** keyword indicates the key specified is encrypted. The key *value* must be an alpha and/or numeric string of 1 through 15 characters, or an alpha and/or numeric string of 1 through 30 characters when encrypted.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **key** keyword is the encrypted version of the plaint text key. Only the encrypted key is saved as part of the configuration file.

max *messages*

Default: 0
Specifies the maximum number of outstanding messages that may be allowed to the server. *messages* must be an integer from 0 through 4000.

oldports

Sets the UDP communication port to the out of date standardized default for RADIUS communications to 1646.

port *port_number*

Default: 1813
Specifies the port number to use for communication.

port_number must be an integer from 0 through 65535.

priority *priority*

Default: 1000
Specifies the relative priority of this accounting server. The priority is used in server selection for determining which server to send accounting data to. *priority* must be an integer from 1 through 1000, where 1 is the highest priority.

admin-status { enable | disable }

Enables or disables the RADIUS authentication/accounting/charging server functionality and saves the status setting in the configuration file to re-establish the set status at reboot.

-noconfirm

Specifies that the command must execute without any prompts and confirmation from the user.

Usage

This command is used to configure the RADIUS charging accounting server(s) with which the system is to communicate for Active Charging Service Prepaid Accounting requests.

Example

Up to 128 AAA servers can be configured per context when the system is functioning as a PDSN and/or HA. Up to 16 servers are supported per context when the system is functioning as a GGSN.

```
radius charging accounting server 1.2.3.4 key sharedKey port 1024 max 127

radius charging accounting server 1.2.5.6 encrypted key scrambledKey
oldports priority 10 ]

no radius charging accounting server 1.2.5.6
```

radius charging algorithm

Specifies the RADIUS authentication server selection algorithm for Active Charging Service for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius charging algorithm { first-server | round-robin }

default radius charging algorithm
```

default

Configures the default setting.
Default: **first-server**

first-server

Accounting data is sent to the first available server based upon the relative priority of each configured server.

round-robin

Accounting data is sent in a circular queue fashion on a per Session Manager task basis where data is sent to the next available server and restarts at the beginning of the list of configured servers. The order of the list is based upon the configured relative priority of the servers.

Usage

Use this command to configure the context's RADIUS server selection algorithm for Active Charging Service to ensure proper load distribution amongst the available servers.

Example

```
radius algorithm first-server

radius algorithm round-robin
```

radius charging server

Configures the RADIUS charging server(s) in the current context for Active Charging Service Prepaid Authentication.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius charging server *ip_address* **[encrypted] key** *value* **[max** *messages* **] [oldports] [port** *port_number* **] [priority** *priority* **] [admin-status { enable | disable }] [-noconfirm]**

no radius charging server *ip_address* **[oldports | port** *port_number* **]**

no

Removes the server or server port(s) specified from the list of configured servers.

ip_address

Specifies the IP address of the server. *ip_address* must be specified using the standard IPv4 dotted decimal notation. A maximum of 128 RADIUS servers can be configured per context. This limit includes accounting and authentication servers.

[encrypted] key *value*

Specifies the shared secret key used to authenticate the client to the servers. The **encrypted** keyword indicates the key specified is encrypted. The key *value* must be an alpha and/or numeric string of 1 through 15 alpha characters, or an alpha and/or numeric string of 1 through 30 characters when encrypted.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **key** keyword is the encrypted version of the plain text key. Only the encrypted key is saved as part of the configuration file.

max *messages*

Default: 256
Specifies the maximum number of outstanding messages that may be allowed to the server. *messages* must be an integer from 0 through 4000.

oldports

Sets the UDP communication port to the old default for RADIUS communications to 1645.

port *port_number*

Default: 1812
Specifies the port number to use for communications.
port_number must be an integer from 1 through 65535.

priority *priority*

Default: 1000
Specifies the relative priority of this accounting server. The priority is used in server selection for determining which server to send accounting data to.
priority must be an integer from 1 through 1000, where 1 is the highest priority.

admin-status { enable | disable }

Enables or disables the RADIUS authentication, accounting, or charging server functionality and saves the status setting in the configuration file to re-establish the set status at reboot.

-noconfirm

Specifies that the command must execute without any prompts and confirmation from the user.

Usage

This command is used to configure the RADIUS charging server(s) with which the system is to communicate for Active Charging Service Prepaid Authentication requests.

Example

Up to 128 AAA servers can be configured per context when the system is functioning as a PDSN and/or HA. Up to 16 servers are supported per context when the system is functioning as a GGSN.

```
radius charging server 1.2.3.4 key sharedKey port 1024 max 127

radius charging server 1.2.5.6 encrypted key scrambledKey oldports
priority 10 ]

no radius server 1.2.5.6
```

radius ip vrf

This command associates the specific AAA group with a Virtual Routing and Forwarding (VRF) Context instance for GRE tunnel interface configuration. By default the VRF is NULL, which means that AAA group is associated with global routing table.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius ip vrf *vrf_name*

no radius ip vrf

no

Removes/disassociates configured IP Virtual Routing and Forwarding (VRF) context instance.

vrf_name

Specifies the name of a pre-configured VRF context instance.
vrf_name is name of a pre-configured virtual routing and forwarding (VRF) context configured in Context configuration mode through **ip vrf** command.

Usage

Use this command to associate/disassociate a pre-configured VRF context for a GRE tunnel interface.
By default the VRF is NULL, which means that AAA group is associated with global routing table.

Example

The following command associates VRF context instance *GRE_vrf1* with this AAA group:

radius ip vrf *GRE_vrf1*

radius keepalive

This command configures the RADIUS keepalive authentication parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[default] radius keepalive [calling-station-id *id* **| consecutive-response** *number* **| encrypted | interval** *seconds* **| password | retries** *number* **| timeout** *seconds* **| username** *name* **| valid-response access-accept [access-reject]]**

default

Configures the default setting for the specified keyword.

calling-station-id *id*

Specifies the Calling-Station-Id to be used for the keepalive authentication.
id must be an alpha and/or numeric string of 1 through 15 characters in length.
Default value is 000000000000000.

consecutive-response *number*

Specifies the number of consecutive authentication responses after which the server is marked as reachable.
number must be an integer from 1 through 5.
Default: 1

encrypted password

Specifies encrypting the password.
password must be an alpha and/or numeric string of 1 through 64 characters in length.
Default password: Test-Password

interval *seconds*

Specifies the time interval, in seconds, between two keepalive access requests.
Default: 30 seconds

password

Specifies the password to be used for authentication.
password must be an alpha and/or numeric string of 1 through 64 characters in length.
Default password: Test-Password

retries *number*

Specifies the number of times the keepalive access request to be sent before marking the server as unreachable.
number must be an integer from 3 through 10.
Default: 3

timeout *seconds*

Specifies the time interval between keepalive access request retries.
seconds must be an integer from 1 through 30.
Default: 3 seconds

username *name*

Specifies the user name to be used for authentication. *name* must be an alpha and/or numeric string of 1 through 127 characters in length.
Default: Test-Username

valid-response access-accept [*access-reject* **]**

Specifies the valid response for the authentication request.
If *access-reject* is configured, then both access-accept and access-reject are considered as success for the keepalive authentication request.
If *access-reject* is not configured, then only access-accept is considered as success for the keepalive access request.
Default: **keepalive valid-response access-accept**

Usage

Use this command to configure the keepalive authentication parameters for the RADIUS server.

Example

The following command configures the user name for RADIUS keepalive access requests to *Test-Username2*:

```
radius keepalive username Test-Username2
```

The following command configures the number of RADIUS keepalive retries to *4*:

```
radius keepalive retries 4
```

radius mediation-device

See the radius accounting server command.

radius probe-interval

This command configures the time interval between two RADIUS authentication probes.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius probe-interval *seconds*

default radius probe-interval

default

Configures the default setting.

seconds

Default: 60
Specifies the number of seconds to wait before sending another probe authentication request to a RADIUS server.
seconds must be an integer from 1 through 65535.

Usage

Use this command for Interchassis Session Recovery (ICSR) support to set the duration between two authentication probes to the RADIUS server.

Example

The following command sets the RADIUS authentication probe interval to 30 seconds.

radius probe-interval *30*

radius probe-max-retries

This command configures the number of retries for RADIUS authentication probe response.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius probe-max-retries *retries*

default radius probe-max-retries

default

Configures the default setting.

retries

Default: 5
Specifies the number of retries for RADIUS authentication probe response before the authentication is declared as failed.
retries must be an integer from 0 through 65535.

Usage

Use this command for Home Agent Geographical Redundancy (HAGR) support to set the number of attempts to send RADIUS authentication probe without a response before the authentication is declared as failed.

Example

The following command configures the maximum number of retries to *6* seconds.

radius probe-max-retries *6*

radius probe-timeout

This command configures the timeout duration for HAGR to wait for a response for RADIUS authentication probes.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius probe-timeout *idle_seconds*

default radius probe-timeout

default

Configures the default setting.

idle_seconds

Default: 3
Specifies the number of seconds to wait for a response from the RADIUS server before re-sending the authentication probe.
idle_seconds must be an integer from 0 through 65535.

Usage

Use this command for Home Agent Geographical Redundancy (HAGR) support to set the time duration to wait for response before re-sending the RADIUS authentication probe to the RADIUS server.

Example

The following command sets the authentication probe timeout to *120* seconds:

radius probe-timeout *120*

radius server

This command configures RADIUS authentication server(s) in the current context for authentication.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius server *ip_address* **[encrypted] key** *value* **[max** *messages* **] [oldports] [port** *port_number* **] [priority** *priority* **] [probe | no-probe] [probe-username** *username* **] [probe-password [encrypted] password** *password* **] [type { mediation-device | standard }] [admin-status { enable | disable }] [-noconfirm]**

no radius server *ip_address* **[oldports | port** *port_number* **]**

no

Removes the server or server port(s) specified from the list of configured servers.

ip_address **port** *port_number*

Specifies the IP address and port number of the server.
ip_address: Must be specified using the standard IPv4 dotted decimal notation. A maximum of 1600 RADIUS servers per context/system and 128 servers per Server group can be configured. This limit includes accounting and authentication servers.
port *port_number*: Specifies the port number to use for communications. *port_number* must be an integer from 1 through 65535. Default: 1812.

Important: Same RADIUS server IP address and port can be configured in multiple RADIUS server group within a context.

[encrypted] key *value*

Specifies the shared secret key used to authenticate the client to the servers. The **encrypted** keyword indicates the key specified is encrypted. The key *value* must be an alpha and/or numeric string of 1 through 15 characters, or an alpha and/or numeric string of 1 through 30 characters when encrypted.
The **encrypted** keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **key** keyword is the encrypted version of the plain text key. Only the encrypted key is saved as part of the configuration file.

max *messages*

Default: 256
Specifies the maximum number of outstanding messages that may be allowed to the server. *messages* must be an integer from 0 through 4000.

oldports

Sets the UDP communication port to the old default for RADIUS communications to 1645.

priority *priority*

Default: 1000
Specifies the relative priority of this accounting server. The priority is used in server selection for determining which server to send accounting data to.
priority must be an integer from 1 through 1000, where 1 is the highest priority. When configuring two or more servers with the same priority you will be asked to confirm that you want to do this. If you use the **-noconfirm** option, you are not asked for confirmation and multiple servers could be assigned the same priority.

probe

Enable probe messages to be sent to the specified RADIUS server.

no-probe

Disable probe messages from being sent to the specified RADIUS server. This is the default behavior.

probe-username *username*

The username sent to the RADIUS server to authenticate probe messages. *username* must be an alpha and/or numeric string of 1 through 127 characters in length.

probe-password [encrypted] password *password*

The password sent to the RADIUS server to authenticate probe messages.
encrypted: This keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.
password *password*: Specifies the probe-user password for authentication. *password* must be an alpha and/or numeric string of 1 through 63 characters in length.

type { mediation-device | standard }

Specifies the type of transactions the RADIUS server accepts.
mediation-device: Specifies mediation-device specific AAA transactions. This device is available if you purchased a transaction control services license. Contact your local sales representative for licensing information.
standard - Specifies standard AAA transactions. (Default)

admin-status { enable | disable }

Enables or disables the RADIUS authentication, accounting, or charging server functionality and saves the status setting in the configuration file to re-establish the set status at reboot.

-noconfirm

Specifies that the command must execute without any prompts and confirmation from the user.

Usage

This command is used to configure the RADIUS authentication server(s) with which the system is to communicate for authentication.
Up to 1600 RADIUS servers per context/system and 128 servers per Server group can be configured. The servers can be configured as accounting, authentication, charging servers, or any combination thereof.

Example

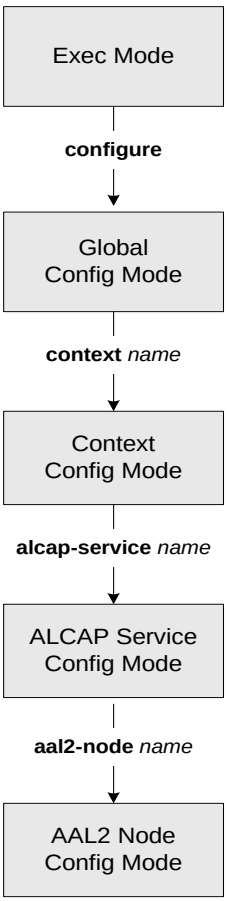
radius server *1.2.3.4* **key** *sharedKey* **port** *1024* **max** *127*

radius server *1.2.5.6* **encrypted key** *scrambledKey* **oldports priority** *10*]

no radius server *1.2.5.6*

Chapter 3
AAL2 Node Configuration Mode Commands

The AAL2 Node Configuration Mode is used to configure the ATM Adaptation Layer 2 nodes to manage the Access Link Control Application Part (ALCAP) on HNB-GW for IuCS-over-ATM support towards CS core network.



Important: The AAL2 Node configured here will be used to bind with ATM port in PVC configuration sub-mode of ATM configuration mode for IuCS-over-ATM functionality.

aal2-path-id

This command set the AAL2 path identifier with AAL2 node and also used to block a particular AAL2 path.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

```
[no] aal2-path-id aal2_path_id [block]
```

no

Removes the configured AAL2 path identifier from this AAL2 node configuration.

aal2_path_id

Specifies the AAL2 path identifier configured with adjacent AAL2 node(s). The AAL2 path id must be unique within an AAL2 node configuration. This value is used to identify a particular path towards an adjacent AAL2 node and is sent in ALCAP protocol messages to peer where path identification is required. The *aal2_path_id* must be an integer between 1 through 16.

Important: This AAL2 path id *aal2_path_id* will be used to bind with ATM port in PVC configuration mode of ATM configuration mode.

block

This keyword block the AAL2 path configured with specific path identifier. When this keyword is executed ALCAP-BLO-REQUEST shall be sent to the adjacent AAL2 node.
To unblock an AAL2 path, the no keyword will be used for a locally blocked path by sending ALCAP-UNBLOCK-REQUEST to the adjacent AAL2 node.

Usage

Use this command to configure an AAL2 path between a pair of adjacent nodes, which is identified by a unique number called AAL2 path identifier. An AAL2 path provides 248 AAL2 channels wherein each AAL2 channel is used for one circuit switched call. The AAL2 channel range defined is 8 to 255.
This command can be used for blocking or unblocking an AAL2 path towards an adjacent AAL2 node.

Important: The AAL2 path id configured here will be used to bind with ATM port in PVC configuration sub-mode of ATM configuration mode for IuCS-over-ATM functionality.

Example

Following command sets the AAL2 path identifier *2* in an AAL2 node configuration.

```
al2-path-id 2
```

Following command unblocks the AAL2 path identifier *6* which was earlier blocked in an AAL2 node configuration.

no al2-path-id *6* **block**

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the previous mode.

point-code

This command configure the point code of adjacent AAL2 node in SS7 format address. This point code shall be filled in the destination point-code (dpc) field of MTP3 routing label. This is required if signaling transport network is based on MTP3-broadband (MTP3B).

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

```
[no] point-code point_code
```

no

Removes the configured point code from this AAL2 node configuration.

point_code

Defines the point code to assign to adjacent AAL2 node in SS7 format.
point_code: value entered must adhere to the point code variant selected when the AAL2 node was defined:

- ITU Range 0.0.1 to 7.255.7
- ANSI Range 0.0.1 to 255.255.255
- TTC Range 0.0.1 to 15.31.255
- a string of 1 to 11 combined digits ad period.

Usage

Use this command to configure configure the point code of adjacent AAL2 node in SS7 format address. This point code shall be filled in the destination point-code (dpc) field of MTP3 routing label. This is required if signaling transport network is based on MTP3-broadband (MTP3B).
A maximum of *TBD* point codes for adjacent AAL2 nodes can be configured in one ALCAP service.

Example

The following command configures the point code *4.121.5* for adjacent AAL2 node.

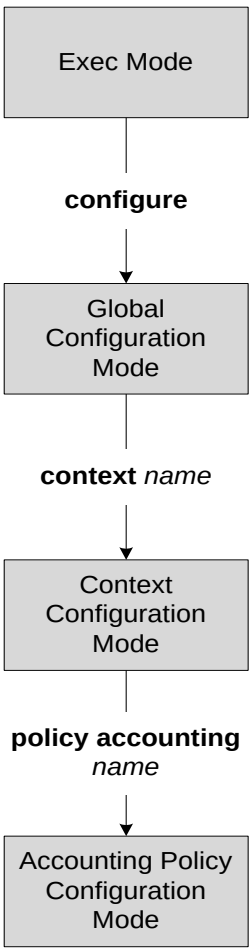
```
point-code 4.121.5
```

The following command removes the point code *4.121.15* from AAL2 node configuration.

```
no point-code 4.121.15
```

Chapter 4
Accounting Policy Configuration Mode Commands

The Accounting Policy Configuration Mode is used to define the accounting method, mode, and event trigger responses for the accounting policy supporting the Rf (off-line charging) interface.



accounting-event-trigger

Configures the response to specific event triggers for this policy. Multiple event instances can be configured.

Product

HSGW, P-GW, S-GW

Privilege

Administrator

Syntax

accounting-event-trigger { flow-information-change | interim-timeout | location-change } action { interim | stop-start }

[default | no] accounting-event-trigger { flow-information-change | interim-timeout | location-change }

default

Returns the command to its default setting of interim for the **action** keyword (for all events).

no

Removes the specified event trigger configuration from this policy.

flow-information-change

Specifies that the action is initiated upon indication of a change in the flow information.

interim-timeout

Specifies that the action is initiated upon expiration of the interim interval.

location-change

Specifies that the action is initiated upon indication of

action { interim | stop-start }

Default: interim
Specifies the action initiated upon the occurrence of an event.
interim: Specifies that an interim ACR is sent.
stop-start: Soecifies that a stop-start ACR is sent.

Usage

Use the is command to configure that action taken upon the occurrence on an accounting event trigger.

Example

The following command configures the policy to send a stop-start ACR upon indication of an interim timeout:

```
accounting-event-trigger interim-timeout
```

accounting-level

Configures the type of accounting performed by this profile.

Product

HSGW, P-GW, S-GW

Privilege

Administrator

Syntax

```
accounting-level { flow | pdn | pdn-qci | qci | sdf | subscriber }

default accounting-level
```

default

Returns the command to the default setting of subscriber-based accounting.

flow

Specifies that flow-based accounting is to be used for this accounting profile. Accounting Request (ACR) Start messages include an AVP with the following EPS information:

- PDN identifier
- QCI for which accounting is done
- Charging rule name for which accounting is being done
- AF charging identifier (included if PCRF has provided a charging identifier to correlate AF generated information)
- Flow description for the flows
- User Equipment information if available (ESN/MEID)
- Address of HSGW/SGW
- Address of the PGW (if available), one or more instances

pdn

Specifies that PDN-based accounting is to be used for this accounting profile. Accounting Request (ACR) Start messages include an AVP with the following EPS information:

- Addresses allocated to the UE in this PDN
- PDN identifier
- User Equipment information if available (ESN/MEID)
- Address of HSGW/SGW
- Address of the PGW (if available), one or more instances

pdn-qci

Specifies that PDN-QCI accounting is to be used for this accounting profile. Accounting Request (ACR) Start messages include an AVP with the following EPS information:

- Addresses allocated to the UE in this PDN

- PDN identifier
- QCI for which accounting is done
- User Equipment information if available (ESN/MEID)
- Address of HSGW/SGW
- Address of the PGW (if available), one or more instances

qci

Specifies that QCI-based accounting is to be used for this accounting profile. Accounting Request (ACR) Start messages include an AVP with the following EPS information:

- QCI for which accounting is done
- User Equipment information if available (ESN/MEID)
- Address of HSGW/SGW
- Address of the PGW (if available), one or more instances

sdf

Specifies that service data flow accounting is to be used for this accounting profile. Accounting Request (ACR) Start messages include an AVP with the following EPS information:

subscriber

Specifies that subscriber-based accounting is to be used for this accounting profile. Accounting Request (ACR) Start messages include an AVP with the following EPS information:

- User Equipment information if available (ESN/MEID)
- Address of HSGW/SGW
- Address of the PGW (if available), one or more instances

Usage

Use this command to specify the type of accounting performed by this profile.

Example

The following command sets the accounting type for this profile to flow-based:

```
accounting-level flow
```

accounting-mode

Configures the accounting mode for this profile.

Product

HSGW, P-GW, S-GW

Privilege

Administrator

Syntax

accounting-mode normal

default accounting-mode

default

Returns the accounting mode for this profile to its default setting of “normal”.

normal

Specifies that “normal” (start/interim/stop) accounting will be performed for this profile.

Usage

Use this command to set the accounting mode for this profile.

cc profile

Configures a charging characteristics profile, within the accounting profile configuration, for CDR generation.

Product

S-GW

Privilege

Administrator

Syntax

cc profile *index* **{ buckets** *num* **| interval** *seconds* **| tariff time1** *min hrs* **[time2** *min hrs*...**time4** *min hrs* **] | volume { downlink** *octets* **{ uplink** *octets* **} | total** *octets* **| uplink** *octets* **{ downlink** *octets* **} } }**

default cc profile *index*

no cc profile *index* **{ buckets | interval | tariff | volume }**

default

Returns all profile features, for the specified profile index, to their default settings.

no

Returns the specified feature to its default setting.

profile *index*

Specifies a billing type to be applied to this profile. *index* must be one of the following:
1: Hot billing
2: Flat billing
4: Prepaid billing
8: Normal billing

buckets *num*

Default: 4
Specifies the number of container changes in the S-GW CDR due to QoS changes or tariff times. *num* must be an integer value from 1 to 4. If an accounting policy is not configured, this value is 4.

interval *seconds*

Default: disabled
Specifies a time interval for closing the charging record if the minimum volume thresholds are satisfied. *seconds* must be an integer valse from 60 to 40000000.

tariff time1 *min hrs* **[time2** *min hrs*...**time4** *min hrs* **]**

Specifies time-of-day values used to determine when a container is closed in the charging records.
time1 *min hrs*: Specifies the first time-of-day value used to close the current container in the charging record. *min* must be an integer value from 0 to 59. *hrs* must be an integer value from 0 to 23.

time2 *min hrs*...time4 *minutes hours*: Specifies the second, third and fourth time-of-day values used to close containers in the charging record. *min* must be an integer value from 0 to 59. *hrs* must be an integer value from 0 to 23.

volume { downlink *octets* **{ uplink** *octets***} | total** *octets* **| uplink** *octets* **{ downlink** *octets* **} }**

Specifies octet volume thresholds for the generation of interim CDRs.
downlink *octets*: Sets the threshold limit for the number of downlink octets that must be reached before the charging record is closed. *octets* must be an interger value from 100000 to 40000000000.
total *octets*: Sets the threshold limit for the total number of octets that must be reached before the charging record is closed. *octets* must be an interger value from 100000 to 40000000000.
uplink *octets*: Sets the threshold limit for the number of uplink octets that must be reached before the charging record is closed. *octets* must be an interger value from 100000 to 40000000000.

Usage

Use this command to set charging characteristics that directly affect the CDR generation on the S-GW.

Example

The following command creates a hot billing profile with a total octet volume threshold set to 500,000:

```
cc profile 1 volume total 500000
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

```
exit
```

Usage

Return to the previous mode.

operator-string

Configures a text string to be included with accounting messages sent by this policy.

Product

HSGW, P-GW, S-GW

Privilege

Administrator

Syntax

operator-string *string*

no operator-string

no

Removes the operator string from this policy.

string

Specifies a text string that is included with accounting messages originating from this policy. *string* must be from 1 to 63 alpha and/or numeric characters.

Usage

Use this command to create a text string to be included with accounting messages originating from this policy.

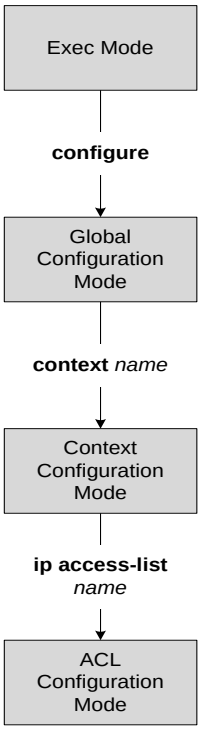
Example

The following command creates the text string “pgw_local” to be included with accounting messages originating from this policy:

```
operator-string pgw_local
```

Chapter 5
ACL Configuration Mode Commands

The Access Control List Configuration Mode is used to create and manage IP access privileges.



deny/permit

The following commands set access permissions based on various parameters:

deny/permit (by source IP address masking)

Used to filter subscriber sessions based on the IP address mask sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

{ deny | permit } [log] *source_address source_wildcard*

after { deny | permit } [log] *source_address source_wildcard*

before { deny | permit } [log] *source_address source_wildcard*

no { deny | permit } [log] *source_address source_wildcard*

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.
deny: indicates the rule, when matched, drops the corresponding packets.
permit: indicates the rule, when matched, allows the corresponding packets.

log

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

Usage

Define a rule when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of filtering rules as it does not require a rule for each source and destination pair.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information.

Example

The following command defines two rules with the second logging filtered packets.
permit*1.2.3.0 0.0.0.31*
deny log *1.2.4.0 0.0.0.15*
The following sets the insertion point before the first rule defined above.
before permit*1.2.3.0 0.0.0.31*
The following command sets the insertion point after the second rule defined above.
after deny log *1.2.4.0 0.0.0.15*
The following deletes the first rule defined above.
no permit*1.2.3.0 0.0.0.31*

deny/permit (any)

Used to filter subscriber sessions based on any packet received. This command is also used to set the access control list insertion point.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
{ deny | permit } [ log ] any

after { deny | permit } [ log ] any

before { deny | permit } [ log ] any

no { deny | permit } [ log ] any
```

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.
deny: indicates the rule, when matched, drops the corresponding packets.
permit: indicates the rule, when matched, allows the corresponding packets.

log

Default: packets are not logged.

Indicates all packets which match the filter are to be logged.

any

Indicates all packets will match the filter regardless of source and/or destination.

Usage

Define a catch all rule to place at the end of the list of ru

Important: It is suggested that any rule which is added to be a catch all should also have the **log** option specified. The logged packets may be used to determine if the current list of rules is adequate or needs modification to ensure proper security. The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information.

Example

The following commands define two rules with the second logging filtered packets.

```
permit any
deny log any
```

The following sets the insertion point before the first rule defined above.

```
before permit any
```

The following command sets the insertion point after the second rule defined above.

```
after deny log any
```

The following deletes the first rule defined above.

```
no permit any
```

deny/permit (by host IP address)

Used to filter subscriber sessions based on the targeted host IP address sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

{ deny | permit } [log] host*source_host_address*

after { deny | permit } [log] host*source_host_address*

before { deny | permit } [log] host*source_host_address*

no { deny | permit } [log] host*source_host_address*

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.
deny: indicates the rule, when matched, drops the corresponding packets.
permit: indicates the rule, when matched, allows the corresponding packets.

log

Default: packets are not logged.

Indicates all packets which match the filter are to be logged.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

Usage

Define a rule when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rules to be very clear and concise.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information.

Example

The following commands define two rules with the second logging filtered packets.

permit host *1.2.3.4*
deny log host *1.2.3.5*

The following sets the insertion point before the first rule defined above.

before permit host *1.2.3.4*

The following command sets the insertion point after the second rule defined above.

after deny log host *1.2.3.5*

The following deletes the first rule defined above.

no permit host *1.2.3.4*

deny/permit (by source ICMP packets)

Used to filter subscriber sessions based on the internet control message protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
{ deny | permit } [ log ] icmp { source_address source_wildcard | any |
hostsource_host_address } { dest_address dest_wildcard | any |
hostdest_host_address } [ icmp_type [ icmp_code ] ]

after { deny | permit } [ log ] icmp { source_address source_wildcard | any |
hostsource_host_address } { dest_address dest_wildcard | any |
hostdest_host_address } [ icmp_type [ icmp_code ] ]

before { deny | permit } [ log ] icmp { source_address source_wildcard | any |
hostsource_host_address } { dest_address dest_wildcard | any |
hostdest_host_address } [ icmp_type [ icmp_code ] ]

no { deny | permit } [ log ] icmp { source_address source_wildcard | any |
hostsource_host_address } { dest_address dest_wildcard | any |
hostdest_host_address } [ icmp_type [ icmp_code ] ]
```

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.
deny : indicates the rule, when matched, drops the corresponding packets.
permit : indicates the rule, when matched, allows the corresponding packets.

log

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in dotted decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. The type can be any integer value between 0 and 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered. The type can be any integer value between 0 and 255.

Usage

Define a rule to block ICMP packets which can be used for address resolution and possible be a security risk. The IP filtering allows flexible controls for pairs of individual hosts or groups by IP masking which allows the filtering of entire subnets if necessary.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information.

Example

The following commands define two rules with the second logging filtered packets.

```
permit icmp host 1.2.3.4 any 168
deny log icmp 1.2.3.0 0.0.0.31 host 1.2.4.16 168 11
```

The following sets the insertion point before the first rule defined above.

```
before permit icmp host 1.2.3.4 any 168
```

The following command sets the insertion point after the second rule defined above.

```
after deny log icmp 1.2.3.0 0.0.0.31 host 1.2.4.16 168 11
```

The following deletes the first rule defined above.

```
no permit icmp host 1.2.3.4 any 168
```

deny/permit (by IP packets)

Used to filter subscriber sessions based on the internet protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
{ deny | permit } [ log ] ip { source_address source_wildcard | any |
hostsource_host_address } { dest_address dest_wildcard | any |
hostdest_host_address } [ fragment ] [ protocol num ]

after { deny | permit } [ log ] ip { source_address source_wildcard | any |
hostsource_host_address } { dest_address dest_wildcard | any |
hostdest_host_address } [ fragment ] [ protocol num ]

before { deny | permit } [ log ] ip { source_address source_wildcard | any |
hostsource_host_address } { dest_address dest_wildcard | any |
hostdest_host_address } [ fragment ] [ protocol num ]

no { deny | permit } [ log ] ip { source_address source_wildcard | any |
hostsource_host_address } { dest_address dest_wildcard | any |
hostdest_host_address } [ fragment ] [ protocol num ]
```

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.
deny: indicates the rule, when matched, drops the corresponding packets.
permit: indicates the rule, when matched, allows the corresponding packets.

log

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in dotted decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

fragment

Indicates packet filtering is to be applied to IP packet fragments only.

protocol *num*

Indicates that the packet filtering is to be applied to a specific protocol number.
num can be any integer ranging from 0 to 255.

Important: This keyword is not applicable to a SPIO interface. Instead, you must specify the type of protocol packets for which you want to deny/permit processing on a SPIO. For example, **deny icmp**, **deny tcp**, or **deny udp**.

Usage

Block IP packets when the source and destination are of interest.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information.

Example

The following commands define two rules with the second logging filtered packets.

```
permit ip host 1.2.3.4 any fragment
deny log ip 1.2.3.0 0.0.0.31 host 1.2.4.16
```

The following sets the insertion point before the first rule defined above.

```
before permit ip host 1.2.3.4 any fragment
```

The following command sets the insertion point after the second rule defined above.

```
after deny log ip 1.2.3.0 0.0.0.31 host 1.2.4.16
```

The following deletes the first rule defined above.

```
no permit ip host 1.2.3.4 any fragment
```

deny/permit (by TCP/UDP packets)

Used to filter subscriber sessions based on the transmission control protocol/user datagram protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

{ deny | permit } [log] { tcp | udp } { { *source_address source_wildcard* | any | host*source_host_address* } [eq*source_port* | gt*source_port* | lt*source_port* | neq*source_port*] } { { *dest_address dest_wildcard* | any | host*dest_host_address* } [eq*dest_port* | gt*dest_port* | lt*dest_port* | neq*dst_port* | range *start_port end_port*]}

after { deny | permit } [log] { tcp | udp } { { *source_address source_wildcard* | any | host*source_host_address* } [eq*source_port* | gt*source_port* | lt*source_port* | neq*source_port*] } { { *dest_address dest_wildcard* | any | host*dest_host_address* } [eq*dest_port* | gt*dest_port* | lt*dest_port* | neq*dst_port* | range *start_port end_port*] }

before { deny | permit } [log] { tcp | udp } { { *source_address source_wildcard* | any | host*source_host_address* } [eq*source_port* | gt*source_port* | lt*source_port* | neq*source_port*] } { { *dest_address dest_wildcard* | any | host*dest_host_address* } [eq*dest_port* | gt*dest_port* | lt*dest_port* | neq*dst_port* | range *start_port end_port*] }

no { deny | permit } [log] { tcp | udp } { { *source_address source_wildcard* | any | host*source_host_address* } [eq*source_port* | gt*source_port* | lt*source_port* | neq*source_port*] } { { *dest_address dest_wildcard* | any | host*dest_host_address* } [eq*dest_port* | gt*dest_port* | lt*dest_port* | neq*dst_port* | range *start_port end_port*] }

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.
deny: indicates the rule, when matched, drops the corresponding packets.
permit: indicates the rule, when matched, allows the corresponding packets.

log

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

tcp | udp

Specifies the filter is to be applied to IP based transmission control protocol or the user datagram protocol.
tcp: filter applies to TPC packets.
udp: filter applies to UDP packets.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in dotted decimal notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be configured to any integer value from 0 to 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

range *start_port end_port*

Specifies a range of ports to be matched.
start_port must be an integer from 0 to 65535, and must be less than the *end_port* value.
end_port must be an integer from 0 to 65535, and must be greater than the *start_port* value.

Important: This option is supported in PDIF Release 8.3.

Usage

Block IP packets when the source and destination are of interest but for only a limited set of ports.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information.

Example

The following commands define four rules with the second and fourth rules logging filtered packets.

```
permit tcp host 1.2.3.4 any
deny log udp 1.2.3.0 0.0.0.31 host 1.2.4.16
permit tcp host 1.2.3.64 gt 1023 any
deny log udp 1.2.3.0 0.0.0.31 1.2.4.127 0.0.0.127
```

The following sets the insertion point before the first rule defined above.

```
before permit tcp host 1.2.3.4 any
```

The following command sets the insertion point after the second rule defined above.

```
after deny log udp 1.2.3.0 0.0.0.31 host 1.2.4.16
```

The following deletes the third rule defined above.

```
no permit tcp host 1.2.3.64 gt 1023 any
```

end

Exits the ACL configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

Example

```
end
```

exit

Exits the ACL configuration mode and returns to the context configuration mode.

Privilege

Security Administrator, Administrator

Product

All

Syntax

```
exit
```

Usage

Return to the context configuration mode.

Example

```
exit
```

readdress server

Alter the destination address and port number in TCP or UDP packet headers to redirect packets to a different server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

readdressserver*redirect_address* **[port***port_no* **] { tcp | udp } { { *source_address source_wildcard* | **any** | **host***source_host_address* } **[eq***source_port* | **gt***source_port* | **lt***source_port* | **neq***source_port* **] } { { *dest_address dest_wildcard* | **any** | **host***dest_host_address* } **[eq***dest_port* | **gt***dest_port* | **lt***dest_port* | **neq***dst_port* **] }**

afterreaddressserver*redirect_address* **[port***port_no* **] { tcp | udp } { { *source_address source_wildcard* | **any** | **host***source_host_address* } **[eq***source_port* | **gt***source_port* | **lt***source_port* | **neq***source_port* **] } { { *dest_address dest_wildcard* | **any** | **host***dest_host_address* } **[eq***dest_port* | **gt***dest_port* | **lt***dest_port* | **neq***dst_port* **] }**

beforereaddressserver*redirect_address* **[port***port_no* **] { tcp | udp } { { *source_address source_wildcard* | **any** | **host***source_host_address* } **[eq***source_port* | **gt***source_port* | **lt***source_port* | **neq***source_port* **] } { { *dest_address dest_wildcard* | **any** | **host***dest_host_address* } **[eq***dest_port* | **gt***dest_port* | **lt***dest_port* | **neq***dst_port* **] }**

noreaddressserver*redirect_address* **[port***port_no* **] { tcp | udp } { { *source_address source_wildcard* | **any** | **host***source_host_address* } **[eq***source_port* | **gt***source_port* | **lt***source_port* | **neq***source_port* **] } { { *dest_address dest_wildcard* | **any** | **host***dest_host_address* } **[eq***dest_port* | **gt***dest_port* | **lt***dest_port* | **neq***dst_port* **] }**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

redirect_address

The IP address to which the IP packets are redirected. TCP or UDP packet headers are rewritten to contain the new destination address. This must be an IPv4 address specified in dotted decimal notation.

port *port_no*

The number of the port at the redirect address where the packets are sent. TCP or UDP packet headers are rewritten to contain the new destination port number.

tcp | udp

Specifies the redirect is to be applied to the IP based transmission control protocol or the user datagram protocol.
tcp : redirect applies to TCP packets.
udp : redirect applies to UDP packets.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in dotted decimal notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be configured to any integer value from 0 to 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered. *dest_port* must be configured to any integer value from 0 to 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered. *dest_port* must be configured to any integer value from 0 to 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered. *dest_port* must be configured to any integer value from 0 to 65535.

Usage

Use this command to define a rule that redirects packets to a different destination address. The TCP and UDP packet headers are modified with the new destination address and destination port.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information.

Important: Prior to Release 8.3, for packets received from the packet data network destined for a subscriber's UE, the system applied logic to reset the source address of a packet to the original destination address of the input packet before applying the outbound access control list (ACL). In Release 8.3 and higher, the system reverses the order and applies the outbound ACL before resetting the source address. This change impacts all current readdress server rules in inbound IPv4 ACLs.

Important: After upgrading to Release 8.3, for every readdress server rule in an inbound IPv4 ACL, customers must now add a permit rule to an outbound ACL that explicitly permits packets from the readdress rule's redirect address and port number. If customers omit this permit rule, the system will reject all packets destined for the subscriber's UE from the readdress rule's redirect address and port number.

Example

The following command defines a rule that redirects packets to the server at 192.168.10.4, UDP packets coming from any host with a destination of any host are matched.

readdress server *192.168.10.4* **udp any any**

The following sets the insertion point before the rule defined above.

before readdress server *192.168.10.4* **udp any any**

The following command sets the insertion point after the first rule defined above.

after readdress server *192.168.10.4* **udp any any**

The following deletes the rule defined above.

no readdress server *192.168.10.4* **udp any any**

redirect context

The following commands redirect subscriber sessions to a different context based on various parameters:

redirect context (by IP address masking)

Used to redirect subscriber sessions based on the IP address mask sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect context*context_id* **[log]** *source_address source_wildcard*

afterredirect context*context_id* **[log]** *source_address source_wildcard*

beforeredirect context*context_id* **[log]** *source_address source_wildcard*

noredirect context*context_id* **[log]** *source_address source_wildcard*

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

Usage

Define a rule when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of redirect rules as it does not require a rule for each source and destination pair.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information.

Important: Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of 23 and the source IP and wildcard of 192.168.22.0 and 0.0.0.31.

```
redirect context 23 198.162.22.0 0.0.0.31
```

The following sets the insertion point before the rule defined above.

```
before redirect context 23 198.162.22.0 0.0.0.31
```

The following command sets the insertion point after the first rule defined above.

```
after redirect context 23 198.162.22.0 0.0.0.31
```

The following deletes the first rule defined above.

```
no redirect context 23 198.162.22.0 0.0.0.31
```

redirect context (any)

Used to redirect subscriber sessions based on any packet received. This command is also used to set the access control list insertion point.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect context*context_id* **[log] any**

after redirect context*context_id* **[log] any**

before redirect context*context_id* **[log] any**

no redirect context*context_id* **[log] any**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

any

Indicates all packets will match the redirect regardless of source and/or destination.

Usage

Define a catch all rule to place at the end of the list of rules to provide explicit handling of rules which do not fit any other criteria.

Important: It is suggested that any rule which is added to be a catch all should also have the log option specified. The logged packets may be used to determine if the current list of rules is adequate or needs modification to ensure proper security.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information.

Important: Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of 23 and any source IP.

redirect context *23* **any**

The following sets the insertion point before the rule defined above.

before redirect context *23* **any**

The following command sets the insertion point after the first rule defined above.

after redirect context *23* **any**

The following deletes the first rule defined above.

no redirect context *23* **any**

redirect context (by host IP address)

Used to redirect subscriber sessions based on the targeted host IP address sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect context*context_id* **[log] host***source_ip_address*

after redirect context*context_id* **[log] host***source_ip_address*

before redirect context*context_id* **[log] host***source_ip_address*

noredirect context*context_id* **[log] host***source_ip_address*

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

Usage

Define a rule when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rules to be very clear and concise.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information.

Important: Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of 23 and a host IP address of 192.168.200.11.

redirect context *23* **host** *192.168.200.11*

The following sets the insertion point before the rule defined above.

before redirect context *23* **host** *192.168.200.11*

The following command sets the insertion point after first the rule defined above.

after redirect context *23* **host** *192.168.200.11*

The following deletes the first rule defined above.

no redirect context *23* **host** *192.168.200.11*

redirect context (by source ICMP packets)

Used to redirect subscriber sessions based on the internet control message protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect contextcontext_id [ log ] icmp { source_address source_wildcard | any |
hostsource_host_address } { dest_address dest_wildcard | any |
hostdest_host_address } [icmp_type [ icmp_code ] ]

after redirect contextcontext_id [ log ] icmp { source_address source_wildcard |
any | hostsource_host_address } { dest_address dest_wildcard | any |
hostdest_host_address } [ icmp_type [ icmp_code ] ]

before redirect contextcontext_id [ log ] icmp { source_address source_wildcard
| any | hostsource_host_address } { dest_address dest_wildcard | any |
hostdest_host_address } [ icmp_type [ icmp_code ] ]

no redirect contextcontext_id [ log ] icmp { source_address source_wildcard |
any | hostsource_host_address } { dest_address dest_wildcard | any |
hostdest_host_address } [ icmp_type [ icmp_code ] ]
```

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in dotted decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. The type can be any integer value between 0 and 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered. The type can be any integer value between 0 and 255.

Usage

Define a rule to block ICMP packets which can be used for address resolution and possibly be a security risk. The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information.

Important: Also note that “redirect” rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of 23, and ICMP packets coming from the host with the IP address 198.162.100.25.

```
redirect context 23 icmp host 192.168.100.25
```

The following sets the insertion point before the rule defined above.

```
before redirect context 23 icmp host 192.168.100.25
```

The following command sets the insertion point after the first rule defined above.

```
after redirect context 23 icmp host 192.168.100.25
```

The following deletes the first rule defined above.

```
no redirect context 23 icmp host 192.168.100.25
```

redirect context (by IP packets)

Used to redirect subscriber sessions based on the internet protocol packets sent by the source to the mobile node or the network.

Product

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in dotted decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

fragment

Indicates packet redirection is to be applied to IP packet fragments only.

protocol *num*

Indicates that the packet filtering is to be applied to a specific protocol number.
num can be any integer ranging from 0 to 255.

Usage

Block IP packets when the source and destination are of interest.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information.

Important: Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of 23, and IP packets coming from the host with the IP address 198.162.100.25, and fragmented packets for any destination are matched.

```
redirect context 23 ip host 198.162.100.25 any fragment
```

The following sets the insertion point before the rule defined above.

```
before redirect context 23 ip host 198.162.100.25 any fragment
```

The following command sets the insertion point after the first rule defined above.

```
after redirect context 23 ip host 198.162.100.25 any fragment
```

The following deletes the first rule defined above.

```
no redirect context 23 ip host 198.162.100.25 any fragment
```

redirect context (by TCP/UDP packets)

Used to redirect subscriber sessions based on the transmission control protocol/user datagram protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect contextcontext_id [ log ] { tcp | udp } { { source_address
source_wildcard | any | hostsource_host_address } [ eqsource_port |
gtsource_port | ltsource_port | neqsource_port ] } { { dest_address
dest_wildcard | any | hostdest_host_address } [ eqdest_port | gtdest_port |
ltdest_port | neqdst_port ] }

afterredirect contextcontext_id [ log ] { tcp | udp } { { source_address
source_wildcard | any | hostsource_host_address } [ eqsource_port |
gtsource_port | ltsource_port | neqsource_port ] } { { dest_address
dest_wildcard | any | hostdest_host_address } [ eqdest_port | gtdest_port |
ltdest_port | neqdst_port ] }

before redirect contextcontext_id [ log ] { tcp | udp } { { source_address
source_wildcard | any | hostsource_host_address } [ eqsource_port |
gtsource_port | ltsource_port | neqsource_port ] } { { dest_address
dest_wildcard | any | hostdest_host_address } [ eqdest_port | gtdest_port |
ltdest_port | neqdst_port ] }

noredirect contextcontext_id [ log ] { tcp | udp } { { source_address
source_wildcard | any | hostsource_host_address } [ eqsource_port |
gtsource_port | ltsource_port | neqsource_port ] } { { dest_address
dest_wildcard | any | hostdest_host_address } [ eqdest_port | gtdest_port |
ltdest_port | neqdst_port ] }
```

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

tcp | udp

Specifies the redirect is to be applied to IP based transmission control protocol or the user datagram protocol.
tcp : redirect applies to TPC packets.
udp : redirect applies to UDP packets.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in dotted decimal notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be configured to any integer value from 0 to 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered. *dest_port* must be configured to any integer value from 0 to 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered. *dest_port* must be configured to any integer value from 0 to 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered. *dest_port* must be configured to any integer value from 0 to 65535.

Usage

Block IP packets when the source and destination are of interest but for only a limited set of ports.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information.Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of 23, and UDP packets coming from any host are matched.

```
redirect context 23 udp any
```

The following sets the insertion point before the rule defined above.

```
before redirect context 23 udp any
```

The following command sets the insertion point after the first rule defined above.

```
after redirect context 23 udp any
```

The following deletes the rule defined above.

```
no redirect context 23 udp any
```

redirect css delivery-sequence

This is a restricted command. In StarOS 9.0 and later, this command is obsoleted.

redirect css service

The following commands redirect subscriber sessions to Content Service Steering (CSS) services based on various parameters:

redirect css service (any)

Used to redirect subscriber sessions based on any packet received. This command is also used to set the access control list insertion point.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect css service svc_name [ log ] any
before redirect css service svc_name [ log ] any
after redirect css service svc_name [ log ] any
no redirect css service svc_name [ log ] any
```

after

Indicates all rule definitions defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definitions which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging all** command to display the names of all configured charging services.
svc_name must be a string from 1 through 15 characters in length.

log

Default: packets are not logged.

Indicates all packets which match the redirect are to be logged.

any

Indicates all packets will match the redirect regardless of source and/or destination.

Usage

Define a catch all rule definitions to place at the end of the list of rule definitions to provide explicit handling of rule definitions which do not fit any other criteria.

Important: It is suggested that any rule definition which is added to be a catch all should also have the **log** option specified. The logged packets may be used to determine if the current list of rule definitions is adequate or needs modification to ensure proper security.

Important: A maximum of 16 rule definitions can be configured per ACL.

Important: Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service with the name *chgsvc1* and any source IP.

redirect css service *chgsvc1* **any**

The following sets the insertion point before the rule definition above.

before redirect service *chgsvc1* **any**

The following command sets the insertion point after the first rule definitions above.

after redirect service *chgsvc1* **any**

The following deletes the first rule definition above.

no redirect service *chgsvc1* **any**

redirect css service (by host IP address)

Used to redirect subscriber sessions based on the targeted host IP address sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect css service svc_name [ log ] host source_host_address
before redirect css service svc_name [ log ] host source_host_address
after redirect css service svc_name [ log ] host source_host_address
no redirect css service svc_name [ log ] host source_host_address
```

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
svc_name must be a string from 1 through 15 characters in length.

log

Default: packets are not logged.

Indicates all packets which match the redirect are to be logged.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

Usage

Define a rule definition when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rule definitions to be very clear and concise.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service with the name *chgsvc1* and a host IP address of *192.168.200.11*.

redirect css service *chgsvc1* **host** *192.168.200.11*

The following sets the insertion point before the rule definition above.

before redirect css service *chgsvc1* **host** *192.168.200.11*

The following command sets the insertion point after the first rule definition above.

after redirect css service *chgsvc1* **host** *192.168.200.11*

The following deletes the first rule definition above.

no redirect css service *chgsvc1* **host** *192.168.200.11*

redirect css service (by ICMP packets)

Used to redirect subscriber sessions based on the internet control message protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* [**log**] **icmp** { **any** | **host** *source_host_address* | *source_address source_wildcard* } { **any** | **host** *dest_host_address* | *dest_address dest_wildcard* } [*icmp_type* [*icmp_code*]
before redirect css service *svc_name* [**log**] **icmp** { **any** | **host** *source_host_address* | *source_address source_wildcard* } { **any** | **host** *dest_host_address* | *dest_address dest_wildcard* } [*icmp_type* [*icmp_code*]
after redirect css service *svc_name* [**log**] **icmp** { **any** | **host** *source_host_address* | *source_address source_wildcard* } { **any** | **host** *dest_host_address* | *dest_address dest_wildcard* } [*icmp_type* [*icmp_code*]
no redirect css service *svc_name* [**log**] **icmp** { **any** | **host** *source_host_address* | *source_address source_wildcard* } { **any** | **host** *dest_host_address* | *dest_address dest_wildcard* } [*icmp_type* [*icmp_code*]

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

`css service` *`svc_name`*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **`show active-charging service all`** command to display the names of all configured charging services.
`svc_name` must be a string from 1 through 15 characters in length.

`log`

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

`source_address`

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *`source_wildcard`* parameter.

`source_wildcard`

This option is used in conjunction with the *`source_address`* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *`source_address`* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *`source_address`* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

`any`

Specifies that the rule definition applies to all packets.

`host`

Specifies that the rule definition applies to a specific host as determined by its IP address.

`source_host_address`

The IP address of the source host to filter against expressed in dotted decimal notation.

`dest_host_address`

The IP address of the destination host to filter against expressed in dotted decimal notation.

`dest_address`

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *`dest_wildcard`* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. The type can be any integer value between 0 and 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered. The type can be any integer value between 0 and 255.

Usage

Define a rule definition to block ICMP packets which can be used for address resolution and possibly be a security risk.
The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and ICMP packets coming from the host with the IP address *198.162.100.25*.
redirect css service *chgsvc1* **icmp host** *192.168.200.11*
The following sets the insertion point before the rule definition above.
before redirect css service *chgsvc1* **icmp host** *192.168.200.11*
The following command sets the insertion point after the first rule definition above.
after redirect css service *chgsvc1* **icmp host** *192.168.200.11*
The following deletes the first rule definition above.
no redirect css service *chgsvc1* **icmp host** *192.168.200.11*

redirect css service (by IP packets)

Used to redirect subscriber sessions based on the internet protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* [**log**] **ip** { **any** | **host** *source_host_address* | *source_address source_wildcard* } { **any** | **host** *dest_host_address* | *dest_address dest_wildcard* } [**fragment**]
before redirect css service *svc_name* [**log**] **ip** { **any** | **host** *source_host_address* | *source_address source_wildcard* } { **any** | **host** *dest_host_address* | *dest_address dest_wildcard* } [**fragment**]
after redirect css service *svc_name* [**log**] **ip** { **any** | **host** *source_host_address* | *source_address source_wildcard* } { **any** | **host** *dest_host_address* | *dest_address dest_wildcard* } [**fragment**]
no redirect css service *svc_name* [**log**] **ip** { **any** | **host** *source_host_address* | *source_address source_wildcard* } { **any** | **host** *dest_host_address* | *dest_address dest_wildcard* } [**fragment**]

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition that exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
svc_name must be a string from 1 through 15 characters in length.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in dotted decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

fragment

Indicates packet redirection is to be applied to IP packet fragments only.

Usage

Block IP packets when the source and destination are of interest.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and IP packets coming from the host with the IP address *198.162.100.25*, and fragmented packets for any destination are matched.

redirect css service *chgsvc1* **ip host 198.162.100.25 any fragment**

The following sets the insertion point before the rule definition above.

before redirect css service *chgsvc1* **ip host 198.162.100.25 any fragment**

The following command sets the insertion point after the first rule definition above.

after redirect css service *chgsvc1* **ip host 198.162.100.25 any fragment**

The following deletes the first rule definition above.

no redirect css service *chgsvc1* **ip host 198.162.100.25 any fragment**

redirect css service (by source IP address masking)

Used to redirect subscriber sessions based on the IP address mask sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect css service svc_name [ log ] source_address source_wildcard
before redirect css service svc_name [ log ] source_address source_wildcard
after redirect css service svc_name [ log ] source_address source_wildcard
no redirect css service svc_name [ log ] source_address source_wildcard
```

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
svc_name must be a string from 1 through 15 characters in length.

log

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

Usage

Define a rule definition when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of filtering rule definitions as it does not require a rule definition for each source and destination pair.

Important: A maximum of 16 rule definitions can be configured per ACL.

Example

The following command defines a rule definition to redirect packets to a charging service named *chgsvc1*.

```
redirect css service chgsvc1 1.2.3.0 0.0.0.31
```

redirect css service (by TCP/UDP packets)

Used to redirect subscriber sessions based on the transmission control protocol/user datagram protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* [**log**] { **tcp** | **udp** } { { *source_address source_wildcard* | **any** | **host** *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | range *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dst_port* | range *start_dest_port end_dest_port*] }
before redirect css service *svc_name* [**log**] { **tcp** | **udp** } { { *source_address source_wildcard* | **any** | **host** *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | range *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dst_port* | range *start_dest_port end_dest_port*] }
after redirect css service *svc_name* [**log**] { **tcp** | **udp** } { { *source_address source_wildcard* | **any** | **host** *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | range *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dst_port* | range *start_dest_port end_dest_port*] }
no redirect css service *svc_name* [**log**] { **tcp** | **udp** } { { *source_address source_wildcard* | **any** | **host** *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | range *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dst_port* | range *start_dest_port end_dest_port*] }

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
svc_name must be a string from 1 through 15 characters in length.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

tcp | udp

Specifies the redirect is to be applied to IP based transmission control protocol or the user datagram protocol.
tcp : redirect applies to TPC packets.
udp : redirect applies to UDP packets.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in dotted decimal notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be configured to any integer value from 0 to 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

range *start_source_port end_source_port*

Specifies that all source TCP ports within a specific range are to be filtered.
start_source_port is the initial port in the range and *end_source_port* is the final port in the range.
Both *start_source_port* and *end_source_port* can be configured to any integer value from 0 to 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

range *start_dest_port end_dest_port*

Specifies that all destination TCP ports within a specific range are to be filtered.
start_dest_port is the initial port in the range and *end_dest_port* is the final port in the range.
Both *start_dest_port* and *end_dest_port* can be configured to any integer value from 0 to 65535.

Usage

Block IP packets when the source and destination are of interest but for only a limited set of ports.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and UDP packets coming from any host are matched.
redirect css service *chgsvc1* **udp any**
The following sets the insertion point before the rule definition above.
before redirect css service *chgsvc1* **udp any**
The following command sets the insertion point after the first rule definition above.
after redirect css service *chgsvc1* **udp any**
The following deletes the rule definition above.
no redirect css service *chgsvc1* **udp any**

redirect css service (for downlink, any)

Used to redirect subscriber sessions based on any packet received in the downlink (from the Mobile Node) direction. This command is also used to set the access control list insertion point.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect css service svc_name [ log ] downlink any
before redirect css service svc_name [ log ] downlink any
after redirect css service svc_name [ log ] downlink any
no redirect css service svc_name [ log ] downlink any
```

after

Indicates all rule definitions defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
svc_name must be a string from 1 through 15 characters in length.

downlink

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

any

Indicates all packets will match the redirect regardless of source and/or destination.

Usage

Define a catch all rule definition to place at the end of the list of rule definitions to provide explicit handling of rule definitions which do not fit any other criteria.

Important: It is suggested that any rule definition which is added to be a catch all should also have the **log** option specified. The logged packets may be used to determine if the current list of rule definitions is adequate or needs modification to ensure proper security.

Important: A maximum of 16 rule definitions can be configured per ACL.

Important: Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service with the name *chgsvc1* and any source IP.

redirect css service *chgsvc1* **downlink any**

The following sets the insertion point before the rule definition above.

before redirect service *chgsvc1* **downlink any**

The following command sets the insertion point after the first rule definition above.

after redirect service *chgsvc1* **downlink any**

The following deletes the first rule definition above.

no redirect service *chgsvc1* **downlink any**

redirect css service (for downlink, by host IP address)

Used to redirect subscriber sessions based on the targeted host IP address in the downlink (from the Mobile Node) direction.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect css service svc_name [ log ] downlink host source_host_address
before redirect css service svc_name [ log ] downlink host
source_host_address
after redirect css service svc_name [ log ] downlink host source_host_address
no redirect css service svc_name [ log ] downlink host source_host_address
```

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
svc_name must be a string from 1 through 15 characters in length.

downlink

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

Usage

Define a rule definition when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rule definitions to be very clear and concise.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service with the name *chgsvc1and* a host IP address of *192.168.200.11.*

redirect service *chgsvc1* **downlink host** *192.168.200.11*

The following sets the insertion point before the rule definition above.

before redirect service *chgsvc1* **downlink host** *192.168.200.11*

The following command sets the insertion point after the first rule definition above.

after redirect service *chgsvc1* **downlink host** *192.168.200.11*

The following deletes the first rule definition above.

no redirect service *chgsvc1* **downlink host** *192.168.200.11*

redirect css service (for downlink, by ICMP packets)

Used to redirect subscriber sessions based on the internet control message protocol packets in the downlink (from the Mobile Node) direction.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect css service svc_name [ log ] downlink icmp { any | host
source_host_address | source_address source_wildcard } { any | host
dest_host_address | dest_address dest_wildcard } [ icmp_type [ icmp_code ]
before redirect css service svc_name [ log ] downlink icmp { any | host
source_host_address | source_address source_wildcard } { any | host
dest_host_address | dest_address dest_wildcard } [ icmp_type [ icmp_code ]
after redirect css service svc_name [ log ] downlink icmp { any | host
source_host_address | source_address source_wildcard } { any | host
dest_host_address | dest_address dest_wildcard } [ icmp_type [ icmp_code ]
no redirect css service svc_name [ log ] downlink icmp { any | host
source_host_address | source_address source_wildcard } { any | host
dest_host_address | dest_address dest_wildcard } [ icmp_type [ icmp_code ]
```

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

`css service` *`svc_name`*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **`show active-charging service all`** command to display the names of all configured charging services.
`svc_name` must be a string from 1 through 15 characters in length.

`downlink`

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

`log`

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

`source_address`

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *`source_wildcard`* parameter.

`source_wildcard`

This option is used in conjunction with the *`source_address`* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *`source_address`* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *`source_address`* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

`any`

Specifies that the rule definition applies to all packets.

`host`

Specifies that the rule definition applies to a specific host as determined by its IP address.

`source_host_address`

The IP address of the source host to filter against expressed in dotted decimal notation.

`dest_host_address`

The IP address of the destination host to filter against expressed in dotted decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. The type can be any integer value between 0 and 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered. The type can be any integer value between 0 and 255.

Usage

Define a rule definition to block ICMP packets which can be used for address resolution and possibly be a security risk.
The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and ICMP packets coming in the downlink (from the Mobile Node) direction from the host with the IP address 198.162.100.25.

```
redirect css service chgsvc1 downlink icmp host 192.168.100.25
```

The following sets the insertion point before the rule definition above.

```
before redirect css service chgsvc1 downlink icmp host 192.168.100.25
```

The following command sets the insertion point after the first rule definition above.

```
after redirect css service chgsvc1 downlink icmp host 192.168.100.25
```

The following deletes the first rule definition above.

no redirect css service *chgsvc1* **downlink icmp host** *192.168.100.25*

redirect css service (for downlink, by IP packets)

Used to redirect subscriber sessions based on the internet protocol packets in the downlink (from the Mobile Node) direction.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect css service svc_name [ log ] downlink ip { any | host
source_host_address | source_address source_wildcard } { any | host
dest_host_address | dest_address dest_wildcard } [ fragment ]
before redirect css service svc_name [ log ] downlink ip { any | host
source_host_address | source_address source_wildcard } { any | host
dest_host_address | dest_address dest_wildcard } [ fragment ]
after redirect css service svc_name [ log ] downlink ip { any | host
source_host_address | source_address source_wildcard } { any | host
dest_host_address | dest_address dest_wildcard } [ fragment ]
no redirect css service svc_name [ log ] downlink ip { any | host
source_host_address | source_address source_wildcard } { any | host
dest_host_address | dest_address dest_wildcard } [ fragment ]
```

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

`css service` *`svc_name`*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **`show active-charging service all`** command to display the names of all configured charging services.
`svc_name` must be a string from 1 through 15 characters in length.

`downlink`

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

`log`

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

`source_address`

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *`source_wildcard`* parameter.

`source_wildcard`

This option is used in conjunction with the *`source_address`* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *`source_address`* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *`source_address`* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

`any`

Specifies that the rule definition applies to all packets.

`host`

Specifies that the rule definition applies to a specific host as determined by its IP address.

`source_host_address`

The IP address of the source host to filter against expressed in dotted decimal notation.

`dest_host_address`

The IP address of the destination host to filter against expressed in dotted decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

fragment

Indicates packet redirection is to be applied to IP packet fragments only.

Usage

Block IP packets when the source and destination are of interest.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and downlink IP packets coming from the host with the IP address *198.162.100.25*, and fragmented packets for any destination are matched.

redirect css service *chgsvc1* **downlink ip host 1***98.162.100.25* **any fragment**

The following sets the insertion point before the rule definition above.

before redirect css service *chgsvc1* **downlink ip host 1***98.162.100.25* **any fragment**

The following command sets the insertion point after the first rule definition above.

after redirect css service *chgsvc1* **downlink ip host 1***98.162.100.25* **any fragment**

The following deletes the first rule definition above.

no redirect css service *chgsvc1* **downlink ip host 1***98.162.100.25* **any fragment**

redirect css service (for downlink, by source IP address masking)

Used to redirect subscriber sessions based on the IP address mask sent by the source in the downlink (from the Mobile Node) direction.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* [**log**] **downlink** *source_address source_wildcard*
before redirect css service *svc_name* [**log**] **downlink** *source_address source_wildcard*
after redirect css service *svc_name* [**log**] **downlink** *source_address source_wildcard*
no redirect css service *svc_name* [**log**] **downlink** *source_address source_wildcard*

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.

svc_name must be a string from 1 through 15 characters in length.

downlink

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

Usage

Define a rule definition when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of filtering rule definitions as it does not require a rule definition for each source and destination pair.

Important: A maximum of 16 rule definitions can be configured per ACL.

Example

The following command defines a rule definition to redirect packets to a charging service named *chgsvc1*.

```
redirect css service chgsvc1 downlink 1.2.3.0 0.0.0.31
```

redirect css service (for downlink, by TCP/UDP packets)

Used to redirect subscriber sessions to a charging service based on the transmission control protocol/user datagram protocol packets in the downlink (from the Mobile Node) direction.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* [**log**] **downlink** { **tcp** | **udp** } { { *source_address source_wildcard* | **any** | **host** *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | range *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dst_port* | range *start_dest_port end_dest_port*] }
before redirect css service *svc_name* [**log**] **downlink** { **tcp** | **udp** } {{ { *source_address source_wildcard* | **any** | **host** *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | range *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dst_port* | range *start_dest_port end_dest_port*] }
after redirect css service *svc_name* [**log**] **downlink** { **tcp** | **udp** } { { *source_address source_wildcard* | **any** | **host** *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | range *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dst_port* | range *start_dest_port end_dest_port*] }
no redirect css service *svc_name* [**log**] **downlink** { **tcp** | **udp** } { { *source_address source_wildcard* | **any** | **host** *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | range *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dst_port* | range *start_dest_port end_dest_port*] }

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
svc_name must be a string from 1 through 15 characters in length.

downlink

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

tcp | udp

Specifies the redirect is to be applied to IP based transmission control protocol or the user datagram protocol.
tcp : redirect applies to TPC packets.
udp : redirect applies to UDP packets.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in dotted decimal notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be configured to any integer value from 0 to 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

range *start_source_port end_source_port*

Specifies that all source TCP ports within a specific range are to be filtered.
start_source_port is the initial port in the range and *end_source_port* is the final port in the range.
Both *start_source_port* and *end_source_port* can be configured to any integer value from 0 to 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

range *start_dest_port end_dest_port*

Specifies that all destination TCP ports within a specific range are to be filtered.
start_dest_port is the initial port in the range and *end_dest_port* is the final port in the range.
Both *start_dest_port* and *end_dest_port* can be configured to any integer value from 0 to 65535.

Usage

Block IP packets when the source and destination are of interest but for only a limited set of ports.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and UDP packets coming from any host are matched.
redirect css service *chgsvc1* **downlink udp any**
The following sets the insertion point before the rule definition above.
before redirect css service *chgsvc1* **downlink udp any**
The following command sets the insertion point after the first rule definition above.
after redirect css service *chgsvc1* **downlink udp any**
The following deletes the rule definition above.

no redirect **css service chgsvc1 downlink** udp any

redirect css service (for uplink, any)

Used to redirect subscriber sessions based on any packet received in the uplink (to the Mobile Node) direction. This command is also used to set the access control list insertion point.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect css service svc_name [ log ] uplink any
before redirect css service svc_name [ log ] uplink any
after redirect css service svc_name [ log ] uplink any
no redirect css service svc_name [ log ] uplink any
```

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
svc_name must be a string from 1 through 15 characters in length.

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

any

Indicates all packets will match the redirect regardless of source and/or destination.

Usage

Define a catch all rule definition to place at the end of the list of rule definitions to provide explicit handling of rule definitions which do not fit any other criteria.

Important: It is suggested that any rule definition which is added to be a catch all should also have the **log** option specified. The logged packets may be used to determine if the current list of rule definitions is adequate or needs modification to ensure proper security.

Important: A maximum of 16 rule definitions can be configured per ACL.

Important: Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service with the name *chgsvc1* and any source IP.

redirect css service *chgsvc1* **uplink any**

The following sets the insertion point before the rule definition above.

before redirect css service *chgsvc1* **uplink any**

The following command sets the insertion point after the first rule definition above.

after redirect css service *chgsvc1* **uplink any**

The following deletes the first rule definition above.

no redirect css service *chgsvc1* **uplink any**

redirect css service (for uplink, by host IP address)

Used to redirect subscriber sessions based on the targeted host IP address in the uplink (to the Mobile Node) direction.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* [**log**] **uplink host** *source_host_address*
before redirect css service *svc_name* [**log**] **uplink host** *source_host_address*
after redirect css service *svc_name* [**log**] **uplink host** *source_host_address*
no redirect css service *svc_name* [**log**] **uplink host** *source_host_address*

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

after

Indicates all rule definitions defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
svc_name must be a string from 1 through 15 characters in length.

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

Usage

Define a rule definition when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rule definitions to be very clear and concise.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service with the name *chgsvc1* and a host IP address of *192.168.200.11*.
redirect service *chgsvc1* **uplink host** *192.168.200.11*
The following sets the insertion point before the rule definition above.
before redirect service *chgsvc1* **uplink host** *192.168.200.11*
The following command sets the insertion point after the first rule definition above.
after redirect service *chgsvc1* **uplink host** *192.168.200.11*
The following deletes the first rule definition above.
no redirect service *chgsvc1* **uplink host** *192.168.200.11*

redirect css service (for uplink, by ICMP packets)

Used to redirect subscriber sessions based on the internet control message protocol packets in the uplink (to the Mobile Node) direction.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* [**log**] **uplink icmp** { **any** | **host** *source_host_address* | *source_address source_wildcard* } { **any** | **host** *dest_host_address* | *dest_address dest_wildcard* } [*icmp_type* [*icmp_code*]]
before redirect css service *svc_name* [**log**] **uplink icmp** { **any** | **host** *source_host_address* | *source_address source_wildcard* } { **any** | **host** *dest_host_address* | *dest_address dest_wildcard* } [*icmp_type* [*icmp_code*]]
after redirect css service *svc_name* [**log**] **uplink icmp** { **any** | **host** *source_host_address* | *source_address source_wildcard* } { **any** | **host** *dest_host_address* | *dest_address dest_wildcard* } [*icmp_type* [*icmp_code*]]
no redirect css service *svc_name* [**log**] **uplink icmp** { **any** | **host** *source_host_address* | *source_address source_wildcard* } { **any** | **host** *dest_host_address* | *dest_address dest_wildcard* } [*icmp_type* [*icmp_code*]]

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

`css service` *`svc_name`*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **`show active-charging service all`** command to display the names of all configured charging services.
`svc_name` must be a string from 1 through 15 characters in length.

`uplink`

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

`log`

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

`source_address`

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *`source_wildcard`* parameter.

`source_wildcard`

This option is used in conjunction with the *`source_address`* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *`source_address`* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *`source_address`* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

`any`

Specifies that the rule definition applies to all packets.

`host`

Specifies that the rule definition applies to a specific host as determined by its IP address.

`source_host_address`

The IP address of the source host to filter against expressed in dotted decimal notation.

`dest_host_address`

The IP address of the destination host to filter against expressed in dotted decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. The type can be any integer value between 0 and 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered. The type can be any integer value between 0 and 255.

Usage

Define a rule definition to block ICMP packets which can be used for address resolution and possibly be a security risk.
The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and ICMP packets in the uplink (to the Mobile Node) direction from the host with the IP address *198.162.100.25*.
redirect css service *chgsvc1* **uplink icmp host** *192.168.100.25*
The following sets the insertion point before the rule definition above.
before redirect css service *chgsvc1* **uplink icmp host** *192.168.100.25*
The following command sets the insertion point after the first rule definition above.
after redirect css service *chgsvc1* **uplink icmp host** *192.168.100.25*
The following deletes the first rule definition above.
no redirect css service *chgsvc1* **uplink icmp host** *192.168.100.25*

redirect css service (for uplink, by IP packets)

Used to redirect subscriber sessions based on the internet protocol packets in the uplink (to the Mobile Node) direction.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* [**log**] **uplink ip** { **any** | **host** *source_host_address* | *source_address source_wildcard* } { **any** | **host** *dest_host_address* | *dest_address dest_wildcard* } [**fragment**]
before redirect css service *svc_name* [**log**] **uplink ip** { **any** | **host** *source_host_address* | *source_address source_wildcard* } { **any** | **host** *dest_host_address* | *dest_address dest_wildcard* } [**fragment**]
after redirect css service *svc_name* [**log**] **uplink ip** { **any** | **host** *source_host_address* | *source_address source_wildcard* } { **any** | **host** *dest_host_address* | *dest_address dest_wildcard* } [**fragment**]
no redirect css service *svc_name* [**log**] **uplink ip** { **any** | **host** *source_host_address* | *source_address source_wildcard* } { **any** | **host** *dest_host_address* | *dest_address dest_wildcard* } [**fragment**]

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

`css service` *`svc_name`*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **`show active-charging service all`** command to display the names of all configured charging services.
`svc_name` must be a string from 1 through 15 characters in length.

`uplink`

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

`log`

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

`source_address`

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *`source_wildcard`* parameter.

`source_wildcard`

This option is used in conjunction with the *`source_address`* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *`source_address`* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *`source_address`* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

`any`

Specifies that the rule definition applies to all packets.

`host`

Specifies that the rule definition applies to a specific host as determined by its IP address.

`source_host_address`

The IP address of the source host to filter against expressed in dotted decimal notation.

`dest_host_address`

The IP address of the destination host to filter against expressed in dotted decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

fragment

Indicates packet redirection is to be applied to IP packet fragments only.

Usage

Block IP packets when the source and destination are of interest.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and uplink IP packets going to the host with the IP address *198.162.100.25*, and fragmented packets for any destination are matched.

redirect css service *chgsvc1* **uplink ip host** *198.162.100.25* **any fragment**

The following sets the insertion point before the rule definition above.

before redirect css service *chgsvc1* **uplink ip host** *198.162.100.25* **any fragment**

The following command sets the insertion point after the first rule definition above.

after redirect css service *chgsvc1* **uplink ip host** *198.162.100.25* **any fragment**

The following deletes the first rule definition above.

no redirect css service *chgsvc1* **uplink ip host** *198.162.100.25* **any fragment**

redirect css service (for uplink, by source IP address masking)

Used to redirect subscriber sessions based on the IP address mask sent by the source in the uplink (to the Mobile Node) direction.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* [**log**] **uplink** *source_address source_wildcard*
before redirect css service *svc_name* [**log**] **uplink** *source_address source_wildcard*
after redirect css service *svc_name* [**log**] **uplink** *source_address source_wildcard*
no redirect css service *svc_name* [**log**] **uplink** *source_address source_wildcard*

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
svc_name must be a string from 1 through 15 characters in length.

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Usage

Define a rule definition when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of filtering rule definitions as it does not require a rule definition for each source and destination pair.

Example

The following command defines a rule definition to redirect packets to a charging service named *chgsvc1*.

redirect css service *chgsvc1* **uplink** *1.2.3.0 0.0.0.31*

redirect css service (for uplink, by TCP/UDP packets)

Used to redirect subscriber sessions to a charging service based on the transmission control protocol/user datagram protocol packets in the uplink (to the Mobile Node) direction.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* [**log**] **uplink** { **tcp** | **udp** } { { *source_address source_wildcard* | **any** | *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | range *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dst_port* | range *start_dest_port end_dest_port*] }
before redirect css service *svc_name* [**log**] **uplink** { **tcp** | **udp** } { { *source_address source_wildcard* | **any** | **host** *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | range *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dst_port* | range *start_dest_port end_dest_port*] }
after redirect css service *svc_name* [**log**] **uplink** { **tcp** | **udp** } { { *source_address source_wildcard* | **any** | **host** *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | range *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dst_port* | range *start_dest_port end_dest_port*] }
no redirect css service *svc_name* [**log**] **uplink** { **tcp** | **udp** } { { *source_address source_wildcard* | **any** | **host** *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | range *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dst_port* | range *start_dest_port end_dest_port*] }

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
svc_name must be a string from 1 through 15 characters in length.

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

tcp | udp

Specifies the redirect is to be applied to IP based transmission control protocol or the user datagram protocol.
tcp : redirect applies to TPC packets.
udp : redirect applies to UDP packets.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in dotted decimal notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be configured to any integer value from 0 to 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

range *start_source_port end_source_port*

Specifies that all source TCP ports within a specific range are to be filtered.
start_source_port is the initial port in the range and *end_source_port* is the final port in the range.
Both *start_source_port* and *end_source_port* can be configured to any integer value from 0 to 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

range *start_dest_port end_dest_port*

Specifies that all destination TCP ports within a specific range are to be filtered.
start_dest_port is the initial port in the range and *end_dest_port* is the final port in the range.
Both *start_dest_port* and *end_dest_port* can be configured to any integer value from 0 to 65535.

Usage

Block IP packets when the source and destination are of interest but for only a limited set of ports.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and UDP packets coming from any host are matched.
redirect css service *chgsvc1* **uplink udp any**
The following sets the insertion point before the rule definition above.
before redirect **css service** *chgsvc1* **uplink** udp any
The following command sets the insertion point after the first rule definition above.
after redirect **css service** *chgsvc1* **uplink** udp any
The following deletes the rule definition above.
no redirect **css service** *chgsvc1* **uplink** udp any

redirect nexthop

The following commands redirect subscriber sessions to a nexthop IP address based on various parameters:

redirect nexthop (by IP address masking)

Used to redirect subscriber sessions based on the IP address mask sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect nexthop*nexthop_addr* **{ context***context_id* **| interface***interface_name* **} [log]** *source_address source_wildcard*

afterredirect nexthop*nexthop_addr* **{ context***context_id* **| interface***interface_name* **} [log]** *source_address source_wildcard*

beforeredirect nexthop*nexthop_addr* **{ context***context_id* **| interface***interface_name* **} [log]** *source_address source_wildcard*

noredirect nexthop*nexthop_addr* **{ context***context_id* **| interface***interface_name* **} [log]** *source_address source_wildcard*

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop *nexthop_addr*

The directly connected IP address to which the IP packets are forwarded.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface *interface_name*

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alpha and/or numeric string from 1 to 79 characters in length.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

Usage

Define a rule when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of redirect rules as it does not require a rule for each source and destination pair.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information.

Important: Also note that “redirect” rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the next hop host at 192.168.10.4, the context with the context ID of 23 and the source IP and wildcard of 192.168.22.0 and 0.0.0.31.

redirect nexthop *192.168.10.4* **context** *23 198.162.22.0 0.0.0.31*

The following sets the insertion point before the rule defined above.

before redirect nexthop *192.168.10.4* **context** *23 198.162.22.0 0.0.0.31*

The following command sets the insertion point after the first rule defined above.

after redirect nexthop *192.168.10.4* **context** *23 198.162.22.0 0.0.0.31*

The following deletes the first rule defined above.

no redirect nexthop *192.168.10.4* **context** *23 198.162.22.0 0.0.0.31*

redirect nexthop (any)

Used to redirect subscriber sessions based on any packet received. This command is also used to set the access control list insertion point.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect nexthopnexthop_addr { contextcontext_id | interfaceinterface_name } [
log ] any

after redirect nexthopnexthop_addr { contextcontext_id | interfaceinterface_name
} [ log ] any

before redirect nexthopnexthop_addr { contextcontext_id |
interfaceinterface_name } [ log ] any

no redirect nexthopnexthop_addr { contextcontext_id | interfaceinterface_name }
[ log ] any
```

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop *nexthop_addr*

The directly connected IP address to which the IP packets are forwarded.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface *interface_name*

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alpha and/or numeric string from 1 to 79 characters in length.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

any

Indicates all packets will match the redirect regardless of source and/or destination.

Usage

Define a catch all rule to place at the end of the list of rules to provide explicit handling of rules which do not fit any other criteria.

Important: It is suggested that any rule which is added to be a catch all should also have the **log** option specified. The logged packets may be used to determine if the current list of rules is adequate or needs modification to ensure proper security.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information.

Important: Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the next hop host at 192.168.10.4, the context with the context ID of 23 and any source IP.
redirect nexthop *192.168.10.4* **context** *23* **any**
The following sets the insertion point before the rule defined above.
before redirect nexthop *192.168.10.4* **context** *23* **any**
The following command sets the insertion point after the first rule defined above.
after redirect nexthop *192.168.10.4* **context** *23* **any**
The following deletes the first rule defined above.
no redirect nexthop *192.168.10.4* **context** *23* **any**

redirect nexthop (by host IP address)

Used to redirect subscriber sessions based on the targeted host IP address sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect nexthop*nexthop_addr* **{ context***context_id* **| interface***interface_name* **} [log] host***source_ip_address*

after redirect nexthop*nexthop_addr* **{ context***context_id* **| interface***interface_name* **} [log] host***source_ip_address*

before redirect nexthop*nexthop_addr* **{ context***context_id* **| interface***interface_name* **} [log] host***source_ip_address*

noredirect nexthop*nexthop_addr* **{ context***context_id* **| interface***interface_name* **} [log] host***source_ip_address*

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop *nexthop_addr*

The directly connected IP address to which the IP packets are forwarded.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface *interface_name*

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alpha and/or numeric string from 1 to 79 characters in length.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

Usage

Define a rule when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rules to be very clear and concise.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information.

Important: Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the next hop host at 192.168.10.4, the context with the context ID of 23 and a host IP address of 192.168.200.11.
redirect nexthop *192.168.10.4* **context** *23* **host** *192.168.200.11*
The following sets the insertion point before the rule defined above.
before redirect nexthop *192.168.10.4* **context** *23* **host** *192.168.200.11*
The following command sets the insertion point after the first rule defined above.
after redirect nexthop *192.168.10.4* **context** *23* **host** *192.168.200.11*
The following deletes the first rule defined above.
no redirect nexthop *192.168.10.4* **context** *23* **host** *192.168.200.11*

redirect nexthop (by source ICMP packets)

Used to redirect subscriber sessions based on the internet control message protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect nexthop*nexthop_addr* **{ context***context_id* **| interface***interface_name* **} [log] icmp { *source_address source_wildcard* **| any | host***source_host_address* **} { *dest_address dst_wildcard* **| any | host***dest_host_address* **} [** *icmp_type* **[** *icmp_code* **]]**

after redirect*interface_name**nexthop_addr***nexthop***nexthop_addr { context***context_id* **| interface***interface_name* **} [log] icmp { *source_address source_wildcard* **| any | host***source_host_address* **} { *dest_address dst_wildcard* **| any | host***dest_host_address* **} [** *icmp_type* **[** *icmp_code* **]]**

before redirect nexthop*nexthop_addr* **{ context***context_id* **| interface***interface_name* **} [log] icmp { *source_address source_wildcard* **| any | host***source_host_address* **} { *dest_address dest_wildcard* **| any | host***dst_host_address* **} [** *icmp_type* **[** *icmp_code* **]]**

no redirect nexthop*nexthop_addr* **{ context***context_id* **| interface***interface_name* **} [log] icmp { *source_address source_wildcard* **| any | host***source_host_address* **} { *dest_address dst_wildcard* **| any | host***dest_host_address* **} [** *icmp_type* **[** *icmp_code* **]]**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop *nexthop_addr*

The directly connected IP address to which the IP packets are forwarded.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface *interface_name*

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alpha and/or numeric string from 1 to 79 characters in length.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in dotted decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. The type can be any integer value between 0 and 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered. The type can be any integer value between 0 and 255.

Usage

Define a rule to block ICMP packets which can be used for address resolution and possible be a security risk. The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information.

Important: Also note that “redirect” rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the next hop host at 192.168.10.4, the context with the context ID of 23, and ICMP packets coming from the host with the IP address 198.162.100.25.

redirect nexthop *192.168.10.4* **context** *23* **icmp host** *192.168.100.25*

The following sets the insertion point before the rule defined above.

before redirect nexthop *192.168.10.4* **context** *23* **icmp host** *192.168.100.25*

The following command sets the insertion point after the first rule defined above.

afterredirect nexthop *192.168.10.4* **context** *23* **icmp host** *192.168.100.25*

The following deletes the first rule defined above.

no redirect nexthop *192.168.10.4* **context** *23* **icmp host** *192.168.100.25*

redirect nexthop (by IP packets)

Used to redirect subscriber sessions based on the internet protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect nexthop*nexthop_addr* **{ context***context_id* **| interface***interface_name* **} [log] ip { *source_address source_wildcard* **| any | host***source_host_address* **} { *dest_address dest_wildcard* **| any | host***dest_host_address* **} [fragment] [protocol** *num* **]**

after redirect nexthop*nexthop_addr* **{ context***context_id* **| interface***interface_name* **} [log] ip { *source_address source_wildcard* **| any | host***source_host_address* **} { *dest_address dest_wildcard* **| any | host***dest_host_address* **} [fragment] [protocol** *num* **]**

before redirect nexthop*nexthop_addr* **{ context***context_id* **| interface***interface_name* **} [log] ip { *source_address source_wildcard* **| any | host***source_host_address* **} { *dest_address dest_wildcard* **| any | host***dest_host_address* **} [fragment] [protocol** *num* **]**

no redirect nexthop*nexthop_addr* **{ context***context_id* **| interface***interface_name* **} [log] ip { *source_address source_wildcard* **| any | host***source_host_address* **} { *dest_address dest_wildcard* **| any | host***dest_host_address* **} [fragment] [protocol** *num* **]**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop *nexthop_addr*

The directly connected IP address to which the IP packets are forwarded.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface *interface_name*

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alpha and/or numeric string from 1 to 79 characters in length.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in dotted decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

fragment

Indicates packet redirection is to be applied to IP packet fragments only.

protocol *num*

Indicates that the packet filtering is to be applied to a specific protocol number.
num can be any integer ranging from 0 to 255.

Usage

Block IP packets when the source and destination are of interest.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information.

Important: Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the next hop host at 192.168.10.4, the context with the context ID of 23, and IP packets coming from the host with the IP address 198.162.100.25, and fragmented packets for any destination are matched.
redirect nexthop *192.168.10.4* **context** *23* **ip host** *198.162.100.25* **any fragment**

The following sets the insertion point before the rule defined above.
before redirect nexthop *192.168.10.4* **context** *23* **ip host** *198.162.100.25* **any fragment**
The following command sets the insertion point after the first rule defined above.
after redirect nexthop *192.168.10.4* **context** *23* **ip host** *198.162.100.25* **any fragment**
The following deletes the first rule defined above.
no redirect nexthop *192.168.10.4* **context** *23* **ip host** *198.162.100.25* **any fragment**

redirect nexthop (by TCP/UDP packets)

Used to redirect subscriber sessions based on the transmission control protocol/user datagram protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect nexthop*nexthop_addr* **{ context***context_id* **| interface***interface_name* **} [log] { tcp | udp } { { *source_address source_wildcard* | **any** | **host***source_host_address* } [**eq***source_port* | **gt***source_port* | **lt***source_port* | **neq***source_port*] } { { *dest_address dest_wildcard* | **any** | **host***dest_host_address* } [**eq***dest_port* | **gt***dest_port* | **lt***dest_port* | **neq***dst_port*] }**

afterredirect nexthop*nexthop_addr* **{ context***context_id* **| interface***interface_name* **} [log] { tcp | udp } { { *source_address source_wildcard* | **any** | **host***source_host_address* } [**eq***source_port* | **gt***source_port* | **lt***source_port* | **neq***source_port*] } { { *dest_address dest_wildcard* | **any** | **host***dest_host_address* } [**eq***dest_port* | **gt***dest_port* | **lt***dest_port* | **neq***dst_port*] }**

beforeredirect nexthop*nexthop_addr* **{ context***context_id* **| interface***interface_name* **} [log] { tcp | udp } { { *source_address source_wildcard* | **any** | **host***source_host_address* } [**eq***source_port* | **gt***source_port* | **lt***source_port* | **neq***source_port*] } { { *dest_address dest_wildcard* | **any** | **host***dest_host_address* } [**eq***dest_port* | **gt***dest_port* | **lt***dest_port* | **neq***dst_port*] }**

noredirect nexthop*nexthop_addr* **{ context***context_id* **| interface***interface_name* **} [log] { tcp | udp } { { *source_address source_wildcard* | **any** | **host***source_host_address* } [**eq***source_port* | **gt***source_port* | **lt***source_port* | **neq***source_port*] } { { *dest_address dest_wildcard* | **any** | **host***dest_host_address* } [**eq***dest_port* | **gt***dest_port* | **lt***dest_port* | **neq***dst_port*] }**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop *nexthop_addr*

The directly connected IP address to which the IP packets are forwarded.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface *interface_name*

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alpha and/or numeric string from 1 to 79 characters in length.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

tcp | udp

Specifies the redirect is to be applied to IP based transmission control protocol or the user datagram protocol.
tcp : redirect applies to TPC packets.
udp : redirect applies to UDP packets.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in dotted decimal notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be configured to any integer value from 0 to 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

Usage

Block IP packets when the source and destination are of interest but for only a limited set of ports.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. Refer to the Engineering Rules appendix located in the Administration and Configuration Guide for more information.

Important: Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the next hop host at 192.168.10.4, the context with the context ID of 23, and UDP packets coming from any host are matched.

redirect nexthop *192.168.10.4* **context** *23* **udp any**

The following sets the insertion point before the rule defined above.

before redirect nexthop *192.168.10.4* **context** *23* **udp any**

The following command sets the insertion point after the first rule defined above.

after redirect nexthop *192.168.10.4* **context** *23* **udp any**

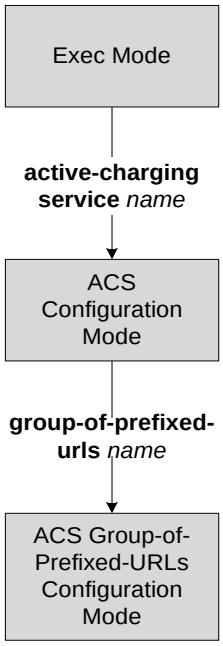
The following deletes the first rule defined above.

no redirect nexthop *192.168.10.4* **context** *23* **udp any**

Chapter 6
ACS Group-of-Prefixed-URLs Configuration Mode Commands

The Active Charging Service (ACS) Group-of-Prefixed-URLs Configuration Mode is used to create and configure ACS Group of Prefixed URLs.

Important: This configuration mode is customer specific. For more information, please contact your local service representative.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

This command returns the CLI prompt to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec mode.

exit

This command exits the Group-of-Prefixed-URLs Configuration mode and returns to the Active Charging Service Configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the Active Charging Service Configuration mode.

prefixed-url

This command configures the URLs to be filtered.

Important: A maximum of 10 URL filters can be configured per group.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] prefixed-url` *`url`*

`no`

Removes the specified URL.

`url`

Specifies the URL, and must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to configure the URLs to be filtered.

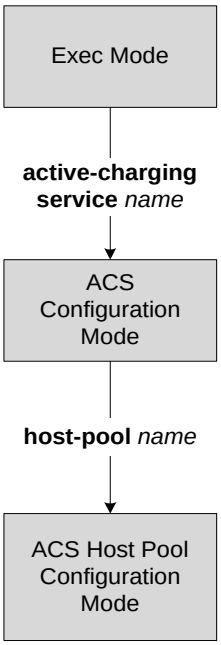
Example

The following command configures the URL *`http://abc.net`*:

`prefixed-url` ***`http://abc.net`***

Chapter 7
ACS Host Pool Configuration Mode Commands

The ACS Host Pool Configuration Mode is used to define pool of host addresses and names within the ACS Configuration Mode. The Host Pool Configuration facilitates to create rules to handle the packets coming from or going to a group of hosts within an access policy.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

This command exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to change to the Exec mode.

exit

This command exits the current configuration mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

ip

This command specifies an individual or a range of host IP address(es) to add to the host pool.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip { *ip_address* **|** *ip_address/maskbit* **| range** *start_ip* **to** *end_ip* **}**

no

Removes the specified IP address(es) that were configured previously from this host pool.

ip_address

Specifies an individual host IP address to add to this host pool.
ip_address is the IP address in dotted decimal notation for IPv4 and in colon notation for IPv6.

ip_address/maskbit

Specifies an individual host IP address with subnet mask bit to add to this host pool.
ip_address/maskbit is the IP address in dotted decimal notation for IPv4, and in colon notation for IPv6 with subnet mask bit. The *maskbit* is a numeric value which is the number of bits in the subnet mask.

range *start_ip* **to** *end_ip*

Specifies a range of host IP addresses to add to this host pool.
start_ip is the start IP address of the range in dotted decimal notation for IPv4 and in colon notation for IPv6, and must be less than *end_ip*.
end_ip is the end IP address of range in dotted decimal notation for IPv4 and in colon notation for IPv6, and must be greater than *start_ip*.

Usage

Use this command to add an individual or range of IP addresses to the host pool. Up to 10 sets of IP addresses can be configured in each host pool.

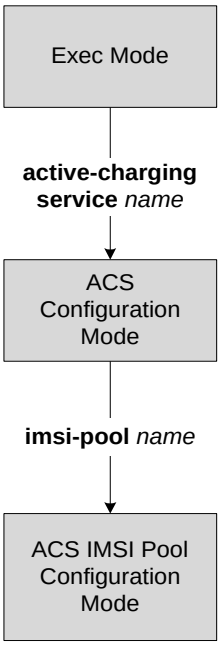
Example

The following command adds all IP addresses from *1.2.3.4* through *1.4.5.6* in IPv4 notation to the host pool:

ip range *1.2.3.4* to *1.4.5.6*

Chapter 8
ACS IMSI Pool Configuration Mode Commands

The ACS IMSI Pool Configuration Mode is used to define pool of subscriber's International Mobile Station Identifier numbers within the ACS Configuration Mode. IMSI pool configuration facilitates creation of rules to handle the packets coming from or going to a group of subscriber of IMSI numbers within an access policy.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

This command exits the current configuration mode and returns to the Executive mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to change to the Executive mode.

exit

This command exits the current configuration mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

imsi

This command specifies an individual or a range of subscriber IMSI numbers to add to the IMSI pool.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imsi { *imsi_num*| range *start_imsi* to *end_imsi* }

no

Removes the specified subscriber IMSI number(s) that were configured previously from this IMSI pool.

imsi_num

Specifies an individual subscriber IMSI number to add to this IMSI pool.
imsi_num is the IMSI number, and must be a sequence of hexadecimal digits between 1 and 15.

range *start_imsi* **to** *end_imsi*

Specifies a range of subscriber IMSI numbers to add to this IMSI pool.
start_imsi must be a sequence of hexadecimal numbers between 1 and 15 digits. This is the start IMSI number of subscriber IMSI range and must be less than *end_imsi*.
end_imsi must be a sequence of hexadecimal numbers between 1 and 15 digits. This is the end IMSI number of subscriber IMSI range and must be greater than *start_imsi*.

Usage

Use this command to specify the individual or range of subscriber IMSI numbers in an IMSI pool. Up to 10 sets of IMSI numbers can be configured in each IMSI pool.

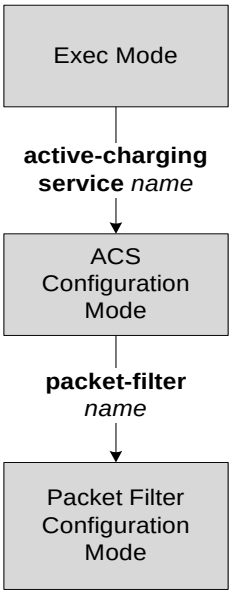
Example

The following command adds the specified range of IMSI numbers to the IMSI pool:

imsi range *<start_imsi>* **to** *<end_imsi>*

Chapter 9
ACS Packet Filter Configuration Mode Commands

The Active Charging Service (ACS) Packet Filter Configuration Mode is used to create and configure ACS packet filters.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

direction

This command configures the direction in which the filter has to be applied.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
direction { bi-directional | downlink | uplink }

default direction
```

default

Applies the default configuration.
Default: **bi-directional**

bi-directional

Specifies that the filter is to be applied in both uplink and downlink directions.

downlink

Specifies that the filter is to be applied in only downlink direction.

uplink

Specifies that the filter is to be applied in only uplink direction.

Usage

Use this command to configure the direction in which the filter has to be applied.

Example

The following command configures the filter in the downlink direction:

```
direction downlink
```

end

This command returns the CLI prompt to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec mode.

exit

This command exits the Packet Filter Configuration mode and returns to the Active Charging Service Configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the Active Charging Service Configuration mode.

ip local-port

This command configures the IP 5-tuple local port setting.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

ip local-port { = *port_number* | range *start_port_number* to *end_port_number* }

no ip local-port

no

Removes the local-port configuration, if previously configured.

= *port_number*

Specifies the port number of the transport protocol.
port_number must be the port number, and must be an integer from 1 through 65535.

range *start_port_number* to *end_port_number*

range specifies a range of port numbers.
start_port_number and *end_port_number* must be integers from 1 through 65535.
end_port_number must be greater than *start_port_number*.

Usage

Use this command to configure a specific or range of IP local port setting for a packet filter.

Example

The following command configures the IP local port as *456*:

ip local-port = *456*

ip protocol

This command configures the IP protocol setting.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

ip protocol { = *protocol_number* | range *start_protocol_number* to *end_protocol_number* }

no ip protocol

no

Removes the IP protocol configuration, if previously configured.

= *protocol_number*

Specifies the transport protocol field in the IP header.
protocol_number must be the numerical value of the protocol, and must be an integer from 1 through 255.

range *start_protocol_number* to *end_protocol_number*

Important: In StarOS 9.0 and later releases this keyword is obsolete.

range specifies a range of protocol assignment numbers.
start_protocol_number and *end_protocol_number* must be integers from 1 through 255.
end_protocol_number must be greater than *start_protocol_number*.

Usage

Use this command to configure the protocol setting for a packet filter.

Example

The following command configures the protocol assignment number *300*:

ip protocol = *300*

ip remote-address

This command configures the IP remote address setting.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

ip remote-address { = { *ip_address* | *ip_address/mask* } | range { *ip_address* | *ip_address/mask* } to { *ip_address* | *ip_address/mask* } }

no ip remote-address

no

Removes the remote address configuration, if previously configured.

= { *ip_address* | *ip_address/mask* }

ip_address specifies the IP address in IPv4 dotted decimal or IPv6 colon separated notation format.
ip_address/mask specifies the IP address in IPv4 dotted decimal or IPv6 colon separated notation format, and the number of subnet bits representing the subnet mask in shorthand.

range { *start_ip_address* | *start_ip_address/mask* } to { *end_ip_address* | *end_ip_address/mask* }

Important: In StarOS 9.0 and later releases this keyword is obsoleted.

range specifies a range of IP addresses.
start_ip_address and *end_ip_address* specify, for the range, the starting and ending IP address in IPv4 dotted decimal or IPv6 colon separated notation format. *end_ip_address* must be greater than *start_ip_address*.
start_ip_address/mask and *end_ip_address/mask* specify, for the range, the starting and ending IP address in IPv4 dotted decimal or IPv6 colon separated notation format, and the number of subnet bits representing the subnet mask in shorthand. *end_ip_address/mask* must be greater than *start_ip_address/mask*.

Usage

Use this command to configure the remote IP address setting for a packet filter.

Example

The following command configures the IP remote address as *1.2.3.4/24*:

ip remote-address = *1.2.3.4/24*

ip remote-port

This command configures the IP remote port setting.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

ip remote-port { = *port_number* | range *start_port_number* to *end_port_number* }

no ip remote-port

no

Removes the remote port configuration, if previously configured.

= *port_number*

Specifies port number of the transport protocol.
port_number must be the port number, and must be an integer from 1 through 65535.

range *start_port_number* to *end_port_number*

Specifies a range of port numbers.
start_port_number and *end_port_number* must be integers from 1 through 65535.
end_port_number must be greater than *start_port_number*.

Usage

Use this command to configure a specific or range of IP remote port settings for a packet filter.

Example

The following command configures the IP remote port as *789*:

ip remote-port = *789*

priority

This command configures the packet filter's priority.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

priority *priority*

no priority

no

Removes the priority configuration, if previously configured.

priority

Specifies this packet filter's priority, and must be an integer from 0 through 255.

Usage

Use this command to configure the packet filter's priority. Without this setting, this filter will not be used.

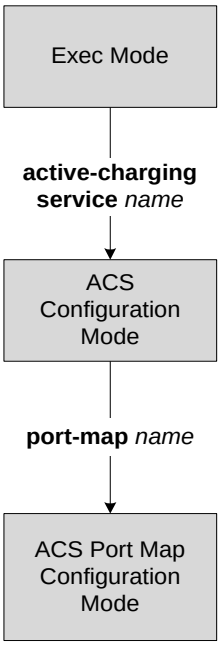
Example

The following command configures the packet filter's priority as *3*:

priority *3*

Chapter 10
ACS Port Map Configuration Mode Commands

The ACS Port Map Configuration Mode is used to define application-port map in the ACS Configuration Mode. The application-port map facilitates to associate a range of port to specific application/protocol within a rule definition (ruledef).



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

This command exits the current configuration mode and returns to the Executive mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to change to the Executive mode.

exit

This command exits the current configuration mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

port

This command specifies a range of ports for application or protocol in ACS Port Map Configuration Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] port { *port_num* | range *start_port* to *end_port* }

no

Removes the specified port(s) / range of ports that were configured previously from this port map.

port_num

Specifies the port number to add to the port map.
port_num must be an integer from 1 through 65535.

range *start_port* **to** *end_port*

Specifies the range of ports for an application/protocol to add to this port map.
start_port must be an integer from 1 through 65535, and must be lesser than *end_port*.
end_port must be an integer from 1 through 65535, and must be greater than *start_port*.

Usage

Use this command to specify mapping between application and range of ports. Up to 10 sets of ports can be configured in each port map.

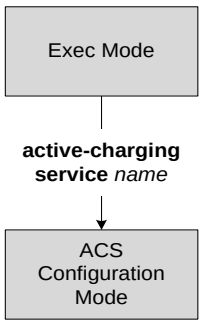
Example

The following command adds all ports from *3112* through *5000* to the port map:

port range *3112* **to** *5000*

Chapter 11
Active Charging Service Configuration Mode Commands

The Active Charging Service (ACS) Configuration Mode is used to manage active charging service configurations. ACS provides flexible, differentiated, and detailed billing to subscribers through Layer 3 through Layer 7 packet inspection and the ability to integrate with back-end billing mediation systems.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

access-ruledef

This command enables creating/configuring/deleting access ruledefs.

Important: This command is only available in StarOS 8.1, and must be used to configure the Policy-based Stateful Firewall and NAT features.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

access-ruledef *ruledef_name* **[-noconfirm]**

no access-ruledef *ruledef_name*

no

Removes the specified access ruledef.

ruledef_name

Specifies the access ruledef name.
ruledef_name must be a string of 1 through 63 characters in length, and can contain punctuation characters.
If the named access ruledef does not exist, it is created, and the CLI mode changes to the Firewall Ruledef Configuration Mode wherein the ruledef can be configured.
If the named access ruledef already exists, the CLI mode changes to the Firewall Ruledef Configuration Mode wherein the ruledef can be configured.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete an access ruledef. A ruledef contains different conditions/criteria to permit, drop, or reject a packet/connection/traffic based on one or more parameters. The ruledef name must be unique within the service. Host pool, port map, IMSI pool, and firewall, routing, and charging ruledefs must have unique names.

Important: An access ruledef can be referenced by multiple firewall rulebases.

Important: The access ruledefs are different from the ACS ruledefs.

Example

The following command creates an access ruledef named *ruledef1*, and enters the Firewall Ruledef Configuration Mode:

firewall ruledef *ruledef1*

bandwidth-policy

This command enables creating/configuring/deleting a bandwidth policy.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

bandwidth-policy *policy_name* **[-noconfirm]**

no bandwidth-policy *policy_name*

no

Removes the specified bandwidth policy.

policy_name

Specifies the bandwidth policy name.
policy_name and must be an alpha and/or numeric string of 1 through 63 characters in length.
If the named bandwidth policy does not exist, it is created, and the CLI mode changes to the Bandwidth Policy Configuration Mode wherein the bandwidth policy can be configured.
If the named bandwidth policy already exists, the CLI mode changes to the Bandwidth Policy Configuration Mode wherein the bandwidth policy can be configured.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete a bandwidth policy.

Example

The following command creates a bandwidth policy named *test73*, and enters the Bandwidth Policy Configuration mode:

bandwidth-policy *test73*

buffering-limit

This command sets the flow- or session-based packet buffering configuration.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

buffering-limit { flow-max-packets *number* **| subscriber-max-packets** *number* **}**

{ default | no } buffering-limit { flow-max-packets | subscriber-max-packets }

default

Sets the default value for the specified buffering limit configuration.
Default: no limit, other than the maximum amount of available memory

no

Removes the specified buffering limit configuration.

flow-max-packets *number*

Specifies the maximum number of packets that can be buffered per flow.
number must be an integer from 1 through 255.

subscriber-max-packets *number*

Specifies the maximum number of packets that can be buffered per subscriber.
number must be an integer from 1 through 255.

Usage

Use this command to configure the limits for buffering packets sent by a subscriber, while it is waiting for a response from the Diameter server. Packets need to be buffered for various reasons, such as, waiting for Credit Control Authorization or waiting for the result of a content filtering rating request.

Example

The following command sets the buffering limit per flow to 55:

buffering-limit flow-max-packets *55*

charging-action

This command enables creating/configuring/deleting a charging action in the current Active Charging Service.

Important: A maximum of 2048 charging actions can be configured in an Active Charging Service.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] charging-action` *`charging_action_name`* **`[ -noconfirm ]`**

`no`

Removes the specified charging action.

`charging_action_name`

Specifies the charging action name.
`charging_action_name` must be an alpha and/or numeric string of 1 through 63 characters in length, and can contain punctuation characters.
If the named charging action does not exist, it is created, and the CLI mode changes to the Charging Action Configuration Mode wherein the charging action can be configured.
If the named charging action already exists, the CLI mode changes to the Charging Action Configuration mode wherein the charging action can be configured.
The charging action name must be unique for a given Active Charging Service. Up to 2048 charging actions can be configured in a system across all Active Charging services.

`-noconfirm`

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete a charging action in the current Active Charging Service.
A charging action represents actions to be taken when a configured rule is matched. Actions could range from generating an accounting record (e.g., an EDR) to dropping the IP packet, etc. The charging action will also determine the metering principle—whether to count retransmitted packets and which protocol field to use for billing (L3/L4/L7 etc).

Example

The following command creates a charging action named *`action123`*:
`charging-action` ***`action123`***

content-filtering category match-method

This command sets the match method to look up URLs in the Category-based Content Filtering database.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

```
content-filtering category match-method { exact | generic }

default content-filtering category match-method
```

default

Sets the default match method.
Default: Generic

exact

Specifies the exact-match method, wherein URLs are rated only on exact match with URLs present in the Category-based Content Filtering database.

generic

Specifies the generic-match method, wherein normalization, multi-lookups, rollback algorithms are applied to URLs during look up, and URLs are rated on generic match with URLs present in the Category-based Content Filtering database.

Usage

Use this command to set the match method to look up URLs in the Category-based Content Filtering database.

Example

The following command sets the exact-match method to look up URLs in the Category-based Content Filtering database:

```
content-filtering category match-method exact
```

content-filtering category policy-id

This command enables creating/configuring/deleting Content Filtering Category Policies for Category-based Content Filtering support.

Important: A maximum of 64 Content Filtering Category Policies can be configured in an Active Charging Service.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

content-filtering category policy-id *cf_policy_id* **[description [** *description_string* **]] [-noconfirm]**

no content-filtering category policy-id *cf_policy_id*

no

Deletes the specified Content Filtering Category Policy.

category policy-id *cf_policy_id*

Specifies the Content Filtering Category Policy ID.
cf_policy_id must be an integer from 1 through 4,294,967,295.
If the specified policy ID does not exist, it is created and the CLI mode changes to the Content Filtering Policy Configuration mode, wherein the policy can be configured.
If the specified policy ID already exists, the CLI mode changes to the Content Filtering Policy Configuration mode, wherein the policy can be configured.

description [*description_string* **]**

Specifies a description for the Content Filtering Category Policy.
description_string must be an alpha and/or numeric string of 1 through 31 characters in length.
Note that both **description** and *description_string* are optional.
"**description** *description_string*" saves *description_string* as the new description.
"**description**" removes the previously specified description.
This description is displayed in the output of the "**show content-filtering category policy-id id** *id*" and "**show active-charging service name** *service_name*" commands.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete a Content Filtering Category Policy.

Example

The following command creates a Content Filtering Policy with the ID *101*, and enters the Content Filtering Policy Configuration mode:

```
content-filtering category policy-id 101
```

credit-control

This command enables/disables Prepaid Credit Control Configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] credit-control [ group` *`group_name`* **`]`**

`no`

Disables Prepaid Credit Control Application configuration.

`group` *`group_name`*

Important: The **`group`** keyword is only available in StarOS 8.1 and later releases.

Specifies the credit control group name.
`group_name` must be an alpha and/or numeric string of 1 through 63 characters in length.
If the named credit control group does not exist, it is created, and the CLI mode changes to the Credit Control Configuration mode, wherein the credit control group can be configured.
If the named credit control group already exists, the CLI mode changes to the Credit Control Configuration mode, wherein the credit control group can be configured.
Creating different credit control groups enables applying different credit control configurations (DCCA dictionary, failure-handling, session-failover, Diameter endpoint selection, etc.) to different subscribers on the same system.
Without credit control groups, only one credit control configuration is possible on a system. All the subscribers in the system will have to use the same configuration.

Usage

Use this command to enable/disable Prepaid Credit Control Configuration for RADIUS/Diameter charging mode.

Example

The following command enables prepaid credit control accounting to use RADIUS and/or Diameter interface mode.
`credit-control`

diameter credit-control

Description This command has been obsoleted, and is replaced by the credit-control command.

edr-format

This command enables creating/configuring/deleting an EDR format specification for the current Active Charging Service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

edr-format *name* **[-noconfirm]**

no edr-format *name*

no

Removes the specified EDR format from the current Active Charging Service.

name

Specifies the EDR format name.
name must be a string of 1 through 63 characters in length.
If the named EDR format does not exist, it is created, and the CLI mode changes to the EDR Format Configuration Mode wherein the EDR format can be configured.
If the named EDR format already exists, the CLI mode changes to the EDR Format Configuration mode wherein the EDR format can be configured.
The EDR format name must be unique for a given Active Charging Service. Up to 256 combined total EDR plus UDR formats can be configured in a system across all Active Charging Services.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete an EDR format for a specified Active Charging Service.

Example

The following command creates an EDR format named *edr_format1*:
edr-format *edr_format1*

edr-udr-flow-control

This command enables Flow Control between Session Managers and the CDRMOD process.

Product

All

Privilege

Security Administrator, Administrator

Syntax

edr-udr-flow-control [unsent-queue-size *queue_size* **]**

{ default | no } edr-udr-flow-control

no

Disables Flow Control.

default

Configures the default setting.
Default: Flow Control is enabled; **unsent-queue-size** is set to 375

unsent-queue-size *queue_size*

Specifies the Flow Control unsent queue size at sessmgr level.
queue_size must be an integer from 1 through 2500.

Usage

Use this command to enable Flow Control between Session Managers and the CDRMOD process, and configure the unsent queue size.

Example

The following command enable Flow Control between Session Managers and the CDRMOD process, and configure the unsent queue size to *1000*:

edr-udr-flow-control unsent-queue-size *1000*

end

This command returns the CLI prompt to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to change to the Exec mode.

exit

This command exits the Active Charging Service Configuration mode and returns to the Global Configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the Global Configuration mode.

fair-usage

This command enables Fair Usage feature configuration.

Product

ECS, CF, FW, NAT, P2P

Privilege

Security Administrator, Administrator

Syntax

```
fair-usage [ deact-margin deactivate_margin | threshold-percent usage_threshold
]

default fair-usage [ deact-margin | threshold-percent ]
```

default

Configures the default Fair Usage monitoring settings.
Default:

- **deact-margin**: 5 percent
- **threshold-percent**: 50 percent

deact-margin *deactivate_margin*

Specifies that Fair Usage monitoring must be disabled when the instance-level credit usage goes *deactivate_margin* percentage below *usage_threshold*.
deactivate_margin is a percentage value, and must be an integer from 1 through 100.

threshold-percent *usage_threshold*

Specifies the threshold to start Fair Usage monitoring. Till the credit usage hits this threshold, all session resource allocation is allowed. On crossing this threshold, any new resource allocation request is evaluated and allowed or failed.
usage_threshold is a percentage value, and must be an integer from 1 through 100.

Usage

Use this command to enable the Fair Usage feature, which enables to perform SessMgr instance-level load balancing for in-line service features, and resource usage control for subscribers. For information, refer to the feature description in the *Enhanced Charging Service Administration Guide*.

Example

The following command enables the Fair Usage feature, and configures the session resource usage threshold to start Fair Usage monitoring to 75%:

```
fair-usage threshold-percent 75
```

The following command configures the deactivate margin to disable Fair Usage monitoring to 10% below the session resource usage threshold (65%):

```
fair-usage deact-margin 10
```

firewall dos-protection

This command configures Stateful Firewall protection for subscribers from Denial-of-Service (DoS) attacks.

Important: In StarOS 8.1 and later, for Rulebase-based Stateful Firewall this command is available in the Rulebase Configuration Mode, and for Policy-based Stateful Firewall in the Firewall-and-NAT Policy Configuration Mode. In StarOS 8.3, this command is available in the Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] firewall dos-protection { all | flooding { icmp | tcp-syn | udp } | ftp-bounce | ip-unaligned-timestamp | mime-flood | seq-number-out-of-range | seq-number-prediction | source-router | teardrop | winnuke }

default firewall dos-protection
```

no

Disables protection for subscribers from the specified DoS attack(s).

default

Sets Stateful Firewall DOS protection to the default setting.

all

Enables protection against all DoS attacks supported by Stateful Firewall.

flooding { icmp | tcp-syn | udp }

Enables protection against specified flooding attacks:

- **icmp**: Enables protection against ICMP Flood attack
- **tcp-syn**: Enables protection against TCP Syn Flood attack
- **udp**: Enables protection against UDP Flood attack

ftp-bounce

Enables protection against FTP bounce attacks.

ip-unaligned-timestamp

Enables protection against IP unaligned timestamp attacks.

mime-flood

Enables protection against Multiple Internet Mail Extension (MIME) header flooding attacks.

seq-number-out-of-range

Enables protection against an out of range sequence attacks.

seq-number-prediction

Enables protection against TCP sequence prediction attacks.

source-router

Enables protection against attacks caused by loose source routing.

teardrop

Enables protection against Teardrop attacks.

winnuke

Enables protection against WIN-NUKE attacks.

Usage

Use this command to enable the Stateful Firewall protection from different types of DoS attacks. This command can be used multiple times for different DoS attacks.

Example

The following command enables protection from all DoS attacks supported by the Stateful Firewall:

```
firewall dos-protection all
```

firewall flooding

This command configures Stateful Firewall protection from packet flooding attacks.

Important: In StarOS 8.1 and later, for Rulebase-based Stateful Firewall this command is available in the Rulebase Configuration Mode, and for Policy-based Stateful Firewall in the Firewall-and-NAT Policy Configuration Mode. In StarOS 8.3, this command is available in the Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall flooding { { protocol { icmp | tcp-syn | udp } packet limit packets } |
{ sampling-interval interval } }

default firewall flooding { { protocol { icmp | tcp-syn | udp } packet limit } |
{ sampling-interval } }
```

default

Sets the specified firewall flooding configuration to the default value.

protocol { icmp | tcp-syn | udp }

Specifies the transport protocol:

- **icmp**: Configuration for ICMP protocol.
- **tcp-syn**: Configuration for TCP-SYN packet limit.
- **udp**: Configuration for UDP protocol.

packet limit *packets*

Specifies the maximum number of specified packets a subscriber can receive during a sampling interval.
packets is the maximum number of packets allowed during a sampling interval, and must be an integer from 1 through 4294967295.
Default: 1000 packets per sampling-interval.

sampling-interval *interval*

Specifies the flooding sampling interval in seconds.
interval must be an integer from 1 through 60.
Default: 1 second
The maximum sampling-interval configurable is 60 seconds.

Usage

Use this command to configure the maximum number of ICMP, TCP-SYN, / UDP packets allowed to prevent the packet flooding attacks to the host.

Example

The following command ensures a subscriber will not receive more that 1000 ICMP packets per sampling interval:

firewall flooding protocol icmp packet limit *1000*

The following command ensures a subscriber will not receive more than 1000 UDP packets per sampling interval on different 5-tuples. That is, if an attacker is sending lot of UDP packets on different ports or using different spoofed IPs, those packets will be limited to 1000 packets per sampling interval. This way only "suspected" malicious packets are limited and not "legitimate" packets.

firewall flooding protocol udp packet limit *1000*

The following command ensures a subscriber will not receive more than 1000 TCP-Syn packets per sampling interval.

firewall flooding protocol tcp-syn packet limit *1000*

The following command specifies a flooding sampling interval of 1 second:

firewall flooding sampling-interval *1*

firewall flow-recovery

This command configures Stateful Firewall Flow Recovery settings.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall flow-recovery { { downlink [ [ timeout timeout ] [ no-flow-creation ] +
]  } | { uplink [ timeout timeout  ] } }

{ default | no } firewall flow-recovery { downlink | uplink }
```

default

Configures the default setting.
Default: downlink and uplink recovery is enabled, 300 seconds

no

Disables the previous configuration.

downlink | uplink

Specifies the packets:
downlink: Enables flow recovery for packets from downlink direction.
uplink: Enable flow recovery for packets from uplink direction.

timeout *timeout*

Specifies the Stateful Firewall Flow Recovery Timeout setting, in seconds.
timeout must be an integer from 1 through 86400.
Default: 300 seconds

no-flow-creation

Specifies not to create data session/flow-related information for downlink-initiated packets (from the Internet to the subscriber) while the firewall downlink flow-recovery timer is running, but send to subscriber.

Usage

Use this command to configure Stateful Firewall Flow Recovery.

Important: NAT flows will not be recovered.

Example

The following command configures Stateful Firewall Flow Recovery for packets in downlink direction with a timeout of 600 seconds:

firewall flow-recovery downlink timeout *600*

firewall icmp-destination-unreachable-message-threshold

This command configures a threshold on the number of ICMP error messages sent by the subscriber for a particular data flow.

Important: In StarOS 8.1 and later, for Rulebase-based Stateful Firewall this command is available in the Rulebase Configuration Mode, and for Policy-based Stateful Firewall in the Firewall-and-NAT Policy Configuration Mode. In StarOS 8.3, this command is available in the Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

`firewall icmp-destination-unreachable-message-threshold` *`messages`* **`then-block-server`**

`{ default | no } firewall icmp-destination-unreachable-message-threshold`

`default`

Sets the threshold to the default value.
Default: No limit

`no`

Disables the threshold.

`messages`

Specifies the number of ICMP error messages sent by the subscriber for a particular data flow. *`messages`* must be an integer value from 1 through100.

Usage

Use this command to configure a threshold on the number of ICMP error messages sent by the subscriber for a particular data flow. After the threshold is reached, it is assumed that the server is not reacting properly to the error messages, and further downlink traffic to the subscriber on the unwanted flow is blocked.
Some servers that run QChat ignore the ICMP error messages (Destination Port Unreachable and Host Unreachable) from the mobiles. So the mobiles continue to receive the unwanted UDP traffic from the QChat servers, and their batteries get exhausted quickly.

Example

The following command configures a threshold of 10 ICMP error messages:
`firewall icmp-destination-unreachable-message-threshold` ***`10`*** **`then-block-server`**

firewall max-ip-packet-size

This command configures the maximum IP packet size allowed over Stateful Firewall.

Important: In StarOS 8.1 and later, for Rulebase-based Stateful Firewall this command is available in the Rulebase Configuration Mode, and for Policy-based Stateful Firewall in the Firewall-and-NAT Policy Configuration Mode. In StarOS 8.3, this command is available in the Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall max-ip-packet-size *packet_size* **protocol { icmp | non-icmp }**

default firewall max-ip-packet-size protocol { icmp | non-icmp }

default

Sets the maximum IP packet size configuration to the default value.
Default: 65535 bytes (for both ICMP and non-ICMP)

packet_size

Specifies the maximum packet size.
packet_size must be an integer from 30000 through 65535.

protocol { icmp | non-icmp }

Specifies the transport protocol:

- **icmp**: Configuration for ICMP protocol.
- **non-icmp**: Configuration for protocols other than ICMP.

Usage

Use this command to configure the maximum IP packet size allowed for ICMP and non-ICMP packets to prevent packet flooding attacks to the host. Packets exceeding the configured size will be dropped for “Jolt Attack” and “Ping-Of-Death Attack”.

Example

The following command allows a maximum packet size of *60000* for ICMP protocol:

firewall max-ip-packet-size *60000* protocol icmp

firewall mime-flood

This command configures Stateful Firewall protection from mime-flood attacks.

Important: In StarOS 8.1 and later, for Rulebase-based Stateful Firewall this command is available in the Rulebase Configuration Mode, and for Policy-based Stateful Firewall in the Firewall-and-NAT Policy Configuration Mode. In StarOS 8.3, this command is available in the Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall mime-flood { http-headers-limit *max_limit* **| max-http-header-field-size** *max_size* **}**

default firewall mime-flood { http-headers-limit | max-http-header-field-size }

default

Sets the specified firewall mime flood configuration to the default value.

http-headers-limit *max_limit*

Specifies the maximum number of headers allowed in an HTTP packet. If the number of HTTP headers in a page received is more than the specified limit, the request will be denied.
max_limit must be an integer from 1 through 256.
Default: 16

max-http-header-field-size *max_size*

Specifies the maximum header field size allowed in the HTTP header, in bytes. If the size of HTTP header in the received page is more than the specified number of bytes, the request will be denied.
max_size must be an integer from 1 through 8192.
Default: 4096 bytes

Usage

Use this command to configure the maximum number of headers allowed in an HTTP packet, and the maximum header field size allowed in the HTTP header to prevent the mime flooding attacks.

Example

The following command sets the maximum number of headers allowed in an HTTP packet to *100*:
firewall mime-flood http-headers-limit *100*
The following command sets the maximum header field size allowed in the HTTP header to *1000* bytes:
firewall mime-flood max-http-header-field-size *1000*

firewall nat-alg

This command enables/disables NAT Application Level Gateways (ALGs).

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] firewall nat-alg { all | ftp | pptp | rtsp | sip }
```

default

Configures the default setting.
Default:

- **ftp**: enabled
- **pptp**: disabled
- **rtsp**: disabled
- **sip**: disabled

no

Disables all/specified NAT ALG configuration. When disabled, the ALG(s) would not do any payload translation for NATd calls.

all | ftp | pptp | rtsp | sip

Specifies the NAT ALG to enable/disable.

- **all**: Enables/disables all of the following NAT ALGs.
- **ftp**: Enables/disables File Transfer Protocol (FTP) NAT ALG.
- **pptp**: Enables/disables Point-to-Point Tunneling Protocol (PPTP) NAT ALG.
- **rtsp**: Enables/disables Real Time Streaming Protocol (RTSP) ALG.
- **sip**: Enables/disables Session Initiation Protocol (SIP) NAT ALG.

Usage

Use this command to enable/disable NAT ALGs.
To enable NAT ALG processing, in addition to this configuration, ensure that the routing rule for that particular protocol is added in the rulebase.

Example

The following command enables FTP NAT ALG:

```
firewall nat-alg ftp
```

The following command disables FTP NAT ALG:

```
no firewall nat-alg ftp
```

The following command enables FTP NAT ALG, and disables PPTP, RTSP, SIP NAT ALGs:

```
default firewall nat-alg all
```

firewall no-ruledef-matches

This command configures the default action for packets when no firewall ruledef matches.

Important: In StarOS 8.1 and later releases, this command is available in the Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall no-ruledef-matches { downlink | uplink } action { deny [ charging-
action charging_action ] | permit }

default firewall no-ruledef-matches { downlink | uplink } action
```

default

Configures the default action for packets with no firewall ruledef match.
Default: uplink direction: permit, downlink direction: deny

downlink | uplink

Specifies the packet type:
downlink: Downlink packets with no firewall ruledef match.
uplink: Uplink packets with no firewall ruledef match.

action { deny [charging-action *charging_action* **] | permit }**

Specifies the default action for packets with no firewall ruledef match.
permit: Permit specified packets.
deny [charging-action *charging_action* **]**: Deny specified packets.
Optionally, a charging action can be specified. *charging_action* must be the name of a charging action, and must be a string of 1 through 63 characters in length.

Usage

Use this command to configure the default action to be taken on packets with no firewall ruledef matches. If, for deny action, the optional charging action is configured, the action taken depends on what is configured in the charging action. For the firewall rule, the “flow action”, “billing action”, and “content ID” of the charging action will be used to take action. If flow exists, flow statistics are updated.

Example

The following command sets Stateful Firewall to permit downlink packets with no ruledef matches:

```
firewall no-ruledef-matches downlink action permit
```

firewall port-scan

This command configures the Port Scan Detection algorithm.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall port-scan { connection-attempt-success-percentage { non-scanner |
scanner } percentage | inactivity-timeout inactivity_timeout | protocol { tcp |
udp } response-timeout response_timeout | scanner-policy { block inactivity-
timeout inactivity_timeout | log-only } }

default firewall port-scan { connection-attempt-success- percentage { non-
scanner | scanner } | inactivity-timeout | protocol { tcp | udp } response-
timeout | scanner-policy }
```

default

Configures default parameters for port-scan detection.

connection-attempt-success-percentage { non-scanner | scanner } *percentage*

Specifies the connection attempt success percentage:
non-scanner: Specifies the connection attempt success percentage for a non-scanner. *percentage* must be an integer from 60 through 99.
Default: 70%
scanner: Specifies the connection attempt success percentage for a scanner. *percentage* must be an integer from 1 through 40.
Default: 30%

inactivity-timeout *inactivity_timeout*

Specifies the port scan inactivity timeout period, in seconds.
inactivity_timeout must be an integer from 60 through 1800.
Default: 300 seconds

protocol { tcp | udp } response-timeout *response_timeout*

Specifies transport protocol specific response timeout period:
tcp: Specifies response timeout for TCP. *response_timeout* must be an integer from 3 through 30.
udp: Specifies response timeout for UDP. *response_timeout* must be an integer from 3 through 60.
Default: 3 seconds

scanner-policy { block inactivity-timeout *inactivity_timeout* **| log-only }**

Specifies the scanner policy.
Default: Log only

block inactivity-timeout *inactivity_timeout*: Specifies blocking any subsequent traffic from the scanner. If the scanner is found to be inactive for the inactivity-timeout period, then the scanner is no longer blocked, and traffic is allowed.
inactivity_timeout specifies the scanner inactivity timeout period, in seconds, and must be an integer from 1 through 4294967295.
log-only: Specifies logging scanner information without blocking scanner traffic.

Usage

Use this command to configure the Port Scan Detection algorithm.

Example

The following command configures the Stateful Firewall Port Scan inactivity timeout period to *900* seconds:
firewall port-scan inactivity-timeout ***900***

firewall ruledef

This command enables creating/configuring/deleting firewall ruledefs.

Important: This command is only available in StarOS 8.1, and is customer-specific. This command must be used to configure the Rulebase-based Stateful Firewall and NAT features.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall ruledef *ruledef_name* **[-noconfirm]**

no firewall ruledef *ruledef_name*

no

Removes the specified firewall ruledef.

ruledef_name

Specifies the firewall ruledef name.
ruledef_name must be a string of 1 through 63 characters in length, and can contain punctuation characters.
If the named firewall ruledef does not exist, it is created, and the CLI mode changes to the Firewall Ruledef Configuration Mode wherein the ruledef can be configured.
If the named firewall ruledef already exists, the CLI mode changes to the Firewall Ruledef Configuration Mode wherein the ruledef can be configured.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete a firewall ruledef. A firewall ruledef contains different conditions/criteria to permit, drop, or reject a packet/connection/traffic based on one or more parameters. The ruledef name must be unique with in the service. Host pool, port map, IMSI pool, and firewall, routing, and charging ruledefs must have unique names.

Important: A firewall ruledef can be referenced by multiple firewall rulebases.

Important: The firewall ruledefs are different from the Active Charging Ruledefs.

Example

The following command creates a firewall ruledef named *fw_ruledef1*, and enters the Firewall Ruledef Configuration Mode:

firewall ruledef *fw_ruledef1*

firewall tcp-syn-flood-intercept

This command enables and configures the TCP intercept parameters to prevent TCP-SYN flooding attacks by intercepting and validating TCP connection requests for DoS protection mechanism configured with the **dos-protection** command.

Important: In StarOS 8.1 and later, for Rulebase-based Stateful Firewall this command is available in the Rulebase Configuration Mode, and for Policy-based Stateful Firewall in the Firewall-and-NAT Policy Configuration Mode. In StarOS 8.3, this command is available in the Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall tcp-syn-flood-intercept { max-attempts *max_attempts* **| mode { none | { intercept | watch } [aggressive] } | retransmit-timeout** *retransmit_timeout* **| watch-timeout** *intercept_watch_timeout* **}**

default firewall tcp-syn-flood-intercept { max-attempts | mode | retransmit-timeout | watch-timeout }

default

Sets the default values of TCP intercept parameters for SYN Flood DoS protection.

max-attempts *max_attempts*

Default: 5
Specifies the maximum number of attempts for sending proxy SYN to the target. This keyword works in conjunction with the **retransmit-timeout** keyword.
max_attempts specifies the maximum number of attempts for sending proxy SYN to the target after the timeout duration, and must be an integer from 1 through 5.

mode { none | { intercept | watch } [aggressive]

Default: **none**
Specifies TCP SYN flood intercept mode:

- **intercept**: Configures TCP SYN flood intercept feature in intercept mode.
- **none**: Disables TCP SYN flood intercept feature.
- **watch**: Configures TCP SYN flood intercept feature in watch mode. The Stateful Firewall passively watches to see if TCP connections become established within a configurable interval. If connections are not established within the timeout period, the Stateful Firewall clears the half-open connections by sending RST to TCP client and server. The default watch-timeout for connection establishment is 30 seconds.
- **aggressive**: Configures TCP SYN flood Intercept or Watch feature for aggressive behavior. Each new connection request causes the oldest incomplete connection to be deleted. When operating in

watch mode, the watch timeout is reduced by half. If the watch-timeout is 30 seconds, under aggressive conditions it becomes 15 seconds. When operating in intercept mode, the retransmit timeout is reduced by half (i.e. if the timeout is 60 seconds, it is reduced to 30 seconds). Thus, the amount of time waiting for connections to be established is reduced by half (i.e. it is reduced to 150 seconds from 300 seconds under aggressive conditions).

retransmit-timeout *retransmit_timeout*

Default: 60
Specifies the SYN-Proxy retransmit timeout in seconds. System waits for this period before sending proxy SYN to the target. This keyword works in conjunction with **max-attempts** keyword.
retransmit_timeout specifies the duration in seconds the system waits before sending proxy SYN, and must be an integer from 15 through 60.

watch-timeout *intercept_watch_timeout*

Default: 30
intercept_watch_timeout specifies the TCP intercept watch timeout in seconds, and must be an integer from 5 through 30.

Usage

This TCP intercept functionality provides protection against TCP SYN Flooding attacks.
The system captures TCP SYN requests and responds with TCP SYN-ACKs. If a connection initiator completes the handshake with a TCP ACK, the TCP connection request is considered as valid by system and system forwards the initial TCP SYN to the valid target which triggers the target to send a TCP SYN-ACK. Now system intercepts with TCP SYN-ACK and sends the TCP ACK to complete the TCP handshake. Any TCP packet received before the handshake completion will be discarded.

Example

The following command sets the maximum number of attempts for sending proxy SYN to the target to *5*:

```
firewall tcp-syn-flood-intercept max-attempts 5
```

firewall track-list

This command configures the maximum number of server IPs to be tracked that are involved in any kind of DOS attacks.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall track-list attacking-servers *no_of_servers*

{ default | no } firewall track-list attacking-servers

default

Sets the default configuration.
Default: 10

no

Important: This variant is only available in StarOS 8.3 and later releases.

Removes the previous configuration.

attacking-servers *no_of_servers*

Specifies to track the attacking servers.
no_of_servers specifies the number of servers to track, and must be an integer from 1 through 100.

Usage

Use this command to configure the maximum number of server IPs to be tracked that are involved in any kind of DOS attacks.

Example

The following command configures the maximum number of server IPs to be tracked that are involved in any kind of DOS attacks to *20*:

firewall track-list attacking-servers *20*

fw-and-nat policy

This command enables creating/configuring/deleting a Firewall-and-NAT policy.

Important: This command is only available in StarOS 8.1 and StarOS 9.0 and later releases. This command must be used to configure the Policy-based Stateful Firewall and NAT features.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

fw-and-nat policy *policy_name* **[-noconfirm]**

no fw-and-nat policy *policy_name*

no

Deletes the specified Firewall-and-NAT policy.

Important: When a Firewall-and-NAT policy is deleted, for all subscribers using the policy, Stateful Firewall and NAT processing is disabled, also ECS sessions for the subscribers are dropped. In case of session recovery, the calls are recovered but with Stateful Firewall and NAT disabled.

policy_name

Specifies the Firewall-and-NAT policy name.
policy_name must be an alpha and/or numeric string of 1 through 63 characters in length.
If the named Firewall-and-NAT policy does not exist, it is created and the CLI mode changes to the Firewall-and-NAT Policy Configuration mode, wherein the policy can be configured.
If the named Firewall-and-NAT policy already exists, the CLI mode changes to the Firewall-and-NAT Policy Configuration mode, wherein the named policy can be configured.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete a Firewall-and-NAT policy.

Example

The following command creates a Firewall-and-NAT policy named *test321*, and changes to the Firewall-and-NAT Policy Configuration Mode:

fw-and-nat policy *test321*

group-of-prefixed-urls

This command enables creating/configuring/deleting a group-of-prefixed-URLs.

Important: This command is customer specific. For more information, please contact your local sales representative.

Important: A maximum of 64 group-of-prefixed-URL groups can be configured in the Active Charging Service.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

group-of-prefixed-urls *group_name* **[-noconfirm]**

no group-of-prefixed-urls *group_name*

no

Deletes the specified group-of-prefixed-urls.

group_name

Specifies the group-of-prefixed-urls name.
group_name must be an alpha and/or numeric string of 1 through 63 characters in length.
If the named group-of-prefixed-urls does not exist, it is created, and the CLI mode changes to the ACS Group of Prefixed URLs Configuration Mode wherein the group can be configured.
If the named group-of-prefixed-urls already exists, the CLI mode changes to the ACS Group of Prefixed URLs Configuration Mode wherein the group can be configured.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete a group of prefixed URLs.

Example

The following command creates group-of-prefixed-urls named *test5*, and enters the ACS Group of Prefixed URLs Configuration Mode:

group-of-prefixed-urls *test5*

group-of-ruledefs

This command enables creating/configuring/deleting a group-of-ruledefs.

Important: A maximum of 64 groups-of-ruledefs can be configured in an Active Charging Service.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

group-of-ruledefs *ruledef_group* **[-noconfirm]**

no group-of-ruledefs *ruledef_group*

no

Removes the specified group-of-ruledefs, if previously configured.

ruledef_group

ruledef_group specifies the group name. The group name must be unique within the Active Charging Service, and must be a string of 1 through 63 characters in length. Up 64 groups may be configured.
If the named group-of-ruledefs does not exist, it is created, and the CLI mode changes to the Group-of-Ruledefs Configuration Mode wherein the group can be configured.
If the named group-of-ruledefs already exists, the CLI mode changes to the Group-of-Ruledefs Configuration Mode wherein the group can be configured.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete a group-of-ruledefs.
A group-of-ruledefs is a collection of rule definitions to use in access policy creation. The group-of-ruledefs name must be unique within the service.

Example

The following command creates a group-of-ruledefs named *group1*, and enters the Group-of-Ruledefs Configuration Mode:
group-of-ruledefs *group1*

host-pool

This command enables creating/configuring/deleting a host pool.

Product

All

Privilege

Security Administrator, Administrator

Syntax

host-pool *host_pool* **[-noconfirm]**

no host-pool *host_pool*

no

Removes the specified host pool.

host_pool

Specifies the host pool name.
host_pool must be a string of 1 through 63 characters in length, and can contain punctuation characters.
If the named host pool does not exist, it is created, and the CLI mode changes to the ACS Host Pool Configuration Mode wherein the host pool can be configured.
If the named host pool already exists, the CLI mode changes to the ACS Host Pool Configuration Mode wherein the host pool can be configured.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete ACS host pools.
A host pool is a collection of hosts and IP addresses to use in access policy creation. The host pool name must be unique with in the service. Host pool, port map, IMSI pool, and firewall, routing, and charging ruledefs must have unique names. A maximum of the 256 host pools can be created.

Important: Host pools in use in other ruledefs cannot be deleted.

Example

The following command creates a host pool named *hostpool1*, and enters the ACS Host Pool Configuration Mode:
host-pool *hostpool1*

idle-timeout

This command configures the maximum duration a flow can remain idle, in seconds, after which the system automatically terminates the flow.

Product

ECS, NAT, FW

Privilege

Security Administrator, Administrator

Syntax

idle-timeout { alg-media | icmp | tcp | udp } *idle_timeout*

{ default | no } idle-timeout { alg-media | icmp | tcp | udp }

default

Configures the default idle-timeout setting for the specified flow.
Default:**alg-media**: 120 seconds; **icmp**, **tcp**, **udp**: 300 seconds

no

Disables the idle-timeout configuration for the specified flow.

alg-media | icmp | tcp | udp

Configures/disables the idle-timeout setting for the specified flow.

idle_timeout

Specifies the timeout duration, in seconds, and must be an integer from 0 through 86400.
For **alg-media** specifies the media inactivity timeout. The *idle_timeout* value gets applied on RTP and RTCP media flows that are created for SIP/H.323 calls. The timeout is applied only on those flows that actually match the RTP and RTCP media pinholes that are created by the SIP/H.323 ALG.
A value of 0 disables the idle-timeout setting.

Usage

Use this command to configure the maximum duration a flow can remain idle, in seconds, after which the system automatically terminates the flow.
Setting the value to 0 will cause the idle-timeout setting to be disabled.
For flows other than TCP, UDP, and ICMP timeout will always be 300 seconds. (Unless configured in the charging-action). Charging action's flow idle-timeout will have precedence over ACS idle-timeout. If charging action's flow idle-timeout is default, then flows will have the value configured in the ACS service.

Example

The following command configures the maximum duration a TCP flow can remain idle to *3000* seconds, after which the system automatically terminates the flow:
idle-timeout tcp *3000*

imsi-pool

This command enables creating/configuring/deleting an IMSI pool.

Product

All

Privilege

Security Administrator, Administrator

Syntax

imsi-pool *imsi_pool* **[-noconfirm]**

no imsi-pool *imsi_pool*

no

Removes the specified IMSI pool.

imsi_pool

Specifies the IMSI pool name.
imsi_pool must be a string of 1 through 63 characters in length, and can contain punctuation characters.
If the named IMSI pool does not exist, it is created, and the CLI mode changes to the ACS IMSI Pool Configuration Mode wherein the IMSI pool can be configured.
If the named IMSI pool already exists, the CLI mode changes to the ACS IMSI Pool Configuration Mode wherein the IMSI pool can be configured.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete pools of International Mobile Subscriber Identifier (IMSI) numbers having group of single or range of IMSI numbers to use in access policy creation. The IMSI pool name must be unique with in the service. Host pool, port map, IMSI pool, and firewall, routing, and charging ruledefs must have unique names. A maximum of the 256 IMSI pools can be created.

Important: IMSI pools in use in other ruledefs cannot be deleted.

Example

The following command creates an IMSI pool named *imsipool1*, and enters ACS IMSI Pool Configuration mode:
imsi-pool *imsipool1*

ip max-fragments

This command limits the maximum number of IP fragments per fragment chain.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip max-fragments *max_fragments*

default ip max-fragments

default ip max-fragments

Sets the maximum number of IP fragments limit to the default value.
Default: 45

max_fragments

Specifies the maximum number of IP fragments per fragment chain.
max_fragments must be an integer from 1 through 300.

Usage

Use this command to limit the maximum number of IP fragments.

Example

The following command limits the maximum number of IP fragments to *100*.

ip max-fragments *100*

label

This command defines a text string label to specific content ID for UDRs/EDRs/eG-CDRs in an Active Charging Service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

label content-id *content_id* **text** *string*

no label content-id *content_id*

no

Removes the previously configured rule definition from the Active Charging Service.

content-id *content_id*

Specifies the content ID to add a text string label for a description.
content_id must be an integer from 0 through 4,294,967,295.

text *string*

This keyword provides option to add descriptive text with each content Id for definition or user specific requirement.
string must be an alpha and/or numeric string of 1 through 64 characters in length.

Usage

Use this command to create a label string to attach to a specific content ID configured in the Charging Action Configuration Mode.
A maximum of 2048 labels can be configured within an Active Charging Service.

Example

The following command creates a label string *test_charge1* for content-id *1378*:
label content-id *1378* text *test_charge1*

nat allocation-failure

Configures action to take when NAT IP/Port allocation fails.

Important: This command is only available in StarOS 8.3 and later releases.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

```
nat allocation-failure send-icmp-dest-unreachable

{ default | no } nat allocation-failure
```

default

Sets the default configuration.
Default: Packets are dropped silently

no

Removes the previous NAT allocation failure configuration.
When set, packets are dropped silently.

send-icmp-dest-unreachable

Specifies sending ICMP Destination Unreachable message when NAT IP/Port allocation fails.

Usage

Use this command to configure the action to take when NAT IP/port allocation fails—to send or not to send an “ICMP destination unreachable message” when a NAT IP/port cannot be assigned to a flow in data-path.

Example

The following command configures sending ICMP Destination Unreachable message when NAT IP/Port allocation fails:

```
nat allocation-failure send-icmp-dest-unreachable
```

nat allocation-in-progress

Configures action to take on packets when NAT IP/NPU allocation is in progress.

Important: This command is only available in StarOS 8.3 and later releases.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

```
nat allocation-in-progress { buffer | drop }

default nat allocation-in-progress
```

default

Sets the default configuration.

buffer | drop

Specifies the action to take on packets when NAT IP/NPU allocation is in progress:
buffer: Specifies to buffer packets
drop: Specifies to drop packets
Default: buffer

Usage

In On-demand NAT IP allocation (wherein NAT IP address is allocated to the subscriber when a packet is being sent), if no free NAT IP address is available, a NAT-IP Alloc Request is sent to the VPNMgr to get NAT-IP. During that time packets are dropped. This command enables buffering the packets received when IP Alloc Request is sent to VPNMgr.

Example

The following command specifies to buffer packets when NAT IP/NPU allocation is in progress:

```
nat allocation-in-progress buffer
```

nat tcp-2msl-timeout

This command configures TCP 2msl timeout configuration for NAT.

Important: This command is only available in StarOS 8.3 and later releases.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

nat tcp-2msl-timeout *timeout*

default nat tcp-2msl-timeout

default

Sets the default configuration.

timeout

Specifies the TCP 2msl timeout in seconds, and must be an integer from 30 through 240.
Default: 60 seconds

Usage

Use this command to configure the TCP 2msl timeout configuration for NAT.

Example

The following command configures the TCP 2msl timeout for NAT to *120* seconds:

nat tcp-2msl-timeout *120*

p2p-detection protocol

This command configures the detection of specific peer-to-peer (P2P) protocols.

Product

P2P

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] p2p-detection protocol [ actsync | aimini | all | applejuice | ares |
battlefd | bittorrent | ddlink | directconnect | edonkey | fasttrack | feidian |
filetopia | freenet | fring | gadugadu | gnutella | gtalk | halflife2 |
hamachivpn | iax | imesh | iptv | irc | iskoot | jabber | manolito | msn | mute
| nimbuzz | oovoo | openft | orb | oscar | paltalk | pando | pandora | popo |
pplive | ppstream | qq | qqgame | qqlive | quake | rdp | secondlife | skinny |
skype | slingbox | sopcast | soulseek | steam | tvants | tvuplayer | uusee |
vpnx | vtun | warcft3 | winmx | winny | wofwarcraft | xbox | yahoo | zattoo + ]
```

all

Configures the system to detect all of the P2P protocols. Specifying **all** is the same as configuring each protocol individually.

actsync

Configures the system to detect actsync protocols.

aimini

Configures the system to detect aimini protocols.

applejuice

Configures the system to detect applejuice protocols.

ares

Configures the system to detect ares protocols.

battlefld

Configures the system to detect battlefld protocols.

bittorrent

Configures the system to detect bittorrent protocols.

ddlink

Configures the system to detect ddlink protocols.

directconnect

Configures the system to detect directconnect protocols.

edonkey

Configures the system to detect edonkey protocols.

fasttrack

Configures the system to detect fasttrack protocols.

feidian

Configures the system to detect feidian protocols.

filetopia

Configures the system to detect filetopia protocols.

freenet

Configures the system to detect freent protocols.

fring

Configures the system to detect fring protocols.

gadugadu

Configures the system to detect gadugadu protocols.

gnutella

Configures the system to detect gnutella protocols.

gtalk

Configures the system to detect gtalk protocols.

halflife2

Configures the system to detect halflife2 protocols.

hamachivpn

Configures the system to detect hamachivpn protocols.

iax

Configures the system to detect iax protocols.

imesh

Configures the system to detect imesh protocols.

iptv

Configures the system to detect iptv protocols.

irc

Configures the system to detect irc protocols.

iskoot

Configures the system to detect iskoot protocols.

jabber

Configures the system to detect jabber protocols.

manolito

Configures the system to detect manolito protocols.

msn

Configures the system to detect msn protocols.

mute

Configures the system to detect mute protocols.

nimbuzz

Configures the system to detect nimbuzz protocols.

oovoo

Configures the system to detect oovoo protocols.

openft

Configures the system to detect openft protocols.

orb

Configures the system to detect orb protocols.

oscar

Configures the system to detect oscar protocols.

paltalk

Configures the system to detect paltalk protocols.

pando

Configures the system to detect pando protocols.

pandora

Configures the system to detect pandora protocols.

popo

Configures the system to detect popo protocols.

pplive

Configures the system to detect pplive protocols.

ppstream

Configures the system to detect ppstream protocols.

qq

Configures the system to detect qq protocols.

qqgame

Configures the system to detect qqgame protocols.

qqlive

Configures the system to detect qqlive protocols.

quake

Configures the system to detect quake protocols.

rdp

Configures the system to detect rdp protocols.

secondlife

Configures the system to detect secondlife protocols.

skinny

Configures the system to detect skinny protocols.

skype

Configures the system to detect skype protocols.

slingbox

Configures the system to detect slingbox protocols.

sopcast

Configures the system to detect sopcast protocols.

soulseek

Configures the system to detect soulseek protocols.

steam

Configures the system to detect steam protocols.

tvants

Configures the system to detect tvants protocols.

tvuplayer

Configures the system to detect tvuplayer protocols.

uusee

Configures the system to detect uusee protocols.

vpnx

Configures the system to detect vpnx protocols.

vtun

Configures the system to detect vtun protocols.

warcft3

Configures the system to detect warcft3 protocols.

winmx

Configures the system to detect winmx protocols.

winny

Configures the system to detect winny protocols.

wofwarcraft

Configures the system to detect wofwarcraft protocols.

xbox

Configures the system to detect xbox protocols.

yahoo

Configures the system to detect yahoo protocols.

zattoo

Configures the system to detect zatoo protocols.

+

More than one of the above keywords can be entered within a single command.

Usage

Use this command to configure the detection of specific P2P protocols. Multiple commands can be specified in the command.

Example

The following command enables detection of all P2P protocols:

```
p2p-detection protocol all
```

p2p-dynamic-rules

This command enables/disables the P2P Dynamic Signature Updates feature, and loads the P2P signature file from the default or specified location into memory, optionally signatures for specific protocol(s) can be specified to be loaded.

Important: This release supports dynamic updates of signatures (detection logic) only for the following protocols: Bittorrent, DirectConnect, eDonkey, Gnutella, Skype, and Yahoo.

Product

P2P

Privilege

Security Administrator, Administrator

Syntax

```
p2p-dynamic-rules { file location [ force ] | protocol [ all | bittorrent |
directconnect | edonkey | gnutella | skype | yahoo + ] }

default p2p-dynamic-rules file

no p2p-dynamic-rules { file | protocol [ all | bittorrent | directconnect |
edonkey | gnutella | skype | yahoo + ] }
```

default

Enables the P2P Dynamic Signature Updates feature, and if available, loads the P2P signature file from the default location: /usr/lib/p2p-rules.xml.

no

Disables the P2P Dynamic Signature Updates feature, also any/specified signature(s) already loaded in the memory is unloaded.
If there are any active sessions using the file, it changes the file status to inactive. And, when the sessions are cleared, the file is removed from the memory.

file *location*

Specifies that the P2P signature file at the specified location (other than the default location) be loaded into memory and applied.
location specifies the file's location, and must be one of the following:
[file:]{/flash | /pcmcia1 | /hd-raid}[/directory]/*<filename>*

force

Specifies to force load the specified file into memory and apply it, even if it is obsolete.
By default, when a signature file is loaded from a specified location **file** *location*, while loading, it is compared with the file at the default location. The newer file of the two files is loaded into memory. To override this behavior, use the **force** keyword.

protocol [all | bittorrent | directconnect | edonkey | gnutella | skype | yahoo +]

Specifies the protocols for which signatures must be enabled for processing.
+ indicates that more than one of the keywords can be specified in the same command. Not applicable if the **all** option is selected first.

Usage

Use this command to enable/disable the P2P Dynamic Signature Updates feature, and load the P2P signature file from the default or specified location. Optionally the specific protocol(s) for which the signatures must be loaded can be specified.

Example

The following command enables the P2P Dynamic Signature Updates feature, and loads the signature file present in the default location:

default p2p-dynamic-rules file

packet-filter

This command enables creating/configuring/deleting an Active Charging Service packet filter.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

packet-filter *filter_name* **[-noconfirm]**

no packet-filter *filter_name*

no

Removes the specified packet filter, if configured previously.

filter_name

filter_name must be the name of the packet filter, and must be a string of 1 through 63 characters in length.
If the named packet filter does not exist, it is created, and the CLI mode changes to the Packet Filter Configuration Mode wherein the packet filter can be configured.
If the named packet filter already exists, the CLI mode changes to the Packet Filter Configuration Mode wherein the packet filter can be configured.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete an ACS packet filter.

Example

The following command creates a packet filter named *filter3*, and enters the Packet Filter Configuration Mode:
packet-filter *filter3*

passive-mode

This command configures the Active Charging Service to operate in passive mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] passive-mode
```

no

Specifies to disable passive mode.

default

Sets the default setting.
Default: Disabled

Usage

Use this command to put the Active Charging Service in/out of passive mode operation. Configures whether the Active Charging Service passively monitors copies of packets.

Example

The following command puts the Active Charging Service into passive mode operation:

```
passive-mode
```

policy-control burst-size

This command configures the burst size for bandwidth limiting per dynamic-rule or per bearer.

Product

All

Privilege

Security Administrator, Administrator

Syntax

policy-control burst-size { auto-readjust [duration *duration* **] | bytes** *bytes* **}**

{ default | no } policy-control burst-size

default | no

Sets the default configuration.
Default: 65535 bytes

auto-readjust

Configures the burst size equal to <seconds> of traffic.
Default: 10 seconds

duration *duration*

Specifies the seconds of traffic configured for burst size.
duration must be an integer from 1 through 20.

bytes *bytes*

Configures the burst size in bytes.
bytes must be an integer from 1 through 4000000000.

Usage

Use this command to configure the burst size for bandwidth limiting per dynamic-rule or per bearer.

Example

The following command configures the burst size for bandwidth limiting per dynamic-rule or per bearer equal to 10 seconds of traffic:

policy-control burst-size auto-readjust

policy-control charging-rule-base-name

This command configures interpretation of Charging-Rule-Base-Name AVP from PCRF either as active-charging rulebase or active charging group-of-ruledefs.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

```
policy-control charging-rule-base-name { active-charging-group-of-ruledefs |
active-charging-rulebase [ ignore-when-removed ] }

default policy-control charging-rule-base-name
```

default

Sets the default configuration.
Default: **active-charging-group-of-ruledefs**

active-charging-group-of-ruledefs

Specifies interpreting Charging-Rule-Base-Name as active-charging group-of-ruledefs.

active-charging-rulebase [ignore-when-removed]

Specifies interpreting Charging-Rule-Base-Name as active-charging rulebase.
When Charging-Rule-Base-Name AVP is interpreted as active-charging rulebase, if PCRF requests the removal of a Charging-Rule-Base-Name, which is the same as the rulebase used for that PDP context, the PDP context is terminated. This is because after removal of the rulebase, the PDP context will have no rulebase. This is the default behavior.
When the **ignore-when-removed** option is configured, PCRF request for removal of Charging-Rule-Base-Name is ignored and no action is taken.
For each call, this interpretation is decided at call setup, and will not be changed during the life of that call. Change will only apply to new calls coming up after the change.

Usage

Use this command to configure interpretation of Charging-Rule-Base-Name AVP from PCRF either as active charging group-of-ruledefs or as active-charging rulebase.

Example

The following command configures interpreting of Charging-Rule-Base-Name AVP as active-charging rulebase:

```
policy-control charging-rule-base-name active-charging-rulebase
```

port-map

This command enables creating/configuring/deleting a port map.

Product

All

Privilege

Security Administrator, Administrator

Syntax

port-map *port_map* **[-noconfirm]**

no port-map *port_map*

no

Removes the specified port map.

port_map

Specifies the port map name.
port_map must be a string of 1 through 63 characters in length, and can contain punctuation characters.
If the named port map does not exist, it is created, and the CLI mode changes to the ACS Port Map Configuration Mode wherein the port map can be configured.
If the named port map already exists, the CLI mode changes to the ACS Port Map Configuration Mode wherein the port map can be configured.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete a port map.
The port map name must be unique with in the service. Host pool, port map, IMSI pool, and firewall, routing, and charging ruledefs must have unique names. A maximum of the 256 port maps can be created.

Important: Port maps in use in other ruledefs cannot be deleted.

Example

The following command creates a port map named *portmap1*, and enters ACS Port Map Configuration mode:
port-map *portmap1*

redirect user-agent

This command specifies the user agent for conditional redirection of traffic flows.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] redirect user-agent *user_agent_name*

no

Removes the specified user agent.

user_agent_name

Specifies the name of the user agent to be used for redirecting traffic flow.
user_agent_name must be an alpha and/or numeric string of 1 through 32 characters in length.
A maximum of 16 user-agents can be configured in an Active Charging Service.

Usage

Use this command to redirect the traffic flow with conditions based on configured user-agent name. This user agent is used with **flow action** command in the Charging Action Configuration Mode.

Example

Following command specifies the redirect user agent *user_rule1* for conditional redirection of traffic flow.

redirect user-agent *user_rule1*

rulebase

This command enables creating/configuring/deleting an ACS rulebase.

Important: A maximum of 512 rulebases can be configured in an Active Charging Service.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

rulebase *rulebase_name* **[-noconfirm]**

no rulebase *rulebase_name*

no

Removes the specified rulebase from the current Active Charging Service.

rulebase_name

rulebase_name must be an alpha and/or numeric string of 1 through 63 characters in length, and can contain punctuation characters.
If the named rulebase does not exist, it is created, and the CLI mode changes to the ACS Rulebase Configuration Mode wherein the rulebase can be configured.
If the named rulebase already exists, the CLI mode changes to the ACS Rulebase Configuration Mode wherein the rulebase can be configured.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete a an rulebase. A rulebase is a collection of protocol rules to match a flow and associated actions to be taken for matched flow. The *rulebase_name* must be unique for a given Active Charging Service.
The default rulebase is used when a subscriber/APN is not configured with a specific rulebase to use.

Example

The following command creates a rulebase named *test1*, and enters the ACS Rulebase Configuration mode:
rulebase *test1*

ruledef

This command enables creating/configuring/deleting a rule definition in an Active Charging Service.

Important: A maximum of 2048 ruledefs can be configured in an Active Charging Service.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

ruledef *ruledef_name* **[-noconfirm]**

no ruledef *ruledef_name*

no

Removes the specified ruledef from the current Active Charging Service.

ruledef_name

ruledef_name must be an alpha and/or numeric string of 1 through 63 characters in length, and can contain punctuation characters.
ruledef_name must be unique with in the service. Host pool, port map, IMSI pool, and firewall, routing, and charging ruledefs must have unique names.
If the named ruledef does not exist, it is created, and the CLI mode changes to the ACS Ruledef Configuration Mode wherein the ruledef can be configured.
If the named ruledef already exists, the CLI mode changes to the ACS Ruledef Configuration Mode wherein the ruledef can be configured.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete an ACS ruledef.
A ruledef represents a set of matching conditions across multiple L3 – L7 protocol based on protocol fields and state information. Each ruledef can be used across multiple rulebases within the Active Charging Service.

Example

The following command creates a rule definition named *test1*, and enters ACS Ruledef Configuration mode
ruledef *test1*

system-limit

This command configures the system-wide Layer 4 flow limit.

Important: This command is customer specific. For more information, please contact your local sales or service representative.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

```
system-limit l4-flows limit

{ default | no } system-limit l4-flows
```

Default

Sets the default configuration.
Default: **no system-limit l4-flows**

no

Disables the limit checking.

limit

Specifies the Layer 4 flows limit, and must be an integer from 1 through 2147483647.

Usage

Use this command to configure the system-wide limit for Layer 4 flows.
The System-wide L4 Flow Limiting feature provides the capability to limit the number of TCP and UDP flow over the system. This limiting can be applied to all subscribers attaching to the system and to all APNs. This feature is compatible with the existing per-subscriber limiting (configured using the flow limit-for-flow-type charging action). Both limiting can be active in the same time.
System-wide flow limiting is implemented by comparing the "Effective Flows" periodically (~ every 10 seconds) against the configurable "System-wide Flow Limit". Where "Effective Flows" is the number of active data sessions, each identified by 5 tuple key. If the "Effective Flows" exceeds the "System-wide Flow Limit", the Resource Manager indicates it to the ECS service. Once ECS is aware of the "System-wide Flow Limit" being reached, no more data sessions are setup. The packets are discarded. While processing a successive flow-usage update from ECS service a change in behavior is indicated to ECS service to start accepting data sessions. As this relies on periodic reporting there is an inherent delay in the detection of "exceeding/returning once exceeded" to the flow limit.

Example

The following command sets the system limit for L4 flows to *100*:

```
system-limit l4-flows 100
```

timedef

This command enables creating/configuring/deleting a Time Definition (timedef).

Important: This command is only available in StarOS 8.1 and StarOS 9.0 and later releases.

Important: A maximum of 10 timedefs can be configured in an Active Charging Service.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

timedef *timedef_name* **[-noconfirm]**

no timedef *timedef_name*

no

Deletes the specified timedef.

timedef_name

timedef_name specifies name of the timedef, and must be an alpha and/or numeric string of 1 through 63 characters in length.
If the named timedef does not exist, it is created, and the CLI mode changes to the Timedef Configuration Mode wherein timeslots for the timedef can be configured.
If the named timedef already exists, the CLI mode changes to the Timedef Configuration Mode wherein timeslots for the timedef can be configured.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete ACS timedefs for the Time-of-Day Activation/Deactivation of Rules feature. Timedefs enable activation/deactivation of ruledefs/groups-of-ruledefs such that they are available for rule matching only when they are active.

Example

The following command creates a timedef named *test1*, and enters the ACS Timedef Configuration mode:
timedef *test1*

udr-format

This command creates/configures/deletes an UDR format specification.

Product

All

Privilege

Security Administrator, Administrator

Syntax

udr-format *name* **[-noconfirm]**

no udr-format *name*

no

Removes the specified UDR format in the current Active Charging Service.

name

Specifies UDR format name, and must be an alpha and/or numeric string of 1 through 63 characters in length.
If the named UDR format does not exist, it is created, and the CLI mode changes to the UDR Format Configuration Mode wherein the UDR format can be configured.
If the named UDR format already exists, the CLI mode changes to the UDR Format Configuration Mode wherein the UDR format can be configured.
Up to 256 UDR and/or EDR formats can be configured in a system across all Active Charging Services.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete an UDR format for a specific Active Charging Service.

Example

The following command creates an UDR format named *udr_fromat1*:

udr-format *udr_format1*

url-blacklisting match-method

This command sets the match method to look up URLs in the URL Blacklisting database.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

```
url-blacklisting match-method { exact | generic }

default url-blacklisting match-method
```

default

Default: **exact**
Sets the default match method.

exact

Specifies the exact-match method, wherein URL Blacklisting is performed only on exact match with URLs present in the URL Blacklisting database.

generic

Specifies the generic-match method, wherein URL Blacklisting is performed on generic match with URLs present in the URL Blacklisting database.

Usage

Use this command to set the match method to look up URLs in the URL Blacklisting database.

Example

The following command sets the exact-match method to look up URLs in the URL Blacklisting database:

```
url-blacklisting match-method exact
```

xheader-format

This command enables creating/configuring/deleting an extension-header (x-header) format specification for the current Active Charging Service.

Important: This is a customer-specific command. For more information, please contact your local sales representative.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

xheader-format *xheader_format_name* **[-noconfirm]**

no xheader-format *xheader_format_name*

no

Removes the specified x-header format for the current Active Charging Service.

xheader_format_name

Specifies the x-header format name.
xheader_format_name must be an alpha and/or numeric string of 1 through 63 characters in length.
If the named x-header format does not exist, it is created, and the CLI mode changes to the x-header Format Configuration Mode wherein the x-header format can be configured.
If the named x-header format already exists, the CLI mode changes to the x-header Format Configuration Mode wherein the x-header format can be configured.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

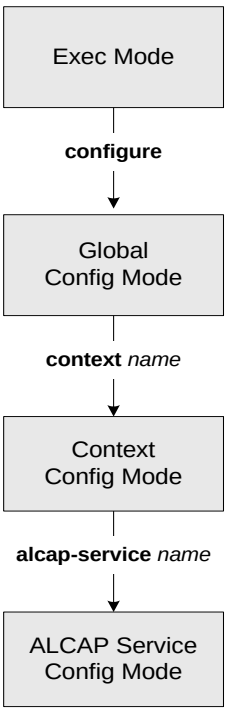
Use this command to create/configure/delete an x-header format specification for a specific Active Charging Service.
An x-header may be specified in a charging action to be inserted into HTTP GET and POST request packets.
See **xheader-insert** CLI command in the *Charging Action Configuration Mode Commands*, and *x-header Format Configuration Mode Commands* chapter.

Example

The following command creates an x-header format named test, and enters the x-header Format Configuration Mode:
xheader-format *test*

Chapter 12
ALCAP Configuration Mode Commands

The ALCAP Service Configuration Mode is used to create, provide, and manage the Access Link Control Application Part (ALCAP) on HNB-GW to support IuCS-over-ATM connectivity to HNB subscriber in a 3G UMTS networks towards CS core network.



aal2-node

Thsi command creates/configures AAL2 node configuration to defined AAL2 node properties for IuCS-over-ATM fucntion.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

```
aal2-node aal2_node_name [-noconfirm]

[no] aal2-node aal2_ndoe_name
```

no

Removes the configured AAL2 node from ALCAP service configuration.

aal2_node_name

Identifies the name of the AAL2 node name to configure the AAL2 node paramters.
The *aal2_node_name* must be an alphanumerical string from 1 through 63 characters.

Usage

Use this command to create/configure the AAL2 node configuration and switch to AAL2 Node Configuration mode.
Entering this command results in the following prompt:
`[context_name]hostname(config-aal2-node-aal2_node_name)#`
A maximum of *TBD* AAL2 node can be configured in one ALCAP service.

Important: The AAL2 Node configured here will be used to bind with ATM port in PVC Configuration sub-mode of ATM Configuration mode for IuCS-over-ATM functionality.

Important: For more information on AAL2 node configuration, refer *AAL2 Node Configuration Mode Commands*.

Example

Following command creates AAL2 node configuration mode named *aal2_1* within the specific ALCAP service for IuCS-over-ATM support towards CS core networks and switch the user to AAL2 Node Configuration Mode named *aal2_1*:

```
aal2-node aal2_node_name -noconfirm
```

aal2-route

This command defines a route for each ATM Endpoint Service Address (AESA) with which it can have transport layer communication. This route actually maps an AESA to one or more AAL2 paths which will be used to setup an end to end communication path.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

```
aal2-route end-point [AESA_address | default] aal2-node aal2_node_name

[no] aal2-route end-point [AESA_address | default] [aal2-node aal2_node_name]
```

no

Removes defined AAL2 route from ALCAP service configuration.

end-point [*AESA_address* | default]

Specifies the AESA address in an ATM (or AAL2) network to map with adjacent AAL2 node. The AESA is based on the generic network service access point (NSAP) format. The ATM connection from HNB-GW terminates at this point.
The *AESA_address* must be an alpha/numeric string from 1 through 63 characters.
The **default** keyword is used to configure a default AAL2 route which will match any AESA received from MSC and for which AESA specific route is not configured. When a connection is established an AESA specific route will have higher priority than **default** route.

Usage

Use this command to create a mapping between ATM endpoint and adjacent node for AAL2 connection routing purposes.
It defines a route for each ATM Endpoint Service Address (AESA) with which it can have transport layer communication. This route actually maps an AESA to one or more AAL2 paths which will be used to setup an end to end communication path.
The **default** keyword can be used to configure a default **aal2-route** which will match any AESA received from MSC and for which AESA specific route is not configured. When a connection is established an AESA specific route will have higher priority than default route.

Important: The default route shall not be used when AESA specific route exists.

If an HNB-GW configured with a route for *MGW1* which consists of *AAL2_path_A* and *AAL2_path_B* for **AAL2 switch-A** and **AAL2 switch-B** switch respectively then similarly **AAL2 switch-A** and **AAL2 switch-B** need to be configured with routes for *MGW1*.
A maximum of *TBD* AAL2 routes can be configured in one ALCAP service.

Example

Following command create a mapping between ATM endpoint *MGW1* and AAL2 node *aal2_1* for AAL2 connection routing purposes:

aal2-route end-point [*MGW1* **aal2-node** *aal2_1*

associate

This command associates a previously configured SS7 routing domain with this ALCAP service on HNB-GW node which will be used to define the SS7 routing domain in 3G UMTS networks.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

```
associate ss7-routing-domain ss7_rd_id

no associate ss7-routing-domain
```

no

Removes the associated SS7 routing domain id from this ALCAP service configuration.

ss7_rd_id

Identifies the SS7 routing domain index configured in Global configuration mode to associate with ALCAP service for IuCS-over-ATM support.
The *ss7_rd_id* must be an integer from 1 through 12.

Important: For SS7 routing doman configuration, refer *SS7 Routing Domain Configuration Commands Mode* chapter.

Usage

Use this command to associate a preconfigured SS7 routing domain index to provide IuCS-over-ATM support towards CS core network for HNB subscriber.
A maximum of *TBD* SS7 routing domains can be configured in one ALCAP service.

Example

Following command associates a predefined SS7 routing domain id *3* with ALCAP service to define routing domain for IuCS-over-ATM supprot towards CS core networks:

```
associate ss7-routing-domain 3
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the previous mode.

maximum reset-retransmission

This command sets the maximum number of retries allowed for transmission of RESET message to reset the AAL2 path.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

```
maximum reset-retransmissions retries

default maximum reset-retransmissions
```

default

Sets the number of RESET meesage retries to default value of 1.

retires

Sets the maximum number of retries allowed for transmission of RESET message to reset the AAL2 path by ALCAP service.
retries must be an integer value from 0 through 4. When 0 is used retransmission will be disabled.
Default: 1

Usage

Use this command to sets the maximum number of retries allowed for transmission of RESET message by ALCAP service to reset the AAL2 path when **Timer_RES** expires. Once the maximum number of RESET retries have been performed the ALCAP service shall stop the RESET procedure for the affected path and path will become available for connections.

Example

The following command configures ALCAP service to send maximum number of *2* RESET messages after expiry of RESET timer for AAL2 path RESET procedure:

```
maximum reset-retransmissions 2
```

self-point-code

This command specifies the SS7 point code address for ALCAP service.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

```
self-point-code point_code

no self-point-code
```

no

Deletes the configured self point code for this ALCAP service.

point_code

Defines the point code to assign to this ALCAP service.
point_code: value entered must adhere to the point code variant selected when the ALCAP service instance was defined:

- ITU Range 0.0.1 to 7.255.7
- ANSI Range 0.0.1 to 255.255.255
- TTC Range 0.0.1 to 15.31.255
- a string of 1 to 11 combined digits and period.

Usage

Use this command to assign the self point code to use for this ALCAP service.

Example

The following command sets an ITU-based point code for this ALCAP service:

```
self-pointcode 4.121.5
```

The following command removes the configured self-point code:

```
no self-pointcode
```

timeout alcap

This command configures the timeout duration for various ALCAP procedure timers in ALCAP service.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

```
timeout alcap {blo blo_timer_value | erq erq_timer_value | mod mod_timer_value |
rel rel_timer_value | res res_timer_value | ubl ubl_timer_value

default timeout alcap {blo | erq | mod | rel | res | ubl}
```

default

Sets the timer values to default duration for specific ALCAP procedure in an ALCAP service.

---

blo *blo_timer_value*

Specifies the maximum time, in seconds, the system waits for response from adjacent AAL2 node before reporting the failure of AAL2 Path Block procedure. When a request to block a particular AAL2 path is recieved by ALCAP service, the ALCAP service sends ALCAP-BLOCK-REQEST message to AAL2 node/peer ALCAP Manage and starts **Timer_BLO** timer. The timer waits for specified timeout duration *blo_timer_value* for ALCAP-BLOCK-CONFRIM message before reporting error in procedure.
If AAL2 Node responds with ALCAP-BLOCK-CONFRIM message the timer will stop before the expiry of timeout duration and system reports the successful completion of the procedure.
blo_timer_value must be an integer value from 2 through 60.
Default: 5

---

erq *erq_timer_value*

Specifies the maximum time, in seconds, the system waits for response from adjacent AAL2 node before reporting the failure of AAL2 Establish Request procedure. When a request to esblish a connection through ALCAP-ESTABLISH-REQUEST message is sent to AAL2 node the system starts the **Timer_ERQ** timer. The timer waits for specified timeout duration *erq_timer_value* for ALCAP-ESTABLISH-CONFRIM message before reporting error in procedure and system requests ALCAP Manager to free the AAL2-channel used for connection and also indicates to start the RESET procedure for this channel.
If AAL2 Node responds with ALCAP-ESTABLISH-CONFRIM message the timer will stop before the expiry of timeout duration and system reports the successful completion of the procedure.
erq_timer_value must be an integer value from 5 through 30.
Default: 5

---

mod *mod_timer_value*

Specifies the maximum time, in seconds, the system waits for response from adjacent AAL2 node before reporting the failure of AAL2 Modify Request procedure. When a request to modify a connection or channel through ALCAP-MODIFY-REQUEST message is sent to AAL2 node the system starts the **Timer_MOD** timer. The timer waits for specified timeout duration *mod_timer_value* for ALCAP-MODIFY-CONFRIM message before reporting error in procedure and system requests ALCAP Manager to initiates the

RESET or any other appropriate procedure for this channel and HNB-GW shall release the RUA connection towards HNB and SCCP connection towards CN.
If AAL2 Node responds with ALCAP-MODIFY-CONFRIM message the timer will stop before the expiry of timeout duration and system reports the successful completion of the procedure.
mod_timer_value must be an integer value from 5 through 30.
Default: 5

rel *rel_timer_value*

Specifies the maximum time, in seconds, the system waits for response from adjacent AAL2 node before reporting the failure of AAL2 Release Request procedure. When a request to release a connection or channel through ALCAP-RELEASE-REQUEST message is sent to AAL2 node the system starts the **Timer_REL** timer and sends RAB-ASST-REQ to HNB. The timer waits for specified timeout duration *rel_timer_value* for ALCAP-RELEASE-CONFRIM message before reporting error in procedure and system requests ALCAP Manager to release the AAL2 channel. System also indicates to start RESET procedure for this channel.
If AAL2 Node responds with ALCAP-RELEASE-CONFRIM message the timer will stop before the expiry of timeout duration and system reports the successful completion of the procedure.
rel_timer_value must be an integer value from 2 through 60.
Default: 2

res *res_timer_value*

Specifies the maximum time, in seconds, the system waits for response from adjacent AAL2 node before reporting the failure of AAL2 Reset Request procedure. When a request to reset a connection or channel through ALCAP-RESET-REQUEST message is sent to AAL2 node the system starts the **Timer_RES** timer. The timer waits for specified timeout duration *res_timer_value* for ALCAP-RESET-CONFRIM message before retrying the RESET procedure. The system will retry the RESET procedure for configured number of times and on completion of retry limit the stops the RESET procedure for the affected path and path will become available for connections.
If AAL2 Node responds with ALCAP-RESET-CONFRIM message the timer will stop before the expiry of timeout duration and system reports the successful completion of the procedure.
res_timer_value must be an integer value from 2 through 60.
Default: 2

ubl *ubl_timer_value*

Specifies the maximum time, in seconds, the system waits for response from adjacent AAL2 node before reporting the failure of AAL2 Path UnBlock procedure. When a request to unblock a particular AAL2 path is recieved by ALCAP service, the ALCAP service sends ALCAP-UNBLOCK-REQEST message to AAL2 node/peer ALCAP Manager and start **Timer_BLO** timer. The timer waits for specified timeout duration *ubl_timer_value* for ALCAP-UNBLOCK-CONFRIM message before reporting error in procedure.
If AAL2 node/peer ALCAP Manager responds with ALCAP-BLOCK-CONFRIM message the timer will stop before the expiry of timeout duration and system reports the successful completion of the procedure.
ubl_timer_value must be an integer value from 2 through 60.
Default: 2

Usage

Use this command to configure the timeout duration for various ALCAP procedures in ALCAP service.

Example

The following command sets the timeout duration of 10 seconds for ALCAP-MODIFY-REQUEST procedure:

```
timeout alcap mod 10
```

timeout stc

This command configures the timeout duration for STC long (T30) and and STC short (T29) timers used in congestion indication procedure at Signaling Transport Converter (STC) layer in ALCAP service.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

```
timeout stc {long long_timer_value | short short_timer_value}

timeout stc {long | short}
```

default

Sets the timer values to default duration for specific STC procedure in an ALCAP service.

long *long_timer_value*

Specifies the duration in millinseconds for STC long timer. This timer is used by the congestion indication procedure. Receipt of a repeated congestion indication from MTP3B before the expiry of this timer is interpreted as the congestion situation. On the other hand, if no congestion indication is received from MTP3B before expiry of this timer, the congestion situation is considered to have improved.
long_timer_value must be an integer value from 5000 through 10000.
Default: 5000

short *short_timer_value*

Specifies the duration in millinseconds for STC short timer. This timer is used by the congestion indication procedure. The role of this timer is to avoid overreacting if multiple congestion indications are received from MTP3B in quick succession.
short_timer_value must be an integer value from 300 through 600.
Default: 300

Usage

Use this command to configure the long (T30) and short (T29) timer for congestion indication procedure in ALCAP service.
When the first congestion indication is received by, the traffic load into the affected destination point code is reduced and the same time two timers STC short timer (T29) and STC long timer (T30) are started. During STC short timer all received congestion indications for the same destination point code are ignored in order not to reduce traffic too rapidly. Reception of a congestion indication after the expiry of STC short timer, but still during STC long timer, will decrease the traffic load by one more step and restart both the timers again. If STC long timer expires (i.e. no congestion indications having been received during the STC long timer period), traffic will be increased by one step and STC long timer will be restarted unless full traffic load has been resumed.

Example

The following command sets the timeout duration of 5000 milliseconds for STC long timer:

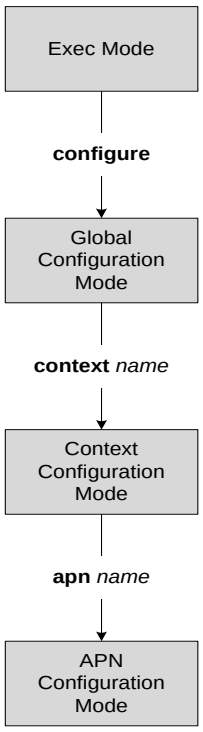
```
default timeout stc long
```

The following command sets the timeout duration of 300 milliseconds for STC short timer:

```
default timeout stc short
```

Chapter 13
APN Configuration Mode Commands

The Access Point Name (APN) Configuration Mode is used to create and configure APN profiles within the current system context of a UMTS/LTE service.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

aaa group

This command configures a AAA server group for the APN for AAA functionality.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] aaa group group_name

default aaa group
```

no

Disables the specified AAA group for the specific APN.

default

Sets / restores default AAA group specified at the context level or in APN template.

group_name

The AAA group to configure for the APN.
group_name must be a string of 1 through 63 characters in length.

Usage

Instead of having a single list of servers per context, this feature configures multiple server groups within a context and applies individual server group for APNs in that context. Each server group consists of a list of AAA servers for each AAA function (accounting, authentication, charging, etc.).

Example

The following command applies the AAA server group *star1* to an APN within the specific context:

```
aaa group star1
```

The following command disables the AAA group for the specific APN:

```
no aaa group group_name
```

access-link

Configures IP fragmentation processing over the Access-link (PPP, GTP etc).

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
access-link ip-fragmentation { normal | df-ignore | df-fragment-and-icmp-notify
}
```

df-ignore

Default: Disabled
Ignore the DF bit setting. Fragment and forward the packet over the access link.

df-fragment-and-icmp-notify

Default: Disabled
Partially ignore the DF bit. Fragment and forward the packet, but also return an ICMP error message to the source of the packet. The number of ICMP errors sent like this is rate-limited to 1 ICMP error packet per second per session.

normal

Default: Enabled
Normal processing. Drop the packet and send an ICMP unreachable message to the source of packet. This is the default behavior.

Usage

If the IP packet to be forwarded is larger than the access-link MTU and if the DF (Don't Fragment) bit is set for the packet, then the fragmentation behavior configured by this command is applied. Use this command to fragment packets even if they are larger than the access-link MTU.
Note that regardless of whether or not fragmentation is performed because of one of the above reasons, fragmentation may also occur for other reasons.
Payloads are encapsulated within IP/UDP/GTP before being sent to the SGSN. If that encapsulation causes the packet to exceed 1500 bytes, the inner IP payload is fragmented (even if it's not considered too-large by the above tests) into two payloads (if the DF bit is not set). If the DF bit is set (and access-link ip-fragmentation normal is configured), the system performs IP fragmentation of the entire packet (i.e., IP fragmentation in the outer IP header) rather than fragmenting the inner IP payload. Either way, the result is two packets, but in one case the MS would have to perform IP reassembly while in the other case the SGSN would have to perform reassembly.

Example

Set fragmentation so that the DF bit is ignored and the packet is forwarded anyway by entering the following command:

```
access-link ip-fragmentation df-ignore
```

accounting-mode

This command configures the protocol to be used for PDP context accounting by this APN.

Product

GGSN, ECS, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
accounting-mode { gtpp | none | radius-diameter [ no-interims ] [ no-early-pdus
] }

default accounting-mode
```

default

Restores the command to its default setting.

gtpp

Configures the APN to use GPRS Tunneling Protocol Prime for accounting purposes. If used, accounting will begin as soon as the PDP context is established. This is the default setting.
Default: Enabled

Important: The system's GTPP parameters must be configured prior to using this protocol for accounting. Refer to the **gtpp** commands in the Context Configuration Mode Commands chapter of this reference.

none

Disables accounting for PDP contexts using this APN.
When accounting mode is set to none, it indicates to the GTP stack at session manager to not generate the regular GTPP accounting triggers.
Default: Disabled.

radius-diameter

Configures the APN to use RADIUS/Diameter protocol for accounting purposes.
Default: Disabled

Important: The system's RADIUS/Diameter accounting parameters must be configured prior to using either of the protocols for accounting. Refer to the **radius**/**diameter** commands in the Context Configuration Mode Commands and the AAA Server Group Configuration Mode Commands chapters of this reference.

no-early-pdus

Configures the GGSN to discard user traffic once the buffer is full until the RADIUS server has returned a response to the GGSN's accounting START request per 3GPP standards.

no-interims

Disables the generation of RADIUS interims per APN. If **no-interims** is specified, then it won't send any RADIUS INTERIM-UPDATEs for this APN, regardless of what is configured in the context that is used for RADIUS accounting.

Usage

This command specifies which protocol, if any, will be used to provide accounting for PDP contexts accessing the APN profile.

When the GTPP protocol is used, accounting messages are sent to the charging gateways (CGs) over the Ga interface. The Ga interface and GTPP functionality are typically configured within the system's source context. As specified by the standards, a CDR is not generated when a session starts - CDRs are generated according to the interim triggers (configured using the **cc** command in the GGSN service configuration mode) and a CDR is generated when the session ends. For interim accounting, STOP/START pairs are sent based on configured triggers.

GTPP version 2 is always used. However, if version 2 is not supported by the CGF, the system reverts to using GTPP version 1. All subsequent CDRs are always fully-qualified partial CDRs. All CDR fields are R4.

If the **radius-diameter** option is used, either the RADIUS or the Diameter protocol is used as configured in the Context Configuration mode or the AAA Server Group Configuration mode.

If the RADIUS protocol is used, accounting messages can be sent over a AAA interface or the Gi to the RADIUS server. The AAA or Gi interface(s) and RADIUS functionality are typically configured with the system's destination context along with the APN. RADIUS accounting begins immediately after an IP address is allocated for the MS. Interim accounting can be configured using the **radius accounting interim interval**. The **radius accounting interim interval** command sends INTERIM-UPDATE messages at specific intervals.

Keywords to this command can be used in combination to each other, depending on configuration requirements.

Important: If the accounting type in the APN is set to 'none' then G-CDRs will not be generated. If accounting type is left as default 'GTPP' and 'billing-records' are configured in Rulebase configuration mode in ECS, then both G-CDRs and eG-CDRs would be generated.

Example

The following command configures the APN to use the RADIUS/Diameter protocol for accounting:

```
accounting-mode radius-diameter

accounting-mode radius-diameter no-interims no-early-pdus

accounting-mode radius-diameter no-early-pdus no-interims
```

active-charging bandwidth-policy

This command configures the bandwidth policy to be used for subscribers who use this APN.

Product

GGSN, ECS

Privilege

Security Administrator, Administrator

Syntax

```
active-charging bandwidth-policy bandwidth_policy
```

```
{ default | no } active-charging bandwidth-policy
```

default

Specifies that the default bandwidth policy configured in the rulebase be used for subscribers who use this APN.

no

Disables bandwidth control for the APN.

bandwidth_policy

Specifies the bandwidth policy name.
bandwidth_policy must be an alpha and/or numeric string from 1 through 63 characters in length.

Usage

Use this command to configure bandwidth policy to be used for subscribers who use this APN.

Example

The following command configures a bandwidth policy named *standard* for the APN:

```
active-charging bandwidth-policy standard
```

active-charging rulebase

This command specifies the name of the ACS rulebase to be used for subscribers who use this APN.

Product

GGSN, ECS, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
active-charging rulebase rulebase_name

no active-charging rulebase
```

no

Removes the rulebase previously specified for this APN.

rulebase_name

Specifies the ACS rulebase name.
rulebase_name must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to specify the name of the ACS rulebase to be used for subscribers who use the APN.

Example

The following command specifies the ACS rulebase rule1 for the APN:

```
active-charging rulebase rule1
```

apn-ambr

Configures the Aggregated Maximum Bit Rate (AMBR) for all PDNs using this APN.

Product

P-GW

Privilege

Administrator

Syntax

```
apn-ambr rate-limit direction { downlink | uplink } [ burst-size { auto-readjust
duration seconds | bytes } | violate-action { drop | lower-ip-precedence | shape
[ transmit-when-buffer-full ] | transmit } ]

[ default | no ] apn-ambr rate-limit direction { downlink | uplink }
```

default

Returns the selected command to it's default setting of no APN-AMBR.

no

Disables the selected command.

rate-limit direction { downlink | uplink }

Specifies that the rate limit is to be applied to either the downlink traffic or the uplink traffic.

downlink: Applies the AMBR parameters to the downlink direction.

uplink: Applies the AMBR parameters to the uplink direction.

burst-size { auto-readjust duration *seconds* **|** *bytes***}**

This parameter is used by policing and shaping algorithms to permit short bursts of traffic in order to not exceed the allowed data rates. It is the maximum size of the token bucket.

auto-readjust duration *seconds*: A duration, in seconds, used in this burst size calculation:

burst size = peak data rate/8 * auto-readjust duration

seconds must be an integer value from 1 to 30. Default is 1 second

bytes: Specifies the burst size in bytes allowed by this APN for the associated PDNs. *bytes* must be an integer value from 1 to 4294967295 (1 byte to 4 GB).

violate-action { drop | lower-ip-precedence | shape [transmit-when-buffer-full] | transmit }

The action that the P-GW will take when the data rate of the bearer context exceeds the AMBR.

drop: Violating packets are dropped.

lower-ip-precedence: The DSCP value is set to zero ("best effort") for the violating packets.

shape [transmit-when-buffer-full]: Place all violating packets into a buffer and, optionally, packets are transmitted when the buffer is full.

transmit: Violating packets are transmitted. This is the default setting.

Usage

Use this command to enforce the AMBR for the APN on bearers that do not have a Guaranteed Bit Rate (GBR).

Example

The following command sets the downlink burst rate to use an auto-readjust duration of 2 seconds and lowers the IP precedence of violating packets:

```
apn-ambr rate-limit direction downlink burst-size auto-readjust duration
2 violate-action lower-ip-precedence
```

associte accounting-policy

Associates the APN with specific pre-configured policies configured in the same context.

Product

P-GW

Privilege

Administrator

Syntax

```
[ no ] associate accounting-policy name
```

no

Removes the selected association from this APN.

accounting-policy*name*

Associates the P-GW APN with an accounting policy configured in the same context. *name* must be an existing accounting policy and be from 1 to 63 alpha and/or numeric characters.
Accounting policies are configured through the policy accounting command in the Context Configuration Mode.

Usage

Use this command to associate the P-GW APN with an accounting policy configured in this context.

Example

The following command associates this P-GW APN with an accounting policy called *acct1*:

```
associate accounting-policy acct1
```

authentication

Configures the APN's authentication parameters.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
authentication {[ msid-auth | imsi-auth [username-strip-apn] [password-use-pco]
| msisdn-auth [username-strip-apn] [password-use-pco]]| [ allow-noauth ][ chap
preference ][ mschap preference ] [ pap preference ]}

default authentication
```

default

Sets the default authentication type for this APN. By default **allow-noauth** is the type for authentication for an APN.

msid-auth

Obsolete. Use **imsi-auth**.

imsi-auth

Default: Disabled.
Configures the APN to attempt to authenticate the subscriber based on their International Mobile Subscriber Identification (IMSI) number.

msisdn-auth

Default: Disabled.
Configures the APN to attempt to authenticate the subscriber based on their Mobile Station International Integrated Services Digital Network (MSISDN) number as described in table in *Usage* section of this command.

username-strip-apn

Default: Disabled.

This keyword if enabled , eaither with **msisdn-auth** or **imsi-auth** strips the APN name from the user name *msisdn@apn* or *imsi@apn*received from AAA and make the user name as *msisdn* or *imsi* respectively.

password-use-pco

Default: Disabled.

This keyword, if enabled, uses the password received through Protocol Configuration Options (PCO) from AAA for authentication.

allow-noauth

Default: Enabled
Configures the APN to not perform authentication for PDP contexts as described in table in *Usage* section.

chap *preference*

Default: Disabled
Configures the APN to attempt to use the Challenge Handshake Authentication Protocol (CHAP) to authenticate the subscriber as described in table in *Usage* section of this command.
A *preference* must be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on. preference must be an integer from 1 through 1000. The lower the integer, the higher the preference.

mschap *preference*

Default: Disabled
Configures the APN to attempt to use the Microsoft Challenge Handshake Authentication Protocol (MSCHAP) to authenticate the subscriber as described in table in *Usage* section of this command.
A *preference* can be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on. preference must be an integer from 1 through 1000. The lower the integer, the higher the preference.

pap *preference*

Default: Disabled
Configures the APN to attempt to use the Password Authentication Protocol (PAP) to authenticate the subscriber as described in table in *Usage* section of this command.
A *preference* must be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on. preference must be an integer from 1 through 1000. The lower the integer, the higher the preference.

Usage

Use this command to specify how the APN profile should handle PDP context authentication and what protocols to use (if any). The ability to configure this option is provided to accommodate the fact that not every MS will implement the same authentication protocols.
The authentication process varies depending on whether the PDP context is of type IP or PPP. Table given in this section describes these differences.
For IP PDP contexts, the authentication protocol and values will be passed from the SGSN as Protocol Configuration Options (PCOs) within the create PDP context PDU to the GGSN. The GGSN requires that the authentication protocol is specified by this command (with no regard to priority) and will use this information to authenticate the subscriber.

Table 6. Authentication Process Variances Between PDP Context Type

Authentication Mechanism	IP PDP Context Behavior	PPP PDP Context Behavior
allow-noauth	Allows the session even if the PCOs do not match any of the configured algorithms. If the there was no match and the **aaa constructed-nai authentication** parameter is enabled in the authentication context, the system attempts to determine a subscriber profile (via PAP with no password) using the subscriber's MSISDN as the username.	Allows the session with no authentication algorithm selected. If the **aaa constructed-nai authentication** parameter is enabled in the authentication context, the system attempts to determine a subscriber profile (via PAP with no password) using the subscriber's MSISDN as the username.

Authentication Mechanism	IP PDP Context Behavior	PPP PDP Context Behavior
chap	If also specified in the PCOs, this protocol will be used to authenticate the subscriber.	Attempts this protocol according to its configured priority. If accepted by the remote end of the PPP connection, this protocol will be used to provide authentication.
mschap	If also specified in the PCOs, this protocol will be used to authenticate the subscriber.	Attempts this protocol according to its configured priority. If accepted by the remote end of the PPP connection, this protocol will be used to provide authentication.
pap	If also specified in the PCOs, this protocol will be used to authenticate the subscriber. If this protocol is used is specified and the **allow-noauth** parameter is disabled, the system will attempt to use the APN's default username/password specified by the **outbound** command for authentication via PAP.	Attempts this protocol according to its configured priority. If accepted by the remote end of the PPP connection, this protocol will be used to provide authentication.
msid-auth	Obsolete. Use **imsi-auth**.	Obsolete. Use **imsi-auth**.
imsi-auth	Values in the PCOs are ignored. The subscriber's IMSI is used as the username for PAP authentication. No password is used.	The subscriber's IMSI is used as the username for PAP authentication. No password is used.
msisdn-auth	Values in the PCOs are ignored. The subscriber's MSISDN is used as the username for PAP authentication. No password is used.	Option not available.

Example

The following command would configure the system to attempt subscriber authentication first using MSCHAP, then CHAP, and finally PAP. Since the allow-noauth command was also issued, if all attempts to authenticate the subscriber using these protocols fail, then the subscriber would be still be allowed access.

```
authentication mschap 1 chap 2 pap 3 allow-noauth
```

To enable **imsi-auth** or **msisdn-auth**, the following command instances must be issued:

```
authentication imsi-authauthentication msisdn-auth
```

bearer-control-mode

This command enables/disables the bearer control mode for network controlled QoS (NCQoS) through this APN. It also controls the sending of IE in GTP messages.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
bearer-control-mode [ ms-only | mixed | none ]

default bearer-control-mode
```

default

Sets the bearer control mode to default mode of "none".

ms-only

Default: Disabled.
This keyword sets the bearer control mode to "MS-only" mode. In this mode bearer will be controlled by User Equipment (UE) side.

mixed

Default: Disabled.
This keyword sets the bearer control mode to "Mixed" mode. In this mode bearer will be controlled by User Equipment (UE) and network side (from GGSN) as well.
To enable network controlled QoS this option must be enabled.

none

Default: Enabled.
This keyword sets the bearer control mode to "none" mode.
With BCM mode as none, system will not send any BCM mode information, BCM IE and BCM information in protocol configuration option (PCO) IE, in GTPC messages sent by GGSN.
This command is useful in networks where AGWs/firewalls do not support unknown optional IEs in GTP message.

Usage

Use this command to enable the QoS through bearer control. This can be done either through MS side or from GGSN and MS both. To enable network requested QoS user need to enable "Mixed" mode for beaer control.
With this keyword operator can control sending of BCM information in GTPC messages from GGSN.
With MS-Only or Mixed options in this mode system sends BCM information element in every Create PDP Context Response & Unknown PDP Context Request and Response message.
It is possible in some networks that AGWs/Firewall drops/rejects GTPC message if there is an Unknown optional IE. To resolve this none option is used so operator can control sending of BCM IE and BCM information in PCO IE in GTPC messages from GGSN.

Example

The following command enables the bearer control from network and MS side for NCQoS.

```
bearer-control-mode mixed
```

cc-home

Configures the home subscriber charging characteristics (CC) used by the GGSN when those from the SGSN will not be accepted.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
cc-home behavior bits profile index
```

behavior *bits*

Specifies the behavior bit for the home subscriber charging characteristic.
bits can be configured to any unique bit from 001H to FFFH (0001 to 1111 1111 1111 bin) where the least-significant bit corresponds to B1 and the most-significant bit corresponds to B12.

profile *index*

Default: 8
Specifies the profile index for the home subscriber charging characteristic.
index can be configured to any integer value between 0 and 15.

Important: 3GPP standards suggest that profile index values of 1, 2, 4, and 8 be used for hot billing, flat rate billing, prepaid billing and normal billing, respectively. A single charging characteristics profile can contain multiple behavior settings.

Usage

When the GGSN is configured to reject the charging characteristics sent by the SGSN for "home" subscribers, it uses the profile index specified by this command to determine the appropriate CCs to use. Multiple behavior bits can be configured for a single profile index by "Or"ing the bit strings together and convert the result to hexadecimal.
The properties of the actual CC profile index are configured as part of the GGSN service using the cc profile command. Refer to the GGSN Service Configuration Mode chapter of this reference for additional information on this command.

Example

The following command configures a behavior bit of 2 (0000 0000 0010) and a profile index of 10 for home subscribers charging characteristics:

```
cc-home behavior 2 profile 10
```

The following command configures the behavior bits 3 (0000 0000 0100) and 5 (0000 0001 0000 bin) and a profile index of 14 for home subscriber charging characteristics:

```
cc-home behavior 14 profile 14
```

cc-roaming

Configures the roaming subscriber charging characteristics (CC) used by the GGSN when those from the SGSN will not be accepted.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
cc-roaming behavior bits profile index
```

behavior *bits*

Specifies the behavior bit for the roaming subscriber charging characteristic.
bits can be configured to any unique bit from 001H to FFFH (0001 to 1111 1111 1111 bin) where the least-significant bit corresponds to B1 and the most-significant bit corresponds to B12.

profile *index*

Default: 8
Specifies the profile index for the roaming subscriber charging characteristic.
index can be configured to any integer value between 0 and 15.

Important: 3GPP standards suggest that profile index values of 1, 2, 4, and 8 be used for hot billing, flat rate billing, prepaid billing and normal billing, respectively. A single charging characteristics profile can contain multiple behavior settings.

Usage

When the GGSN is configured to reject the charging characteristics sent by the SGSN for "roaming" subscribers, it uses the profile index specified by this command to determine the appropriate CCs to use. Multiple behavior bits can be configured for a single profile index by "Or"ing the bit strings together and convert the result to hexadecimal.
The properties of the actual CC profile index are configured as part of the GGSN service using the cc profile command. Refer to the GGSN Service Configuration Mode chapter of this reference for additional information on this command.

Example

The following command configures a behavior bit 10 (0010 0000 0000) and a profile index of 10 for roaming subscriber charging characteristics:

```
cc-roaming behavior 200 profile 10
```

The following command configures the behavior bits 9 (0001 0000 0000) and 6 (0000 0010 0000) and a profile index of 14 for roaming subscriber charging characteristics:

```
cc-roaming behavior 120 profile 14
```

cc-sgsn

Specifies the GGSN's source for charging characteristics (CC) - those configured locally or those received from the SGSN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
cc-sgsn { radius-returned | home-subscriber-use-GGSN | roaming-subscriber-use-GGSN | visiting-subscriber-use-GGSN } +

cc-sgsn { use-GGSN behavior bits profile index[ 0...15 ]  [ radius-returned ] }

no cc-sgsn { { radius-returned | home-subscriber-use-GGSN | roaming-subscriber-use-GGSN | visiting-subscriber-use-GGSN } + | [ use-GGSN ] [ radius-returned ] }
```

no

Causes the GGSN to accept CCs from the SGSN(s) when the **no cc-sgsn** command is entered with all applicable keywords. Otherwise, **no cc-sgsn** can be used to turn off one or more of the GGSN sources of CC.
Before entering **no cc-sgsn**, it is helpful to determine which CC sources have been configured. This can be done with either **show configuration** or **show apn name** in Exec Command Mode.

home-subscriber-use-GGSN

Configures the GGSN to use the locally defined charging characteristics for home subscribers, as configured with the APN Configuration Mode **cc-home** command.

roaming-subscriber-use-GGSN

Configures the GGSN to use the locally defined charging characteristics for roaming subscribers, as configured with the APN Configuration Mode **cc-roaming** command.

visiting-subscriber-use-GGSN

Configures the GGSN to use the locally defined charging characteristics for visiting subscribers, as configured with the APN Configuration Mode **cc-visiting** command.

radius-returned

Configures the GGSN to accept charging characteristics returned from the RADIUS server for all subscribers for the APN.

use-GGSN [behavior *bits* **] profile** *index[0...15]*

Configures the GGSN to accept charging characteristics for all subscribers in the APN.

bits specifies the behavior bit for the charging characteristic. This variable can be configured to any unique bit from 001H to FFFH (0001 to 1111 1111 1111 bin) where the least-significant bit corresponds to B1 and the most-significant bit corresponds to B12.
index indicates which profile defined with **cc profile**, in GGSN Service Configuration mode, GGSN uses as a source for CCs. The index can be configured to any integer value from 0 to 15.
use-GGSN keyword can be entered alone or in conjunction with the **radius-returned** keyword. When entered, this keyword, overrides previous configuration using any of the home, roaming, and/or visiting keywords.

+

More than one of the above keywords can be entered within a single command.

Usage

This command specifies whether or not CCs received from the SGSN will be accepted. If they are not accepted, the GGSN will use those that have been configured locally.
The GGSN's behavior can be configured for the following subscriber types:

- **Home:** Subscribers belonging to the same Public Land Mobile Network (PLMN) as the one on which the GGSN is located.
- **Roaming:** Subscribers that are serviced by a an SGSN belonging to a different PLMN than the one on which the GGSN is located.
- **Visiting:** Subscribers belonging to a different PLMN than the one on which the GGSN is located.
- Any subscriber in the APN.

Example

The following command instructs the GGSN to accept CCs for any subscriber in the APN based on local profile configurations of CCs.

```
cc-sgsn use-GGSN profile x
```

Assuming the CC source as defined with the previous command, the following command instructs the GGSN to accept CCs supplied by the SGSN(s) and disables the acceptance of CCs supplied by the GGSN for any subscriber within the APN:

```
no cc-sgsn use-GGSN
```

The following command instructs the GGSN to accept CCs for any subscriber in the APN based on CC information returned from the RADIUS server. This command can be issued after the previous command to expand the possible sources.

```
cc-sgsn radius-returned
```

The following command disables the acceptance of CCs supplied by the GGSN for visiting and roaming subscribers:

```
no cc-sgsn roaming-subscriber-use-GGSN visiting-subscriber-use-GGSN
```

cc-visiting

Configures the visiting subscriber charging characteristics (CC) used by the GGSN when those from the SGSN will not be accepted.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
cc-visiting behavior bits profile index
```

behavior *bits*

Specifies the behavior bit for the visiting subscriber charging characteristic.
bits can be configured to any unique bit from 001H to FFFH (0001 to 1111 1111 1111 bin) where the least-significant bit corresponds to B1 and the most-significant bit corresponds to B12.

profile *index*

Default: 8
Specifies the profile index for the visiting subscriber charging characteristic.
index can be configured to any integer value between 0 and 15.

Important: 3GPP standards suggest that profile index values of 1, 2, 4, and 8 be used for hot billing, flat rate billing, prepaid billing and normal billing, respectively. A single charging characteristics profile can contain multiple behavior settings.

Usage

When the GGSN is configured to reject the charging characteristics sent by the SGSN for "visiting" subscribers, it uses the profile index specified by this command to determine the appropriate CCs to use. Multiple behavior bits can be configured for a single profile index by "Or"ing the bit strings together and convert the result to hexadecimal.
The properties of the actual CC profile index are configured as part of the GGSN service using the cc profile command. Refer to the GGSN Service Configuration Mode chapter of this reference for additional information on this command.

Example

The following command configures a behavior bit 7 (0000 0100 0000) and a profile index of 10 for visiting subscriber charging characteristics:

```
cc-visiting behavior 40 profile 10
```

The following command configures the behavior bits 1 (0000 0000 0001) and 12 (1000 0000 0000) and a profile index of 14 for visiting subscriber charging characteristics:

```
cc-visiting behavior 801 profile 14
```

content-filtering category

This command enables/disables the specified pre-configured Category Policy Identifier for Category-based Content Filtering support.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
content-filtering category policy-id cf_policy_id

no content-filtering category policy-id
```

no

Disables the previously configured category policy identifier for Content Filtering support to the APN. This is the default setting.

category policy-id *cf_policy_id*

This command applies the specified content filtering category policy ID, configured in Active Charging Configuration mode, to this APN.
cf_policy_id must be a preconfigured category policy ID in Active Charging Configuration Mode.
In case category policy identifier *cf_policy_id* used here is not configured in Active Charging Configuration Mode, all packets will be passed regardless of the categories determined for such packets.

Important: Category Policy Id configured through this mode overrides the Category Policy id configured through **content-filtering category policy-id** command in Rulebase Configuration Mode of Active Charging Service Configuration mode.

Usage

Use this command to enter the Content Filtering Policy Configuration mode and to enable or disable the Content Filtering Category Policy ID for an APN.

Important: If Content Filtering Category Policy ID is not specified here the similar command in ACS Rulebase Configuration Mode determines the policy.

Up to 64 different policy identifier can be defined in a Content Filtering support service.

Example

Following command enters the Content filtering Policy Configuration mode and enables the Category Policy Id *101* for Content Filtering support:

```
content-filtering category policy-id 101
```

credit-control-group

This command configures the Credit Control Group to be used for subscribers who use this APN.

Product

GGSN, ECS, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
credit-control-group cc_group_name

no credit-control-group
```

no

Removes the previously configured Credit Control Group from the APN configuration.

cc_group_name

Specifies the Credit Control Group name.
cc_group_name must be a alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to configure the Credit Control Group for this APN.
Creating different credit control groups enables applying different credit control configurations (DCCA dictionary, failure-handling, session-failover, Diameter endpoint selection, etc.) to different subscribers on the same system.
Without credit control groups, only one credit control configuration is possible on a system. All the subscribers in the system will have to use the same configuration.

Example

The following command configures a Credit Control Group named *testgroup12* to the current APN:

credit-control-group *testgroup12*

data-tunneling ignore df-bit

Controls the handling of the DF (Don't Fragment) bit present in the user IPv4/IPv6 packet for tunneling used for the Mobile IP data path.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
data-tunneling ignore df-bit

no data-tunneling ignore df-bit
```

no

Disables this option. The DF bit in the tunneled IP packet header is not ignored during tunneling. This is the default setting.

Usage

Use this command to configure a user so that during Mobile IP tunneling the DF bit is ignored and packets are fragmented.
If this feature is enabled, and fragmentation is required for the tunneled user IPv4/IPv6 packet, then the DF bit is ignored and the packet is fragmented. Also the DF bit is not copied to the outer header.
In the GGSN, this command also affects the other L3 tunneling options, IP-in-IP and GRE, but does not affect L2TP tunneling.

Example

To enable fragmentation of a subscribers packets over a MIP tunnel even when the DF bit is present, enter the following command:

```
data-tunneling ignore df-bit
```

data-tunnel mtu

Configures the Maximum Transmission Unit (MTU) for data sent on the IPv6 tunnel between the P-GW and the mobile node.

Product

P-GW

Privilege

Administrator

Syntax

```
data-tunnel mtu bytes
default data-tunnel mtu
```

default

Returns the command to the default value of 1500.

mtu*bytes*

Default: 1500
Specifies the MTU for the IPv6 tunnel between the P-GW and the mobile node. *bytes* must be an integer between 1280 and 2000.

Usage

Use this command to set the MTU for data traffic on the IPv6 tunnel between the P-GW and the mobile node.

Example

The following command sets the MTU for IPv6 data traffic to *1400* bytes:

```
data-tunnel mtu1400
```

dcca origin endpoint

DescriptionThis command is obsolete. To configure the Diameter Credit Control Origin Endpoint, in the Credit Control Configuration mode, use the **`diameter origin endpoint`** command.

dcca peer-select

Specifies the Diameter credit control primary and secondary host for credit control.

Product

GGSN, ECS, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
dcca peer-select peer host_name [ realm realm_name ] [ secondary-peer host_name
[ realm realm_name ] ]

no dcca peer-select
```

no

Removes the previously configured Diameter credit control peer selection.

peer *host_name*

A unique name that you specify for the peer.
peer_name must be an alpha and/or numeric string of from 1 through 127 characters. *peer_name* allows punctuation marks.

secondary-peer *host_name*

Specifies a back-up host that is used for fail-over processing. When the route-table does not find an AVAILABLE route the secondary host performs a fail-over processing.

realm *realm_name*

The *realm_name* must be an alpha and/or numeric string of from 1 to 127 characters. The realm may typically be a company or service name. *realm_name* allows punctuation marks.

Usage

Use this command to select a Diameter credit control peer and realm.

WARNING: This configuration completely overrides all instances of **diameter peer-select** that have been configured within the Credit Control Configuration Mode for an Active Charging service.

Example

The following command selects a Diameter credit control peer named test and a realm of *companyx*:

dcca peer-select test realm *companyx*

default

Sets/restores the default value assigned for the specified parameter.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
default { access-link ip-fragmentation | accounting-mode | authentication | cc-
home | cc-roaming | cc-sgsn | cc-visiting | data-tunneling ignore df-bit | dhcp
lease-expiration-policy | idle-timeout-activity (take condition off entry below
when this clears too) | ip { address { allocation-method } | header-compression
| multicast discard | qos-dscp | source-violation } | l3-to-l2-tunnel |
loadbalance-tunnel-peers | long-duration-action | max-contexts | mobile ip {
home-agent | mn-aaa-removal-indication | required | reverse-tunnel } | pdp-type
| ppp { data-compression { mode | protocols } | keepalive | min-compression-size
| mtu } | proxy-mip {required | null-username static-homeaddr} | selection-mode
| sgsn payload-compression| timeout [ absolute | idle | long-duration | qos-
renegotiate ] | tunnel load-balance }
```

`access-link ip-fragmentation`

Restores the APN access-link parameter to its default setting of normal.

`accounting-mode`

Restores the APN accounting-mode parameter to its default setting of gtpp.

`authentication`

Restores the APN authentication parameter to its default setting of allow-noauth.

`cc-home`

Restores the cc-home parameter to its default setting of the following:

- **behavior bits:** 0x00
- **profile index:** 8

`cc-roaming`

Restores the cc-roaming parameter to its default setting of the following:

- **behavior bits:** 0x00
- **profile index:** 8

`cc-sgsn`

Restores the cc-sgsn parameter to its default setting of the following:

- **home-subscriber-use-GGSN :** Disabled
- **roaming-subscriber-use-GGSN :** Disabled

- **visiting-subscriber-use-GGSN :** Disabled

cc-visiting

Restores the cc-visiting parameter to its default setting of the following:

- **behavior bits:** 0x00
- **profile index:** 8

data-tunneling ignore df-bit

Restores the data-tunneling parameter to its default setting of disabled.

dhcp lease-expiration-policy

Restores the dhcp lease-expiration-policy parameter to its default setting of auto-renew.

idle-timeout-activity

Sets or restores the session idle-timeout default so it is reset with both uplink and downlink packets.

ip { address { allocation-method } | header-compression | multicast discard | qos-dscp | source-violation }

Restores the APN ip parameters to the following default settings:

- **address allocation-method:** local and allow-user-specified enabled
- **header-compression:** Disabled
- **multicast discard:** configures the default multicast settings which is to discard PDUs
- **qos-dscp:** conversational ef streaming af11 interactive af21 background be
- **source-violation:** check enabled, drop-limit 10

l3-to-l2-tunnel

Restores the layer 3-to-layer 2 tunnel address policy parameter to its default setting of validation with no allocation.

loadbalance-tunnel-peers

Restores the loadbalance-tunnel-peers parameter to its default setting of random.

long-duration-action

Restores the long-duration-action parameter to its default setting of detection.

max-contexts

Restores the max-contexts parameter to its default settings of:

- **primary:** 1000000
- **total:** 1000000

mobile ip { home-agent | mn-aaa-removal-indication | required | reverse-tunnel }

Restores the APN mobile-ip parameters to the following default settings:

- **home-agent :** No HA address defined

- **mn-aaa-removal-indication :** Disabled
- **required :** Disabled
- **reverse-tunnel :** Enabled

`npu qos traffic priority`

Restores the APN NPU QoS parameter to its default setting of Derive from packet DSCP.

`pdp-type`

Restores the APN pdp-type parameter to its default setting of ipv4.

`ppp { data-compression { mode | protocols } | keepalive | min-compression-size | mtu }`

Restores the APN ppp parameters to the following default settings:

- **data-compression mode:** normal
- **data-compression protocols:** stac, mppc, deflate
- **keepalive:** 0
- **min-compression-size:** 128
- **mtu:** 1500

`proxy-mip {required | null-username static-homeaddr}`

Restores the APN proxy-mip required parameter to its default setting of Disabled.

- **`required:`** Configures handling of RRQ to enable the acceptance without NAI extension in this APN. Default: Disabled.
- **`null-username static-homeaddr:`** Configures handling of RRQ to enable the acceptance without NAI extension in this APN. Default: Disabled.

`qos-renegotiate`

This keyword is obsolete.

`selection-mode`

Restores the APN selection-mode parameter to its default setting of subscribed.

`sgsn payload-compression`

Configures payload compression by SGSN for this APN.

`timeout [ absolute | idle | long-duration | qos-renegotiate]`

Restores the APN timeout parameters to the following default settings:

- **absolute :** 0
- **idle :** 0
- **load-balance :** 0
- **qos-renegotiate** : 180 - This keyword is obsolete.

This is the timeout value for the dampening timer during the dynamic QoS renegotiation.

Usage

After system parameters have been modified, this command is used to set/restore specific parameters to their default values.

Example

The following command restores the ppp min-compression-size parameter to its default setting of 128:

```
default ppp min-compression-size
```

dhcp context-name

Configures the name of the context on the system in which Dynamic Host Control Protocol (DHCP) functionality is configured.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
dhcp context-name name
```

```
no dhcp context-name name
```

no

Removes a previously configured context name.

name

The name of a context configured on the system in which one or more DHCP services are configured. It can be from 1 to 79 alpha and/or numeric characters in length and is case sensitive.

Usage

If the APN is to support dynamic address assignment via DHCP (either the proxy or relay mode), this parameter must be configured to point the APN to the name of a pre-configured context on the chassis in which one or more DHCP services are configured.
The command can be used to identify a single DHCP service instance within the specified context to use to facilitate the address assignment.

Example

The following command configures the APN to look for DHCP services in a context called *dhcp-ctx:*

dhcp context-name *dhcp-ctx*

dhcp lease-expiration-policy

Configures the system's handling of PDP contexts whose DHCP assigned IP lease has expired.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
dhcp lease-expiration-policy { auto-renew | disconnect }
```

auto-renew

Default: Enabled
Configures the system to automatically renew an IP address' lease when it is about to expire for PDP contexts facilitated by the APN.

disconnect

Default: Disabled
Configures the system to automatically release the PDP context when the lease for the IP address associated with that context expires.

Usage

Use this command to specify the action the system is to take when leases for IP addresses for PDP contexts that it are currently facilitated by the current APN are about to expire.

Example

The following command causes the system to release PDP contexts associated with the current APN when the lease for their DHCP-assigned IP address expires:

```
dhcp lease-expiration-policy disconnect
```

dhcp service-name

Configures the name of a specific DHCP service to use when dynamically assigning IP addresses to PDP contexts using the the Dynamic Host Control Protocol.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
dhcp service-name svc_name

no dhcp service-name svc_name
```

no

Removes a previously configured DHCP service name.

svc_name

Configures the name of the DHCP service instance that is to be used by the current APN for the dynamic assignment of IP addresses to PDP contexts.
The name can be from 1 to 63 alpha and/or numeric characters in length and it case sensitive.

Usage

Use this command to specify a pre-configured DHCP service instance that is to be used by the APN for IP address assignment when the Dynamic Host Control Protocol is used.
The name of the context in which the desired DHCP service is configured must be specified by the parameter.

Example

The following command instructs the APN to use a DHCP service called *dhcp1*:

```
dhcp service-name dhcp1
```

dns

Configures the Domain Name Service (DNS) servers that will be used by the APN for PPP.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
dns { primary | secondary } { address }
```

```
no dns { primary | secondary } [ dns_address ]
```

no

Deletes a previously configured DNS server.

primary

Configures the primary DNS server for the APN.

secondary

Configures the secondary DNS server for the APN. Only one secondary DNS server can be configured.

address

Default: primary = 0.0.0.0, secondary = 0.0.0.0
Configures the IP address of the DNS server. *address* must be expressed in dotted decimal notation.

dns_address

Specifies the IP address of the DNS server to remove. *dns_address* must be expressed in dotted decimal notation.

Usage

DNS servers are configured on a per-APN profile basis. This allows each APN profile to use specific servers in processing PDP contexts.
The configured DNS IP addresses are relayed to the subscriber within IPCP if the PDP type is PPP, or as PCOs (Protocol Configuration Options) if the PDP type is IP.
The DNS can be specified at the APN level in APN configuration as well as at the Context level in Context configuration mode with **ip name-servers** command, or it can be received from AAA server.
When DNS is requested in PCO configuration, the following preference will be followed for DNS value:
1. DNS Values received from LNS have the first preference.
2. DNS values received from RADIUS Server has the second preference.
3. DNS values locally configured with APN has the third preference.
4. DNS values configured at context level with **ip name-servers** command has the last preference.

Important: The same preference would be applicable for the NBNS servers to be negotiated via ICPC with the LNS.

Example

The following commands configure a primary DNS server address of 192.168.100.3 and a secondary DNS server address of 192.168.100.4:

```
dns primary 192.168.100.3
dns secondary 192.168.100.4
```

ehrpd-access

Configures the P-GW to exclude IPv6 traffic from being delivered to UEs, accessing PDNs from the eHRPD network, that do not have IPv6 capabilities.

Product

P-GW

Privilege

Administrator

Syntax

```
[ default | no ] ehrpd-access drop-ipv6-traffic
```

[default | no]

Resets this command to its default setting of disabled.

Usage

Use this command to exclude IPv6 traffic from being delivered to UEs on the eHRPD network that do not have IPv6 capabilities.

end

Exits the APN configuration mode and returns to the Administrator-Exec mode prompt.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Administrator-Exec mode.

exit

Exits the APN configuration mode and returns to the context configuration mode.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Returns to the context configuration mode.

firewall policy

This command enables/disables Stateful Firewall support for the APN.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
firewall policy firewall-required

{ default | no } firewall policy
```

no

Disables Stateful Firewall support for this APN.

default

Configures the default setting for Stateful Firewall support.
Default: Disabled

firewall-required

Enables Stateful Firewall support for this APN.

Usage

Use this command to enable or disable Stateful Firewall support for this APN.

Important: This command is only available in StarOS 8.0. In StarOS 8.1 and later, this configuration is available in the Rulebase Configuration Mode.

Important: Unless Stateful Firewall support for this APN is enabled using this command, firewall processing for this APN is disabled.

Important: If firewall is enabled, and the rulebase has no firewall configuration, Stateful Firewall will cause all packets to be discarded.

Example

The following command enables Stateful Firewall support for this APN:

```
firewall policy firewall-required
```

The following command disables Stateful Firewall support for this APN:

```
no firewall policy
```

fw-and-nat policy

This command configures the Firewall-and-NAT policy to be used for subscribers who use this APN.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

```
fw-and-nat policy fw_nat_policy

{ default | no } fw-and-nat policy
```

default

Specifies that the default Firewall-and-NAT policy configured in the rulebase be used for subscribers who use this APN.

no

Disables Firewall and NAT for the APN.

fw_nat_policy

Specifies the Firewall-and-NAT policy for the APN.
fw_nat_policy must be an alpha and/or numeric string of 1 through 63 characters in length. Note that this policy will override the **default Firewall-and-NAT policy** configured in the ACS rulebase.

Usage

Use this command to configure the Firewall-and-NAT policy for the APN. Note that the policy configured in the subscriber mode will override the default policy configured in the ACS rulebase. If a policy is not configured in the subscriber mode, the default policy configured in the ACS rulebase will be used.

Important: This command is customer-specific and is only available in StarOS 8.1.

Important: This command must be used to configure the Policy-based Firewall-and-NAT feature.

Example

The following command configures a Firewall-and-NAT policy named *standard* for the APN:

```
fw-and-nat policy standard
```

gsm-qos negotiate

Enables negotiation of QoS attribute Reliability Class based on the configuration provided for Service Data Unit (SDU) Error Ratio and Residual Bit Error Ratio (BER) attributes in the APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
gsm-qos negotiate sdu-error-ratio sdu-error-ratio-code [residual-ber residual-ber-code]

[no] gsm-qos negotiate sdu-error-ratio [sdu-error-ratio-code [residual-ber residual-ber-code]]
```

no

Disables the configuration for negotiation of QoS attribute reliability class.

sdu-error-ratio *sdu-error-ratio-code*

Enables the negotiation of QoS attribute reliability class based on Service Data Unit (SDU) Error Ratio attributes.
sdu-error-ratio-code corresponds to distinct SDU Error ratio values in integer between the range of 1 to 7.

residual-ber *residual-ber-code*

Enables the optional configuration of negotiation of QoS attribute reliability class based on Residual Bit Error Ratio (BER) attributes.
residual-ber-code corresponds to distinct Residual Bit Error Ratio values in integer between the range of 1 to 9.

Usage

This command configures the QoS attribute Reliability Class to be negotiated based on the configuration provided for SDU Error Ratio and Residual BER attributes. The derived Reliability Class and the configured values for SDU Error Ratio and Residual BER are sent back in CPC and UPC response.
The mapping for *sdu-error-ratio-code* is as follows:

Code	Value
1	10-2
2	7*10-3
3	10-3
4	10-4
5	10-5

Code	Value
6	10-6
7	10-1

Residual BER needs to be specified when SDU Error Ratio is set to codes 1, 2, 3 or 7 (Or, SDU Error Ratio is intended to be set to a value greater than 5*10-4), for determining the Reliability Class QoS attribute. Otherwise, the Residual BER value received in the Create PDP context request QoS (or UPC request) would be used. The mapping for *residual-ber-code* is as follows:

Code	Value
1	5*10-2
2	10-2
3	5*10-3
4	4*10-3
5	10-3
6	10-4
7	10-5
8	10-6
9	6*10-8

Example

The following commands configures the negotiation of QoS attribute Reliability Class based on Service Data Unit (SDU) Error Ratio *3* attributes in the APN:

```
gsm-qos negotiate sdu-error-ratio 3
```

gtpp group

This command enables a configured GTPP server group to an APN for CGF accounting functionality.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
gtpp group group_name [ accounting-context ac_context_name ]

[ no | default ] gtpp group group_name
```

no

Disables the applied GTPP group for specific APN.

default

Sets / Restores default GTPP server group specified at the context level or in APN template.

group_name

Specifies the name of server group that is used for authentication/accounting for specific APN.
group_name must be a string of size 1 to 63 character. It must be the same as configured earlier within the same context of APN.

accounting-context *ac_context_name*

Specifies the name of an accounting context on the system that processes accounting for PDP contexts handled by this GGSN service for accounting to specific APN.
ac_context_name specifies the name of the context to be used for accounting. The name must be between 1 and 79 alpha and/or numeric characters and is case sensitive.
Note that if accounting context is not specified here, it uses the GGSN service context or the context configured by the **accounting context** CLI command in GGSN Service Configuration Mode.

Usage

This feature provides the GTPP server configurables under GTPP group node. Instead of having a single list of servers per context, this feature configures multiple server groups within a context and applies individual GTPP server group for subscriber in that context. Each server group consists of a list of CGF accounting servers.
In case no GTPP group is applied for the said APN or default APN template, then the default GTPP server group available at context level is applicable for accounting of specific APN.

Example

The following command applies a previously configured GTPP server group named *star1* to an APN within the specific context:

```
gtpp group star1
```

The following command disables the applied GTPP server group for the specific APN:

```
no gtpp group star1
```

gtpp secondary-group

This command enables/associates a preconfigured secondary GTPP server group to an APN for CGF accounting functionality. By default it is disabled.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
gtpp secondary-group group_name [accounting-context actt_ctxt_name]

[no | default] gtpp secondary-group group_name
```

no

Disables the configured/associated GTPP secondary group for specific APN.

default

Default: Enabled
Restores the default mode for secondary GTPP group for APN template.

group_name

Specifies the name of secondary GTPP server group that is used as an alternate for primary GTPP group associated with specific APN for storage of GTPP messages.
group_name must be a string of size 1 to 63 character. It must be the same as configured earlier within the same context of APN.

accounting-context *actt_ctxt_name*

Specifies the name of an accounting context on the system that processes accounting for PDP contexts handled by this GGSN service for accounting to specific APN.
ac_context_name specifies the name of the context to be used for accounting. The name must be between 1 and 79 alpha and/or numeric characters and is case sensitive.
Note that if accounting context is not specified here, it uses the GGSN service context or the context configured by the **accounting context** CLI command in GGSN Service Configuration Mode .

Usage

Use this feature to provide the secondary GTPP server group support for an APN.
When the secondary GTPP group is configured with this command, the GTPP messages will be duplicated to the secondary servers also.
This secondary group configuration is ignored, if configured *group_name* is same as the primary group. It will also be ignored, if the configured GTPP group *group_name* and/or accounting context *ac_context_name* is invalid. In such a case, the call will be established successfully unlike the primary group configuration where the call drops.
In the absence of the configured *ac_context_name* context; by default the GGSN service context is chosen.

The secondary group messages are the low priority ones, and thus they are preferred to be purged when there is no room for the new messages.
For more information on GTPP group, refer **gtpp group** command in this guide.

Example
The following command applies a previously configured GTPP server group named *star2* to as secondary GTPP group to an APN within the specific context:

```
gtpp secondary-group star2
```

The following command disables the applied secondary GTPP server group for the specific APN:

```
no gtpp secondary-group star2
```

idle-timeout-activity ignore-downlink

Configures a session idle-timeout to be reset with uplink packets only, or with both uplink and downlink packets.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[no] idle-timeout-activity ignore-downlink

default idle-timeout-activity
```

no

This is the default setting. When set, the downlink traffic is also considered to be an idle timeout activity.

default

Sets or restores the command to the default setting.

Usage

If **idle-timeout-activity ignore-downlink** is configured, the downlink traffic will not be used to reset the idle-timeout. Only uplink packets will be able to reset the idle-timeout.
By default, **ignore-downlink** is negated by the **no** command so downlink traffic is also used to reset the idle-timeout.

Example

The following command causes both uplink and downlink traffic to reset a session idle-timeout:

```
default idle-timeout-activity
```

The following command causes the session idle-timeout to be reset with only uplink packets:

```
idle-timeout-activity ignore-downlink
```

ims-auth-service

It applies an IMS authorization service to a subscriber through APN for Gx interface support and functionality.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
ims-auth-service auth_svc_name

[ no | default ] ims-auth-service auth_svc_name
```

no

Disables the applied IMS authorization service for specific APN.

default

Sets / Restores default state of IMS authorization service, disabled or as specified at the context level or in APN template.

auth_svc_name

Specifies the name of IMS authorization service name that is used for Gx interface authentication for specific APN.
auth_svc_name must be a string of size 1 to 63 character preconfigured with in the same context of this APN.

Usage

This feature provides the IMS authorization service configuration for Gx interface in IMS service node.

Example

Following command applies a previously configured IMS authorization service named *gx_interface1* to an APN within the specific context:

```
ims-auth-service gx_interface1
```

Following command disables the applied IMS authorization service *gx_interface1* for the specific APN:

```
no ims-auth-service gx_interface1
```

ip access-group

Configures IPv4/IPv6 access group for the current APN profile.

Product

GGSN, ECS, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[no] ip access-group acl_group_name [in | out]
```

no

Removes a previously configured IPv4/IPv6 access group association.

acl_group_name

Specifies the name of the IPv4/IPv6 access group. *acl_group_name* is a configured ACL group and must be an alpha and/or numeric string of 1 to 79 characters.

in | out

Default: both (in and out)
Specifies the access-group as either inbound or outbound by the keywords **in** and **out**, respectively.

Usage

Use this command to apply a Single IPv4/IPv6 access control list to multiple subscribers via this APN for inbound or outbound IPv4/IPv6 traffic.
If no traffic direction specified the selected access control list will be applied to both direction of traffic.

Example

The following command associates the *sampleipv4Group* access group with the current APN profile for both inbound and outbound access.

```
ip access-group sampleipv4Group
```

The following removes the outbound access group flag for *sampleipv4Group*.

```
no ip access-group sampleipv4Group out
```

ip address alloc-method

Configures the method by which this APN will obtain IP addresses for PDP contexts.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
ip address allocation-method { dhcp-proxy [ prefer-dhcp-options ] | dhcp-relay |
local | no-dynamic } [ allow-user-specified ]
```

dhcp-proxy

Default: Disabled
Configures the APN to assign an IP address received from a DHCP server.

Important: If this option is used, the system's DHCP parameters must be configured.

dhcp-relay

Default: Disabled
Configures the APN to forward DHCP packets received from the MS to a DHCP server.

Important: If this option is used, the system's DHCP parameters must be configured.

local

Default: Enabled
Configures the APN to allocate IP addresses from a pool configured in the destination context on the system.

Important: If this option is used, the name of the IP address pool from which to allocate addresses must be configured using the **ip address pool-name** command. If no pool name is specified, the system will attempt to allocate an address from any public pool configured in the destination context.

no-dynamic

Default: Disabled
Disables the dynamic assignment of IP addresses to PDP contexts using this APN.
If a PDP context needing an IP address is received by an APN with this option enabled, it will be rejected with a cause code of 220 (Unknown PDP address or PDP type).

prefer-dhcp-options

Default: Disabled

This keyword, when specified with **dhcp-proxy** for IP address allocation configuration, GGSN will prefer DHCP supplied parameters over values provided by AAA server or by local configuration. This keyword controls following parameters:

- primary and secondary Domain Name Server (DNS) address
- primary and secondary NetBIOS Name Server (NBNS) address

These values will be sent out in PCO IE of GTP Create PDP Response Message whenever MS Requests for them in Create PDP Request Message.

Important: This keyword is available only with dhcp-proxy ip allocation method as this functionality is implemented only for GGSN acting as DHCP proxy.

By default, this functionality is disabled. Hence, DNS and NBNS values, if received from DHCP server will not be considered by the GGSN.

allow-user-specified

Default: Enabled
Enables support for PDP contexts requesting the use of specific (static) addresses.

Important: If this option is not enabled, PDP contexts requesting the use of a static address will be rejected with a cause code of 220 (Unknown PDP address or PDP type).

Usage

Use this command to configure the method by which the APN profile will assign IP addresses to PDP contexts.
When the PDP context is being established and the APN name is determined, the system will examine the APN's configuration profile. Part of that procedure is determining how to handle IP address allocation. Figure in Example section displays the process used by the system to determine how the address should be allocated.

Example

The following command configures the APN to dynamically assign an address from a DHCP server and reject PDP sessions with static IP addresses:

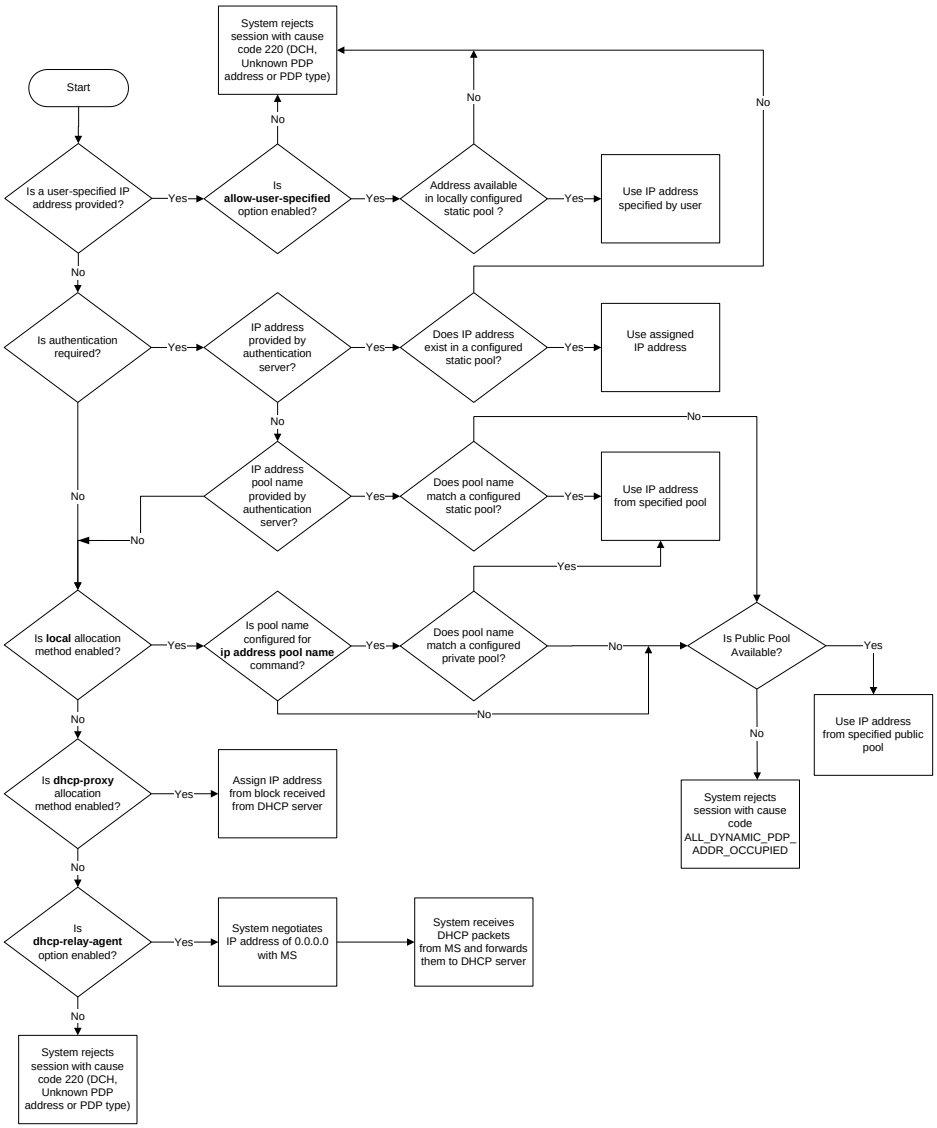
```
ip address alloc-method dhcp-proxy
```

The following command configures the APN to reject sessions requesting dynamically assigned addresses and only allow those with static addresses:

```
ip address alloc-method no-dynamic allow-user-specified
```

The following figure provides the IP address allocation process:

Figure 4. IP Address Allocation Process



ip address pool

Configures the name of a a private IP address pool configured on the system from which to assign an address for a PDP context.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
ip address pool name pool_name
no ip address pool name pool_name
```

no

Removes a previously configured pool name.

name *pool_name*

Specifies the name of the private pool configured on the system from which an IP address will be assigned. The name can be from 1 to 31 alpha and/or numeric characters and is case sensitive.

Usage

If the **ip address alloc-method** command is configured to allow the assignment of IP addresses from a local pool configured on the system, this command instructs the system as to which pool should be used.
The pool specified by this command must be a private pool configured in the destination context on the system. Please refer to the ip pool command in the context configuration mode for information on configuring IP address pools.
Multiple APNs can use the same IP address pool if required. In addition, this command could be issued multiple times to allow a single APN to use different address pools.

Example

The following command configures the system to use a pool named private_pool1 for address allocation:

```
ip address pool private_pool1
```

ip context-name

Configures the name of the destination context to use for subscribers accessing this APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
ip context-name name
no ip context-name name
```

no

Removes a previously configured context name.

name

Specifies the name of the context through which subscriber data traffic will be routed. *name* must be from 1 to 79 alpha and/or numeric characters.

Usage

Use this command to specify the name of a destination context configured on the system through which to route all subscriber data traffic. This context will be used for subscribers accessing this APN. If no name is specified, the system will use the context in which the APN is configured as the destination context.
When the APN is used to support Mobile IP functionality, this command is used to indicate the context in which the FA service is configured. If no name is specified, the context in which the GGSN service facilitating the subscriber PDP context is used.

Example

The following command configures the system to route subscriber traffic for the APN through a context called isp1:

```
ip context-name isp1
```

ip header-compression

Configures IP packet header compression parameters for this APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
ip header-compression vj

no ip header-compression
```

no

Disables Van-Jacobson header compression.

vj

Default: Enabled
Enables Van-Jacobson header compression for IP packets.

Usage

IP header compression reduces packet header overhead resulting in more efficient utilization of available bandwidth.

Example

The following command disables packet header compression for the APN:

```
no ip header-compression
```

ip hide-service-address

This command is configured on a per-APN basis. It renders the IP address of the GGSN unreachable from MS's using this APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] ip hide-service-address
```

no

Allows the mobile station to reach the GGSN's IP address using this APN.

default

Does not allow the mobile station to reach the GGSN's IP address using this APN.

Usage

This hides the GGSN's IP address from the mobile station for security purposes.

Example

The following command allows the GGSN's IP address to be viewed by the mobile station:

```
no ip hide-service-address
```

ip local-address

Configures the local-side IP address of the subscriber's point-to-point connection.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
ip local-address ip_address
```

```
no ip local-address
```

no

Removes a previously configured IP local-address.

ip_address

Specifies an IP address configured in a destination context on the system through which a packet data network can be accessed.
ip_address must be expressed in dotted-decimal notation.

Usage

This parameter specifies the IP address on the system that the MS uses as the remote-end of the PPP connection. If no local address is configured, the system uses an unnumbered scheme for local-side addresses.

Example

The following command configures a local address of 192.168.1.23 for the MS:

```
ip local-address 192.168.1.23
```

ip multicast discard

Configures the IP multicast discard packet behavior.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[no] ip multicast discard
```

no

Removes a previously configured IP multicast discard.

Usage

This command specifies if IP multicast discard is enabled or disabled.

Example

The following command enables IP multicast discard for an APN:

```
ip multicast discard
```

ip qos-dscp

Configures the quality of service (QOS) differentiated service code point (DSCP) used when sending data packets over the Gi interface.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
ip qos-dscp { { allocation-retention-priority | background | conversational |
interactive traffic_priority | streaming } { dscp}} +

no ip qos-dscp { allocation-retention-priority | background | conversational |
interactive | streaming } +
```

no

Restores the QoS parameter to its default setting.

allocation-retention-priority

Specifies the DSCP for interactive class if the allocation priority is present in the QOS profile.
allocation-retention-priority can be the integers 1, 2, or 3.
DSCP values use the following matrix to map based on traffic handling priority and Alloc/Retention priority if the allocation priority is present in the QOS profile.
Following table shows the DSCP value matrix for *allocation-retention-priority*.

Table 7. Default DSCP Value Matrix

Allocation Priority	1	2	3
Traffic Handling Priority			
1	ef	ef	ef
2	af21	af21	af21
3	af21	af21	af21

Important: If you only configure DCSP marking for interactive traffic classes without specifying ARP, it may not properly take effect. The CLI allows this scenario for backward compatibility however, it is recommended that you configure all three values.

background

Specifies the QOS for traffic patterns in which the data transfer is not time-critical (for example email exchange). This traffic pattern should be the lowest QOS.

conversational

Specifies the QOS for traffic patterns in which there is an constant flow of packets in each direction, upstream and downstream. This traffic pattern should be the highest QOS.

interactive *traffic_priority*

Specifies the QOS for traffic patterns in which there is an intermittent flow of packets in each direction, upstream and downstream. This traffic pattern should be a higher QOS than the background pattern, but not as high as that for the streaming pattern.
traffic_priority is the 3GPP traffic handling priority and can be the integers 1,2 or 3.

streaming

Specifies the QOS for traffic patterns in which there is a constant flow of data in one direction, either upstream or downstream. This traffic pattern should be a higher QOS than the interactive pattern, but not as high as that for the conversational pattern.

dscp

Specifies the DSCP for the specified traffic pattern. *dscp* can be configured to any one of the following:

• **af11:** Assured Forwarding 11 per-hop-behavior (PHB)	• **af33:** Assured Forwarding 33 PHB
• **af12:** Assured Forwarding 12 PHB	• **af41:** Assured Forwarding 41 PHB
• **af13:** Assured Forwarding 13 PHB	• **af42:** Assured Forwarding 42 PHB
• **af21:** Assured Forwarding 21 PHB	• **af43:** Assured Forwarding 43 PHB
• **af22:** Assured Forwarding 22 PHB	• **be:** Best effort forwarding PHB
• **af23:** Assured Forwarding 23 PHB	• **ef:** Expedited forwarding PHB
• **af31:** Assured Forwarding 31 PHB	• **pt:** Pass through (ToS of user packet is not modified)
• **af32:** Assured Forwarding 32 PHB	

Default:

- background : be
- interactive
- Traffic Priority 1: ef
- Traffic Priority 1: af21
- Traffic Priority 1: af21
- streaming : af11
- conversational : ef

+

More than one of the above keywords can be entered within a single command.

Usage

DSCP levels can be assigned to specific traffic patterns in order to ensure that data packets are delivered according to the precedence with which they're tagged. The diffserv markings are applied to the IP header of every subscriber data packet transmitted over the Gi interface(s).

The four traffic patterns have the following order of precedence: background (lowest), interactive, streaming, and conversational (highest). Data packets falling under the category of each of the traffic patterns are tagged with a DSCP that further indicate their precedence as shown in following tables respectively:

Table 8. Class structure for assured forwarding (af) levels

Drop Precedence	Class			
	Class 1	Class 2	Class 3	Class 4
Low	af11	af21	af31	af41
Medium	af12	af22	af32	af41
High	af13	af23	af33	af43

Precedence (low to high)	DSCP
1	Best Effort (be)
2	Class 1
3	Class 2
4	Class 3
5	Class 4
6	Express Forwarding (ef)

The DSCP level can be configured for multiple traffic patterns within a single instance of this command.

Example

The following command configures the DSCP level for the streaming traffic pattern to be **ef**:

```
ip qos streaming ef
```

The following command configures the DSCP levels for the conversational, streaming, interactive and background traffic patterns to be ef, ef, af22, and af41, respectively:

```
ip qos-dscp conversational ef streaming ef interactive af22 background
af41
```

ip source-violation

Enables/disables packet source validation for the current APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax `ip source-violation { ignore | check [ drop-limit limit ] } [ exclude-from-accounting ]`

ignore

Default: Disabled
Disables source address checking for the APN.

check [drop-limit *limit*]

Default: Enabled, limit = 10
Enables the checking of source addresses received from subscribers for violations.
A **drop-limit** can be configured to set a limit on the number of invalid packets that can be received from a subscriber prior to their session being deleted. *limit* can be configured to any integer value between 0 and 1000000. A value of 0 indicates that all invalid packets will be discarded but the session will never be deleted by the system.

exclude-from-accounting

Default: Disabled
Excludes the packets identified with IP source violation from the stats generated for accounting records on a basis of configurables.

Usage

Source validation is useful if packet spoofing is suspected or for verifying packet routing and labeling within the network.
Source validation requires the source address of received packets to match the IP address assigned to the subscriber (either statically or dynamically) during the session.

Example

The following command enables source address validation for the APN and configures a drop-limit of 15:

```
ip source-violation check drop-limit 15
```

ip user-datagram-tos copy data-tunnel

This command controls copying of IP TOS octet value from user IPv4/IPv6 datagrams to IP header of GTP data tunnel header.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[no | default] ip user-datagram-tos copy data-tunnel
```

no

Removes the preconfigured parameter for this command.

default

Sets the default behavior of this command. By default this function is disabled.

Usage

This command needs to copy TOS byte from inner IP header to the outer IP header for RP connection. This functionality will enable SGSN to detect special TOS marking in the outer IP header of GTP tunnel packets and to identify certain packets as control messages.

Example

The following command will copy TOS octet in the IP header of datagram to IP header of GTP tunnel encapsulation:

```
ip user-datagram-tos copy data-tunnel
```

ipv6 access-group

This command configures IPv6 access group for the current APN profile which applies a Single ACL to Multiple Subscribers via APN for ipv6 traffic.

Product

GGSN, ECS, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[no] ipv6 access-group group_name [in | out]
```

no

Removes a previously configured IPv6 ACL applied to a particular APN for IPv6 traffic. As per your requirement at least one of the two **{in | out}** must be selected for which the ACL will be removed.

group_name

Specifies the name of the IPv6 access group. *group_name* must be an alpha and/or numeric string of 1 to 79 characters.

[in | out]

Default: both (in and out)
Specifies the access-group as either inbound or outbound by the keywords **in** and **out**, respectively.
If neither of any specified with the base command the specific IPv6 access control list will be applied to both the traffic (downlink and uplink).

Usage

Use this command to apply a single IPv6 access control list to multiple subscribers via an APN for inbound or outbound IPv6 traffic.
If no traffic direction specified the selected access control list will be applied to both direction of traffic.

Example

The following command associates the *sampleipv6Group* access group with the current APN profile for both inbound and outbound access:

```
ipv6 access-group sampleipv6Group
```

The following removes the outbound access group flag for *sampleipv6Group*:

```
no ipv6 access-group sampleipv6Group out
```

ipv6 address prefix-pool

Configures the IPv6 address prefix pool name to the subscriber session. User can configure up to a maximum of 4 pools per subscriber.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
ipv6 address prefix-pool value
```

value

Default: None
The value may be a string size of 1 to 31 characters.

Usage

Names the IPv6 address prefix pool.

Example

The following command will Configures the IPv6 address prefix pool name ap1_ipv6 to the subscriber session:

ipv6 address prefix-pool *ap1_ip6*

ipv6 dns

Configures the IPv6 Domain Name Service (DNS) servers.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[no] ipv6 dns { primary | secondary } { ipv6_dns_address }
```

no

Deletes a previously configured DNS server.

primary

Configures the primary DNS server for the APN.

secondary

Configures the secondary DNS server for the APN. Only one secondary DNS server can be configured.

ipv6_dns_address

Configures the IP address of the DNS server.

Usage

DNS servers are configured on a per-APN profile basis. This allows each APN profile to use specific servers in processing PDP contexts.
The DNS can be specified at the APN level in APN configuration as well as at the Context level in Context configuration mode with **ip name-servers** command, or it can be received from AAA server.
When DNS is requested in PCO configuration, the following preference will be followed for DNS value:
1. DNS Values received from LNS have the first preference
2. DNS values received from RADIUS Server has the second preference
3. DNS values locally configured with APN has the third preference
4. DNS values configured at context level with **ip name-servers** command has the last preference.

Important: The same preference would be applicable for the NBNS servers to be negotiated via ICPC with the LNS.

Example

The following command provides an example of setting the primary DNS server:

```
ipv6 dns primary 1:1:1:1:1:1:1:1
```

ipv6 egress-address-filtering

Egress address filtering filters out packets not meant for the mobile interface ID. The GGSN records the source interface ID of all the packets received from the Mobile. When packets sent to the Mobile are received, the destination interface ID is compared against the list of recorded interface IDs and with the local interface-ID assigned to the Mobile during IPv6CP. If no match is found, the packet is dropped.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[no] ipv6 egress-address-filtering
```

no

Disables IPv6 egress address filtering.

ipv6 egress-address-filtering

Enables IPv6 egress address filtering.

Usage

Used to filter packets that arrive from the internet to a particular site.

Example

The following command provides an example disabling egress address filtering:

```
no ipv6 egress-address-filtering
```

ipv6 initial-router-advt

Creates an IPv6 initial router advertisement interval for the current APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
ipv6 initial-router-advt { interval | num-advts } { value }

default ipv6 initial-router-advt { interval | num-advts }
```

default

Resets interval or num-advts to their default setting.

interval value

Default: 3000ms
The time interval the initial IPv6 router advertisement is sent to the mobile node in milliseconds.
value is an integer between 100 and 16000 milliseconds.

num-advts value

Default: 3
The number of initial IPv6 router advertisements sent to the mobile node.
value is an integer between 1 to 16.

Usage

This command is used to set the advertisement interval and the number of advertisements. Using a smaller advertisement interval increases the likelihood of router being discovered more quickly when it first becomes available.

Example

The following command specifies the initial ipv6 router interval to be 2000ms:

ipv6 initial-router-advt interval *2000*

l3-to-l2-tunnel address policy

Configures the address allocation/validation policy, when subscriber L3 (IPv4/IPv6) sessions are tunneled using a L2 tunneling protocol, such as L2TP.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
l3-to-l2-tunnel address-policy { alloc-only | alloc-validate | no-alloc-validate
}
```

alloc-only

Default: Disabled
Specifies that the system locally allocates and validates subscriber addresses.

alloc-validate

Default: Disabled
Specifies that the system allocates addresses for cases in which IP addresses are dynamically assigned. The system does not validate the address specified by the subscriber.

no-alloc-validate

Default: Enabled
Specifies that the system does not allocate or validate subscriber addresses locally for such sessions, it passes the address between remote tunnel terminator to the Mobile Node.

Usage

This command can be useful for such tunnels are MIP HA sessions tunneled from the system using a L2TP tunnels or GGSN PDP contexts of type IP tunneled using L2TP to a remote LNS.

Example

The following command configures the system to locally allocate and validate subscriber addresses:

```
l3-to-l2-tunnel address-policy alloc-only
```

loadbalance-tunnel-peers

Configures how tunnel-peers are selected for this APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
load-balancing { balanced | prioritized | random }
```

balanced

Default: Disabled
Tunnel-peer selection is made without regard to prioritization, but in a sequential order that balances the load across the total number of peer nodes available.

prioritized

Default: Disabled
Tunnel-peer selection is made based on the priority configured for the peer.

random

Default: Enabled
Tunnel-peer selection is random in order.

Usage

Use this command to configure the load-balancing algorithm that defines how the tunnel-peers are selected by the APN when multiple peers are configured in the APN.

Example

The following command sets the APN to connect to tunnel-peers in a sequential order:

```
load-balancing balanced
```

long-duration-action detection

This command sets the detection of a session that exceeds the long duration timer and sends notification.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
long-duration-action detection
```

`detection`

Default: Enabled
Detects long duration sessions and sends SNMP TRAP and CORBA notification. This is the default behavior.

Usage

Use this command to detect a session exceeds the limit set by the long duration timer.
Refer to the **`timeout idle`** and **`timeout long-duration`** command for information on setting the long duration timer.

Example

Use the following command to enable detecting the session that exceeds the long duration timer:

```
long-duration-action detection
```

long-duration-action disconnection

This command specifies what action is taken when the long duration timer expires.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
long-duration-action disconnection [ suppress-notification ] [ dormant-only ] +
```

disconnection

Default: Disabled
Detects a long duration session and disconnects the session after sending SNMP TRAP and CORBA notification.

suppress-notifiaction

Default: Disabled
Suppress the SNMP TRAP and CORBA notification after detecting and disconnecting a long duration session.

dormant only

Default: Disabled
Disconnects the dormant sessions after long duration timer and inactivity time with idle time-out duration expires. It sends the SNMP TRAP and CORBA notification after disconnecting a long duration session.

Usage

Use this command to determine what action is taken when a session exceeds the limit set by the long duration timer.
Refer to the **timeout idle** and **timeout long-duration** command for information on setting the long duration timer.

Example

Use the following command to enable disconnecting sessions that exceed the long duration timer:

```
long-duration-action disconnection
```

Use the following command to disconnect the session that exceed the long duration timer without sending SNMP TRAP and CORBA notification:

```
long-duration-action disconnection suppress-notification
```

Use the following command to disconnect the session that exceed the long duration timer and also inactivity timer for idle time-out duration and send SNMP TRAP and CORBA notification:

long-duration-action disconnection dormant-only

Use the following command to disconnect the session that exceed the long duration timer and also inactivity timer for idle time-out duration without sending any SNMP TRAP and CORBA notification. If the session is idle and the session-idle-time >= inactivity time the session gets disconnected. Even if session is idle when the long-duration timed-out and session-idle time < inactivity time the timer value is reset to idle-timeout time.

long-duration-action disconnection dormant-only suppress-notification

max-contexts

Configures the maximum number of PDP contexts (primary and secondary) that can be facilitated by the APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
max-contexts {[per-subscriber secondary secondary_ctx] [primary number total
total_number]

[ default ] max-contexts
```

per-subscriber secondary *secondary_ctx*

This keyword specifies the maximum number of secondary PDP contexts that can be facilitated by the APN per primary context (per-subscriber). Subscribers can have primary PDP and secondary PDP contexts- the secondary contexts share the same IP address as the primary.
secondary_ctx can be configured to any integer value from 0 to 10.
Default: 10

primary *number*

This keyword specifies the maximum number of primary PDP contexts that can be facilitated by the APN. Subscribers can have primary PDP and secondary PDP contexts- the secondary contexts can be configured using **per-subscriber secondary** keyword.
number can be configured to any integer value from 1 to 4000000.
Default: 4000000

total *total_number*

Specifies the maximum total number of PDP contexts (primary and secondary) that can be facilitated by the APN.
total_number can be configured to any integer value from 1 to 4000000.
Default: 4000000

Usage

This parameter can be used to configure a “soft” limit on the number of PDP contexts supported by a single APN.
Soft limits are based on measurements gathered at regular short intervals (several times per minute) as opposed to measurements taken in real-time. Therefore the sampled measurement may not match the actual number of PDP contexts currently being processed. Every PDP context request received is compared against the result of the last sample. If the sample is less than the soft limit configured, the request will be processed. If it is more, the request will be rejected.

Example

The following command specifies that the maximum number of primary PDP contexts the APN can facilitate is 500,000 while the maximum total number is 750,000:

max-contexts primary *500000* **total** *750000*

mbms bmsc-profile

It applies a configured Broadcast-Multicast Service Center (BM-SC) profile to subscribers through APN for Multimedia Broadcast Multicast Service (MBMS) support and functionality.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
mbms bmsc-profile name bmsc_profile_name

no mbms bmsc-profile
```

no

Deletes a previously associated BM-SC profile with this APN.

bmsc_profile_name

Specifies a name for the BM-SC profile already configured in BMSC configuration mode.
bmsc_profile_name can be from 1 to 62 alpha and/or numeric characters and is not case sensitive. It may also contain dots (.) and/or dashes (-).

Usage

Use this command to associate a configured BM-SC profile to use for MBMS contexts with this APN for MBMS feature support.
For more information on BM-SC profile configuration, refer BMSC Profile Configuration Mode.
This command also configures the specific BM-SC profile to use for Internet group Management Protocol (IGMP) JOIN requests received from PDP contexts with this APN.

Example

Following command applies a previously configured BM-SC profile named *bm_sc_1* to an APN within the specific context.

```
mbms bmsc-profile name bm_sc_1
```

mbms bearer timeout

Configures the session timeout values for the MBMS bearer contexts with this MBMS APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
mbms bearer timeout { absolute | idle } time
[ no | default ] mbms bearer timeout { absolute | idle }
```

no

Returns the timeout parameter to its default setting. If neither the absolute or idle keywords are used in conjunction with this keyword, both timeout options will be returned to their default settings.

default

Set the default value for the followed option for MBMS bearer context timeout.

absolute

Default: Disabled
Configures the absolute maximum time an MBMS bearer context may exist in any state (active or idle).

idle

Default: Disabled
Configures the maximum amount of time an MBMS bearer context may be idle.

time

Default: 0
Measured in seconds, the time can be configured to any integer value between 0 and 4294967295.
A time of 0 disables timeouts for this APN.

Usage

Use this command to limit the amount of time that an MBMS bearer context session can remain connected.

Example

The following commands enables an absolute time timeout of *60000* seconds for MBMS bearer context:

```
mbms bearer timeout absolute 60000
```

mbms ue timeout

Configures the session timeout values for the MBMS user equipment (UE) contexts with this MBMS APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
mbms ue timeout { absolute | idle } time
```

```
[ no | default ] mbms ue timeout { absolute | idle }
```

no

Returns the timeout parameter to its default setting. If neither the absolute or idle keywords are used in conjunction with this keyword, both timeout options will be returned to their default settings.

default

Set the default value for the followed option for MBMS UE context timeout.

absolute

Default: Disabled
Configures the absolute maximum time an MBMS UE context may exist in any state (active or idle).

idle

Default: Disabled
Configures the maximum amount of time an MBMS UE context may be idle.

time

Default: 0
Measured in seconds, the time can be configured to any integer value between 0 and 4294967295.
A time of 0 disables timeouts for this APN.

Usage

Use this command to limit the amount of time that an MBMS UE context session can remain connected.

Example

The following commands enables an absolute time timeout of *60000* seconds for MBMS UE context:

mbms bearer timeout absolute *60000*

mediation-device

Enables the use of a mediation device and specifies the system context to use for communicating with the device.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
mediation-device [context-name context-name] [delay-GTP-response] [no-early-
pdus] [no interims] +

[ no | default ] mediation-device
```

+

Indicates that more than one of the options can be specified with a single execution of the command.

no

Deletes the mediation-device configuration.

default

Changes the mediation device to no context-name configured and restores the mediation device's default properties.

context-name *context-name*

Default: The subscribers destination context.
Configures the mediation VPN context for this APN.
context-name can be from 1 to 79 alpha and/or numeric characters and is case sensitive.
If not specified, the mediation context is same as the destination context of the subscriber.

delay-GTP-response

Default: Disabled
When enabled, delays the CPC response until an Accounting Start response is received from the mediation device.

no-early-pdus

Default: Disabled
Specifies that the system delays PDUs from the MS until a response to the GGSN's accounting start request is received from the mediation device. The PDUs are queued if possible, or discarded
If "no-early-PDUs" is enabled, the chassis shall not send uplink/downlink data from/to a MS till it receives the Acct-Rsp Start for the same--from the mediation device. On receiving the Acct-Rsp, pending PDUs are sent out. The chassis shall buffer up to 4 PDUs per call, before it flushes all the PDUs for that call. It is disabled by default.

no-interims

Default: Disabled
Disables sending of interims to the mediation device.

Usage

This command is used to enable mediation device support for the APN. Mediation devices can be either deep-packet inspection servers or transaction control servers.
Keywords to this command can be used in combination to each other, depending on configuration requirements.

Example

The following command enables mediation device support for the APN and uses the protocol configuration located in an system context called *ggsn1*:

```
mediation-device context-name ggsn1
```

```
mediation-device context-name ggsn1 no-interims no-early-pdus
```

```
mediation-device no-early-pdus no-interims
```

```
mediation-device no-interims no-early-pdus
```

The following command enables mediation device support for the APN and uses the protocol configuration located in the subscribers destination context:

```
mediation-device
```

mobile-ip home-agent

Configures the IP address of the home agent (HA) used by the current APN to facilitate subscriber Mobile IP sessions.

Product

GGSN, FA, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[no] mobile-ip home-agent ip_address
```

no

Removes a previously configured HA address.

ip_address

The IP address of the HA expressed in dotted-decimal notation.

Usage

If the APN is configured to support Mobile IP for all PDP contexts it is facilitating, this command specifies the IP address of the HA that is to be used.

Example

The following command configures an HA IP address of 192.168.1.15:

```
mobile-ip home-agent 192.168.1.15
```

mobile-ip mn-aaa-removal-indication

Configures the system to remove various information elements when relaying Registration Request messages to the HA.

Product

GGSN, FA, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[no] mobile-ip mn-aaa-removal-indication
```

no

Disables this functionality. This is the default setting.

Usage

When this functionality is enabled, the MN-FA challenge and MN-AAA authentication extensions are removed when relaying a Registration Request (RRQ) to the HA.

Example

The following command enables the system to remove information elements from RRQs relayed to the HA:

```
mobile-ip mn-aaa-removal-indication
```

mobile-ip mh-ha-hash-algorithm

Designates the encryption algorithm to use.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
mobile-ip mn-ha-hash-algorithm { hmac-md5 | md5 | rfc2002-md5 }
```

hmac-md5 | md5 | rfc-2002-md5

Default: hmac-md5
The encryption algorithms that may be used.

Usage

Provides security by encrypting the data.

Example

The following command sets encryption for md5:

```
mobile-ip mn-ha-hash-algorithm md5
```

mobile-ip mh-ha-shared-key

Configures the subscriber MN-HA shared key.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
mobile-ip mn-ha-shared-key key
no mobile-ip mn-ha-shared-key
```

no

Disables this functionality. This is the default setting.

key

The key must be entered as either a string or a hexadecimal number beginning with “0x”.

Usage

Configures a shared key for the APN.

Example

The following command configures a shared key of *sfd23408imi9yn*:

```
mobile-ip mn-ha-shared-key sfd23408imi9yn
```

mobile-ip mh-ha-spi

Configures the SPI number.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
mobile-ip mn-ha-spi spi_number
```

```
[no] mobile-ip mn-ha-spi
```

no

Disables this functionality. This is the default setting.

spi_number

The number must be an integer between 256 and 4294967295.

Usage

Configures an SPI number for the APN.

Example

The following command configures an SPI number of 428856:

```
mobile-ip mn-ha-spi 428856
```

mobile-ip required

Enables support for Mobile IP functionality for all PDP contexts facilitated by the current APN.

Product

GGSN, FA, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[no] mobile-ip required
```

no

Disables this functionality. This is the default setting.

Usage

Mobile IP functionality for IP PDP contexts is only supported at the APN-level. This command enables/disables Mobile IP support for the APN.
When Mobile IP is performed, the system authenticates the subscriber and the Mobile IP FA.
If this option is enabled, the system deletes all PDP contexts attempting to access the APN for which a Mobile IP session can not be established.

Example

The following command enables Mobile IP support for the current APN:

```
mobile-ip required
```

mobile-ip reverse-tunnel

Configures the system to support reverse-tunneling for Mobile IP sessions facilitated by the current APN.

Product

GGSN, FA, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[no] mobile-ip reverse-tunnel
```

no

Disables this functionality. The default is enabled.

Usage

Use this command to enable support for Mobile IP reverse tunneling for the APN. Reverse tunneling is enabled by default.

Example

The following command enables reverse-tunneling for the APN:

```
mobile-ip reverse-tunnel
```

nai-construction

Configures the NAI construction parameters on a per-APN basis only rather than by per-aaa-group when constructed NAI authentication is enabled.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
nai-construction {imsi | msisdn} [override-null-username] [ encrypted password
string | use-shared-secret-password | password string ]

[default | no] nai-construction
```

default

Enables default method for NAI construction using International Mobile Subscriber Identity (IMSI) for authentication for a user. GGSN constructs NAI using IMSI when no user-name is received.

no

Disables the NAI construction at the APN level.

imsi

Default: Enabled.
Enables NAI construction using IMSI for authentication for a user. GGSN constructs NAI using IMSI when no user-name is received. This is the default setting.

msisdn

Enables NAI construction using Mobile Station International ISDN Number (MSISDN) for authentication for a user. GGSN constructs NAI using MSISDN when no user-name is received.

override-null-username

Enables NAI construction using IMSI/MSISDN for authentication for a user or when empty user name is received.

encrypted password

Specifies an encrypted password is to be used for this NAI-constructed user. string is a string from 0 - 63 characters.

password

Configures the authentication user-password for this NAI-constructed user. password is a string from 0 - 63 characters.

use-shared-secret-password

Specifies use of the RADIUS authentication shared secret password for this NAI-constructed user.

Usage

NAI-construction defines the behavior for construction at the APN level. If defined for a particular APN, this CLI both works independently and overwrites the behavior of aaa constructed-nai defined at the context level for calls involving this APN.
Note that NAI construction using IMSI or MSISDN, where ether no user name is received or a blank user name is received for authentication, is applicable only when NAI constructed authentication is enabled using **aaa nai-construction authentication** command in context configuration mode.

Example

The following command enables NAI-construction using IMSI as the authentication type with an encrypted password:

nai-construction imsi encrypted password *string*

nexthop-forwarding-address

Configures the next hop forwarding address for the APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
nexthop-forwarding-address ip_address

no nexthop-forwarding-address
```

no

Disables this function. This is the default setting.

ip_address

Configures the IP address of the nexthop forwarding address.

Usage

Use this command to configure the next hop forwarding address for the APN.

Example

The following command configures the next hop forwarding address to 1.1.1.1 using IPv4:

```
nexthop-forwarding-address 1.1.1.1
```

no

Enables/Disables the followed option.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
no { data-tunneling ignore | dhcp [ context-name | service-name ] | dns [
primary ip_address | secondary ip_address ] |

ip [ access-group access_group_name | address pool name pool_name | context-name
| header-compression | hide-service-address | local-address | qos-dscp [
background | conversational | interactive interaction level | streaming ] |
user-datagram-tos copy data-tunnel ] |

ipv6 [ address prefix pool | dns [ primary | secondary ] | egress-address-
filtering ] | mediation-device |

mobile-ip [ home-agent | mn-aaa-removal-indication | mn-ha-shared-key | mn-ha-
spi | required | reverse-tunnel ] |

nbns [ primary | secondary ] IPv4_address |

nexthop-forwarding-address | outbound [ password | username ]| ppp [ data-
compression protocols | keepalive | mtu ] | proxy-mip required | qos-renegotiate
| qos traffic-police direction [ downlink class | uplink class ] | timeout [
absolute | idle | long-duration ] | tunnel [ gre | ipip | l2tp [ peer-address
<ipv4_address> | <cr> ]] | virtual-apn preference <value>}
```

data-tunneling

Configure parameters related subscriber data tunneling.

dhcp

Configures the DHCP related parameters for the APN.

dns

Disables use of Domain Name Service.

ip

Configures Internet Protocol (IP) parameters.

ipv6

Configures ipv6 related parameters

mediation-device

Configures Mediation Device Parameters.

mobile-ip

Configures mobile-ip for the APN.

nexthop-forwarding-address

Configure the nexthop forwarding address for this APN.

nbns

Disables use of NetBios Name Service

outbound

Configures designated apn host password for PDP Type PPP session authentication.

ppp

Disables PPP-related parameters.

proxy-mip

Enables APN's Proxy MIP setting

qos-renegotiate

This keyword is obsolete.
Disables the enabled dynamic QoS renegotiation for the APN.

qos

Configures QoS attributes related to all the PDP context for the APN.

timeout

Configures session timeout values for this APN.

tunnel

Configures layer 2 or layer 3 tunneling for the APN

virtual-apn

Configures virtual APN.

Usage

This key is used to disable or de-activate the configured commands.

Example

The following command disables the mobile IP support for specific APN:

```
no mobile-ip
```

nbns

Configures and Enables use of NetBios Name Service for the APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[no] nbns { primary | secondary } IP_address
```

no

Removes/disables use of a previously configured NetBios Name Service.

primary

Designates primary NBNS server. Must be followed with IPv4 address in dotted-decimal notation.

secondary

Designates secondary/failover NBNS server. Must be followed with IPv4 address in dotted-decimal notation.

IP_address

Specifies the IPv4/IPv6 address expressed in standard notation.

Usage

This command specifies NBNS parameters. The NBNS option is present for both pdp type IP and pdp type PPP for GGSN.
The system can be configured to use NetBios Name Service for the APN.

Example

The following command configures the APN's NetBios Name Service to primary IP 192.168.1.15.

```
nbns primary 192.168.1.15
```

npu qos

Configures an NPU QoS priority queue for packets facilitated by the APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator\

Syntax

```
[no] npu qos traffic priority { best-effort | bronze | derive-from-packet-dscp |
gold | silver }
```

no

Removes a previously configured priority queue.

best-effort

Assigns the best-effort queue priority. This is the lowest priority.

bronze

Assigns the bronze queue priority. This is the third-highest priority.

derive-from-packet-dscp

Default: Enabled
Specifies that the priority is to be determined from the DSCP field in the packet's TOS octet.

gold

Assigns the gold queue priority. This is the highest priority.

silver

Assigns the silver queue priority. This is the second-highest priority.

Usage

This command is used in conjunction with the Network Processing Unit (NPU) Quality of Service (QoS) functionality.
The system can be configured to determine the priority of a subscriber packet either based on the configuration of theAPN, or from the differentiated service (DS) field in the packet's TOS octet (representing the differentiated service code point (DSCP) value).
Refer to the GGSN System Administration and Configuration Guide for additional information on NPU QoS functionality.

Example

The following command configures the APN’s priority queue to be gold:

```
npu qos traffic priority gold
```

outbound

Configures the APN host username and password.

Syntax

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
outbound { [ encrypted ] password pwd | username name}
no outbound password
```

no

Removes previously configured outbound information for the APN.

encrypted

The **encrypted** keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

password *pwd*

Specifies the password to use for session authentication.
pwd must be from 1 to 63 alpha and/or numeric characters and is case sensitive.

username *name*

Specifies the username to use for session authentication.
name must be from 1 to 63 alpha and/or numeric characters and is case sensitive.

Usage

This command can be used to provide a username and password for authentication when the subscriber doesn't supply one in accordance with 3GPP standards. In addition, it can be used to create a PPP session when using L2TP to tunnel IP PDP contexts.
If only a username is specified using this command, the password is determined based on the setting of the **aaa constructed-nai** command in the Context Configuration mode. That command is also used to determine the password if an outbound username and password are configured for the APN when the imsi-auth keyword is specified for the **authentication** command in this mode.

Example

The following commands configures an APN username of *isp1* and a password of *secRet123*.4.

```
outbound username isp1
```

outbound password *secRet123.4*

pdp-type

Configures the type of PDP contexts that are supported by this APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
pdp-type { ipv4 [ ipv6 ] | ipv6 [ ipv4 ] | ppp }
```

ipv4 [ipv6]

Default: Enabled
Enables support for IPv4 PDP contexts. Also enables support for IPv6 if the IPv6 optional keyword is entered in this command.

Important: Entering both IPv4 and IPv6 in either order enables support for both.

ipv6 [ipv4]

Default: Disabled
Enables support for IPv6 PDP contexts. Also enables support for IPv4 if the IPv6 optional keyword is entered in this command.

Important: Entering both IPv4 and IPv6 in either order enables support for both.

ppp

Default: Disabled
Enables support for PPP PDP contexts.

Usage

IP PDP context types are those in which the MS is communicating with a PDN such as the Internet or an intranet using IP. PPP PDP contexts are those in which PPP or PPP Network Control Protocol (NCP) frames from the MS are either terminated at, or forwarded by the GGSN.
If a session specifies a PDP type that is not supported by the APN, the system rejects the session with a cause code of 220 (DCH, Unknown PDP address or PDP type).

Example

The following command configures the APN to support PPP context types:

```
pdp-type ppp
```

ppp

Configures the Point-to-Point Protocol (PPP) options for the current APN.

Syntax

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
ppp { data-compression { protocols protocols | mode modes } | keepalive seconds
| min-compression-size min_octets | mtu max_octets }

no ppp { data-compression protocols | keepalive seconds | mtu }
```

no

Resets the option specified to its default setting.

data-compression { mode *modes* **| protocols** *protocols***}**

Default: all protocols enabled
Configures the data compression or the compression protocol to use for the APN.
mode *modes*: Sets the compression mode to one of the following:

- **normal:** Packets are compressed using the packet history for automatic adjustment and for best compression.
- **stateless:** Each packet is compressed individually.

protocols *protocols*: Sets the compression protocol to one of the following:

- **deflate:** DEFLATE algorithm
- **mppc:** Microsoft Point-to-Point Compression
- **stac:** STAC LZS algorithm

keepalive *seconds*

Default: 30
Specifies the frequency of sending the Link Control Protocol (LCP) keep alive messages. *seconds* must be either 0 or in the range from 5 to 14400.
The special value 0 disables the keep alive messages entirely.

min-compression-size *min_octets*

Default: 128
Specifies the smallest packet to which compression may be applied. *min_octets* must be a value in the range from 0 to 2000.

mtu *max_octets*

Default: 1500
Specifies the maximum transmission unit (MTU) for packets accessing the APN. *max_octets* must be a value in the range from 100 to 2000.

Important: The MTU refers to the PPP payload which excludes the 2 PPP octets. Therefore, an MTU of 1500 corresponds to the 3GPP standard MTU of 1502 for GTP packets with PPP payloads.

Usage

Adjust packet sizes and compression to improve bandwidth utilization. Each network may have unique characteristics such that determining the best packet size and compression options may require system monitoring over an extended period of time.

Example

The following command configures the ppp data-compression mode for the APN to be stateless:

```
ppp data-compression mode stateless
```

The following command configures an MTU of 500 for the APN:

```
ppp mtu 500
```

proxy-mip

Configures support for Proxy Mobile IP functionality for the APN.

Product

GGSN, FA, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[no] proxy-mip { required | null-username static-homeaddr }
```

no

Disables this functionality. This is the default setting.

required

Default: Disabled.
Enables proxy-mip for all subscribers using this APN.

null-username

Default: Disabled.
Configures handling of RRQ to enable the acceptance without NAI extension in this APN.

Usage

This command requires that Proxy Mobile IP functionality be performed for all PDP contexts facilitated by the APN.
When Proxy Mobile IP is performed, the system performs subscriber authentication but not Mobile IP FA authentication. It can be configured to handling of RRQ without NAI extension in an APN.
More information about Proxy Mobile IP support for the GGSN can be found in the System Overview Guide.

Example

The following command causes the system to support Proxy Mobile IP for all PDP contexts facilitated by the APN:

```
proxy-mip required
```

The following command will enables the accepting of RRQ without NAI extensions in this APN.

```
proxy-mip null-username static-homeaddr
```

qos negotiate-limit

This command configure the QoS profile to provide the peak and committed data rate limits that the GGSN assigns to the APN, and sends to the SGSNs in response to GTP create/update PDP context requests for traffic shaping and policing functionality.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
qos negotiate-limit direction { downlink | uplink } [ class { background |
conversational | interactive traffic_priority | streaming } ] [ peak-data-rate
bps [ committed-data-rate bps ] | committed-data-rate [ peak-data-rate bps ]]

no negotiate-limit direction { downlink | uplink } [ class { background |
conversational | interactive traffic_priority | streaming }]
```

no

Disables the QoS Profile for the APN.

Important: When no Qos Profile is configured, the system's default behavior is to use the information provided by the SGSN.

downlink

Apply the specified limits and actions to the downlink (to-Gn direction).

uplink

Apply the specified limits and actions to the uplink (to-Gi direction).

class { background | conversational | interactive *traffic_priority* **| streaming }**

Apply the specified limits and actions to PDP contexts of the specified UMTS traffic class. The following classes are supported:

- **background :** Specifies the QOS for traffic patterns in which the data transfer is not time-critical (for example email exchange). This traffic pattern should be the lowest QOS.
- **conversational :** Specifies the QOS for traffic patterns in which there is an constant flow of packets in each direction, upstream and downstream. This traffic pattern should be the highest QOS.
- **interactive** *traffic_priority :* Specifies the QOS for traffic patterns in which there is an intermittent flow of packets in each direction, upstream and downstream. This traffic pattern should be a higher QOS than the background pattern, but not as high as that for the streaming pattern. *traffic_priority* is the 3GPP traffic handling priority and can be the integers 1,2 or 3.

- **streaming :** Specifies the QOS for traffic patterns in which there is a constant flow of data in one direction, either upstream or downstream. This traffic pattern should be a higher QOS than the interactive pattern, but not as high as that for the conversational pattern.

Important: If this keyword is omitted, the same values are used for all classes.

committed-data-rate *bps*

Default: See Usage section for this command
The committed data rate (guaranteed-data-rate) in bps (bits per second).
bps must be an integer from 1 through 16000000 for the downlink direction or 1 through 8640000 for the uplink direction. The value must also correspond to one of the permitted values identified in table given in this chapter. Note that if a non-permitted value is entered for this parameter, then the system rounds the value to the nearest lower supported value, except in the case where value is less than 1,000 bps. In this case, the system rounds the value to 1,000 bps. In addition, if the configured committed rate is lower than the value configured for the peak-data-rate, then the system uses the configured peak rate for this parameter.

Important: System measurements for this value exclude the GTP and outer packet headers. In addition, some traffic classes have both a committed rate and a peak rate, while other traffic classes have just a peak rate. If a committed rate is not applicable (i.e., the traffic class is **background** or **interactive**), then an error occurs if this option is configured. If the committed-rate is applicable (i.e., the traffic class is **conversational** or **streaming**), the values supplied by the SGSN are used if this option is not configured.

peak-data-rate *bps*

Default: See Usage section for this command
Specifies the peak data-rate for the subscriber, in bps (bits per second).
bps must be an integer from 1 through 16000000 for the downlink direction or 1 through 8640000 for the uplink direction. The value must also correspond to one of the permitted values identified in table given in this chapter. Note that if a non-permitted value is entered for this parameter, then the system rounds the value to the nearest lower supported value, except in the case where value is less than 1,000 bps. In this case, the system rounds the value to 1,000 bps.

Usage

This command configures the APN's quality of service (QoS) profile. This feature enables configuring and enforcing bandwidth limitations on individualPDP contexts of a particular traffic class. Traffic classes are defined in 3GPP TS 23.107 and are negotiated during PDP context activation. Bandwidth enforcement is configured and enforced independently on the downlink and the uplink directions.
The profile information is sent to the SGSN(s) in response to GTP Create/Update PDP Context Request messages. If the QoS profile requested by the SGSN is lower than the configured QoS profile configured, the profile requested by the SGSN is used. If the QoS profile requested by the SGSN is higher, the configured rates are used.
Note that the values for the uplink/downlink committed-data-rate and peak-data-rate parameters are exchanged in the GTP messages between the GGSN and the SGSN. Therefore, the values used may be lower than the configured values. When negotiating the rate with the SGSN(s), the system convert this to a value that is permitted by GTP as shown in table given in this chapter.

Table 9. Permitted Values for Committed and Peak Data Rates in GTP Messages

Value (bps)	Increment Granularity (bps)
From 1000 to 63,000	1,000 (e.g 1000, 2000, 3000, ... 63000)
From 64,000 to 568,000	8,000 (e.g. 64000, 72000, 80000, ... 568000)
From 57,6000 to 8,640,000	64,000 (e.g. 576000, 640000, 704000, ... 86400000)
From 8,700,000 to 16,000,000	100,000 bps (e.g. 8700000, 8800000, 8900000, ... 16000000)

The command can be entered multiple times to specify different combinations of direction and class. If this command is not configured at all, the GGSN does not perform traffic policing or QoS negotiation with the SGSN (i.e. it accepts all of the SGSN-provided values for the PDP context.

Important: This command should be used in conjunction with the **`max-contexts`** command to limit the maximum possible bandwidth consumption by the APN.

Additional information on the QoS traffic shaping functionality is located in the *System Enhanced Feature Configuration Guid*e.
Default Values:
The following table displays the default values for each of the traffic classes:

Table 10.

Class: Conversational	
Downlink Traffic: Disabled Peak Data Rate (in bps): 16000000 Committed Data Rate(in bps): 16000000 Burst Size (in bytes): 65535 Exceed Action: lower-ip-precedence Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate(in bps): 8640000 Committed Data Rate(in bps): 8640000 Burst Size(in bytes): 65535 Exceed Action: lower-ip-precedence Violate Action: drop
Class: Streaming

Class: Background	
Downlink Traffic: Disabled Peak Data Rate(in bps): 16000000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate(in bps): 8640000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop

Important: If a “Subscribed” traffic class is received, the system changes the class to “Background” and sets the following parameters: The uplink and downlink guaranteed data rates are set to 0. If the received uplink or downlink data rates are 0 and traffic policing is disabled, the default of 64 kbps is used. When enabled, the APN configured values are used. If the configured value for downlink max data rate is larger than can fit in an R4 QoS profile, the default of 64 kbps is used. If either the received uplink or downlink max data rates is non-zero, traffic policing is employed if enabled for the “Background” class. The received values are used for responses when traffic policing is disabled.

Example

The following command sets an uplink peak data rate of 128000 bps for QoS negotiation limit:

```
qos negotiate-limit direction uplink peak-data-rate 128000
```

qos rate-limit

Configure the action on subscriber traffic flow that violates or exceeds the peak/committed data rate under traffic policing/shaping functionality.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
qos rate-limit { downlink | uplink } [ class { background | conversational |
interactive traffic_priority | streaming } ] [ burst-size { bytes | auto-
readjust [ duration dur ] } ] [ exceed-action { drop | lower-ip-precedence |
transmit } [ violate-action { drop | lower-ip-precedence | shape [transmit-when-
buffer-full] | transmit }]] | [ violate-action { drop | lower-ip-precedence |
shape [transmit-when-buffer-full] | transmit } [ exceed-action { drop | lower-
ip-precedence | transmit }]] +

no qos rate-limit direction { downlink | uplink } [ class { background |
conversational | interactive traffic_priority | streaming } ]
```

no

Disables the QoS data rate limit configuration for the APN.

Important: When no Qos Profile is configured, the system's default behavior is to use the information provided by the SGSN.

downlink

Apply the specified limits and actions to the downlink (the Gn direction).

uplink

Apply the specified limits and actions to the uplink (the Gi direction).

class { background | conversational | interactive *traffic_priority* **| streaming }**

Apply the specified limits and actions to PDP contexts of the specified UMTS traffic class. The following classes are supported:

- **background :** Specifies the QOS for traffic patterns in which the data transfer is not time-critical (for example email exchange). This traffic pattern should be the lowest QOS.
- **conversational :** Specifies the QOS for traffic patterns in which there is an constant flow of packets in each direction, upstream and downstream. This traffic pattern should be the highest QOS.
- **interactive** *traffic_priority :* Specifies the QOS for traffic patterns in which there is an intermittent flow of packets in each direction, upstream and downstream. This traffic pattern should be a higher QOS than the background pattern, but not as high as that for the streaming pattern. *traffic_priority* is the 3GPP traffic handling priority and can be the integers 1,2 or 3.

- **streaming :** Specifies the QOS for traffic patterns in which there is a constant flow of data in one direction, either upstream or downstream. This traffic pattern should be a higher QOS than the interactive pattern, but not as high as that for the conversational pattern.

Important: If this keyword is omitted, the same values are used for all classes.

burst-size { *bytes* | auto-readjust [duration *dur*] }

Default: See Usage section for this command
The burst size allowed, in bytes for peak data rate and committed data rate.
bytes must be an integer from 1 through 6000000.

Important: It is recommended that the minimum value of this parameter be configured to the greater of the following two values: 1) 3 times greater than packet MTU for the subscriber connection, OR 2) 3 seconds worth of token accumulation within the "bucket" for the configured peak-data-rate. In addition, if the committed-data-rate parameter is specified, the burst-size is applied to both the committed and peak rates.

auto-readjust [duration *dur* **]** keyword provides the option to calcualte the Burst size dynamically while configuring rate-limit. Whenever this keyword is enabled to calculate burst size GGSN QoS negotiated rate to be enforced for this calculation.
Every time there is a change in the rates (due to update QoS), the burst sizes will be updated accordingly. This keyword also provides two different burst sizes. One burst size for peak rate and another for committed rate.
By default this keyword is disabled.
duration *dur* describes the duration of burst in seconds. If duration is not specified this keyword will use 1 second as default value. *dur* must be an integer between 1 through 30.

exceed-action { drop | lower-ip-precedence | transmit }

Default: See Usage section for this command
The action to take on the packets that exceed the committed-data-rate but do not violate the peak-data-rate. The following actions are supported:

- **drop**: Drop the packet
- **lower-ip-precedence**: Transmit the packet after lowering the ip-precedence
- **transmit**: Transmit the packet

violate-action { drop | lower-ip-precedence | shape [transmit-when-buffer-full] | transmit }

Default: See Usage section for this command
The action to take on the packets that exceed both the committed-data-rate and the peak-data-rate. The following actions are supported:
drop: Drop the packet
lower-ip-precedence: Transmit the packet after lowering the IP precedence
shape [transmit-when-buffer-full]: Enables the traffic shaping and provides the buffering of user packets when subscriber traffic violates the allowed peak/committed data rate. The **[transmit-when-buffer-full]** keyword allows the packet to be transimitted when buffer memory is full.
transmit: Transmit the packet

+

More than one of the above keywords can be entered within a single command.

Usage

This command configures the APN's quality of service (QoS) data rate shaping through traffic policing/shaping. This command enables the actions on subscriber flow exceeding or violating peak/committed data rate allowed. The shaping function also provides an enhanced function to buffer the exceeded user packets in a buffer memory and sends them to the subscriber when subscriber traffic goes below the committed or peak data rate limit.

Important: The user packet buffer function in traffic shaping is not applicable for real-time traffic.

Important: If the exceed/violate action is set to "lower-ip-precedence", this command may override the configuration of the **`ip qos-dscp`** command in the GGSN service configuration mode for packets from the GGSN to the SGSN. In addition, the GGSN service **`ip qos-dscp`** command configuration can override the APN setting for packets from the GGSN to the Internet. Therefore, it is recommended that command not be used in conjunction with this action.

The command can be entered multiple times to specify different combinations of direction and class. If this command is not configured at all, the GGSN does not perform traffic policing or QoS negotiation with the SGSN (i.e. it accepts all of the SGSN-provided values for the PDP context.

Important: This command should be used in conjunction with the **`max-contexts`** command to limit the maximum possible bandwidth consumption by the APN.

Additional information on the QoS traffic shaping and policing functionality is located in the *System Enhanced Feature Configuration Guide*.
Default Values:
The following table displays the default values for each of the traffic classes:

Table 11.

Class: Conversational	
Downlink Traffic: Disabled Peak Data Rate (in bps): 16000000 Committed Data Rate(in bps): 16000000 Burst Size (in bytes): 65535 Exceed Action: lower-ip-precedence Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate(in bps): 8640000 Committed Data Rate(in bps): 8640000 Burst Size(in bytes): 65535 Exceed Action: lower-ip-precedence Violate Action: drop
Class: Streaming	
Downlink Traffic: Disabled Peak Data Rate(in bps): 16000000 Committed Data Rate(in bps): 16000000 Burst Size(in bytes): 65535 Exceed Action: lower-ip-precedence Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate(in bps): 8640000 Committed Data Rate(in bps): 8640000 Burst Size(in bytes): 65535 Exceed Action: lower-ip-precedence Violate Action: drop

Class: Interactive, Traffic Handling Priority: 1	
Downlink Traffic: Disabled Peak Data Rate(in bps): 16000000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate(in bps): 8640000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop
Class: Interactive, Traffic Handling Priority: 2	
Downlink Traffic: Disabled Peak Data Rate(in bps): 16000000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate(in bps): 8640000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop
Class: Interactive, Traffic Handling Priority: 3	
Downlink Traffic: Disabled Peak Data Rate(in bps): 16000000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate(in bps): 8640000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop
Class: Background	
Downlink Traffic: Disabled Peak Data Rate(in bps): 16000000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate(in bps): 8640000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop

Important: If a “Subscribed” traffic class is received, the system changes the class to “Background” and sets the following parameters: The uplink and downlink guaranteed data rates are set to 0. If the received uplink or downlink data rates are 0 and traffic policing is disabled, the default of 64 kbps is used. When enabled, the APN configured values are used. If the configured value for downlink max data rate is larger than can fit in an R4 QoS profile, the default of 64 kbps is used. If either the received uplink or downlink max data rates is non-zero, traffic policing is employed if enabled for the “Background” class. The received values are used for responses when traffic policing is disabled.

To calculate the burst size dynamically a new optional keyword **auto-readjust [duration** *dur* **]** is provide with **burst-size** keyword. By default the burst size is fixed if defined in bytes with this command. In other words irrespective of the rate being enforced, burst-size fixed as given in the **burst-size** *bytes* parameter.

For the need of variable burst size depending on the rate being enforced this new keyword **auto-readjust [duration** *dur* **]** is provided. Use of this keyword enables the calculation of burst size as per token bucket algorithm calculation as T=B/R, where T is the time interval, B is the burst size and R is the Rate being enforced.

It also provides different burst size for Peak and Committed data rate-limiting.

If **auto-readjust** keyword is not used a fixed burst size must be defined which will be applicable for peak data rate and committed data rate irrespective of rate being enforced.

If **auto-readjust** keyword is provided without specifying the duration a default duration of 1 second will be taken for burst size calculation.

Example

The following command lowers the IP precedence when the committed-data-rate and the peak-data-rate are violated in uplink direction:

```
qos rate-limit direction uplink violate-action lower-ip-precedence
```

The following command buffers the excess user packets when the subscriber traffic violates the configured peak or committed data-rate bps in uplink direction. Once the peak/committed data rate for that subscriber goes below the configured limit it transmit them. It also transmits them if buffer memory is full:

```
qos rate-limit direction uplink violate-action shape transmit-when-
buffer-full
```

qos-renegotiate

This keyword is obsolete.

qos traffic-police

Configure the maximum rates for PDP context negotiation and for Traffic Policing functionality.

This command is obsolete. This functionality is now supported through **`qos negotiate-limit`** and **`qos rate-limit`** commands.

radius

DescriptionThis command is obsoleted.

radius group

DescriptionThis command is obsoleted.

radius returned-framed-ip-address

This command sets the policy whether or not to reject a call when the RADIUS server supplies 255.255.255.255 as the framed IP address and the MS does not supply an address.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
radius returned-framed-ip-address 255.255.255.255-policy {accept-call-when-ms-ip-not-supplied | reject-call-when-ms-ip-not-supplied}

default radius returned-framed-ip-address 255.255.255.255-policy
```

default

Set the policy to its default of rejecting calls when the RADIUS server does not supply a framed IP address and the MS does not supply and address.

accept-call-when-ms-ip-not-supplied

Accept calls when the RADIUS server does not supply a framed IP address and the MS does not supply and address.

reject-call-when-ms-ip-not-supplied

Reject calls when the RADIUS server does not supply a framed IP address and the MS does not supply and address.

Usage

Use this command to set the behavior in the APN when the RADIUS server supplies 255.255.255.255 as the framed IP address and the MS does not supply an address.

Example

Use the following command to set the APN to reject calls when the RADIUS server does not supply a framed IP address and the MS does not supply and address:

```
radius returned-framed-ip-address 255.255.255.255-policy reject-call-when-ms-ip-not-supplied
```

radius returned-username

Product

This command configures the username that is returned in accounting messages. If the username is not available in the Protocol Configuration Options (PCO), then the radius returned username is preferred to the constructed username (imsi@apn, msisdn@apn, or outbound username).

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
radius returned-username { override-constructed-username | prefer-constructed-username} default radius returned-username
```

override-constructed-username

If Radius Server returns a username in the Access-Accept message and username is not available in the Protocol Configuration Options (PCO) and then the new username from the radius server will be used.

prefer-constructed-username

If the username is not available in the PCO, constructed username (imsi@apn, msisdn@apn) will be used irrespective of the username for the Radius Server. This is the default.

default radius returned-username

The default value for the radius returned-username is prefer-constructed-username i.e. constructed username (imsi@apn, msisdn@apn) will be used.

Important: If the username is available in the PCO, then that username will be used irrespective of this CLI (radius returned-username).

Usage

Use this command to configure the username that is returned in accounting messages

Example

Following command sets the default value for the radius returned-username is prefer-constructed-username; i.e. constructed username (imsi@apn, msisdn@apn):

```
default radius returned-username
```

restriction-value

Configures the level of restriction to ensure controlled co-existence of the Primary PDP Contexts.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
restriction-value value
[ default | no ] restriction-value
```

value

A unique number identifying the type of network supported for primary PDP contexts facilitated by this APN. The following values are supported:

- *1*: Value used for WAP or MMS type of networks. This corresponds to APN type public-1.
- *2*: Value used for Internet or PSPDN type of networks. This corresponds to APN type public-2.
- *3*: Value used for corporate customers who use MMS. This corresponds to APN type private-1.
- *4*: Value used for corporate who do not use MMS. his corresponds to APN type private-2.

default | no

Default: no restriction-value
Entering either **default** or **no restriction-value** sets the internal value to zero (0) so that connection to any APN is allowed.

Usage

Restricts the ability to have connections to public access and certain private APNs as required by the APN configuration. Also allows co-existence of the Primary PDP Contexts in a controlled manner.
It does not restrict total number of Primary PDP Context for the user. It also configures a method for preventing hackers in the public domain from using the UE as a router.
Access is provided based on the following rules:

- If *value* = 1, then PDP contexts with restriction values of 0, 1, 2, and/or 3 are allowed
- If *value* = 2, then PDP contexts with restriction values of 0, 1 and/or 2 are allowed
- If *value* = 3, then PDP contexts with restriction values of 0 and/or 1 are allowed
- If *value* = 4, then PDP contexts with no restriction values are allowed
- If **default** or **no** syntax is entered, then no PDP contexts have restriction

In the event that a Maximum APN Restriction value is received from the SGSN as part of a PDP context Create (CPCR) or Update (UPCR) message, the GGSN allows the request based on the following matrix:

- If maximum = 0, then allow connection to any APN
- If maximum = 1, then allow APN Restriction values of 0, 1, 2, and/or 3
- If maximum = 2, then allow APN Restriction values of 0, 1 and/or 2

- If maximum = 3, the allow APN Restriction values of 0 and/or 1
- If maximum = 4, then always reject
- If maximum = anything else, then allow all APN Restriction values (1, 2, 3, and/or 4)

Refer to 3GPP 23.060 version 6.9.0 for more information.

Example

The following command sets the restriction value of the APN to *2*:

```
restriction-value 2
```

secondary ip pool

This command specifies a secondary IP pool to be used as backup pool for NAT.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

```
secondary ip pool pool_name
no secondary ip pool
```

no

Removes the previous secondary IP pool configuration.

pool_name

Specifies the secondary IP pool name.
pool_name must be an alpha and/or numeric string of 1 through 31 characters in length.

Usage

Use this command to configure a secondary IP pool for NAT subscribers, which is not overwritten by the RADIUS supplied list. The secondary pool configured will be appended to the RADIUS supplied IP pool list / APN provided IP pool list whichever is applicable during call setup.

Important: This command is license dependent, requiring the 600-00-7871 NAT Bypass license. Please contact your local sales representative for more information.

Example

The following command configures a secondary IP pool named *test123*:

```
secondary ip pool test123
```

selection-mode

Configures the level of verification that will be used to ensure a MS's subscription to use this APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
selection-mode { chosen-by-sgsn | sent-by-ms | subscribed } +
```

chosen-by-sgsn

Default: Disabled
The MS's subscription will not be verified and the APN will be provided by the SGSN.

sent-by-ms

Default: Disabled
The MS's subscription will not be verified and the APN will be provided by the MS.

subscribed

Default: Enabled
The MS's subscription will be verified by the SGSN.

+

More than one of the above keywords can be entered within a single command.

Usage

Use this command to specify the level of verification that will be used to ensure a MS's subscription to use this APN. This setting must mach the corresponding setting on the SGSN. If the two settings are not identical, the GGSN rejects the session with a cause code of 201 (D1H, User authentication failed).

Example

The following command specifies that the MS's subscription will not be verified and that the APN name will be supplied by the SGSN:

```
selection-mode chosen-by-sgsn
```

timeout

Configures the session timeout values for this APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
timeout { absolute | qos-renegotiate } time
```

```
[ no | default ] timeout [ absolute | qos-renegotiate ]
```

no

Returns the timeout parameter to its default setting. If neither the absolute or idle keywords are used in conjunction with this keyword, both timeout options will be returned to their default settings.

default

Set the default value for the followed option.

absolute

Configures the absolute maximum time a session may exist in any state (active or idle).

qos-renegotiate

This keyword is obsolete.

time

Default:

- absolute = 0 (Disabled)
- qos-renegotiation = 300

Measured in seconds, the time can be configured to any integer value between 0 and 4294967295.
A time of 0 disables timeouts for this APN.

Usage

Use this command to limit the amount of time that a subscriber session can remain connected or QoS renegotiation dampening timer.

Example

The following commands enables an absolute time timeout of *60000* seconds:

```
timeout absolute 60000
```

timeout bearer-inactivity

This command configures the bearer inactivity timer and the threshold value of the traffic (uplink + downlink) through an APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
timeout bearer-inactivity time volume-threshold total bytes
[ no | default ] timeout bearer-inactivity
```

no

Removes the configured bearer inactivity timer values and traffic threshold limit.

default

Sets the bearer inactivity timer to disabled mode.

time

Specifies the timeout duration in second to check inactivity on the bearer.
time must be an integer value from 3600 through 2592000.

qos-renegotiate

Configures the dampening timeout value for the QoS renegotiation (in seconds).
In event of QoS upgrade specified timeout duration will be ignored and renegotiation will start immediately.

volume-threshold total *bytes*

The keyword sets the volume threshold in bytes to check the low activity on the bearer. This total volume is sum of the traffic in uplink and downlink direction
bytes must be an integer value from 1 through 4294967295.

Usage

Use this command to configures the bearer inactivity timer and the threshold value of the traffic (uplink + downlink) through an APN.

Example

The following commands enables the inactivity time on bearer with timeout duration of *7200* seconds and total traffic volume of *256000* bytes in uplink and downlink direction as threshold:

timeout bearer-inactivity *7200* **volume-threshold total** *256000*

timeout idle

Configures the idle timeout duration for long duration timer for subscriber session.

Product

All

Privilege

Security Administrator, Administrator

Syntax`timeout idle idle_dur`

`no timeout idle`

no

Indicates the timeout specified is to be returned to its default behavior. If no specific timeout is specified then all are set to their default behavior.

idle_dur

Default: 0
Designates the maximum duration of the session, in seconds, after the expiry of which the system considers the session as dormant or idle and invokes the long duration timer action.
idle_dur must be a value in the range from 0 through 4294967295.
The special value 0 disables the timeout specified.

Usage

Use this command to set the idle time duration for subscriber session to determine the dormant session. Refer to the **long-duration-action detection** and **long-duration-action disconnection** command in this chapter for additional information.

Example

Following command sets the idle timeout duration to *450* seconds.

timeout idle *450*

timeout long-duration

Configures the long duration timeout and inactivity duration for subscriber session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
timeout long-duration ldt_timeout [ inactivity-time inact_timeout ]

no timeout long-duration
```

no

Indicates the timeout specified is to be returned to its default behavior. If no specific timeout is specified then all are set to their default behavior.

long-duration *ldt_timeout*

Default: 0
Designates the maximum duration of the session, in seconds, before the system automatically reports/terminates the session.
Specifies the maximum amount of time, in seconds, before the specified timeout action is activated.
ldt_timeout must be a value in the range from 0 through 4294967295.
The special value 0 disables the timeout specified.

inactivity-time *inact_timeout*

Specifies the maximum amount of time, in seconds, before the specified session is marked as dormant.
inact_timeout must be a value in the range from 0 through 4294967295.
The special value 0 disables the inactivity time specified.

Usage

Use this command to set the long duration timeout period and inactivity timer for subscriber session. Reduce the idle timeout to free session resources faster for use by new requests.
Refer to the **long-duration-action detection** and **long-duration-action disconnection** command in this chapter for additional information.

Example

Following command sets the long duration timeout duration to 300 seconds and inactivity timer for subscriber session to 45 seconds.

```
timeout long-duration 300 inactivity-time 45
```

tunnel address-policy

This command specifies the address allocation / validation policy for all tunneled calls (IP-IP, IP-GRE) except L2TP calls. This means that GGSN IP address validation could be disabled for specified incoming calls.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
tunnel address-policy { alloc-only | alloc-validate | no-alloc-validate }

default tunnel address-policy
```

alloc-only

IP addresses are allocated locally and no validation is done.

alloc-validate

Default.
The VPN Manager allocates and validates all incoming IP addresses from a static pool of IP addresses.

no-alloc-validate

No IP address assignment or validation is done for calls coming in via L3 tunnels. Incoming static IP addresses are passed. This allows for the greatest flexibility.

default

Resets the tunnel address-policy to alloc-validate.

Usage

This command supports scalable solutions for Corporate APN deployment as many corporations handle their own IP address assignment. In some cases this is done to relieve the customer or the mobile operators from the necessity of reconfiguring the range of IP addresses for the IP pools at the GGSN.
For calls coming through L2TP tunnels, the command **l3-to-l2-tunnel address policy** as defined in the APN Configuration mode, will continue to be in effect.

Example

Use the following command to reset the IP address validation policy to validate against a static pool of address:

```
default tunnel address-policy
```

Use the following command to disable all IP address validation for calls coming through tunnels:

```
tunnel address-policy no-alloc-validate
```

tunnel gre

Configures Generic Routing Encapsulation (GRE) tunnel parameters between the GGSN and an external gateway for the APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
tunnel gre peer-address peer_address local-address local_addr [ preference num ]
no tunnel gre peer-address peer_address
```

no

Disables GRE tunneling for the APN.

peer-address *peer_address*

Specifies the IP address of the external gateway terminating the GRE tunnel.
peer_address must be expressed in dotted decimal notation.

local-address *local_addr*

Specifies the IP address of the interface in the destination context of the GGSN originating the GRE tunnel.
local_addr must be expressed in dotted decimal notation.

preference *num*

Default: 1
This option can be used to assign a preference to the tunnel.
preference can be configured to any integer value from 1 to 128.

Important: Only one GRE tunnel per APN is supported. Therefore, the preference should always be set to "1".

Usage

Subscriber IP payloads are encapsulated with IP/GRE headers and tunneled by the GGSN to an external gateway.

Example

The following command configures the system to encapsulate subscriber traffic using GRE and tunnel it from a local address of 192.168.1.100 to a gateway with an IP address of 192.168.1.225:

```
tunnel gre peer-address 192.168.1.225 local-address 192.168.1.100
preference 1
```

tunnel ipip

Configures IP-in-IP tunnelling parameters between the GGSN and an external gateway for the APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
tunnel ipip peer-address peer_address local-address local_addr [ preference num
]

no tunnel ipip
```

no

Disables IP-in-IP tunneling for the APN.

peer-address *peer_address*

Specifies the IP address of the external gateway terminating the IP-in-IP tunnel.
peer_address must be expressed in dotted decimal notation.

local-address *local_addr*

Specifies the IP address of the interface in the destination context of the GGSN originating the IP-in-IP tunnel.
local_addr must be expressed in dotted decimal notation.

preference *num*

Default: 1
If multiple tunnels will be configured, this option can be used to assign a preference to the tunnel.
preference can be configured to any integer value from 1 to 128.

Usage

Subscriber IP payloads are encapsulated with IP-in-IP headers and tunneled by the GGSN to an external gateway.

Example

The following command configures the system to encapsulate subscriber traffic using IP-in-IP and tunnel it from a local address of 192.168.1.100 to a gateway with an IP address of 192.168.1.225:

```
tunnel ipip peer-address 192.168.1.225

local-address 192.168.1.100 preference 1
```

tunnel ipsec

This command configures sessions for the current APN to use an IPSEC tunnel based on the IP pool corresponding to the subscribers assigned ip address.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[no] tunnel ipsec use-policy-matching-ip-pool
```

no

Disables the use of the IPSEC policy that matches the IP pool that the assigned IP address relates to.

Usage

Use this command to set the APN to use an IPSEC policy that is assigned to the IP pool that the subscribers assigned IP address relates to.

Example

The following command enables the use of the policy that matches the IP pool address:

```
tunnel ipsec use-policy-matching-ip-pool
```

tunnel l2tp

Configures Layer 2 Tunnelling Protocol (L2TP) parameters between the GGSN and an external gateway for the APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
tunnel l2tp [peer-address lns-address [[encrypted] secret l2tp_secret]
[preference num] [tunnel-context name] [local-address ip-address] [crypto-map
map_name {[encrypted] isakmp-secret crypto_secret}] [local-hostname hostname]

no tunnel [peer-address lns-address]
```

no

Disables L2TP, or secure L2TP tunneling for the APN if a specific peer-address is not specified, or, if a peer-address is specified, this keyword removes the peer-address configuration from the APN.

l2tp

Configures the APN to support L2TP tunnels to a peer LNS.

peer-address *lns-address*

Specifies the IP address of the LNS node that the LAC service connects to.
lns-address must be expressed in dotted decimal notation.

Important: A maximum of four LNS peers can be configured per APN.

encrypted

This keyword is intended only for use by the system while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the secret keyword is the encrypted version of the plain text secret. Only the encrypted secret is saved as part of the configuration file.

secret *l2tp_secret*

Specifies the shared secret (password) between the LAC service (configured on the system) and the LNS node.
l2tp_secret must be from 1 to 127 alpha and/or numeric characters and is case sensitive.

preference *num*

Default: 1
Specifies the preference of the tunnel if the LAC service communicates with multiple LNS nodes.
preference can be configured to any integer value from 1 to 128.

tunnel-context *name*

Specifies the name of the destination context on the system in which the LAC service(s) is configured.
name must be from 1 to 79 alpha and/or numeric characters and is case sensitive.

Important: If this option is not configured, the system will attempt to determine the name of the destination context from the **ip context-name** parameter configured for the APN.

local-address *ip-address*

Specifies the IP address of an interface that is bound to a LAC service. This is a mechanism to dictate which LAC service to use to facilitate the subscriber's L2TP session.
address is the IP address of the interface in dotted decimal notation.

Important: If the address configured does not exist or is not bound to a LAC service, the system will automatically choose a LAC service to use.

local-hostname *hostname*

This keyword configures LAC-Hostname to be used for the communication with the LNS peer for this APN. When Tunnel parameters are not received from the RADIUS Server, Tunnel parameters configured in APN are considered for the LNS peer selection. When APN Configuration is selected, local-hostname configured with "tunnel l2tp" command in the APN for the LNS peer will be used as a LAC Hostname.

Important: For this configuration to take effect **allow aaa-assigned-hostname** command, which is used to configure LAC-Hostname based on the "Tunnel-Client-Auth-ID" attribute received from the RADIUS Server, needs to be configured in the LAC Service Configuration mode.

hostname is name of the local host for the LNS peer and must be an alpha and/or numeric string of between 1 through 127 characters.
When Tunnel parameters are not received from the RADIUS Server, Tunnel parameters configured in APN will be considered for the LNS peer selection. When APN Configuration is selected, local hostname *hostname* configured with this command in the APN for the LNS peer will be used as a LAC Hostname.

crypto-map *map_name* **{ [encrypted] secret** *crypto_secret* **}**

Configures the IPSec crypto-map policy that is to be associated with this L2TP tunnel configuration for secure L2TP.
map_name is the name of a crypto-map policy configured on the system and must be from 1 to 127 alpha and/or numeric characters and is case sensitive.
encrypted is intended only for use by the system while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the secret keyword is the encrypted version of the plain text secret. Only the encrypted secret is saved as part of the configuration file.
secret specifies the secret associated with the crypto-map policy. *crypto_secret* can be from 0x to 255 bytes.

Usage

This command can be used to configure the GGSN to tunnel subscriber traffic to one or more peer LNSs using L2TP or L2TP with IPSec.

When using L2TP, the system functions as a L2TP access Concentrator (LAC) and tunnels traffic to a peer L2TP Network Server (LNS). LAC functionality is supported through the configuration of LAC Services defined in destination contexts configured on the system.
When using crypt-map policies, the system functions in the same fashion as with L2TP, with the exception that the encapsulated L2TP traffic is further encrypted using IPSec. IPSec functionality is supported through the definition of crypto maps configured in the same destination context as the LAC services.
A maximum of four LNS peers can be configured per APN. If no peer is specified, the system will use the LAC Service(s) configured in the same destination context as the APN.

Example
The following command configures L2TP support for the APN. It configures the APN to tunnel traffic to an LNS with an IP address of 192.168.1.50 through a LAC service bound to an interface with an IP address 192.168.1.201 configured in a destination context on the system called pdn1. The shared secret between the system and the LNS is 5496secRet. This will be the only LNS configured so the default preference of 1 will not be changed.

```
tunnel l2tp peer-address 192.168.1.50 secret 5496secRet tunnel-context
pdn1 local-address 192.168.1.201
```

virtual-apn

Configures references (or links) to alternative APNs to be used for PDP context processing based on properties of the context. This command also configures the APN properties against which the PDP contexts are compared. This command supports roaming and visiting subscriber also.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
virtual-apn {gcdr apn-name-to-be-included {gn | virtual} | preference priority
apn apn_name { domain domain_name | mcc mcc_number mnc mnc_number | ggsn-service
svc-name |  sgsn-address {ip_address |ip_address/mask } | roaming-mode { home |
visiting | roaming } } }

no virtual-apn preference priority
```

no

Removes a previously configured “virtual” APN.

gcdr apn-name-to-be-included { *gn* | *virtual* }

If *virtual* APN to be used is configured, the virtual APN name is sent in G-CDRs. Provides an option to either send the virtual APN name or the Gn APN name (that comes from the SGSN) in G-CDRs.
gn: the APN received in the Create PDP Context Request message from SGSN
virtual: the APN selected by the GGSN. This is the default.

preference *priority*

Specifies the order in which the referenced APNs are compared by the system.
priority specifies the order and can be configured to any integer value from 1 (highest priority) to 1000 (lowest priority).

apn *apn_name*

Specifies the name of an alternative APN configured on the system that is to be used for PDP contexts with matching properties.
apn_name is the name of the alternative APN and can be from 1 to 62 alpha and/or numeric characters and is not case sensitive. It may also contain dots (.) and/or dashes (-).

domain *domain_name*

Specifies the subscriber’s domain name (realm).
domain_name must be a string of 1 through 79 characters in length, is case sensitive and can contain all special characters.

ggsn-service *svc-name*

Specifies the name of the GGSN service.

svc-name must be from 1 to 63 alpha and/or numeric characters and is case sensitive.

mcc *mcc_number*

Specifies the mobile country code (MCC) portion of the PLMN's identifier.
mcc_number is the PLMN MCC identifier and can be configured to any integer value between 100 and 999.

mnc *mnc_number*

Specifies the mobile network code (MNC) portion of the PLMN's identifier.
mnc_number is the PLMN MNC identifier and can be configured to any 2 or 3 digit integer value between 00 and 999.

sgsn-address {*ip_address | ip_address/mask***}**

Specifies SGSN address (or network) for this virtual APN.
ip_address is the IP address of the SGSN in dotted decimal notation.
ip_address/mask is the IP address of the SGSN in dotted decimal notation with network-host mask separation.

roaming-mode { home | visiting | roaming }

Supports separate PDP context processing for roaming, visiting, and home subscribers. It supports separate rule type along with domain, imsi, and sgsn-address types.

Usage

This command simplifies the configuration process for mobile operators allowing them to provide subscribers with access to a large number of packet data networks, characterized by APN templates, while only having to configure a small number of APNs on the HLR.
Each "virtual" APN is a reference, or a link, to an alternate APN configured on the system. Each reference is configured with a rule that subscriber PDP contexts are compared against and a priority that dictates the comparison order. The references works as follows:
1. A Create PDP Context Request message is received by the GGSN. The message specifies an APN configured in the HLR.
2. The GGSN determine whether its own matching APN configuration contains "virtual" APN references.
3. The system determines the priority of the references and compares the associated information pertaining to the PDP context against the configured rules.
4. If the rule matches, the parameters in the APN specified by the reference are applied to the PDP context. If not, the rules in the reference with the next highest priority are compared against the PDP context. This occurs until a match is found. If none of the references match, then the parameters within the current APN are applied to the PDP context.
The GGSN supports a maximum of 1023 Virtual APN mapping configurations in a system. A single Gn APN can be configured with up to 1000 mapping rules. Multiple Gn APNs are supported - each requiring Virtual APN mapping configurations. The limit imposed is that the total virtual apn mappings across all Gn APNs should not exceed 1023.
The functionality provided by this command can also be used to restrict access to particular APNs. To restrict access based on a particular rule (either domain name or mobile country code/mobile network code), the "virtual" APN reference should refer to an APN that not is configured on the system and contain the desired rule. All PDP contexts matching the configured rule would then be denied with a reason code of 219 (DBH), Missing or Unknown APN.

Example

The following commands configure two “virtual” APNs, priority 1 references the bigco APN with a domain rule of bigco.com, priority 2 references the bigtown APN with a mobile country code rule of 100 and a mobile network code rule of 50.

```
virtual-apn preference 1 apn bigco domain bigco.com

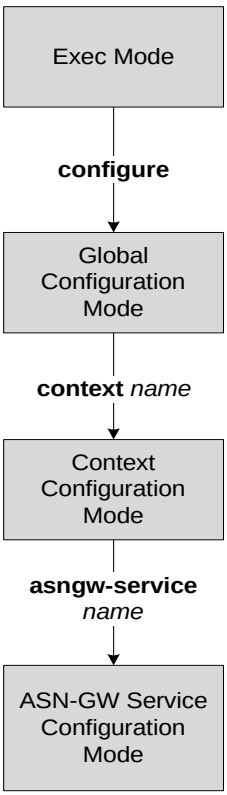
virtual-apn preference 2 apn bigtown mcc 100 mnc 50

virtual-apn preference 3 apn bigco.com sgsn-address 192.168.62.2

virtual-apn preference 4 apn bigco.co.kr sgsn-address 192.168.60.2/24
```

Chapter 14
ASN Gateway Service Configuration Mode Commands

The ASN GW Service Configuration Mode is used to create and manage ASN Gateway services within the current context.



active-relay

This command enables the active relay functionality for R4 and R6 messages in ASN GW and configures the timeout duration in seconds for R4 or R6 messages actively relayed by the ASN GW (e.g. Data Path messages).

Product

ASN GW

Privilege

Administrator

Syntax

active-relay timeout *duration*

[default] active-relay timeout

default

Sets the total timeout duration to 15 seconds to actively relayed R4 or R6 messages.

duration

Default: 15
Specifies the maximum allowable timeout duration for the ASN GW service to actively relay the R4 or R6 messages.
duration is measured in seconds and can be configured to any integer value from 5 through 65535.

Usage

Use this command to enable the active relay of R4 and R6 messages and also to configure the maximum timeout duration for the actively relayed R4 or R6 messages by ASN GW.
By default system is pre-configured for passive relay functionality for R4 and R6 messages.

Example

The following command configures the timeout duration of *20* seconds for actively relayed R4 or R6 messages:

active-relay timeout *20*

authentication

This command configures the authentication type and parameters used for subscribers in this service.

Product

ASN GW

Privilege

Administrator

Syntax

```
authentication { single-eap |  none }

default authentication
```

default

Disables the authentication requirement for the ASN GW service.

single-eap

This keyword enables single Extensible Authentication Protocol (EAP) authentication for specific ASN GW service subscriber. Possible single-EAP authentication are User-only, Device-only, or Device-User authentication.

none

This is the default setting for authentication. This keyword disables all type of authentications for specific ASN GW service.

Usage

Use this command to configure authentication requirements for the ASN GW service.

Example

The following command sets the user authentication for ASN GW service with single EAP:

```
authentication single-eap
```

bind

This command binds the ASN GW service to a logical IP interface and configures the maximum number of subscriber supported within an ASN GW service.

Product

ASN GW

Privilege

Administrator

Syntax

bind address *ip_address* **[max-subscribers** *max_subs* **]**

no bind

no

Removes the binding of the service to a specified interface.

ip_address

Specifies the IP address of the interface to which the service is being bound. *ip_address* must be expressed in IPv4 dotted decimal or IPv6 colon separated notation.

max-subscribers *max_subs*

Configures the maximum number of subscribers allowed to connect with this ASN Gateway within specific ASN GW service.
max_subs must be an integer between 1 and 1500000.

Usage

Use this command to associated the service with a specific logical IP address and provides the identity of the ASN Gateway as either the domain name of the ASN GW service or the IP address. This command also configures the maximum number of subscribers can be allowed with this service.

Example

The following command binds the ASN GW service to a logical interface with an IP address of *1.2.3.4* with a limit of *250000* subscribers:

bind address *1.2.3.4* **max-subscribers** *250000*

bs-monitor

This command provides the configurations to enable or disable the ASN base station monitoring and related parameters in a WiMAX ASN.

Product

ASN GW

Privilege

Administrator

Syntax

bs-monitor [interval *duration* **| num-retry** *retries* **| timeout** *idle_time* **]**

[default | no] bs-monitor

default

Disables the configured BS monitoring parameters.

no

Removes the configured BS monitoring feature and parameters.

interval *duration*

Default: 60
Configures the interval duration in seconds between two ICMP ping messages sent to ASN BS for BS monitoring.
duration specifies the amount of time in seconds between two ICMP ping message to monitor an ASN BS and must be an integer value in the range of 1 through 36000.

num-retry *retries*

Default: 5
Configures the number of retries before marking specific ASN BS as down/dead.
retries specifies the number of retries to sent ICMP ping messages to an ASN BS before the ASN BS is declared as dead/unreachable and must be an integer value in the range of 0 through 100.

timeout *idle_time*

Default: 3
Configures the timeout duration to wait for a response from ASN BS of ICMP ping message before retransmitting the ICMP ping packets.
idle_time must be an integer value in the range of 1 through 10.

Usage

Use this command to enable or disable the base station monitoring and to configure the ASN BS monitoring parameters in a WiMAX ASN.

Important: Base Station Monitoring is a license-enabled feature.

Example

The following command configures the timeout duration of *5* seconds before sending ICMP ping message if ASN BS not responded:

bs-monitor timeout *6*

end

This command exits the current mode and returns to the Executive Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Executive mode.

exit

This command exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

gre

This command configures the GRE tunnel parameters for ASN GW gateway functionality within specific ASN GW service.

Product

ASN GW

Privilege

Administrator

Syntax

gre mtu *mtu_size*

default gre mtu

default

Sets the MTU size for GRE tunnel to default value of 1500 bytes in WiMAX network.

mtu *mtu_size*

Default: 1500 bytes
Configures the maximum transmission unit size in bytes in GRE tunnel with specific ASN GW service. *mtu_size* must be an integer between 36 and 2000.

Usage

Use this command to support the tunnel reassembly optimization with MTU size in GRE tunnel in WiMAX network.

Example

The following command configures the maximum transmission unit (MTU) size to *1700* bytes for GRE tunnel:

default gre mtu *1700*

handover

This command specifies the handover related parameters between BS, ASN GW, and MS.

Product

ASN GW

Privilege

Administrator

Syntax

```
handover { anchor { dp-pre-reg-termination timeout duration| dp-termination
timeout duration } | max-dp-pre-registrations reg_num | non-anchor { dp-pre-reg-
termination timeout duration | dp-termination timeout duration } }

default handover { anchor { dp-pre-reg-termination timeout | dp-termination
timeout } | max-dp-pre-registrations | non-anchor { dp-pre-reg-termination
timeout | dp-termination timeout } }
```

default

Sets the default values for configured handover parameters.

anchor

Configures datapath pre-registration and/or termination parameters for an anchor gateway handover.

dp-pre-reg-termination timeout *duration*

Default: 5
Configures the maximum allowable duration in seconds that a single MS can keep the pre-registration datapath with the previous BS after a handover has completed to another BS.
duration is measured in seconds and can be configured to any integer value from 0 through 65535.

dp-termination timeout *duration*

Default: 0
Configures the maximum allowable duration in seconds for which the datapath with the previous BS is maintained after a handover has completed to another BS. The system maintains the old datapath after new datapath setup is completed with another BS for specified period and then terminates it.
duration is measured in seconds and can be configured to any integer value from 0 through 65535.

max-dp-pre-registrations *reg_num*

Default: 1
Configures the maximum number of pre-registrations from multiple BSs that a single MS can keep at a time.
reg_num is the number of pre-registrations and can be configured to any integer value from 0 through 5.

non-anchor

Configures datapath pre-registration and/or termination parameters for a non-anchor gateway handover.

Usage

Use this command to configure the handover related parameters between MS, BS, and ASN GW.
By default system is configured to terminate the previous sessions immediately and number of pre-registration from multiple BSs is set to 0 for an MS.

Example

The following command configures the maximum allowable duration as *20* seconds for which the datapath with the previous BS is maintained after a handover has completed to another BS:

```
dp-pre-reg-termination timeout 20
```

idle-mode

Configures the timeout duration in seconds an ASN GW service waits to send a session to the idle mode if no activity occurs for specified duration of entry timeout or reactivate an idle session after the specified duration of exit timeout.

Product

ASN GW

Privilege

Administrator

Syntax

idle-mode { entry-timeout *duration*| **exit-timeout***duration* | **timeout** *duration* **}**

default idle-mode { entry-timeout| **exit-timeout | timeout }**

default

Resets the idle mode durations to their respective default values.

no

Disables/removes the configured idle mode entry and/or exit timeout duration for a session.

entry-timeout *duration*

Default: 60
Specifies the maximum duration in seconds allowed for idle mode entry for a session.
duration is measured in seconds and can be configured to any integer value from 1 through 100000.

exit-timeout *duration*

Default: 60
Specifies the maximum duration in seconds allowed for session to reenter in to active mode after idle mode exit.
duration is measured in seconds and can be configured to any integer value from 1 through 100000.

timeout *duration*

Default: 4069
Specifies the maximum time (in seconds) allowed for a session to remain in idle mode. *duration* must be an integer from 128 to 65535.

Usage

Use this command to configure the ASN GW service to send a session for idle mode or active mode after specified duration of time.

Example

The following command configures the idle mode entry timeout value to *50* seconds:

idle-mode entry-timeout *50*

max-retransmission

This command the maximum number of times that the system attempts retransmission of R6 control packets to communicate with unresponsive BS.

Product

ASN GW

Privilege

Administrator

Syntax

max-retransmission *retry*

default max-retransmission

default

Sets the maximum number of retransmission counter to 3 for R6 control packets within specific ASN GW service.

retry

Default: 3
Configures the maximum number of retransmission of R6 control packets to BS before marking it as dead/failed. *retry* must be an integer between 1 and 10.

Usage

Use this command to configure number of retransmission of R6 control packets to BS before marking it as fail/dead.

Example

The following command configures the system to attempt *2* times to send R6 control packets to BS:

max-retransmission *2*

mobile-ip

This command configures Mobile IP support with FA service(s) for specific ASN GW service and specifies the context in which the FA service is configured. Default: no

Product

ASN GW

Privilege

Administrator

Syntax

mobile-ip foreign-agent context*context_name*

no mobile-ip foreign-agent context

foreign-agent context *context_name*

Default: No FA context specified.
Specifies the name of the previously configured context that facilitates the FA service(s).
context_name must be between 1 and 79 alpha or numeric characters and is case sensitive.

Usage

FA services on the system can be configured either in the same or different contexts from those facilitating ASN GW services. When they are configured in separate contexts, this command configured within an ASN GW service instructs the ASN GW service to route traffic to the context facilitating the FA service.
Use the **no mobile-ip foreign-agent context** to delete a previously configured destination context.

Example

The following command instructs the ASN GW service to use the context named FA-destination for FA functionality:

mobile-ip foreign-agent context *fa-destination*

peer-asngw

This command provides the facility to configure the addresses of trusted non-anchor ASN GW or non-anchor ASN PC/LR peers that a specific ASN GW service can allow R4 control and data path registration with.

Product

ASN GW

Privilege

Administrator

Syntax

[no] peer-asngw address *ip_address*

no

Removes the configured non-anchor ASN GW or non-anchor ASN PC/LR peers from a specific ASN GW service's trusted peer list.

address ip_address ip_address

Specifies the IP address of the non-anchor ASN GW or non-anchor ASN PC/LR peers which is added as a trusted peer with the ASN GW service.
ip_address is the IP address of the non-anchor ASN GW or non-anchor ASN PC/LR peers expressed in IPv4 dotted decimal or IPv6 colon separated notation.

Usage

Use this command to create the trusted non-anchor ASN GW or non-anchor ASN PC/LR peers with a specific ASN GW service to establish R4 control and data path registration.
On receipt of R4 control or data path registration request message the ASN GW service checks whether non-anchor DPF/Authenticator ASN GW/ASN PC-LR address received in request message is in trusted peer ASN GW/ASN PC-LR list configured with this command. If the Anchor DPF/Authenticator ASN GW/ASN PC-LR address received in request message is not there (or not configured) in non-anchor ASN GW or non-anchor ASN PC/LR peers list the ASN GW service sends response for request message with Failure Indication TLV with unspecified error code.
A maximum of 32 ASN GWs or ASN PC/LRs can be configured with this command.

Example

The following command adds the ASN GW with an IP address of *1.2.3.4* as a trusted peer within an ASN GW service.

peer-asngw address *1.2.3.4*

policy

This command configures the policies for ASN Gateway behavior within specific ASN GW service.

Product

ASN GW

Privilege

Administrator

Syntax

```
policy { ms-unexpected-network-reentry | msid-dhcp-chaddr-mismatch | non-anchor-mode } { allow | disallow }

default policy { ms-unexpected-network-reentry | msid-dhcp-chaddr-mismatch | non-anchor-mode }
```

default

Resets the policy parameters to their respective default values.

ms-unexpected-network-reentry

Default: allow
Configures the ASN Gateway to allow/disallow an MS re-entry from the same or a new BS, when an active call already exists for the same MS on the ASN Gateway.
This policy performs in the following manner:

- If the pre-attachment request of the new call comes from a different BS, re-entry is accepted regardless of the call state.
- If the pre-attachment request of the new call comes from the same BS, re-entry is accepted if the original call is in any state past the pre-attachment phase.
- Original call is dropped in favor of new call.

msid-dhcp-chaddr-mismatch

Default: disallow
Configures the ASN Gateway to allow/disallow an MS to connect if MSID and DHCP address information mismatched.

non-anchor-mode

Default: allow
Configures the ASN Gateway to allow/disallow the creation of non-anchor sessions based on DP Registration Request from any Base Station.
When non-anchor mode is not allowed and a DP Registration Request is received, and there is no matching session for the MSID, the request is rejected and a DP Registration Response is sent with an error code as "**Admin Prohibited**".

allow

Sets the policies to allow the MS matching with specified policy for ASN Gateway.

disallow

Sets the policies to deny/disallow the MS matching with specified policy for ASN Gateway.

Usage

Use this command to configure the policies for behavior of ASN Gateway to handle the MS connection within specific ASN GW service.

Example

The following command enforce the policy to allow an MS re-entry from new BS, when an active call exists for the same MS on the ASN Gateway via another BS.:

```
policy ms-unexpected-network-reentry allow
```

policy asngw-initiated-reauth

This command configures the policies for ASN Gateway behavior to initiate reauthorization triggers from ASN GW service.

Product

ASN GW

Privilege

Administrator

Syntax

policy asngw-initiated-reauth { allow | disallow | max-cmac-key-count *max_count*| **pmk-grace-time** *grace_time* **}**

default policy asngw-initiated-reauth [max-cmac-key-count | pmk-grace-time]

default

Resets the policy to disallow ASN GW initiated re-authorization and sets the default values for CMAC key count and PMK grace time within the specific ASN GW service.

max-cmac-key-count *max_count*

Default: 100
Configures the ASN Gateway to trigger the reauthorization on the basis of Cipher-based Message Authentication Code (CMAC) key counter. Once the CMAC counter crosses the configured value, the system initiates the reauthorization trigger.
max_count is the CMAC key counter and must be an integer from 2 through 32768.

pmk-grace-time *grace_time*

Default: 60
Configures the ASN Gateway to trigger the reauthorization on the basis of Pairwaise Master Key (PMK) key grace period. Once the configured PMK grace period exhausted the system initiates the reauthorization trigger.
grace_time is the grace period in seconds to wait for Pairwaise Master Key (PMK) and must be an integer from 10 through 65335.

allow

Default: disabled
Configures the ASN Gateway to initiate the reauthorization trigger to start the re-authentication based on two locally configured parameters; i.e. **pmk-grace-time** and **cmac-key-count**.

disallow

Default: enabled
Configures the ASN Gateway not to initiate the reauthorization trigger to start the re-authentication based on two locally configured parameters; i.e. **pmk-grace-time** and **cmac-key-count**.

Usage

Use this command to configure to enable the ASN GW to initiated reauthorization trigger on the basis of configured policy.

Example

The following command enforces the policy to trigger the reauthorization from the ASN GW:

```
policy asngw-initiated-reauth allow
```

policy overload

Configures traffic overload policy to control congestion in this service.

Product

ASN GW

Privilege

Administrator

Syntax

```
policy overload { drop | reject }

default policy overload
```

default

Sets the traffic overload policy action to reject in this service.

drop

Default: disabled
Specifies that the system is to drop incoming packets containing new session requests.

reject

Default: enabled
Specifies that the system processes new session request messages and responds with a reject message.

Usage

Congestion policies at the service-level can be configured for service. When congestion control functionality is enabled at service level, these policies dictate how services respond should the system detect that a congestion condition threshold has been crossed.

Example

The following command configures an overload policy of reject for this ASN GW service:

```
policy overload reject
```

ran-peer-map

Identifies a base station peer map for this service.

Product

ASN GW

Privilege

Administrator

Syntax

ran-peer-map *name*

no ran-peer-map

name

Specifies the name of the RAN Peer Map. *name* must be from 1 to 31 alpha and/or numeric characters and be an existing peer map. RAN Peer Maps are configured in the Global Configuration Mode.

Usage

Use this command to configure a base station peer map that this service will use to map MAC addresses received in R6 protocol messages to IPv4 addresses.

Example

The following command configures the service to refer to a peer map named *ran12* when reconciling a base station MAC address to an IP address:

ran-peer-map *ran12*

retransmission-timeout

Configures the amount of time that must pass without any response before the system re-attempts to send R6 control packets to BS.

Product

ASN GW

Privilege

Administrator

Syntax

retransmission-timeout *duration*

[no | default] retransmission-timeout

default

Sets the timeout duration to 3 seconds for retransmission of R6 control packets.

no

Disables/removes the configured timeout duration for retransmission of R6 control packets.

duration

Default: 3
Specifies the maximum allowable time for the ASN GW service to wait for a response from the BS before it (a) attempts to communicate with the BS again (if the system is configured to retry the BS) or (b) marks the BS as unreachable.
duration is measured in seconds and can be configured to any integer value between 1 and 1,000.

Usage

Use this command in conjunction with the **max-retransmission** command in order to configure the ASN GW services behavior when it does not receive a response from a particular BS.
Use the **no retransmission-timeout** command to delete a previously configured timeout value. If after deleting the lifetime setting you desire to return the lifetime parameter to its default setting, use the **default retransmission-timeout** command.
The chassis is shipped from the factory with the retransmission timeout set to 3 seconds.

Example

The following command configures a retransmission timeout value of 5 seconds:

retransmission-timeout *5*

The following command deletes a previously configured retransmission-timeout setting:

no retransmission-timeout

secondary-ip-hosts

This command enable/disables the multiple host support behind a WiMAX customer premise equipment (CPE). .
Default: disabled

Product

ASN GW

Privilege

Administrator

Syntax

secondary-ip-hosts*max_hosts*

default multiple-ip-hosts

default

Sets the multiple host configuration in an ASN GW service to default mode, i.e. disabled.

max_hosts

Default: 0 (disabled)
Specifies the maximum number of hosts allowed to connect through one primary node connection behind a WiMAX CPE.
max_hosts must be and integer from 0 through 4. Where 0, the default value, keeps this feature disabled.

Usage

Use this command to enable or disable the multi IP host support in an ASN GW service behind one WiMAX CPE through single primary airlink. If enabled this command supports up to 4 hosts as an auxiliary connection. Accounting and UDR generation for such connection will be based on the primary connection with WiMAX CPE. To apply this facility to a subscriber you need to configure the **ip address secondary-pool** command in the **Subscriber Configuration** mode.

Example

The following command enables the multiple host support and instructs the ASN GW service to allow *3* IP hosts as auxiliary connections behind one CPE:

secondary-ip-hosts *3*

The following command disable the multiple host support and instructs the ASN GW service not to allow auxiliary connections behind one CPE:

default secondary-ip-host

setup-timeout

Configures the total amount of allowable time for the ASN GW service to setup a connection with the BS before it marks the BS as unreachable.

Product

ASN GW

Privilege

Administrator

Syntax

setup-timeout*duration*

default setup-timeout

default

Sets the total timeout duration to 60 seconds to setup a connection with BS.

duration

Default: 60
Specifies the maximum allowable time for the ASN GW service to setup the R6 connection with BS before marks the BS as unreachable.
duration is measured in seconds and can be configured to any integer value between 1 and 100000.

Usage

Use this command to configure the maximum setup timeout duration to setup an R6 connection with BS. This command supersedes the duration set through the **max-retransmission** and **retransmission-timeout** commands for R6 connection.
The chassis is shipped from the factory with the connection setup timeout duration to 60 seconds.

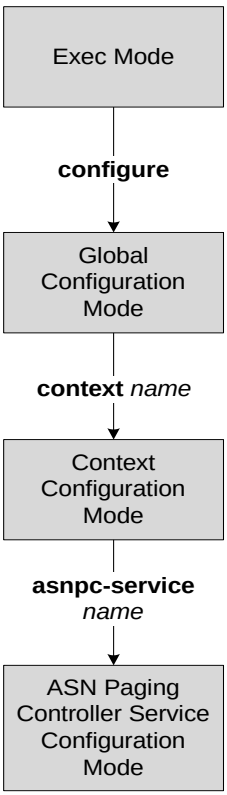
Example

The following command configures an ASN GW service to mark a BS after waiting for *100* seconds before marks it as dead or unreachable:

setup-timeout *100*

Chapter 15
ASN Paging Controller Configuration Mode Commands

The ASN Paging Controller Configuration Mode is used to create and manage ASN paging and location register services for WiMAX subscribers within a context.



asnpc-id

This command configures the identifier for an ASN Paging Controller for subscribers in this service.

Product

ASN PC-LR

Privilege

Administrator

Syntax

asnpc-id *mac_address*

default asnpc-id

default

Sets the ASN paging controller identifier as IP address of system running ASN paging controller and location registry service.

mac_address

Specifies the MAC address of the system running ASN paging controller and location registry service. *mac_address* is the MAC address of paging controller in standard (IEEE 802) format in six groups of two hexadecimal digits, separated by hyphens (-) or colons (:).

Usage

Use this command to configure the MAC address of paging controller for ASN paging controller service.

Example

The following command sets the MAC address of paging controller to *01:23:45:67:89:ab* in colon (:) separated format:

asnpc-id *01:23:45:67:89:ab*

bind

This command binds the ASN paging controller service to a logical IP interface and configures the maximum number of subscribers allowed within a service.

Product

ASN PC-LR

Privilege

Administrator

Syntax

bind address *ip_address* **[max-subscribers** *max_subs* **]**

no bind

no

Removes the binding of the service to a specified interface.

ip_address

Specifies the IP address of the interface to which the service is being bound.
ip_address must be expressed in IPv4 dotted decimal or IPv6 colon separated notation.

max-subscribers *max_subs*

must be an integer between 0 and 1000000 for an ST16 system.
max_subs must be an integer between 0 and 3000000 for an ASR 5000 system.

Usage

Use this command to associated the service with a specific logical IP address and provides the identity of the ASN paging controller as either the domain name of the ASN paging controller service or the IP address. This command also configures the maximum number of subscribers can be allowed with this service.

Example

The following command binds the ASN paging controller service to a logical interface with an IP address of *1.2.3.4* with a limit of *250000* subscribers:

bind address *1.2.3.4* **max-subscribers** *250000*

end

This command exits the current mode and returns to the Executive Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Executive mode.

exit

This command exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the previous mode.

max-retransmission

This command configures the maximum number of times that the system attempts retransmission of R6 control packets to communicate with unresponsive BS.

Product

ASN PC-LR

Privilege

Administrator

Syntax

max-retransmission *retry*

default max-retransmission

default

Sets the maximum number of retransmission counter to 3 for R6 control packets within specific ASN paging controller service.

retry

Default: 3
Configures the maximum number of retransmission of R6 control packets to BS before marking it as dead/failed. *retry* must be an integer between 1 and 10.

Usage

Use this command to configure number of retransmission of R6 control packets to BS before marking it as fail/dead.

Example

The following command configures the system to attempt *2* times to send R6 control packets to BS:

max-retransmission *2*

paging-announce

Configures the number of seconds to wait before sending paging announcement messages to MS.

Product

ASN PC-LR

Privilege

Administrator

Syntax

paging-announce timeout *duration*

default paging-announce timeout

default

Sets the paging announce timeout duration to 10 seconds for sending paging announce.

duration

Default: 10
Specifies the maximum duration in seconds to wait for sending a paging announce to MS.
duration is measured in seconds and must be an integer value from 1 through 1,000.

Usage

Use this command to configure the ASN paging controller services to send a paging announce if no data communication is happened for specified duration of time.

Example

The following command configures the paging announce timeout value of *500* seconds:

paging-announce timeout *500*

paging-group

This command creates/removes the Paging-Group Identifier within specific ASN paging controller service.

Product

ASN PC-LR

Privilege

Administrator

Syntax

paging-group id *paging_group_id* **[-noconfirm]**

no paging-group id *paging_group_id*

no

Disables/removes the Paging Group identifier from specific ASN paging controller service.

id *paging_group_id*

Configures the Paging Group identifier to configure paging agent and other parameters within specific ASN paging controller service.
This is a logical network identifier for the serving BS or other network entity retaining MS service and operational information and/or administering paging activity for the MS while in idle mode
paging_group_id must be an integer from 1 through 65535.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

WARNING: If this keyword option is used with **no paging-group id** *paging_group_id* command the **paging group id** *paging_group_id* will be deleted and disabled with all active/inactive configurations in a paging group without prompting any warning or confirmation.

Usage

Use this command to enter/enable/disable Paging Group Identifier Configuration mode functionality within specific ASN paging controller service.

Important: A maximum of 32 paging groups can be configured within a service.

Example

The following command configures the paging group identifier as *1234* for the ASN paging controller service:

paging-group id *1234*

peer-asngw

This command provides the facility to configure the addresses of trusted anchor ASN GW peers that a specific ASN Paging Controller and Location Registry service will allow R4 control and data path registration with.

Product

ASN PC-LR

Privilege

Administrator

Syntax

[no] peer-asngw address *ip_address*

no

Removes the configured peer anchor ASN GW from a specific ASN PC/LR service's trusted peer list.

address *ip_address*

Specifies the IP address of the anchor ASN GW which is added as a trusted peer with the ASN PC/LR service.
ip_address is the IP address of the anchor ASN GW peers expressed in IPv4 dotted decimal or IPv6 colon separated notation.

Usage

Use this command to create the trusted peer anchor ASN GWs with a specific ASN PC/LR service to establish R4 control and data path registration.
On receipt of idle mode entry request message the ASN PC/LR service checks whether the Anchor DPF/Authenticator ASN GW address received in idle mode entry request message is in trusted peer ASN GW list configured with this command. If the Anchor DPF/Authenticator ASN GW address received in idle mode entry request message is not there (or not configured) in peer list the ASN PC/LR service sends idle mode entry response message with Failure Indication TLV with unspecified error code.
A maximum of 32 ASN GWs can be configured with this command.

Example

The following command adds the anchor ASN GW with an IP address of *1.2.3.4* as a trusted peer within an ASN PC service.

peer-asngw address *1.2.3.4*

peer-asnpc

This command configures the peer Anchor Paging Controller(s) in this ASN PC/LR service.

Product

ASN PC-LR

Privilege

Administrator

Syntax

[no] peer-asnpc id *mac_address* **ip-address** *ip_address*

no

Removes the configured peer ASN PC/LR MAC address and IP address as trusted peer anchor ASN PC/LR.

id *mac_address*

Specifies the MAC address of the trusted peer system running ASN paging controller and location registry service.
mac_address is the MAC address of paging controller in standard (IEEE 802) format in six groups of two hexadecimal digits, separated by hyphens (-) or colons (:).

ip-address *ip_address*

Specifies the IP address of the trusted peer system running ASN paging controller and location registry service.
ip_address is the IP address of paging controller in standard IPv4 format in dotted decimal notation.

Usage

Use this command to configure the trusted peer anchor paging controller for ASN paging controller service. This command provides the input for the internal mapping from PC ID to IP address that is needed to forward the Location Update request from new Anchor PC to current Anchor PC during PC relocation.

Example

The following command sets the peer AS NPC id to *01:23:45:67:89:ab* in colon (:) separated format and the IP address of the paging controller to 1.1.1.1:

peer-asnpc id *01:23:45:67:89:ab* **ip-address** *1.1.1.1*

policy overload

Configures traffic overload policy to control congestion in this service.

Product

ASN PC-LR

Privilege

Administrator

Syntax

```
policy overload { drop | reject }

default policy overload
```

default

Sets the traffic overload policy action to reject in this service.

drop

Default: disabled
Specifies that the system is to drop incoming packets containing new session requests.

reject

Default: enabled
Specifies that the system processes new session request messages and responds with a reject message.

Usage

Congestion policies at the service-level can be configured for service. When congestion control functionality is enabled at service level, these policies dictate how services respond should the system detect that a congestion condition threshold has been crossed.

Example

The following command configures an overload policy of reject for this ASN PC service:

```
policy overload reject
```

retransmission-timeout

Configures the amount of time that must pass without any response before the system re-attempts to send R6 control packets to BS.

Product

ASN PC-LR

Privilege

Administrator

Syntax

default

Sets the timeout duration to 3 seconds for retransmission of R6 control packets.

no

Disables/removes the configured timeout duration for retransmission of R6 control packets.

duration

Default: 3
Specifies the maximum allowable time for the ASN paging controller service to wait for a response from the BS before it a) attempts to communicate with the BS again (if the system is configured to retry the BS) or b) marks the BS as unreachable.
duration is measured in seconds and can be configured to any integer value between 1 and 1,000.

Usage

Use this command in conjunction with the **max-retransmission** command in order to configure the ASN paging controller services behavior when it does not receive a response from a particular BS.
Use the **no retransmission-timeout** command to delete a previously configured timeout value. If after deleting the lifetime setting you desire to return the lifetime parameter to its default setting, use the **default retransmission-timeout** command.
The chassis is shipped from the factory with the retransmission timeout set to 3 seconds.

Example

The following command configures a retransmission timeout value of 5 seconds:

```
retransmission-timeout 5
```

The following command deletes a previously configured retransmission-timeout setting:

setup-timeout

Configures the total amount of allowable time for the ASN paging controller service to setup a connection with the BS before it marks the BS as unreachable.

Product

ASN PC-LR

Privilege

Administrator

Syntax

setup-timeout *duration*
default setup-timeout

default

Sets the total timeout duration to 60 seconds to setup a connection with BS.

duration

Default: 60
Specifies the maximum allowable time for the ASN paging controller service to setup the R6 connection with BS before marks the BS as unreachable.
duration is measured in seconds and can be configured to any integer value between 1 and 100000.

Usage

Use this command to configure the maximum setup timeout duration to setup an R6 connection with BS. This command supersedes the duration set through the **max-retransmission** and **retransmission-timeout** commands for R6 connection.
The chassis is shipped from the factory with the connection setup timeout duration to 60 seconds.

Example

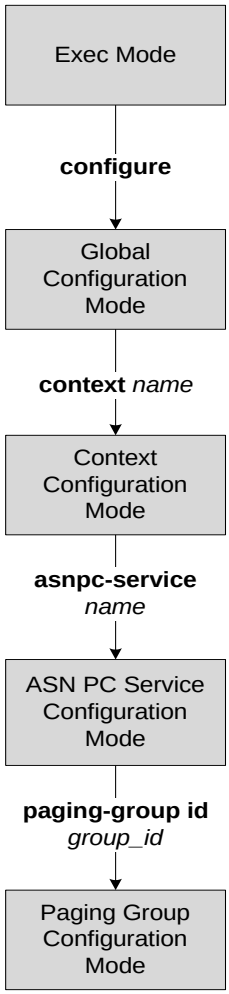
The following command configures an ASN paging controller service to mark a BS after waiting for *100* seconds before marks it as dead or unreachable:

setup-timeout *100*

Chapter 16
ASN Paging Group Configuration Mode Commands

The Paging Group Configuration Mode is used to create and manage Paging Agents for paging and location register controller within the current ASN PC-LR service.

Important: This functionality is still in development stage.



end

This command exits the current mode and returns to the Executive Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Executive mode.

exit

This command exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

paging

Configures the paging parameters within the paging group for PC-LR functionality.

Product

ASN PC-LR

Privilege

Administrator

Syntax

paging { cycle *cycle_value* **| interval** *interval_value* **| node id** *mac_address* **address***ip_address* **| offset algorithm uniform start** *start_value* **increment** *inc_value* **count** *count_value* **}**

no paging { cycle | node id *mac_address* **| offset }**

no

Disables the configured paging parameters within this paging group.

cycle *cycle_value*

Specifies the cycle in which the paging message is transmitted within the paging group.
cycle_value must be an integer from 0 through 65535.

interval *interval_value*

Specifies the maximum duration in frames of Paging Listening Interval; used in calculation of Paging Listening Interval.
interval_value must be an integer from 1 through 5.

node id *mac_address* **address** *ip_address*

id *mac_address*: Configures the MAC address of the node in the paging group.
mac_address must be in one of the following formats:
nn:nn:nn:nn:nn:nn or nn-nn-nn-nn-nn-nn
address *ip_address*: Specifies the IP address of the node. *ip_address* must be expressed in IPv4 or IPv6 dotted decimal notation.

Important: Up to 128 paging nodes can be configured per paging group.

offset algorithm uniform start *start_value* **increment** *inc_value* **count** *count_value*

start *start_value*: Specifies the starting value of the available offset.
start_value must be an integer from 0 through 65535.
increment *inc_value*: Specifies the distance between two offsets.
inc_value must be an integer from 0 through 65535.
count *count_value*: Specifies the number of offsets available.
count_value must be an integer from 0 through 65535.
Offsets are uniformly load balanced across the available range. For this configuration:

paging offset algorithm uniform start *10* **increment** *10* **count** *4*
the following occurs:
if MS1, MS2,...MS100 perform IM-Entry, then offset assigned would be MS1=10, MS2=20, MS3=30, MS4=40, MS5=10, MS6=20, etc.

Usage

Use this command to define the paging behavior of a paging group. There must be only one instance of paging parameters per paging group.

Example

The following example configures the paging cycle for a paging group to *10*.

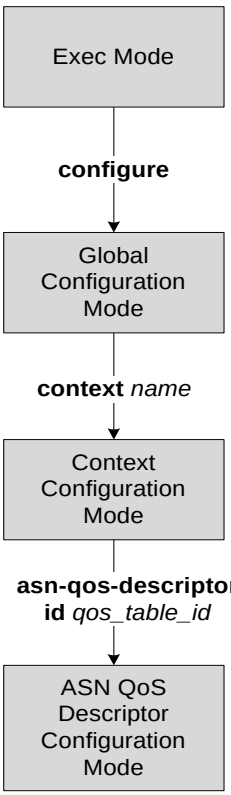
paging cycle ***10***

The following example configures a paging node in the group:

paging node id ***00:05:47:00:37:44*** **address** ***12.345.76.789***

Chapter 17
ASN QoS Descriptor Configuration Mode Commands

The ASN QoS Descriptor Configuration Mode is used to create and manage Quality of Service Descriptor table for the ASN GW service subscribers within the current source context.



end

This command exits the current mode and returns to the Executive Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Executive mode.

exit

This command exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the previous mode.

global-service-class-name

This command configures the global service class name within specific QoS descriptor table.

Product

ASN GW

Privilege

Administrator

Syntax

global-service-class-name *svc_class_name*

no global-service-class-name

no

Removes/deletes the configured global service class name from this QoS descriptor table.

svc_class_name

Specifies the global service class name in QoS descriptor table.
svc_class_name must be an ASCII string of 6 characters in length.

Usage

Use this command to specify global service class name as per IEEE 802.16e standard within specific QoS descriptor table for an ASN GW service.
Global Service Class Name is similar in function to the Service Class Name except that (1) Global Service Class Name use may not be modified by a BS, (2) Global Service Class Name remains consistent among all BS, and 3) Global Service Class Names are a rules-based naming system and contains referential QoS parameter codes.

Example

The following command specifies the global service class name *g_svc1* in an ASN QoS descriptor table:

global-service-class-name *g_svc1*

schedule-type

This command configures the type of data delivery service identifier/type for specific ASN GW service.

Product

ASN GW

Privilege

Administrator

Syntax

schedule-type be [max-sustained-traffic-rate *max_sust_traffic_rate* **| traffic-priority** *priority_value* **] +**

schedule-type ert-vr min-reserved-traffic-rate *min_resd_traffic_rate* **max-latency** *dur_ms* **unsolicited-grant-interval** *dur_ms* **[max-sustained-traffic-rate** *max_sust_traffic_rate* **| max-traffic-burst** *burst_size* **| tolerated-jitter** *dur_ms* **| traffic-priority** *priority_value* **] +**

schedule-type nrt-vr min-reserved-traffic-rate *min_resd_traffic_rate* **[max-sustained-traffic-rate** *max_sust_traffic_rate* **| max-traffic-burst** *burst_size* **| traffic-priority** *priority_value* **] +**

schedule-type rt-vr min-reserved-traffic-rate *min_resd_traffic_rate* **max-latency** *dur_ms* **unsolicited-polling-interval** *dur_ms* **[max-sustained-traffic-rate** *max_sust_traffic_rate* **| max-traffic-burst** *burst_size* **| traffic-priority** *priority_value* **] +**

schedule-type ugs min-reserved-traffic-rate *min_resd_traffic_rate* **max-latency** *dur_ms* **unsolicited-grant-interval** *dur_ms* **[sdu-size** *sdu_size* **| tolerated-jitter** *dur_ms* **| traffic-priority** *priority_value***] +**

default schedule-type

default

Configures the data delivery service type to Best Efforts (BE) service for specific ASN GW service.

be

Configures the data delivery service type to Best Efforts (BE) service for specific ASN GW service.

ert-vr

Configures the data delivery service type to Extended Real-Time Variable Rate (ERT-VR) service for specific ASN GW service.

nrt-vr

Configures the data delivery service type to Non-Real-Time Variable Rate (NRT-VR) service for specific ASN GW service.

rt-vr

Configures the data delivery service type to Real-Time Variable Rate (RT-VR) service for specific ASN GW service.

ugs

Configures the data delivery service type to Unsolicited Grant Service (UGS) for specific ASN GW service.

max-latency *dur_ms*

Specifies the maximum interval in milliseconds between the reception of a packet to BS or SS on its network interface/Convergence Sublayer (CS) and the arrival of packet to its RF interface or the peer device. This value represents a service commitment.
dur_ms must be any integer value between 0 and 65535. Maximum latency set to zero means no commitment available for this service flow.

min-reserved-traffic-rate *min_resd_traffic_rate*

Default: 0 (disabled)
Specifies the minimum traffic rates in bits per second, reserved for a service flow.
min_resd_traffic_rate must be any integer value between 0 and 65535. Minimum reserved traffic rate set to zero means no minimum traffic rate reservation is required for this service flow.

max-sustained-traffic-rate *max_sust_traffic_rate*

Configures the maximum sustained traffic rate in bits per second for traffic schedule.
traffic_rate must be an integer between 1 and 65535.

max-traffic-burst *burst_size*

Default: 0 (disabled)
Specifies the maximum burst size in bits that must be maintained for the service.
burst_size must be any integer value between 0 and 65535. Maximum traffic burst set to zero means no maximum traffic burst reservation is required for this service flow.

sdu-size *sdu_size*

Default: 49
Specifies the length of the Service Data Unit (SDU) in bytes for a fixed-length SDU service flow.
sdu_size must be any integer value between 1 and 65535.

Important: This parameter is used only if packing is on and the service flow is indicated as carrying fixed-length SDUs.

tolerated-jitter *dur_ms*

Specifies the maximum delay variation (jitter) allowed for the connection.
dur_ms must be any integer value between 1 and 65535.

traffic-priority *priority_value*

Default: 0 (disabled)
This optional keyword specifies the traffic priority.
priority_value must be an integer from 0 to 7.

unsolicited-grant-interval *dur_ms*

Specifies the nominal interval in millisecond between successive data grant opportunities for this service flow.
dur_ms must be an integer value between 1 and 65535.

unsolicited-polling-interval *dur_ms*

Specifies the maximum nominal interval in millisecond between successive polling grants opportunities for this service flow.
dur_ms must be any integer value between 1 and 65535.

Usage

Use this command to configure type of data delivery service identifier within ASN GW service.

Important: Only one data delivery service type between **be**, **et-vr**, **rt-vr**, **nrt-vr**, or **ugs** is allowed within an ASN GW service.

Example

The following command configures the data delivery service type to Best Efforts (BE) service for an ASN GW service:

```
default schedule-type
```

service-class-name

This command configures the Service Class Name name within specific QoS descriptor table.

Product

ASN GW

Privilege

Administrator

Syntax

service-class-name *svc_class_name*

no service-class-name

no

Removes/deletes the configured global service class name from this QoS descriptor table.

svc_class_name

Specifies the service class name in QoS descriptor table.
svc_class_name must be an ASCII string of 2 through 128 characters.

Usage

A Service Class Name is a group of QoS parameters defined at the BS and can be referenced by a service flow to apply certain QoS parameters. Use this command to specify Service Class Name as per IEEE 802.16 standard within specific QoS descriptor table for ASN GW service

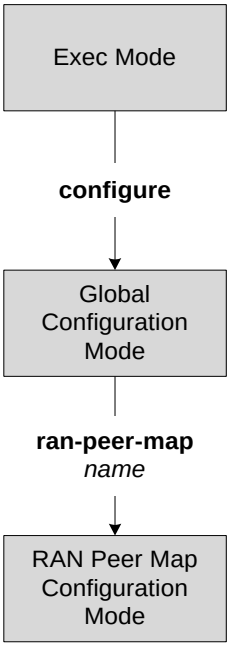
Example

The following command specifies the service class name *ASN_Serv_class1* in a ASN QoS descriptor table:

service-class-name *ASN_Serv_class1*

Chapter 18
ASN RAN Peer Map Configuration Mode Commands

The RAN Peer Map Configuration Mode is used to create and manage global mapping tables of base station peers.



end

This command exits the current mode and returns to the Executive Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Executive mode.

exit

This command exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

ran-peer

Configures the MAC and IP addresses of base station peers being added to this map.

Product

ASN GW

Privilege

Administrator

Syntax

[no] ran-peer id *mac_address* **address** *ip_address*[**mode{non-legacy | legacy}]**

no

Removes the base station peer entry from this map.

id *mac_address* **address** *ip_address*

id *mac_address*: Configures the MAC address of the base station peer in this map.
mac_address must be in one of the following formats:
nn:nn:nn:nn:nn:nn or nn-nn-nn-nn-nn-nn
address *ip_address*: Specifies the IP address of the base station peer. *ip_address* must be expressed in IPv4 or IPv6 dotted decimal notation.
mode {non-legacy | legacy}: Default mode is non-legacy.

Usage

Use this command to add base station peers to this peer map.

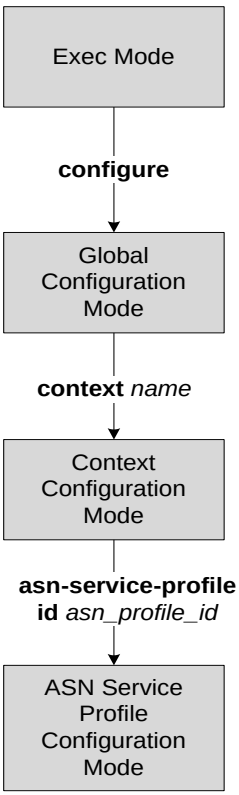
Example

The following command adds a base station peer to this map:

```
ran-peer id 00:05:47:00:37:44 address 12.345.76.789
```

Chapter 19
ASN Service Profile Configuration Mode Commands

The ASN Service Profile Configuration Mode is used to create and manage the service profiles table for the ASN GW service subscribers within the current context.



downlink-classifier

This command specifies the classifier to match for traffic flow in downlink direction for subscribers in this service.

Product

ASN GW

Privilege

Administrator

Syntax

[no] downlink-classifier class-map *class_map_name*

no

Removes/deletes the configured class map for this traffic flow in the ASN GW service.

class-map *class_map_name*

Specifies the configured Class-Map to this traffic flow.
class_map_name is the name of an existing Class-Map configured in the destination context.
Refer to the Class-Map Configuration Mode chapter of this reference for additional information to configure the class maps.

Usage

Use this command to configure classifier for downlink traffic with a configured Class-Map for the ASN GW service subscribers.
A maximum of 4 class-maps can be configured in one ASN GW service profile.
Class-Map Configuration Mode is accessible through Context Configuration Mode.

Example

The following command applies the Class-Map *class_1* to this traffic:

downlink-classifier class-map *class_1*

downlink-qos-id

This command specifies the QoS table identifier to traffic flow in downlink direction for subscribers in this service.

Product

ASN GW

Privilege

Administrator

Syntax

downlink-qos-id *qos_table_id*

[no] downlink-qos-id

no

Removes/deletes the configured class map for this traffic flow in the ASN GW service.

qos_table_id

Specifies the configured ASN QoS Descriptor Identifier to this traffic flow.
qos_table_id is the identifier of an existing ASN QoS Descriptor Table configured in the source context.
Refer to the ASN QoS Descriptor Configuration Mode chapter of this reference for additional information to configure QoS descriptor table identifier.

Usage

Use this command to apply a QoS identifier for downlink traffic with a configured ASN QoS Descriptor Table Identifier for the ASN GW service subscribers.
Only one QoS identifier can be configured in one ASN GW service profile.
ASN QoS Descriptor Configuration Mode is accessible through Context Configuration Mode.

Example

The following command applies the QoS table identifier *123* to this traffic:

downlink-qos-id *123*

end

This command exits the current mode and returns to the Executive Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Executive mode.

exit

This command exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the previous mode.

uplink-classifier

This command specifies the classifier to match for traffic flow in uplink direction for subscribers in this service.

Product

ASN GW

Privilege

Administrator

Syntax

[no] uplink-classifier class-map *class_map_name*

no

Removes/deletes the configured class map for this traffic flow in the ASN GW service.

class-map *class_map_name*

Specifies the configured Class-Map to this traffic flow.
class_map_name is the name of an existing Class-Map configured in the destination context.
Refer to the Class-Map Configuration Mode chapter of this reference for additional information to configure class maps.

Usage

Use this command to configure classifier for uplink traffic with a configured Class-Map for the ASN GW service subscribers.
A maximum of 4 class-maps can be configured in one ASN GW service profile.
Class-Map Configuration Mode is accessible through Context Configuration Mode.

Example

The following command applies the Class-Map *class_1* to this traffic:

uplink-classifier class-map *class_1*

uplink-qos-id

This command specifies the QoS table identifier to traffic flow in uplink direction for subscribers in this service.

Product

ASN GW

Privilege

Administrator

Syntax

uplink-qos-id *qos_table_id*

[no] uplink-qos-id

no

Removes/deletes the configured class map for this traffic flow in the ASN GW service.

qos_table_id

Specifies the configured ASN QoS Descriptor Identifier to this traffic flow.
qos_table_id is the identifier of an existing ASN QoS Descriptor Table configured in the source context.
Refer to the ASN QoS Descriptor Configuration Mode chapter of this reference for additional information to configure QoS descriptor table identifier.

Usage

Use this command to apply a QoS identifier for uplink traffic with a configured ASN QoS Descriptor Table Identifier for the ASN GW service subscribers.
Only one QoS identifier can be configured in one ASN GW service profile.
ASN QoS Descriptor Configuration Mode is accessible through Context Configuration Mode.

Example

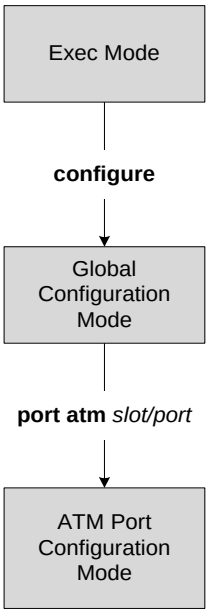
The following command applies the QoS table identifier *123* to this traffic:

uplink-qos-id *123*

Chapter 20
ATM Port Configuration Mode Commands

The Asynchronous Transfer Mode (ATM) port configuration mode provides the commands to create, configure, bind, and manage the ATM ports on line cards that support ATM, such as the ATM/POS OC-3 single-mode and multi-mode optical line cards.

Important: Before using these commands, card framing should be configured for either SDH or SONET with the framing command described in the *Card Configuration Mode* chapter.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

default

Restores the port's default speed and communication mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

default { **preferred slot** | **threshold** { *threshold_type* } }

preferred slot

Sets the port for non-revertive operation for port redundancy auto-recovery; requiring an administrative user to manually issue a port switch to command to return service to the original port.

threshold { *threshold_type***}**

Restores the system defaults for the selected threshold. The possible threshold types are:

- **high-activity:** High port activity threshold settings
- **monitoring:** Threshold monitoring configuration settings
- **rx-utilization:** Receive port utilization threshold settings
- **tx-utilization:** Transmit port utilization threshold settings

Usage

Restores port-level parameters to their default values.

Example

```
default preferred slot
```

description

Defines descriptive text that provides useful information about the port.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

description *text*

no description

no

Erases the port's defined description from the configuration file.

text

text must be a string of 1 to 79 alphanumeric characters with no spaces or a string within double quotes that includes printable characters. The description is case-sensitive.

Usage

Set the description to provide helpful information, for example the port's primary function, services, end users. Define any information, the only limit is the number of characters.

Example

description *samplePortDescriptiveText*

description *"This is a sample description"*

end

Exits the ATM Port configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the ATM Port configuration mode and returns to the global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the Global configuration mode.

line-timing

This command enables the SPIO to recover transmit timing source via line attached to the selected port. By default, line-timing is not enabled.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] line-timing
```

no

Disables line-timing as the source for the transmit clock.

Usage

The port must be enabled (**no shutdown**) to enable recovery of timing source via the line. As well, the card's slot number must be entered in the **recover line#** command of the BITS port configuration mode.

Example

Disable timing clock recovery on this port.

```
no line-timing
```

preferred slot

Identifies which card in a chassis should assume revertive (redundancy auto-recovery) functionality should the slot/port being configured go down. This command must be issued on a per port basis, allowing you to configure specific ports to be used on individual LCs or SPIO cards. For example, ports 1 through 4 could be configured as "preferred" on the LC in slot 17 while ports 5 through 8 are "preferred" on the LC in slot 33. In this scenario, both LCs would be in an Active operational state while still providing LC and port redundancy for the other.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

preferred slot *slot#*

[default | no] preferred slot

default

Default: non-revertive operation.

no

Disables revertive, or auto-recovery, operation for the port.

slot#

Identifies the physical slot in the chassis where the preferred line card is installed.

Usage

This command enables or disables revertive port redundancy. So after a port failover, when the original port is restored to service (i.e. link up) the system will return service to that port automatically.
Disabled, which is the default setting, causes non-revertive operation; requiring an administrative user to manually issue a port switch to command to return service to the original port.

Example

preferred slot *17*

pvc

This command creates a Permanent Virtual Connection (PVC), including the definition of the associated Virtual Path Identifiers (VPI) and Virtual Connection Identifiers (VCI) for the PVC. By defining a PVC, this command enters into PVC configuration mode. The ATM port supports a maximum of 256 PVC definitions.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] pvc vpi vpi# vci vci#
```

no

Deletes the PVC's entry from the configuration.

vpi *vpi#*

VPI identifies a unique path to a destination point in the ATM portion of the network. The VPI and the VCI combine to create the PVC between the MS and the destination point. *vpi#* must be an integer, 0 to 255.

vci *vci#*

VCI identifies a unique virtual circuit within the associated VPI. *vci#* must be an integer, 0 to 65535.

Usage

Creates a virtual circuit between two specific points that the carrier will use repeatedly.

Example

Define a PVC with VPI 2 and VCI 353.

```
pvc vpi 2 vci 353
```

shutdown

Terminates all processes supporting the port or blocks the shutting down of the port. Conversely, this command with the **no** keyword enables the port.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

shutdown

no shutdown

no

Enables the port's administrative state. When omitted the card is shutdown (removed from service).

Usage

Shut down a port prior to re-cabling and/or other maintenance activities.
This command with the **no** keyword is required to bring a port into service.

Example

shutdown

no shutdown

snmp trap link-status

Enables/disables the generation and sending of an SNMP (notification) trap when the port experiences a change of state (up or down).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
snmp trap link-status
no snmp trap link-status
```

no

Disables the sending of traps for link-status changes.

Usage

Enable the sending of link-status change traps if there is a monitoring facility that can use the information or if there are troubleshooting activities in progress.

Example

```
snmp trap link-status
no snmp trap link-status
```

threshold high-activity

Configures the port's high and low activity thresholds.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

threshold high-activity *high_thresh* [**clear** *low_thresh*]

high_thresh

Default: 50
Sets the threshold for the highest percentage of port activity that must be met or exceeded, within the polling interval, to generate an alert or alarm.
high_thresh_% can be configured to any integer value between 0 and 100.

clear *low_thresh*

Default: 50
Sets the threshold for the lowest percentage level of port activity that must be met to generate and send a clear alarm. If port activity does not drop to or below this threshold then the alarm is maintained.
low_thresh_% can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

High port activity thresholds generate alerts or alarms based on the utilization percentage of each configured port during the specified polling interval. This threshold is configured on a per-port basis.
Alerts or alarms are triggered for high port activity based on the following rules:

- **Enter condition:** Actual percent utilization of a port ³ High Threshold
- **Clear condition:** Actual percent utilization of a port < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command in the Global Configuration Mode Commands chapter of this reference to configure the polling interval and the **threshold monitoring** command in this chapter to enable thresholding for this value.

Example

The following command configures a high port utilization threshold percent of 70 and a low threshold of 50 for an system using the Alarm thresholding model:

threshold high-activity *70* **clear** *50*

threshold monitoring

Enables thresholding for port-level values.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
threshold monitoring

no threshold monitoring
```

no

Disables threshold monitoring for port-level values. This is the default setting.

Usage

Thresholding on the system is used to monitor the system for conditions that could potentially cause errors or outage. Typically, these conditions are temporary (i.e high-activity) and are quickly resolved. However, continuous or large numbers of these error conditions within a specific time interval may be indicative of larger, more severe issues. The purpose of thresholding is to help identify potentially severe conditions so that immediate action can be taken to minimize and/or avoid system downtime.

Thresholding reports conditions using one of the following mechanisms:

- **SNMP traps:** SNMP traps have been created that indicate the condition (high threshold crossing and/or clear) of each of the monitored values. Complete descriptions and other information pertaining to these traps is located in the starentMIB(8164).starentTraps(2) section of the SNMP MIB Reference.

The generation of specific traps can be enabled or disabled on the system allowing you to view only those traps that are most important to you.

- **Logs:** The system provides a facility called threshold for which active and event logs can be generated. As with other system facilities, logs are generated Log messages pertaining to the condition of a monitored value are generated with a severity level of WARNING.
- **Alarm System:** High threshold alarms generated within the specified polling interval are considered "outstanding" until a the condition no longer exists and/or a condition clear alarm is generated.

"Outstanding" alarms are reported to through the system's alarm subsystem and are viewable through the system's CLI.

The following table indicates the reporting mechanisms supported by each of the above models.

Table 12. Thresholding Reporting Mechanisms by Model

Model	SNMP Traps	Logs	Alarm System
Alert	X	X	
Alarm	X	X	X

This command enables thresholding for port-level values. Refer to the sections covering **threshold high-activity**, **threshold rx-utilization,** and **threshold tx-utilization** commands in this chapter for information on configuring these values. In addition, refer to the **threshold poll** command in the *Global Configuration Mode Commands* chapter of this reference for information on configuring the polling interval over which these values are monitored.

threshold rx-utilization

Configures thresholds for receive-port utilization.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold rx-utilization *high_thresh* [**clear** *low_thresh*]

high_thresh

Default: 80
The high threshold receive port utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
The percentage can be configured to any integer value between 0 and 100.

clear *low_thresh*

Allows the configuration of the low threshold.
Default: 80
The low threshold receive port utilization percentage that maintains a previously generated alarm condition. If the utilization percentage falls below the low threshold within the polling interval, a clear alarm will be generated.
The percentage can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Receive port utilization thresholds generate alerts or alarms based on the utilization percentage of each configured port in relation to data received during the specified polling interval. This threshold is configured on a per-port basis.

Important: Ports configured for half-duplex do not differentiate between data received and data transmitted. Therefore, to avoid redundant alarms, it is recommended that only the receive **or** transmit utilization threshold be configured.

Alerts or alarms are triggered for receive port utilization based on the following rules:

- **Enter condition:** Actual percent utilization of a port for received data ³ High Threshold
- **Clear condition:** Actual percent utilization of a port for received data < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command in the Global Configuration Mode Commands chapter of this reference to configure the polling interval and the **threshold monitoring** command in this chapter to enable thresholding for this value.

Example

The following command configures a receive port high utilization threshold percent of 70 and a low threshold of 50 for an system using the Alarm thresholding model:

```
threshold rx-utilization 70 clear 50
```

threshold tx-utilization

Configures thresholds for transmit port utilization.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold tx-utilization *high_thresh* [**clear** *low_thresh*]

high_thresh

Default: 80
The high threshold transmit port utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
The percentage can be configured to any integer value between 0 and 100.

clear *low_thresh*

Allows the configuration of the low threshold.
Default: 80
The low threshold transmit port utilization percentage that maintains a previously generated alarm condition. If the utilization percentage falls below the low threshold within the polling interval, a clear alarm will be generated.
The percentage can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Transmit port utilization thresholds generate alerts or alarms based on the utilization percentage of each configured port in relation to data transmitted during the specified polling interval. This threshold is configured on a per-port basis.

Important: Ports configured for half-duplex do not differentiate between data received and data transmitted. Therefore, to avoid redundant alarms, it is recommended that only the receive **or** transmit utilization threshold be configured.

Alerts or alarms are triggered for transmit port utilization based on the following rules:

- **Enter condition:** Actual percent utilization of a port for transmit data ³ High Threshold
- **Clear condition:** Actual percent utilization of a port for transmit data < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command in the Global Configuration Mode Commands chapter of this reference to configure the polling interval and the **threshold monitoring** command in this chapter to enable thresholding for this value.

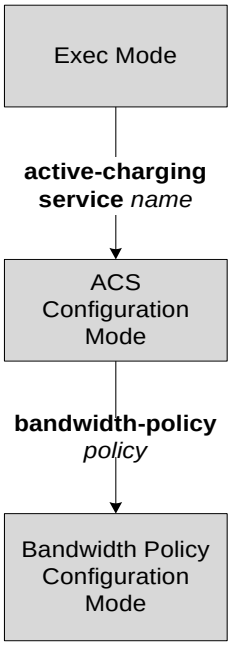
Example

The following command configures a transmit port high utilization threshold percent of 70 and a low threshold of 50 for an system using the Alarm thresholding model:

```
threshold tx-utilization 70 clear 50
```

Chapter 21
Bandwidth Policy Configuration Mode Commands

The Bandwidth Policy Configuration Mode is used to create and manage ACS bandwidth policies.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Returns the CLI prompt to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec mode.

exit

Exits the current configuration mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

flow limit-for-bandwidth

This command configures the ACS Bandwidth-Policy Flow Limit-for-bandwidth configuration.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

flow limit-for-bandwidth id *bandwidth_id* **group-id** *group_id*

no flow limit-for-bandwidth id *bandwidth_id*

no

Removes the specified bandwidth policy configuration.

id *bandwidth_id*

Specifies the ACS Bandwidth-Policy ID.
bandwidth_id must be an integer from 1 through 65535.

group-id *group_id*

Specifies the ACS Bandwidth-Policy Group ID.
group_id must be an integer from 1 through 65535.

Usage

Use this command to configure the ACS Bandwidth-Policy Flow Limit-for-bandwidth configuration.

Example

The following command configures the flow limit-for-bandwidth configuration with bandwidth policy ID *test123* and group ID *123*:

flow limit-for-bandwidth id *test123* group-id *123*

group-id

This command configures the ACS Bandwidth-Policy Group ID.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

group-id *group_id* **direction { downlink | uplink } peak-data-rate** *bps* **peak-burst-size** *bytes* **violate-action { discard | lower-ip-precedence } [committed-data-rate** *bps* **committed-burst-size** *bytes* **[exceed-action { discard | lower-ip-precedence }]]**

{ default | no } group-id *group_id* **direction { downlink | uplink }**

default

Configures default settings for the specified group ID.

no

Removes configuration for the specified group ID.

group_id

Specifies the group ID.
group_id must be an integer from 1 through 65535.

direction { downlink | uplink }

Specifies the direction for which bandwidth will be controlled.

peak-data-rate *bps*

Specifies peak data rate in bits per second.
bps must be an integer from 1 through 4294967295.
Default: 0

peak-burst-size *bytes*

Specifies peak burst size in bytes.
bytes must be an integer from 1 through 4294967295.
Default: 0

violate-action { discard | lower-ip-precedence }

Specifies the action to be taken if Peak Data Rate is surpassed.
discard: Specifies to discard the packet
lower-ip-precedence: Specifies to lower IP precedence of the packet

committed-data-rate *bps*

Specifies the committed Data Rate in bits per second. This can also be used to specify GBR in NCQoS (without the exceed-action).
bps must be an integer from 1 through 4294967295.
Default: 0

committed-burst-size *bytes*

Specifies the committed burst size in bytes.
bytes must be an integer from 1 through 4294967295.
Default: 0

exceed-action { discard | lower-ip-precedence }

Specifies the action to be taken if Committed Data Rate is surpassed.
discard: Specifies to discard the packet
lower-ip-precedence: Specifies to lower IP precedence of the packet

Usage

Use this command to configure the ACS Bandwidth-Policy Group ID.

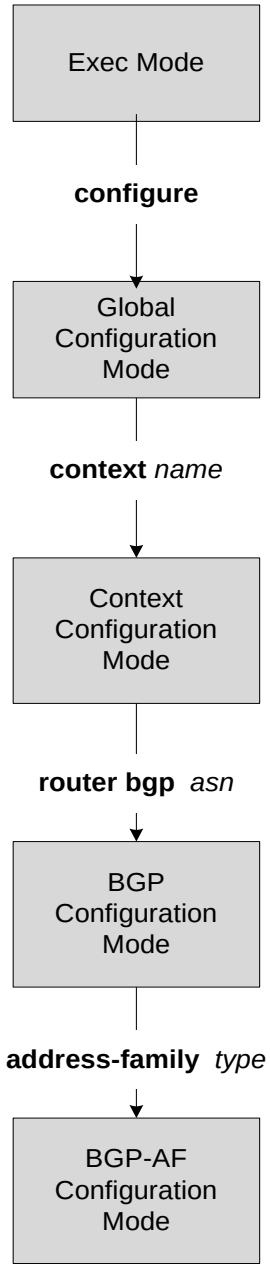
Example

The following command configures group ID of *111* to control bandwidth for the downlink direction specifying peak data rate of *10000* bits per second and peak burst size of *10000* bytes while specifying the action to be taken on violation as discard:

```
group-id 111 direction downlink peak-data-rate 10000 peak-burst-size 10000
violate-action discard
```

Chapter 22
BGP Address-Family (IPv4/IPv6) Configuration Mode Commands

The Border Gateway Protocol (BGP) Address-Family (IPv4/IPv6) Configuration Mode is used to configure the IPv4 and IPv6 address family information.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the global configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the context configuration mode.

neighbor

This command configures IPv4/IPv6 Address Family for BGP routers that interconnect to non-broadcast networks.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
[no] neighbor ip_address {activate|advertisement-interval adv_time | default-
originate [route-map map_name] | distribute-list dist_list {in | out}| ebgp-
multihop [max-hop number] | filter-list filt_list {in | out}| max-prefix max_num
[threshold thresh_percent] [warning-only] | remote-as AS_num| remove-private-AS
| route-map map_name {in | out} | shutdown | timers {[connect-interval
conn_time] | [keepalive-interval keep_time Holdtime-interval hold_time]}|
update-source ip_address | weight value}
```

no

Delete the specified parameter from the router configuration.

activate

Enable the exchange of routes with this neighbor.

advertisement-interval *adv_time*

The minimum interval, in seconds, between sending BGP routing updates.
adv_time must be an integer from 0 through 600.
Default: 30

default-originate [route-map *map_name*]

Originate default routes to this neighbor
route-map *map_name*: Specifies the route-map that contains the criteria to originate default routes.
map_name must be the name of an existing route-map in the current context.

distribute-list *dist_list* **{in | out}**

Filter updates to and from this neighbor based on a route access list.
Default: No filtering is performed.
dist_list: The name or number of an existing route-access-list.
in: Indicates that incoming advertised routes should be filtered.
out: Indicates that outgoing advertised routes should be filtered.

ebgp-multihop [max-hop *number*]

Allow EBGP neighbors not on directly connected networks.
max-hop *number*: The maximum number of hops allowed to reach a neighbor. *number* must be an integer from 1 through 255.
Default hop count: 255

filter-list *filt_list* **{in | out}**

Establish BGP filters based on an AS path access list
filt_list: The name of an existing AS path access list.
in: Indicates that incoming advertised routes will be filtered.
out: Indicates that outgoing advertised routes will be filtered.

max-prefix *max_num* **[threshold** *thresh_percent***] [warning-only]**

The maximum number of prefixes accepted from this peer. When the maximum is exceeded the neighbor connection is reset.
max_num: Specifies the maximum number of prefixes permitted. This must be an integer from 1 through 4294967295.
Default: No maximum prefix limit.
threshold *thresh_percent*: A percentage value which specifies that when the BGP table is the specified percentage full from this peer warnings are sent to the neighbor. *thresh_percent* must be an integer from 1 through 100.
warning-only: This keyword specifies that only a warning message is sent when the limit is exceeded. The neighbor connection is not reset

remote-as *AS_num*

Specify the AS number of the BGP neighbor.
AS_num: The neighbor's autonomous system number. must be an integer from 1 through 65535.

remove-private-AS

Remove the private AS number from outbound updates.
Default: Do not remove the private AS number.

route-map *map_name* **{in | out}**

Apply a route map to the neighbor.
map_name: Specifies the route-map apply. *map_name* must be the name of an existing route-map in the current context.
in: Indicates that the route map applies to incoming advertisements.
out: Indicates that the route map applies to outgoing advertisements.

shutdown

Administratively shut down this neighbor. This disables exchanging routes or configuring parameters for this neighbor.

timers {[connect-interval *conn_time***] | [keepalive-interval** *keep_time* **Holdtime-interval** *hold_time***]}**

BGP timers for the specified neighbor.
connect-interval *conn_time*: Specifies the connect timer in seconds. *conn_time* must be an integer from 0 through 65535. The default is 60 seconds.
keepalive-interval *keep_time*: The frequency, in seconds, at which the current BGP router sends keepalive messages to its neighbor. *keep_time* must be an integer from 0 through 65535. The default is 30 seconds.
Holdtime-interval *hold_time*: The interval, in seconds, the router waits for a keepalive message before declaring a neighbor dead. *hold_time* must be an integer from 0 through 65535. The default is 90 seconds.

update-source *ip_address*

use this keyword to bind the specified IP address to the bgp socket that is used to communicate to the peer.
ip_address is an IPv4 address in dotted decimal notation.
In most cases you should set the update-source address to the address of the loopback interface in the current context. By doing this, the tcp connection does not go down until there is no route for the loopback address in the peering router.

weight *value*

This command sets the default weight for routes from this neighbor.
value: This must be an integer from 0 through 65535.
Default: 0

Usage

Use this command to set parameters for communication with a specified neighbor. The chassis supports a maximum of 64 peers per context.

Important: A remote AS number must be specified for a neighbor before other parameters can be configured.

Example

The following command specifies that the neighbor at the IP address *192.168.100.25* has an AS number of 2000:

neighbor *192.168.100.25* **remote-as** *2000*

The following command allows BGP neighbors that are a maximum of *27* hops away:

neighbor *192.168.100.25* **ebgp-multihop max-hop** *27*

The following command sets the minimum interval between sending routing updates to *3* minutes

neighbor *192.168.100.25* **advertisement-interval** *180*

The following command sets the default weight for all routes from the specified neighbor to 100:

neighbor *192.168.100.25* **weight** *100*

network

This command configures and specifies a network to announce via BGP.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
network ip_adrress/mask [ route-map map_name ]
```

```
no network ip_adrress/mask [ route-map map_name ]
```

no

Delete the specified network from the configuration for the BGP router.

ip_adrress/mask

Specifies the IP address and netmask bits for the network to announce via BGP. *ip_address* is a network IP address (in dotted-decimal notation) and *mask* is the number of subnet bits, representing a subnet mask in shorthand. These must be entered in the IPv4 dotted-decimal notation/subnet bits format .

route-map *map_name*

Filter routes through the specified route map before announcing the network. map_name specifies the name of the route-map to use and must be specified as a string of 1 through 79 alphanumeric characters.

Usage

Use this command to specify a network to announce via BGP.

Example

The following command announces the network 192.168.0.0 with a netmask of 16 via BGP:

```
network 192.168.0.0/16
```

The following command removes the network from the BGP router configuration:

```
no network 192.168.0.0/16
```

redistribute

This command redistributes routes into BGP. This means that any routes from another protocol are redistributed to BGP neighbors using the BGP protocol.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
[no] redistribute {connected | ospf | rip | static} [route-map map_name]
```

no

Remove the specified redistribution parameters from the BGP router configuration.

connected

Specifies that connected routes will be redistributed.

ospf

Specifies that OSPF routes will be redistributed

rip

Specifies that RIP routes will be redistributed. (RIP is not supported at this time.)

static

Specifies that static routes will be redistributed.

route-map *map_name*

Filter routes through the specified route map before redistribution.
map_name specifies the name of the route-map to use and must be specified as a string of 1 through 79 alphanumeric characters

Usage

Use this command to specify what routes this BGP router should redistribute into BGP.

Example

The following command redistributes OSPF routes after filtering them through the route map named Map1:

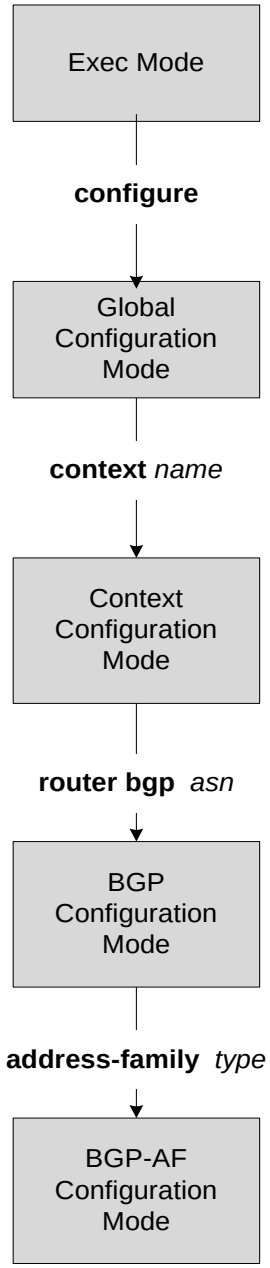
```
redistribute ospf route-map Map1
```

The following command removes the redistribution of OSPF routes from the router's configuration:

```
no redistribute ospf route-map Map1
```

Chapter 23
BGP Address-Family (VPNv4) Configuration Mode Commands

The Border Gateway Protocol (BGP) Address-Family (VPNv4) Configuration Mode is used to configure the VPNv4 address family information.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the global configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the context configuration mode.

neighbor

This command configures VPNv4 address family on BGP routers that interconnect to non-broadcast networks and enables the exchange of routing information with a peer router (neighbor).

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[no] neighbor ip_address {activate| remote-as AS_num | send-community {both |
extended | standard} }
```

no

Delete the specified parameter from the router configuration.

ip_address

Specifies the IP address of the peer router (neighbor).

activate

Enable the exchange of routing information with this neighbor.

remote-as *AS_num*

Specify the AS number of the BGP neighbor.
AS_num: The neighbor's autonomous system number. must be an integer from 1 through 65535.

send-community extended

This keyword sends the extended community attributes to a peer router (neighbor).

Usage

Use this command to enable the exchange of routing information with a peer router. The chassis supports a maximum of 64 peers per context.

Important: A remote AS number must be specified for a neighbor before other parameters can be configured.

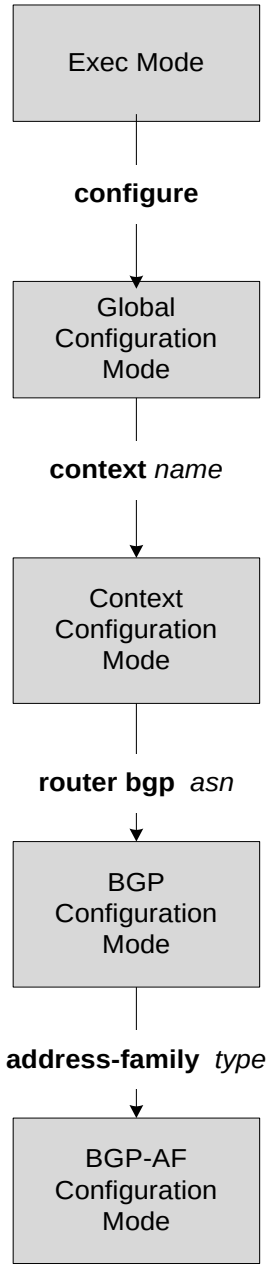
Example

The following command specifies that the neighbor at the IP address 192.168.100.25 has an AS number of 2000:

neighbor *192.168.100.25* **remote-as** *2000*

Chapter 24
BGP Address-Family (VPNv4) Configuration Mode Commands

The Border Gateway Protocol (BGP) Address-Family (VPNv4) Configuration Mode is used to configure the VPNv4 address family information.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

Return to the context configuration mode.

neighbor

This command configures IPv4/IPv6 Address Family for BGP routers that interconnect to non-broadcast networks.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
[no] neighbor ip_address {activate|advertisement-interval adv_time | default-
originate [route-map map_name] | distribute-list dist_list {in | out}| ebgp-
multihop [max-hop number] | filter-list filt_list {in | out}| max-prefix max_num
[threshold thresh_percent] [warning-only] | remote-as AS_num| remove-private-AS
| route-map map_name {in | out} | shutdown | timers {[connect-interval
conn_time] | [keepalive-interval keep_time Holdtime-interval hold_time]}|
update-source ip_address | weight value}
```

no

Delete the specified parameter from the router configuration.

activate

Enable the exchange of routes with this neighbor.

advertisement-interval *adv_time*

The minimum interval, in seconds, between sending BGP routing updates.
adv_time must be an integer from 0 through 600.
Default: 30

default-originate [route-map *map_name*]

Originate default routes to this neighbor
route-map *map_name*: Specifies the route-map that contains the criteria to originate default routes.
map_name must be the name of an existing route-map in the current context.

distribute-list *dist_list* **{in | out}**

Filter updates to and from this neighbor based on a route access list.
Default: No filtering is performed.
dist_list: The name or number of an existing route-access-list.
in: Indicates that incoming advertised routes should be filtered.
out: Indicates that outgoing advertised routes should be filtered.

ebgp-multihop [max-hop *number*]

Allow EBGP neighbors not on directly connected networks.
max-hop *number*: The maximum number of hops allowed to reach a neighbor. *number* must be an integer from 1 through 255.
Default hop count: 255

filter-list *filt_list* **{in | out}**

Establish BGP filters based on an AS path access list
filt_list: The name of an existing AS path access list.
in: Indicates that incoming advertised routes will be filtered.
out: Indicates that outgoing advertised routes will be filtered.

max-prefix *max_num* **[threshold** *thresh_percent***] [warning-only]**

The maximum number of prefixes accepted from this peer. When the maximum is exceeded the neighbor connection is reset.
max_num: Specifies the maximum number of prefixes permitted. This must be an integer from 1 through 4294967295.
Default: No maximum prefix limit.
threshold *thresh_percent*: A percentage value which specifies that when the BGP table is the specified percentage full from this peer warnings are sent to the neighbor. *thresh_percent* must be an integer from 1 through 100.
warning-only: This keyword specifies that only a warning message is sent when the limit is exceeded. The neighbor connection is not reset

remote-as *AS_num*

Specify the AS number of the BGP neighbor.
AS_num: The neighbor's autonomous system number. must be an integer from 1 through 65535.

remove-private-AS

Remove the private AS number from outbound updates.
Default: Do not remove the private AS number.

route-map *map_name* **{in | out}**

Apply a route map to the neighbor.
map_name: Specifies the route-map apply. *map_name* must be the name of an existing route-map in the current context.
in: Indicates that the route map applies to incoming advertisements.
out: Indicates that the route map applies to outgoing advertisements.

shutdown

Administratively shut down this neighbor. This disables exchanging routes or configuring parameters for this neighbor.

timers {[connect-interval *conn_time***] | [keepalive-interval** *keep_time* **Holdtime-interval** *hold_time***]}**

BGP timers for the specified neighbor.
connect-interval *conn_time*: Specifies the connect timer in seconds. *conn_time* must be an integer from 0 through 65535. The default is 60 seconds.
keepalive-interval *keep_time*: The frequency, in seconds, at which the current BGP router sends keepalive messages to its neighbor. *keep_time* must be an integer from 0 through 65535. The default is 30 seconds.
Holdtime-interval *hold_time*: The interval, in seconds, the router waits for a keepalive message before declaring a neighbor dead. *hold_time* must be an integer from 0 through 65535. The default is 90 seconds.

update-source *ip_address*

use this keyword to bind the specified IP address to the bgp socket that is used to communicate to the peer.
ip_address is an IPv4 address in dotted decimal notation.
In most cases you should set the update-source address to the address of the loopback interface in the current context. By doing this, the tcp connection does not go down until there is no route for the loopback address in the peering router.

weight *value*

This command sets the default weight for routes from this neighbor.
value: This must be an integer from 0 through 65535.
Default: 0

Usage

Use this command to set parameters for communication with a specified neighbor. The chassis supports a maximum of 64 peers per context.

Important: A remote AS number must be specified for a neighbor before other parameters can be configured.

Example

The following command specifies that the neighbor at the IP address *192.168.100.25* has an AS number of 2000:

neighbor *192.168.100.25* **remote-as** *2000*

The following command allows BGP neighbors that are a maximum of *27* hops away:

neighbor *192.168.100.25* **ebgp-multihop max-hop** *27*

The following command sets the minimum interval between sending routing updates to *3* minutes

neighbor *192.168.100.25* **advertisement-interval** *180*

The following command sets the default weight for all routes from the specified neighbor to 100:

neighbor *192.168.100.25* **weight** *100*

redistribute

This command redistributes routes into BGP. This means that any routes from another protocol are redistributed to BGP neighbors using the BGP protocol.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
[no] redistribute {connected | ospf | rip | static} [route-map map_name]
```

no

Remove the specified redistribution parameters from the BGP router configuration.

connected

Specifies that connected routes will be redistributed.

ospf

Specifies that OSPF routes will be redistributed

rip

Specifies that RIP routes will be redistributed. (RIP is not supported at this time.)

static

Specifies that static routes will be redistributed.

route-map *map_name*

Filter routes through the specified route map before redistribution.
map_name specifies the name of the route-map to use and must be specified as a string of 1 through 79 alphanumeric characters

Usage

Use this command to specify what routes this BGP router should redistribute into BGP.

Example

The following command redistributes OSPF routes after filtering them through the route map named Map1:

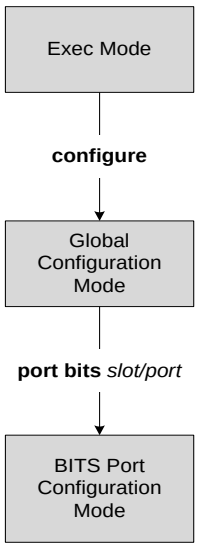
```
redistribute ospf route-map Map1
```

The following command removes the redistribution of OSPF routes from the router's configuration:

```
no redistribute ospf route-map Map1
```

Chapter 25
BITS Port Configuration Mode Commands

The Building Integrated Timing Supply (BITS) port configuration mode provides the commands to configure the BITS ports on the SPIO and optionally to configure the transmit timing source.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

default

Restores the port's default speed and communication mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
default { mode | preferred slot }
```

mode

Sets the default for the ports framing mode. The default is no mode configuration.

preferred slot

Sets the port for non-revertive operation for port redundancy auto-recovery; requiring an administrative user to manually issue a port switch to command to return service to the original port.

Usage

Restores port-level parameters to their default values.

Example

```
default preferred slot
```

description

Defines descriptive text that provides useful information about the port.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

description *text*

no description

no

Erases the port's description from the configuration file.

text

text must be a string of 1 to 79 alphanumeric characters with no spaces or a string within double quotes that includes printable characters. The description is case-sensitive.

Usage

Set the description to provide helpful information, for example the port's primary function, services, end users. Define any information, the only limit is the number of characters.

Example

description ***samplePortDescriptiveText***
description ***"This is a sample description"***

end

Exits the BITS port configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the BITS port configuration mode and returns to the Global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the Global configuration mode.

mode

Configures the framing mode for the port.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

mode { **e1** | **t1** } **framing** *type*

e1 | t1

e1 selects the SDH E1 framing mode.
t1 selects the SONET T1 framing mode.

framing *type*

basic selects the Frame Alignment Signal (FAS) used with E1.
crcmf selects the Multiframe with CRC (FAS+CRC) used with E1.
esf selects the extended superframe format used with T1.
sf select the superframe format (D4) used with T1.

Usage

Set the ports framing mode parameters.

Example

Configure the port to support E1 with crcmf framing.
mode e1 framing *crcmf*

preferred slot

Identifies which card in a chassis should assume revertive (redundancy auto-recovery) functionality should the slot/port being configured go down. There are only two SPIO, one in slot 24 and the other in slot 25.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

preferred slot *slot#*

[**default** | **no**] **preferred slot**

default

Default: non-revertive operation.

no

Disables revertive, or auto-recovery, operation for the port.

slot#

Identifies the physical slot in the chassis where the SPIO is installed.

Usage

This command enables or disables revertive port redundancy. So after a port failover, when the original port is restored to service (i.e. link up) the system will return service to that port automatically.
Disabled, which is the default setting, causes non-revertive operation; requiring an administrative user to manually issue a **port switch** to command to return service to the original port.

Example

preferred slot *25*

recover

Configure line-timing so the SPIO recovers the transmit timing source from an external source via one of the line cards in the chassis. The recovered clock is then distributed for use to all line cards in the chassis.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

recover { **line1** *slot#* | **line2** *slot* # }

no recover { **line1** | **line2** }

no

Deletes the identified line-timing source definition from the configuration.

line1 *slot#*

Sets first priority for line-timing clock recovered from the line card in the specified slot.
slot#: a number between 1 and 48.

line2 *slot#*

Sets second priority for line-timing clock recovered from the line card in the specified slot.
slot#: a number between 1 and 48. Can not be the same slot number entered for **line1**.

Usage

Define which line-timing source has priority.

Example

Configure the line card in slot 19 as the preferred line-timing source.

```
recover line1 19
```

shutdown

Terminates all processes supporting the port or blocks the shutting down of the port. Conversely, this command with the **no** keyword enables the port and BITS -timing as a transmit timing source.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

shutdown

no shutdown

no

Enables the port's administrative state. When omitted the card is shutdown (removed from service).

Usage

Shut down a port prior to re-cabling and/or other maintenance activities.
This command with the **no** keyword is required to bring a port into service.

Example

```
shutdown
no shutdown
```

snmp trap link-status

Enables/disables the generation and sending of an SNMP (notification) trap when the port experiences a change of state (up or down).

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
snmp trap link-status

no snmp trap link-status
```

no

Disables the sending of traps for link-status changes.

Usage

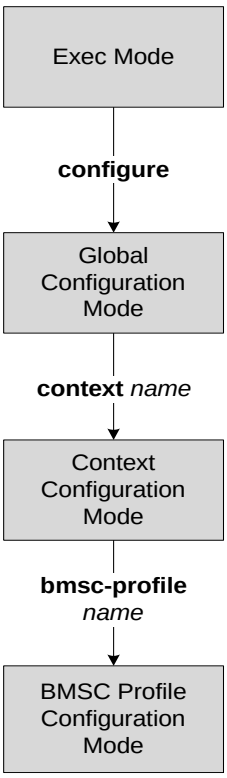
Enable the sending of link-status change traps if there is a monitoring facility that can use the information or if there are troubleshooting activities in progress.

Example

```
snmp trap link-status
no snmp trap link-status
```

Chapter 26
BMSC Profile Configuration Mode Commands

The BMSC Profile Configuration Mode is used to configure Broadcast Multicast Service Center profiles for Multimedia Broadcast Multicast Service (MBMS) applications. The mode is accessed by entering the bmsc-profile command from the Context Configuration Mode.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Returns the CLI prompt to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

Example

```
end
```

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the previous or parent mode.

Example

```
exit
```

gmb diameter dictionary

Specifies the Diameter dictionary for the Gmb interface in BM-SC profile of MBMS user service.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
gmb diameter dictionary { custom1 | custom10 | custom2 | custom3 |
custom4 | custom5 | custom6 | custom7 | custom8 | custom9 | standard }
default gmb diameter dictionary
```

custom1 ... custom10

Custom-defined Diameter dictionary. Specific to customer requirement.

standard

Default: Enabled
Specifies the standard Gmb Diameter dictionary conforming to 3GPP TS 29.061 (Rel. 7).

default

Sets the Diameter dictionary to standard.

Usage

Use this command to select the Gmb Diameter dictionary in BM-SC profile of MBMS user service.

Example

The following command sets the Gmb Diameter dictionary to TS 29.061 (Rel. 7) specific:

```
gmb diameter dictionary standard
```

gmb diameter endpoint

Specifies the Diameter endpoint name for Gmb interface in BM-SC profile of MBMS user service.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gmb diameter endpoint *endpoint_name*

no gmb diameter endpoint

no

Removes the previously configured Diameter endpoint name for Gmb interface in BM-SC profile of MBMS user service.

endpoint_name

Specifies the Diameter endpoint name for Gmb interface. This must be present in all Diameter messages and is the endpoint that originates the Diameter message.
endpoint_name must be an alpha and/or numeric string of length between 1 to 63 characters.

Usage

Use this command to create a Gmb Diameter endpoint for BM-SC profile.

Example

The following command creates a Diameter endpoint named *test1* in BM-SC profile of MBMS user service:
gmb diameter endpoint *test1*

gmb diameter peer-select

Specifies the peer ids of BM-SC Diameter primary and secondary host in BM-SC profile for MBMS user service.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
gmb diameter peer-select peer peer_name [ realm realm_name ] [ secondary-
peer sec_peer_name [ realm sec_realm_name ] ]
gmb diameter peer-select
```

---

no

Removes the previously configured BM-SC Diameter peer ids configured in BM-SC profile of MBMS user service.

---

peer *peer_name*

Specifies the primary diameter host id for BM-SC in this BM-SC profile for MBMS user service. This is a unique name that is specified for the primary peer.
peer_name must be an alpha and/or numeric string of from 1 through 127 characters and it allows punctuation marks.

---

realm *realm_name*

Specifies the realm or domain for Gmb diameter peer. The realm may typically be a company or service name.
realm_name must be an alpha and/or numeric string of from 1 to 127 characters and allows punctuation marks.

---

secondary-peer *sec_peer_name*

Specifies a back-up host that is used for fail-over processing. When the route-table does not find an AVAILABLE route the secondary host performs a fail-over processing.
sec_peer_name must be an alpha and/or numeric string of from 1 through 127 characters and it allows punctuation marks.

---

realm *sec_realm_name*

Specifies the realm or domain for Gmb diameter secondary host. The realm may typically be a company or service name.
sec_realm_name must be an alpha and/or numeric string of from 1 to 127 characters and allows punctuation marks.

Usage

Use this command to select a BM-SC Diameter peer and realm in this BM-SC profile for MBMS user service.

Example

The following command selects a Gmb Diameter peer named *test1* and a realm of *companyx*:

gmb diameter peer-select peer *test1* **realm** *companyx*

gmb user-data

This command configures the parameters in this BM-SC profile for user data of MBMS user service.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gmb user-data { mode-preference { multicast | unicast } | unicast-self-address *self_ip_address* **}**

```
default gmb user-data mode-preference
```

```
no gmb user-data unicast-self-address
```

no

Removes the configured self address of GGSN for unicast in BM-SC profile for user data of MBMS user service.

defualt

Sets the user data mode to unicast in BM-SC profile for user data of MBMS user service.

mode-preference { multicast | unicast }

Default: unicast
Specifies the preferred mode of GGSN for receiving MBMS suer service data.
multicast: specifies the preferred mode as multicast for MBMS user service.

Important: Note that this **multicast** keyword is not supported in this release.

unicast: specifies the preferred mode as unicast for MBMS user service.

unicast-self-address *self_ip_address*

Specifies the GGSN's IP address for BM-SC to use as outer destination address for the IP-in-IP tunnel to send multicast data if configured preferred data mode is unicast.
self_ip_address must be the IPv4 address in dotted decimal notation.
This command must be configured if GGSN's user-data mode-preference is Unicast.

Usage

Use this command to configure user data mode and other parameters in BM-SC profile for user data of MBMS user service.
GGSN can receive multicast data from BM-SC in one of two modes - Multicast or Unicast. In Unicast mode, BM-SC tunnels the multicast data to the GGSN in an IP-in-IP tunnel instead of direct multicast. This

command with mode-preference keyword configures the GGSN's preferred mode for receiving multicast data.

Important: Both GGSN and BM-SC must support the Unicast mode of multicast data transfer. If any of GGSN or BM-SC doesn't support Multicast mode, BM-SC will transfer multicast data using Unicast mode only.

Use unicast-self-address keyword to configure GGSN's IP address which the BM-SC should use as the outer destination address for the IP-in-IP tunnel to send multicast data if the selected user data mode to receive multicast data is Unicast (i.e. either of GGSN or BM-SC doesn't support Multicast mode of data transfer).

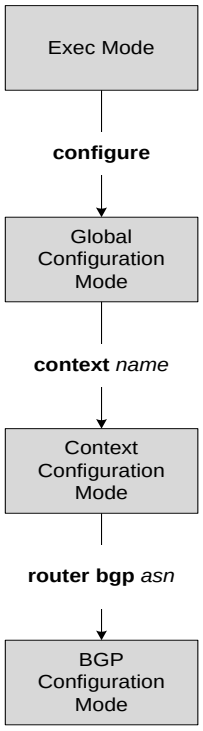
Example

The following command sets the MBMS data transfer mode to unicast:

```
default gmb user-data mode-preference
```

Chapter 27
Border Gateway Protocol Configuration Mode Commands

The Border Gateway Protocol (BGP) Configuration Mode is used to configure properties for BGP-4 routing.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

address-family ipv4

Configures the IPv4 Address Family information for the specified BGP AS number. Optionally it also enables the VRF routing information, if specified.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
address-family ipv4 [ vrf vrf_name]

[no] address-family ipv4 vrf vrf_name}
```

no

This keyword removes the configured IPv4 address family VRF mode for specific BGP AS number.

vrf *vrf_name*

This optional keyword enables the exchange of VRF routing informaiton. When this keyword is specified with this command then the address family mode changed to VRF address family mode for specific BGP AS number.

Important: The route distinguigher id must be configured for this VRF name through **route-distinguisher** command in BGP VRF Configuration mode, before using this keyword.

Usage

Use this command to configure the IPv4 BGP address family configuration parameters for BGP router and optionally enables the exchange of VRF routing information. This command is also used to switch the command mode to enter the *BGP Address Family Configuration Mode*.
Use of **address-family ipv4** command swithces the command mode to *BGP Address Family Configuraiton Mode* and prompt will be changed to the following:

```
[context_name>]host_name(config-bgp-af-v4)#
```

Use of **address-family ipv4 vrf** *vrf_name* command swithces the command mode to *BGP Address Family Configuraiton Mode* and prompt will be changed to the following:

```
[context_name>]host_name(config-bgp-af-vrf)#
```

Example

Use following command to enter the IPv4 BGP Address-Family configuration mode:

```
address-family ipv4
```

Use following command to enter the IPv4 VRF BGP Address-Family configuration mode for exchange of VRF routing information from VRF *route_vrf1*:

address-family ipv4 vrf*route_vrf1*

address-family ipv6

Configures the IPv6 Address Family information for the specified BGP AS number.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
address-family ipv6
```

Usage

Use this command to configure the IPv6 BGP address family configuration parameters for BGP router. This command is also used to switch the command mode to enter the *BGP Address Family Configuration Mode*. Use of **address-family ipv6** command swithces the command mode to *BGP Address Family Configuraiton Mode* and prompt will be changed to the following:

```
[context_name>]host_name(config-bgp-af-v6)#
```

Example

Use the following command to enter the IPv6 BGP Address-Family configuration mode:

```
address-family ipv6
```

address-family vpnv4

Configures the VPNv4 Address Family information for the specified BGP AS number.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
address-family vpnv4
```

Usage

Use this command to configure the VPNv4 address family configuration parameters for BGP router. This command is also used to switch the command mode to enter the *BGP Address Family Configuration Mode*. Use of **address-family vpnv4** command swithces the command mode to *BGP Address Family Configuraiton Mode* and prompt will be changed to the following:

```
[context_name>]host_name(config-bgp-af-vpnv4)#
```

Example

Use the following command to enter the BGP Address-Family configuration mode for VPNv4 address parameters:

```
address-family vpnv4
```

distance

Define the administrative distance for routes. The administrative distance is the default priority for a specific route or type route.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
distance { admin distance prefix prefix_addr [ route-access-list list_name ]
| bgp external ebgp_dist internal ibgp_dist local local_dist }
no distance { admin distance prefix prefix_addr [ route-access-list
list_name ] | bgp [ external ebgp_dist internal ibgp_dist local local_dist ]
}
```

no

Remove the specified administrative distance for the specific route.

admin *distance* **prefix** *prefix_addr* **[route-access-list** *list_name* **]**

This keyword sets the administrative distance to a specified value for routes with a specific IP prefix. If you also specify a route access list, the IP prefix must match the rules of that access list.
admin *distance*: The administrative distance that you want to apply to the IP prefix. *distance* must be an integer from 1 through 254.
prefix *prefix_addr*: The IP prefix of routes that should have the admin distance applied. *prefix_addr* must be an IPv4 address (in dotted-decimal notation) and the number of subnet bits, representing the subnet mask in shorthand (1.1.1.1/24).
route-access-list *list_name*: Define the name of a route access list that defines for which routes the administrative distance should be set.

bgp external *ebgp_dist* **internal** *ibgp_dist* **local** *local_dist*

This keyword sets the administrative distance for internal (IBGP), external (EBGP) and local routes.
external *ebgp_dist*: Set the administrative distance for EBGP routes. *ebgp_dist* must be an integer from 1 through 254.
internal *ibgp_dist*: Set the administrative distance for IBGP routes. *ibgp_dist* must be an integer from 1 through 254.
local *local_dist*: Set the administrative distance for local routes. *local_dist* must be an integer from 1 through 254.

Usage

Use this command to set the administrative distance for specific routes to values that you specify. These values are only applied to the current router.

Example

Use the following command to set the administrative distance to 100 for all routes that have an IP prefix of 192.168.0.0 with a netmask of 16 and are specified in a remote access list named racl1:
distance admin 100 prefix 192.168.0.0/16 route-access-list racl1

end

Exits the current configuration mode and returns to the Exec mode.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Return to the Exec mode.

enforce-first-as

Enforce the first Autonomous System (AS) for Exterior Border Gateway Protocol (EBGP) routes. As stated in RFC1930; “An AS is a connected group of one or more Internet Protocol prefixes run by one or more network operators which has a single and clearly defined routing policy.”

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
enforce-first-as
```

Usage

Use this command to enforce the use of the first AS for EBGP routes.

Example

Use the following command to enable this functionality:

```
enforce-first-as
```

exit

Exits the current configuration mode and returns to the global configuration mode.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the context configuration mode.

ip vrf

This command adds a preconfigured IP VRF context instance to the BGP ASN and configures the BGP attributes and related parameters to the VRF. This command also switches the command mode to BGP VRF Configuration mode.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[no] ip vrf vrf_name
```

no

Removes an associated IP VRF from specified BGP AS number and other configured parameters.

vrf_name

Specifies the IP VRF context configured in the Context configuration mode and to be associated with a BGP AS number.
vrf_name must be a string from 1 to 79 identifying an existing instance.

Usage

Use this command to associate the specified IP VRF context instance to the BGP AS number and configures the BGP attributes and related parameters to the VRF. This command also switches the command mode to BGP VRF Configuration mode.
This command swithces the command mode to *BGP IP VRF Configuraiton Mode* and prompt will be changed to the following:

```
[context_name>]host_name(config-bgp-vrf)#
```

Example

Use the following command associates the pre-defined VRF context instance *router_mpls* to this BGP AS number:
ip vrf *router_mpls*

neighbor

This command configures BGP routers that interconnect to non-broadcast networks. Note that a remote AS number must be specified for a neighbor before other parameters can be configured.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

[no] neighbor *ip_address* **{activate|advertisement-interval** *adv_time* **| default-originate [route-map** *map_name***] | distribute-list** *dist_list* **{in | out}| ebgp-multihop [max-hop** *number***] | filter-list** *filt_list* **{in | out}| max-prefix** *max_num* **[threshold** *thresh_percent***] [warning-only] | remote-as** *AS_num***| remove-private-AS | route-map** *map_name* **{in | out} | shutdown | timers {[connect-interval** *conn_time***] | [keepalive-interval** *keep_time* **Holdtime-interval** *hold_time***]}| update-source** *ip_address* **| weight** *value***}**

---

no

Delete the specified parameter from the router configuration.

---

activate

Enable the exchange of routes with this neighbor.

---

advertisement-interval *adv_time*

The minimum interval, in seconds, between sending BGP routing updates.
Default: 30
adv_time must be an integer from 0 through 600.

---

default-originate [route-map *map_name***]**

Originate default routes to this neighbor
route-map *map_name*: Specifies the route-map that contains the criteria to originate default routes.
map_name must be the name of an existing route-map in the current context.

---

distribute-list *dist_list* **{in | out}**

Filter updates to and from this neighbor based on a route access list.
Default: No filtering is performed.
dist_list: The name or number of an existing route-access-list.
in: Indicates that incoming advertised routes should be filtered.
out: Indicates that outgoing advertised routes should be filtered.

---

ebgp-multihop [max-hop *number***]**

Allow EBGP neighbors not on directly connected networks.
Default hop count: 255
max-hop *number*: The maximum number of hops allowed to reach a neighbor. *number* must be an integer from 1 through 255.

filter-list *filt_list* **{in | out}**

Establish BGP filters based on an AS path access list
filt_list: The name of an existing AS path access list.
in: Indicates that incoming advertised routes will be filtered.
out: Indicates that outgoing advertised routes will be filtered.

max-prefix *max_num* **[threshold** *thresh_percent***] [warning-only]**

The maximum number of prefixes accepted from this peer. When the maximum is exceeded the neighbor connection is reset.
Default: No maximum prefix limit.
max_num: Specifies the maximum number of prefixes permitted. This must be an integer from 1 through 4294967295.
threshold *thresh_percent*: A percentage value which specifies that when the BGP table is the specified percentage full from this peer warnings are sent to the neighbor. *thresh_percent* must be an integer from 1 through 100.
warning-only: This keyword specifies that only a warning message is sent when the limit is exceeded. The neighbor connection is not reset

remote-as *AS_num*

Specify the AS number of the BGP neighbor.
AS_num: The neighbor's autonomous system number. must be an integer from 1 through 65535.

remove-private-AS

Remove the private AS number from outbound updates.
Default: Do not remove the private AS number.

route-map *map_name* **{in | out}**

Apply a route map to the neighbor.
map_name: Specifies the route-map apply. *map_name* must be the name of an existing route-map in the current context.
in: Indicates that the route map applies to incoming advertisements.
out: Indicates that the route map applies to outgoing advertisements.

shutdown

Administratively shut down this neighbor. This disables exchanging routes or configuring parameters for this neighbor.

timers {[connect-interval *conn_time***] | [keepalive-interval** *keep_time* **Holdtime-interval** *hold_time***]}**

BGP timers for the specified neighbor.
connect-interval *conn_time*: Specifies the connect timer in seconds. *conn_time* must be an integer from 0 through 65535. The default is 60 seconds.
keepalive-interval *keep_time*: The frequency, in seconds, at which the current BGP router sends keepalive messages to its neighbor. *keep_time* must be an integer from 0 through 65535. The default is 30 seconds.
Holdtime-interval *hold_time*: The interval, in seconds, the router waits for a keepalive message before declaring a neighbor dead. *hold_time* must be an integer from 0 through 65535. The default is 90 seconds.

update-source *ip_address*

use this keyword to bind the specified IP address to the bgp socket that is used to communicate to the peer.
ip_address is an IPv4 address in dotted decimal notation.
In most cases you should set the update-source address to the address of the loopback interface in the current context. By doing this, the tcp connection does not go down until there is no route for the loopback address in the peering router.

weight *value*

This command sets the default weight for routes from this neighbor.
Default: 0
value: This must be an integer from 0 through 65535.

Usage

Use this command to set parameters for communication with a specified neighbor. The chassis supports a maximum of 64 peers per context.

Example

The following command specifies that the neighbor at the IP address 192.168.100.25 has an AS number of 2000:
```
neighbor 192.168.100.25 remote-as 2000
```
The following command allows BGP neighbors that are a maximum of 27 hops away:
```
neighbor 192.168.100.25 ebgp-multihop max-hop 27
```
The following command sets the minimum interval between sending routing updates to 3 minutes
```
neighbor 192.168.100.25 advertisement-interval 180
```
The following command sets the default weight for all routes from the specified neighbor to 100:
```
neighbor 192.168.100.25 weight 100
```

network

Specify a network to announce via BGP

Product

HA

Privilege

Security Administrator, Administrator

Syntax

network *ip_adrress/mask* **[route-map** *map_name* **]**
no network *ip_adrress/mask* [**route-map** *map_name*]

no

Delete the specified network from the configuration for the BGP router.

ip_adrress/mask

Specifies the IP address and netmask bits for the network to announce via BGP. *ip_address* is a network IP address (in dotted-decimal notation) and *mask* is the number of subnet bits, representing a subnet mask in shorthand. These must be entered in the dotted-decimal notation/subnet bits format (1.1.1.1/24).

route-map *map_name*

Filter routes through the specified route map before announcing the network. map_name specifies the name of the route-map to use and must be specified as a string of 1 through 79 alphanumeric characters.

Usage

Use this command to specify a network to announce via BGP.

Example

The following command announces the network 192.168.0.0 with a netmask of 16 via BGP:
network 192.168.0.0/16
The following command removes the network from the BGP router configuration:
no network 192.168.0.0/16

redistribute

This command redistributes routes into BGP. This means that any routes from another protocol are redistributed to BGP neighbors using the BGP protocol.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

redistribute { connected | ospf | rip | static } [route-map *map_name* **]**

no

Remove the specified redistribution parameters from the BGP router configuration.

connected

Specifies that connected routes will be redistributed.

ospf

Specifies that OSPF routes will be redistributed

rip

Specifies that RIP routes will be redistributed. (RIP is not supported at this time.)

static

Specifies that static routes will be redistributed.

route-map map_name

Filter routes through the specified route map before redistribution. map_name specifies the name of the route-map to use and must be specified as a string of 1 through 79 alphanumeric characters.

Usage

Use this command to specify what routes this BGP router should redistribute into BGP.

Example

The following command redistributes OSPF routes after filtering them through the route map named Map1:
redistribute ospf route-map *Map1*
The following command removes the redistribution of OSPF routes from the router's configuration:
no redistribute ospf route-map *Map1*

router-id

Override the configured router identifier (peers will reset).

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
router-id ip_address
no router-id [ ip_address ]
```

no

Remove the specified router ID from the router's configuration and use the default router ID.

ip_address

The IP address to use as the BGP router ID. *ip_address* must be an IPv4 address in dotted decimal notation (###.###.###.###).

Usage

Use this command to configure a specific router ID that overrides the default.

Example

The following command sets the router ID to 192.168.100.25:
router-id 192.168.100.25

scan-time

Configure background scanner interval. The background scanner scans routers for next hop validation.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

scan-time *time*
no scan-time

no

Remove the user specified scan time from the router's configuration. The scan time is reset to the default value.

time

Default: 60
The amount of time, in seconds, to wait between background scans to determine next-hop validity. *time* must be an integer from 5 through 60.

Usage

Use this command to set the background scanner interval for the BGP router.

Example

The following command sets the background scanner interval to 30 seconds:
scan-time 30

timers

This command configures BGP routing timers.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

timers bgp Keepalive-interval *interval* **Holdtime-interval** *time* **[Min-peer-holdtime-interval]** *time*
no timers bgp

---

no

Remove the user specified timer values from the router's configuration. The timer values are reset to the default values.

Keepalive-interval *interval*

Default: 30
The interval, in seconds, to wait between sending keepalive packets. Must be an integer from 0 through 65535.

Holdtime-interval *time*

Default: 90
The interval, in seconds, after which the neighbor is considered dead if keepalive messages are not received. Must be an integer from 0 through 65535.

Min-peer-holdtime-interval *time*

Default: 0
The interval, in seconds, that is the minimum acceptable hold time from a neighbor. Must be an integer from 0 through 65535. The default is 0 so that there is no restriction on the hold time received in an OPEN message from the peer.

Usage

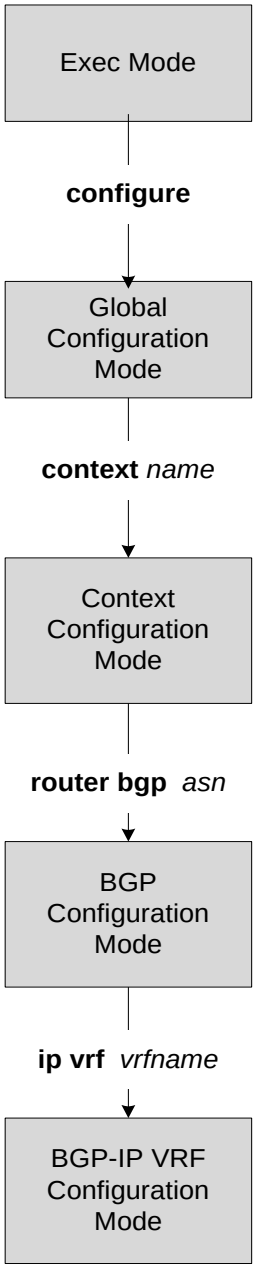
Use this command to configure the how long to wait between sending keepalive packets and how long to wait for a keepalive before considering a a neighbor dead.

Example

The following command sets the keepalive interval to 2 minutes and the holdtime interval to 3 minutes:
timers bgp Keepalive-interval *120* **Holdtime-interval** *180* **Min-peer-holdtime-interval** *0*

Chapter 28
Border Gateway Protocol IP VRF Configuration Mode Commands

The Border Gateway Protocol (BGP) IP VRF Configuration Mode is used to configure properties for BGP-4 routing.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the global configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the context configuration mode.

route-distinguisher

This command assigns a route distinguisher (RD) for the VRF. The route distinguisher value must be a unique value on the router for each VRF.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
route-distinguisher {as_value | ip_address} rd_value
```

as_value

The *ASN value* is a 16-bit autonomous-system (AS) number from 0 through 65535.

ip_address **}**

ip_address is an 32 bit IP address in IPv4 dotted decimal notation.

rd_value **}**

rd_value is an unique route distinguisher identifier and must be an integer between 0 through 4294967295.

Usage

Use this command to assign a router distinguisher (RD) for the IP VRF. The combination of AS number/IP address and RD value must be unique for every VRF configured. The RD is added to the beginning of the pool addresses to change them into globally unique VPN-IPv4 prefixes.
If the RD is not configured for a VRF, user cannot enter into the BGP Address-Family mode for that VRF to configure the neighbors or other related BGP commands.
An RD assigined to a VRF cannot be changed untill the existing VRF is deleted or removed and reconfigured.

Example

The following command assigns a router distingusher *12345* to VRF with AS number *300*:

route-distingusher *300 12345*

The following command assigns a router distingusher *12345* to VRF with IP address *1.5.3.4*:

route-distingusher *1.5.3.4 12345*

route-target

This command adds a list of import and/or export route target extended communitites to the VRF.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
route-target {both | import | export} {as_value | ip_address} rt_value
```

both

This keyword creates list of import and export route targets for the VRF with same parameters. The list contains AS number or IP address along with RT value.

import

This keyword creates list of import route targets for the VRF with same parameters. The list contains AS number or IP address along with RT value.

export

This keyword creates list of import route targets for the VRF with same parameters. The list contains AS number or IP address along with RT value.

as_value

The *ASN value* is a 16-bit autonomous-system (AS) number from 0 through 65535.

ip_address **}**

ip_address is an 32 bit IP address in IPv4 dotted decimal notation.

rt_value **}**

rt_value is an unique route target identifier and must be an integer between 0 through 4294967295.

Usage

Use this command to create the list of export and/or import route target extended communities for VRF. It specifies the a target VPN extened community.
A maximm of 5 route targets can be defined with this command up to release 9.0.
A maximm of 10 route targets can be defined with this command from release 10.0 onvward.

Important: This command must be executed for each route target extended communities.

Example

The following command creates an export list of route target extended community *12345* for VRF with AS number *300*:

```
route-target export  300 12345
```

The following command creates an export list of route target extended community *12345* for VRF with IP address *192.168.1.2*:

```
route-target export  192.168.1.2 12345
```

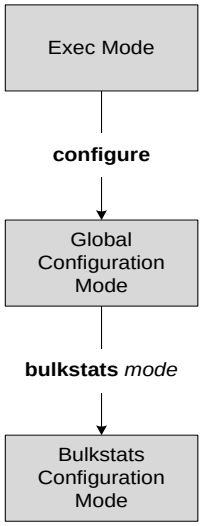
Chapter 29
Bulk Statistics File Configuration Mode Commands

This section describes a bulk statistic “file” under which to group the bulk statistic configuration. The Bulk Statistics File Configuration mode supports the configuration of “files” used for organizing bulk statistics schema, delivery options, and receiver information.

Because multiple “files” can be configured, this functionality provides greater flexibility in that it allows you to configure different schemas to go to different receivers. To configure a bulk statistics file, enter the following command:

Important: Use of bulk statistics “files” is optional. However system logically assigns “file 1” to the standard configuration. Therefore, if you wish to configure bulk statistics “files” at a later time, “file 1” can be used.

Caution: If the Web Element Manager application is used to collect and process (XML parsing, graphing, etc.) bulk statistics data, “file 1” is used by the Web Element Manager’s default bulk statistics collection information and schemas. To avoid errors in processing by the Web Element Manager, do not configure “file 1" via the CLI. However, it is possible to configure files 1 through 4 using the system’s CLI, regardless of whether or not the Web Element Manager is configured as a receiver. In this case, the bulk statistics data is written to the server but not processed by the Web Element Manager application.



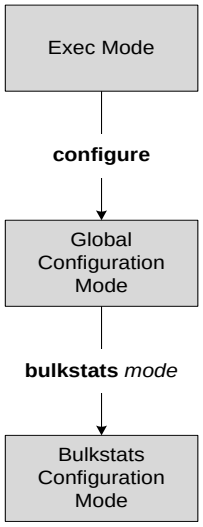
Important: The commands in this configuration mode are identical to the same commands in the “Bulk Statistics Configuration Mode Commands” chapter.

Chapter 30
Bulk Statistics Configuration Mode Commands

The Bulk Statistics Configuration Mode is used to manage the system statistics options for collection and delivery as well as for the format of data delivered to remote nodes.

Refer to the Common Syntax Options section in this chapter for information about formatting bulk statistics output.

Important: Unless otherwise indicated, all statistics are counters. For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295. For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.



Common Syntax Options

The following defines common syntax block options. These options appear in similar commands and are detailed here for easy reference.

Schema Format String Syntax

The schema format string is used to define the structure of generated bulk statistics data. The string may contain static text, dynamic content, and bulk statistic variables, or any combination.

Static text includes any ASCII characters that are of a fixed value. Static text may also include control characters by using escape character sequences.

Escape character shortcuts are supported are “\n” for new line and “\t” for tab.

Variables within the format string must be enclosed within “%”, for example “%var%”. The actual variables supported are command-dependent and are described in the *Statistics and Counters Reference*.

Common Statistics

For a list of the statistics that are common to all schema, refer to the *Statistics and Counters Reference*.

apn schema

This command configures APN bulk statistics schema.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

apn schema*schema_name***format***format_string*

no apn schema*schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for APN bulk statistics collection. Multiple APN schemas can be created to further categorize APN-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple APN schemas, re-issue the **apn schema** command using a different schema name.

Example

The following command creates a schema called apn1stats1 that records the number of sessions currently facilitated by the APN:

```
apn schema apn1stats1 format "%sess-curr%"
```

asngw schema

This command configures ASN-GW bulk statistics schema.

Product

ASN GW

Privilege

Security Administrator, Administrator

Syntax

asngw schema*schema_name***format***format_string*

no asngw schema*schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for ASN-GW bulk statistics collection. Multiple ASN-GW service schemas can be created to further categorize ASN-GW service bulk statistics. All of the schemas are processed at each collection interval. To create multiple ASN-GW service schemas, re-issue the **asngw schema** command using a different schema name.

Example

To create an ASN-GW schema called *asngw_statistics* that specifies a schema format of:

- VPN context name: *vpnname*
- VPN Context Identifier: *vpnid*
- ASN-GW Service name: *servname*
- ASN-GW Service identifier: *servid*
- Peer IP address: *peeripaddr*

Use the following command:

asngw schema *asngw_statistics* **format "***VPN name: %vpnname%\nVPN ID: %vpnid%\nASN-GW Service Name: %servname%\nASN-GW Service Identifier: %servid%\nPeer IP Address: %peeripaddr%"*

bcmcs schema

This command configures BCMCS bulk statistics schema.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

bcmcs schema*schema_name***format***format_string*

no bcmcs schema*schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for BCMCS bulk statistics collection. Multiple BCMCS schemas can be created to further categorize BCMCS-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple BCMCS schemas, re-issue the **bcmcs schema** command using a different schema name.

Example

The following command creates a schema named *bcmcs1stats1* that records the number of sessions currently facilitated by BCMCS:

```
bcmcs schema bcmcs1stats1 format "%sess-curr%"
```

card schema

This command configures card bulk statistics schema.

Product

All

Privilege

Security Administrator, Administrator

Syntax

card schema*schema_name***format***format_string*

no card schema*schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for card bulk statistics collection. Multiple card schemas can be created to categorize card-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple card schemas, re-issue the **card schema** command using a different schema name.

Important: Not supported on all platforms

Example

The following command creates a schema called card1stats1 that records the number of processes for all installed cards:

```
card schema card1stats1 format "%slot%-%numproc%"
```

To create a card-level schema called cardresourcestats that specifies a schema format of:

```
Chassis slot number: slot
Available Memory: memtotal Memory Used (%): memused
```

Available CPU (%): cpuidle
Use the following command:

```
card schema cardresourcestats format "Chassis slot number:
%slot%\nAvailable Memory: %memtotal%\tMemory Used (%):
%memused%\nAvailable CPU (%): %cpuidle%"
```

context schema

This command configures Firewall bulk statistics schema.

Product

All

Privilege

Security Administrator, Administrator

Syntax

context schema*schema_name***format***format_string*

no context schema*schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3600 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For the complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for Context bulk statistics collection. Multiple context schemas can be created to categorize context statistics. All of the schemas are processed at each collection interval. To create multiple context schemas, re-issue the context schema command using a different schema name.

Example

To create a context schema called *sfw_context_stats1* that specifies a schema format of:

- Total packets received by firewall: *sfw-total-rxpackets*
- Total packets sent by firewall: *sfw-total-txpackets*
- Total ICMP packets discarded by firewall: *fw-icmp-discardpackets*

Use the following command:

context schema *sfw_context_stats1* **format** **"***Packets received Rx: %sfw-total-rxpackets%\nPackets Sent Tx:: %sfw-total-txpackets%\nICMP Packets discarded: %fw-icmp-discardpackets%"*

cscf schema

This command configures CSCF bulk statistics schema.

Product

SCM

Privilege

Security Administrator, Administrator

Syntax

cscf schema*schema_name***format***format_string*

no cscf schema*schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for CSCF bulk statistics collection. Multiple CSCF-service schemas can be created to categorize CSCF-service bulk statistics. All of the schemas are processed at each collection interval. To create multiple CSCF-service schemas, re-issue the **cscf schema** command using a different schema name.

Example

To create a CSCF schema called *cscf_statistics* that specifies a schema format of:

- Call attempts received: *callattrx*
- Call attempts transmitted: *callatttx*
- Call successes received: *callsuccrx*
- Call successes transmitted: *callsucctx*
- Call failures received: *callfailrx*

- Call failures transmitted: *callfailtx*

Use the following command:

```
cscf schema cscf_statistics format "Call Attempts Rx: %callattrx%\nCall
Attempts Tx: %callatttx%\nCall Successes Rx: %callsuccrx%\nCall Successes
Tx: %callsucctx%\nCall Failures Rx: %callfailrx%\nCall Failures Tx:
%callfailtx%"
```

dcca schema

This command configures Diameter Credit Control Application (DCCA) bulk statistics schema. This command is available only in StarOS 9.0 and later releases.

Product

All

Privilege

Security Administrator, Administrator

Syntax

dcca schema *schema_name* **format** *format_string*

no dcca schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for DCCA bulk statistics collection.

default

Restores the system default for the option specified.

Product

All

Privilege

Security Administrator, Administrator

Syntax

default { limit | receiver mode | remotefileformat | sample-interval | transfer-interval }

limit

Restores the memory utilization limit system default: 1000 kilobytes.

receiver mode

Restores the behavior for sending files to the receivers to the default value.
Default: secondary-on-failure

remotefile format

Restores the format of remote bulkstats file names to the default value.
Default: "%date%-%time%"

sample-interval

Restores the system default for the local polling interval for statistic sampling.
Default: 15 minutes

transfer-interval

Restores the system default for the time between transfer of data files to receivers.
Default: 480 minutes

Usage

Restore the default values when troubleshooting the system. Setting values to the system defaults places them in well known states as starting points for monitoring for problems.

Example

```
default limit
default transfer-interval
```

dpca schema

This command configures Diameter Policy Control Application (DPCA) bulk statistics schema. This command is available only in StarOS 9.0 and later releases.

Product

All

Privilege

Security Administrator, Administrator

Syntax

dpca schema *schema_name* **format** *format_string*

no dpca schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for DPCA bulk statistics collection.

ecs schema

This command configures Enhanced Charging Service (ECS) bulk statistics schema.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ecs schema *schema_name* **format** *format_string*

no ecs schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for ECS bulk statistics collection. Multiple ECS schemas can be created to categorize ECS bulk statistics. All of the schemas are processed at each collection interval. To create multiple ECS schemas, re-issue the **ecs schema** command using a different schema name.

egtpc schema

Configures the enhanced GTP-C statistics schema for naming conventions of data files.

Product

P-GW, S-GW

Privilege

Administrator

Syntax

egtpc schema*schema_name***format***format_string*

no egtpc schema*schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for enhanced GTP-C bulk statistics collection. Multiple eGTP-C service schemas can be created to categorize eGTP-C service bulk statistics. All of the schemas are processed at each collection interval. To create multiple eGTP-C service schemas, re-issue the **egtpc schema** command using a different schema name.

Example

For an eGTP-C-level schema called *egtpcservicestats* that specifies a schema format of:
Tunnel - Create Session Request Sent: tun-sent-cresess
Tunnel - Create Session Request Received: tun-recv-cresess
Use the following command:

```
egtpc schema egtpcservicestats format "Number of GTP Tunnel Requests
Sent: %tun-sent-cresess%\nNumber of GTP Tunnel Requests Received: %tun-
recv-cresess%\n"
```

end

Exits the bulk statistics configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the bulk statistics configuration mode and returns to the global configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the global configuration mode.

fa schema

This command configures Foreign Agent (FA) bulk statistics schema.

Product

All

Privilege

Security Administrator, Administrator

Syntax

fa schema*schema_name***format***format_string*

no fa schema*schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for FA bulk statistics collection. Multiple FA service schemas can be created to categorize FA service bulk statistics. All of the schemas are processed at each collection interval. To create multiple FA service schemas, re-issue the **fa schema** command using a different schema name.

Example

To create a FA-level schema named *faservicestats* that separates the *date*, *time*, and *vpnname* by tabs, enter the following command:

fa schema *faservicestats* **format** *%date%\t%time%\t%vpnname%*

The schema format appears as follows:
date time vpnname

file

Enters the Bulk Statistics File Configuration mode which supports the configuration of "files" used for grouping bulk statistic configuration information.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] file *number*

no

Removes a previously configured bulk statistic file.

number

Specifies the a number for the bulkstatistics file. This number is how the file is recognized by the system. *number* must be an integer value from 1 to 4.

Usage

Bulk statistics "files" are used to group bulk statistic schema, delivery options, and receiver configuration. Because multiple "files" can be configured, this functionality provides greater flexibility in that it allows you to configure different schemas to go to different receivers. A Maximum of 4 files can be assigned for bulk statistics collection.

Executing this command allows you to enter the Bulk Statistics File Configuration Mode. This mode supports all of the commands from the Bulk Statistics Configuration mode except **limit, local-directory, sample-interval,** and **transfer-interval** (these commands are configured globally for all "files").

Important: Use of bulk statistics "files" is optional. If you do not wish to configure bulk statistic "files", you can perform a standard configuration using the commands in the Bulk Statistic Configuration Mode. Note, however, that the system logically assigns "file 1" to the standard configuration. Therefore, if you wish to configure bulk statistics "files" at a later time, "file 1" will already be used.

Caution: If the Web Element Manager application is used to collect and process (XML parsing, graphing, etc.) bulk statistics data, "file 1" is used by the Web Element Manager's default bulk statistics collection information and schemas. To avoid errors in processing by the Web Element Manager, do not configure "file 1" via the CLI. However, it is possible to configure files 1 through 4 using the system's CLI, regardless of whether or not the Web Element Manager is configured as a receiver. In this case, the bulk statistics data is written to the server but not processed by the Web Element Manager application.

Example

The following command creates a bulk statistics file numbered 2 and enter the Bulk Statistics File Configuration Mode:

file *2*

footer

Configures the footer string placed in the end of the generated bulk statistics data files.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
footer format format_string
no footer format
```

no

Clears the footer format string which results in the default file footer being used in generated data files.

format *format_string*

Default: "" (an empty footer)
Specifies the footer format string for use in generated data files. *format_string* must be from 1 to 2047 alpha and/or numeric characters with no spaces or as a quoted string. The format string syntax is described in the Schema Format String Syntax section.
The following variables are supported:

Table 13. footer Command Format String Variables

Variable	Description	Data Type
date	The date that the collection file was created in YYYYMMDD format where YYYY represents the year, MM represents the month and DD represents the day.	String
host	The system hostname that created the file	String
ipaddr	The default management (local context) IP address in ###.###.###.### format. An empty string is inserted if no address is available.	String
sysuptime	The uptime (in seconds) of the system that created the file.	32-bit signed
time	The time that the collection file was created in HHMMSS format where HH represents the hours, MM represents the minutes, and SS represents the seconds.	String

Usage

Define a unique footer in data files which allows for easy identification of which system generated the data file or any other useful information. The use of the variables is suggested so as to allow for a uniform footer across all systems. The hostname variable should be used to identify the source of the data in the footer and all remaining items can be formatted consistently across all chassis.

Example

Following command can be used to define different header formats:

```
footer format northStreet
footer format "Created on: %date%-%time% by %host%"
no footer format
```

gather-on-standby

This command controls whether or not statistics are gathered when a system is in the standby state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] gather-on-standby
```

no

Do not gather bulk statistics when the system is in the standby state.

default

Reset this command to its default action of gathering bulk statistics when the system is in the standby state.

Usage

Use this command to configure a system to either gather or not gather statistics when the system is in the standby state. This is useful for HA or GGSN systems configured for Interchassis Session Recovery. See the System Administration Guide for more details on this feature.
If a chassis transitions to standby state and it has accumulated but not yet transferred bulk statistics data, the previously accumulated data is transferred at the first opportunity, but no additional statistics gathering takes place.

Example

The following command disables gathering statistics when the system is in the standby state:

```
no gather-on-standby
```

The following command enables the gathering of statistics when the system is in the standby state:
gather-on-standby

gprs schema

This command configures GPRS bulk statistics schema.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gprs schema*schema_name***format***format_string*

no gprs schema*schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

gtpc schema

This command configures GPRS Tunneling Protocol-Control (GTPC) message statistics schema.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gtpc schema*gtpc_schema_name***format***gtpc_schema_format*

no gtpc schema*gtpc_schema_name*

no

Removes the specified schema.

gtpc_schema_name

Specifies the schema name.
gtpc_schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *gtpc_schema_format*

Specifies the schema format.
gtpc_schema_format must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for GTPC bulk statistics collection. Multiple GTPC schemas can be created to categorize GTPC bulk statistics. All of the schemas are processed at each collection interval. To create multiple GTPC schemas, re-issue the **gtpc schema** command using a different schema name.

Example

To create a GTPC-level schema named *gtpc_stats* that specifies a schema format of:

```
Context Name: vpnname
GGSN Service Name: servname
Total PDP Contexts Processed: setup-total
```

Use the following command:

```
gtpc schema gtpc_stats format "Context Name: %vpnname%\nGGSN Service
Name: %servname%\nTotal PDP Contexts Processed: %setup-total%\n"
```

gtpp schema

This command configures GPRS Tunneling Protocol-Prime (GTPP) statistics schema.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp schema*gtpp_schema_name***format***gtpp_schema_format*

no gtpp schema *gtpp_schema_name*

no

Removes the specified schema.

gtpp_schema_name

Specifies the schema name.
gtpp_schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *gtpp_schema_format*

Specifies the schema format.
gtpp_schema_format must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for GTPP bulk statistics collection. Multiple GTPP schemas can be created to categorize GTPP bulk statistics. All of the schemas are processed at each collection interval. To create multiple GTPP schemas, re-issue the **gtpp schema** command using a different schema name.

Example

To create a GTPP schema named *gtpp_statistics* that specifies a schema format of:
Time: time Total Redirection Requests Received: redir-rcvd
Use the following command:

```
gtpp schema gtpp_statistics format "Time: %time%\tTotal Redirection
Requests Received: %redir-rcvd%\n"
```

ha schema

This command configures Home Agent (HA) bulk statistics schema.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

ha schema*schema_name***format***format_string*

no ha schema*schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for HA bulk statistics collection. Multiple HA service schemas can be created to categorize HA service bulk statistics. All of the schemas are processed at each collection interval. To create multiple HA service schemas, re-issue the **ha schema** command using a different schema name.

Example

For an HA schema named *haservicestats* that specifies a schema format of:
Number of HA authentication failures: reply-haauthfail
Number of Mobile Node authentication failures: reply-mnauthfail
Use the following command:

```
ha schema haservicestats format "Number of HA authentication failures:
%reply-haauthfail%\nNumber of Mobile Node authentication failures:
%reply-mnauthfail%\n"
```

header

Configures the header string placed in the beginning of the generated bulk statistics data files.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
header format format_string
no header format
```

no

Clears the header format string which results in the default file header being used in generated data files.

format *format_string*

Default: "" (an empty header)
Specifies the header format string for use in generated data files. *format_string* must be from 1 to 2047 alpha and/or numeric characters with no spaces or as a quoted string. The format string syntax is described in the Schema Format String Syntax section.
The following variables are supported:

Table 14. header Command Format String Variables

Variable	Description	Data Type
date	The UTC date that the collection file was created in YYYYMMDD format where YYYY represents the year, MM represents the month and DD represents the day.	String
date3	The UTC date that the collection file was created in YYMMDD format where YY represents the year, MM represents the month and DD represents the day.	String
host	The system hostname that created the file	String
ipaddr	The default management (local context) IP address in ###.###.###.### format. An empty string is inserted if no address is available.	String
sysuptime	The uptime (in seconds) of the system that created the file.	32-bit signed
time	The time that the collection file was created in HHMMSS format where HH represents the hours, MM represents the minutes, and SS represents the seconds.	String

Usage

Define a unique header in data files which allows for easy identification of which system generated the data file or any other useful information.

The use of the variables is suggested so as to allow for a uniform header across all systems. The hostname variable should be used to identify the source of the data in the header and all remaining items can be formatted consistently across all chassis.

Example

Following command can be used to define different header formats:

```
header format northStreet
header format "Created on: %date%-%time% by %host%"
no header format
```

ippool schema

This command configures IP pool bulk statistics schema.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ippool schema*schema_name***format***format_string*

no ippool schema*schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for IP pool bulk statistics collection. Multiple IP pool schemas can be created to further IP pool bulk statistics. All of the schemas are processed at each collection interval. To create multiple IP pool schemas, re-issue the **ippool schema** command using a different schema name.

Example

To create an IP pool schema named *ippoolstats* that specifies a schema format of:
Number of IP addresses on hold: hold
Number of free IP addresses: free
Use the following command:

```
ippool schema ippoolstats format "Number of IP addresses on hold:
%hold%\nNumber of free IP addresses: %free%\n"
```

ipsg schema

This command configures IP Services Gateway (IPSG) bulk statistics schema.

Product

IPSG

Privilege

Security Administrator, Administrator

Syntax

ipsg schema*schema_name***format***format_string*

no ipsg schema*schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define the schemas used for IPSG bulk statistics collection. Multiple IPSG schemas can be created to categorize IPSG bulk statistics. All of the schemas are processed at each collection interval. To create multiple schemas, re-issue the **ipsg schema** command using a different schema name.

Example

To create an IPSG schema named *ipsgstats* that specifies a schema format of:
Context name: vpnname
Service name: servname
Total responses sent: total-rsp-sent
Use the following command:

```
ipsg schema ippoolstats format "Context name: %vpnname%\nService name:
%servname%\nTotal responses sent: %total-rsp-sent%\n"
```

lac schema

This command configures LAC bulk statistics schema.

Product

All

Privilege

Security Administrator, Administrator

Syntax

lac schema*schema_name***format***format_string*

no lac schema*schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see TSchema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for LAC bulk statistics collection. Multiple LAC schemas can be created to categorize LAC bulk statistics. All of the schemas are processed at each collection interval. To create multiple schemas, re-issue the **lac schema** command using a different schema name.

Example

The following command creates a schema called lac1stats1 that records the number of active subscriber sessions and the number of sessions that failed or were disconnected due to the maximum tunnel limit being reached:

```
lac schema lac1stats1 format "%sess-curactive%-%sess-maxtunnel%"
```

To create a schema called *lacresourcestats* that specifies a schema format of:
Number of Successful Session Connections: sess-successful
Number of Session Attempts That Failed: sess-failed
Number of Sessions Currently Active: sess-curative
Use the following command:

lac schema *lacresourcestats* **format** *"Number of Successful Session Connections: %sess-successful%\nNumber of Session Attempts That Failed: %sess-failed%\nNumber of Sessions Currently Active: %sess-curative%"*

limit

Configures the maximum amount of system memory bulk statistics may utilize.

Product

All

Privilege

Security Administrator, Administrator

Syntax

limit *kilobytes*

kilobytes

Specifies the maximum amount of memory, in kilobytes, that may be used for bulk statistics. *kilobytes* must be a value in the range from 1 to 32000.

Usage

Adjust bulk statics memory usage when considering the sampling interval adjustments.
The system is shipped from the factory with the limit set to 1000.

Caution: Bulk statistics are stored in Random Access Memory (RAM) on the SMC. In the event of power loss or system failure, the statistics will be lost. If the maximum storage limit has been reached before the system's configured transfer-interval is reached, the oldest information stored in the collection will be overwritten.

Example

limit *2048*

lma schema

Configures the Local Mobility Anchor (LMA) statistics schema for naming conventions of data files.

Product

P-GW

Privilege

Administrator

Syntax

lma schema*schema_name***format***format_string*

no lma schema*schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for LMA bulk statistics collection. Multiple LMA service schemas can be created to categorize LMA service bulk statistics. All of the schemas are processed at each collection interval. To create multiple LMA service schemas, re-issue the **lma schema** command using a different schema name.

Example

For an LMA-level schema called *lmaservicestats* that specifies a schema format of:
Binding Update Received: bindupd
Binding Update Received - Denied: bindupd-denied
Use the following command:

```
lma schema lmaservicestats format "Number of Binding Updates Received:
%bindupd%\nNumber of Binding Updates Received and Denied: %bindupd-
denied%\n"
```

local-directory

Sets the local directory for storing bulkstats collection files

Product

All

Privilege

Security Administrator, Administrator

Syntax

local-directory*pathname*

nolocal-directory

no

Delete the setting for local-directory.

pathname

The local path of the directory in which to store bulkstats collection files. This must be an alpha and/or numeric string of 1 to 127 characters. Pathnames are case sensitive.

Usage

Use this command to designate a directory on a local file system in which collection files with bulkstats information are stored. The directory specified must already exist. Use the Exec Mode command **mkdir** to create a directory.

Example

To specify that bulkstats collection files are stored in the local directory /flash/bulkstats, enter the following command:

```
local-directory /flash/bulkstats
```

mag schema

Configures the Mobile Access Gateway (MAG) statistics schema for naming conventions of data files.

Product

HSGW, S-GW

Privilege

Administrator

Syntax

mag schema*schema_name***format***format_string*

no mag schema*schema_name*

no

Removes the specified schema from MAG bulk statistics generation.

schema_name

Specifies the name to use to refer to the schema and associated format string.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for MAG bulk statistics collection. Multiple MAG service schemas can be created to categorize MAG service bulk statistics. All of the schemas are processed at each collection interval. To create multiple MAG service schemas, re-issue the **mag schema** command using a different schema name.

Example

For a MAG-level schema called *magservicestats* that specifies a schema format of:
Binding Update Sent: bindupd
Binding Acknowledgement Received: bindack
Use the following command:

```
mag schema magservicestats format "Number of Binding Updates Sent:
%bindupd%\nNumber of Binding Acknowledgements Received: %bindack%\n"
```

mipv6ha schema

This command configures MIPv6 HA bulk statistics schema.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

mipv6ha schema*schema_name***format***format_string*

no mipv6ha schema*schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for MIPv6 HA bulk statistics collection. Multiple MIPv6 HA bulk statistics schemas can be created to categorize MIPv6 HA bulk statistics. All of the schemas are processed at each collection interval. To create multiple MIPv6 HA service schemas, re-issue the **mipv6ha schema** command using a different schema name.

Example

The following command creates a schema called *mipv6haservicestats* that records the number of authorization attempt failures due to access rejects from AAA:

mipv6ha schema *mipv6haservicestats* **format** *"%aaa-actauthfail%"*

nat-realm schema

This command creates and configures Network Address Translation (NAT) realm statistics schema.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

nat-realm schema *schema_name* **format** *format_string*

no nat-realm schema *schema_name*

schema_name

Specifies the NAT realm bulk statistics schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for NAT Realm bulk statistics collection. Multiple NAT realm schemas can be created to further categorize NAT realm level bulk statistics. All of the schemas are processed at each collection interval. To create multiple NAT Realm schemas, re-issue the **nat-realm schema** command using a different schema name.

Example

The following command creates a NAT realm schema with the VPN name, realm name, and flows information:

nat-realm schema *relam1* **format** *"%vpnname% %realmname% %nat-rlm-flows%"*

pdif schema

This command configures PDIF bulk statistics schema.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

pdif schema*schema_name***format***format_string*

no pdif schema*schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3600 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for PDIF bulk statistics collection. Multiple PDIF schemas can be created to categorize PDIF bulk statistics. All of the schemas are processed at each collection interval. To create multiple schemas, re-issue the **pdif schema** command using a different schema name.

Example

The following command creates a schema called *pdifschema1* for the category current active ipv4 sessions:

pdif schema *pdifschema1* **format** *%sess-curactip4%*

port schema

This command configures port bulk statistics schema.

Product

All

Privilege

Security Administrator, Administrator

Syntax

port schema*schema_name***format***format_string*

no port schema*schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for port bulk statistics collection. Multiple port schemas can be created to categorize port-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple port schemas, re-issue the **port schema** command using a different schema name.

Important: The *card* variable in the Port schema is not supported on all platforms

Example

To create a port-level schema named *portstats1* that separates the *card/port*, *bcast_inpackets*, and *bcast-outpackets* variables by hyphens ("-"), enter the following command:

```
port schema portstats1 format "%card%/%port% - %bcast_inpackets% -
%bcast_outpackets%"
```

ppp schema

This command configures point-to-point protocol bulk statistics schema.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ppp schema*schema_name***format***format_string*

no ppp schema*schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for point-to-point protocol bulk statistics collection. Multiple PPP-service schemas can be created to categorize PPP-service bulk statistics. All of the schemas are processed at each collection interval. To create multiple PPP-service schemas, re-issue the **ppp schema** command using a different schema name.

Example

To create a ppp-level schema named *pppstats* that specifies a schema format of:

```
CHAP:
Auth. Attempts: auth-attempt-chapAuth. Successes: auth-success-chap
PAP:
Auth. Attempts: auth-attempt-papAuth. Successes: auth-success-pap
```

Use the following command:

ppp schema *pppstats* **format** **"***CHAP:\nAuth. Attempts: %auth-attempt-chap%\tAuth. Successes: %auth-success-chap%\nPAP:\nAuth. Attempts: %auth-attempt-pap%\tAuth. Successes: %auth-success-pap%\n***"**

radius schema

This command configures RADIUS bulk statistics schema.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

radius schema *schema_name* **format** *format_string*

no radius schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length and is case sensitive.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for RADIUS bulk statistics collection. Multiple RADIUS schemas can be created to categorize RADIUS bulk statistics. All of the schemas are processed at each collection interval. To create multiple RADIUS schemas, re-issue the **radius schema** command using a different schema name.

Example

To create a RADIUS schema named *radius_statistics* that specifies a schema format of:

- Server: ipaddr
- Authentication Requests Sent: auth-req-sent
- Accounting Requests Sent: acc-req-sent

Use the following command:

radius schema *radius_statistics* **format** *"Server: %ipaddr%\nAuthentication Requests Sent: %auth-req-sent%\nAccounting Requests Sent: %acc-req-sent%"*

receiver

Configures host system to receive bulkstats information through TFTP transfer.

Product

All

Privilege

Security Administrator, Administrator

Syntax

receiver { mode { redundant | secondary-on-failure } | *ip_address* { primary | secondary } [mechanism { { { ftp | sftp } login*user_name*** [encrypted] password***pwd*** } | tftp } }] }**

no receiver*ip_address*

---

no

Removes the receiver specified from the list of receivers where data files are sent.

---

mode { redundant | secondary-on-failure }

Determines how bulkstats are delivered to the primary and secondary receivers.
Default: **secondary-on-failure**
redundant: Files are transferred to both the primary and secondary receivers. If either transfer isn't possible, the file is transferred when possible. The system continues to hold in memory as much data as possible until the data has been successfully transferred to both receivers. Data is only discarded if the in-memory data reaches the configured limit. Refer to the **limit** command.
secondary-on-failure: Files are transferred to the secondary receiver if the primary receiver fails. In-memory data is erased once the data is transferred to either the primary or secondary receiver. This is the default behavior.

---

ip_address

Specifies the IP address of the receiver of interest. *ip_address* must be specified using the standard IPv4 dotted decimal notation.

---

primary | secondary

Primary and secondary are used to indicate the order in which receivers are connected. The secondary is used when the primary is unreachable.
primary: indicates the receiver is the primary receiver of data.
secondary: indicates the receiver is the secondary receiver of data.

---

mechanism { { { ftp | sftp } login *user_name* **[encrypted] password** *pwd* **} | tftp } }**

Specifies the method by which data is transferred to the receiver.
ftp login *user_name* [**encrypted**] **password** *pwd*: the FTP protocol shall be used for data file transfer. *user_name* specifies the user to provide for remote system secure logins and must be an alpha and/or numeric string of 1 through 31 characters in length. The password to use for remote system

authentication is specified as *pwd* and must be from 1 to 31 alpha and/or numeric characters or 1 to 64 alpha and/or numeric characters if the **encrypted** keyword is also specified.
sftp login *user_name* [**encrypted**] **password** *pwd*: the SFTP protocol shall be used for data file transfer. *user_name* specifies the user to provide for remote system secure logins and must be an alpha and/or numeric string of 1 through 31 characters in length. The password to use for remote system authentication is specified as *pwd* and must be from 1 to 31 alpha and/or numeric characters or 1 to 64 alpha and/or numeric characters if the **encrypted** keyword is also specified.
tftp: the TFTP protocol is to be used to transfer files.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

Usage

Use TFTP methods to reduce transfer times if excessive system resources are being used across the network for transfer of data.
FTP transfer method allows for login which then provides system logging within the enabled FTP logs.
The initially connection is attempted to the primary. If the primary is unreachable for any reason the secondary is used. If the secondary is also unreachable the system retrys after a delay period where it again attempts to connect to the primary followed by the secondary as necessary.

Important: For redundant receivers, configuration changes to the receivers are applied to all existing and all subsequent data sets pending transfer. If no receiver is configured, bulk statistics will be collected and stored on the system until the maximum amount of memory is used; they will not be transferred to the receiver(s). When the storage limit has been reached the oldest information is overwritten. When a receiver is configured for the primary and secondary target, this command will use both receivers as default if no receiver is specified.

Example

receiver *1.2.3.4* **primary mechanism tftpreceiver** *1.2.3.5* **secondaryno receiver** *1.2.3.4*

remotefile

Configures the naming convention with support for multiple file format to multiple receivers when storing the data files on the remote receiver/s.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
remotefile formatformat_string[ both-receivers | primary-receiver | secondary-receiver ]

no remotefile format
```

no

Resets the remote file naming convention to the system default.

format *format_string*

Default: "%date%-%time%"
Specifies the naming convention format to use. *format_string* must be from 1 to 127 alpha and/or numeric characters with no spaces or as a quoted string. The format string syntax is described in the Schema Format String Syntax section.

Important: The remote file naming format should only use static text and bulk statistic variables to avoid any possible file creation issues on the receivers.

The following variables are supported:

Table 15. remote file Command Naming Format Variables

Variable	Description	Data Type
date	The UTC date that the collection file was created in YYYYMMDD format where YYYY represents the year, MM represents the month and DD represents the day.	String
date3	The UTC date that the collection file was created in YYMMDD format where YY represents the year, MM represents the month and DD represents the day.	String
host	The system hostname that created the file	String
sysuptime	The uptime (in seconds) of the system that created the file.	32-bit signed
time	The time that the collection file was created in HHMMSS format where HH represents the hours, MM represents the minutes, and SS represents the seconds.	String

both-receivers | primary-receiver | secondary-receiver

Set the remote file creation target to both receivers, primary receiver or secondary receiver.
Default: Both receivers.

Usage

Set the remote file naming format to ensure consistent data file naming across a network or adjusting a single system's format for easy identification.
This command specify whether the format should be used in conjunction with both receivers, only the primary receiver, or only the secondary receiver.

Important: For redundant receivers, the filenames for the output data files are applied when the information is first gathered. If the name format is modified, the change takes effect for the next data set. The current data set name remains unchanged. even if has not yet been transferred.

Example

remotefile format *simpleFormat***remotefile format** *"%host%-%date%-%time%"***remotefile format** *"%host%-%date%-%time%"* **[both-receivers]remotefile format** *"%host%-%date%"* **[primary-receiver]no remotefile format**

rp schema

This command configures R-P bulk statistics schema.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

rp schema*schema_name***format***format_string*

no rp schema*schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for R-P bulk statistics collection. Multiple PDSN service schemas can be created to categorize PDSN service bulk statistics. All of the schemas are processed at each collection interval. To create multiple PDSN service schemas, re-issue the **rp schema** command using a different schema name.

Example

To create an PDSN-level schema called pdsnservicestats that specifies a schema format of:
Date: date
Time: time
Number of Authentication Denials: deny-auth
Use the following command:

rp schema *rpservicestats* **format** *"Date: %date%\nTime: %time%\nNumber of Authentication Denials: %deny-auth%\n"*

sample-interval

This command configures the time interval between collecting local statistics.

Product

All

Privilege

Security Administrator, Administrator

Syntax

sample-interval*minutes*

minutes

Specifies the frequency of polling for local statistics.
minutes must be an integer from 1 through 1440.

Usage

Adjust the sampling interval to tune the system response as shorter periods can cause undue system overhead whereas longer periods have less of a statistical importance when analyzing data.
The system is shipped from the factory with the sampling interval set to 15 minutes.

Example

sample-interval *120*

sccp schema

This command configures the statistics collection schema for the Signalling Connection Control Part function (SCCP).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sccp schema *schema_name* **format** *format_string*
no sccp schema *schema_name*

no

Removes the specified SCCP schema from statistics collection.

schema_name

Specifies the name to use to refer to the schema and associated format string. *schema_name* must be from 1 to 31 alpha and/or numeric characters.

format *format_string*

Specifies the naming convention format to use. *format_string* must be from 1 to 3599 alpha and/or numeric characters with no spaces or as a quoted string. The format string syntax is described by Schema Format String Syntax .

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

schema

This command configures the system-level bulk statistics schema.

Product

All

Privilege

Security Administrator, Administrator

Syntax

schema*schema_name***format***format_string*

no schema*schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for system-level bulk statistics collection. Multiple schemas can be created to categorize system-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple system schemas, re-issue the **schema** command using a different schema name.

Example

The following command creates a schema called *systemstats1* that records the number of current Simple IP and the number of current Mobile IP sessions:

```
schema systemstats1 format "%sess-cursipconn% - %sess-curmipconn%"
```

To create a system-level schema called bulksysstats that specifies a schema format of:
Number of currently active sessions: sess-curactcall
Number of currently dormant sessions: sess-curdormcall
Use the following command:

schema *bulksysstats* **format** **"***Number of currently active sessions: %sess-curactcall%\nNumber of currently dormant sessions: %sess-curdormcall%\n***"**

sgsn schema

This command configures the statistics collection schema for the SGSN services.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sgsn schema*schema_name***format***format_string*

no sgsn schema*schema_name*

no

Removes the specified SGSN schema from statistics collection.

schema_name

Specifies the name to use to refer to the schema and associated format string. *schema_name* must be from 1 to 31 alpha and/or numeric characters.

format *format_string*

Specifies the naming convention format to use. *format_string* must be from 1 to 3599 alpha and/or numeric characters with no spaces or as a quoted string. The format string syntax is described by Schema Format String Syntax .

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

sgtp schema

This command configures the statistics collection schema for the SGSN's GTP-C and GTP-U activity.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sgtp schema*schema_name***format***format_string*

no sgtp schema*schema_name*

no

Removes the specified SGTP schema from statistics collection.

schema_name

Specifies the name to use to refer to the schema and associated format string. *schema_name* must be from 1 to 31 alpha and/or numeric characters.

format *format_string*

Specifies the naming convention format to use. *format_string* must be from 1 to 3599 alpha and/or numeric characters with no spaces or as a quoted string. The format string syntax is described by Schema Format String Syntax .

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

ss7link schema

This command configures the collection schema for the SS7 Link services statistics.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ss7link schema*schema_name***format***format_string*

no ss7link schema*schema_name*

no

Removes the specified SS7 Link schema from statistics collection.

schema_name

Specifies the name to use to refer to the schema and associated format string. *schema_name* must be from 1 to 31 alpha and/or numeric characters.

format *format_string*

Specifies the naming convention format to use. *format_string* must be from 1 to 3599 alpha and/or numeric characters with no spaces or as a quoted string. The format string syntax is described by Schema Format String Syntax .

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

ss7rd schema

This command configures the collection schema for the SS7 Routing Domain services statistics which include the statistics for Stream Control Transmission Protocol (SCTP) activities, the statistics for MTP3, and M3UA data activity.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ss7rd schema*schema_name***format***format_string*

no ss7rd schema*schema_name*

no

Removes the specified SS7 routing domain schema from statistics collection.

schema_name

Specifies the name to use to refer to the schema and associated format string. *schema_name* must be from 1 to 31 alpha and/or numeric characters.

format *format_string*

Specifies the naming convention format to use. *format_string* must be from 1 to 3599 alpha and/or numeric characters with no spaces or as a quoted string. The format string syntax is described by Schema Format String Syntax .

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

show variables

Displays the bulk statistics variable information.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
show variables [ [ apn | asngw | bcmcs | card | closedrp | common | context |
cscf | ecs | fa | gprs | gtpc | gtpp | ha | ippool | ipsg | lac | pdif | port |
ppp | radius | rp | sccp | sgsn | sgtp | ss7rd | ss7link| system | vpn ] [
obsolete ] ]
```

```
[ apn | asngw | bcmcs | card | closedrp | common | context | cscf | ecs |
fa | gtpc | gtpp | ha | ippool | ipsg | lac | pdif | port | ppp | radius
| rp | sccp | sgsn | sgtp | ss7rd | ss7link| system | vpn ] [ obsolete ]
```

Displays only the variables for the specified schema.
If the **obsolete** keyword is used, obsolete (but still available) schema variables are displayed. An asterisk (*) is displayed next to schema variables that have been obsoleted.
For information on available schemas, refer to the Bulk Statistics Configuration Mode Commands chapter.

Usage

Use this command to list supported bulk statistic variables. Variables can be listed for a specified schema. If no schema is specified, all supported variables are listed on a per-schema basis.

Example

The following command displays the bulkstat variables only for the card schema:

```
show variables card
```

transfer-interval

Configures the frequency of transfer of collected statistics to the receiver.

Product

All

Privilege

Security Administrator, Administrator

Syntax

transfer-interval*minutes*

minutes

Specifies the number of minutes between the transfer of collected statistics to the receivers. *minutes* must be an integer from 1 through 999999.

Usage

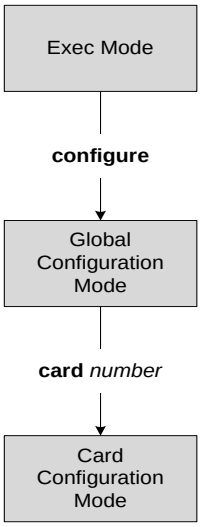
Modify the transfer interval based upon the number of sessions per second. As the number of session requests a second increases it may become necessary to increase the transfer interval to reduce the processing overhead frequency for statistics delivery. This is tempered by the impact reduced resolution of statical data has on usefulness of data when the interval gets larger than the least busy hours and most busy hours of the day.
The system is shipped from the factory with the transfer interval set to 480 minutes.

Example

transfer-interval *1440*

Chapter 31
Card Configuration Mode Commands

The Card Configuration Mode is used to create and manage the different types of physical cards in the chassis.



aps

This command configures automatic protection switching (APS) features for SONET/SDH line cards - OLC2 or CLC2.

Important: This feature is not yet fully supported.

Product

SGSN

Privilege

Security Administrator, Administrator

1+1

Linear 1+1 Uni-directional APS type redundancy:
- Linear means th

`1:1`

APS type Linear 1:1 Bi-directional.

`non-revertive`

revertive

`-noconfirm`

Instructs the system to execute the command without additional prompting for command confirmation.

`aps 1+1`

end

Exits the card configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the command mode back to the Exec mode.

Example

end

exit

Exits the current mode, card configuration mode, and returns the CLI session to the previous mode, global configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the Global configuration mode.

Example

exit

framing

This command configures the type of framing used for the signaling generated on a specific type of line card.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
framing { ethernet | sdh [ ds1 | e1 ] | sonet [ ds1 | e1 ] | unspecified } [  -noconfirm  ]

default framing [ -noconfirm ]
```

default

Resets the framing generated by the card to the default for the particular card type.

ethernet

Configures the system to use Ethernet framing for this line card. This type of framing can only be used on an ethernet card.
Default: Ethernet framing type is the default for an Ethernet line card.

Important: Using this keyword with an OLC/OLC2 or CLC/CLC2 would take the card offline.

sdh [ds1 | e1]

Configures the system to use SDH signal framing for either an OLC/OLC2 or CLC/CLC2 line card in an SGSN.

Important: Using this keyword with an Ethernet line card would take the line card offline.

In releases 8.1 and higher, you can also set the type of signaling path for a CLC2.
ds1 - configures the card to support a DS1/T1.
e1 - configures the card to support an E1. This is the default for SDH.

sonet [ds1 | e1]

Configures the system to use SONET signal framing for either an OLC/OLC2 or CLC/CLC2 line card in an SGSN.
Default: SONET is the default framing type for an OLC/OLC2 or CLC/CLC2 line card.

Important: Using this keyword with an Ethernet line card would take the line card offline.

In releases 8.1 and higher, you can also set the type of signaling path for a CLC2.
ds1 - configures the card to support a DS1/T. This is the default for SONET.

e1 - configures the card to support an E1.

unspecified

Configures the system to use the default framing type for the particular line card resident in the identified slot.

-noconfirm

Instructs the system to execute the command without additional prompting for command confirmation.

Usage

Use the **framing** command to identify the type of signal framing to be used by the line card in the identified slot.
It should be noted that each type of line card uses a different type of signal framing. If the wrong type of framing is configured for a line card, the line card will be taken offline.

Important: This command is not supported on all platforms.

Example
The following command could be used to configure SDH signal framing on a CLC2. By not including the path-type, the default of **e1** will automatically be included in the card's framing configuration:

```
framing sdh
```

header-type

This command defines the size of the header frame for Frame Relay transmissions over a CLC or CLC2 channelized line card.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

header-type *header-size* [**-noconfirm**]

default header-type [**-noconfirm**]

default

Resets the configuration to the default header size of 2-bytes.

header-size

This sets the size, number of bytes, for the header frame.
header-size must be either 2-bytes or 4-bytes.

-noconfirm

Instructs the system to execute the command without additional prompting for command confirmation.

Usage

Use this command to set the size of the header frame for Frame Relay messages emanating from the line card. The size (2-bytes or 4-bytes) determines the amount of information that can be transmitted in that first information frame.

Important: Not supported on all platforms

Example

Set the header to the smallest size.

header-type *2-byte*

initial-e1-framing

Configures the type of framing mode that will be initially available at the time the line card boots.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

initial-e1-framing [crc4 | standard]

default initial-e1-framing

default

Returns the configuration to CRC4 as the default type.

crc4

Accepts the default CRC4, in the configuration, as the initial at-boot framing mode.

standard

Accepts the **standard** mode as the initialization framing mode.

Usage

For a CLC-type line card, the default E1 framing mode is "CRC4". When a card reboots, all E1s are initialized with "CRC4" framing mode and then switch to the configured framing mode. With this keyword, the user has the option to choose the initialization framing mode.

Important: Only supported on CLC/CLC2

Example

initial-e1-framing standard

link-aggregation

Configures the link-aggregation system-priority for a Quad Gig-E line card (QGLC). This parameter is usually changed to match the feature requirements of the remote switch.

Product

WiMAX, PDSN, HA, FA, GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
link-aggregation { system-priority priority | toggle-link } [ -noconfirm ]

{ default | no } link-aggregation { system-priority | toggle-link } [
-noconfirm ]
```

default

Resets the configuration to the default.

link-aggregation system-priority *priority*

This command sets the system priority used by LACP to form the system ID.
priority is a hex value in the range of 0x0000 to 0xFFFF.
Default system priority value is 0x8000 (32768).

toggle-link

When enabled, port line down and port link up events are generated.
Default is disabled.

-noconfirm

Instructs the system to execute the command without additional prompting for command confirmation.

Usage

This value is combined with the Master port's MAC address to form the system ID. A system is a PSC or PSC2 and its associated QGLC(s) The highest system ID priority (the lowest number) handles dynamic changes.
For additional usage and configuration information for the link aggregation feature, go to Configuring Link Aggregation in the System Administration Guide.

Important: Not supported on all platforms

Example

The following command configures the link aggregation system-priority to 10640:

```
link-aggregation system-priority 0x2990
```

mode

Sets the application Processor Card's current administrative state to active or standby.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
mode { active [ pac | psc] | standby } [ -noconfirm ]
default mode [ -noconfirm ]
```

default

Returns the mode to the default value appropriate to the card type.
The default administrative mode for line cards affects a single card and its mated line card. The default state for line cards in the top shelf is active. The default for line cards in the bottom shelf is standby.
The default administrative state for the SPIO in slot 24 is active and the SPIO in slot 25 is standby.
The default administrative mode for PSCs or PSC2s is standby.

Important: This command results in a migration of processes if the default mode for a card is different than the current state of the card.

active [pac | psc]

Defines which card type is to be switched from standby to active state. If a card is present in the slot, the Processing Card is automatically selected depending upon the type of card. If no card is present in the slot, Processing Card is assumed.
pac: Identifies a PAC
psc: Identifies a PSC or PSC2

standby

Sets the PSC, or PSC2 in the slot to standby mode.

Caution: Switching an active PSC/PSC2 to standby deletes all port configurations, including bindings, for the attached line cards.

-noconfirm

Instructs the system to execute the command without additional prompting for command confirmation.

Usage

Set the desired mode of mated cards. The card targeted for maintenance is placed in the standby state first. The setting of the mode determines which PSCs or PSC2s are to be active and which are to be the standby cards for redundancy. Use this command to configure the set of active and standby PSCs/PSC2s. The

application processor card's standby priority is then used in conjunction with the set of standby PSCs or PSC2s to determine the order in which the standby cards are used for redundancy support.

Important: Not supported on all platforms

Important: This command results in a migration of processes if the mode specified for the card is different than the current state of the card.

Example
The following commands set the state of a card to active and standby, respectively.

```
mode active

mode standby
```

redundancy

Configures the type of redundancy for a line card or SPIO.

Product

PDSN, FA, HA, GGSN, SSGN

Privilege

Security Administrator, Administrator

Syntax

redundancy { **card-mode** | **mixed-mode** | **port-mode** | **pseudo-aps-mode** } [**-noconfirm**]

default redundancy [**-noconfirm**]

default

Restores redundancy to **port-mode** type redundancy.

card-mode

Specifies no port redundancy is used. This is used mostly for legacy products.

mixed-mode

port-mode

Enables port redundancy on line cards or on SPIO cards.
This is the default setting used by the system.

Important: Port-type redundancy does not affect line card failover/redundancy operations.

pseudo-aps-mode

Important: This feature is not yet fully supported.

With release 8.1 and higher, this keyword enables pseudo-APS type port redundancy on OLC2/CLC2 line cards.

-noconfirm

Instructs the system to execute the command without additional prompting for command confirmation.

Usage

Use this command to configure redundancy on a line card (LC) or a SPIO card. With **port-mode** enabled, if an external network device or cable failure occurs that causes a link down failure on the port, the redundant port is used.

Important: Not supported on all platforms

Important: You do not need to enter this command for each LC or SPIO card, as the system intuitively understands that if the command is entered for an active LC or SPIO card, the standby LC or SPIO card switches to operate in the same mode. For example, entering the **port-mode** command for an LC in slot 17 automatically enables a redundant LC in slot 33 for port redundant operation.

Example

The following command sets the redundancy mode to port redundancy.

```
redundancy port-mode
```

service-type

This command configures the type of service the CLC or CLC2 line card will support.

Important: Supported in software releases 8.1 and higher.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

service-type { frame-relay | mtp2 | pwe3-cesopsn | unspecified } [-noconfirm]

default service-type [-noconfirm]

default

Returns the card configuration to 'unspecified'.

frame-relay

Configures the card to operate in Frame Relay service mode.

mtp2

Important: MTP2 functionality is not yet supported.

Enables MTP2 type service to support narrowband transmissions.

pwe3-cesopsn

Important: pwe3-cesopsn functionality has been replaced by **mtp2**.

unspecified

This is the default mode for a CLC or CLC2 linecard.

Important: You must configure the linecard to one of the available service types or the card will not function.

-noconfirm

Instructs the system to execute the command without additional prompting for command confirmation.

Usage

Use this command to configure the operational service mode for the channelized line card - CLC or CLC2. Once you select the service-type, refer to the Channelized Port configuration mode chapter to review the commands needed to configure the parameters for the port.

Example

```
service-type frame-relay
```

shutdown

Configures a card for active service or terminates all processes on the card.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] shutdown
```

no

no shutdown enables the card.
Enter only the **shutdown** keyword to shut the the card down.

Usage

Shut down a card to remove it from service or to enable a card to put it into service.

Important: Do not use this command to remove a card from service for maintenance. Use the command **card halt** to remove a card for service to avoid changing or deleting the active-mode configuration. See the Exec Mode chapter.

Important: Not supported on all platforms

Example

The following commands shutdown the card and switch a card to online, respectively.

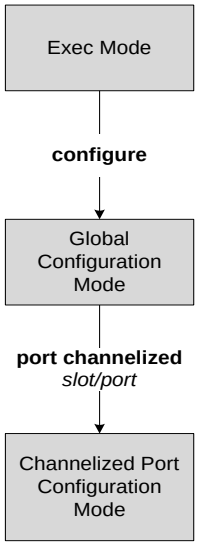
```
shutdown

no shutdown
```

Chapter 32
Channelized Port Configuration Mode Commands

The channelized port configuration mode provides the commands to create, configure, bind, and manage the Frame Relay service ports on the channelized line card.

Important: Before using these commands, card framing should be configured for either SDH or SONET with the framing command described in the Card Configuration Mode chapter.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

alarm-disable

Entering this command disables the alarm detection for designated sets of alarms.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

alarm-disable { all | ds1-e1 | none | sonet-sdh }

[no | default] alarm-disable

no

Deletes the disable configuration.

default

Returns the settings for disabling alarms to the system default.

all

Disables detection of all SONET/SDH and DS1/E1 alarms.

ds1-e1

Disables detection of the DS1/E1 alarms.

none

None of the alarm detection is disabled so that all DS1/E1 and SONET/SDH alarms are detected.

sonet-sdh

Disables detection of SONE/SDH alarms.

Usage

Configure selected alarm detection for the port.

Example

Enter the following command to enable DS1/E1 and SONET/SDH alarm detection.

```
alarm-disable none
```

alarm-soak-timer

This command sets the timer for the duration that a detected alarm will be soaked before the alarm is reported.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

alarm-soak-timer *seconds*

default alarm-soak-timer

default

Returns the timer settings to the system default.

seconds

Defines the number of seconds the system waits (soaks the alarm) before reporting the alarm.
seconds: any integer from 0 to 32767.

Usage

Configures the delay before reporting detected alarms.

Example

Configure a 20 second alarm report delay.

alarm-soak-timer *20*

clock-source

This command sets the source of the port's transmit clock.

Important: This command is only available for releases 8.1 or higher.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
clock-source { internal-timing | loop-timing }

default clock-source
```

default

Using this command combination sets the port clock source to internal timing.

internal-timing

Sets the port clock to derive timing from the recovered receive clock.

loop-timing

Sets the port clock to transmit in sync with the system timing.

Usage

Use this command for either SONET or SDH channelized (Frame Relay) ports on the SGSN.

Example

The following command resets the transmit clock source to internal timing.

```
default clock-source
```

description

Defines descriptive text that provides useful information about the port.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

description *text*

no description

no

Erases the port's description from the configuration file.

text

text must be a string of 1 to 79 alphanumeric characters with no spaces or a string within double quotes that includes printable characters. The description is case-sensitive.

Usage

Set the description to provide helpful information, for example the port's primary function, services, end users. Define any information, the only limit is the number of characters.

Example

description *samplePortDescriptiveText*

description *"This is a sample description"*

dlci

Identifies a data link connection identifier (DLCI), a frame relay logical connection, and binds it with a specific channelized path configuration. Once the DLCI is bound to the path, the system enters DLCI configuration mode.

Important: The **path** command must be configured prior to attempting configuration with the **dlci** command.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

dlci path *path_id* { **ds1** | **e1** } *connects* { **dlci** *dlci_id* | **timeslots** *slot#* **dlci** *dlci_id* }

no dlci path path_id { **ds1** | **e1** } *connects*

no

Disables the configured DLCI.

path *path_id*

Identifies a specific path configuration, set with the **path** command in this configuration mode, that will be associated with a DLCI.
path_id must be an integer from 1 to 3.

ds1 *connects* **| e1** *connects*

Selects the framing speed for the connection.
DS1: Is associated with North American networks and would be the best choice to work with the SONET framing selected with the **card** configuration command.
connects: Defines the number of logical connections supported via the DS1. The selection must be an integer from 1 to 28.
E1: is associated with European networks and would be associated with the SDH framing selected with the **card** configuration command.
connects: Defines the number of logical connections supported via the E1. The selection must be an integer from 1 to 21.

dlci *dlci_id*

Identifies a specific Frame Relay PVC DLCI to associate with the path.
dlci_id: an integer from 16 to 991.

timeslot *slot#*

Identifies one of the timeslots within a timeslot group configured with the **path** command for the E1, DS1 or fractional E1 port. Identifying one slot in a group means that all the slots in that group will have the Frame Relay parameters configured in the same manner.

slot#: Must be an integer from 1 to 31.

Usage

Associating a routing path with a specific frame relay DLCI is a significant part of the process for defining the frame relay interface.

Example

Associate path 1 with DLCI 123.

```
dlci path 1 ds1 21 dlci 123
```

end

Exits the Channelized Port configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the Channelized Port configuration mode and returns to the Global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the Global configuration mode.

frame-relay

Configures the parameters for the Frame Relay connections for E1, DS1 and fractional E1 ports created with the **path** command. Frame

Important: The **path** command must be configured prior to attempting configuration with the **frame-relay** command.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

frame-relay path *path_id* { **ds1** *connects* | **e1** *connects* } **timeslot** *slot#* [**intf-type** *intf_type*] [**lmi_type** *lmi_type*]

path *path_id*

Identifies a specific path configuration, set with the **path** command in this configuration model. *path_id* must be an integer from 1 to 3.

ds1 *connects* | **e1** *connects*

Selects the pipe splitting for the connection.
DS1: Is associated with North American networks and would be the best choice to work with the SONET framing selected with the **card** configuration command. DS1 splits the path into 28 logical connections.
connects: Defines the number of logical connections supported via the DS1. The selection must be an integer from 1 to 28.
E1: is associated with European networks and would be associated with the SDH framing selected with the **card** configuration command. E1 splits the path into 21 logical connections.
connects: Defines the number of logical connections supported via the E1. The selection must be an integer from 1 to 21.

timeslot *slot#*

Identifies one of the timeslots within a timeslot group configured with the **path** command for the E1, DS1 or fractional E1 port. Identifying one slot in a group means that all the slots in that group will have the Frame Relay parameters configured in the same manner.
slot#: Must be an integer from 1 to 31.

intf-type *intf_type*

Selecting the interface type specifies signaling parameters for the DLCI, options include:

- **dce**: Selects data circuit-terminating equipment -type signaling.
- **dte**: Selects data terminal equipment -type signaling.
- **nni**: Selects the network-to-network interface

Default: DTE for Release 8.0
Default: DCE for Release 8.1

frame-relay lmi_type *lmi_type*

Default: **none**.
Line management options include:

- **ansi** - ANSI ANNEXED LMI, may include option:
- **cisco** - Cisco/Gang Of Four LMI
- **none** - LMI Disabled
- **q933a** - Q.933A LMI

Any of the above LMI types can take one or more additional options

- **n391** *value* - Number of keep exchanges before requesting a full status message. Default is 6. *value* must be an integer from 1 to 255.
- **n392** *value* - Error Threshold value. Default is 2. *value* must be an integer from 1 to 10.
- **n393** *value* - Monitored events count value. Default is 2. *value* must be an integer from 1 to 10.
- **t391** *value* - Timer to send messages. Default is 10. *value* must be an integer from 5 to 30.
- **t392** *value* - Polling verification timer value. Default is 15. *value* must be an integer from 5 to 30.

Usage

Use this command to define LMI type and timers and to associate time group 2 with the Frame Relay connection.

Example

frame-relay path *1* *e1 3* **timeslot** *2*

hopath-sdsf

Configures the high-order path for SDSF bit error rate (BER) thresholds.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

hopath-sdsf *hopath_value*

hopath_value

- 0: Disabled
- 1 -1.E-03
- 2 - 1.E-04
- 3 - 1.E-05
- 4 - 1.E-06
- 5 - 1.E-07
- 6 - 1.E-08
- 7 - 1.E-09
- 8 - 1.E-10

Usage

Sets a standard option for the high-order path for SDSF.

Example

hopath-sdsf *1*

line-timing

This command enables the SPIO to recover transmit timing source via line attached to the selected port. By default, line-timing is not enabled.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] line-timing
```

no

Disables line-timing as the source for the transmit clock.

Usage

The port must be enabled (with the **no shutdown** command) to enable recovery of timing source via the line. As well, the card's slot number must be entered in the **recover line#** command of the BITS port configuration mode.

Example

Disable timing clock recovery on this port.

```
no line-timing
```

loopback

Configures the type of loopback mode used for diagnostic testing.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

loopback { **ds1-e1-diag** | **ds1-e1-line** | **none** | **sonet-sdh-diag** | **sonet-sdh-line** }

ds1-e1-diag

Enables a system generated diagnostic lookback signal at the DS1/E1 layer.

ds1-e1-line

Loops back a network diagnostic signal at the DS1/E1 layer.

none

Stops diagnostic loopback signalling.

sonet-sdh-diag

Enables a system generated diagnostic lookback signal at the SONET/SDH layer.

sonet-sdh-line

Loops back a network diagnostic signal at the SONET/SDH layer.

Usage

Setup diagnostic loopback signals for troubleshooting purposes.

Example

loopback ds1-e1-diag

lopath-sdsf

Configures the low-order path for SDSF bit error rate (BER) thresholds.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

lopath-sdsf *lopath_value*

lopath_value

- 0: Disabled
- 1 -1.E-03
- 10 - 1.E-12
- 2 - 1.E-04
- 3 - 1.E-05
- 4 - 1.E-06
- 5 - 1.E-07
- 6 - 1.E-08
- 7 - 1.E-09
- 8 - 1.E-10
- 9 - 1.E-11

Usage

Sets a standard option for the low-order path for SDSF.

Example

lopath-sdsf *1*

mtp2

Creates an MTP2 configuration instance for the port.

Important: The port DS1/E1 tributaries must be configured using the **path** command prior to creating a port MTP2 configuration.

Important: The MTP2 feature is not yet fully supported and so the command is not yet fully functional. Please ignore this keyword, at this time, while configuring the channelized port.

Product

SGSN

Privilege

Security Administrator, Administrator

path

This command configures the parameters that define the routing path for a DLCI. It must match with the DLCI configuration parameters. The values entered with these commands should be noted as they will be needed to configure the **frame-relay** and **dlci** commands also in this configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

path *path_id* { **ds1** *connects* | **e1** *connects* } *frame-mapping multiplexing index# index#* **framing** *mode* **mapping-mode** { **bit-sync** | **byte-sync** } [**timeslots** *slot#* [*slot#*] | **frame-relay** [**intf-type***intf_type* [**lmi_type** *lmi_type*]]]

no path *path_id* { **ds1** | **e1** } *connects*

no

Deletes the routing path entry from the configuration.

path *path_id*

Identifies a specific path configuration that will be associated with a DLCI. The *path_id* must be an integer from 1 to 3.

ds1 *connects* **| e1** *connects*

Selects the channelization for the connection.
DS1: (AKA: T1) Is associated with North American networks and would be the best choice to work with the SONET (can also work with SDH) framing selected with the **card** configuration command. DS1 splits the path into 28 logical connections.
connects: Defines the number of logical connections supported via the DS1. The selection must be an integer from 1 to 28.
E1: is associated with European networks and would be associated with the SDH (can also work with SONET) framing selected with the **card** configuration command. E1 splits the path into 21 logical connections.
connects: Defines the number of logical connections supported via the E1. The selection must be an integer from 1 to 21.

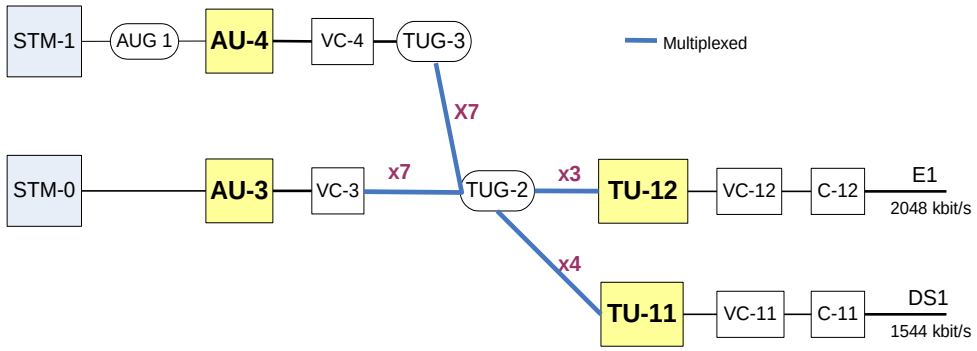
frame-mapping

Frame mapping sets the channelization according to the national standards that correlate with the framing/speed standards. This option selects the mapping of containers (C), virtual containers (VC), tributary units (TU), and tributary unit groups (TUG), that is appropriate for the channel characteristics:

- **tu11-au3**: Appropriate for DS1 in SDH. Maps as follows AU-3—VC-3— m# —TUG-2— m# —TU-12—VC-12—C-12
- **tu11-au4**: Appropriate for DS1 in SDH. Maps as follows AU-4—VC-4—TUG-3— m# —TUG-2— m# —TU-11—VC-11—C-11

- **tu12-au3**: Appropriate for E1 in SDH. Maps as follows AU-3—VC-3— m# —TUG-2— m# —TU-12—VC-12—C-12
- **tu12-au4**: Appropriate for E1 in SDH. Maps as follows AU-4—VC-4—TUG-3— m# —TUG-2— m# —TU-12—VC-12—C-12

Frame Mapping for E1 and DS1 to STM-n Interfaces



- **vt1.5**: Only appropriate for DS1 in SONET framing.
- **vt2**: Only appropriate for E1 in SONET framing.

---

multiplexing index# index#

index#: TUG-2 index - Must be an integer from 1 to 7 to identify a multiplex channel between TUG-2 and VC-3 (E1) or TUG-3 (DS1).
index#: TU index - Must be an integer from 1 to 4 (DS1) or 1 to 3 (E1) to identify a multiplex channel between TU-11 (DS1) and TUG-2 or between TU-12 (E1) and TUG-2.

---

framing *mode*

Defines the framing modes to be used for the channelization to E1 or T1 of the (optical) port.

- options for E1:
  - **cas:** standard mapping with CAS
  - **cas-crc4:** CRC4 mapping with CAS
  - **crc4:** CRC4 mapping
  - **standard:** mapping
- options for DS1:
  - **esf:** extended superframe mapping
  - **sf:** superframe mapping
  - option for either E1 or DS1:
  - **unframed**

---

mapping-mode

- **bit-sync**
- **byte-sync**

timeslots *timeslots*

Defines up to 8 timeslot groupings for multiple fractional DS1/E1 channels. Each slot is 2.048/32 Mbytes. Slots 0 and 16 are reserved for synchronization and alarms. Slots 1-15 and 17-31 are used for data. Timeslots must be unique -- a timeslot can not be used in more than one grouping.
timeslots: Must be an integer from 1 to 31. Timeslot groups are separated by spaces and can consist of a single slot and/or a range indicated with a hyphen. Example: 3,7-10 is a single fractional group. NOTE there is no space after the comma. Timeslots must be unique -- a timeslot can not be used in more than one grouping.

frame-relay

Enables definition of a Frame Relay connection with the **frame-relay** command.

Important: For release 8.1 and higher, this feature has been moved to the **frame-relay** command.

intf-type *intf_type*

Selecting the interface type specifies signaling parameters for the DLCI, options include:

- **dce**: Selects data circuit-terminating equipment -type signaling.
- **dte**: Selects data terminal equipment -type signaling.
- **nni**: Selects the network-to-network interface

Default: DTE for Release 8.0
Default: DCE for Release 8.1

Important: For release 8.1 and higher, this feature has been moved to the **frame-relay** command.

lmi_type *lmi_type*

Default: **none**.
Line management type options include:

- **ansi** - ANSI ANNEXED LMI, may include option:
- **cisco** - Cisco/Gang Of Four LMI
- **none** - LMI Disabled
- **q933a** - Q.933A LMI

Any of the above LMI types can take one or more additional options

- **n391** *value* - Number of keep exchanges before requesting a full status message. Default is 6. *value* must be an integer from 1 to 255.
- **n392** *value* - Error Threshold value. Default is 2. *value* must be an integer from 1 to 10.
- **n393** *value* - Monitored events count value. Default is 2. *value* must be an integer from 1 to 10.
- **t391** *value* - Timer to send messages. Default is 10. *value* must be an integer from 5 to 30.
- **t392** *value* - Polling verification timer value. Default is 15. *value* must be an integer from 5 to 30.

Important: For release 8.1 and higher, this feature has been moved to the **frame-relay** command.

Usage

Defines the signaling characteristics of a frame relay connection or timeslots for a fractional connection. Use this command to create E1 ports or fractional E1 ports. Fractional E1 ports are created with the timeslot definitions. The fractional E1 port can consist of one or more or all of the timeslots.

Example

In the first example, define timers for the q933a LMI-type.

```
path 1 e1 1 tu12-au4 1 1 framing crc4 mapping-mode bit-async
frame-relay intf-type dce lmi_type q933a n391 6 n392 2 n393 2
t391 10 t392 15
```

The next example defines 3 groups of fractional timeslots with group 1 having slots 1-5 and 8, group 2 having slot 22-25, and group 3 having slots 31.

```
path 1 e1 1 tu12-au3 1 1 framing cas mapping-mode bit-async
timeslots 1-5,8 22-25 31
```

preferred slot

Identifies which card in a chassis should assume revertive (redundancy auto-recovery) functionality should the slot/port being configured go down. This command must be issued on a per port basis, allowing you to configure specific ports to be used on individual LCs or SPIO cards. For example, ports 1 through 4 could be configured as "preferred" on the LC in slot 17 while ports 5 through 8 are "preferred" on the LC in slot 33. In this scenario, both LCs would be in an Active operational state while still providing LC and port redundancy for the other.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

preferred slot *slot#*

no preferred slot

slot#

Identifies the physical slot in the chassis where the line card is installed.

no

Disables revertive, or auto-recovery, operation for the port.

Usage

This command enables or disables revertive port redundancy. So after a port failover, when the original port is restored to service (i.e. link up) the system will return service to that port automatically.
Disabled, which is the default setting, causes non-revertive operation; requiring an administrative user to manually issue a port switch to command to return service to the original port.

Example

preferred slot 17

pwe3-cesopsn

This command has been replaced by the **mtp2** command.

Product

SGSN

Privilege

Security Administrator, Administrator

shutdown

Terminates all processes supporting the port or blocks the shutting down of the port. Conversely, this command with the **no** keyword enables the port.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

shutdown

no shutdown

no

Enables the port's administrative state. When omitted the card is shutdown (removed from service).

Usage

Shut down a port prior to re-cabling and/or other maintenance activities.
This command with the **no** keyword is required to bring a port into service.

Example

shutdown

no shutdown

snmp trap link-status

Enables/disables the generation and sending of an SNMP (notification) trap when the port experiences a change of state (up or down).

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
snmp trap link-status
no snmp trap link-status
```

no

Disables the sending of traps for link-status changes.

Usage

Enable the sending of link-status change traps if there is a monitoring facility that can use the information or if there are troubleshooting activities in progress.

Example

```
snmp trap link-status
no snmp trap link-status
```

threshold high-activity

Configures the port's high and low activity thresholds.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

threshold high-activity *high_thresh* [**clear** *low_thresh*]

high_thresh

Default: 50
Sets the threshold for the highest percentage of port activity that must be met or exceeded, within the polling interval, to generate an alert or alarm.
high_thresh_% can be configured to any integer value between 0 and 100.

clear *low_thresh*

Default: 50
Sets the threshold for the lowest percentage level of port activity that must be met to generate and send a clear alarm. If port activity does not drop to or below this threshold then the alarm is maintained.
low_thresh_% can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

High port activity thresholds generate alerts or alarms based on the utilization percentage of each configured port during the specified polling interval. This threshold is configured on a per-port basis.
Alerts or alarms are triggered for high port activity based on the following rules:

- **Enter condition:** Actual percent utilization of a port ³ High Threshold
- **Clear condition:** Actual percent utilization of a port < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command in the Global Configuration Mode Commands chapter of this reference to configure the polling interval and the **threshold monitoring** command in this chapter to enable thresholding for this value.

Example

The following command configures a high port utilization threshold percent of 70 and a low threshold of 50 for an system using the Alarm thresholding model:

threshold high-activity *70* **clear** *50*

threshold monitoring

Enables thresholding for port-level values.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
threshold monitoring

no threshold monitoring
```

no

Disables threshold monitoring for port-level values. This is the default setting.

Usage

Thresholding on the system is used to monitor the system for conditions that could potentially cause errors or outage. Typically, these conditions are temporary (i.e high-activity) and are quickly resolved. However, continuous or large numbers of these error conditions within a specific time interval may be indicative of larger, more severe issues. The purpose of thresholding is to help identify potentially severe conditions so that immediate action can be taken to minimize and/or avoid system downtime.

Thresholding reports conditions using one of the following mechanisms:

- **SNMP traps:** SNMP traps have been created that indicate the condition (high threshold crossing and/or clear) of each of the monitored values. Complete descriptions and other information pertaining to these traps is located in the starentMIB(8164).starentTraps(2) section of the SNMP MIB Reference.

The generation of specific traps can be enabled or disabled on the system allowing you to view only those traps that are most important to you.

- **Logs:** The system provides a facility called threshold for which active and event logs can be generated. As with other system facilities, logs are generated Log messages pertaining to the condition of a monitored value are generated with a severity level of WARNING.
- **Alarm System:** High threshold alarms generated within the specified polling interval are considered "outstanding" until a the condition no longer exists and/or a condition clear alarm is generated.

"Outstanding" alarms are reported to through the system's alarm subsystem and are viewable through the system's CLI.

The following table indicates the reporting mechanisms supported by each of the above models.

Table 16. Thresholding Reporting Mechanisms by Model

Model	SNMP Traps	Logs	Alarm System
Alert	X	X	
Alarm	X	X	X

This command enables thresholding for port-level values. Refer to the **threshold high-activity**,**threshold rx-utilization**, and **threshold tx-utilization** commands in this chapter for information on configuring these values. In addition refer to the **threshold poll** command in the Global Configuration Mode Commands chapter of this reference for information on configuring the polling interval over which these values are monitored.

threshold rx-utilization

Configures thresholds for receive-port utilization.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

threshold rx-utilization *high_thresh* [**clear** *low_thresh_*]

high_thresh

Default: 80
The high threshold receive port utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
The percentage can be configured to any integer value between 0 and 100.

clear*low_thresh*

Default: 80
Allows the configuration of the low threshold.
The low threshold receive port utilization percentage that maintains a previously generated alarm condition. If the utilization percentage falls below the low threshold within the polling interval, a clear alarm will be generated.
The percentage can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Receive port utilization thresholds generate alerts or alarms based on the utilization percentage of each configured port in relation to data received during the specified polling interval. This threshold is configured on a per-port basis.

Important: Ports configured for half-duplex do not differentiate between data received and data transmitted. Therefore, to avoid redundant alarms, it is recommended that only the receive **or** transmit utilization threshold be configured.

Alerts or alarms are triggered for receive port utilization based on the following rules:

- **Enter condition:** Actual percent utilization of a port for received data ³ High Threshold
- **Clear condition:** Actual percent utilization of a port for received data < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command in the Global Configuration Mode Commands chapter of this reference to configure the polling interval and the **threshold monitoring** command in this chapter to enable thresholding for this value.

Example

The following command configures a receive port high utilization threshold percent of 70 and a low threshold of 50 for an system using the Alarm thresholding model:

```
threshold rx-utilization 70 clear 50
```

threshold tx-utilization

Configures thresholds for transmit port utilization.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

threshold tx-utilization *high_thresh* [**clear** *low_thresh*]

high_thresh

Default: 80
The high threshold transmit port utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
The percentage can be configured to any integer value between 0 and 100.

clear *low_thresh*

Default: 80
Allows the configuration of the low threshold.
The low threshold transmit port utilization percentage that maintains a previously generated alarm condition. If the utilization percentage falls below the low threshold within the polling interval, a clear alarm will be generated.
The percentage can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Transmit port utilization thresholds generate alerts or alarms based on the utilization percentage of each configured port in relation to data transmitted during the specified polling interval. This threshold is configured on a per-port basis.

Important: Ports configured for half-duplex do not differentiate between data received and data transmitted. Therefore, to avoid redundant alarms, it is recommended that only the receive **or** transmit utilization threshold be configured.

Alerts or alarms are triggered for transmit port utilization based on the following rules:

- **Enter condition:** Actual percent utilization of a port for transmit data ³ High Threshold
- **Clear condition:** Actual percent utilization of a port for transmit data < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command in the Global Configuration Mode Commands chapter of this reference to configure the polling interval and the **threshold monitoring** command in this chapter to enable thresholding for this value.

Example

The following command configures a transmit port high utilization threshold percent of 70 and a low threshold of 50 for an system using the Alarm thresholding model:

```
threshold tx-utilization 70 clear 50
```

toh-sdsf

Configures the line SDSF bit error rate (BER) thresholds.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

toh-sdsf *toh_value*

toh_value

- 0: Disabled
- 1 -1.E-04
- 2 - 1.E-05
- 3 - 1.E-06
- 4 - 1.E-07
- 5 - 1.E-08
- 6 - 1.E-09
- 7 - 1.E-10
- 8 - 1.E-11

Usage

Sets a standard option for the line SDSF BER.

Example

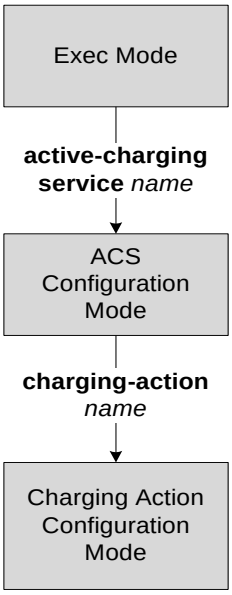
toh-sdsf *1*

vc-mapping

This command has been deprecated. Go to the **frame-mapping** keyword in the **path** command to configure this functionality.

Chapter 33
Charging Action Configuration Mode Commands

The Charging Action Configuration Mode is used to create and manage Charging Action services.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

billing-action

This command configures billing actions for packets that match ruledefs.

Product

All

Privilege

Security Administrator, Administrator

Syntax

billing-action { edr *edr_format_name* **[wait-until-flow-ends] | egcdr | exclude-from-udrs | radius | rf } +**

no billing-action [edr | egcdr | exclude-from-udrs | radius | rf] +

no

Disables billing-action configuration for the charging action.
Specifying one of the optional keywords disables that functionality. If you want to disable all billing-action functionality, do not specify any of the optional keywords.

edr *edr_format_name* **[wait-until-flow-ends]**

Enables EDR billing for packets matching this charging action.
edr_format_name must be the name of an existing EDR format, and must be a string of 1 through 63 characters in length.

Important: If the EDR format name supplied here is not configured in the EDR Format Configuration Mode, or has been deleted, the system accepts it without applying any EDR format for the billing action in this ACS service.

If this option is configured, the system generates an EDR immediately when a packet is received and it matches a ruledef that is associated with this charging action. Other events configured for flow end-condition, flow action, termination, and/or session control also creates the triggers for EDR generation.
wait-until-flow-ends: By default, the EDR is generated immediately after a ruledef hit results in this charging action. When this keyword is specified, no EDR is generated on a ruledef hit. When the flow ends, an attempt is made to generate an EDR with the format specified.

egcdr

Enables eG-CDRs billing for packets matching this charging action.
If this option is configured, system generates an eG-CDR when the subscriber session ends or an interim trigger condition occurs. The interim triggers are configurable in the Rulebase Configuration Mode. In addition, whenever there is an SGSN-to-SGSN handoff the system treats that as a trigger.
To generate an eG-CDR the **accounting-mode** CLI command in the APN Configuration Mode must be configured with the "none" option.
The format of enhanced G-CDRs is controlled by the **inspector** CLI command in Context Configuration Mode.

exclude-from-udrs

Default: Disabled.

By default, statistics are accumulated on a per content ID basis for possible inclusion in UDRs. The **exclude-from-udrs** keyword causes the system to not include the packet's statistics in UDRs. When this option is disabled, (the default setting) UDRs will be generated based on the udr format declared in the rulebase.

radius

Default: Disabled.
Enables billing action as RADIUS CDRs for packets matching this charging action, and the data packet statistics will be included in the postpaid RADIUS accounting.

rf

Enables Rf accounting.
Rf accounting is applicable only for dynamic and predefined rules that are marked for it. Dynamic rules have a field offline-enabled to indicate this. To mark a predefined rule as offline-enabled, use this keyword and the **billing-records** CLI in the Rulebase Configuration Mode.

Usage

Use this command to enable an EDR, eG-CDR and/or RADIUS CDR type of billing for content matching this charging action.

Example

The following command enables the EDR billing type with EDR format *charge1_format*:

billing-action *edr charge1_format*

cca charging

This command enables Credit Control Application and configures RADIUS/Diameter prepaid charging behavior.

Product

All

Privilege

Security Administrator, Administrator

Syntax

cca charging credit [preemptively-request | rating-group *coupon_id* **]**

{ default | no } dcca charging

no

Disables RADIUS/Diameter Prepaid Credit Control Charging.

default

Disables RADIUS/Diameter Prepaid Credit Control Charging.

credit

Specifies RADIUS/Diameter Prepaid Credit Control Charging Credit behavior.

preemptively-request

Specifies RADIUS/Diameter prepaid credit preemptively requested charging credit behavior. If this option is used, a quota is requested for the specific type of content during the session initialization.

rating-group *coupon_id*

Specifies the coupon ID used in prepaid charging as rating-group which maps to the coupon ID for prepaid customer.
coupon_id must be an integer from 0 through 65535.
This option also assigns different content-types for the same charging action depending upon whether prepaid is enabled or not.

Important: This rating-group overrides the content ID, if present in the same charging-action for the prepaid customer in DCCA. But only the content IDs will be used in eG-CDRs irrespective of the presence of rating-group in that charging-action.

Usage

Use this command to configure RADIUS/Diameter Prepaid Credit Control Charging behavior.
This command selects reservation based credit control. A CCR-Initial is used to reserve quota upon the first traffic, then a series of CCR-updates are issued as the traffic proceeds and quota dwindles. A CCR-Terminate is issued at the end of the session or at the end of the quota-hold-time.

Example

```
cca charging credit
```

charge-units

This command configures the unit amount counters for RADIUS/DCCA charging calculation.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

charge-units *units*

{ default | no } charge-units

no

Disables the charge-units configuration.

default

Configures the default setting.
Default: 0; disables the counter, same as **no charge-units**

units

Sets the service-specific fixed unit counter per content ID for RADIUS/DCCA charging.
units is the value set for charging unit, and must be an integer from 1 through 65535.

Usage

This command configures the unit amount counters for charging calculation on per content ID basis for different protocols and packets regardless of packet direction (uplink or downlink).

Important: For more information on content ID, refer to the **if-protocol** command in the *Ruledef Configuration Mode Commands* chapter.

Example

The following command sets the charging unit to *1024*:

charge-unit *1024*

charge-volume

This command configures how the volume amount counter for eG-CDR and DCCA charging are calculated.

Product

All

Privilege

Security Administrator, Administrator

Syntax

charge-volume { *protocol* { bytes | packet-length | packets } [downlink | uplink] | constant *value* }

{ no | default } charge-volume

---

no

Disables the charge-volume configuration.

---

default

Configures the default setting.
Default: **charge-volume ip bytes**

---

protocol

Specifies the charge volume method for the specific rule definition.
protocol must be one of the following:

- **dns**: Charge volume for DNS
- **ftp-control**: Charge volume for FTP-Control
- **ftp-data**: Charge volume for FTP-Data
- **http**: Charge volume for HTTP
- **icmp**: Charge volume for ICMP
- **imap**: Charge volume for Internet Message Access Protocol (IMAP)
- **ip**: Charge volume for IP
- **mms**: Charge volume for MMS
- **pop3**: Charge volume for POP3
- **rtp**: Charge volume for RTP
- **rtsp**: Charge volume for RTSP
- **sdp**: Charge volume for SDP
- **secure-http**: Charge volume for secure-https
- **sip**: Charge volume for SIP
- **smtp**: Charge volume for SMTP
- **tcp**: Charge volume for TCP

- **udp**: Charge volume for UDP
- **wsp**: Charge volume for WSP
- **wtp**: Charge volume for WTP

bytes

Sets charge volume for bytes.

packet-length

Sets charge volume for packet length.

packets

Sets charge volume for packets.

constant *units*

This sets the fixed increment value for charging.
units is the value set for charging, and must be an integer from 0 through 65535.
If **constant** *3* is configured for every invocation of this Charging Action, the system adds 3 to the downlink/uplink volume counter, depending on the direction of packet.

Usage

This command provides the method for charging volume calculation for different protocols and packets.
For information on supported protocols see the *Ruledef Configuration Mode Commands* chapter.
If **charge-volume rtp packets** is configured, system computes volume amounts for different options for RTP as follows:

Volume	Description
Volume amount	Total (downlink and uplink) RTP packets
Volume amount uplink	Uplink RTP packets
Volume amount downlink	Downlink RTP packets
Volume amount uplink packets	Uplink RTP packets
Volume amount downlink packets	Downlink RTP packets
Volume amount uplink bytes	Uplink RTP bytes
Volume amount downlink bytes	Downlink RTP bytes

Important: Whenever service counts volume, it counts all packets that the relevant analyzers accepted.

Important: If a TCP packet is routed to the HTTP analyzer but there is no HTTP payload, then the TCP statistics will be updated but the HTTP statistics will not be updated (except for the "packets ignored by the HTTP analyzer" statistic).

Example

Following command sets the charging volume of downlink packets for RTP:

```
charge-volume rtp packets downlink
```

content-filtering processing server-group

This command enables/disables content filtering in the charging action.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

```
content-filtering processing server-group

{ default | no } content-filtering processing
```

default

Configures the default setting.
Default: content filtering configured for the rulebase is attempted

no

Specifies to bypass content filtering.
This configuration should only be specified for charging actions that are performed when known safe sites are being accessed.

Usage

Use this command to enable/disable content filtering in the charging action.
This command works as second level filter to process the HTTP/WAP GET request with ICAP after ruledef matching. The first level filtering is in the rulebase configuration. This CLI command is only effective when the rulebase is configured with content-filtering mode server-group.

Example

The following command enables content filtering in the current charging action:

```
content-filtering processing server-group
```

content-id

This command specifies an optional content ID to use in the generated billing records, as well as the AVP used by the credit control application, such as the Rating-Group AVP for use by DCCA.

Product

All

Privilege

Security Administrator, Administrator

Syntax

content-id *content_id*

no content-id

no

Removes the content ID configuration from the charging action.

content_id

content_id is the content ID specified for credit control service in an active charging service, and must be an integer from 1 through 65535.

Usage

This command specifies an optional content ID to use in the generated billing records. This identifier assists the carrier's billing post processing and also used by credit-control system to use independent quotas for different value of **content-id**.
If the specified Ruledef uses the **if-protocol** command to select a value for content ID, then the *content_id* specified through this command is not used for billing record generation.

Important: For more information on **content-id**, refer to the **if-protocol** command in the *Ruledef Configuration Mode Commands* chapter.

Example

The following command sets the content ID in the current charging action to *23*:
content-id *23*

end

This command returns the CLI prompt to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec mode.

exit

This command exits the Charging Action Configuration mode and returns to the Active Charging Service Configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the Active Charging Service Configuration mode.

flow action

This command specifies the actions for packets that match a rule definition. This command also specifies action on packet and flow for Session Control functionality.

Product

All

Privilege

Security Administrator, Administrator

Syntax

flow action { conditional user-agent end-token *end_token_name* **| discard [downlink | uplink] | random-drop interval** *interval_start* **to** *interval_end* **pkts-to-drop** *packet_min* **to** *packet_max* **| readdress [server** *ip_address* **] [port** *port_number* **] | terminate-flow | terminate-session }**

no flow action

---

no

Disables the flow action configured in this charging action.

---

conditional user-agent end-token *end_token_name*

Conditionally redirects the HTTP packets matched to a configured user-agent to a specified URL. The user agent is configured using the **redirect user-agent** command in the Active Charging Service Configuration Mode.
end_token_name must be an alpha and/or numeric string of 1 through 32 characters in length, and is configured with this command to end the redirection condition.

---

discard [downlink | uplink]

Discards the packet associated with this charging action.
downlink: Discards only downlink packets.
uplink: Discards only uplink packets.

---

random-drop interval *interval_start* **to** *interval_end* **pkts-to-drop** *packet_min* **to** *packet_max*

Specifies random drop as a charging action to degrade voice quality.
interval_start **to** *interval_end*: Specifies the random drop interval, in seconds, at which the voice packets will be dropped. *interval_start* and *interval_end* must be integers from 1 through 999.
pkts-to-drop *packet_min* **to** *packet_max*: Specifies the number of voice packets to be dropped at a time in a flow when the packets have to be dropped. *packet_min* and *packet_max* must be integers from 1 through 100.

---

readdress { server *ip_address* **[port** *port_number* **] | port** *port_number* **}**

Specifies the re-address server's IP address/port number for this charging action. Enables readdressing of packets based on the destination IP address in the packets.
ip_address must be the re-address server's IP address, and must be an IPv4 address.

port_number must be the re-address server's port number, and must be an integer from 1 through 65535.

terminate-flow

Specifies the flow action to terminate flow.
Terminates the TCP connection gracefully between the subscriber and external server and sends a TCP FIN to the subscriber and a TCP RST to the server. If the flow does not use TCP, this option simply discard the packets. This option is used for flows that use TCP only.

terminate-session

Specifies the flow action to terminate session.
When a rule pointing to a charging action configured with the terminate-session keyword is hit, then the corresponding session will be terminated.

Usage

Use this command to set the flow actions; e.g. discard, terminate, or conditional redirect.
When a re-address server is configured for a charging action, the **show configuration** command will show the readdress related configuration only if server address is configured. And the **show configuration verbose** command will show the readdress sever if configured, else will display "no flow action".

Example

The following command sets the flow action to terminate:

```
flow-action terminate-flow
```

flow action redirect-url

This command specifies the redirection of URL for packets that matches a rule definition. This command also specifies the redirect-URL action on packet and flow for Session Control functionality.

Product

All

Privilege

Security Administrator, Administrator

Syntax

flow action redirect-url *url***/%3furl=***dynamic_field* **[clear-quota-retry-timer]**

{ default | no } flow action redirect-url

no

Disables the configured flow action in this charging action.

default

Disables the flow action and forward the packets normally.

redirect-url *url***/%3furl=***dynamic_field*

Redirects the HTTP packets matched to this Ruledef to the specified URL.
url must be a string size of from 1 through 511 characters in http://search.com/subtarg/%3furl=#*HTTP.URL*# format.
%3furl=: specifies the delimiter “?url=” between URLs.
Note that user cannot supply “?” through CLI so %3f is the value for “?”.
dynamic_field indicates the dynamic fields for redirect URLs.
Dynamic fields must be enclosed in '#'. Up to 16 dynamic fields are allowed in the redirect string.
Allowed dynamic fields are:

- #BEARER.CALLED-STATION-ID#
- #BEARER.CALLING-STATION-ID#
- #BEARER.NAS-IP-ADDRESS#
- #BEARER.USER-NAME#
- #BEARER.ACCT-SESSION-ID#
- #BEARER.CORRELATION-ID#
- #BEARER.RULEBASE#
- #BEARER.SERVED-BSA-ADDR#
- #BEARER.SERVICE-NAME#
- #BEARER.SUBSCRIBER-ID#
- #BEARER.MSISDN#
- #HTTP.URL#
- #HTTP.URI#

- #HTTP.HOST#
- #RTSP.URI#
- #WSP.URL#

clear-quota-retry-timer

This option resets the Credit Control Application quota retry timer for specific subscriber upon redirection.

Usage

Use this command to set the redirection of URL as flow actions upon matching of a Ruledef.
This CLI can be used to redirect SIP requests as well. The following is a sample configuration:

```
configure
   active-charging service s1
      charging-action ca_sip_redir
         content-id 10
         flow action redirect-url sip:test@sip.org
         exit
      ruledef sip_req
         sip request packet = TRUE
         exit
      rulebase plan1
         action priority 08 ruledef sip_req charging-action ca_sip_redir
         /* other rules, routing rules for sip, etc */
         end
```

This would mean any SIP request that hits the *sip_req* ruledef, would get redirected to the url given in *ca_sip_redir*. This involves creating a redirection packet with the following response line and "Contact" header in the response.
SIP/2.0 302 Moved Temporarily
302 Moved Temporarily
Most of the header fields are copied directly from the request, so that the mandatory SIP headers are present. If content-length header was seen in the original message, it is replaced in the reply with 'Content-Length: 0'.

Example

The following command resets quota retry timer upon redirection of flow to HTTP URL *http://search.com/?url=#http://msn.com#*:

flow action redirect-url *http://search.com/%3url=#http://msn.com#* clear-quota-retry-timer

flow idle-timeout

This command configures the maximum duration a flow can remain idle after which the system automatically terminates the flow.

Product

All

Privilege

Security Administrator, Administrator

Syntax

flow idle-timeout *idle_timeout*

{ no | default } idle-timeout

no

Disables the idle-timeout configuration; sets the idle-timeout to 0 seconds.

default

Configures the default setting.
Default: 300 seconds

idle-timeout *idle_timeout*

Specifies the maximum duration, in seconds, a flow can remain idle.
idle_timeout must be an integer from 0 through 86400.

Usage

Use this command to configure the maximum duration a flow can remain idle after which the system automatically terminates the flow.

Example

The following command configures the idle-timeout setting to *400* seconds:

flow idle-timeout *400*

flow limit-for-bandwidth

This command enables and configures bandwidth limits for Session Control functionality to the subscriber. Uplink and downlink limits are configured separately.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
flow limit-for-bandwidth { { direction { downlink | uplink } peak-data-rate bps
peak-burst-size bytes violate-action { discard | lower-ip-precedence } [
committed-data-rate bps committed-burst-size bytes [ exceed-action { discard |
lower-ip-precedence } ] ] } | { id id } }

{ default | no } flow limit-for-bandwidth { direction { downlink | uplink } | id
}
```

no

Disable bandwidth control traffic policing for the specified direction for the current subscriber.

default

Resets the bandwidth control policy to default mode.

direction { downlink | uplink }

Specifies the direction of flow downlink/uplink to apply bandwidth limit.
downlink: Flow of data towards subscriber.
uplink: Flow of data from subscriber.

peak-data-rate *bps*

Default: 256000
Specifies the peak data-rate for the subscriber, in bps (bits per second).
bps must be an integer from 1 through 4294967295.

peak burst-size *bytes*

Default: 3000
The peak burst size allowed, in bytes.
bytes must be an integer from 1 through 4294967295.

Important: It is recommended that this parameter be configured to at least the greater of the following two values: 1) 3 times greater than packet MTU for the subscriber connection, OR 2) 3 seconds worth of token accumulation within the “bucket” for the configured peak-data-rate.

violate-action { discard | lower-ip-precedence }

Default: Discard.
Specifies the action to take on packets that exceed both the committed-data-rate and the peak-data-rate. The following actions are supported:
discard: Discard the packet
lower-ip-precedence: Transmit the packet after lowering the IP precedence

committed-data-rate *bps*

Default: 144000
The committed data rate (guaranteed-data-rate) in bps (bits per second).
bps must be an integer from 1 through 4294967295.

committed-burst-size *bytes*

Default: 3000
The committed burst size allowed, in bytes.
bytes must be an integer from 1 through 4294967295.

exceed-action { discard | lower-ip-precedence }

Default: lower-ip-precedence
The action to take on the packets that exceed the committed-data-rate but do not violate the peak-data-rate. The following actions are supported:
discard: Discard the packet
lower-ip-precedence: Transmit the packet after lowering the ip-precedence
If exceed-action is not configured, the packets are forwarded.

id *id*

Important: This keyword is only available in StarOS 8.1 and later releases.

Specifies identifier for bandwidth limiting, and must be an integer from 1 through 65535.
This identifier enables traffic policing based on a separate identifier other than content ID. This identifier will always take priority over content ID. If this identifier is not configured, traffic policing will be based on content ID.

Usage

Use this command to limit the bandwidth a subscriber uses in the uplink and downlink directions under Session Control.

Important: If the exceed/violate action is set to "lower-ip-precedence", the TOS value for the outer packet becomes "best effort" for packets that exceed/violate the traffic limits regardless of what the **ip user-datagram-tos copy** command is configured to. In addition, the **lower-ip-precedence** option may also override the **ip qos-dscp** command configuration. Therefore, it is recommended that command not be used when specifying this option.

Details of the QoS Traffic Policing feature is available in the *System Enhanced Feature Configuration Guide*.

Example

The following command sets an uplink peak data rate of *128000* bps and lowers the IP precedence when the committed-data-rate and the peak-data-rate are exceeded:

flow limit-for-bandwidth uplink peak-data-rate *128000* violate-action lower-ip-precedence

The following command sets a downlink peak data rate of *256000* bps and discards the packets when the committed-data-rate and the peak-data-rate are exceeded:

flow limit-for-bandwidth downlink peak-data-rate *256000* violate-action discard

flow limit-for-flow-type

This command controls the action in the event of number of flows exceeds for a type of flow under Session Control feature.

Product

All

Privilege

Security Administrator, Administrator

Syntax

flow limit-for-flow-type *limit* **over-limit-action** *action_type*

[no] limit-for-flow-type

no

Disables limit for the total number of flow for a type.

limit

Sets the maximum number of flows of a type exceeding which action triggers.
limit must be an integer from 1 through 4000000000.

over-limit-action *action_type*

Triggers the action of *action_type* on exceeding *limit* for a flow type.
action_type must be one of the following:
discard: Discards the packets
redirect-url: Redirects the flow
terminate-flow: Terminates the flow to which this packet belongs
terminate-session: Terminates the session to which this packet belongs

Usage

Use this command to control the action for the total number of flow of a type.

Example

The following command terminates the flow if total number of flows of a type exceeds *1024*:
flow limit-for-flow-type *1024* over-limit-action terminate-flow

ip tos

This command sets the IP Type of Service (ToS) octets being used in the charging action.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
ip tos { af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 |
af42 | af43 | be | ef | lower-bits tos_value } [ uplink | downlink ]

no ip tos [ uplink | downlink ]
```

no

Disables IP ToS being used in the charging action.

af*xx*

Specifies the use of an assured forwarding *xx* PHB.

be

Specifies the use of best effort forwarding PHB.

ef

Specifies the use of expedited forwarding PHB.

lower-bits *tos_value*

Important: In StarOS 8.1 and later releases, this keyword is **lower-bits** *tos_value*. In StarOS 8.0, it is *tos_value*.

Sets the least-significant 6 bits in the TOS byte with the specified numeric value.
tos_value must be an integer from 0 through 63.

downlink

Specifies the ToS for downlink packets only.

uplink

Specifies the ToS for uplink packets only.

Usage

Use this command to set the IP Type of Service (ToS) octets used in the charging action. If one of the enumerated values is set, the DSCP bits which are the six most-significant bits in the TOS byte are marked. If the integer value is set, it will be written into the six least-significant bits of the TOS byte.

Example

The following command sets the IP ToS to *be* with *downlink*:

ip tos *be* downlink

ip vlan

This command configures the VLAN identifier to be associated with the IP address for the session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip vlan *range*

{ default | no } ip vlan

default | no

These options delete or disable the IP VLAN configuration.

range

range must be an integer from 1 through 4094.

Usage

This command configures the subscriber VLAN ID which is used with the assigned address for the subscriber session to receive packets. If the IP pool from which the address is assigned is configured with a VLAN ID, then this subscriber configured VLAN ID overrides it.
Subscriber traffic can be routed to specific VLANs based on the configuration of their user profile. Using this functionality provides a mechanism for routing all traffic from a subscriber over the specified VLAN. All packets destined for the subscriber must also be sent using only IP addresses valid on the VLAN or they will be dropped.

Example

The following command sets the IP VLAN range to go up to *500*:
ip vlan *500*
The following command sets the IP VLAN range back to default.
default ip vlan

nexthop-forwarding-address

This command configures the next-hop forwarding address for this charging action.

Product

All

Privilege

Security Administrator, Administrator

Syntax

nexthop-forwarding-address *ipv4_address*

no nexthop-forwarding-address

no

Removes the next-hop forwarding address, if previously configured.

ipv4_address

ipv4_address must be the next-hop forwarding address for this charging action, and must be specified using the standard IPv4 dotted decimal notation.

Usage

Use this command to configure the next-hop forwarding address for a charging action. When an uplink packet matches a rule and a charging action is applied to it this next-hop forwarding address is used. There are different methods to configure a next-hop forwarding address, they are prioritized as follows:

- the next-hop forwarding address, if configured, in a redirect ACL is used
- else, the next-hop address configured in the charging action is used
- else, the next-hop address, if configured, in the IP pool is used

Example

The following command sets the next-hop forwarding address for the current charging action to *1.1.1.1*:

nexthop-forwarding-address *1.1.1.1*

qos-class-identifier

This command sets the QoS Class Identifier.

Product

All

Privilege

Security Administrator, Administrator

Syntax

qos-class-identifier *identifier*

no qos-class-identifier

no

Removes QoS Class Identifier, if previously configured.

identifier

Specifies the QoS Class Identifier, and must be an integer from 1 through 9.

Usage

Use this command to set the QoS Class Identifier.

Example

The following command sets the QoS Class Identifier as *3*:

qos-class-identifier *3*

qos-renegotiate

This command configures the QoS traffic class for the charging action for the Layer 7 QoS Renegotiation feature, enabling triggering QoS renegotiation from an active-charging rule.

Important: This command is controlled by the dynamic-qos-renegotiation license.

Product

All

Privilege

Security Administrator, Administrator

Syntax

qos-renegotiate traffic-class { background | conversational | interactive *priority* **| streaming }**

no qos-renegotiate

no

Removes any previously configured traffic class setting.

background

Specifies the traffic class as Background.
For traffic patterns in which the data transfer is not time-critical (for example e-mail exchange).

conversational

Specifies the traffic class as Conversational.
For traffic patterns in which there is a constant flow of packets.

interactive *priority*

Specifies the traffic class as Interactive.
For traffic patterns in which there is an intermittent flow of packets.
priority specifies the traffic handling priority, and must be an integer from 1 through 3.

streaming

Specifies the traffic class as Streaming.
For traffic patterns in which there is a constant flow of data in one direction, either upstream or downstream.

Usage

Use this command to configure the QoS traffic class for a charging action for the Layer 7 QoS Renegotiation feature, enabling triggering QoS renegotiation from an active-charging rule.
Layer 7 QoS Renegotiation is an extension of the Dynamic QoS Renegotiation feature. Upon matching a particular layer 7 rule, for example the access of a particular URL, the GGSN triggers the renegotiation of the PDP context.

Example

The following command sets the QoS traffic class for the charging action to streaming:

```
qos-renegotiate traffic-class streaming
```

retransmissions-counted

This command enables the charging action to count the number of retransmissions.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] retransmissions-counted
```

no | default

Disables the count retries from the charging action.

Usage

Use this command to enable counting of the number of retransmissions.

Example

```
retransmissions-counted
```

service-identifier

This command configures the service identifier for a service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

service-identifier *service_id*

no service-identifier

no

Removes any previously configured service ID.

service_id

Specifies the service identifier, and must be an integer from 1 through 65535.

Usage

Use this command to configure the service identifier for a service.

Example

The following command sets the service identifier for a service as *99*:

service-identifier *99*

tft packet-filter

This command configures the packet filter to be sent to the MS.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tft packet-filter *packet_filter_name*

no

Removes the specified packet filter, if previously configured.

packet_filter_name

packet_filter_name specifies the packet filter's name, and must be a string of 1 through 63 characters in length.

Usage

Use this command to configure the packet filter to be sent to the MS. Up to eight packet filters can be specified in a charging action.

Example

The following command configures the packet filter *filter23* to be sent to the MS:

tft packet-filter *filter23*

tos

This command sets the Type of Service (ToS) octets used in the charging action.

Product

All

Privilege

Security Administrator, Administrator

Syntax

tos { af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 | af43 | be | ef | lower-bits *tos_value* **} [downlink | uplink]**

no tos [downlink | uplink]

no

Disables the ToS being used in the charging action.

af*xx*

Specifies the use of an assured forwarding *xx* Per Hop Behavior (PHB).

be

Specifies use of Best Effort forwarding PHB.

ef

Specifies use of Expedited Forwarding PHB.

lower-bits *tos_value*

Important: In StarOS 8.1 and later releases, this keyword is **lower-bits** *tos_value*. In StarOS 8.0, it is *tos_value*.

Sets the least-significant 6 bits in the TOS byte with the specified numeric value.
value must be an integer from 0 through 63.

downlink

Specifies the ToS only for downlink packets.

uplink

Specifies the ToS only for uplink packets.

Usage

Use this command to set the ToS octets used in the charging action. If one of the enumerated values is set, the DSCP bits which are the six most-significant bits in the TOS byte are marked. If the integer value is set, it will be written into the six least-significant bits of the TOS byte.

Example

The following command sets the ToS to *be* for downlink packets:

```
tos be downlink
```

xheader-insert

This command specifies the extension-header (x-header) format name whose fields are to be inserted in HTTP GET and POST request packets.

Important: This command is license dependent. For more information please contact your local sales representative.

Product

All

Privilege

Security Administrator, Administrator

Syntax

xheader-insert xheader-format *xheader_format_name* **[first-request-only] [-noconfirm]**

no xheader-insert

no

Removes previously configured x-header format name.

xheader-format *format_name*

Enables x-header mode configuration, and specifies name of the x-header format whose fields are to be inserted in the packets.
format_name must be a string of 1 through 63 characters in length.

first-request-only

Specifies x-header insertion only for the first HTTP request in the IP flow. If not configured, the default behavior is insertion for all requests.

-noconfirm

Specifies that the command must execute without any prompts and confirmation from the user.

Usage

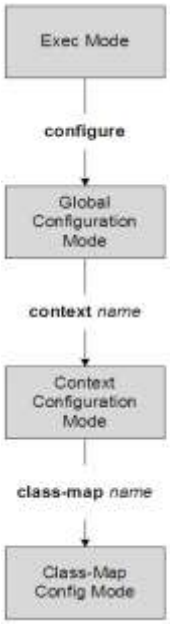
Use this command to enable x-header mode, and specify the x-header format name whose fields are to be inserted in HTTP GET and POST request packets.
Also, see **xheader-format** CLI command in the *Active Charging Service Configuration Mode* and the *x-header Format Configuration Mode Commands* chapters.

Example

The following command enables x-header mode, and specifies the x-header format name as *test12*:
xheader-insert xheader-format *test12*

Chapter 34
Class-Map Configuration Mode Commands

Class-Map is used to configure a packet classifier for flow-based Traffic Policing feature within destination context. It filters egress and/or ingress packets of a subscriber session based on rules configured in a subscriber context.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the context configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the context configuration mode and returns to the global configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the global configuration mode.

match any

This command allows all traffics in this class map.

Product

PDSN, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
match any
```

Usage

Sets the match rule to allow all traffic flow for specific class map.

Example

The following commands allows all packets going to a system with this class map.

```
match any
```

match dst-ip-address

This command specifies a traffic classification rule based on the destination IP address of packets.

Product

PDSN, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

match dst-ip-address*dst_ip_address subnet_mask*

dst_ip_address

Specifies the destination IP address of the packets.
dst_ip_address must be specified using the standard IPv4 dotted decimal notation.

subnet_mask

Specifies the IP address mask bits to determine the number of IP addresses in the pool. *ip_mask* must be specified using the standard IPv4 dotted decimal notation.
1 bits in the *ip_mask* indicate that bit position in the *ip_address* must also have a value of 1.
0 bits in the *ip_mask* indicate that bit position in the *ip_address* does not need to match, i.e., the bit can be either a 0 or a 1.
For example, if the IP address and mask are specified as 172.168.10.0 and 255.255.255.224, respectively, the pool will contain IP addresses in the range 172.168.10.0 through 172.168.10.31 for a total of 32 addresses.

Usage

Sets the match rule based on the destination IP address of packets for specific Class Map.

Example

The following commands specifies the rule for packets going to a system having an IP address 10.1.2.6.
match dst-ip-address *10.1.2.6*

match dst-port-range

This command specifies a traffic classification rule based on the range of destination ports of L4 packets.

Product

PDSN, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

match dst-port-range*initial_port_number* **[to***last_port_number* **]**

initial_port_number **[to** *last_port_number* **]**

Specifies the destination port or range of ports of L4 packets.
initial_port_number is the starting port number and must be an integer value in the range from 1 through 65535 but less than *last_port_number*, if specified.
last_port_number is the end port number and must be an integer value in the range from 1 through 65535 but more than *initial_port_number*.

Usage

Sets the match rule based on the destination port number or range of ports of L4 packets for specific Class Map.

Example

The following commands specifies the rule for packets having destination port number from 23 to 88.

```
match dst-port-range 23 to 88
```

match ip-tos

This command specifies a traffic classification rule based on the IP Type of Service value in ToS field of packet.

Product

PDSN, HA, ASN-GW

Privilege

Administrator

Syntax

match ip-tos { *service_value* **[ip-tos-mask** *mask_value* **] | tos-range** *low_value* **to** *high_value* **}**

service_value

Specifies the IP Type-of-Service value to match inside the ToS field of packets.
service_value must be an integer value in the range from 0 through 255.

ip-tos-mask *mask_value*

Specifies the IP Type-of-Service mask value to match inside the ToS field of packets.
mask_value must be an integer value in the range from 1 through 255.

tos-range *low_value* **to** *high_value*

Specifies a range that a ToS value in a received packet must fall within to be considered a match.
low_value and *high_value* must be an integer from 0 to 255.

Usage

Sets the match rule based on the IP ToS value in ToS field of packets for specific Class Map.

Example

The following commands specifies the IP ToS value of 3 is the value to match in a ToS field in received packets.

match ip-tos *3*

match ipsec-spi

This command specifies a traffic classification rule based on the IPSec Security Parameter Index (SPI) value in SPI field of packet.

Product

PDSN, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

match ipsec-spi *index_value*

index_value

Specifies the IPSec SPI value to match inside the SPI field of packets.
index_value must be an integer value in the range from 1 through 65535

Usage

Sets the match rule based on the IPSec SPI value in SPI field of packets for specific Class Map.

Example

The following commands specifies the IPsec SPI value to 1234 for SPI field in packets

match ipsec-spi *1234*

match packet-size

This command specifies a traffic classification rule based on the size of packet.

Product

PDSN, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

match packet-size [gt | lt] *size*

size

Specifies the packet length in bytes.
length must be an integer value in the range from 1 through 65535.

[gt | lt]

Applies operator to specify a range of packets having packet size greater than or less than the specified size *size*.

Usage

Sets the match rule based on the size of packets for specific Class Map. This command is only applicable for static policies; it is not available for dynamic policies.

Example

The following commands specifies the packet length to 1024 bytes.

match packet-size *1024*

match protocol

This command specifies a traffic classification rule based on the protocol used for session flow.

Product

PDSN, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
match protocol { tcp | udp | gre | ip-in-ip }
```

tcp

Sets the match rule for a session flow using Transmission Control Protocol (TCP). It matches the protocol field to tcp inside the packet.

udp

Sets the match rule for a session flow having User Datagram Protocol (UDP). It matches the protocol field to udp inside the packet.

gre

Sets the match rule for session flow using Generic Routing Encapsulation (GRE) Protocol. It matches the protocol field to gre inside the packet.

ip-in-ip

Sets the match rule for session flow using IP-in-IP encapsulation protocol. It matches the protocol field to ip-in-ip inside the packet.

Usage

Sets the match rule based on the protocol of packet flow for a specific Class Map.

Example

The following commands specifies the rule for packet flow using IP-in-IP as protocol.

```
match protocol ip-in-ip
```

match src-ip-address

This command specifies a traffic classification rule based on the source IP address of packets.

Product

PDSN, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

match src-ip-address*src_ip_address subnet_mask*

src_ip_address

Specifies the source IP address of the packets.
ip_address must be specified using the standard IPv4 dotted decimal notation.

subnet_mask

Specifies the IP address mask bits to determine the number of IP addresses in the pool. *ip_mask* must be specified using the standard IPv4 dotted decimal notation.
1 bits in the *ip_mask* indicate that bit position in the *ip_address* must also have a value of 1.
0 bits in the *ip_mask* indicate that bit position in the *ip_address* does not need to match, i.e., the bit can be either a 0 or a 1.
For example, if the IP address and mask are specified as 172.168.10.0 and 255.255.255.224, respectively, the pool will contain IP addresses in the range 172.168.10.0 through 172.168.10.31 for a total of 32 addresses.

Usage

Sets the match rule based on the source IP address of packets for specific Class Map.

Example

The following commands specifies the rule for packets coming from a system having an IP address 10.1.2.3.

match src-ip-address *10.1.2.3*

match src-port-range

This command specifies a traffic classification rule based on the range of source ports of L4 packets.

Product

PDSN, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

match src-port-range*initial_port_number* **[to***last_port_number* **]**

initial_port_number **[to** *last_port_number* **]**

Specifies the source port or range of ports of the L4 packets.
initial_port_number is the starting port number and must be an integer value in the range from 1 through 65535 but less than *last_port_number*, if specified.
last_port_number is the end port number and must be an integer value in the range from 1 through 65535 but more than *initial_port_number*.

Usage

Sets the match rule based on source port number or range of ports of L4 packets for specific Class Map.

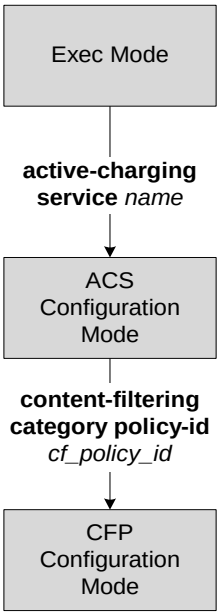
Example

The following commands specifies the rule for packets having source port number from 23 to 88.

```
match src-port-range 23 to 88
```

Chapter 35
Content Filtering Policy Configuration Mode Commands

In the Content Filtering Policy (CFP) Configuration Mode, you can configure analysis and action on matching results of content filtering analysis for Content Filtering Category Policy Identifier.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

analyze

This command specifies the action to take for the indicated result after content filtering analysis.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

analyze priority *priority* **{ all | category** *category* **| x-category** *string* **} action { allow | content-insert** *content_string* **| discard | redirect-url** *url* **| terminate-flow | www-reply-code-and-terminate-flow** *reply_code* **} [edr** *edr_format_name* **]**

no analyze priority *priority*

no

Removes the specified analyze priority configuration.

priority *priority*

Specifies the precedence of a category in the content filtering policy.
priority must be an integer from 1 through 65535, and must be unique in the content filtering policy.

all

Specifies the default action to take if the category returned after rating is not configured in the subscriber's content filtering policy. This has the lowest priority.

category *category*

Specifies the category. *category* must be one of the following.

Important: Content can simultaneously match multiple categories, therefore specific **priority** must be used for required evaluation precedence.

• ABOR	• ADULT	• ADVERT	• ANON	• ART
• AUTO	• BLACK	• BLOG	• BUSI	• CAR
• CHAT	• CMC	• CRIME	• CULT	• DRUG
• DYNAM	• EDU	• ENERGY	• ENT	• FIN
• FORUM	• GAMB	• GAME	• GLAM	• GOVERN
• HACK	• HATE	• HEALTH	• HOBBY	• HOSTS

• KIDS	• LEGAL	• LIFES	• MAIL	• MIL
• NEWS	• OCCULT	• PEER	• PERS	• POLTIC
• PORN	• PORTAL	• PROXY	• REF	• REL
• SCI	• SEARCH	• SHOP	• SPORT	• STREAM
• SUIC	• SXED	• TECH	• TRAV	• VIOL
• VOIP	• WEAP	• WHITE	• UNKNOW	

x-category *string*

This keyword can be used to configure runtime categories not present in the CLI.
string specifies the unclassified category to be rated, and must be an alpha and/or numeric string of 1 through 6 characters in length.
A maximum of 10 x-categories can be configured.

action { allow | content-insert *content_string* **| discard | redirect-url** *url* **| terminate-flow | www-reply-code-and-terminate-flow** *reply_code* **}**

Specifies the action to take for the indicated result of content filtering analysis.
allow: In the case of static content filtering this option allows the request for content, and in dynamic content filtering allows the content itself.
content-insert *content_string*: Specifies the content string to be inserted in place of the message returned from prohibited/restricted site or content server.
In case of static content filtering, *content_string* is used to create a response to the subscriber's attempt to get content, and in dynamic content filtering, it is used to replace the content returned by a server.
content_string must be an alpha and/or numeric string of 1 through 1023 characters in length.
discard: in case of static content filtering this option discards the packet(s) that requested, and in dynamic content filtering it discards the packet(s) that contain(s) the content.
redirect-url *url*: Specifies redirecting the subscriber to the specified URL.
url must be a string of 1 through 1023 characters in length, and in the http://search.com/subtarg=#*HTTP.URL*# format.
terminate-flow: Specifies terminating the TCP connection gracefully between the subscriber and server, and sends a TCP FIN to the subscriber and a TCP RST to the server.
www-reply-code-and-terminate-flow *reply_code*: Specifies terminating flow with the specified reply code. *reply_code* must be a reply code, and must be an integer from 100 through 599.

Important: Static-and-Dynamic Content Filtering is only supported in StarOS 9.0 and later.

edr *edr_format_name*

Specifies to generate separate EDRs for content filtering based on action and content category using EDR file format name *edr_format_name*.
edr_format_name is the name of a pre-defined EDR file format name in the EDR Format Configuration Mode, and must be an alpha and/or numeric string of 1 through 63 characters in length.

Important: EDRs generated through this keyword are different from charging EDRs generated for subscriber accounting and billing. For more information on generation of charging EDRs, refer to the *Rulebase Configuration Mode Commands* chapter.

Usage

Use this command to specify the action and priorities for the indicated result of content filtering analysis. Up to 64 priorities and actions can be entered with this command.

Example

The following command sets priority *10* for category *ADULT* with action as **terminate-flow**:

analyze priority *10* category *ADULT* action terminate-flow

discarded-flow-content-id

This command is used in the configuration to account for packets discarded as a result of content filtering action.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

discarded-flow-content-id *content_id*

no discarded-flow-content-id

content_id

Specifies content ID for discarded flows.
content_id must be an integer from 1 through 65535.

Usage

Use this command in the configuration to account for packets discarded as a result of CF action.
A flow end-condition EDR would be generated as a charging EDR for content-filtered packets. No billing EDRs (even with flow-end) would be generated for a discarded packet as the flow will not end. Dual EDRs would exist for customers who want to use "flow end" to get EDRs for charging, plus CF-specific EDRs. The second EDR for charging comes from the **flow end-condition content-filtering** configuration in the Rulebase Configuration Mode.
The **discarded-flow-content-id** configuration can be used for accumulating stats for UDR generation in case CF discards the packets. These stats for UDR generation (based on the CF content ID) would also be accumulated in case of ACS error scenarios where the packets are discarded but the flow does not end.
If, in the Rulebase Configuration Mode, the **content-filtering flow-any-error** configuration is set to **deny**, then all the denied packets will be accounted for by the **discarded-flow-content-id** config. I.e. the *content_id* will be used to generate UDRs for the denied packets in case of content filtering.

Example

Use the following command to set the accumulation of stats for UDR generation based on the CF content ID *1003*:
discarded-flow-content-id ***1003***

failure-action

This command specifies the failure action when the content filtering analysis results are not available to analyze.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

failure-action { allow | content-insert *content_string* **| discard | redirect-url** *url* **| terminate-flow | www-reply-code-and-terminate-flow** *reply_code* **} [edr** *edr_format_name* **]**

default failure-action [edr *edr_format_name* **]**

default

Configures the default setting.
Default: **discard**

allow

In static content filtering, this option allows the request for content, and in dynamic content filtering allows the content itself.

Important: Static-and-Dynamic Content Filtering is only supported in StarOS 9.0 and later.

content-insertion *content_string*

Specifies the content string to be inserted in place of the message returned from the content server due to connection timeout or when no category policy ID is available for the content.
In case of static content filtering, the *content_string* is used to create a response to the subscriber's attempt to get content, and in dynamic content filtering it replaces the content returned by a server.
content_string must be an alpha and/or numeric string of 1 through 1023 characters in length.

Important: Static-and-Dynamic Content Filtering is only supported in StarOS 9.0 and later.

discard

In static content filtering, specifies discarding the packet(s) that requested, and in dynamic content filtering discards the packet(s) that contain the content.

Important: Static-and-Dynamic Content Filtering is only supported in StarOS 9.0 and later.

redirect-url *url*

Redirects the subscriber to the specified URL.
url must be a string of 1 through 1023 characters in length, and must be in the following format:

http://search.com/subtarg=#HTTP.URL#

terminate-flow

Terminates the TCP connection gracefully between the subscriber and external server and sends a TCP FIN to the subscriber and a TCP RST to the server.

www-reply-code-and-terminate-flow *reply_code*

Sets action as terminate-flow with specified reply code.
reply_code must be a reply code, and must be an integer from 100 through 599.

edr *edr_format_name*

Specifies name of the EDR format to be generated on the content filtering action using EDR file format name *edr_format_name*.
edr_format_name is the name of a pre-defined EDR file format name in the EDR Format Configuration Mode, and must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to set the failure action to take when no content filtering analysis result is available to analyze for **analyze priority** *priority* **category** *category_string* command.

Example

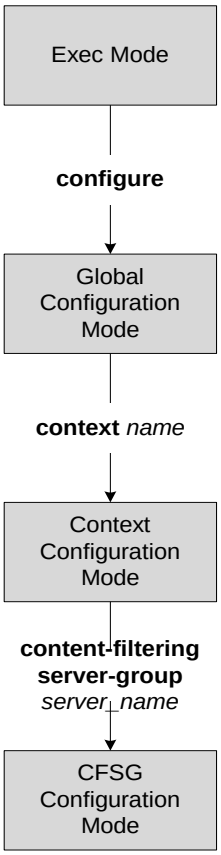
The following command sets the failure action as **discard**:
failure-action discard

timeout action

This command has been deprecated, and is replaced by the **failure-action** command.

Chapter 36
Content Filtering Server Group Configuration Mode Commands

Content Filtering Server Group (CFSG) Configuration Mode is accessed by entering the content-filtering server-group command in the Context Configuration Mode.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

connection retry-timeout

This command configures the TCP connection retry timer for Internet Content Adaptation Protocol (ICAP) server and client.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

connection retry-timeout *duration*

{ default | no } connection retry-timeout

default

Configures the default setting.
Default: 30 seconds

no

Removes the connection retry timeout configuration.

duration

duration is the duration in seconds, and must be an integer from 1 through 3600.

Usage

Use this command to configure the connection retry timer between ICAP server and client TCP connection, i.e. how long to wait before reattempting to establish a TCP connection.

Example

The following command sets the ICAP client and server connection retry timer to 120 seconds.
connection retry-timeout *120*

deny-message

This command configures the text message that is returned to the subscriber in a deny response.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

deny-message *string*

{ default | no } deny-message

default

Configures the default setting.
Default: Disabled

no

Removes previously configured deny message setting.

string

Specifies a text message that is to be returned to the subscriber in a deny response.
string must be an alpha and/or numeric string of 1 through 511 characters in length.

Usage

Use this command to define a text message that is returned to the subscriber in a deny response.

Example

The following command sets the text message to *no_Authorization* in a deny message:
deny-message *no_Authorization*

dictionary

This command specifies the dictionary to use for requests to the server(s) in this CFSG.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

```
dictionary { custom1 | custom2 | standard }

{ default | no } dictionary
```

default

Sets the default dictionary.
Default: standard

no

Removes the previously configured dictionary setting.

custom1

Custom-defined dictionary. It conforms to TS 32.015 v 3.6.0 for R99. It provides proprietary header fields for MSISDN and APN/subscriber. Please contact your local sales representative for additional information.

custom2

Custom-defined dictionary. Please contact your local sales representative for additional information.

standard

Default: Enabled
This dictionary is used to use an HTTP Get Request to specify the URL. It is conforming to TS 32.215 v 4.6.0 for R4 (and also R5 - extended QoS format).

Usage

Use this command to specify the standard and customized encoding mechanism used for elements included messages.

Example

The following command configures the system to use standard dictionary to encode messages:

```
default dictionary
```

end

Returns the CLI prompt to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

failure-action

This command specifies the actions to be taken when communication between ICAP endpoints within this CFSG fail.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

failure-action { allow | content-insertion *content_string* **| discard | redirect-url** *url* **| terminate-flow }**

{ default | no } failure-action

default

Configures the default setting.
Default: **terminate-flow**

no

Removes previously configured failure action.

allow

In case of static content filtering this option allows the request for content, and for dynamic content filtering it allows the content itself.

content-insertion *content_string*

Specifies the content string to be used for failure action.
In case of static content filtering, the specified text *content_string* is used to create a response to the subscriber's attempt to get content. In dynamic content filtering, the specified text *content_string* is used to replace the content returned by a server.
content_string must be an alpha and/or numeric string of 1 through 128 characters in length.

discard

In case of static content filtering this option discards the packet(s) requested, and for dynamic content filtering it discards the packet(s) that contain(s) the content.

redirect-url *url*

Redirects the subscriber to the specified URL.
url must be a string of 1 through 128 characters in length, and must be in the following format:
http://search.com/subtarg=#HTTP.URL#

terminate-flow

For TCP, gracefully terminates the connection between the subscriber and external server, and sends a TCP FIN to the subscriber and a TCP RST to the server.

For WAP-Connection Oriented, the WSP session is gracefully terminated by sending WTP Aborts for each of the outstanding requests, and WSP Disconnect to the client and the server. For WSP-Connectionless only the current WSP request is rejected.

Usage

Use this command to set the actions on failure for server connection.
ICAP rating is enabled for retransmitted packet when default ICAP failure action was taken on an ICAP request for that flow. ICAP default failure action is taken on the pending ICAP request for a connection when the connection needs to be reset and there is no other redundant connection available. For example, in the ICAP request timeout and ICAP connection timeout scenarios. In these cases the retransmitted packet in the uplink direction is sent for ICAP rating again.
In case of WAP CO, uplink retransmitted packet for the WAP transactions for which ICAP failure action was taken will be sent for ICAP rating. WSP header of the retransmitted packet is not parsed by the WSP analyzer. The URL received in the previous packet for that transaction is used for ICAP rating. If failure action was taken on multiple WTP transactions for the same flow (case: WTP concatenated GET request) then uplink retransmitted packet for each of the transaction is sent for rating again.
In case of HTTP, uplink retransmitted packets for the HTTP flow on which ICAP failure action is taken is sent for ICAP rating. The URL present in the current secondary session (last uplink request) is used for ICAP rating. However, if there were multiple outstanding ICAP request for the same flow (pipelined request) then for the retransmitted packet the URL that will be sent for rating will be that of the last GET request.
Retransmission in various cases of failure-action taken on re-transmitted packets when the ICAP response is not received for the original request and the retransmitted request comes in:

- WSP CO:
  - Permit: The uplink packet is sent for ICAP rating and depending on the ICAP response the WTP transaction is allowed/blocked. It is possible that the WAP gateway sends the response for the permitted GET request. Hence, there is a race condition and the subscriber may be able to view the web page even thought the rating was redirect or content insert.
  - Content Insert: The retransmitted packet is not sent for ICAP rating.
  - Redirect: The retransmitted packet is not sent for ICAP rating.
  - Discard: The uplink packet is sent for ICAP rating and depending on the ICAP response the WTP transaction is allowed/blocked.
  - Terminate flow: The uplink packet is sent for ICAP rating and depending on the ICAP response the WTP transaction is allowed or blocked. The WAP gateway may send an Abort transaction for this GET request if the WSP disconnect packet sent while terminating the flow is received by the WAP gateway.
- HTTP:
  - Permit: The uplink packet is sent for ICAP rating and depending on the ICAP response the last HTTP GET request. It is possible that the HTTP server sends the response for the permitted GET request. Hence there is a race condition and the subscriber may be able to view the web page even thought the rating was redirect or content insert.
  - Content Insert: Retransmitted packets are dropped and not charged.
  - Redirect: Retransmitted packets are dropped and not charged.
  - Discard: The uplink packet is sent for ICAP rating and depending on the ICAP response the WTP transaction allowed/blocked.
  - Terminate flow: Retransmitted packets will be dropped and not charged.

Example

The following command sets the failure action to terminate:

```
failure-action terminate-flow
```

icap server

This command adds an Internet Content Adaptation Protocol (ICAP) server configuration to the current Content Filtering Server Group.

Important: In StarOS 8.1 and later releases, a maximum of five ICAP servers can be configured per Content Filtering Server Group. In StarOS 8.0 and earlier releases, only one ICAP Server can be configured per Content Filtering Server Group.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

icap server *ip_address* **[port** *port_number* **] [max** *msgs* **] [priority** *priority* **]**

no icap server *ip_address* **[port** *port_number* **] [priority** *priority* **]**

no

Removes the specified ICAP server configuration from the current Content Filtering Server Group.

ip_address

Specifies the ICAP server's IP address.
ip_address must be a standard IPv4 address expressed in dotted decimal notation format, or an IPv6 address expressed in colon notation format.

port *port_number*

Default: 1344
Specifies the ICAP server's port number to use for communications.
port_number must be an integer from 1 through 65535.

max *msgs*

Specifies the maximum number of unanswered outstanding messages that may be allowed to the ICAP server.

Important: The maximum outstanding requests per ICAP connection is limited to one. Therefore the value configured using the **max** keyword will be ignored.

priority *priority*

Default: 1
Specifies priority of the ICAP server in the current Content Filtering Server Group. The priority is used in server selection to determine which standby server becomes active.

priority must be an integer from 1 through 65535, where 1 is the highest priority.

Important: The **priority** keyword is only available in StarOS 8.1 and later.

Usage

This command is used to add an ICAP server configuration to a Content Filtering Server Group with which the system is to communicate for content filtering communication.

In StarOS 8.0, the ICAP solution supports only one connection between ACS Manager and ICAP server.

In StarOS 8.1, multiple ICAP server connections are supported per manager. At any time only one connection is active with the other connections acting as standby. In case of a connection failure, based on its priority, a standby connection becomes active. Any pending ICAP requests are moved to the new active connection. If a standby connection is unavailable, failure action is taken on all pending ICAP requests. See the failure-action command.

In StarOS 8.1 and later, a maximum of five ICAP servers can be configured per Content Filtering Server Group with a priority associated with each server. Once configured, an ICAP server's priority cannot be changed. To change a server's priority, the server configuration must be removed, and added with the new priority.

Example

The following command sets the ICAP server IP address to *1.2.3.4* and port to *1024*:

icap server *1.2.3.4* port *1024*

The following command specifies an ICAP server with IP address *5.6.7.8*, port number *1024*, and priority *3*:

icap server *5.6.7.8* port *1024* priority *3*

origin address

This command specifies a bind address for the CFSG endpoint.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

origin address *ip_address*

no origin address

no

Disables/releases the binding address for the CFSG endpoint.

ip_address

Specifies the IP address to bind the CFSG endpoint.
ip_address can be an IPv4 address expressed in dotted decimal notation, or an IPv6 address expressed in colon notation.

Usage

Use this command to set the bind address for the CFSG endpoint.

Example

The following command sets the origin address of *1.1.1.1*:

origin address *1.1.1.1*

response-timeout

This command sets the response timeout for the ICAP connection between ICAP server and client.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

response-timeout *duration*

{ default | no } response-timeout

default

Configures the default setting.
Default: 30 seconds

no

Removes the response timeout configuration.

duration

Default: 30 seconds
duration is the timeout duration in seconds, and must be an integer from 1 through 300.

Usage

Use this command to set the ICAP connection response timeout, after which connection will be marked as unsuccessful between ICAP endpoint.

Example

The following command sets the ICAP connection response timeout to *100* seconds:
response-timeout *100*

timeout action

This command has been deprecated, and is replaced by the failure-action command.

url-extraction

This command enables configuration of ICAP URL extraction behavior.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

url-extraction { after-parsing | raw }

default url-extraction

default

Configures the default setting.
Default: **after-parsing**

after-parsing

Specifies sending parsed URI and host name. Percent-encoded hex characters in URLs sent from the ACF client to the ICAP server will be converted to corresponding ASCII characters and sent.
For example, the URL:
http://www.google.co.uk/?this%20is%20a%20test
will be sent to the ICAP server as:
http://www.google.co.uk/?this is a test

raw

Specifies sending raw URI and host name. The URLs will contain percent-encoded hex characters as is.
For example, the URL:
http://www.google.co.uk/?this%20is%20a%20test
will be sent to the ICAP server as:
http://www.google.co.uk/?this%20is%20a%20test

Usage

Use this command to configure the ICAP URL extraction behavior. Percent-encoded hex characters—for example, space (%20) and the percent character (%25)—in URLs sent from the ACF client to the ICAP server can be sent either as percent-encoded hex characters or as their corresponding ASCII characters.

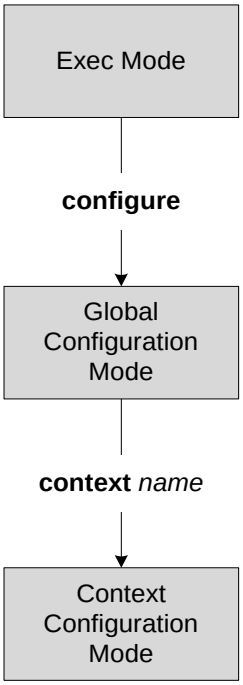
Example

The following command configures URLs sent from the ACF client to the ICAP server to contain the escape encoding as is:

url-extraction raw

Chapter 37
Context Configuration Mode Commands

The Context Configuration Mode is used to create and manage the contexts within the system. Contexts facilitate management of subscribers and services within a system.



aaa accounting

This command enables/disables accounting for subscribers and context-level administrative users for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
aaa accounting { administrator radius-diameter | subscriber [ radius-diameter ]
}

default aaa accounting { administrator | subscriber }

no aaa accounting { administrator | subscriber } [ radius-diameter ]
```

default

Configures the default setting.
Default: RADIUS

no

Disables AAA accounting per the options specified.

administrator | subscriber

administrator: Enables/disables AAA accounting for context-level administrative users.
subscriber: Enables/disables AAA accounting for subscribers.

radius-diameter

Enables/disables RADIUS or Diameter accounting for administrator(s)/subscribers as specified.

Usage

Use this command to enable/disable accounting for subscribers and context-level administrative users for the current context.
To enable or disable accounting for individual local subscriber configurations refer to the **accounting-mode** command in the *Subscriber Configuration Mode Commands* chapter.

Important: The accounting parameters in the APN Configuration Mode take precedence over this command for subscriber sessions. Therefore, if accounting is disabled using this command but enabled within the APN configuration, accounting is performed for subscriber sessions.

Example

The following command disables AAA accounting for context-level administrative users:

no aaa accounting administrator

The following command enables AAA accounting for context-level administrative users:

aaa accounting administrator radius-diameter

aaa authentication

This command enables/disables authentication for subscribers and context-level administrative users for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] aaa authentication { administrator | subscriber } { local | none |
radius-diameter }

default aaa authentication { administrator | subscriber }
```

default

Configures the default setting.
administrator: Configures default administrator authentication (local+RADIUS).
subscriber: Configures AAA authentication for subscriber(s). This sets the default value, which is RADIUS.

no

Disables AAA authentication for administrator(s)/subscribers as specified.
local: Disables local authentication for current context.
radius-diameter: Disables RADIUS or Diameter-based authentication.

administrator | subscriber

administrator: Enables/disables authentication for administrative users.
subscriber: Enables/disables authentication for subscribers.

local | none | radius-diameter

Enables AAA authentication for administrator(s)/subscribers as specified.
local: Enables local authentication for current context.
none: Disables authentication for current context.
radius-diameter: Enables RADIUS or Diameter-based authentication.

Usage

Use this command to enable/disable AAA authentication during specific maintenance activities or during test periods. The authentication can then be enabled again for the entire context as needed.

Example

The following command disables RADIUS or Diameter-based authentication for subscribers for the current context:

```
no aaa authentication subscriber radius-diameter
```

The following command enables RADIUS or Diameter-based authentication for subscribers for the current context:

```
aaa authentication subscriber radius-diameter
```

aaa constructed-nai

Configures the password used during authentication for sessions using a constructed network access identifier (NAI) or an APN-specified user name.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

aaa constructed-nai authentication [[encrypted] password *user_password* **| use-shared-secret-password]**

no aaa constructed-nai authentication

no

Disables authentication based upon the constructed network access identifier.

[[encrypted] password *user_password* **]**

encrypted: Specifies that the specified password is an encrypted password.
password *user_password*: Configures an authentication user-password for the NAI-constructed user. *user_password* must be an alpha and/or numeric string of 0 through 63 characters in length.

use-shared-secret-password

Specifies using RADIUS shared secret as the password.
Default: No Password

Usage

This command is used to configure passwords for user sessions that utilize a constructed NAI assigned via a PDSN service or a user name assigned via the APN configuration.
For simple IP sessions facilitated by PDSN services in which the **authentication allow-noauth** and **aaa constructed-nai** commands are configured, this command provides a password used for the duration of the session.
For PDP contexts using an APN in which the outbound user name is configured with no password, this command is used to provide the password. Additionally, this command is also used to provide a password for situations in which an outbound username and password are configured and the **authentication imsi-auth** command has been specified.
The encrypted keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.
If a password is configured with this keyword, then the specified password is used. Otherwise, an empty user-password attribute is sent.
Note that this configuration works in a different way for GGSN services. If a password is configured with this keyword for GGSN service, the specified password is used. Otherwise, if an outbound password is

configured, that password is used. If no outbound password is configured, the RADIUS server secret is used as the user-password string to compute the user-password RADIUS attribute.
The NAI-construction consists of the subscriber's MSID, a separator character, and a domain. The domain that is used is either the domain name supplied as part of the subscriber's user name or a domain alias.

Important: The domain alias can be set with the **nai-construction domain** command in the PDSN Service Configuration mode, or the **aaa default-domain subscriber** command in the Global Configuration mode for other core network services.

The domain alias is determined according to the following rules:

- If the domain alias is set by **nai-construction domain**, that value is always used and the **aaa default-domain subscriber** value is disregarded, if set. The NAI is of the form **<msid><symbol><nai-construction domain>**.
- If the domain alias is not set by **nai-construction domain**, and the domain alias is set by **aaa default-domain subscriber**, the **aaa default-domain subscriber** value is used. The NAI is of the form **<msid><symbol><aaa default-domain subscriber>**.
- If the domain alias is not set by **nai-construction domain** or **aaa default-domain subscriber**, the domain name alias is the name of the source context for the PDSN service. The NAI is of the form **<msid><symbol><source context of PDSN Service>**.

The special separator character can be one of the following six: @, -, %, \, -, /
The subscriber's MSID is constructed in one of the formats displayed in the following figure.

Mobile Country Code (3 digits)	Mobile Network Code (2 or 3 digits)	Mobile Subscriber Identification Number (10 digits max)

International Mobile Station Identity (IMSI)

Area Code (3 digits)	Office Code (3 digits)	Subscriber Number (4 digits)

Mobile Identification Number (MIN)

Mobile Country Code (3 digits)	Mobile Network Code (1 digit)	Subscriber Number (6 digits)

International Roaming MIN (IRM)

Example

```
aaa constructed-nai authentication
aaa constructed-nai authentication use-shared-secret-password
```

aaa filter-id rulebase mapping

This command configures the system to use value of the Filter-Id AVP as the ACS rulebase name.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] aaa filter-id rulebase mapping
```

no

Disables the mapping of Filter-Id AVP and ACS rulebase name.

default

Configures the default setting.
Default: Disabled; same as **no aaa filter-id rulebase mapping**

Usage

Use this command to enable the mapping of Filter-Id attribute's value returned during RADIUS authentication as the ACS rulebase name.
This feature provides the flexibility for operator to transact between multi-charging-service support for postpaid and prepaid subscribers through Access Control Lists (ACLs) entered in AAA profiles in RADIUS server to single-charging-service system based on rulebase configuration for postpaid and prepaid subscribers.
This feature internally maps the received ACL in to rulebase name and configures subscriber for postpaid or prepaid services accordingly.
When this feature is enabled and ACS rulebase attribute is not received from RADIUS or not configured in local default subscriber template system copies the filter-id attribute value to ACS rulebase attribute.
This copying happens only if the filter-id is configured and received from RADIUS server and ACS rulebase is not configured in ACS or not received from RADIUS.

Example

Following command enables the mapping value of the Filter-Id attribute to ACS rulebase name:

```
aaa filter-id rulebase mapping
```

aaa group

This command enables creating/configuring/deleting AAA server groups in the context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

aaa group *group_name* **[-noconfirm]**

no aaa group *group_name*

no

Deletes the specified AAA group.

group_name

Specifies the AAA group's name.
If the specified AAA group does not exist, it is created, and the prompt changes to the AAA Server Group Configuration Mode, wherein the AAA group can be configured.
If the specified AAA group already exists, the prompt changes to the AAA Server Group Configuration Mode, wherein the AAA group can be configured.
group_name must be a string of 1 through 63 characters in length.

-noconfirm

Specifies that the command must execute without any prompt and confirmation from the user.

Usage

Use this command to create/configure/delete AAA server groups within the context. Also, refer to the AAA Server Group Configuration Mode chapter.

Example

The following command creates a AAA group named *test321*, and enters the AAA Group Configuration Mode:
aaa group *test321*

aaa nai-policy

This commands sets policies on how NAIs (Network Access Identifiers) are handled during the authentication process.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] aaa nai-policy reformat-alg-hex-0-9
```

default

Sets the NAI policy back to its default setting which is to remap hexadecimal digits in NAIs and accept calls with embedded 0x00 hexadecimal digits.

no

Disable remapping of hexadecimal digits in the NAI and reject calls that have a 0x00 hexadecimal digit embedded in the NAI

reformat-alg-hex-0-9

Default: Enabled
This keyword controls remapping of NAIs that consist only of hex digits 0x00 through 0x09 or if a 0x00 hexadecimal digit is embedded in the NAI.
By default, the system remaps NAIs that consist solely of characters 0x00 through 0x09 to their ASCII equivalent. For example; 0x00 0x01 0x2 0x03 will get remapped to 123.
Also by default the system accepts an NAI containing one or more 0x00 characters within the NAI ignoring all characters after the first 0x00.
When this keyword is disabled NAIs are processed ad follows:

- Remapping of hexadecimal digits 0x00 through 0x09 within the user-provided NAI is disabled.
- When the NAI has an embedded 0x00 character anywhere within it (including if there is an extra 0x00 character at the end) the call is rejected.

Usage

Use this command to disable or re-enable remapping of hexadecimal digits in the NAI.

Example

The following command disables the remapping of hexadecimal digits in the NAI:

```
no aaa nai-policy reformat-alg-hex-0-9
```

access-list undefined

Configures the behavior of access control for the current context when an undefined access control list is specified.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
access-list undefined { deny-all | permit-all }

no access-list undefined
```

no

Disables handling undefined access lists.

deny-all | permit-all

Specifies the handling of packets when an undefined access control list is specified.
deny-all: Specifies all packets will be dropped.
permit-all: Specifies all packets will be forwarded.

Usage

Use this command to specify the default behavior when an access control list specified does not exist.
When the security policies require strict access control the **deny-all** handling should be configured.

Example

The following command sets the packet handling to ignore (drop) all packets when an undefined ACL is specified.

```
access-list undefined deny-all
```

administrator

This command configures a user with security administrator privileges in the current context.

Product

All

Privilege

Security Administrator

Syntax

administrator *user_name* **[encrypted] password** *password* **| [ecs] [expiry-date** *date_time* **] [ftp] [li-administration] [nocli] [noecs] [timeout-absolute** *timeout_absolute* **] [timeout-min-absolute** *timeout_min_absolute* **] [timeout-idle** *timeout_idle* **] [timeout-min-idle** *timeout_min_idle* **]**

no administrator *user_name*

---

no

Removes security administrator privileges for the specified user name.

---

user_name

Specifies the user name for which security administrator privileges must be enabled in the current context. *user_name* must be an alpha and/or numeric string of 1 through 32 characters in length.

[encrypted] password *password*

Specifies password for the user name. Optionally, the **encrypted** keyword can be used to specify the password uses encryption.
Without encryption *password* must be an alpha and/or numeric string of 1 through 63 characters in length.
With encryption *password* can be an alpha and/or numeric string of 1 through 127 characters in length.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

---

ecs

Permits the user to use ACS-specific configuration commands.
Default: Permitted.

---

expiry-date *date_time*

Specifies the date and time that this login account expires.
Enter the date and time in the YYYY:MM:DD:HH:mm or YYYY:MM:DD:HH:mm:ss format. Where YYYY is the year, MM is the month, DD is the day of the month, HH is the hour, mm is minutes, and ss is seconds.

---

ftp

Permits the user to use FTP and SFTP .

Default: Not permitted.

li-administration

Permits the user to execute Lawful Intercept commands.

Important: Users who have Lawful Intercept privileges are only given those privileges when connected to the system through a Secure Shell (SSH). If this user connects through a Telnet session or through the console port, Lawful Intercept privileges are not enabled.

nocli

Default: Permitted.
Prevents the user from using the command line interface.

noecs

Prevents the user from accessing ACS-specific commands.

timeout-absolute *timeout_absolute*

Specifies the maximum time, in seconds, the security administrator may have a session active before the session is forcibly terminated. *timeout_absolute* must be an integer from 0 through 300000000.
The value 0 disables this timeout configuration.
Default: 0

timeout-min-absolute *timeout_min_absolute*

Specifies the maximum time, in minutes, the security administrator may have a session active before the session is forcibly terminated. *timeout_min_absolute* must be an integer from 0 through 525600 (365 days).
The value 0 disables this timeout configuration.
Default: 0

timeout-idle *timeout_idle*

Specifies the maximum time, in seconds, the security administrator may have a session active before the session is terminated. *timeout_idle* must be an integer from 0 through 300000000.
The value 0 disables the idle timeout configuration.
Default: 0

timeout-min-idle *timeout_min_idle*

Specifies the maximum time, in minutes, the security administrator may have a session active before the session is terminated. timeout_min_idle must be an integer from 0 through 525600 (365 days).
The value 0 disables the idle timeout configuration.
Default: 0

Usage

Use this command to create new security administrators or modify existing user's settings.
Security Administrator users have read-write privileges and full access to all contexts and command modes.
Refer to the *Command Line Interface Overview* chapter for more information.

Important: A maximum of 128 administrative users and/or subscribers may be locally configured per context.

Example

The following command creates a security administrator named *user1* with access to ACS configuration commands:

administrator *user1* password *secretPassword*

The following removes the security administrator account named *user1*:

no administrator *user1*

apn

Creates/deletes Access Point Name (APN) templates and enters the APN configuration mode within the current context.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

apn*apn_name***[-noconfirm]**

no apn*apn_name***[-noconfirm]**

no

Deletes a previously configured APN template.

apn_name

Specifies a name for the APN template.
apn_name can be from 1 to 62 alpha and/or numeric characters and is not case sensitive. It may also contain dots (.) and/or dashes (-).

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

WARNING: If this keyword option is used with **no apn** *apn_name* command the APN named *apn_name* will be deleted with all active/inactive subscribers without prompting any warning or confirmation.

Usage

This command creates an APN within the system and causes the CLI to enter the APN configuration mode. The APN is a logical name for a packet data network and/or a service to which the system supports access. When a create PDP context request is received by the system, it examines the APN information element within the packet. The system determines if an APN with the identical name is configured. If so, the system uses the configuration parameters associated with that APN as a template for processing the request. If the names do not match, the request is rejected with a cause code of 219 (DBH, Missing or unknown APN). APN templates should be created/configured within destination contexts on the system. Up to 1000 APNs can be configured.

Example

The following command creates an APN template called isp1:

apn *isp1*

asn-qos-descriptor

Creates/deletes/manages the Quality of Service (QoS) descriptor table identifier for Access Service Node Gateway (ASN-GW) service and enters the ASN QoS Descriptor Table Identifier Configuration mode within the source context.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

asn-qos-descriptor id*qos_table_id***[default] dscp [be | af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af 42 | af 43 | ef][-noconfirm]**

no asn-qos-descriptor*qos_table_id***[default] dscp [be | af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af 42 | af 43 | ef][-noconfirm]**

no

Deletes a preciously configured ASN QoS descriptor table identifier.

qos_table_id

Specifies an unique identifier for ASN QoS descriptor table to create/configure.
qos_table_id must be an integer between 1 to 65535.

[default] dscp

Specifies DSCP marking for this QoS descriptor.

[be | af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af 42 | af 43 | ef]

The DSCP marking for this QoS descriptor. Deafault value is be (best effort).

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

WARNING: If this keyword option is used with **no asn-qos-descriptor id** *qos_table_id* command the ASN QoS descriptor table with identifier *qos_table_id* will be deleted with all active/inactive configurations without prompting any warning or confirmation.

Usage

Use this command to configure a QoS description table to manage QoS functionality for an ASN-GW service subscriber. This command creates and allows the configuration of QoS tables with in a context. This command is also used to remove previously configured ASN-GW services QoS descriptor table.
A maximum of 16 QoS Descriptor Tables can be configured per system.
Refer to the ASN QoS Descriptor Configuration Mode chapter of this reference for additional information.

Example

The following command creates a QoS descriptor table with identifier *1234* for the ASN-GW service subscribers:

asn-qos-descriptor id *1234*

asn-service-profile

Creates/deletes/manages the Service Profiles Identifier for Access Service Node Gateway (ASN-GW) service subscribers and enters the ASN Service Profile Configuration mode within the current context.

Product

ASN-GW

Privilege

Administrator

Syntax

asn-service-profile id*asn_profile_id***direction { bi-directional | downlink | uplink } [-noconfirm]**

no asn-service-profile id*asn_profile_id***[-noconfirm]**

no

Deletes a preciously configured ASN service profile identifier.

qos_table_id

Specifies an unique identifier for ASN QoS descriptor table to create/configure.
qos_table_id must be an integer between 1 to 65535.

direction { bi-directional | downlink | uplink }

Specifies the direction of data traffic to apply this service profile.
bi-directional: This keyword enables this service profile in both direction of uplink and downlink.
downlink: This keyword enables this service profile in downlink direction, towards the subscriber.
uplink: This keyword enables this service profile in uplink direction, towards the system.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

WARNING: If this keyword option is used with **no asn-service-profile id** *asn_profile_id* command the ASN service profile with identifier *asn_profile_id* will be deleted with all active/inactive configurations without prompting any warning or confirmation.

Usage

Use this command to configure a service profile to apply the ASN-GW service subscribers. This command creates and allows the configuration of service profiles with in a context. This command is also used to remove previously configured ASN-GW services profiles.
A maximum of 32 ASN Service Profiles can be configured per context.
Refer to the ASN Service Profile Configuration Mode chapter of this reference for additional information.

Example

The following command creates an ASN Service Profile with identifier *1234* for the ASN-GW service subscribers:

```
asn-service-profile id 1234 direction uplink
```

asngw-service

Creates/deletes/manages an Access Service Node Gateway (ASN-GW) service and enters the ASN Gateway service configuration mode within the current context.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

asngw-service *asngw_name* **[-noconfirm]**

no asn-service *asngw_name* **[-noconfirm]**

no

Deletes a previously configured ASN-GW service.

asngw_name

Specifies the name of the ASN-GW service to create/configure.
asngw_name must be from 1 to 63 alpha and/or numeric characters and is case sensitive.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

WARNING: If this keyword option is used with **no asn-service** *asngw_name* command the ASN-GW service named *asngw_name* will be deleted with all active/inactive subscribers without prompting any warning or confirmation.

Usage

Services are configured within a context and enable certain functionality. This command creates and allows the configuration of services enabling the system to function as an ASN Gateway in a WiMAX network. This command is also used to remove previously configured ASN-GW services.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (i.e. resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Refer to the ASN Gateway Service Configuration Mode chapter of this reference for additional information.

Example

The following command creates an ASN-GW service name *asn-gw1*:

asngw-service *asn-gw1*

asnpc-service

This command Creates/deletes/manages an ASN Paging Controller service to manage the ASN paging controller service and enters the ASN Paging Controller Configuration mode within the current context.

Product

ASN GW

Privilege

Security Administrator, Administrator

Syntax

[no] asnpc-service*asn_pc_svc_name***[-noconfirm]**

no

Deletes a preciously configured ASN paging controller service.

asn_pc_svc_name

Specifies the name of the ASN Paging Controller Service to create and enable.
asn_pc_svc_name must be from 1 to 63 alpha and/or numeric characters and is case sensitive.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

WARNING: If this keyword option is used with **no asnpc-service** *asn_pc_svc_name* command the ASN Paging Controller service named *asn_pc_svc_name* will be deleted and disabled with all active/inactive paging groups and paging agents configured in a context for ASN paging controller service without prompting any warning or confirmation.

Usage

Use this command to create and enable the ASN paging controller services in the system to provide functionality of an ASN Paging Controller service within a context. Additionally this command provides the access to the ASN Paging Controller Service Configuration mode and also used to remove previously configured ASN Paging Controller services.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (i.e. resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Refer to the ASN Paging Controller Service Configuration Mode chapter of this reference for additional information.

Example

The following command creates an ASN paging controller service name *asnpc_1*:

asnpc-service *asnpc_1*

bmsc-profile

Creates/deletes Broadcast Multicast Service Center (BM-SC) profiles and enters the BMSC Profile configuration mode within the current context.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

bmsc-profile name*bmsc_profile_name***[-noconfirm]**

no bmsc-profile name*bmsc_profile_name***[-noconfirm]**

no

Deletes a previously configured BM-SC profile.

bmsc_profile_name

Specifies a name for the BM-SC profile.
bmsc_profile_name can be from 1 to 62 alpha and/or numeric characters and is not case sensitive. It may also contain dots (.) and/or dashes (-).

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

WARNING: If this keyword option is used with **no bmsc-profile name** *bmsc_profile_name* command the BM-SC profile named *bmsc_profile_name* will be deleted with all active/inactive subscribers without prompting any warning or confirmation.

Usage

This command creates a BM-SC profile within the context and take the user to enter the BMSC profile configuration mode.
The BM-SC profile is a logical name for a Broadcast Multicast Service Center in Multimedia Broadcast and Multicast service.
BM-SC profile should be created/configured within contexts on the system. Up to 4 BM-SC profiles can be configured.

Example

The following command creates a BM-SC Profile called *mbms_sc_1*:

bmsc-profile name *mbms_sc_1*

busyout ip pool

This command makes addresses from an IP pool in the current context unavailable once they are free.

Product

PDSN, HA, GGSN, NAT

Privilege

Security Administrator, Administrator

Syntax

busyout ip pool { all | all-dynamic | all-static | name *pool_name* **} [address-range** *start_address end_address* **| lower-percentage** *percent* **| upper-percentage** *percent* **]**

no busyout ip pool { all | all-dynamic | all-static | name *pool_name* **} [address-range** *start_address end_address* **| lower-percentage** *percent* **| upper-percentage** *percent* **]**

no

Disable the busyout command specified.

all

This command applies to all IP pools in the current context.

all-dynamic

This command applies to all dynamic IP-pools in the current context.

all-static

This command applies to all static IP pools in the current context.

name *pool_name*

This is the name of an IP pool or IP pool group in the current context to which this command is applied. *pool_name* must be the name of an existing IP pool or IP pool group in the current context.

address-range *start_address end_address*

Busyout all addresses from *start_address* through *end_address*. *start_address*: The beginning IP address of the range of addresses to busyout. This IP address must exist in the pool specified and must be entered in IP v4 dotted decimal notation.
end_address: The ending IP address of the range of addresses to busyout. This IP address must exist in the pool specified and must be entered in IP v4 dotted decimal notation.

lower-percentage *percent*

Busyout the percentage of IP addresses specified, beginning at the lowest numbered IP address. This is a percentage of all of the IP addresses in the specified IP pool. *percent* must be an integer from 0 through 100.

upper-percentage *percent*

Busyout the percentage of IP addresses specified, beginning at the highest numbered IP address. This is a percentage of all of the IP addresses in the specified IP pool. *percent* must be an integer from 0 through 100.

Usage

Use this command to busyout IP addresses when resizing an IP pool.
Up to 32 instances of this command can be executed per context.
A single instance of this command can busy-out multiple IP address pools in the context through the use of the **all**, **all-static**, or **all-dynamic** keywords.

Example

Assume an IP pool named Pool10 with addresses from 192.168.100.1 through 192.168.100.254. To busy out the addresses from 192.168.100.50 through 192.169.100.100, enter the following command:

busyout ip pool name *Pool10* **address-range** *92.168.100.50 192.169.100.100*

To restore the IP addresses from the previous example and make them accessible again, enter the following command:

no busyout ip pool name *Pool10* **address-range** *92.168.100.50 192.169.100.100*

class-map

This command deletes/creates and enters the Class-Map configuration mode within the current destination context to configure the match rules for packet classification to flow-based traffic policing for a subscriber session flow.

Product

PDSN, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

`[ no ] class-map name` *`class_name`* **`[ match-all | match-any ]`**

`no`

Deletes configured Class-Map within the context.

`class_name`

Specifies the name of Class-Map rule and can consist of from 1 to 15 alpha and/or numeric characters in length and is case sensitive.

`match-all`

Default: Enabled.
Enables AND logic for all matching parameters configured in specific Class-Map to classify traffic flow/packets. It indicates to match all classification rules in specific Class-Map to consider the specified Class-Map as a match.

`match-any`

Default: Disabled.
Enables OR logic for matching parameters configured in specific Class-Map to classify traffic flow/packets. It indicates to match any of the classification rule in specific Class-Map to consider the specified Class-Map as a match.

Usage

Use this command to enter in Class-Map configuration mode to set classification parameters or filters in traffic policy for a subscriber session flow.

Important: In this mode classification rules added sequentially with **match** command to form a Class-Map. To change and/or delete or re-add a particular rule entire Class-Map is required to delete.

Example

Following command configures classification map class_map1 with option to match any condition in match rule.

`class-map name` *`class_map1`* **`match-any`**

closedrp-rp handoff

This command enables session handoff between Closed-RP and RP connections. Default: Disabled

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
closedrp-rp handoff
```

```
[ default | no ] closedrp-rp handoff
```

default

Resets the command to it's default setting of disabled.

no

Disables Closed-RP to RP session handoff.

Usage

Use this command to enable a PDSN service to handoff sessions between Closed-RP and RP connections.

Example

To enable Closed-RP to RP handoffs, use the following command:

```
closedrp-rp handoff
```

To disable Closed-RP to RP handoffs, use the following command:

```
no closedrp-rp handoff
```

config-administrator

Configures a context-level administrator account within the current context.

Product

All

Privilege

Security Administrator

Syntax

config-administrator user_name [encrypted] password pwd [ecs] [expiry-date*date_time* **] [ftp] [li-administration] [nocli] [noecs] [timeout-absolute abs_seconds] [timeout-min-absolute abs_minutes] [timeout-idle idle_seconds] [timeout-min-idle idle_minutes]**

no config-administrator user_name

no

Removes a previously configured context-level administrator account.

user_name

Specifies the name for the account. user_name must be from 1 to 32 alpha and/or numeric characters.

[encrypted] password pwd

Specifies the password to use for the user which is being given context-level administrator privileges within the current context. The encrypted keyword indicates the password specified uses encryption.
The password specified as pwd must be from 1 to 63 alpha and/or numeric characters without encryption and must be from 1 to 127 alpha and/or numeric characters when encryption has been indicated.
The encrypted keyword is intended only for use by the system while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the password keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

ecs

Default: ACS-specific configuration commands allowed.
Permits the specific user to access ACS-specific configuration commands.

expiry-date *date_time*

The date and time that this account expires. Enter the date and time in the format YYYY:MM:DD:HH:mm or YYYY:MM:DD:HH:mm:ss.
Where YYYY is the year, MM is the month, DD is the day of the month, HH is the hour, mm is minutes, and ss is seconds.

ftp

Default: FTP and SFTP are not allowed.
Indicates the user gains FTP and SFTP access with the administrator privileges.

li-administration

Permits this user to execute Lawful Intercept commands.

Important: Users who have Lawful Intercept privileges are only given those privileges when connected to the system through a Secure Shell (SSH). If this user connects through a Telnet session or through the console port, Lawful Intercept privileges are not enabled.

nocli

Default: CLI access allowed.
Indicates the user is not allowed to access the command line interface.

noecs

Prevents the specific user to access ACS-specific configuration commands.

timeout-absolute *abs_seconds*

Default: 0
This keyword is obsolete. It has been left in place for backward compatibility. If used a warning is issued and the value entered is rounded to the nearest whole minute.
Specifies the maximum amount of time, in seconds, the administrator may have a session active before the session is forcibly terminated. abs_seconds must be a value in the range from 0 through 300000000.
The special value 0 disables the absolute timeout.

timeout-min-absolute abs_minutes

Default: 0
Specifies the maximum amount of time, in minutes, the context-level administrator may have a session active before the session is forcibly terminated. abs_minutes must be a value in the range from 0 through 525600 (365 days).
The special value 0 disables the absolute timeout.

timeout-idle *idle_seconds*

Default: 0
This keyword is obsolete. It has been left in place for backward compatibility. If used a warning is issued and the value entered is rounded to the nearest whole minute.
Specifies the maximum amount of idle time, in seconds, the context-level administrator may have a session active before the session is terminated. idle_seconds must be a value in the range from 0 through 300000000.
The special value 0 disables the idle timeout.

timeout-min-idle idle_minutes

Default: 0
Specifies the maximum amount of idle time, in minutes, the context-level administrator may have a session active before the session is terminated. idle_minutes must be a value in the range from 0 through 525600 (365 days).
The special value 0 disables the idle timeout.

Usage

Create new context-level administrators or modify existing administrator's options, in particular, the timeout values.
Administrator users have read-write privileges and full access to all contexts and command modes (except for a few security functions). Refer to the Command Line Interface Overview chapter of this guide for more information.

Important: A maximum of 128 administrative users and/or subscribers may be locally configured per context.

Example
The following configures a context-level administration named user1 with ACS parameter control:

```
config-administrator user1 password secretPassword ecs
```

The following command removes a context-level administrator named user1:

```
no config-administrator user1
```

content-filtering

This command enables creating/configuring/deleting Content Filtering Server Groups (CFSG).

Product

CF

Privilege

Security Administrator, Administrator

Syntax

content-filtering server-group *cf_server_group_name* **[-noconfirm]**

no content-filtering server-group *cf_server_group_name*

no

Removes the specified CFSG previously configured in this context.

cf_server_group

Specifies the CFSG name.
cf_server_group_name must be an alpha and/or numeric string of 1 through 63 characters in length.

-noconfirm

Creates the specified CFSG without prompting for confirmation.

Usage

Use this command to create/configure/delete a CFSG.

Example

The following command creates a CFSG named *CF_Server1*:

content-filtering server-group *CF_Server1*

credit-control-service

This command enables creating/configuring/deleting credit-control services.

Product

All

Privilege

Security Administrator, Administrator

Syntax

credit-control-service *service_name* **[-noconfirm]**

no credit-control-service *service_name*

no

Deletes the specified credit-control service.

service_name

Specifies the credit-control service's name.
service_name must be an alpha and/or numeric string of 1 through 63 characters in length.
If the named credit-control service does not exist, it is created, and the CLI mode changes to the Credit Control Service Configuration mode wherein the service can be configured.
If the named credit-control service already exists, the CLI mode changes to the Credit Control Service Configuration mode wherein the service can be configured.

-noconfirm

Specifies that the command must execute without any additional prompt and confirmation from the user.

Usage

Use this command to create/configure/delete credit-control services.

Example

The following command creates a credit-control service named *test159*, and enters the Credit control Service Configuration mode:

credit-control-service *test159*

crypto group

Creates a crypto group and enters the crypto configuration mode allowing the configuration of crypto group parameters.

Product

PDSN, PDIF, HA, GGSN, SCM

Privilege

Administrator, Config-Administrator

Syntax

crypto group*group_name*

no crypto group*group_name*

no

Deletes a previously configured crypto group.

group_name

The name of the crypto group and can consist of from 1 to 127 alpha and/or numeric characters in length and is case sensitive.

Important: A maximum of 32 crypto groups per context can be configured.

Usage

Use this command to enter the configuration mode allowing the configuration of crypto group parameters. Crypto (tunnel) groups are used to support the Redundant IPSec Tunnel Fail-over feature and consist of two configured ISAKMP crypto maps. Each crypto map defines the IPSec policy for a tunnel. In the crypto group, one tunnel serves as the primary, the other as the secondary (redundant).

Example

The following command configures a crypto group called *group1*:

crypto group *group1*

crypto ipsec transform-set

Configures transform-sets on the system and enters the Crypto Trans Configuration Mode.

Product

PDSN, PDIF, HA, GGSN, SCM

Privilege

Security Administrator, Administrator

Syntax

crypto ipsec transform-set*transform_name***[ah { hmac { md5-96 | none | sha1-96 } { esp { hmac { { md5-96 | sha1-96 } { cipher {des-cbc | 3des-cbc | aes-cbc } } | none } } } }]**

no crypto ipsec transform-set*transform_name*

---

no

Removes a previously configured transform set

---

transform_name

Configures the name by which the transform set will be recognized by the system.
transform_name must be from 1 to 127 alpha and/or numeric characters and is case sensitive.

---

ah hmac

Configures the Authentication Header (AH) hash message authentication codes (HMAC) parameter for the transform set to one of the following:

- **md5-96:** Message Digest 5 truncated to 96 bits
- **none:** Disables the use of the AH protocol for the transform set.
- **sha1-96:** Secure Hash Algorithm-1 truncated to 96 bits

---

esp hmac

Configures the Encapsulating Security Payload (ESP) hash message authentication codes (HMAC) parameter for the transform set to one of the following:

- **md5-96:** Message Digest 5 truncated to 96 bits
- **none:** Disables the use of the AH protocol for the transform set.
- **sha1-96:** Secure Hash Algorithm-1 truncated to 96 bits

---

cipher

If ESP is enabled, this option must be used to set the encapsulation cipher protocol to one of the following:

- **3des-cbc:** Triple Data Encryption Standard (3DES) in chain block (CBC) mode
- **aes-cbc:** Advanced Encryption Standard (AES) in CBC mode
- **des-cbc:** DES in CBC mode

Usage

Use this command to create a transform set on the system.

Transform Sets are used to define IPSec security associations (SAs). IPSec SAs specify the IPSec protocols to use to protect packets.

Transform sets are used during Phase 2 of IPSec establishment. In this phase, the system and a peer security gateway negotiate one or more transform sets (IPSec SAs) containing the rules for protecting packets. This negotiation ensures that both peers can properly protect and process the packets.

Important: The **ah** and subsequent keywords are required when the transform set is initially configured.

Example

Create a transform set that has the name tset1, no authentication header, an encapsulating security protocol header hash message authentication code of md5, and a bulk payload encryption algorithm of des-cbc with the following command:

```
crypto ipsec transform-set tset1 ah hmac none esp hmac md5 cipher des-cbc
```

crypto map

Configures the name of the policy and enters either the specified Crypto Map Configuration Mode.

Product

PDSN, HA, GGSN, SCM, P-GW, PDIF

Privilege

Security Administrator, Administrator

Syntax

```
crypto map name[ ikev2-ipv6 | ipsec-dynamic | ipsec-ikev1 | ipsec-manual ] no
crypto map name
```

no

Removes a previously configured crypto map.

name

The name by which the crypto map will be recognized by the system. *name* must be a string of from 1 through 127 alpha and/or numeric characters and is case sensitive.

ikev2-ipv6

Creates an IKEv2-IPv6 crypto map and enters the Crypto Map IKEv2-IPv6 configuration mode

ipsec-dynamic

Creates a dynamic crypto map and/or enters the Crypto Map Dynamic Configuration Mode.

ipsec-ikev1

Creates an IKEv1 crypto map and/or enters the Crypto Map IKEv1 Configuration Mode.

ipsec-manual

Creates a manual crypto map and/or enters the Crypto Map Manual Configuration Mode.

Usage

Crypto Maps define the policies that determine how IPSec is implemented for subscriber data packets. There are several types of crypto maps supported by the system. They are:

- **Manual crypto maps:** These are static tunnels that use pre-configured information (including security keys) for establishment. Because they rely on statically configured information, once created, the tunnels never expire; they exist until their configuration is deleted.

Important: Because manual crypto map configurations require the use of static security keys (associations), they are not as secure as crypto maps that rely on dynamically configured keys. Therefore, it is recommended that they only be configured and used for testing purposes.

- **IKEv1 crypto maps:** These tunnels are similar to manual crypto maps in that they require some statically configured information such as the IP address of a peer security gateway and that they are applied to specific system interfaces. However, IKEv1 crypto maps offer greater security because they rely on dynamically generated security associations through the use of the Internet Key Exchange (IKE) protocol.
- **IKEv2-IPv6 crypto maps**: Used to protect X3 data between a P-GW and a Lawful Intercept server.
- **Dynamic crypto maps:** These tunnels are used for protecting L2TP-encapsulated data between the system and an LNS/security gateway or Mobile IP data between an FA service configured on one system and an HA service configured on another.

Important: The crypto map type (dynamic, IKEv1, IKEv2-IPv6, or manual) is specified when the map is first created using this command.

Example

Create a dynamic crypto map named map1 and enter the Crypto Map Dynamic configuration mode by entering the following command:

```
crypto map map1 ipsec-dynamic
```

crypto node

Creates a crypto node.

Product

SCM

Privilege

Administrator, Config-Administrator

Syntax

crypto node*node_name***map***name*

no crypto node*node_name*

node_name

The name of the crypto node and can consist of from 1 to 127 alpha and/or numeric characters in length and is case sensitive.

map *name*

Assigns a previously configured crypto map policy to this crypto node. *name* must be a string of from 1 through 127 alpha and/or numeric characters and is case sensitive.

no

Deletes a previously configured crypto node.

Usage

Use this command to configure a crypto node and assign policies (crypto maps) to the node.

Example

The following command configures a crypto node called *node1* and assigns a policy named *map1* to it:

```
crypto node node1 map map1
```

crypto template

Creates a new, or specifies an existing, crypto template and enters the Crypto Template Configuration Mode.

Product

PDIF, SCM

Privilege

Security Administrator, Administrator

Syntax

```
crypto template name { ikev2-pdif | ipsec-3gpp-cscf }

no crypto template name
```

name **{ ikev2-pdif | ipsec-3gpp-cscf }**

Specifies the name of a new or existing crypto template. *name* must be from 1 to 127 alpha and/or numeric characters.
ikev2-pdif: Configure the Crypto Template to be used for configuring PDIF functionality.

Important: This keyword cannot be used with IPSec for the SCM.

ipsec-3gpp-cscf: Configure the Crypto Template to be used for configuring P-CSCF IPSec functionality.

Important: This keyword can only be used with IPSec for the SCM.

Usage

Use this command to create a new or enter an existing PDIF or P-CSCF crypto template.

Important: The CSCF crypto template should be configured in the same context in which the P-CSCF is configured.

Entering this command results in one of the following prompts:
[*context_name*]*hostname*(cfg-crypto-tmpl-ikev2-tunnel)#
[*context_name*]*hostname*(cfg-crypto-tmpl-ims-cscf-tunnel)#
Crypto Template Configuration Mode commands are defined in the *Crypto Template Configuration Mode Commands* and *CSCF Crypto Template Configuration Mode Commands* chapters.

Example

The following command configures a PDIF crypto template called *crypto1* and enters the Crypto Template Configuration Mode:

```
crypto template crypto1 ikev2-pdif
```

The following command configures a P-CSCF crypto template called *crypto2* and enters the CSCF Crypto Template Configuration Mode:

```
crypto template crypto2 ipsec-3gpp-cscf
```

cscf

The commands in this section are used for configuring parameters associated with the CSCF service.

cscf access-profile

Creates a new or enters an existing access profile used to set signaling compression for various network access types.

Product

SCM

Privilege

Administrator

Syntax

cscf access-profile { default | name *profile_name* **[-noconfirm] }**

no cscf access-profile name *profile_name*

default

Specifies that the system is to enter the Access Profile Configuration Mode for the default access profile.

name *profile_name*

Specifies a name for the access profile.
profile_name must be from 1 to 79 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no cscf access-profile name *profile_name*

Removes the CSCF access profile from the context.

Usage

Use this command to create an access profile for the CSCF service and cause the system to enter the Access Profile Configuration Mode where parameters are configured for the profile.
Entering this command results in the following prompt:
[*context_name*]*hostname*(config-cscf-access-profile)#
Access Profile Configuration Mode commands are defined in the *CSCF Access Profile Configuration Mode Commands* chapter.

Example

The following command creates a CSCF Access Profile named *profile2* and enters the Access Profile Configuration Mode:

cscf access-profile name *profile2*

cscf acl

Creates an access control list (ACL) and enters the ACL Configuration Mode.

Product

SCM

Privilege

Administrator

Syntax

cscf acl { default | name *list_name* **[-noconfirm] }**

no cscf acl name *list_name*

default

Specifies that the system is to enter the ACL Configuration Mode for the default ACL.

name *list_name*

Specifies a name for the ACL.
list_name must be from 1 to 47 alpha and/or numeric characters in length.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no cscf acl name *list_name*

Removes the CSCF ACL from the context.

Usage

Use this command to create an access control list for the CSCF service and cause the system to enter the ACL Configuration Mode where parameters are configured for the new list.
Entering this command results in the following prompt:
[*context_name*]*hostname*(config-cscf-acl)#
ACL Configuration Mode commands are defined in the *CSCF ACL Configuration Mode Commands* chapter.
Use this command when configuring the following SCM components: P-CSCF, S-CSCF, and SIP Proxy.

Example

The following command creates a CSCF access control list named *acl1* and enters the ACL Configuration Mode:

cscf acl name *acl1*

cscf ifc-filter-criteria

Creates Initial Filter Criteria (iFC) filter criteria for shared iFC functionality.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

cscf ifc-filter-criteria name *fc_name* **priority** *pri* **profile-part-indicator { registered | unregistered } app-server uri scheme { sip | sips }** *as* **as-default-handling { session-continue | session-terminate } [-noconfirm] | [service-info** *info* **][trigger-point** *tp_name* **] [-noconfirm] | [trigger-point** *tp_name* **] [-noconfirm]**

no cscf ifc-filter-criteria name *fc_name*

name *fc_name*

Specifies a name for the iFC filter criteria.
fc_name must be from 1 to 39 alpha and/or numeric characters in length.

priority *pri*

Specifies the priority of the filter criteria, which is used to select a particular filter criteria from multiple ones present under an ISC template.
pri must be an integer from 0 through 1024.

profile-part-indicator { registered | unregistered }

Indicates whether the iFC is a part of the registered (**registered**) or unregistered (**unregistered**) user profile.

app-server uri scheme { sip | sips }

Determines the associated application server's uri scheme.
sip: sip uri
sips: sips uri

as

Specifies an address for the associated application server.
as must be from 1 to 127 alpha and/or numeric characters in length.

as-default-handling { session-continue | session-terminate }

Determines whether the dialog should be released (**session-terminate**) or not (**session-continue**) if the application server could not be reached or on application server error return.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

service-info *info*

Specifies optional service information to be sent to the application server.
info must be from 1 to 63 alpha and/or numeric characters in length.

trigger-point *tp_name*

Assigns an iFC trigger point to the filter criteria.
tp_name must be from 1 to 39 alpha and/or numeric characters in length.

no cscf ifc-filter-criteria name *fc_name*

Removes the specified CSCF iFC filter criteria from the context.

Usage

Use this command to create a filter criteria name and associate an application server address to it. You may also define a trigger point name to be executed in order to select the application server. If no trigger point is specified, then the application server is selected unconditionally.

Important: Filter criteria is associated with an ISC template in the ISC Template Configuration Mode.

Important: Filter criteria can be assigned to more than one ISC template.

Example

The following command creates an iFC filter criteria named *ifcfc1*, which has a priority of 2 and is part of the registered user profile. *ifcfc1* is assigned to a sip application server named *appserver*. The dialog will not be released if the application server can not be reached. *ifcfc1* is also assigned a trigger point named tp2:

```
cscf ifc-filter-criteria name ifcfc1 priority 2 profile-part-indicator
registered app-server uri scheme sip appserver as-default-handling
session-continue trigger-point tp2
```

cscf ifc-spt-condition

Creates an Initial Filter Criteria (iFC) Service Point Trigger (SPT) condition for shared iFC functionality.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

cscf ifc-spt-condition name *cond_name* **{ request-uri content** *uri_content* **| session-case { originating-registered | originating-unregistered | terminating-registered | terminating-unregistered } | session-description** *sdp* **[content** *sdp_data* **] | sip-header** *hdr* **[content** *hdr_data* **] | sip-method** *method* **} [-noconfirm] [condition-negated]**

no cscf ifc-spt-condition name *cond_name*

---

name *cond_name*

Specifies a name for the iFC SPT condition.
cond_name must be from 1 to 39 alpha and/or numeric characters in length.

---

request-uri content *uri_content*

Specifies request uri content.
uri_content must be from 1 to 127 alpha and/or numeric characters in length.

Important: Wildcard Extended Regular Expressions (ERE) are supported for this value. For example, "sip.user[0-9]@192\\.168\\.176\\.150"

---

session-case {originating-registered | originating-unregistered | terminating-registered | terminating-unregistered}

Determines the type of session:

- **originating-registered**: Session handling an originating end user.
- **originating-unregistered**: Session handling an unregistered originating end user.
- **terminating-registered**: Session handling a terminating registered end user.
- **terminating-unregistered**: Session handling a terminating unregistered end user.

---

session-description *sdp* **[content** *sdp_data* **]**

Specifies an SDP line type.
sdp must be from 1 to 15 alpha and/or numeric characters in length.
content specifies content on the SDP line.
sdp_data must be from 1 to 127 alpha and/or numeric characters in length.

---

sip-header *hdr* **[content** *hdr_data* **]**

Specifies a header type.

hdr must be from 1 to 127 alpha and/or numeric characters in length.
content specifies content on the header.
hdr_data must be from 1 to 127 alpha and/or numeric characters in length.

sip-method *method*

Specifies a sip method.
method must be from 1 to 127 alpha and/or numeric characters in length.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

condition-negated

Negates the specified condition.

no cscf ifc-spt-condition name *cond_name*

Removes the specified CSCF iFC SPT condition from the context.

Usage

Use this command to create individual SPT conditions that are later associated with an SPT group in the iFC SPT Group Configuration Mode.

Important: An iFC SPT group may be associated with multiple SPT conditions.

Example

The following command creates an iFC SPT condition named *cond2* which handles an originating end user:

```
cscf ifc-spt-condition name cond2 session-case originating-registered
```

The following command negates the condition created above:

```
cscf ifc-spt-condition name cond2 session-case originating-registered
condition-negated
```

cscf ifc-spt-group

Creates an Initial Filter Criteria (iFC) Service Point Trigger (SPT) group for shared iFC functionality.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

cscf ifc-spt-group name *group_name* **[[-noconfirm] | reg-type { de-registration | initial-registration | re-registration } [-noconfirm]]**

no cscf ifc-spt-group name *group_name*

name *group_name*

Specifies a name for the iFC SPT group.
group_name must be from 1 to 39 alpha and/or numeric characters in length.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

reg-type { de-registration| initial-registration | re-registration }

Defines whether the SPT condition matches to REGISTER messages that are related to:

- **de-registration**
- **initial-registration**
- **re-registration**

no cscf ifc-spt-group name *group_name*

Removes the specified CSCF iFC SPT group from the context.

Usage

Use this command to create an iFC SPT group name and bind different SPT conditions under it.

Important: An iFC SPT group may be associated with multiple SPT conditions.

The SPT group can also specify the registration type that defines whether the SPT condition matches to REGISTER messages that are related to initial registrations, re-registrations, or de-registrations.
Entering this command results in the following prompt:
[*context_name*]*hostname*(config-cscf-ifc-spt-group)#
iFC SPT Group Configuration Mode commands are defined in the *CSCF IFC SPT Group Configuration Mode Commands* chapter.

Example

The following command creates an iFC SPT group named *group2*:

```
cscf ifc-spt-group name group2
```

cscf ifc-trigger-point

Creates an Initial Filter Criteria (iFC) trigger point for shared iFC functionality.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

cscf ifc-trigger-point name *tp_name* **condition-type { cnf | dnf } [-noconfirm]**

no cscf ifc-trigger-point name *tp_name*

name *tp_name*

Specifies a name for the iFC trigger point.
tp_name must be from 1 to 39 alpha and/or numeric characters in length.

condition-type { cnf | dnf }

Defines the condition type of the iFC trigger point:
cnf: conjunctive normal form
dnf: disjunctive normal form

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no cscf ifc-trigger-point name *tp_name*

Removes the specified CSCF iFC trigger point from the context.

Usage

Use this command to create a trigger point name and bind different SPT groups under it.

Important: An iFC SPT group can be assigned to more than one iFC trigger point.

Entering this command results in the following prompt:
[*context_name*]*hostname*(config-cscf-ifc-trigger-point)#
IFC Trigger Point Configuration Mode commands are defined in the *CSCF IFC Trigger Point Configuration Mode Commands* chapter.

Example

The following command creates an iFC trigger point named *tp_2* with a cnf condition type:

cscf ifc-trigger-point name *tp_2* **condition-type cnf**

cscf isc-template

Creates an IMS Service Control (ISC) template and enters the ISC Template Configuration Mode.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

[no] cscf isc-template name *template_name*

no

Removes the CSCF ISC template from the context.

name *template_name*

Specifies a name for the ISC template.
template_name must be from 1 to 39 alpha and/or numeric characters in length.

Usage

Use this command to create an ISC template for the CSCF service and cause the system to enter the ISC Template Configuration Mode where parameters are configured for the new template.
Entering this command results in the following prompt:
[*context_name*]*hostname*(config-cscf-isc-tmpl)#
ISC Template Configuration Mode commands are defined in the *CSCF ISC Template Configuration Mode Commands* chapter.
Use this command when configuring the following SCM component: S-CSCF.

Example

The following command creates an ISC template named *template1* and enters the ISC Template Configuration Mode:

cscf isc-template name *template1*

cscf last-route-profile

Creates a last route profile, which will be specified on peer server configuration to select the Last Routing Option (LRO) number while forwarding an emergency call packet to a particular peering server, and enters the Last Route Profile Criteria Configuration Mode.

Product

SCM

Privilege

Administrator

Syntax

cscf last-route-profile name *profile_name* **criteria** {**county-name** | **round-robin**} [**-noconfirm**]**no cscf last-route-profile name** *profile_name*

name *profile_name*

Specifies the name of the last route profile.
profile_name must be from 1 to 79 alpha and/or numeric characters in length.

criteria { county-name | round-robin }

county-name: Profile specific to the county-name criteria.
Entering this command results in the following prompt:
[*context_name*]*hostname*(config-county-name-lro-profile)#
Last Route Profile Criteria Configuration Mode commands are defined in the *CSCF Last Route Profile Criteria Configuration Mode Commands* chapter.
round-robin: Profile specific to the round-robin criteria.
Entering this command results in the following prompt:
[*context_name*]*hostname*(config-round-robin-lro-profile)#
Last Route Profile Criteria Configuration Mode commands are defined in the *CSCF Last Route Profile Criteria Configuration Mode Commands* chapter.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no cscf last-route-profile name *profile*

Removes the specified CSCF last route profile from the context.

Usage

Use this command to create a last route profile and enter the Last Route Profile Criteria Configuration Mode.

Important: Last route profiles are associated with peer servers in the CSCF Peer Server Monitoring Configuration Mode.

Use this command when configuring the following SCM components: S-CSCF and SIP Proxy.

Example

The following command creates a last route profile named *lro1* and enters the CSCF Last Route Profile Criteria Configuration Mode to specify county name criteria:

```
cscf last-route-profile name lro1 criteria county-name
```

The following command creates a last route profile named *lro2* and enters the CSCF Last Route Profile Criteria Configuration Mode to specify round robin criteria:

```
cscf last-route-profile name lro2 criteria round-robin
```

cscf peer-servers

Creates a peer server group type for next-hop session routing and enters the Peer Server Configuration Mode.

Product

SCM

Privilege

Administrator

Syntax

cscf peer-servers *server_name* **type { bgcf | ibcf | icscf | mgcf | mrfc | pcscf | scscf | sip-as } [-noconfirm]**

no cscf peer-servers *server_name*

server_name

Specifies the name of the peer server group.
server_name must be from 1 to 79 alpha and/or numeric characters in length.

type { bgcf | ibcf | icscf | mgcf | mrfc | pcscf | scscf | sip-as }

Specifies the type of peer server group to configure:

- bgcf: Borader Gateway Control Function
- **ibcf**: Interconnect Border Control Function
- icscf: Interrogating-Call/Session Control Function
- mgcf: Media Gateway Control Function
- mrfc: Media Resource Function Controller
- pcscf: Proxy-Call/Session Control Function
- scscf: Serving-Call/Session Control Function
- sip-as: Session Initiation Protocol-Application Server

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no cscf peer-servers *server_name*

Removes the specified CSCF peer server group from the context.

Usage

Use this command to create a specific peer server group and enter the Peer Server Configuration Mode where connectivity parameters can be entered.
Entering this command results in the following prompt:
[*context_name*]*hostname*(config-cscf-peer-servers)#
Peer Servers Configuration Mode commands are defined in the *CSCF Peer Servers Configuration Mode Commands* chapter.

Use this command when configuring the following SCM components: P-CSCF, S-CSCF, and SIP Proxy.

Example

The following command creates an I-CSCF server group type called *icscf_group1* and enters the Peer Server Configuration Mode:

```
cscf peer-servers icscf_group1 type icscf
```

cscf policy

Creates a policy group for specific AoR profiles and enters the Policy Configuration Mode.

Product

SCM

Privilege

Administrator

Syntax

cscf policy { default | name *policy_name* **[-noconfirm] }**

no cscf policy name *policy_name*

default

Specifies that the system is to enter the AoR Policy Rules Configuration Mode for the default policy. The default policy uses AoR policy rules.
Entering this command results in the following prompt:
[*context_name*]*hostname*(config-aor-policy)#
Default (AoR) Policy Configuration Mode commands are defined in the *CSCF AoR Policy Rules Configuration Mode Commands* chapter.

name *policy_name*

Specifies the name of the policy group.
policy_name must be from 1 to 79 alpha and/or numeric characters in length.
Entering this command results in the following prompt:
[*context_name*]*hostname*(config-cscf-policy)#
Policy Configuration Mode commands are defined in the *CSCF Policy Configuration Mode Commands* chapter.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no cscf policy name *policy_name*

Removes the specified CSCF policy group from the context.

Usage

Use this command to create a policy group and enter either the AoR Policy Rules Configuration Mode (**default**) or Policy Configuration Mode (**name** *policy_name*).
Use this command when configuring the following SCM components: P-CSCF, S-CSCF, and SIP Proxy.

Example

The following command creates a policy group named *group2* and enters the CSCF Policy Configuration Mode:

cscf policy name *group2*

cscf routes

Creates a route group for specifying routing information and enters the Routes Configuration Mode.

Product

SCM

Privilege

Administrator

Syntax

cscf routes { default | name *route_name* **[-noconfirm] }**

no cscf routes name *route_name*

default

Specifies that the system is to enter the Routes Configuration Mode for the default route group.

name *route_name*

Specifies the name of the route group.
route_name must be from 1 to 79 alpha and/or numeric characters in length.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no cscf routes name *route_name*

Removes the specified CSCF route group from the context.

Usage

Use this command to create a route group and enter the Routes Configuration Mode.
Entering this command results in the following prompt:
[*context_name*]*hostname*(config-cscf-route)#
Routes Configuration Mode commands are defined in the *CSCF Routes Configuration Mode Commands* chapter.
Use this command when configuring the following SCM components: P-CSCF, S-CSCF, SIP Proxy.

Example

The following command creates a route group named *route_group5* and enters the Route Group Configuration Mode:

cscf routes name *route_group5*

cscf service

Creates a CSCF service or specifies an existing CSCF service and enters the CSCF service configuration mode for the current context.

Product

SCM

Privilege

Administrator

Syntax

cscf service*service_name* **[-noconfirm]**

no cscf service*service_name*

service_name

Specifies the name of the CSCF service. If *service_name* does not refer to an existing service, the new service is created if resources allow.
service_name must be from 1 to 63 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no cscf service *service_name*

Removes the specified CSCF service from the context.

Usage

Enter the CSCF service configuration mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:
[*context_name*]*hostname*(config-cscf-service)#
CSCF Service Configuration Mode commands are defined in the *CSCF Service Configuration Mode Commands* chapter.
Use this command when configuring the following SCM components: P-CSCF, S-CSCF, SIP Proxy.

Example

The following command enters the existing CSCF service configuration mode (or creates it if it doesn't already exist) for the service named *cscf-service1*:

cscf service *cscf-service1*

The following command will remove *cscf-service1* from the system:

no cscf service *cscf-service1*

cscf session-template

Creates a session template and/or enters the Session Template Configuration Mode.

Product

SCM

Privilege

Administrator

Syntax

cscf session-template { default | name *template_name* **[-noconfirm] }**

no cscf session-template name *template_name*

default

Specifies that the system is to enter the Session Template Configuration Mode for the default session template.

name *template_name*

Specifies a name for the template.
template_name must be from 1 to 79 alpha and/or numeric characters in length.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no cscf session-template name *template_name*

Removes the specified CSCF session template from the context.

Usage

Use this command to create a new session template and enter the Session Template Configuration Mode or enter the mode for an existing template.
Entering this command results in the following prompt:
[*context_name*]*hostname*(config-cscf-session-template)#
Session Template Configuration Mode commands are defined in the *CSCF Session Template Configuration Mode Commands* chapter.
Use this command when configuring the following SCM components: P-CSCF, S-CSCF, SIP Proxy.

Example

The following command enters the Session Template Configuration Mode for a template named *sess_temp4*:

cscf session-template name *sess_temp4*

cscf translation

Creates/removes a translation list and/or enters the Translation Configuration Mode.

Product

SCM

Privilege

Administrator

Syntax

cscf translation { default | name *list_name* **[-noconfirm] }**

no cscf translation name *list_name*

default

Specifies that the system is to enter the Translation Configuration Mode for the default translation list.

name *list_name*

Specifies a name for the translation list.
list_name must be from 1 to 79 alpha and/or numeric characters in length.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no cscf translation name *list_name*

Removes the specified CSCF translation list from the context.

Usage

Use this command to create a new translation list and enter the Translation Configuration Mode or enter the mode for an existing list.
Translation lists are used to modify or replace a request-URI such as an E.164 number. For example, a translation list can be configured to append digits to the end of a number or replace a domain name with another.
Entering this command results in the following prompt:
[*context_name*]*hostname*(config-cscf-translation)#
Translation Configuration Mode commands are defined in the *CSCF Translation Configuration Mode Commands* chapter.
Use this command when configuring the following SCM components: P-CSCF, S-CSCF, SIP Proxy.

Example

The following command enters the Translation Configuration Mode for a translation list named *trans_list3*:

cscf translation name *trans_list3*

cscf urn-service-list

Creates/removes a URN service list and/or enters the URN List Configuration Mode.

Product

SCM

Privilege

Administrator

Syntax

cscf urn-service-list { default | name *list_name* **[-noconfirm] }**

no cscf urn-service-list name *list_name*

default

Specifies that the system is to enter the URN List Configuration Mode for the default URN service list.

name *list_name*

Specifies a name for the URN service list.
list_name must be from 1 to 79 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no cscf urn-service-list name *list_name*

Removes the specified CSCF URN service list from the context.

Usage

Use this command to create a URN service list name and enter the URN List Configuration Mode. URN lists contain URN to URI mappings used for emergency and location-based services. A URN service list is selected by a CSCF session template.
Entering this command results in the following prompt:
[*context_name*]*hostname*(config-cscf-service-urn)#
URN List Configuration Mode commands are defined in the *CSCF URN List Configuration Mode Commands* chapter.
Use this command when configuring the following SCM components: P-CSCF.

Example

The following command enters the URN List Configuration Mode for a URN list named *urn_list1*:

cscf urn-service-list name *urn_list1*

css server

This is a restricted command. In Release 9.0 and later, this command is obsoleted.

default aaa

Restores the system's accounting and authentication parameters to default settings for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
default aaa { accounting {administrator | subscriber } | authentication {
administrator | subscriber }
```

accounting { administrator | subscriber }

administrator: Restores the system default setting for RADIUS accounting for administrative user sessions.
subscriber: Restores the system default setting for RADIUS accounting for subscriber sessions.

authentication { administrator | subscriber }

subscriber: Restores the system default setting for RADIUS authentication for subscribers.
administrator: Restores the system default setting for RADIUS authentication for administrative users.

Usage

Use this command to restore the system's accounting and authentication options to the default settings for the current context.
The system is shipped from the factory with the administrative user and subscriber RADIUS accounting enabled.

Example

```
default aaa accounting subscriberdefault aaa authentication default
```

default access-list

Restores the system default for packet handling when an undefined ACL is specified.

Product

PDSN, FA, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
default access-list undefined
```

undefined

Restores the system default for handling of packets when an undefined ACL is specified.

Usage

Restore the chassis to the system defaults.

Example

```
default access-list undefined
```

default gtpp

Restores gtpp parameter settings to their default values.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
default gtpp { attribute { diagnostics | duration-ms | local-record-sequence-
number | plmn-id } | algorithm | deadtime | detect-dead-server { consecutive-
failures } | duplicate-hold-time | echo-interval | egcdr final-record { include-
content-ids only-with-traffic closing-cause same-in-all-partials } | egcdr
losdv-max-containers | egcdr lotdv-max-containers | egcdr service-idle-timeout |
max-cdrs | max-pdu-size | max-retries | redirection-allowed | timeout | trigger}
```

`attribute { diagnostics | duration-ms | local-record-sequence-number | plmn-id }`

Restores the gtpp attribute parameter to the following default settings:

- **`diagnostics`**: Disabled
- **`duration-ms`**: Disabled
- **`local-record-sequence-number`**: Disabled
- **`plmn-id`**: Enabled

`algorithm`

Restores the gtpp algorithm parameter to its default setting of first-server.

`deadtime`

Restores the gtpp deadtime parameter to its default setting of 120 seconds.

`detect-dead-server { consecutive-failures }`

Restores the gtpp detect-dead-server consecutive-failure parameter to its default setting of 5.

`duplicate-hold-time`

Restores the gtpp duplicate-hold-time parameter to its default setting of 60 minutes.

`echo-interval`

Restores the gtpp echo-interval parameter to its default setting of 60 seconds.

egcdr final-record { include-content-ids only-with-traffic closing-cause same-in-all-partials }

Restores the gtpp egcdr final record to the default settings to include content-ids with some data to report are included. Also sets the closing cause to the default of using the same closing cause for multiple final eGCDRs.

egcdr losdv-max-containers

Restores the gtpp egcdr maximum number of List of Service Data Volume (LoSDV) containers in one EGCDR to the default of 10.

egcdr lotdv-max-containers

Restores the gtpp egcdr maximum number of List of Traffic Data Volume (LoTDV) containers in one EGCDR to the default of 8.

egcdr service-idle-timeout

Restores the gtpp egcdr service-idle-timeout parameter to its default setting of 0.

max-cdrs

Restores the gtpp max-cdrs parameter to its default setting of 1 CDR per packet.

max-pdu-size

Restores the gtpp max-pdu-size parameter to its default setting of 4096 octets.

max-retries

Restores the gtpp max-retries parameter to its default setting of 4.

redirection-allowed

Restores the gtpp redirection-allowed parameter to its default setting of enabled.

timeout

Restores the gtpp timeout parameter to its default setting of 5.

trigger

Restores the gtpp triggers to their default settings.

Usage

After system parameters have been modified, this command is used to set/restore specific parameters to their default values.

Example

The following command restores the gtpp max-pdu-size to its default setting of 4096 octets:

```
default gtpp max-pdu-size
```

default mobile-ip

Sets the behavior of all HA services when a new call has a duplicate home address or IMSI.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
defaultmobile-ip { hanewcall { duplicate-home-address | duplicate-imsi-session }
| fa { multiple-dynamic-reg-per-nai | newcallduplicate-home-address } }
```

duplicate-home-address

Set HA or FA services to reject a new call that requests an IP address that is already assigned.

duplicate-imsi-session

Set HA services to accept new calls that have the same IMSI as a call that is already active.

multiple-dynamic-reg-per-nai

All FA services in the current context can not simultaneously setup multiple dynamic home address registrations that have the same NAI.

Usage

Use this command to reset the HA behavior for new calls.

Example

The following commands reset the HA and the FA to reject new calls that request a static IP address that is already in use from an IP pool in the same destination context:

```
default mobile-ip ha newcall duplicate-home-address

default mobile-ip fa newcall duplicate-home-address
```

default network-requested-pdp-context

Restores network-requested-pdp-context parameters to their default settings.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
default network-requested-pdp-context { hold-down-time | sgsn-cache-time }
```

hold-down-time

Restores the hold-down-time parameter to its default setting of 60 seconds.

sgsn-cache-time

Restores the sgsn-cache-time parameter to its default setting of 300 seconds.

Usage

After system parameters have been modified, this command is used to set/restore specific parameters to their default values.

Example

The following command restores the network-requested-pdp-context hold-down-time parameter to its default setting:

```
default network-requested-pdp-context hold-down-time
```

default ppp

Restores the point-to-point protocol option defaults.

Product

All

Privilege

Security Administrator, Administrator

Syntax

default ppp { acfc { receive | transmit } | auth-retry suppress-aaa-auth | echo-max-retransmissions | echo-retransmit-timeout | first-lcp-retransmit-timeout | lcp-authentication-reject retry alternate | lcp start-delay | lcp-terminateconnect-state | lcp-terminate mip-lifetime-expiry | lcp-terminate mip-revocation | max-authentication-attempts | max-configuration-nak | max-retransmissions | max-terminate | mru | negotiate default-value-options | peer-authentication | pfc { receive | transmit } | reject-peer-authentication | retransmit-timeout|renegotiation retain-ip-address}

acfc { receive | transmit }

receive: Set the ACFC receive setting to the default, allow. The local PPP side indicates that it can process ACFC compressed PPP packets and compressed packets are allowed.
transmit: Set the ACFC transmit setting to the default, ignore. If the peer requests ACFC, the request is accepted, but ACFC is not applied for transmitted PPP packets.

auth-retry suppress-aaa-auth

Restores the system default and allows authentication retries to the AAA server after authorization has already been performed.

chap fixed-challenge-length

Disables a specified fixed PPP CHAP challenge length and sets the system back to the default of a random PPP CHAP challenge length from 17 to 32 bytes.

echo-max-retransmissions

Restores the system default for the maximum number of retransmissions of LCP ECHO_REQ before a session is terminated in an always-on session.

echo-retransmit-timeout

Restores the system default for the timeout before trying LCP ECHO_REQ for an always-on session.

first-lcp-retransmit-timeout

Sets the number of milliseconds to wait before the first retransmit of a control packet. to the system default.

lcp-authentication-reject retry-alternate

Default: Disabled. No alternate authentication option will be retried.

The action that is taken if the authentication option is rejected during LCP negotiation and retry the allowed alternate authentication option

lcp start-delay

Sets the delay before Line Control Protocol (LCP) starts to it's default of 0 (zero) milliseconds.

lcp-terminate connect-state

This option enables sending an LCP terminate message to the Mobile Node when a PPP session is disconnected if the PPP session was already in a connected state.
Note that if the no keyword is used with this option, the PDSN must still send LCP Terminate in the event of an LCP/PCP negotiation failure or PPP authentication failure, which happens during connecting state.

Important: This option is not supported in conjunction with the GGSN product.

lcp-terminate mip-lifetime-expiry

This option configures the PDSN to send a LCP Terminate Request when a MIP Session is terminated due to MIP Lifetime expiry (default).
Note that if the no keyword is used with this option, the PDSN does not send a LCP Terminate Request when a MIP session is terminated due to MIP Lifetime expiry.

lcp-terminate mip-revocation

This option configures the PDSN to send a LCP Terminate Request when a MIP Session is terminated due to a Revocation being received from the HA (default).
Note that if the no keyword is used with this option, the PDSN does not send a LCP Terminate Request when a MIP session is terminated due to a Revocation being received from the HA.

max-authentication-attempts

Restores the maximum PPP authentication retry attempts possible from the peer, when the authentication attempts fail to the default of 1.

max-configuration-nak

Restores the maximum number of consecutive configuration NAKs to be sent to the peer before disconnecting the PPP session to the default of 10

max-retransmissions

Restores the system default for the maximum number of times to retransmit control packets.

max-terminate

Restore the maximum number of PPP LCP Terminate Requests transmitted to the Mobile Node to the system default of 2.

mru

Resets the maximum packet size than can be received to the default of 1500.

negotiate default-value-options

Disables the inclusion of configuration options with default values in PPP configuration requests.

peer-authentication

Sets the peer authentication user name and password to its system default.

pfc { receive | transmit }

receive: Sets the Protocol Field Compression (PFC) receive setting to the default, allow. The peer is allowed to request PFC during LCP negotiation.
transmit: Sets the PFC transmit setting to the default, ignore. If the peer requests PFC, it is accepted but PFC is not applied for transmitted packets.

reject-peer-authentication

Rejection of peer requests for authentication is enabled.

renegotiation retain-ip-address

Retain the currently allocated IP address for the session during PPP renegotiation (Simple IP) between FA and Mobile node.

retransmit-timeout

Restores the number of milliseconds to wait before retransmitting packets.

Usage

Restore the PPP settings for the current context to the system defaults.

Example

```
default ppp echo-max-retransmissions

default ppp echo-retransmit-timeout

default ppp max-retransmissions

default ppp peer-authentication

default ppp retransmit-timeout
```

default radius

This command restores the context's RADIUS parameters to the system default settings.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
default radius { accounting { algorithm | deadtime | detect-dead-server
consecutive-failures | max-outstanding | max-pdu-size | max-retries | timeout }
| algorithm | attribute { nas-identifier } | deadtime | detect-dead-server
consecutive-failures | dictionary | keepalive | max-outstanding | max-retries |
max-transmissions | probe-interval | timeout }
```

`accounting { algorithm | apn-to-be-included | archive | deadtime | detect-dead-server consecutive-failures | keepalive | max-outstanding | max-pdu-size | max-retries | max-transmissions | rp trigger-policy | timeout }`

Restores the system default value for the RADIUS accounting option specified.
`algorithm`: restores the accounting server selection algorithm to the system default.
`apn-to-be-included:` configures the APN name to be included for radius accounting.
`archive`: enables archiving of RADIUS accounting messages.
`deadtime`: restores the default number of seconds before attempting to communicate an accounting server marked as unreachable.
`detect-dead-server consecutive-failures`: restores the default value for the number of consecutive failed attempts to reach an accounting server before it is marked as unreachable.
`radius accounting ha policy`: resets the HA accounting policy to the system default: session-start-stop. Send Accounting Start when the Session is connected, Send Accounting Stop when the session is disconnected.
`keepalive`: restores the default keepalive accounting related parameters values.
`max-outstanding`: restores the system default for the maximum number of outstanding messages to queue for a given accounting server.
`max-pdu-size`: restores the maximum size a packet data unit can be.
`max-retries`: restores the maximum number of times a packet will be retransmitted to the system default.
`max-transmissions`: disables the maximum transmissions limit.
`rp trigger-policy`: restores the RADIUS accounting R-P policy to the default of Airlink Usage.
`timeout`: restores the number of seconds to wait before retransmitting a PDU to the system default.

`algorithm`

Restores the RADIUS server selection algorithm to the system default.

`attribute { nas-identifier }`

`nas-identifier`: restores the network access server Id to the system default.

deadtime

Restores the default number of seconds before attempting to communicate an RADIUS server marked as unreachable.

detect-dead-server

Restores consecutive failures to the default of 4 and disables response-timeout.

dictionary

Restores the context's dictionary to the system default.

keepalive [calling-station-id *id* **| consecutive-response** *number* **| encrypted | interval** *seconds* **| password | retries** *number* **| timeout** *seconds* **| username** *name* **| valid-response access-accept [access-reject]]**

calling-station-id *id:* restores the default calling-station-id to be used for the keepalive authentication.
consecutive-response *number:* restores the default number of consecutive authentication responses after which the server is marked as reachable.
interval *seconds:* restores the default time interval between the keepalive access requests.
password: restores the default password to be used for the authentication.
retries *number:* restores the default number of times the keepalive access request to be sent before marking the server as unreachable.
timeout *seconds:* restores the default time interval between each keepalive access request retries.
username *name:* restores the default username to be used for the authentication.
valid-response access-accept [*access-reject*]: restores the default valid response for the authentication request.

max-outstanding

Restores the system default for the maximum number of outstanding messages to queue for a given RADIUS server.

max-retries

Restores the maximum number of times a packet will be retransmitted to the system default.

probe-interval

Sets the amount of time to wait before sending another probe authentication request to a RADIUS server to the default setting of 60 seconds.

timeout

Restores the number of seconds to wait before retransmitting a message to the system default.

Usage

Restores RADIUS parameters to the system default settings.

Example

default radius accounting deadtimedefault radius accounting max-outstandingdefault radius algorithmdefault radius attribute nas-identifier

default radius authenticate null-username

Restores the system default for authenticating null, or blank, user names. The default behavior is to authenticate, send Access-Request messages to the AAA server, all user names including null user names.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
default radius authenticate null-username
```

Usage

Use this command to return to the default behavior of authenticating, sending Access-Request messages to the AAA server, all user names, including NULL user names.

Example

Enter the following command to return username authentication to the default behavior:

```
default radius authenticate null-username
```

default threshold

Restores context-level thresholds to their default settings.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
default threshold { available-ip-pool-group | ip-pool-free | ip-pool-hold | ip-pool-release | ip-pool-used | monitoring available-ip-pool-group }
```

available-ip-pool-group

Restores the context-level IP address pool group utilization thresholds to their default values.

ip-pool-free

Default: 0
Restores to it's default the thresholds for the percentage of the IP pool addresses that are in the free state.

ip-pool-hold

Default: 0
Restores to it's default the thresholds for the percentage of the IP pool addresses that are in the hold state.

ip-pool-release

Default: 0
Restores to it's default the thresholds for the percentage of IP pool address that are in the release state.

ip-pool-used

Default: 0
Restores to it's default the thresholds for the percentage off the IP pool addresses that are used.

monitoring available-ip-pool-group

Restores the IP address pool threshold monitoring parameter to its default setting.

Usage

Use this command to restore IP address pool-related threshold parameters to their default settings.

Example

```
default threshold available-ip-pool-group
```

dhcp-service

Adds a Dynamic Host Control Protocol (DHCP) service instance to the current context and enters the configuration mode for that service.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

dhcp-service*service_name*

no dhcp-service*service_name*

no

Removes a previously configured DHCP service from the current context.

service_name

The name by which the DHCP service is to be recognized by the system. The name can be from 1 to 63 alpha and/or numeric characters in length and is case sensitive.

Usage

Use this command to add a DHCP service to a context configured on the system and enter the DHCP service configuration mode. A DHCP service is a logical grouping of external DHCP servers.
The DHCP configuration mode provides parameters that dictate the system's communication with one or more of these DHCP servers.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (i.e. resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Refer to the DHCP Service Configuration Mode chapter of this reference for additional information.

Example

The following command creates a DHCP service called DHCP1 and enter the DHCP service configuration mode:

dhcp-service *dhcp1*

diameter accounting

This command configures Diameter accounting related settings.

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter accounting { dictionary { aaa-custom1 | aaa-custom10 | aaa-custom2 | aaa-custom3 | aaa-custom4 | aaa-custom5 | aaa-custom6 | aaa-custom7 | aaa-custom8 | aaa-custom9 | nasreq | rf-plus } | endpoint *endpoint_name* **| hd-mode fall-back-to-local | hd-storage-policy** *hd_policy* **| max-retries** *tries* **| max-transmissions** *transmissions* **| request-timeout** *duration* **| server** *host_name* **priority** *priority* **}**

default diameter accounting { dictionary | hd-mode | max-retries | max-transmissions | request-timeout }

no diameter accounting { endpoint | hd-mode | hd-storage-policy | max-retries | max-transmissions | server *host_name* **}**

---

no diameter accounting { endpoint | hd-mode | hd-storage-policy | max-retries | max-transmissions | server *host_name* **}**

endpoint: Removes the currently configured accounting endpoint. The default accounting server configured in the default AAA group will be used.
hd-mode: Sends records to the Diameter server, if all Diameter servers are down or unreachable, then copies records to the local HDD and periodically retries the Diameter server.
hd-storage-policy: Disables use of the specified HD storage policy.
max-retries: Disables the retry attempts for Diameter accounting in this AAA group.
max-transmissions: Disables the maximum number of transmission attempts for Diameter accounting in this AAA group.
server *host_name*: Removes the Diameter host *host_name* from this AAA server group for Diameter accounting.

---

default diameter accounting { dictionary | hd-mode | max-retries | max-transmissions | request-timeout }

dictionary: Sets the context's dictionary as the system default.
hd-mode: Sends records to the Diameter server, if all Diameter servers are down or unreachable, then copies records to the local HDD and periodically retries the Diameter server.
max-retries: Sets the retry attempts for Diameter accounting in this AAA group to default 0 (disable).
max-transmissions: Sets the maximum transmission attempts for Diameter accounting in this AAA group to default 0 (disable).
request-timeout: Sets the timeout duration, in seconds, for Diameter accounting requests in this AAA group to default (20).

dictionary { aaa-custom1 | aaa-custom10 | aaa-custom2 | aaa-custom3 | aaa-custom4 | aaa-custom5 | aaa-custom6 | aaa-custom7 | aaa-custom8 | aaa-custom9 | nasreq | rf-plus }

Specifies the Diameter accounting dictionary.
aaa-custom1 ... aaa-custom10: The custom dictionaries. Even though the CLI syntax supports several custom dictionaries, not necessarily all of them have been defined. If a custom dictionary that has not been implemented is selected, the default dictionary will be used.
nasreq: nasreq dictionary—the dictionary defined by RFC 4005.
rf-plus: RF Plus dictionary.

endpoint *endpoint_name*

Enables Diameter to be used for accounting, and specifies which Diameter endpoint to use.
endpoint_name must be a string of 1 through 63 characters in length.

hd-mode fall-back-to-local

Specifies that records be copied to the local HDD if the Diameter server is down or unreachable. CDF/CGF will pull the records through SFTP.

hd-storage-policy *hd_policy*

Specifies the HD Storage policy name.
hd_policy must be the name of a configured HD Storage policy, and must be a string of 1 through 63 alpha and/or numeric characters in length.
HD storage policies are configured through the Global Configuration Mode.
This and the **hd-mode** command are used to enable the storage of Rf Diameter Messages to HDD in case all Diameter Servers are down or unreachable.

max-retries *tries*

Specifies how many times a Diameter request should be retried with the same server, if the server fails to respond to a request.
tries specifies the maximum number of retry attempts. The value must be an integer from 1 through 1000.
Default: 0

max-transmissions *transmissions*

Specifies the maximum number of transmission attempts for a Diameter request. Use this in conjunction with the "**max-retries** *tries*" option to control how many servers will be attempted to communicate with.
transmissions specifies the maximum number of transmission attempts for a Diameter request. The value must be an integer from 1 through 1000.
Default: 0

request-timeout *duration*

Specifies how long the system will wait for a response from a Diameter server before re-transmitting the request.
duration specifies the number of seconds the system will wait for a response from a Diameter server before re-transmitting the request. The value must be an integer from 1 to 3600.
Default: 20

server *host_name* **priority** *priority*

Specifies the current context Diameter accounting server's host name and priority.

host_name specifies the Diameter host name, it must be a string of 1 through 63 characters in length.
priority specifies the relative priority of this Diameter host. The priority is used in server selection. The priority must be an integer from 1 through 1000.

Usage

Use this command to manage the Diameter accounting options according to the Diameter server used for the context.

Example

The following command specifies the Diameter accounting dictionary:

```
diameter accounting dictionary <dictionary>
```

The following command specifies the Diameter endpoint:

```
diameter accounting endpoint <endpoint_name>
```

The following commands specify the Diameter accounting options:

```
diameter accounting max-retries <tries>
diameter accounting max-transmissions <transmissions>
diameter accounting request-timeout <duration>
diameter accounting server <host_name> priority <priority>
```

The following commands disable/clear the options:

```
no diameter accounting endpoint
no diameter accounting server <host_name>
```

diameter authentication

Use this command to configure Diameter authentication related settings.

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter authentication { dictionary { aaa-custom1 | aaa-custom10 | aaa-custom11 | aaa-custom12 | aaa-custom13 | aaa-custom14 | aaa-custom15 | aaa-custom16 | aaa-custom17 | aaa-custom18 | aaa-custom19 | aaa-custom2 | aaa-custom20 | aaa-custom3 | aaa-custom4 | aaa-custom5 | aaa-custom6 | aaa-custom7 | aaa-custom8 | aaa-custom9 | nasreq } | endpoint *endpoint_name* **| max-retries** *tries* **| max-transmissions** *transmissions* **| redirect-host-avp { just-primary | primary-then-secondary } | request-timeout** *duration* **| server** *host_name* **priority** *priority* **}**

default diameter authentication { dictionary | max-retries | max-transmissions | redirect-host-avp | request-timeout }

no diameter authentication { endpoint | max-retries | max-transmissions | server *host_name* **}**

---

no diameter authentication { endpoint | max-retries | max-transmissions | server *host_name* **}**

endpoint: Removes the authentication endpoint. The default server configured in default AAA group will be used.
max-retries: Disables the retry attempts for Diameter authentication in this AAA group.
max-transmissions: Disables the maximum transmission attempts for Diameter authentication in this AAA group.
server *host_name*: Removes the Diameter host *host_name* from this AAA server group for Diameter authentication.

---

default diameter authentication { dictionary | max-retries | max-transmissions | redirect-host-avp | request-timeout }

dictionary: Sets the context's dictionary as the system default.
max-retries: Sets the retry attempts for Diameter authentication requests in this AAA group to default 0 (disable).
max-transmissions: Sets the configured maximum transmission attempts for Diameter authentication in this AAA group to default 0 (disable).
redirect-host-avp: Sets the redirect choice to default (just-primary).
request-timeout: Sets the timeout duration, in seconds, for Diameter authentication requests in this AAA group to default (20).

---

dictionary { aaa-custom1 | aaa-custom10 | aaa-custom11 | aaa-custom12 | aaa-custom13 | aaa-custom14 | aaa-custom15 | aaa-custom16 | aaa-custom17 | aaa-custom18 | aaa-custom19 | aaa-custom2 | aaa-custom20 | aaa-custom3

| aaa-custom4 | aaa-custom5 | aaa-custom6 | aaa-custom7 | aaa-custom8 | aaa-custom9 | nasreq }

Specifies the Diameter authentication dictionary.
aaa-custom1 ... aaa-custom20: The custom dictionaries. Even though the CLI syntax supports several custom dictionaries, not necessarily all of them have been defined. If a custom dictionary that has not been implemented is selected, the default dictionary will be used.

Important: **aaa-custom11** dictionary is only available in Release 8.1 and later. **aaa-custom12** to **aaa-custom20** dictionaries are only available in Release 9.0 and later releases.

nasreq: nasreq dictionary—the dictionary defined by RFC 4005.

endpoint *endpoint_name*

Enables Diameter to be used for authentication, and specifies which Diameter endpoint to use.
endpoint_name must be a string of 1 through 63 characters in length.

max-retries *tries*

Specifies how many times a Diameter authentication request should be retried with the same server, if the server fails to respond to a request.
tries specifies the maximum number of retry attempts, and must be an integer from 1 through 1000.
Default: 0

max-transmissions *transmissions*

Specifies the maximum number of transmission attempts for a Diameter authentication request. Use this in conjunction with the "**max-retries** *tries*" option to control how many servers will be attempted to communicate with.
transmissions specifies the maximum number of transmission attempts, and must be an integer from 1 through 1000.
Default: 0

diameter authentication redirect-host-avp { just-primary | primary-then-secondary }

Specifies whether to use just one returned AVP, or use the first returned AVP as selecting the primary host and the second returned AVP as selecting the secondary host.
just-primary: Redirect only to primary host.
primary-then-secondary: Redirect to primary host, if fails then redirect to the secondary host.
Default: just-primary

request-timeout *duration*

Specifies how long the system will wait for a response from a Diameter server before re-transmitting the request.
duration specifies the number of seconds the system will wait for a response from a Diameter server before re-transmitting the request, and must be an integer from 1 through 3600.
Default: 20 seconds

server *host_name* **priority** *priority*

Specifies the current context Diameter authentication server's host name and priority.

host_name specifies the Diameter host name, and must be a string of 1 through 63 characters in length.
priority specifies the relative priority of this Diameter host, and must be an integer from 1 through 1000. The priority is used in server selection.

Usage

Use this command to manage the Diameter authentication options according to the Diameter server used for the context.

Example

The following command specifies the Diameter authentication dictionary:

```
diameter authentication dictionary <dictionary>
```

The following command specifies the Diameter endpoint:

```
diameter authentication endpoint <endpoint_name>
```

The following commands specify Diameter authentication options:

```
diameter authentication max-retries <tries>
diameter authentication max-transmissions <transmissions>
diameter authentication redirect-host-avp primary-then-secondary
diameter authentication server <host_name> priority <priority>
diameter authentication request-timeout <duration>
```

The following commands disable/clear the options:

```
no diameter authentication endpoint
no diameter authentication server <host_name>
```

diameter authentication failure-handling

This command configures error handling for Diameter EAP requests.

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter authentication failure-handling { authorization-request | eap-request | eap-termination-request } { request-timeout action { continue | retry-and-terminate | terminate } | result-code *result_code* **{ [to** *result_code* **] action { continue | retry-and-terminate | terminate } } }**

no diameter authentication failure-handling { authorization-request | eap-request | eap-termination-request } result-code *result_code* **[to** *result_code* **]**

default diameter authentication failure-handling { authorization-request | eap-request | eap-termination-request } request-timeout action

no

Disables Diameter authentication failure handling.

default

Configures the default Diameter authentication failure handling setting.

authorization-request

Specifies that failure handling is to be performed on Diameter authorization request messages (AAR/AAA).

eap-request

Specifies configuring failure handling for EAP requests.

eap-termination-request

Specifies configuring failure handling for EAP termination requests.

request-timeout action { continue | retry-and-terminate | terminate }

Specifies the action to be taken for failures:

- **continue**: Continues the session
- **retry-and-terminate**: First retries, if it fails then terminates the session
- **terminate**: Terminates the session

result-code *result_code* **{ [to** *result_code* **] action { continue | retry-and-terminate | terminate } }**

result_code: Specifies the result code number, must be an integer from 1 through 65535.

to *result_code*: Specifies the upper limit of a range of result codes. **to** *result_code* must be greater than *result_code*.
action { continue | retry-and-terminate | terminate }: Specifies action to be taken for failures:

- **continue**: Continues the session
- **retry-and-terminate**: First retries, if it fails then terminates the session
- **terminate**: Terminates the session

Usage

Use this command to configure error handling for Diameter EAP, EAP-termination, and authorization requests. Specific actions (continue, retry-and-terminate, or terminate) can be associated with each possible result-code. Ranges of result codes can be defined with the same action, or actions can be specific on a per-result code basis.

Example

The following commands configure result codes 5001, 5002, 5004, and 5005 to use "action continue" and result code 5003 to use "action terminate”:

```
diameter authentication failure-handling eap-request result-code 5001 to
5005 action continue

diameter authentication failure-handling eap-request result-code 5003
action terminate
```

diameter dictionary

This command is deprecated and is replaced by the **diameter accounting dictionary** and **diameter authentication dictionary** commands. See **diameter accounting** and **diameter authentication** commands respectively.

diameter endpoint

This command enables creating/configuring/deleting a Diameter endpoint.

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter endpoint *endpoint_name* **[-noconfirm]**

no diameter endpoint *endpoint_name*

no

Removes the specified Diameter endpoint.

endpoint_name

Specifies the Diameter endpoint name.
endpoint_name must be an alpha and/or numeric string of 1 through 63 characters in length.
If the named endpoint does not exist, it is created, and the CLI mode changes to the Diameter Endpoint Configuration mode wherein the endpoint can be configured.
If the named endpoint already exists, the CLI mode changes to the Diameter Endpoint Configuration mode wherein the endpoint can be reconfigured.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create/configure/delete a Diameter origin endpoint.

Example

The following command creates a Diameter origin endpoint named *test13*:

diameter endpoint *test13*

diameter sctp

Configures Diameter SCTP parameters for all diameter endpoints within the context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter sctp { hearbeat-interval *interval* **| path max-retransmissions** *retransmissions* **}**

default diameter sctp { heartbeat-interval | path max-retransmissions }

default

Configures this command with the default settings.
heartbeat-interval: Sets the heartbeat interval to the default value.
path max-retransmissions: Sets the SCTP path maximum retransmissions to the default value.

hearbeat-interval *interval*

Specifies the time interval between heartbeat chunks sent to a destination transport address in seconds.
interval must be an integer from 1 through 255.
Default: 30 seconds

path max-retransmissions *retransmissions*

Specifies the maximum number of consecutive retransmissions over a destination transport address of a peer endpoint before it is marked as inactive.
retransmissions must be an integer from 1 through 10.
Default: 10

Usage

Use this command to configure Diameter SCTP parameters for all diameter endpoints within the context.

Example

The following command configures the heartbeat interval to *60* seconds:

```
diameter sctp hearbeat-interval 60
```

The following command configures the maximum number of consecutive retransmissions to *6*, after which the endpoint is marked as inactive:

```
diameter sctp path max-retransmissions 6
```

diameter origin

This command is deprecated and is replaced by the **diameter endpoint** command.

dns-client

Creates a DNS client and/or enters the DNS Client Configuration Mode.

Product

SCM, SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] dns-client *name* **[-noconfirm]**

no

Removes the specified DNS client from the context.

name

Specifies a name for the DNS client. *name* must be from 1 to 63 alpha and/or numeric characters in length.

Usage

Use this command to create a new DNS client and enter the DNS Client Configuration Mode or enter the mode for an existing client.
Entering this command results in the following prompt:
[*context_name*]*hostname*(config-dns-client)#
DNS Client Configuration Mode commands are defined in the DNS Client Configuration Mode Commands chapter.

Example

The following command enters the DNS Client Configuration Mode for a DNS client named *dns1*:

dns-client *dns1*

domain

Configures a domain alias for the current context.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

domain [*] *domain_name* **[default subscriber** *subs_temp_name* **]**

no domain [*] *domain_name*

no domain [*] *domain_name*

Indicates the domain specified is to be removed as an alias to the current context.

[*] *domain_name*

domain_name specifies the domain alias to create/remove from the current context. If the domain portion of a subscribers user name matches this value, the current context is used for that subscriber.
domain_name must be an alpha and/or numeric string of 1 through 79 characters in length. The domain name can contain all special characters, however note that the character * (wildcard character) is only allowed at the beginning of the domain name.
If the domain name is prefixed with * (wildcard character), and an exact match is not found for the domain portion of a subscriber's user name, subdomains of the domain name are matched. For example, if the domain portion of a subscriber's user name is abc.xyz.com and you use the domain command **domain** **xyz.com* it matches. But if you do not use the wildcard (**domain** *xyz.com*) it does not match.

Important: The domain alias specified must not conflict with the name of any existing context or domain names.

default subscriber *subs_temp_name*

Specifies the name of the subscriber template to apply to subscribers using this domain alias.
subs_temp_name must be an alpha and/or numeric string of 1 through 127 characters in length. If this keyword is not specified the default subscriber configuration in the current context is used.

Usage

Set a domain alias when a single context may be used to support multiple domains via aliasing.

Example

domain *sampleDomain.net*

no domain *sampleDomain.net*

eap-profile

Creates a new, or specifies an existing, Extensible Authentication Protocol (EAP) profile and enters the EAP Configuration Mode.

Product

ASN GW, PDIF

Privilege

Security Administrator, Administrator

Syntax

[no] eap-profile *name*

name

Specifies the name of a new or existing EAP profile. *name* must be from 1 to 256 alpha and/or numeric characters.

Usage

Use this command to create a new or enter an existing EAP profile.
Entering this command results in the following prompt:
[*context_name*]*hostname*(config-ctx-eap-profile)#
EAP Configuration Mode commands are defined in the EAP Configuration Mode Commands chapter.

Example

The following command configures an EAP profile called *eap1* and enters the EAP Configuration Mode:

eap-profile *eap1*

edr-module active-charging-service

This command creates the Event Data Record (EDR) module and enters the EDR Module Active Charging Service Configuration Mode.

Product

ACS, GGSN, HA, LNS, PDSN

Privilege

Security Administrator, Administrator

Syntax

```
edr-module active-charging-service
```

Usage

Use this command to create the EDR module for the context and configure the EDR module for active charging service records. You must be in a non-local context when specifying this command, and you must use the same context when specifying the UDR module command.

Example

```
edr-module active-charging-service
```

egtp-service

Creates an eGTP service or specifies an existing eGTP service and enters the eGTP service configuration mode for the current context.

Product

MME, P-GW, S-GW

Privilege

Administrator

Syntax

egtp-service*service_name* **[-noconfirm]**

no egtp-service*service_name*

service_name

Specifies the name of the eGTP service. If *service_name* does not refer to an existing service, the new service is created if resources allow.
service_name must be from 1 to 63 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no egtp-service *service_name*

Removes the specified eGTP service from the context.

Usage

Enter the eGTP service configuration mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:
[*context_name*]*hostname*(config-egtp-service)#
eGTP Service Configuration Mode commands are defined in the eGTP Service Configuration Mode Commands chapter.
Use this command when configuring the following GTP SAE components: MME, P-GW, and S-GW.

Example

The following command enters the existing eGTP service configuration mode (or creates it if it doesn't already exist) for the service named *egtp-service1*:

egtp-service *egtp-service1*

The following command will remove *egtp-service1* from the system:

no egtp-service *egtp-service1*

end

Exits the context configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to change to the Exec mode.

exit

Exits the context configuration mode and returns to the global configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the Global Configuration mode.

external-inline-server

This is a restricted command.

fa-service

Creates/deletes a foreign agent service or specifies an existing FA service for which to enter the foreign agent service configuration mode for the current context.

Product

PDSN, ASN-GW, FA

Privilege

Security Administrator, Administrator

Syntax

[no] fa-service*name*

no

Indicates the foreign agent service specified is to be removed.

name

Specifies the name of the FA service to configure. If *name* does not refer to an existing service, the new service is created if resources allow. *name* must be from 1 to 63 alpha and/or numeric characters.

Usage

Enter the FA service configuration mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (i.e. resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Example

The following command will enter the FA service configuration mode creating the service *sampleService*, if necessary.

```
fa-service sampleService
```

The following command will remove *sampleService* as being a defined FA service.

```
no fa-service sampleService
```

firewall max-associations

This command is obsolete.

ggsn-service

Creates/deletes a Gateway GPRS Support Node (GGSN) service and enters the GGSN service configuration mode within the current context.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

ggsn-service*name* **[-noconfirm]**

no ggsn-service*name*

no

Deletes a preciously configured GGSN service.

name

Specifies the name of the GGSN service to create/configure.
name must be from 1 to 63 alpha and/or numeric characters and is case sensitive.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Services are configured within a context and enable certain functionality. This command creates and allows the configuration of services enabling the system to function as a GGSN in a GPRS or UMTS network. This command is also used to remove previously configured GGSN services.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (i.e. resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Example

The following command creates a GGSN service name ggsn1:

ggsn-service *ggsn1*

gprs-service

This command creates a GPRS service instance and enters the GPRS Service configuration mode. This mode configures all of the parameters specific to the operation of an SGSN in a GPRS network.

Important: For details about the commands and parameters for this mode, check the GPRS Service Configuration Mode chapter.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gprs-service *srvc_name*

no gprs-service *srvc_name*

no

Remove the configuration for the specified IGPRS service from the configuration for the current context.

srvc_name

A unique string of 1 to 63 alphanumeric characters that identify the specific GPRS service.

Usage

Use this command to create or remove a GPRS service. Entering this command will move the system to the GPRS Service configuration mode and change the prompt to:
[*context_name*]*hostname*(config-gprs-service)#

Example

The following command creates an GPRS service named gprs1:

gprs-service *gprs1*

The following command removes the GPRS service named gprs1:

no gprs-service *gprs1*

gs-service

This command creates a Gs service instance and enters the Gs Service configuration mode. This mode configures the parameters specific to the Gs interface between the SGSN and the MSC/VLR.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gs-service *svc_name* [-noconfirm]

no gs-service *svc_name*

no

Remove the configured Gs service from the current context.

svc_name

A unique string of 1 to 63 alphanumeric characters that identify the specific Gs service.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create, edit, or remove a Gs service.
A maximum of 32 Gs service can be configured in one context/system. This limit is subject to maximum of 256 services (regardless of type) can be configured per system.

Important: For details about the commands and parameters for this mode, refer Gs Service Configuration Mode chapter.

Example

The following command creates an Gs service named '*gs1*':

gs-service *gs1*

The following command removes the Gs service named '*gs1*':

no gs-service *gs1*

gtpp

The commands in this section change gtpp related parameters.

gtpp algorithm

Configures GTPP routing algorithms for the current context.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp algorithm { first-server | round-robin | first-n*n*}

first-server

Default: Enabled
Specifies that accounting data is sent to the first available charging gateway function (CGF) based upon the relative priority of each configured CGF.

round-robin

Default: Disabled
Specifies that accounting data is transmitted in a circular queue fashion such that data is sent to the highest priority CGF first, then to the next available CGF of the highest priority, and so on. Ultimately, the queue returns to the CGF with the highest configured priority.

first-n *n*

Default: 1 (Disabled)
Specifies that the AGW must send accounting data to *n* (more than one) CGFs based on their priority. Response from any one of the *n* CGFs would suffice to proceed with the call. The full set of accounting data is sent to each of the *n* CGFs.
n is the number of CGFs to which accounting data will be sent, and must be an integer from 2 through 65535.

Usage

Use this command to control how G-CDR accounting data is routed among the configured CGFs.

Example

The following command configures the system to use the round-robin algorithm when transmitting G-CDR accounting data:

```
gtpp algorithm round-robin
```

gtpp attribute

This command allows the specification of the optional attributes to be present in the call detail records (CDRs) that the GPRS/UMTS access gateway generates. It also defines that how the information is presented in CDRs by encoding the attribute field values.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp attribute { cell-plmn-id | diagnostics | duration-ms | imei | local-record-sequence-number | msisdn | node-id-suffix suffix | plmn-id [ unknown-use uncode_value ] | rat | record-extensions rat | sms { destination-number | recording-entity | service-centre }

[ default ] gtpp attribute { cell-plmn-id | diagnostics | duration-ms | imei | local-record-sequence-number | msisdn | plmn-id | rat | record-extensions | sms { destination-number | recording-entity | service-centre }

[ no ] gtpp attribute { cell-plmn-id | diagnostics | duration-ms | imei | local-record-sequence-number | msisdn | node-id-suffix | plmn-id | rat | record-extensions rat | sms { destination-number | recording-entity | service-centre }
```

no

Removes the configured GTPP attributes from the CDRs.

defualt

Sets the default GTPP attributes in generated the CDRs. It also sets the default presentation of attribute values in generated CDRs.

cell-plmn-id

Default: Disabled
This keyword configures the SGSN to include the cell's PLMN identifier (MCC and MNC) in generated CDRs (M-CDRs and/or the S-CDRs).
This keyword is applicable for SGSN only.

diagnostics

Default: Disabled
Includes the Diagnostic field in the CDR that is created when PDP contexts are released. The field will contain one of the following values:

- **36** - if the SGSN sends us "delete PDP context request".
- **38** - if the GGSN sends "delete PDP context request" due to GTP-C/GTP-U echo timeout with SGSN.
- **40** - if the GGSN sends "delete PDP context request" due to receiving a RADIUS Disconnect-Request message.

- **26** - if the GGSN sends "delete PDP context request" for any other reason (e.g., the operator types "clear subscribers" on the GGSN).

duration-ms

Default: Disabled
Specifies that the information contained in the mandatory Duration field be reported in milliseconds instead of seconds (as the standards require).

imei

Default: Disabled
This keyword configures the SGSN to include the International Mobile Equipment Id in generated CDRs (M-CDRs and/or the S-CDRs).
This keyword is applicable for SGSN only.

local-record-sequence-number

Default: Disabled
Includes the Node ID field in the CDR that is created when PDP contexts are released. The field consists of a AAA Manager identifier automatically appended to the name of the GGSN or SGSN service.
The name of the GGSN/SGSN service may be truncated, because the maximum length of the Node ID field is 20 bytes. Since each AAA Manager generates CDRs independently, this allows the Local Record Sequence Number and Node ID fields to uniquely identify a CDR.

msisdn

Default: Disabled
This keyword configures the SGSN to include the Mobile Subscribers Integrated Services Digital Network identifier in generated CDRs (M-CDRs and/or the S-CDRs).
This keyword is applicable for SGSN only.

node-id-suffix *string*

Default: Disabled
Specifies the string suffix to use in the NodeID field of GTPP CDRs. Each Session Manager task generates a unique NodeID string per GTPP context.
string: This is the configured Node-ID-Suffix having any string between 1 to16 characters.

Important: The NodeID field is a printable string of the *ndddstring* format: *n*: The first digit is the SessMgr restart counter having a value between 0 and 7. *ddd*: The number of SessMgr instances. Uses the specified NodeID-suffix in all CDRs. The “Node-ID” field is consists of SessMgr Recovery counter (1 digit) *n* + AAA Manager identifier (3 digits) *ddd* + the configured Node-Id-suffix (1 to 16 characters) *string*.

Important: If the centralized LRSN feature is enabled, the “Node-ID” field consists of only the specified NodeID-suffix. Otherwise GTPP group name is used. For default GTPP groups, GTPP context-name (truncated to 16 characters) is used.

Important: SessMgr recovery counter gets updated in case of “session recovery not enabled” If session recovery is enabled, the counter never updates. The node-id is displayed in the G-CDR irrespective of gtpp dictionary. The G-CDR is not decoded in monitor protocol for custom1 / custom3 dictionaries.

plmn-id [unknown-use *uncode_value*]

Default: Enabled
Includes the SGSN PLMN Identifier value (the RAI) in generated CDR (M-CDRs and/or the S-CDRs), if it is provided by the SGSN in the GTP create PDP context request. It is omitted if the SGSN does not supply one.

Important: For the GGSN it provides radio access identifier as the SGSN PLMN Id and for SGSN it includes the PLMN-id of RNC.

unknown-use *uncode_value* encodes the specified value for "SGSN PLMN Identifier" in the CDR if SGSN PLMN-ID information is unavailable.
Must be followed by the *uncode_value* value to be encoded.
uncode_value must be an hexadecimal value between 0x0 and 0xFFFFFF.
This keyword is applicable for SGSN only.

rat

Default: Disabled
This keyword configures the SGSN to include the radio access technology attribute in generated CDRs (M-CDRs and/or the S-CDRs).
This keyword is applicable for SGSN only.

record-extensions rat

Default: Disabled
This keyword configures the SGSN to include the radio access technology attribute in record extension field of generated CDRs (M-CDRs and/or the S-CDRs).
This keyword is applicable for SGSN only.

sms { destination-number | recording-entity | service-centre }

Default: Disabled
This keyword configures the SGSN to include the SMS related attributes in generated S-SMO-CDRs or S-SMT-CDRs.
destination-number: This keyword includes the destination-number information of SMS in generated S-SMO-CDRs or S-SMT-CDRs.
Note: This is the destination number of the short message subscriber.
recording-entity: This keyword includes the recording entity information of SMS in generated S-SMO-CDRs or S-SMT-CDRs.
Note: The recording entity is the E.164 number of the SGSN.
service-centre: This keyword includes the service-centre information of SMS in generated S-SMO-CDRs or S-SMT-CDRs.
Note: This is the E.164 address of the SMS-service centre.
This keyword is applicable for SGSN only.

Usage

Use this command to configure the type of optional information fields to include in generated CDRs (M-CDRs, S-CDRs, S-SMO-CDR, S-SMT-CDR from SGSN and G-CDRs, eG-CDRs from GGSN) by the AGW (SGSN and/or GGSN). In addition, it controls how the information for some of the mandatory fields are reported.
Fields described as optional by the standards but not listed above will always be present in the CDRs, except for Record Extensions (which will never be present).

Important: This command can be repeated multiple times with different keywords to configure multiple GTPP attributes.

Example

The following command configures the system to present the time provided in the Duration field of the CDR is reported in milliseconds:

```
gtpp attribute duration-ms
```

gtpp charging-agent

Configures the IP address and port of the system interface within the current context used to communicate with the CGF.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp charging-agent address *ip_address* **[port** *port* **]**

no gtpp charging-agent

no

Removes a previously configured charging agent address.

address *ip_address*

Specifies the IP address of the interface configured within the current context that is used to transmit CDR records (G-CDR/eGCRD/M-CDR/S-CDR) to the CGF.
ip_address must be configured using dotted decimal notation.

port *port*

It is an optional parameter. It specifies the Charging Agent UDP port.
If *port* is not defined IP will take default port number 49999.
port is a port number. Must be followed by an integer, ranging from 1 to 65535.

Important: Configuring gtpp charging-agent on port 3386 may interfere with ggsn-service configured with the same ip address.

Default: 49999

Usage

This command establishes a Ga interface for the system. For GTPP accounting, one or more Ga interfaces must be specified for communication with the CGF. These interfaces must exist in the same context in which GTPP functionality is configured (refer to the **gtpp** commands in this chapter).
This command instructs the system as to what interface to use. The IP address supplied is also the address by which the GSN is known to the CGF. Therefore, the IP address used for the Ga interface could be identical to one bound to a GSN service (a Gn interface).
If no GSN service is configured in the same context as the Ga interface, the address configured by this command is used to receive unsolicited GTPP packets.

Example

The following command configures the system to use the interface with an IP address of 192.168.13.10 as the accounting interface with port *20000* to the CGF:

```
gtpp charging-agent address 192.168.13.10

gtpp charging-agent address 192.168.13.10 port 20000
```

gtpp data-request sequence-numbers

Configures the range of sequence numbers to be used in the GTPP data record transfer record (DRT). Use this command to set the start value for the sequence number.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp data-request sequence-numbers start { *0* | *1* }

default gtpp data-request sequence-numbers start

default

Default is 0 (zero).

start { *0* | *1* }

Specifies the value of the start sequence number for the GTPP Data Record Transfer Request. Default: 0

- 0 = Designates the start sequence number as 0.
- 1 = Designates the start sequence number as 1.

Usage

When the GGSN/SGSN is configured to send GTPP echo request packets, the SGSN always uses 0 as the sequence number in those packets. Re-using 0 as a sequence number in the DRT packets is allowed by the 3GPP standards; however, this CLI command ensures the possibility of inter-operating with CGFs that can not properly handle the re-use of sequence number 0 in the echo request packets.

Example

The following command sets the sequence to start at 1.

gtpp data-request sequence-numbers start *1*

gtpp dead-server suppress-cdrs

This command enables/disables CDR archival when a dead server is detected.

Important: This command is customer specific. For more information please contact your local service representative.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] gtpp dead-server suppress-cdrs
```

default

Configures the default setting.
Default: Disabled

no

Disables CDR archival.

Usage

Use this command to enable/disable CDR archival when a dead server is detected. With this CLI, once a server is detected as down, requests are purged. Also the requests generated for the period when the server is down are purged.

gtpp deadtime

Configures the amount of time to wait before attempting to communicate with a CGF that was previously marked as unreachable.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp deadtime*time*

time

Default: 120
Specifies the amount of time that must elapse before the system attempts to communicate with a CGF that was previously unreachable.
time is measured in seconds and can be configured to any integer value from 1 to 65535.

Usage

If the system is unable to communicate with a configured CGF, after a pre-configured number of failures the system marks the CGF as being down.
This command specifies the amount of time that the system waits prior to attempting to communicate with the downed CGF.
Refer to the **gtpp detect-dead-server** and **gtpp max-retries** commands for additional information on the process the system uses to mark a CGF as down.

Example

The following command configures the system to wait 60 seconds before attempting to re-communicate with a CGF that was marked as down:

gtpp deadtime *60*

gtpp detect-dead-server

Configures the number of consecutive communication failures that could occur before the system marks a CGF as down.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp detect-dead-server consecutive-failures*max_number*

consecutive-failures *max_number*

Default: 0
Specifies the number of failures that could occur before marking a CGF as down.
max_number could be configured to any integer value from 0 to 1000.

Usage

This command works in conjunction with the **gtpp max-retries** parameter to set a limit to the number of communication failures that can occur with a configured CGF.
The gtpp max-retries parameter limits the number of attempts to communicate with a CGF. Once that limit is reached, the system treats it as a single failure. The gtpp detect-dead-server parameter limits the number of consecutive failures that can occur before the system marks the CGF as down and communicate with the CGF of next highest priority.
If all of the configured CGFs are down, the system ignores the detect-dead-server configuration and attempt to communicate with highest priority CGF again.
If the system receives a GTPP Node Alive Request, Echo Request, or Echo Response message from a CGF that was previously marked as down, the system immediately treats it as being active.
Refer to the **gtpp max-retries** command for additional information.

Example

The following command configures the system to allow 8 consecutive communication failures with a CGF before it marks it as down:

gtpp detect-dead-server consecutive-failures *8*

gtpp dictionary

This command designates specific dictionary used by GTPP for specific context.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp dictionary { custom1 | custom10 | custom11 | custom12 | custom13 | custom14
| custom15 | custom16 | custom17 | custom18 | custom19 | custom2 | custom20 |
custom21 | custom22 | custom23 | custom24 | custom25 | custom26 | custom27 |
custom28 | custom29 | custom3 | custom30 | custom4 | custom5 | custom6 | custom7
| custom8 | custom9 | standard }

default gtpp dictionary
```

default

Configures the default dictionary.

custom1

Custom-defined dictionary. It conforms to TS 32.015 v 3.6.0 for R99. It supports the encoding of IP addresses in text format for G-CDRs.

custom2

Custom-defined dictionary.

custom3

Custom-defined dictionary. It conforms to TS 32.015 v 3.6.0 for R99 except that it supports the encoding of IP addresses in Binary format for G-CDRs.

custom4

Custom-defined dictionary. It conforms to TS 32.015 v 3.6.0 for R99 except that:

- IP addresses are encoded in binary format
- the Data Record Format Version information element contains 0x1307 instead of 0x1308
- QoSRequested is not present in the LoTV containers
- QoSnegotiated is added only for the first container and the container after a QoS change

custom5

Custom-defined dictionary.

custom6

Custom-defined dictionary for eG-CDR encoding.

custom7 ... custom30

Custom-defined dictionaries. These dictionary have default behavior or “standard” dictionary.

standard

Default: Enabled
A dictionary conforming to TS 32.215 v 4.6.0 for R4 (and also R5 - extended QoS format).

Usage

Use this command to designate specific dictionary used by GTPP for specific context.

Example

The following command configures the system to use custom3 dictionary to encode IP address in Binary format in G-CDRs:

```
gtpp dictionary custom3
```

gtpp duplicate-hold-time

This command configures the number of minutes to hold onto CDRs that are possibly duplicates while waiting for the primary CGF to come back up.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp duplicate-hold-time *minutes*

minutes

Default: 60
When the primary CGF is down, the number of minutes to hold onto CDRs that may be duplicates. *minutes* must be an integer from 1 to 10080.

Usage

Use this command to configure how long to hold onto CDRs that are possibly duplicates while waiting for the primary CGF to come back up. If the GGSN determines that the primary CGF is down, CDRs that were sent to the primary CGF but not acknowledged are sent by the GSN to the secondary CGF as "possibly duplicates". When the primary CGF comes back up, the GSN uses GTPP to determine whether the possibly duplicate CDRs were received by the primary CGF. Then the secondary CGF is told whether to release or cancel those CDRs. This command configures how long the system should wait for the primary CGF to come back up. As soon as the configured time expires, the secondary CGF is told to release all of the possibly duplicate CDRs.

Example

Use the following command to set the amount of time to hold onto CDRs to 2 hours (120 minutes);

gtpp duplicate-hold-time *120*

gtpp echo-interval

Configures the frequency at which the system sends GTPP echo packets to configured CGFs.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp echo-interval*time*

no gtpp echo-interval

no

Disables the use of the echo protocol except for the scenarios described in the Usage section for this command.

time

Default: 60
Specifies the time interval for sending GTPP echo packets.
time is measured in seconds and can be configured to any integer value from 60 to 2147483647.

Usage

The GTPP echo protocol is used by the system to ensure that it can communicate with configured CGFs. The system initiates this protocol for each of the following scenarios:

- Upon system boot
- Upon the configuration of a new CGF server on the system using the **gtpp server** command as described in this chapter
- Upon the execution of the **gtpp test accounting** command as described in the Exec Mode Commands chapter of this reference
- Upon the execution of the **gtpp sequence-numbers private-extensions** command as described in this chapter

The echo-interval command is used in conjunction with the gtpp max-retries and gtpp timeout commands as described in this chapter.
In addition to receiving an echo response for this echo protocol, if we receive a GTPP Node Alive Request message or a GTPP Echo Request message from a presumed dead CGF server, we will immediately assume the server is active again.
The alive/dead status of the CGFs is used by the AAA Managers to affect the sending of CDRs to the CGFs. If all CGFs are dead, the AAA Managers will still send CDRs, (refer to the **gtpp deadtime** command), albeit at a slower rate than if a CGF were alive. Also, AAA Managers independently determine if CGFs are alive/dead.

Example

The following command configures an echo interval of 120 seconds:

```
gtpp echo-interval 120
```

gtpp egcdr

Configures the eG-CDR parameters and triggers.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp egcdr { final-record [closing-cause [same-in-all-partials | unique] | include-content-ids { all | only-with-traffic } [closing-cause { same-in-all-partials | unique }] | losdv-max-containers*number***| lotdv-max-containers***number***| service-data-flow threshold [interval** *seconds* **| volume { downlink | total | uplink }***bytes* **] | service-idle-timeout***seconds***}**

default gtpp egcdr { final-record include-content-ids only-with-traffic closing-cause same-in-all-partials | losdv-max-containers | lotdv-max-containers | service-idle-timeout 0 }

no gtpp egcdr service-data-flow threshold { interval | volume { downlink [uplink] | total | uplink [downlink] } }

final-record [closing-cause [same-in-all-partials | unique] | include-content-ids [all | only-with-traffic]]

Enables configuration of the final eG-CDR.

- **closing-cause** - Configures closing cause for the final eG-CDR.
- **same-in-all-partials** - Specifies that the same closing cause is to be included for multiple final eG-CDRs
- **unique** - Specifies that the closing cause for final eG-CDRs is to be unique.
- **include-content-ids** - Controls which content-ids are being included inthe final eG-CDR.
- **all** - Specifies that all content-ids be included in the final eG-CDR.
- **only-with-traffic** - Specifies that only content-ids with traffic be included in the final eG-CDRs.

losdv-max-containers *number*

The maximum number of List of Service Data Volume (LoSDV) containers in one eG-CDR. number can be configured to any integer value from 1 to 255.
Default: 10

lotdv-max-containers *number*

The maximum number of List of Traffic Data Volume (LoTDV) containers in one eG-CDR. number can be configured to any integer value from 1 to 8.
Default: 8

service-data-flow threshold [interval *seconds* **| volume { downlink | total | uplink }** *bytes* **]**

Configures the thresholds for closing a service data flow container within an eG-CDR.

- interval - configures the time interval in seconds
- volume - can specify uplink or downlink or combined total (uplink + downlink) byte thresholds.

A service data flow container has statistics for an individual content-id. When the threshold is reached, the service data flow container is closed.
Default: disabled

service-idle-timeout *seconds*

Specifies a time period where if no data is reported for a service flow, then the service container is closed and added to eG-CDR (as part of LOSDV container list) with service condition change as ServiceIdleOut.
seconds can be configured to any integer value from 10 to 86,400.
Default: 0. This means there is no service-idle-timeout trigger.

Usage

Use this command to configure individual triggers for eG-CDR generation.

Example

Use the following command to set the maximum number of LoSDV containers to 7.

```
gtpp egcdr losdv-max-containers 7
```

gtpp error-response

This command configures the response when the system receives an error response after transmitting a DRT (data record transfer) request.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp error-response { discard-cdr | retry-request }

default gtpp error-response
```

default

Resets the system's configuration to the default value for error-response. Default is retry-request.

discard-cdr

Instructs the system to purge the request upon receipt of an error response and not to retry.

retry-request

Instructs the system to retry sending a DRT after receiving an error response. This is the default behavior.

Usage

This command configures the system's response to receiving an error message after sending a DRT request.

Example

```
gtpp error-response discard-cdr
```

gtpp group

It configures GTPP server group in a context for the charging gateway function (CGF) accounting server(s) that the system is to communicate with.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp group*group_name***[-noconfirm]**

group_name

Specifies the name of GTPP server group that is used for charging and/or accounting in a specific context. *group_name* must be a string of size 1 to 63 character.
A maximum of 8 GTPP server groups (excluding system created default GTPP server group "default") can be configured with this command in a context.

no

Removes the previously configured GTPP group within a context.
When a GTPP group is removed accounting information is not generated for all calls using that group and all calls associated with that group are dropped. A warning message displays indicating the number of calls that will be dropped.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

This feature provides the charging gateway function (CGF) accounting server configurables for a group of servers. Instead of having a single list of CGF accounting servers per context, this feature configures multiple GTPP accounting server groups in a context and each server group is consist of list of CGF accounting servers.
In case no GTPP server group is configured in a context, a server group named "default" is available and all the CGF servers configured in a specific context for CGF accounting functionality will be part of this "default" server group.

Example

Following command configures a GTPP server group named *star1* for charging gateway function accounting functionality and this server group is available for all subscribers with in that context.

gtpp group *star1*

gtpp max-cdrs

Configures the maximum number of charging data records (CDRs) included per packet.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp max-cdrs*number_cdrs* **[wait-time** *time* **]**

number_cdrs

Default: 1
Specifies the maximum number of CDRs to be insert in a single packet.
number_cdrs: any integer value from 1 to 255.

wait-time *time*

Default: disabled
Specifies the number of seconds the system waits for CDRs to be inserted into the packet before sending it.
time: any integer from 1 to 300.

Important: If the **wait-time** expires, the packet is sent as this keyword over-rides *number_cdrs*.

Usage

CDRs are placed into a GTPP packet as the CDRs close. The system stops placing CDRs into a packet when either the maximum *number_cdrs* is met, or the **wait-time** expires, or the value for the **gtpp max-pdu-size** command is met.

Example

The following command configures the system to place a maximum of 10 CDRs in a single GTPP packet before transmitting the packet.

```
gtpp max-cdrs 10
```

gtpp max-pdu-size

Configures the maximum payload size of a single GTPP packet that could be sent by the system.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp max-pdu-size*pdu_size*

pdu_size

Default: 4096
Specifies the maximum payload size of the GTPP packet. The payload includes the CDR and the GTPP header.
pdu_size is measured in octets and can be configured to any integer value from 1024 to 65400.

Usage

The GTPP packet contains headers (layer 2, IP, UDP, and GTPP) followed by the CDR. Each CDR contains one or more volume containers. If a packet containing one CDR exceeds the configured maximum payload size, the system creates and send the packet containing the one CDR regardless.
The larger the packet data unit (PDU) size allowed, the more volume containers that can be fit into the CDR.
The system performs standard IP fragmentation for packets that exceed the system's maximum transmission unit (MTU).

Important: The maximum size of an IPv4 PDU (including the IPv4 and subsequent headers) is 65,535. However, a slightly smaller limit is imposed by this command because the system's max-pdu-size doesn't include the IPv4 and UDP headers, and because the system may need to encapsulate GTPP packets in a different/larger IP packet (for sending to a backup device).

Example

The following command configures a maximum PDU size of 2048 octets:

gtpp max-pdu-size *2048*

gtpp max-retries

Configures the maximum number of times the system attempts to communicate with an unresponsive CGF.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp max-retries*max_attempts*

max_attempts

Default: 4
Specifies the number of times the system attempts to communicate with a CGF that is not responding. *max_attempts* can be configured to any integer value from 1 to 15.

Usage

This command works in conjunction with the **gtpp detect-dead-server** and **gtpp timeout** parameters to set a limit to the number of communication failures that can occur with a configured CGF.
When the value specified by this parameter is met, a failure is logged. The gtpp detect-dead-server parameter specifies the number of consecutive failures that could occur before the server is marked as down.
In addition, the gtpp timeout command controls the amount of time between re-tries.
If the value for the max-retries is met, the system begins storing CDRs in Random Access Memory (RAM). The system allocates memory as a buffer, enough to store one million CDRs for a fully loaded chassis (a maximum of one outstanding CDR per PDP context). Archived CDRs are re-transmitted to the CGF until they are acknowledged or the system's memory buffer is exceeded.
Refer to the **gtpp detect-dead-server** and **gtpp timeout** commands for additional information.

Example

The following command configures the maximum number of re-tries to be 8.

```
gtpp max-retries 8
```

gtpp node-id

This command configures the GTPP Node ID for all CDRs.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp node-id *node_id*

no gtpp node-id

no

Removes the previous gtpp node ID configuration.

node_id

Specifies the node ID for all CDRs.
node_id must be a string of 1 through 16 characters in length.

Usage

Use this command to configure the GTPP Node ID for all CDRs.

Example

The following command configures the GTPP Node ID as *test123*:

gtpp node-id *test123*

gtpp redirection-allowed

Configures the system to allow/disallow the redirection of CDRs when the primary CGF is unavailable.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp redirection-allowed

no gtpp redirection-allowed
```

Usage

This command allows operators to better handle erratic network links, without having to remove the configuration of the backup server(s) via the **no gtpp server** command.
This functionality is enabled by default.
If the no gtpp redirection-allowed command is executed, the system only sends CDRs to the primary CGF. If that CGF goes down, we will buffer the CDRs in memory until the CGF comes back or until the system runs out of buffer memory. In addition, if the primary CGF announces its intent to go down (with a GTPP Redirection Request message), the system responds to that request with an error response.

gtpp redirection-disallowed

This command has been obsoleted and replaced with the **gtpp redirection-allowed** command.

gtpp server

Configures the charging gateway function (CGF) accounting server(s) that the system is to communicate with.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp server*ip_address***[max***msgs***] [priority***priority***][udp-port***port***] [node-alive { enable | disable }] [-noconfirm]**

no gtpp server*ip_address*

no

Deletes a previously configured CGF.

ip_address

Specifies the IP address of the CGF in dotted decimal notation for IPv4 or colon notation for IPv6.

max *msgs*

Default: 256
Specifies the maximum number of outstanding or unacknowledged GTPP packets (from any one AAA Manager task) allowed for this CGF before the system begins buffering the packets.
msgs can be configured to any integer value from 1 to 256.

priority *priority*

Default:1000
Specifies the relative priority of this CGF. When multiple CGFs are configured, the priority is used to determine which CGF server to send accounting data to.
priority can be configured to any integer value from 1 to 1000. When configuring two or more servers with the same priority you will be asked to confirm that you want to do this. If you use the **-noconfirm** option, you are not asked for confirmation and multiple servers could be assigned the same priority.

udp-port *port*

Default: 3386
Specifies the UDP port over which the GSN communicates with the CGF. *port* can be configured to any integer value between 1 and 65535.

node-alive { enable | disable }

Default: Disable.
This optional keyword allows operator to enable/disable GSN to send Node Alive Request to GTPP Server (i.e. CGF). This configuration can be done per GTPP Server basis.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to configure the CGF(s) that the system sends CDR accounting data to. Multiple CGFs can be configured using multiple instances of this command. Up to 12 CGFs can be configured per system context. Each configured CGF can be assigned a priority. The priority is used to determine which server to use for any given subscriber based on the routing algorithm that has been implemented. A CGF with a priority of "1" has the highest priority.

Important: The configuration of multiple CGFs with the same IP address but different port numbers is not supported.

Each CGF can also be configured with the maximum allowable number of unacknowledged GTPP packets. Since multiple AAA Manager tasks could be communicating with the same CGF, the maximum is based on any one AAA Manager instance. If the maximum is reached, the system buffers the packets Random Access Memory (RAM). The system allocates memory as a buffer, enough to store one million CDRs for a fully loaded chassis (a maximum of one outstanding CDR per PDP context).

Example

The following command configures a CGF with an IP address of 192.168.2.2 and a priority of 5.

```
gtpp server 192.168.2.2 priority 5
```

The following command deletes a previously configured CGF with an IP address of 100.10.35.7:

```
no gtpp server 100.10.35.7
```

gtpp source-port-validation

Toggles port checking for node alive/echo/redirection requests from the CGF.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp source-port-validation

[no | default] gtpp source-port-validation
```

no

Disables CGF port checking. Only the IP address will be used to verify CGF requests.

default

Restores this parameter to its default setting of enabled.

Usage

This command is for enabling or disabling port checking on node alive/echo/redirection requests from the CGF. If the CGF sends messages on a non-standard port, it may be necessary to disable port checking in order to receive CGF requests. On the default setting, both IP and port are checked.

Example

The following command disables port checking for CGF requests:

```
no gtpp source-port-validation
```

gtpp storage-server

Configures information for the GTPP back-up storage server.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp storage-server *ip-address* **port** *port-num*

no gtpp storage-server *ip-address* **port** *port-num*

no

Removes a previously configured back-up storage server.

ip-address

The IP address of the back-up storage server expressed in dotted decimal notation.

port *port-num*

Default: 3386
Specifies the UDP port number over which the GSN communicates with the back-up storage server.

Usage

This command configures the information for the server to which GTPP packets are to be backed-up to in the event that all CGFs are unreachable.
One backup storage server can be configured per system context.

Important: This command only takes affect if **gtpp single-source** in the Global Configuration Mode is also configured. Additionally, this command is customer specific. Please contact your local sales representative for additional information.

Example

The following command configures a back-up server with an IP address of 192.168.1.2:

gtpp storage-server *192.168.1.2*

gtpp storage-server local file

Configures the parameters for GTPP files stored locally on the GTPP storage server. This command is available for ASR 5000 platform only.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp storage-server local file { compression { gzip | none } | format { custom1 | custom2 | custom3 | custom4 | custom5 | custom6 } | name prefix*prefix***| purge-processed-files [purge-interval***purge_dur***] | rotation { cdr-count***count***| time-interval***time***| volume mb***size***} }**

default gtpp storage-server local file { compression | format | name prefix | purge-processed-files | rotation { cdr-count | time-interval | volume } }

no gtpp storage-server local file rotation { purge-processed-files | rotation { cdr-count | time-interval } }

---

no

Removes a previously configured parameters for local storage of CDR files on HDD on SMC card.

---

compression { gzip | none }

Configures the type of compression to be used on the files stored locally.
gzip — Enables Gzip file compression.
none — Disables Gzip file compression -this is the default value.

---

format (*custom-n***)**

Configures the file format to be used to format files to be stored locally.
custom1 — File format custom1 - this is the default value.
custom2 — File format custom2.
custom3 — File format custom3.
custom4 — File format custom4.
custom5 — File format custom5.
custom6 — File format custom6 with a block size of 8K for CDR files.

---

name prefix *prefix*

Defines the prefix to be used for the file name. By default the file name prefix would be 'GTPP-group-name + VPN-ID'.
prefix — Enter a string of 1 to 64 alphanumeric characters.

---

purge-processed-files [purge-interval *purge_dur* **]**

Default: Disabled.

Enables the GSN to periodically (every 4 minutes) delete locally processed (*.p) CDR files from the HDD on the SMC card.

Important: This option is available only when GTPP server storage mode is configured for local storage of CDRs with the **gtpp storage-server mode local** command.

Optional keyword **purge-interval** *purge_dur* provides an option for user to control the purge interval duration in minutes by setting *purge_dur*.
purge_dur must be and integer between 1 through 259200. Which has a default value of 60 minutes.

rotation { cdr-count *count* **| time-interval** *time* **| volume mb** *size* **}**

Specifies rotation related configuration for GTPP files stored locally.
cdr-count *count* — Configure the CDR count for the file rotation. Enter a value from 1000 to 65000. Default value 10000.
time-interval *time* — Configure the time interval for file rotation. Enter a value in seconds ranging from 30 to 86400. Default value is 3600 seconds (1 hour).
volume mb *size* — Configure the file volume, in MB, for file rotation. Enter a value ranging from 2 to 40. This trigger can not be disabled. Default value is 10MB.

Usage

This command configures the parameters for storage of GTPP packets as files on the local server - meaning the hard disk.

Example

The following command configures rotation for every 1.5 hours for locally stored files.

```
gtpp storage-server local file rotation time-interval 5400
```

gtpp storage-server max-retries

Configures the maximum number of times the system attempts to communicate with an unresponsive GTPP back-up storage server.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp storage-server max-retries*max_attempts*

max_attempts

Default: 2
Specifies the number of times the system attempts to communicate with a GTPP back-up storage server that is not responding.
max_attempts can be configured to any integer value from 1 to 15.

Usage

This command works in conjunction with the **gtpp storage-server timeout** parameters to set a limit to the number of communication failures that can occur with a configured GTPP back-up storage server.
The gtpp storage-server timeout command controls the amount of time between re-tries.
Refer to the gtpp storage-server timeout command for additional information.

Example

The following command configures the maximum number of re-tries to be 8.

```
gtpp storage-server max-retries 8
```

gtpp storage-server mode

This command configures storage mode, local or remote, for CDRs. Local storage mode is available with ASR 5000 platforms only.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp storage-server mode { local | remote | streaming }

default gtpp storage-server mode
```

default

Returns the GTPP group configuration to the default 'remote' value for the GTPP storage server mode.

local

Default: Disabled
Specifies the use of the hard disk on the SMC for storing CDRs

remote

Specifies the use of an external server for storing CDRs. This is the default value.

streaming

Default: Disabled
This keyword allows the operator to configure "streaming" mode of operation for GTPP group. When this keyword is supplied the CDRs will be stored in following fashion:

- When GTPP link is active with CGF, CDRs are sent to a CGF via GTPP and local hard disk is NOT used as long as every record is acknowledged in time.
- If the GTPP connection is considered to be down, all streaming CDRs will be saved temporarily on the local hard disk and once the connection is restored, unacknowledged records will be retrieved from the hard disk and sent to the CGF.

Usage

This command configures whether the CDRs should be stored on the hard disk of the SMC or remotely, on an external server.

Example

The following command configures use of a hard disk for storing CDRs.

```
gtpp storage-server mode local
```

gtpp storage-server timeout

Configures the amount of time that must pass with no response before the system re-attempts to communicate with the GTPP back-up storage server.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp storage-server timeout*duration*

duration

Default: 30
Specifies the maximum amount of time the system waits for a response from the GTPP back-up storage server before assuming the packet is lost.
duration is measured in seconds and can be configured to any integer value from 30 to 120.

Usage

This command works in conjunction with the **gtpp storage-server max-retries** command to establish a limit on the number of times that communication with a GTPP back-up storage server is attempted before a failure is logged.
This parameter specifies the time between retries.

Example

The following command configures a retry timeout of 60 seconds:

```
gtpp storage-server timeout 60
```

gtpp suppress-cdrs zero-volume-and-duration

This command suppresses the CDRs created by session having zero duration and/or zero volume. By default this mode is ‘disabled’.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp suppress-cdrs zero-volume-and-duration { gcdrs [egcdrs] | egcdrs [gcdrs] }

default gtpp suppress-cdrs zero-volume-and-duration
```

default

Disables the CDR suppression mode.

gcdrs [egcdrs]

Specifies that this command will handle G-CDRs before eG-CDRs.

gcdrs [egcdrs]

Specifies that this command will handle eG-CDRs before G-CDRs.

Usage

Use this command to suppress the CDRs (G-CDRs and eG-CDRs) which were created due with zero-duration session and zero-volume session due to any reason. By default this command is disabled and system will not suppress any CDR.

Example

The following command configures the system to suppression the eG-CDRs created for a zero duration session or zero volume session::

```
gtpp suppress-cdrs zero-volume-and-duration egcdrs gcdrs
```

gtpp timeout

Configures the amount of time that must pass with no response before the system re-attempts to communicate with the CGF.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp timeout*time*

time

Default: 20
Specifies the maximum amount of time the system waits for a response from the CGF before assuming the packet is lost.
time is measured in seconds and can be configured to any integer value from 1 to 60.

Usage

This command works in conjunction with the **gtpp max-retries** command to establish a limit on the number of times that communication with a CGF is attempted before a failure is logged.
This parameter specifies the time between retries.

Example

The following command configures a retry timeout of 30 seconds:

```
gtpp timeout 30
```

gtpp trigger

This command is left in place for backward compatibility. To disable and enable GTPP triggers you should use the **gtpp trigger** command in GTPP Server Group Configuration mode.

gtpp transport-layer

This commands selects the transport layer protocol for Ga interface for communication between AGW (GSNs) and GTPP servers.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp transport-layer { tcp | udp }

default gtpp transport-layer
```

default

Resets the transport layer protocol to GTPP servers to the default UDP.

tcp

Default: Disabled
Enables the system to implement TCP as transport layer protocol for communication with GTPP server.

udp

Default: Enabled
Enables the system to implement UDP as transport layer protocol for communication with GTPP server.

Usage

Use this command to select the TCP or UDP as the transport layer protocol for Ga interface communication between GTPP servers and AGWs (GSNs).

Example

The following command enables TCP as the transport layer protocol for the GSN's Ga interface.

```
gtpp transport-layer tcp
```

gtpu-service

Creates a GTP-U service or specifies an existing GTP-U service and enters the GTP-U service configuration mode for the current context.

Product

GGSN, P-GW, S-GW

Privilege

Administrator

Syntax

gtpu-service*service_name* **[-noconfirm]**

no gtpu-service*service_name*

service_name

Specifies the name of the GTP-U service. If *service_name* does not refer to an existing service, a new service is created if resources allow.
service_name must be from 1 to 63 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no gtpu-service *service_name*

Removes the specified GTP-U service from the context.

Usage

Enter the GTP-U service configuration mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:
[*context_name*]*hostname*(config-gtpu-service)#
GTP-U Service Configuration Mode commands are defined in the GTP-U Service Configuration Mode Commands chapter.

Example

The following command enters the existing GTP-U service configuration mode (or creates it if it doesn't already exist) for the service named *gtpu-service1*:

gtpu-service *gtpu-service1*

The following command will remove *gtpu-service1* from the system:

no gtpu-service *gtpu-service1*

ha-service

Creates/deletes a home agent service or specifies an existing HA service for which to enter the home agent service configuration mode for the current context.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

ha-service *name*

no ha-service *name*

no

Indicates the home agent service specified is to be removed.

name

Specifies the name of the HA service to configure. If *name* does not refer to an existing service, the new service is created if resources allow. *name* must be from 1 to 63 alpha and/or numeric characters.

Usage

Enter the HA service configuration mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (i.e. resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Example

The following command will enter the HA service configuration mode creating the service *sampleService*, if necessary.

ha-service *sampleService*

The following command will remove *sampleService* as being a defined HA service.

no ha-service *sampleService*

hnbgw-service

This command creates/removes an Home NodeB Gateway (HNB-GW) service or configures an existing HNB-GW service and enters the HNB-GW service configuration mode for Femto UMTS access networks in the current context.

Product

HNB-GW

Privilege

Administrator

Syntax

```
hnbgw-service service_name [-noconfirm]

no hnbgw-service service_name
```

no

Removes the specified HNB-GW service from the context.

service_name

Specifies the name of the HNB-GW service. If *service_name* does not refer to an existing service, the new service is created if resources allow.
service_name must be from 1 to 63 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to enter the HNB-GW service configuration mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 8 HNB-GW service can be configured on a system which is further limited to a maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:
`[context_name]hostname(config-hnbgw-service)#`
The commands configured in this mode are defined in the *HNB-GW Service Configuration Mode Commands* chapter of *Command Line Interface Reference*.

Caution: This is a critical configuration. The HNB-GW service can not be configured without this configuration. Any change to this configuration would lead to restarting the HNB-GW service and removing or disabling this configuration will stop the HNB-GW service.

Example

The following command enters the existing HNB-GW service configuration mode (or creates it if it doesn't already exist) for the service named *hnb-service1*:

```
hnbgw-service hnb-service1
```

The following command will remove *hnb-service1* from the system:

```
no hnbgw-service hnb-service1
```

hsgw-service

Creates an HSGW service or specifies an existing HSGW service and enters the HSGW service configuration mode for the current context.

Product

HSGW

Privilege

Administrator

Syntax

hsgw-service*service_name* **[-noconfirm]**

no hsgw-service*service_name*

service_name

Specifies the name of the HSGW service. If *service_name* does not refer to an existing service, the new service is created if resources allow.
service_name must be from 1 to 63 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no hsgw-service *service_name*

Removes the specified HSGW service from the context.

Usage

Enter the HSGW service configuration mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:
[*context_name*]*hostname*(config-hsgw-service)#
HSGW Service Configuration Mode commands are defined in the HSGW Service Configuration Mode Commands chapter.
Use this command when configuring the following eHRPD components: HSGW.

Example

The following command enters the existing HSGW service configuration mode (or creates it if it doesn't already exist) for the service named *hsgw-service1*:

hsgw-service *hsgw-service1*

The following command will remove *hsgw-service1* from the system:

no hsgw-service *hsgw-service1*

ikev1 disable-phase1-rekey

This command configures the rekeying of Phase1 SA when the Internet Security Association and Key Management Protocol (ISAKMP) lifetime expires in Internet Key Exchange (IKE) v1 protocol.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ikev1 disable-phase1-rekey
```

no

Disable this command which re-enables Phase 1 SAs when the ISAKMP lifetime expires.

Usage

Use this command to disable the rekeying of Phase 1 SAs when the ISAKMP lifetime expires in IKE v1 protocol.

Example

The following command disables rekeying of Phase1 SAs when the lifetime expires:

```
ikev1 disable-phase1-rekey
```

ikev1 keepalive dpd

This command configures the ISAKMP IPSec Dead Peer Detection (DPD) message parameters for IKE v1 protocol.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

[no] ikev1 keepalive dpd interval*interval***timeout***time***num-retry***retries***

no

Deletes previously configured IPSec DPD Protocol settings.

interval *interval*

The time interval at which IPSec DPD Protocol messages are sent.
interval is measured in seconds and can be configured to any integer value between 10 and 3600.

timeout *time*

The amount of time allowed for receiving a response from the peer security gateway prior to re-sending the message.
time is measured in seconds and can be configured to any integer value between 10 and 3600.

num-retry *retries*

The maximum number of times that the system should attempt to reach the peer security gateway prior to considering it unreachable.
retries can be configured to any integer value between 1 and 100.

Usage

Use this command to configure the ISAKMP dead peer detection parameters in IKE v1 protocol. Tunnels belonging to crypto groups are perpetually kept “up” through the use of the IPSec Dead Peer Detection (DPD) packets exchanged with the peer security gateway.

Important: The peer security gateway must support RFC 3706 in order for this functionality to function properly.

This functionality is for use with the Redundant IPSec Tunnel Fail-over feature and to prevent IPSec tunnel state mismatches between the FA and HA when used in conjunction with Mobile IP applications. Regardless of the application, DPD must be supported/configured on both security peers. If the system is configured with DPD but it is communicating with a peer that does not have DPD configured, IPSec tunnels still come up. However, the only indication that the remote peer does not support DPD exists in the output of the **show crypto isakmp security associations summary dpd** command.

Important: If DPD is enabled while IPSec tunnels are up, it will not take affect until all of the tunnels are cleared.

Example

The following command configures IPSec DPD Protocol parameters to have an interval of *15*, a timeout of *10*, to retry each attempt *5* times:

```
ikev1 keepalive dpd interval 15 timeout 10 num-retry 5
```

ikev1 policy

This command configures/creates an ISAKMP policy with the specified priority and enters ISAKMP Configuration Mode for IKE v1 protocol.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

[no] ikev1policy*priority*

no

Removes a previously configured ISAKMP policy for IKE v1 protocol.

priority

Default: 0
This must be an integer from 0 through 100. ISAKMP policies for IKE v1 protocol with lower priority numbers take precedence over policies with higher priorities. “0” is the highest priority.

Usage

Use this command to create ISAKMP policies to regulate how IPSec key negotiation is performed for IKE v1 protocol.
Internet Security Association Key Management Protocol (ISAKMP) policies are used to define Internet Key Exchange (IKE) SAs. The IKE SAs dictate the shared security parameters (i.e. which encryption parameters to use, how to authenticate the remote peer, etc.) between the system and a peer security gateway.
During Phase 1 of IPSec establishment, the system and a peer security gateway negotiate IKE SAs. These SAs are used to protect subsequent communications between the peers including the IPSec SA negotiation process.
Multiple ISAKMP policies can be configured in the same context and are used in an order determined by their priority number.

Example

Use the following command to create an ISAKMP policy with the priority 1 and enter the ISAKMP Configuration Mode:
ikev1 policy *1*

ikev2-ikesa

Creates a new, or specifies an existing, IKEv2 security association transform set and enters the IKEv2 Security Association Configuration Mode.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

[no] ikev2-ikesa transform-set *name*

name

Specifies the name of a new or existing security association transform set. *name* must be from 1 to 127 alpha and/or numeric characters.

Usage

Use this command to create a new or enter an existing IKEv2 security association transform-set. A list of up to four separate transform-sets can be created.
Entering this command results in the following prompt:
[*context_name*]*hostname*(cfg-ctx-ikev2ikesa-tran-set)#
IKEv2 Security Association Configuration Mode commands are defined in the IKEv2 Security Association Configuration Mode Commands chapter.

Example

The following command configures an IKEv2 security association transform set called *ikesa3* and enters the IKEv2 Security Association Configuration Mode:

ikev2-ikesa transform-set *ikesa3*

ims-auth-service

This command creates the specified IMS authorization service, and enters the IMS Authorization Service Configuration Mode within the current context for Gx/Ty interface support to a subscriber session for IMS authorization and flow-based charging procedures.

Product

PDSN, GGSN, HA

Privilege

Security Administrator, Administrator

Syntax

ims-auth-service*auth_svc_name* **[-noconfirm]**

[no | default] ims-auth-service*auth_svc_name*

no

Deletes the specified IMS authorization service with in specific context.

default

Restores default state of IMS authorization service, disabled for specific context.

auth_svc_name

Specifies the unique name of IMS authorization service across the system to be configured for Gx/Ty interface authentication within specific context.
auth_svc_name must be a unique string of 1 through 63 characters in length.
A maximum of 16 authorization services can be configured globally in the system. There is also a system limit for the maximum number of total configured services.

-noconfirm

Specifies that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create/delete an IMS authorization service for Gx/Ty interface for a subscriber.

Example

The following command configures an IMS authorization service *ims_interface1* with in this context:

ims-auth-service *ims_interface1*

ims-sh-service

This command creates the specified IMS Sh service name to allow configuration of Sh service.

Product

PDIF, SCM

Privilege

Administrator

Syntax

ims-sh-service *name*

no ims-sh-service *name*

no

Removes a previously configured IMS-Sh-service.

name

Name of the IMS-Sh-service to be configured. *name* must be from 1 to 63 alpha and/or numeric characters.

Usage

The IMS-Sh-service is named in the pdif-service and/or cscf-service. Use this command to enter the IMS Sh Service Configuration Mode.
Entering this command results in the following prompt:
[*context_name*]*hostname*(config-ims-sh-service)#
IMS Sh Service Configuration Mode commands are defined in the IMS Sh Service Configuration Mode Commands chapter in this guide.

Example

The following example names a service to be configured:

ims-sh-service *ims-1*

inspector

Configures a context-level inspector account within the current context.

Product

All

Privilege

Security Administrator

Syntax

inspector user_name [encrypted] password pwd [ecs | noecs] [expiry-date*date_time* **] [li-administration] [noecs] [timeout-absolute abs_seconds] [timeout-min-absolute abs_minutes] [timeout-idle idle_seconds] [timeout-min-idle idle_minutes]**

no inspector*user_name*

no

Removes a previously configured inspector account.

user_name

Specifies a name for the context-level inspector account. user_name must be from 1 to 32 alpha and/or numeric characters.

[encrypted] password pwd

Specifies the password to use for the user which is being given context-level inspector privileges within the current context. The encrypted keyword indicates the password specified uses encryption.
The password specified as pwd must be from 1 to 63 alpha and/or numeric characters without encryption and must be from 1 to 127 alpha and/or numeric characters when encryption has been indicated.
The encrypted keyword is intended only for use by the system while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the password keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

[ecs | noecs

Default: **noecs**
ecs - Permits the specific user to access ACS-specific configuration commands.
noecs - Prevents the specific user to access ACS-specific configuration commands.

expiry-date *date_time*

The date and time that this account expires. Enter the date and time in the format YYYY:MM:DD:HH:mm or YYYY:MM:DD:HH:mm:ss.
Where YYYY is the year, MM is the month, DD is the day of the month, HH is the hour, mm is minutes, and ss is seconds.

li-administration

Permits this user to execute Lawful Intercept commands.

Important: Users who have Lawful Intercept privileges are only given those privileges when connected to the system through a Secure Shell (SSH). If this user connects through a Telnet session or through the console port, Lawful Intercept privileges are not enabled.

timeout-absolute *abs_seconds*

Default: 0
This keyword is obsolete. It has been left in place for backward compatibility. If used a warning is issued and the value entered is rounded to the nearest whole minute.
Specifies the maximum amount of time, in seconds, the context-level inspector may have a session active before the session is forcibly terminated. abs_seconds must be a value in the range from 0 through 300000000.
The special value 0 disables the absolute timeout.

timeout-min-absolute abs_minutes

Default: 0
Specifies the maximum amount of time, in minutes, the context-level inspector may have a session active before the session is forcibly terminated. abs_minutes must be a value in the range from 0 through 525600 (365 days).
The special value 0 disables the absolute timeout.

timeout-idle *idle_seconds*

Default: 0
This keyword is obsolete. It has been left in place for backward compatibility. If used a warning is issued and the value entered is rounded to the nearest whole minute.
Specifies the maximum amount of idle time, in seconds, the context-level inspector may have a session active before the session is terminated. idle_seconds must be a value in the range from 0 through 300000000.
The special value 0 disables the idle timeout.

timeout-min-idle idle_minutes

Default: 0
Specifies the maximum amount of idle time, in minutes, the context-level inspector may have a session active before the session is terminated. idle_minutes must be a value in the range from 0 through 525600 (365 days).
The special value 0 disables the idle timeout.

Usage

Create new context-level inspector or modify existing inspector's options, in particular, the timeout values. Inspector users have minimal read-only privileges. Refer to the Command Line Interface Overview chapter of Cisco ASR 5000 Series Command Line Interface Reference for more information.

Important: A maximum of 128 administrative users and/or subscribers may be locally configured per context.

Example

The following command creates a context-level inspector account named user1:

```
inspector user1 password secretPassword
```

The following command removes a context-level inspector account named user1:

```
no inspector user1
```

interface

Creates/deletes an interface or specifies an existing interface. By identifying an interface, the mode changes to configure this interface in the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

interface*name* **[broadcast | loopback**| point-to-point **| tunnel]**

no interface*name*

no

Indicates the interface specified is to be removed.

name

Specifies the name of the interface to configure. If *name* does not refer to an existing interface, the new interface is created if resources allow. *name* must be from 1 to 79 alpha and/or numeric characters.

broadcast

Default: Enabled
Creates an Ethernet broadcast (IP) interface and enters the Ethernet configuration mode.

Important: Refer to the Ethernet interface Configuration Mode Command chapter for more information.

loopback

Default: Disabled
Creates an internal IP address that can be reached by any interface configured in the current context. The interface must be configured for loopback when configuring Interchassis Session Recovery. A total of 256 loopback interfaces can be configured.

Important: Refer to the Loopback Interface Configuration Mode Command chapter for more information.

point-to-point

Creates a permanent virtual connection (PVC) in the current context and enters the PVC configuration mode. Currently, this type of interface is only used with an optical (ATM) line card.

Important: Refer to the PVC interface Configuration Mode Command chapter for more information.

tunnel

Creates a tunnel interface to support the various tunnel interfaces. Currently only IPv6-over-IPv4 and GRE tunnel interface is supported.

Important: Refer to the Tunnel Interface Configuration Mode Command chapter for more information.

Usage

Use this command to enter/create the interface configuration mode for an existing interface or for a newly defined interface. This command is also used to remove an existing interface when it longer is needed.

Important: If no keyword is specified, broadcast is assumed and the interface is Ethernet by default.

For IPv6-over-IPv4 or GRE tunneling user need to specify the interface type as **tunnel**.

Example

The following command enters the Ethernet Interface Configuration mode creating the interface *sampleService*, if necessary.

```
interface sampleInterface
```

The following command removes *sampleService* as being a defined interface.

```
no interface sampleInterface
```

The following command enters the Tunnel Interface Configuration mode creating the interface *GRE_tunnel1*, if necessary.

```
interface GRE_tunnel1 tunnel
```

ip

The commands in this section set context level IP parameters.

ip access-group

Configures access group with access control list (ACL) for IP traffic for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip access-group *name* **[in | out] [** *priority_value* **]**

no ip access-group *name* **[in | out]**

no

Indicates the specified ACL rule is to be removed from the group.

name

Specifies the ACL rule to be added/removed from the group.
In Release 8.1 and later, *name* must be an alpha and/or numeric string of 1 through 47 characters in length.
In Release 8.0, *name* must be an alpha and/or numeric string of 1 through 79 characters in length.

Important: Up to 8 ACLs can be applied to a group provided that the number of rules configured within the ACL(s) does not exceed the 256 rule limit for the context.

in | out

The **in** and **out** keywords are deprecated and are only present for backward compatibility. The Context-level ACL are applied only to outgoing packets.

priority_value

Default: 0
Specifies the priority of the access group. 0 is the highest priority. If *priority_value* is not specified, the priority is set to 0. *priority_value* must be an integer from 0 through 4294967295.
If access groups in the list have the same priority, the last one entered is used first.

Usage

Use this command to add IP access lists (refer to the **ip access-list** command) configured with in the same context to an ACL group.
Refer to the Access Control Lists chapter of the System Enhanced Feature Configuration Guide for more information ACLs and ACL rules.

Example

The following commands add *sampleGroup* to the context-level ACL with a priority of 0.

```
ip access-group sampleGroup 0
```

ip access-list

This command enables creating/configuring/deleting an IP Access List in the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip access-list*name*

[default | no] ip access-list*name*

default

Sets the context's default access control list to that specified by *name*.

no

Removes the specified access list.

name

Specifies the access list name.
In Release 8.0, *name* must be an alpha and/or numeric string of 1 through 79 characters in length.
In Release 8.1 and later, *name* must be an alpha and/or numeric string of 1 through 47 characters in length.
If the named access list does not exist, it is created, and the CLI mode changes to the Access Control List Configuration Mode, wherein the access list can be configured.
If the named access list already exists, the CLI mode changes to the Access Control List Configuration mode, wherein the access list can be reconfigured.

Usage

Executing this command enters the Access Control List Configuration Mode in which rules and criteria are defined for the ACL.

Important: A maximum of 64 rules can be configured per ACL. The maximum number of ACLs that can be configured per context is limited by the amount of available memory in the VPN Manager software task; it's typically less then 200.

The no version of this command deletes the ACL.
Refer to the Configuring and Applying Access Control Lists chapter of the System Administration Guide for more information on ACLs and ACL rules.

Example

The following command creates an access list named *sampleList*, and enters the Access List configuration mode:

ip access-list *sampleList*

ip arp

Configures the address resolution protocol options for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip arp*ip_address mac_address*[vrf *vrf_name*]

no ip arp*ip_address*

no

Indicates the ARP configuration data for the IP address specified is to be removed from the configuration.

ip_address

Specifies the IP address to configure the ARP options where *ip_address* must be specified using the standard IPv4 dotted decimal notation.

mac_address

Specifies the media-specific access control layer address for the IP address. *mac_address* must be specified as a an 6-byte hexadecimal number with each byte separated by a colon, e.g., 'AA:12:bb:34:f5:0E'.

vrf *vrf_name*

This keyword associates a Virtual Routing and Forwarding (VRF) context with this static ARP entry. *vrf_name* is name of a preconfigured virtual routing and forwarding (VRF) context configured in Context configuration mode through **ip vrf** command.

Usage

Manage the IP address mapping which is a logical/virtual identifier to the more lower layer addressing used for address resolution in ICMP messages.
For tunnel-based interface, network IP pool can have overlapping ip-addresses across VRFs. To manage it adding a preconfigured VRF context is required to associate with an static ARP entry. By default, the ARP is added in the given context. If the VRF name is specified, then the ARP is added to the VRF ARP table.

Example

The following commands set the IP and MAC address for the current context then remove it from the configuration.

```
ip arp 1.2.3.4 F1:E2:D4:C5:B6:A7

no ip arp 1.2.3.4
```

The following commands set the IP and MAC address for a VRF context GRE_vrf1 in the configuration.

```
ip arp 1.2.3.4 F1:E2:D4:C5:B6:A7 vrf GRE_vrf1
```

ip as-path access-list

Defines BGP AS Path access lists.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

ip as-path access-list*list_name***[{deny | permit}***reg_expr***]**

no ip as-path access-list*list_name***[{deny | permit}***reg_expr***]**

no

Remove the specified regular expression from the AS path access list.

list_name

To add new rules to an existing list, enter the list name. *list_name* must be a string of alpha numerical characters from 1 through 79 characters.

{deny | permit}

deny: Deny access to AS paths that match the regular expression.
permit: Allow access to AS paths that match the regular expression.

reg_expr

A regular expression to define the AS paths to match. *reg_expr* must be a string containing 1 through 254 alpha and/or numeric characters.

Important: The **?** (question mark) character is not supported in regular expressions for this command.

Usage

Use this command to define AS path access lists for the BGP router in the current context. The chassis supports a maximum of 64 access lists per context.

Example

The following command creates an AS access list named ASlist1 and permits access to AS paths.

```
ip as-path access-list ASlist1 permit
```

ip dns-proxy source-address

Enables the proxy DNS functionality and identifies this context as the destination context for all redirected DNS requests.

Important: This command must be entered in the destination context for the subscriber. If there are multiple destination contexts for different subscribers, the command must be entered in each context.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

`[ no ] ip dns-proxy source-address` *`ip_address`*

`no`

Removes the address in this context as a destination for redirected DNS packets.

`ip dns-proxy source-address` *`ip_address`*

Specifies an interface in this context used for redirected DNS packets. *`ip_address`* must be specified using the standard IPv4 dotted decimal notation.

Usage

Use this command to identify the interface in this context where redirected DNS packets are sent to the home DNS. The system uses this address as the source address of the DNS packets when forwarding the intercepted DNS request to the home DNS server. For a more detailed explanation of the proxy DNS intercept feature, see the **`proxy-dns intercept-list`** command.

Example

The following command identifies an interface with an address of 1.23.456.456 in a destination context where the system forwards all intercepted DNS requests:

`ip dns-proxy source-address` *`1.23.456.456`*

ip domain-lookup

Enables/disables domain name lookup via domain name servers for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip domain-lookup

no ip domain-lookup

no

Disables domain name lookup.

Usage

Domain name look up is necessary if the subscribers configured for the context are to be allowed to use logical host names for services which requires the host name resolution via DNS.

Example

ip domain-lookup

no ip domain-lookup

ip domain-name

Configures/removes the logical domain name for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip domain-name*name*

no ip domain-name*name*

no

Indicates the logical domain name for the current context is to be removed.

name

Specifies the logical domain name to use for domain name server address resolution. *name* must be from 1 to 1023 alpha and/or numeric characters formatted to be a valid IP domain name.

Usage

Set a logical domain name if the context is to be accessed by logical domain name in addition to direct IP address.

Example

ip domain-name *sampleName.org*

ip forward

This command configures an IP forwarding policy to forward outgoing pool packets whose flow lookup fails to the default-gateway.

By default the behavior is to either send an ICMP Unreachable message or to discard the packet depending on the configuration of the IP pool.

Pool packets coming from the linecard whose flow lookup fails are discarded or ICMP unreachable is sent irrespective of whether the above command is configured or not.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] ip forward outbound unused-pool-dest-address default-gateway
```

no

Disable forwarding to the default gateway.

Usage

Use this command to set an IP forwarding policy that forwards outgoing pool packets whose flow lookup fails to the default-gateway.

Example

To enable this functionality, enter the following command:

```
ip forward outbound unused-pool-dest-address default-gateway
```

To disable this functionality, enter the following command:

```
no ip forward outbound unused-pool-dest-address default-gateway
```

ip identification packet-size-threshold

Configures the packet size above which system will assign unique IP header identification.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

ip identification packet-size-threshold*size*

default ip identification packet-size-threshold

default

Restores default value of 576 bytes to IP packet size for fragmentation threshold.

size

Default: 576 bytes.
Specifies the size of IP packet in bytes above which system will assign unique IP header identification for system generated IP encapsulation headers. (such as MIP data tunnel).
size can be configured to any integer value from 0 to 2000.

Usage

This configuration is used to set the upper limit of the IP packet size. All packets above that size limit will be considered 'fragmentable', and an unique non-zero identifier will be assigned.

Example

The following commands set the IP packet size to 1024 bytes as threshold. above this limit system will assign unique IP header identification for system generated IP encapsulation headers:

ip identification packet-size-threshold *1024*

ip localhost

Configures or removes the static local host logical name to IP address mapping for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip localhost*name ip_address*

no ip localhost*name ip_address*

no

Indicates the static mapping is to be removed.

name

Specifies the logical host name for the local machine the current context resides on. *name* must be from 1 to 1023 alpha and/or numeric characters formatted to be a valid IP host name.

ip_address

Specifies the IP address for the static mapping. *ip_address* must be specified using the standard IPv4 dotted decimal notation.

Usage

Avoid excessive DNS lookups across the network by statically mapping the logical host name to the local host's context.

Example

ip localhost *localHostName 1.2.3.4*

no ip localhost *localHostName 1.2.3.4*

ip name-servers

Modifies the list of domain name servers the current context may use for logical host name resolution.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip name-servers*ip_address secondary_ip_address*

no ip name-servers*ip_address*

no

Indicates the name server specified is to be removed from the list of name servers for the current context.

ip_address

Specifies the IP address of a domain name server. *ip_address* must be specified using the standard IPv4 dotted decimal notation.

secondary_ip_address

Specifies the IP address of a secondary domain name server. *secondary_ip_address* must be specified using the standard IPv4 dotted decimal notation.

Usage

Manage the list of name servers the current context may use in resolving logical host names.
The DNS can be specified at the Context level in Context configuration as well as at the APN level in APN configuration mode with **dns** and **ipv6 dns** commands, or it can be received from AAA server.
When DNS is requested in PCO configuration, the following preference will be followed for DNS value:
1. DNS Values received from LNS have the first preference.
2. DNS values received from RADIUS Server has the second preference.
3. DNS values locally configured with APN with **dns** and **ipv6 dns** commands has the third preference.
4. DNS values configured at context level has the last preference.

Important: The same preference would be applicable for the NBNS servers to be negotiated via ICPC with the LNS.

Example

ip name-servers *1.2.3.4*

ip pool

This command enables to add/configure/delete IP address pools in the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip pool *pool_name* **{** *ip_address subnet_mask* **|** *ip_address_mask_combo* **| range** *start_ip_address end_ip_address* **} [address-hold-timer** *address_hold_timer* **] [advertise-if-used] [alert-threshold [group-available | pool-free | pool-hold | pool-release | pool-used]** *low_thresh* **[clear** *high_thresh* **]] [explicit-route-advertise] [group-name** *group_name* **] [include-nw-bcast] [napt-users-per-ip-address** *users_per_ip* **[alert-threshold { { pool-free | pool-hold | pool-release | pool-used }** *low_thresh* **[clear** *high_thresh* **] } +] [max-chunks-per-user** *max_chunks_per_user* **[nat-binding-timer** *nat_binding_timer* **] [nexthop-forwarding-address** *ip_address* **] [on-demand] [port-chunk-size** *port_chunk_size* **] [port-chunk-threshold** *port_chunk_threshold* **] [send-nat-binding-update] +] [nat** *priority* **] [nat-one-to-one [alert-threshold { { pool-free | pool-hold | pool-release | pool-used }** *low_thresh* **[clear** *high_thresh* **] } +] [nat-binding-timer** *nat_binding_timer* **] [nexthop-forwarding-address** *ip_address* **] [on-demand] [send-nat-binding-update] +] [nat-realm users-per-nat-ip-address** *users* **[on-demand [address-hold-timer** *address_hold_timer* **]]] [nexthop-forwarding-address** *ip_address* **[overlap vlanid** *vlan_id* **] [respond-icmp-echo** *ip_address* **]] [nw-reachability server** *server_name* **] [policy allow-static-allocation] [private** *priority* **] [public** *priority* **] [resource** *priority* **] [send-icmp-dest-unreachable] [srp-activate] [static] [suppress-switchover-arps] [tag { none | pdif-setup-addr }] [unicast-gratuitous-arp-address** *ip_address* **] [vrf** *vrf_name* **{ [mpls-label input** *in_label_value* **| output** *out_label_value1* **[** *out_label_value2* **] }] +**

no ip pool *pool_name* **[address-hold-timer] [advertise-if-used] [alert-threshold [[group-available] [pool-free] [pool-hold] [pool-release] [pool-used] +] [explicit-route-advertise] [group-name] [include-nw-bcast] [nexthop-forwarding-address [respond-icmp-echo]] [nw-reachability server] [policy allow-static-allocation] [send-icmp-dest-unreachable] [srp-activate] [suppress-switchover-arps] [tag { none | pdif-setup-addr }] [unicast-gratuitous-arp-address] + [send-nat-binding-update]**

no

Removes the specified IP address pool from the current context's configuration, or disables the specified option(s) for the specified IP pool.

no alert-threshold

This command without any optional keywords disables all alert thresholds.

name

Specifies the logical name of the IP address pool. *name* must be an alpha and/or numeric string of 1 through 31 characters in length.

Important: An error message displays if the **ip** *pool name* and the *group name* in the configuration are the same. An error message displays if the **ip** *pool name* or *group name* are already used in the context.

ip_address

Specifies the beginning IP address of the IP address pool. *ip_address* can either be an IPv4 address expressed in dotted decimal notation, or an IPv6 address expressed in colon notation.

subnet_mask

Specifies the IP address mask bits to determine the number of IP addresses in the pool. *ip_mask* must be specified using the standard IPv4 dotted decimal notation.
1 bits in the *ip_mask* indicate that bit position in the *ip_address* must also have a value of 1.
0 bits in the *ip_mask* indicate that bit position in the *ip_address* does not need to match, i.e., the bit can be either a 0 or a 1.
For example, if the IP address and mask are specified as 172.168.10.0 and 255.255.255.224, respectively, the pool will contain IP addresses in the range 172.168.10.0 through 172.168.10.31 for a total of 32 addresses.

ip_address_mask_combo

Specifies a combined IP address subnet mask bits to indicate what IP addresses the route applies to. *ip_address_mask_combo* must be specified using the form 'IP Address/Mask Bits' where the IP address is specified using the standard IPv4 dotted decimal notation and the mask bits are a numeric value which is the number of bits in the subnet mask.

range *start_ip_address end_ip_address*

Specifies the IP addresses for the IP pool as a range of addresses.
start_ip_address specifies the beginning of the range of addresses for the IP pool.
end_ip_address specifies the end of the range of addresses for the IP pool.
The IP address range must be specified using the standard IPv4 dotted decimal notation.
For example, if start_ip_address is specified as 172.168.10.0 and end_ip_address is specified as 172.168.10.31 the IP pool will contain addresses in the range 172.168.10.0 through 172.168.10.31 for a total of 32 addresses.

private [*priority* **]**

Address pool may only be used by mobile stations which have requested an IP address from a specified pool. When private pools are part of an IP pool group, they are used in a priority order according to the precedence setting. *priority* must be a value in the range from 0 through 10 with 0 being the highest priority. The default value is 0.

public [*priority* **]**

Address pool is used in priority order for assigning IP addresses to mobile stations which have not requested a specific address pool. *priority* must be a value in the range from 0 through 10 with 0 being the highest priority. The default value is 0.

static

Address pool is used for statically assigned mobile stations. Statically assigned mobile stations are those with a fixed IP address at all times.

tag { none | pdif-setup-addr }

Default: **none**
none: default tag for all IP address pools
pdif-setup-addr: pool with this tag should only be used for PDIF calls.

address-hold-timer *seconds*

When this is enabled, and an active subscriber is disconnected, the IP address is held, or condsidered still in use, and is not returned to the free state until the address-hold-timer expires. This enables subscribers who reconnect within the length of time specified (in seconds) to obtain the same IP address from the IP pool. *seconds* is the time in seconds and must be an integer from 0 through 31556926.

alert-threshold { group-available | pool-free | pool-hold | pool-release | pool-used } *low_thresh* **[clear** *high_thresh* **]**

Default: All thresholds are disabled.
Configures IP address pool-level utilization thresholds. These thresholds take precedence over context-level IP pool thresholds.
group-available: Set an alert based on the available percentage of IP addresses for the entire IP pool group.
pool-free: Set an alert based on the percentage of IP addresses that are unassigned in this IP pool.
pool-hold: Set an alert based on the percentage of IP addresses from this IP pool that are on hold.
pool-release: Set an alert based on the percentage of IP addresses from this IP pool that are in the release state.
pool-used: This command sets an alert based on the percentage of IP addresses that have been assigned from this IP pool.

Important: Refer to the **threshold available-ip-pool-group** and **threshold monitoring** commands in this chapter for additional information on IP pool utilization thresholding.

low_thresh: The IP pool utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100.
clear *high_thresh* : The IP pool utilization percentage that maintains a previously generated alarm condition. If the utilization percentage rises above the high threshold within the polling interval, a clear alarm is generated. It may be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

group-name *group_name*

Assigns preconfigured one or more IP pools to the IP pool group *group_name*. *group_name* is case sensitive and must be a string of 1 to 31 characters. One or more IP pool groups are assigned to a context and one IP pool group consists one or more IP pool(s).

IP pool group name is used in place of an IP pool name. When specifying a desired pool group in a configuration the IP pool with the highest precedence is used first. When that IP pool's addresses are exhausted the pool with the next highest precedence is used.

include-nw-bcast

Includes the network and broadcast addresses as part of the pool.
To remove the include-nw-bcast option from the ip pool, use the **no ip pool test include-nw-bcast** command.

napt-users-per-ip-address *users_per_ip* **[alert-threshold { { pool-free | pool-hold | pool-release | pool-used }** *low_thresh* **[clear** *high_thresh* **] } +] [max-chunks-per-user** *max_chunks_per_user* **[nat-binding-timer** *nat_binding_timer* **] [nexthop-forwarding-address** *ip_address* **] [on-demand] [port-chunk-size** *port_chunk_size* **] [port-chunk-threshold** *port_chunk_threshold* **] [send-nat-binding-update] +**

Important: In UMTS deployments this keyword is available in Release 9.0 and later releases. In CDMA deployments this keyword is available in Release 8.3 and later releases.

Important: In UMTS deployments, on upgrading from Release 8.1 to Release 9.0, and in CDMA deployments, on upgrading from Release 8.1 to 8.3, all NAT realms configured in Release 8.1 using the **nat-realm** keyword must be reconfigured using either the **nat-one-to-one** (for one-to-one NAT realms) or the **napt-users-per-ip-address** (for many-to-one NAT realms) keywords.

Configures many-to-one NAT realms.

- *users_per_ip*: Specifies how many users can share a single NAT IP address. *users_per_ip* must be an integer from 2 through 2016.
- **alert-threshold**: Specifies alert threshold for the pool:

  Important: Thresholds configured using the **alert-threshold** keyword are specific to the pool that they are configured in. Thresholds configured using the **threshold ip-pool-*** commands in the Context Configuration Mode apply to all IP pools in that context, and override the threshold configurations set within individual pools.

  - **pool-free**: Percentage free alert threshold for this pool
  - **pool-hold**: Percentage hold alert threshold for this pool
  - **pool-release**: Percentage released alert threshold for this pool
  - **pool-used**: Percentage used alert threshold for this pool
  - *low_thresh*: The IP pool utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm. *low_thresh* must be an integer from 0 through 100.
  - **clear** *high_thresh* : The IP pool utilization percentage that maintains a previously generated alarm condition. If the utilization percentage rises above the high threshold within the polling interval, a clear alarm is generated. *high_thresh* must be an integer from 0 through 100.

Important: The *high_thresh* value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

- **max-chunks-per-user** *max_chunks_per_user*: Specifies the maximum number of port chunks to be allocated per subscriber in the many-to-one NAT pool. *max_chunks_per_user* must be an integer from 1 through 2016. Default: 1
- **nat-binding-timer** *binding_timer*: Specifies NAT Binding Timer for the NAT pool. *timer* must be an integer from 0 through 31556926. If set to 0, is disabled. Default: 0
- **nexthop-forwarding-address** *address*: Specifies the nexthop forwarding address for this pool. *address* must be a standard IPv4 or IPv6 address. If configured for a NAT pool, packets that are NATed using that NAT pool will be routed based on the configured nexthop address.

Important: The **nexthop-forwarding-address** support for NAT IP pools is functional only in later releases of Release 9.0 and in Release 10.0 and later releases.

- **on-demand**: Specifies allocating IP when matching data traffic begins.
- **port-chunk-size** *size*: Specifies NAT port chunk size (number of NAT ports per chunk) for many-to-one NAT pool. *size* must be an integer from 32 through 32256.

Important: The **port-chunk-size** configuration is only available for many-to-one NAT pools.

- **port-chunk-threshold** *chunk_threshold*: Specifies NAT port chunk threshold in percentage of number of chunks for many-to-one NAT pool. *chunk_threshold* must be an integer from 1 through 100. Default: 100%

Important: The **port-chunk-threshold** configuration is only available for many-to-one NAT pools.

- **send-nat-binding-update**: Specifies sending NAT binding updates to AAA for this realm. Default: Disabled

Important: **send-nat-binding-update** is not supported for many-to-one realms.

The following IP pool configuration keywords can also be used in the many-to-one NAT pool configuration:

- **group-name** *group_name* : This keyword is available for NAT pool configuration only in Release 10.0 and later releases.

  Specifies the pool group name. The grouping enables to bind discontigous IP address blocks in individual NAT IP pools to a single pool group.

  NAT pool and NAT pool group names must be unique.

  group_name must be an alpha and/or numeric string of 1 through 31 characters in length, and is case sensitive .

- **srp-activate**

nat *priority*

Designates the IP address pool as a Network Address Translation (NAT) address pool.
priority specifies the priority of the NAT pool. 0 is the highest priority. If *priority* is not specified, the priority is set to 0.
Must be a value from 0 (default) to 10.

Important: This functionality is currently supported for use with systems configured as an A-BG or P-CSCF.

nat-one-to-one [alert-threshold { { pool-free | pool-hold | pool-release | pool-used } *low_thresh* [clear *high_thresh*] } +] [nat-binding-timer *nat_binding_timer*] [nexthop-forwarding-address *ip_address*] [on-demand] [send-nat-binding-update] +

Important: In UMTS deployments this keyword is available in Release 9.0 and later releases. In CDMA deployments this keyword is available in Release 8.3 and later releases.

Important: In UMTS deployments, on upgrading from Release 8.1 to Release 9.0, and in CDMA deployments, on upgrading from Release 8.1 to Release 8.3, all NAT realms configured in Release 8.1 using the **nat-realm** keyword must be reconfigured using either the **nat-one-to-one** (for one-to-one NAT realms) or the **napt-users-per-ip-address** (for many-to-one NAT realms) keywords.

Configures one-to-one NAT realm.

- **alert-threshold**: Specifies alert threshold for this pool:

  Important: Thresholds configured using the **alert-threshold** keyword are specific to the pool that they are configured in. Thresholds configured using the **threshold ip-pool *** commands in the Context Configuration Mode apply to all IP pools in the context, and override the threshold configurations set within individual pools.

  - **pool-free**: Percentage free alert threshold for this pool
  - **pool-hold**: Percentage hold alert threshold for this pool
  - **pool-release**: Percentage released alert threshold for this pool
  - **pool-used**: Percentage used alert threshold for this pool
  - *low_thresh*: The IP pool utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm. *low_thresh* must be an integer from 0 through 100.
  - **clear** *high_thresh* : The IP pool utilization percentage that maintains a previously generated alarm condition. If the utilization percentage rises above the high threshold within the polling interval, a clear alarm is generated. *high_thresh* must be an integer from 0 through 100.

Important: The *high_thresh* value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

- **nat-binding-timer** *nat_binding_timer*: Specifies NAT binding timer for the NAT pool. *binding_timer* must be an integer from 0 through 31556926. If set to 0, is disabled.

Important: For many-to-one NAT pools, the default NAT binding timer value is 60 seconds. For one-to-one NAT pools, it is 0. I.e., by default, the feature is disabled—the IP addresses/ port-chunks once allocated will never be freed.

- **nexthop-forwarding-address** *ip_address*: Specifies the nexthop forwarding address for this pool. *address* must be a standard IPv4 or IPv6 address. If configured for a NAT pool, packets that are NATed using that NAT pool will be routed based on the configured nexthop address.

Important: The **nexthop-forwarding-address** support for NAT IP pools is functional only in later releases of Release 9.0 and in Release 10.0 and later releases.

- **on-demand**: Specifies allocating IP address when matching data traffic begins.
- **send-nat-binding-update**: Specifies sending NAT binding updates to AAA for this realm. Default: Disabled

Important: **send-nat-binding-update** is not supported for many-to-one realms.

The following IP pool configuration keywords can also be used in the one-to-one NAT pool configurations:

- **address-hold-timer** *address_hold_timer*
- **group-name** *group_name* : This keyword is available for NAT pool configuration only in Release 10.0 and later releases.

  Specifies the pool group name. The grouping enables to bind discontigous IP address blocks in individual NAT IP pools to a single pool group.

  NAT pool and NAT pool group names must be unique.

  group_name must be an alpha and/or numeric string of 1 through 31 characters in length, and is case sensitive .
- **srp-activate**

nat-realm users-per-nat-ip-address *users* **[on-demand [address-hold-timer** *address_hold_timer* **]]**

Important: The **nat-realm** keyword is only available in Release 8.1.

Important: In Release 8.1, the NAT On-demand feature is not supported.

Important: This functionality is currently supported for use with systems configured as an A-BG or P-CSCF.

Designates the IP address pool as a Network Address Translation (NAT) realm pool.
users-per-nat-ip-address *users*: Specifies the number of users sharing a single NAT IP address. *users* must be an integer from 1 through 5000.
on-demand: Specifies to allocate IP when matching data traffic begins.

address-hold-timer *address_hold_timer*: Specifies the address hold timer for this pool, in seconds. *address_hold_timer* must be an integer from 0 through 31556926. If set to 0, the address hold timer is disabled.

nexthop-forwarding-address *ip_address*

A subscriber that is assigned an IP address from this pool is forwarded to the next hop gateway with the specified IP address.

overlap vlanid *vlan_id*

When a nexthop forwarding address is configured, this keyword can be configured to enable over-lapping IP address pool support and associates the pool with the specified virtual LAN (VLAN).
For more information on configuring VLANs, refer to the *System Enhanced Features Guide*.
vlan_id is the identification number of a VLAN assigned to a physical port and can be configured to any integer value from 1 to 4095.

Important: This functionality is currently supported for use with systems configured as an HA, or as a PDSN for Simple IP, or as a GGSN. This keyword can only be issued for pools of type private or static and must be associated with a different nexthop forwarding address and VLAN. A maximum of 256 over-lapping pools can be configured per context and a maximum of 256 over-lapping pools can be configured per HA or simple IP PDSN. For GGSNs, the total number of pools is limited by the number of VLANs defined but the maximum number per context is 256. Additional network considerations and configuration outside of the system may be required.

nw-reachability server *server_name*

Bind the name of a configured network reachability server to the IP pool and enable network reachability detection for the IP pool. This takes precedence over any network reachability server settings in a subscriber configuration.
server_name: Specifies the name of a network reachabile server that has been defined in the current context, and must be a string of 1 through 16 characters in length.

Important: Also see the following commands for more information: Refer to the **policy nw-reachability-fail** command in the HA Configuration Mode to configure the action that should be taken when network reachability fails. Refer to the **nw-reachability server** command in this chapter to configure network reachability servers. Refer to the **nw-reachability-server** command in the Subscriber Configuration Mode to bind a network reachability server to a specific subscriber.

respond-icmp-echo *ip_address*

Pings the first IP address from overlapping IP address pools.

Important: In order for this functionality to work, all of the pools should contain an initial IP address that can be pinged.

resource

Default: Disabled
Specifies this IP pool as a resource pool. The IP addresses in resource pools may have IP addresses that exist in other resource pools. IP addresses from a resource pool should not be used for IP connectivity within the system where the pool is defined. These IP addresses should be allocated for sessions which are L3 tunneled

through the system (IP-in-IP or GRE). It is possible for resource pools in the same context to have overlapping addresses when the terminating network elements for the L3 tunnels are in different VPNs. Also refer to the subscriber configuration mode **l3-to-l2-tunnel address-policy** command.

send-icmp-dest-unreachable

Default: Disabled
When enabled, this generates an ICMP destination unreachable PDU when the system receives a PDU destined for an unused address within the pool.

explicit-route-advertise

Default: Enabled
When enabled, the show ip pool verbose output includes the total number of explicit host routes.

srp-activate

Activates the IP pool for Interchassis Session Redundancy.

suppress-switchover-arp

Default: Disabled
Suppress corresponding gratuitous ARP generation when a line card switchover occurs.

unicast-gratuitous-arp-address *ip_address*

Default: Perform broadcast gratuitous ARP.
Perform a unicast gratuitous ARP to the specified IP address rather than broadcast gratuitous ARP when gratuitous ARP generation is required.

vrf *vrf_name* **{ [mpls-label input** *in_label_value* **| output** *out_label_value1* **[** *out_label_value2* **] }**

This keyword associates a preconfigured Virtual Routing and Forwarding (VRF) context instance with this IP pool and configures the other MPLS label parameters like values of In and Out labels.

Important: This command must be used with next-hop paramters.

vrf_name is name of a preconfigured virtual routing and forwarding (VRF) context configured in Context configuration mode through **ip vrf** command.

- *in_label_value* is the MPLS label that identifies the inbound traffic destined for this pool.
- The *out_label_value1* and *out_label_value2* identify the MPLS labels to be added to the outgoing packets sent for subscriber from this pool. Where *out_label_value1* is the inner output label and *out_label_value2* is the outer output label.

MPLS label values must be an integer from 16 to 1048575.
By default, the pools configured are bound to the default VRF unless specified with a VRF name.

Important: You cannot have overlapping pool addresses using the same VRF. Also you cannot have two pools using different VRF's but the same in-label irrespective of whether the pools are overlapping or not. The pool must be private or static pool in-order to be associated with a certain VRF. If the VRF with such a name is not configured, then the pool configuration would return an error prompting to add the VRF before configuring a pool.

policy allow-static-allocation

Configures static address allocation policy for dynamic IP pool. This keyword enables a dynamic IP pool to accept a static address for allocation.

Important: In static allocation scenario, the pool group name is returned by AAA in the attribute **SN1-IP-Pool-Name**, and the IP address to use will be returned in the **Framed-IP-Address** attribute.

+

Indicates that more than one of the previous keywords can be entered within a single command.

Usage

Define one or more pools of IP addresses for the context to use in assigning IPs to mobile stations. This command is also useful in resizing existing IP pools to expand or contract the number of addresses allocated. If you resize an IP pool, the change is effective immediately.
When using the ip pool command to resize an IP pool, the type must be specified since by default the command assumes the type as public. In other words, the CLI syntax to resize an ip pool is the same syntax used to create the pool. See examples below.

```
ip pool pool1 100.1.1.0/24 static
```

Then the syntax to resize that pool would be

```
ip pool pool1 100.1.1.0/25 static
```

A pool which is deleted will be marked as such. No new IP addresses will be assigned from a deleted pool. Once all assigned IP addresses from a deleted pool have been released, the pool, and all associated resources, are freed.

Important: If an IP address pool is matched to a ISAKMP crypto map and is resized, removed, or added, the corresponding security association must be cleared in order for the change to take effect. Refer to the **clear crypto** command in the Exec mode for information on clearing security associations.

Over-lapping IP Pools - The system supports the configuration of over-lapping IP address pools within a particular context. Over-lapping pools are configured using either the resource or overlap keywords.
The **resource** keyword allows over-lapping addresses tunneled to different VPN end points.
The **overlap** keyword allows over-lapping addresses each associated with a specific virtual LAN (VLAN) configured for an egress port. It uses the VLAN ID and the nexthop address to determine how to forward subscriber traffic with addresses from the pool thus resolving any conflicts with overlapping addresses.
Note that if an overlapping IP Pool is bound to an IPSec Tunnel (refer to the **match ip pool** command in the Crypto Group Configuration Mode chapter), that tunnel carries the traffic ignoring the nexthop configuration. Therefore, the IPSec Tunnel takes precedence over the nexthop configuration. (Thus, one can configure the overlapping IP Pool with fake VLAN ID and nexthop and still be able to bind it to an IPSec Tunnel for successful operation.
The **overlap** keyword allows over-lapping addresses each associated with a specific VLAN can only be issued for pools of type private or static and must be associated with a different nexthop forwarding address and VLAN. A maximum of 128 over-lapping pools can be configured per context and a maximum of 256 over-lapping pools can be configured per system.

Important: Overlapping IP address functionality is currently supported for use with systems configured as an HA for Mobile IP, or as a PDSN for Simple IP, or as a GGSN. For deployments in which subscriber traffic is tunneled from the FA to the HA using IP-in-IP, a separate HA service must be configured for each over-lapping pool.

IP Pool Address Assignment Method - IP addresses can be dynamically assigned from a single pool or from a group of pools. The addresses are placed into a queue in each pool. An address is assigned from the head of the queue and, when released, returned to the end. This method is known as least recently used (LRU).
When a group of pools have the same priority, an algorithm is used to determine a probability for each pool based on the number of available addresses, then a pool is chosen based on the probability. This method, over time, allocates addresses evenly from the group of pools.

Important: Note that setting different priorities on each individual pool in a group can cause addresses in some pools to be used more frequently.

Example
The following commands define a private IP address pool, a public IP address pool and a static address pool, respectively.

```
ip pool samplePool1 1.2.3.0 255.255.255.0 private

ip pool samplePool2 1.3.0.0 255.255.0.0 public 1

ip pool samplePool3 1.4.5.0 255.255.255.0 static
```

The following command defines a private IP pool specified with a range of IP addresses. The pool has 101 addresses.

```
ip pool samplePool4 range 1.5.5.0 1.5.5.100 private
```

The following command sets the address hold timer on the pool to 60 minutes (3600 seconds):

```
ip pool samplePool4 address-hold-timer 3600
```

The following command removes the IP address pool from the configuration:

```
no ip pool samplePool1
```

The following command creates a static IP pool:

```
ip pool pool1 100.1.1.0/24 static
```

The following command resizes the static IP pool created in the previous example:

```
ip pool pool1 100.1.1.0/25 static
```

ip prefix-list

Creates an IP prefix list for filtering routes.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

ipprefix-list name*list_name* **[seq***seq_number* **] { deny | permit } { any |** *network_address*/*net_mask* **[ge***ge_value* **] [le***le_value* **]**

noipprefix-list*list_name* **[seq***seq_number* **] { deny | permit } { any |** *network_address*/*net_mask* **[ge***ge_value* **] [le***le_value* **]**

no

Delete the specified prefix-list entry.

name *list_name*

Specifies a name for the prefix list. *list_name* must be a string of 1 through 79 characters in length.

seq *seq_number*

Assign the specified sequence number to the prefix list entry. *seq_number* must be an integer from 1 through 4294967295.

deny

Specify prefixes to deny.

permit

Specify prefixes to permit.

any

Match any prefix.

network_address/*net_mask* **[ge** *ge_value* **] [le** *le_value* **]**

The prefix to match.
network_address/*net_mask* : the IP address and the length, in bits, of the network mask that defines the prefix. This must be an IP address entered in dotted decimal notation and a mask (192.168.0/24). When neither ge or le are specified an exact match is assumed.
ge *ge_value*: The minimum prefix length to match. This must be an integer from 0 through 32. If only the ge value is specified, the range is from the ge value to 32. The ge value must be greater than *net_mask* and less than the le value.
le *le_value*: The maximum prefix length to match. This must be an integer from 0 through 32. If only the le value is specified, the range is from the *net_mask* to the le value. The le value must be less than or equal to 32.

The following equation describes the conditions that ge and le values must satisfy :
net_mask < *ge_value* < *le_value* <= 32

Usage

Use this command to filter routes by their IP prefix.

Example

```
ip prefix-list name prelist10 seq 5 permit 192.168.100.0/8 ge 12 le 24
```

ip prefix-list sequence-number

This enables and disables the inclusion of IP prefix list sequence numbers in the configuration file. This is enabled by default.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
ip prefix-list sequence-number

no ip prefix-list sequence-number
```

no

Disable listing IP prefix list sequence numbers in the configuration file.

Usage

Use this command to enable and disable the inclusion of IP prefix list sequence numbers in the configuration file.

Example

To disable the inclusion of IP prefix list sequence numbers in the configuration file, enter the following command:

```
no ip prefix-list sequence-number
```

ip route

Adds/removes routing information from the current context's configuration.

Product

All

Privilege

Administrator

Syntax

[no] ip route {*ip_address***/***ip_mask* **|** *ip_address ip_mask***} {** *gateway_ip_address* **| next-hop** *next_hop_ip_address* **| point-to-point | tunnel}** *egress_intrfc_name* **[cost***cost* **] [precedence***precedence* **]** [vrf *vrf_name*] **+**

---

no

Indicates the route specified by this options is to be removed from the configuration.

---

*ip_address***/***ip_mask* **|** *ip_address ip_mask*

Specifies a destination IP address or group of addresses that will use this route.
*ip_address***/***ip_mask*: Specifies a combined IP address subnet mask bits to indicate what IP addresses to which the route applies. *ip_address***/***ip_mask* must be specified using the form 'IP Address/Mask Bits' where the IP address is specified using the standard IPv4 dotted decimal notation and the mask bits are a numeric value which is the number of bits in the subnet mask.
ip_address ip_mask: Specifies an IP address and the networking (subnet) mask pair which is used to identify the set of IP addresses to which the route applies. *ip_address* must be specified using the standard IPv4 dotted decimal notation. *ip_mask* must be specified using the standard IPv4 dotted decimal notation as network mask for subnets.
The mask as specified by *ip_mask* or resulting from *ip_address***/***ip_mask* is used to determine the network for packet routing.
0's in the resulting mask indicate the corresponding bit in the IP address is not significant in determining the network for packet routing.
1's in the resulting mask indicate the corresponding bit in the IP address is significant in determining the network.

---

gateway_ip_address **| next-hop** *next_hop_ip_address* **| point-to-point | tunnel**

Specifies which device or network to use when forwarding packets.
gateway_ip_address: Specifies the IP address of the network gateway to which to forward packets. The address must be entered in IPv4 dotted decimal notation (###.###.###.###).
next-hop *next_hop_ip_address*: The next-hop IP address to which to forward packets. The address must be entered in IPv4 dotted decimal notation (###.###.###.###).
point-to-point: Specifies that the egress port is an ATM point-to-point interface.
tunnel: This keyword sets the static route for this egress interfaceas tunnel type. i.e. IPv6-over-IPv4 or GRE.

egress_intrfc_name

Specifies the name of the egress (out-bound) interface name in the current context. *egress_intrfc_name* must be from 1 to 79 alpha and/or numeric characters.

cost *cost*

Default: 0
Specifies the relative cost of the route. *cost* must be a value in the range 0 through 255 where 255 is the most expensive.

precedence *precedence*

Default: 1
Specifies the selection order precedence for this routing information. *precedence* must be a value in the range from 1through 254 where 1 is the highest precedence.

vrf *vrf_name*

This keyword associates a Virtual Routing and Forwarding (VRF) context with this static route configuration. *vrf_name* is name of a preconfigured virtual routing and forwarding (VRF) context configured in Context configuration mode through **ip vrf** command.

Usage

Use this command to configure the IP route parameters. Precedence and cost options are used to tailor the route selections such that routes of the same precedence are grouped together then lowest cost is selected first. This results in route's being selected first by lower precedence then the cost is used if multiple route's are defined with the same precedence.

Important: A maximum of 1200 static routes may be configured per context.

Virtual Routing and Forwarding (VRF) context can be associated with static IP route for GRE tunneling support.

Example
The following command adds a route using the combined IP address and subnet mask form:

```
ip route 1.2.3.0/32 192.168.1.2 egressSample1 precedence 160
```

The following configures route options for a route specified using the distinct IP address and subnet mask form:

```
ip route 1.2.3.4 255.224.0.0 10.1.2.3 egressSample2 cost 43
```

The following deletes the two routes configured above:

```
no ip route 1.2.3.0/32 192.168.1.2 egressSample1 precedence 160
```

```
no ip route 1.2.3.4 255.224.0.0 10.1.2.3 egressSample2 cost 43
```

The following command adds a route using the combined IP address and subnet mask form and specifies the egress interface as tunnel type:
ip route *1.2.3.0/32* **tunnel** *egressSample1* **precedence** *160* **vrf** *GRE_vrf1*

ip routing maximum-paths

This command enables Equal Cost Multiple Path (ECMP) routing support and specifies the maximum number of ECMP paths that can be submitted by a routing protocol in the current context.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

ip routing maximum-paths[*max_no*]

[default | no] ip routing maximum-paths

default

Resets the command to it's default setting of 4.

no

Disables ECMP for the current context.

max_no

Default: 4
The maximum number of ECMP paths that can be submitted by a routing protocol. *max_no* must be an integer from 1 through 10.

Usage

Use this command to enable ECMP for routing and set the maximum number of ECMP paths that can be submitted by a routing protocol.

Example

To enable ECMP and set the maximum number of paths that may be submitted by a routing protocol in the current context to *10*, enter the following command:

```
ip routing maximum-paths 10
```

To disable ECMP in the current context, enter the following command:

```
no ip routing maximum-paths
```

ip routing overlap-pool

Configures the routing behavior for overlap-pool addresses.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] ip routing overlap-pool
```

default

Resets the command to it's default setting of disabled.

no

Disables the routing behavior for overlap-pool addresses for the current context.

Usage

Default: disabled
Use this command configuration to advertise overlap-pool addresses in dynamic routing protocols when overlap pools are configured using vlan-ids. If the "ip routing overlap-pool" is configured, then the overlap-addresses are added as interface addresses and advertised.

ip vrf

This command creats a Virtual Routing and Forwarding (VRF) context instance, assigns a VTF id, and configures the VRF parameters for BGP MPLS VPN and GRE tunnel interface configuration.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
ip vrf vrf_name

no ip vrf
```

no

Disables IP Virtual Routing and Forwarding (VRF) parameters.

vrf_name

Specifies the name of the virtual routing and forwarding interface.
vrf_name must be an alpha and/or neumeric string of 1 t o 79 characters.

Usage

Use this command to create a VRF context and assigns a VRF id to this instance. This command used when system works as a BGP router with MPLS VPN and binds a MPLS VPN to system or to facilitate GRE tunnelling. The addresses that assigned to this interface are visible in the VRF routing table.
This command swithces the command mode to *IP VRF Context Configuraiton Mode* and prompt will be changed to the following:

```
[context_name>]host_name(config-context-vrf)#
```

If required, this command creates IP Virtual Routing and Forwarding context configuration mode instance. While using this command user must take note of the following:

- A VRF context instance must be created and configured before referring, associating, or binding the same with any command or mode.
- If interface binding to a VRF context instance is changed or any IP address assigned to the interface is deleted a warning will be displayed.
- All interface bind with a VRF context instance will be deleted when that VRF is removed/deleted.
- An interface can be bound to only one VRF context instance.
- A maximum of 100 VRF context instances can be configured on a systme.

Kindly refer *IP VRF Context Configuration Mode Commands* chapter for parameter configurations.

Example

Following command configures the virtual routing and forwarding context instance *GRE_vrf1* in a context:
ip vrf *GRE_vrf1*

ipms

Enables/disables/manages an intelligent packet monitoring system (IPMS) client service and enters the IPMS client configuration mode within the current context.

Important: The IPMS is a license enabled external application support. Refer to the IPMS Installation and Administration Guide for more information on this product.

Product

IPMS

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ipms[-noconfirm ]
```

no

Deletes a previously configured IPMs client service.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

WARNING: If this keyword option is used with **no ipms** command the IPMS client service will be deleted with all active/inactive IPMS sessions without prompting any warning or confirmation.

Usage

Use this command to enable/disable/manage the IPMS client service within a context and configure certain functionality. This command enables and allows the configuration of service enabling the system to function as an IPMS-enabled Access Gateway in a network. This command is also used to remove previously configured IPMS client service.
A maximum of 1 IPMS client can be configured per system.
Refer to the IPMS Installation and Administration Guide and IPMS Configuration Mode chapter of this reference for additional information.

Example

The following command creates an IPMS client service name within the context:

```
ipms
```

ipsec

Creates a new, or specifies an existing, IPSec transform set and enters the IPSec Transform Set Configuration Mode for the current context.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

`[ no ] ipsec transform-set` *`name`*

`name`

Specifies the name of a new or existing transform set. *`name`* must be from 1 to 127 alpha and/or numeric characters .

Usage

Use this command to create an new or enter an existing IPSec transform-set. Up to four transform-sets can be created.
Entering this command results in the following prompt:
[*`context_name`*]*`hostname`*(cfg-ctx-ipsec-tran-set)#
IPSec Transform Set Configuration Mode commands are defined in the IPSec Transform Set Configuration Mode Commands chapter.

Example

The following command configures an IPSec transform set called *`ipsec12`* and enters the IPSec Transform Set Configuration Mode:

`ipsec transfrom-set` *`ipsec12`*

ipsg-service

Creates an IP Services Gateway service, or specifies an existing IPSG service, in the current context and enters the IPSG RADIUS Snoop or IPSG RADIUS Server Configuration Mode.

Product

IPSG

Privilege

Security Administrator, Administrator

Syntax

ipsg-service *name* **[mode { radius-server | radius-snoop }] [-noconfirm]**

no ipsg-service *name* **[mode { radius-server | radius-snoop }]**

no

Removes the IPSG service from the system.

name

Specifies the name of the IPSG service to be configured. If *name* does not refer to an existing service, the new service is created if resources allow. *name* must be an alpha and/or numeric string of 1 through 63 characters in length.

mode { radius-server | radius-snoop }

Configures the IPSG to perform as either a RADIUS server or as a device to extract user information from RADIUS accounting request messages (snoop). If the **mode** optional keyword is not entered, the system defaults to **radius-server**.
radius-server: Creates an IP Services Gateway RADIUS Server service in the context and enters the IPSG RADIUS Server Configuration Mode.
radius-snoop: Creates an IP Services Gateway RADIUS Snoop service in the context and enters the IPSG RADIUS Snoop Configuration Mode.

-noconfirm

Indicates that the command is to execute without an additional prompt and confirmation from the user.

Usage

Enter the IPSG RADIUS Snoop or IPSG RADIUS Server Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of one IPSG service can be configured per context.
Entering this command results in the following prompt (RADIUS Server shown):
[*context_name-service_name*]*hostname*(config-radius-server)#
IPSG service commands are defined in the IPSG RADIUS Snoop Configuration Mode Commands chapter or the IPSG RADIUS Server Configuration Mode Commands chapter of the Cisco ASR 5000 Series Command Line Interface Reference.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: A large number of services greatly increases the complexity of system management and may impact overall system performance (i.e., resulting from system handoffs). Do not configure a large number of services unless your application requires it. Contact your local service representative for more information.

Important: IP Services Gateway functionality is a license-controlled feature. A valid feature license must be installed prior to configuring an IPSG service. If you have not previously purchased this feature, contact your sales representative for more information.

For more information about the IP Services Gateway, refer to the IP Services Gateway Configuration Guide.

Example

The following command configures an IPSG RADIUS Snoop service named *ipsg1* and enters the IPSG RADIUS Snoop Configuration Mode:

```
ipsg-service ipsg1 mode radius-snoop
```

ipv6 access-group

Configures the IPv6 Access group.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

ipv6 access-group *group name* **{** *priority_value* **}**

group_name

Specifies the name of the access group. group_name must be an alpha and/or numeric string of 1 to 79 characters.

priority_value

Default: 0
Specifies the priority of the access group. 0 is the highest priority. If *priority_value* is not specified the priority is set to 0. *priority_value* must be a value from 0 to 4294967295.
If access groups in the list have the same priority, the last one entered is used first.

Usage

Use this command to specify Ipv6 access group name and priority. Use a lower value to indicate a higher priority for the group.

Example

ipv6 access-group group_1

ipv6 access-list

Configures access list (or packet filter) name and enters the IPv6 access list configuration mode.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

[no] ipv6 access-list *name*

no

Indicates the access list specified is to be removed from the configuration.

name

Specifies the access list for which to enter the access list configuration mode or the list to remove. *name* must be from 1 to 79 alpha and/or numeric characters.

Usage

Executing this command enters the Access Control List Configuration Mode in which rules and criteria are defined for the ACL.

Example

ipv6 access-list *samplelist*

no ipv6 access-list *samplelist*

ipv6 dns-proxy

Configures the domain name server proxy for the context.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

ipv6 dns-proxy source-ipv4-address*ip_address*

no ipv6 dns-proxy source-ipv4-address*ip_address*

no

Removes the predefined IP address for local interface in the destination context.

source-ipv4-address

Enables the IPv6 proxy DNs functionality for a context. It makes PDSN to use this address as the source address of the IPv4 packets.
Default: no address is configured.

ip_address

Specifies the IPv4 address of one of the local interface in the destination context to configure the IPv6 DNS proxy where *ip_address* must be specified using the standard IPv4 dotted decimal notation.

Usage

The IPv6 DNS proxy source IPv4 address is used as the source IP address for the DNS proxy transaction.

Example

The following command provides an example of configuring a IPv6 DNS proxy of 192.168.23.1:

ipv6 dns-proxy source-ipv4-address *192.168.23.1*

ipv6 neighbor

Add a static IPv6 neighbor entry into the neighbor discovery table.

Product

PDIF

Privilege

Administrator, Security Administrator

Syntax

[no] ipv6 neighbor *ipv6_address hardware_address*

no

Removes the specified address.

ipv6 neighbor *ipv6_address hardware_address*

ipv6_address is the IP address of node to be added to the table.
hardware_address is the associated 48-bit MAC address.

Usage

Add a static IPv6 neighbor entry into the neighbor discovery table.

Example

Add the ipv6 address *fe80::210:83ff:fef7:7a9d::/24* and associated 48 bit MAC address *0:10:83:f7:7a:9d* to the table.

ipv6 neighbor *fe80::210:83ff:fef7:7a9d::/24 0:10:83:f7:7a:9d*

ipv6 pool

Modifies the current context's IP address pools by adding, updating, or deleting a pool. Also use this command to resize an existing IP pool.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ipv6 pool*name***{ 6to4 local-endpoint***ipv4_address***[default-relay-router***router_address***] | alert threshold | group-name***name***| policy { allow-static-allocation | dup-addr-detection} | prefix***ip_address/len***[6to4-tunnel local-endpoint***ip_address***| default-relay-router***router_address***] | range***start_address end_address***| suppress-switchover-arps } [private***priority***] [public***priority***] [shared***priority***] [static***priority***] [group-name***name***]**

no ipv6 pool*name*

---

no

Deletes the previously configured ipv6 pool.

---

name

Specifies the logical name of the IP address pool. *name* must be from 1 to 31 alpha and/or numeric characters.

6to4-tunnel local-endpoint *ip_address*

Specifies the IPv4 Address of the local interface to be used for 6to4 compatible pool address construction.

---

alert threshold { 6to4 local-endpoint *ipv4_address* **| alert threshold | group-available | group-name** *name* **| policy { allow-static-allocation | dup-addr-detection} | pool-free | pool-used | prefix | range** *start_address end_address* **}**

Default: All thresholds are disabled.
Configures IP address pool-level utilization thresholds. These thresholds take precedence over context-level IPv6 pool thresholds.

- **6to4** - Sets an alert based on the IPv6 Pool for 6to4 compatible address type.
- **alert-threshold** - Sets an alert based on the percentage free alert threshold for this group.
- **group-available** - Sets an alert based on the percentage free alert threshold for this group.
- **group-name** - Sets an alert based on the IPv6 Pool Group.
- **policy allow-static-allocation**- Sets an alert based on the address allocation policy.
- **pool-free** - Sets an alert based on the percentage free alert threshold for this pool.
- **pool-used** - Sets an alert based on the percentage used alert threshold for this pool.

- **prefix** - Sets an alert based on the IPv6 Pool address prefix.
- **range** - Sets an alert based on the IPv6 address pool range of addresses.
- **suppress-switchover-arps** - Sets an alert based on the Suppress Gratuitous ARPS when performing a line card switchover.

---

group name *name*

IPv6 Pool Group.
The following options are available:

- 6to4 - IPv6 Pool for 6to4 compatible address type
- alert-threshold - Percentage free alert threshold for this group
- group-name - IPv6 Pool Group
- policy - Configure an address allocation policy
- prefix - IPv6 Pool address prefix
- range - Configures IPv6 address pool to use a range of addresses
- suppress-switchover-arps - Suppress Gratuitous ARPS when performing a line card switchover

---

ipv4_address

Specifies the beginning IPv4 address of the IPv4 address pool. *ipv4_address* must be specified using the standard IPv4 dotted decimal notation.

---

default-relay-router *router address*

Specifies the default relay router for the tunnel.

---

policy allow-static-allocation

Allows a dynamic pool to accept a static address allocation.
The following options are available:

- 6to4 - IPv6 Pool for 6to4 compatible address type
- alert-threshold - Percentage free alert threshold for this group
- group-name - IPv6 Pool Group
- policy - Configure an address allocation policy
- prefix - IPv6 Pool address prefix
- range - Configures IPv6 address pool to use a range of addresses
- suppress-switchover-arps - Suppress Gratuitous ARPS when performing a line card switchover

---

policy dup-addr-detection

Default: Disabled.
This command is valid for IPv6 shared pools only (Sample syntax: **ipv6 pool** *name* **prefix** *ip_address/len* **shared policy dup-addr-detection**). When this policy is enabled, the IPv6 shared pool allows a prefix to be shared in different call sessions with different interface IDs for an IPv6 address. This allows the tracking of interface IDs per prefix and the detection of duplicated IDs.
With this policy disabled, the IPv6 shared pool will allow a prefix to be shared across different call sessions. The interface ID is not considered for any duplicate address detection.
The following options are available:

- 6to4 - IPv6 pool for 6to4 compatible address type
- alert-threshold - Percentage free alert threshold for this group
- group-name - IPv6 pool group
- policy - Configure an address allocation policy
- prefix - IPv6 pool address prefix
- range - Configures IPv6 address pool to use a range of addresses
- suppress-switchover-arps - Suppress gratuitous ARPS when performing a line card switchover

---

prefix *ip_address/len*

Specifies the beginning IPv6 address of the IPv6 address pool. *ip_address/len* must be specified using colon notation.

---

range *start_address end_address*

Configures IPv6 address pool to use a range of addresses.
start_address specifies the beginning of the range of addresses for the IPv6 pool.
end_address specifies the end of the range of addresses for the IPv6 pool.

---

suppress-switchover-arps

Suppresses Gratuitous ARPS when performing a line card switchover.
The following options are available:

- 6to4 - IPv6 Pool for 6to4 compatible address type
- alert-threshold - Percentage free alert threshold for this group
- group-name - IPv6 Pool Group
- policy - Configure an address allocation policy
- prefix - IPv6 Pool address prefix
- range - Configures IPv6 address pool to use a range of addresses
- suppress-switchover-arps - Suppress Gratuitous ARPS when performing a line card switchover

---

private *priority* | **public** *priority* | **shared** *priority* | **static** *priority*

Default: public
private *priority*: address pool may only be used by mobile stations which have requested an IP address from a specified pool. When private pools are part of an IP pool group, they are used in a priority order according to the precedence setting. *priority* must be a value in the range from 0 through 10 with 0 being the highest. The default is 0.
public *priority*: address pool is used in priority order for assigning IP addresses to mobile stations which have not requested a specific address pool. *priority* must be a value in the range from 0 through 10 with 0 being the highest and with a default of 0.
shared *priority*: address pool that may be used by more than one session at any time. *priority* must be a value in the range from 0 through 10 with 0 being the highest and with a default of 0.
static *priority*: address pool is used for statically assigned mobile stations. Statically assigned mobile stations are those with a fixed IP address at all times. *priority* must be a value in the range from 0 through 10 with 0 being the highest and with a default of 0.

group-name *name*

This keyword is used to group the IPv6 pools in to different groups. The subscribers/domain can be configured with the group-name instead of the prefix-pool names.
name is the name of the group by which the IPv6 pool is to be configured and must be a string having 1 to 79 alpha and/or numeric characters.

Usage

Use this command to modify the current context's IP address pools by adding, updating, or deleting a pool. Also use this command to resize an existing IP pool.

Example

Following command provides an example of adding IPv6 pool named *ip6Star*.

```
ipv6 pool ip6Star
```

ipv6 route

Configures a static IPv6 route to the next-hop router.

Product

All

Privilege

Administrator

Syntax

[no] ipv6 route *ipv6_address/prefix_length* **{ interface** *name* **| next-hop** *ipv6_address* **interface** *name* **} [cost** *cost* **] [precedence** *precedence* **]**

no

Removes the specified static route.

ipv6_address/prefix_length

Specifies a destination IPv6 address or group of addresses that will use this route. *ipv6_address/prefix_length* must be specified in IPv6 colon separated notation.

interface *name*

Specifies the name of the interface on this system associated with the specified route or next-hop address. *name* must be an existing interface name on the system and be from 1 to 79 alpha and/or numeric characters.

next-hop *ipv6_address*

The IPv6 address of the directly connected next hop device. *ipv6_address* must be specified in IPv6 colon separated notation.

cost *cost*

Default: 0
Defines the number of hops to the next gateway. *cost* must be an integer value from 0 to 255.

precedence *precedence*

Default: 1
Indicates the administrative preference of the route. A low precedence specifies that this route takes preference over the route with a higher precedence. *precedence* must be an integer value from 1 to 254.

Usage

Use this command to create a static route and send data traffic to a next-hop device.

Example

Use the following example to configure a static route with ipv6 prefix/length *2001:0db8:3c4d:0015:0000:0000:abcd:ef12/24* to the next hop interface *egress1*:

ipv6 route *2001:0db8:3c4d:0015:0000:0000:abcd:ef12/24* **interface** *egress1*

isakmp disable-phase1-rekey

This command is deprecated. Use **ikev1 disable-phase1-rekey** command to configure the parameters for Phase1 SA rekeying when ISAKMP lifetime expires for IKE v1 protocol.

isakmp keepalive

This command is deprecated. Use **ikev1 keepalive dpd** command to configure ISAKMP IPSec Dead Peer Detection (DPD) message parameters for IKE v1 protocol.

isakmp policy

This command is deprecated. Use **ikev1 policy** command to create/configure an ISAKMP policy with the specified priority for IKE v1 protocol.

iups-service

This command creates an Iu-PS service instance and enters the Iu-PS Service configuration mode. This mode defines the configuration and usage of Iu-PS interfaces between the SGSN and the RNCs in the UMTS radio access network (UTRAN) and defines both the control plane (GTP-C) and the data plane (GTP-U) between these nodes.

Important: For details about the commands and parameters for this mode, check the IuPS Service Configuration Mode chapter.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

iups-service *srvc_name*

no iups-service *srvc_name*

no

Remove the configuration for the specified Iu-PS service from the configuration for the current context.

srvc_name

A unique string of 1 to 63 alphanumeric characters that identify the specific IuPS service.

Usage

Use this command to create, edit, or remove an Iu-PS service. Add up to 8 definitions to be used with a single SGSN service so the SGSN can support multiple PLMNs.

Example

The following command creates an Iu-PS service named iu-ps1:

```
iups-service iu-ps1
```

The following command removes the Iu-PS service named iu-ps1:

```
no iups-service iu-ps1
```

l2tp peer-dead-time

Configures a delay for attempting to tunnel to a specific peer which is initially unreachable due to reasons such as a network issue or temporarily having reached its capacity.

Product

All

Privilege

Security Administrator, Administrator

Syntax

l2tp peer-dead-time *seconds*

default l2tp peer-dead-time

default

Rests the command to it's default setting of 60.

peer-dead-time

seconds: Must be an integer value from 5 to 64,000.
Default: 60

Usage

The time to wait before trying to establish a tunnel to a known peer after the initial attempt was unsuccessful.

Example

The following example configures the delay in attempting to tunnel to a temporarily unreachable peer. The delay is set to 120 seconds in this example.

l2tp peer-dead-time *120*

lac-service

Enters the lac-service configuration mode, or is used to add or remove a specified LAC service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

lac-service*name*

no lac-service*name*

no

Removes the specified lac-service from the current context.

name

Specifies the name of a LAC service to configure, add, or remove. It can be from 1 to 63 alpha and/or numeric characters in length and is case-sensitive.

Usage

Enter the LAC service configuration mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (i.e. resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Example

To add a new LAC service named LAC1and enter the lac-service configuration mode, enter the following commands:

```
lac-service LAC1

Are you sure? [Yes|No]: Yes
```

To configure an existing LAC service named LAC2, enter the following command:

```
lac-service LAC2
```

To delete an existing LAC service named LAC3, enter the following command:

```
no lac-service LAC3
```

lma-service

Creates an Local Mobility Anchor (LMA) service or specifies an existing LMA service and enters the LMA service configuration mode for the current context.

Product

P-GW

Privilege

Administrator

Syntax

lma-service*service_name* **[-noconfirm]**

no lma-service*service_name*

service_name

Specifies the name of the LMA service. If *service_name* does not refer to an existing service, the new service is created if resources allow.
service_name must be from 1 to 63 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no lma-service *service_name*

Removes the specified LMA service from the context.

Usage

Enter the LMA service configuration mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:
[*context_name*]*hostname*(config-lma-service)#
LMA Service Configuration Mode commands are defined in the LMA Service Configuration Mode Commands chapter.
Use this command when configuring the following eHRPD and PMIP SAE components: P-GW.

Example

The following command enters the existing LMA service configuration mode (or creates it if it doesn't already exist) for the service named *lma-service1*:

lma-service *lma-service1*

The following command will remove *lma-service1* from the system:

no lma-service *lma-service1*

lns-service

Enters the lac-service configuration mode, or is used to add or remove a specified LNS service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

lns-service*name*

no lns-service*name*

no

Removes the specified lac-service from the current context.

name

Specifies the name of a LNS service to configure, add, or remove. It can be from 1 to 63 alpha and/or numeric characters in length and is case-sensitive.

Usage

Enter the LNS service configuration mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (i.e. resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Example

To add a new LNS service named LNS1and enter the lns-service configuration mode, enter the following commands:

```
lns-service LNS1

Are you sure? [Yes|No]: Yes
```

To configure an existing LNS service named LNS2, enter the following command:

```
lns-service LNS2
```

To delete an existing LNS service named LNS3, enter the following command:

```
no lns-service LNS3
```

lawful-intercept

This command defines the acknowledgement parameters for the UDP event delivery interface. It also specifies the interface IP address(es) that go into the headers of the content and event delivery messages going to the DF.

Product

PDSN, HA, GGSN, PDIF,SGSN, ASN-GW, SCM

Privilege

Security Administrator, Administrator with LI-Administrator privileges

Syntax

```
lawful-intercept { acked-udp [ num-retry number ] [ timeout time] | event-
attributes bsid | hand-off-policy send-start-intercept-with-pdp-active-iri |
interception-point-policy { { sms-mo | sms-mt } { message-delivered | request-
received } } | reprovision-target-policy resend-pdp-context-active-iri | src-ip-
addr ip_address | sms-content-policy { exclude-content | include-content } | tcp
tcp_option | unack-format use-service-address }

default lawful-intercept { acked-udp { num-retry | timeout } | event-attributes
bsid | hand-off-policy send-start-intercept-with-pdp-active-iri | interception-
point-policy { sms-mo | sms-mt } | reprovision-target-policy resend-pdp-context-
active-iri | sms-content-policy | tcp tcp_option | unack-format use-service-
address }

no lawful-intercept { event-attributes bsid | hand-off-policy send-start-
intercept-with-pdp-active-iri | reprovision-target-policy resend-pdp-context-
active-iri | src-ip-addr ip_address | tcp tcp_option | unack-format use-service-
address}
```

no

Disables the configuration parameters for selected keyword(s) for the Lawful Intercept configuration.

default

Sets the behavior of command/keyword to its default setting.

acked-udp

Entering this keyword, enables the acknowledged-UDP interface. After enter acked-udp, one or both of the following options can be entered:
num-retry *number:* Enter an integer between 1 and 100 to define the maximum number of retries for sending an unacknowledged message. Default is 20.
timeout *time:* Enter an integer between 1 and 100 to define the maximum number of seconds that the system waits before retransmitting an unacknowledged message. Default is 3.

event-attributes bsid

This keyword enables the transmission of base-station id in event attributes for intercepted PDSN.
By default this keyword is disabled.

hand-off-policy send-start-intercept-with-pdp-active-iri

This optional keyword enables a policy for hand-off in the case of ISRAU (inter-SGSN routing area update) and sends a 'start intercept' message with the PDP context LI event to the mediation server.
Default: Disabled.
This keyword is only applicable to the SGSN.

interception-point-policy

Configures the point of interception and the time of interception for an SMS. One of the following options must be selected to specify the point of interception include:

- **sms-mo:** point of interception for a mobile-originated SMS
- sms-mt: point of interception for a mobile-terminated SMS

After configuring the point of interception, one of the following options must be selected to configure the point in time for the interception:

- **message-delivered**: intercept when the SGSN receives notification from the SMSC/MS. This is the default for either SMS-MO or SMS-MT.
- **request-received**: intercept when the SGSN receives the request.

This keyword is only applicable to the SGSN.

reprovision-target-policy resend-pdp-context-active-iri

Reprovisions the target identity in case of duplicates and sends a PDP context active LI IRI event to the mediation server.
This keyword is only applicable to the SGSN.

sms-content-policy {exclude-content | include-content}

This optional keyword is used to define the SMS content policy and used to configure to send only the SMS header or SMS header and content in SMS IRI event. The delivery from/to the mobile subscriber a SMS event, which contains the content and header of the SMS, is generated and sent via the Delivery Function 2 to the LEA in the same way as the IRI. LEA can configure the SMS policy if an SMS event shall contain only SMS header, or SMS header and SMS content.

Default behaviour is to send SMS header and Content in SMS IRI.

Following options can be configured:

- **exclude-content**: Sets the policy to send only SMS header in IRI.
- **include-content**: Sets the policy to send SMS header and content both in IRI.

  By default it is enabled.

src-ip-address

ip_address: This is known as the source-address. It is an IPv4 address that identifies the system's interface, in the current context, from which the intercepted messages are forwarded to the DF according to the event delivery or content delivery provisioning done in the Exec configuration mode.

tcp *tcp_option*

Enables the use of TCP (in place of UDP) as the transport for sending the intercepted information to the DF. One of the following options must be configured:

- **application-heartbeat-messages timout minute** *dur* - In firewall enabled scenrio TCP connections get dropped by because of the connections being idle most of the time. This keyword enables the SGSN to send application level heart beat messages to the mediation server to

keep connection live. This keyword is used to enable/disable sending of heart beat messages. By default this mode is disabled

timout minute*dur* sets the timeout duration for heartbeat timer. By default heart beat timer value is 5 minutes.

- **connection-retry-timer** *time* - configures the maximum time to wait before retrying to connect, in seconds. Default is 2 seconds. *time:* enter any integer from 1 to 65535.
- **content-delivery dest-addr** *ip_address* - configures the destination IP address of the DF3 to send the intercepted content (ie: data/CC). *ip_address:* enter an address in standard IPv4/IPv6 format. Must be followed by:
  - **dest-port** *port_num* - configures the destination port where the intercepted information is to be forwarded. *port_num:* enter any integer from 1 to 65535.
- **event-delivery dest-addr** *ip_address* - configures the destination address of the DF2 to send the intercepted events information (ie: IRI). *ip_address:* enter an address in standard IPv4/IPv6 format. Must be followed by:
  - **dest-port** *port_num* - configures the destination port where the intercepted information is to be forwarded. *port_num:* enter any integer from 1 to 65535.

unack-format use-service-address

This set of keywords instructs the system to use the service-address, in place of the source-address in the ip-headers of the intercepted messages that are forwarded to the DF according to the content delivery provisioning done in the Exec configuration mode. The service-address is an IPv4 address that identifies on which of the system's interfaces the intercept was received.

Important: This function requires that the Lawful Intercept provisioning (done in the Exec configuration mode) include the **udp-unack-format-1** for the **content delivery** keyword. Changing the configuration and the provisioning to enable/disable this feature can be done on the fly.

Usage

Use this command to configure the parameters controlling the forwarding of the intercepted messages to the DF.
For details on provisioning the Lawful Intercepts, refer to the Exec configuration mode.
For details on using the Lawful Intercept capability of the system, refer to System Administration and Configuration Guide.

Important: When monitoring for calls that are not yet active, the source-address information does not need to be configured immediately. However, it must be configured as soon as the call becomes active in order for Lawful Interception to function properly.

Example

To set the source-address in the current context to 198.162.100.10, use the following command:

```
lawful-intercept src-ip-addr 198.162.100.10
```

lawful-intercept dictionary

This command configures LI dictionary to support customer specific LI requirements.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
lawful-intercept dictionary {standard |cust_dict }

[default] lawful-intercept dictionary
```

default

Sets the LI dictionary to default; i.e. **standard**.

standard

Specifies the standard dictionary to be used for LI session.

cust_dict

Specifies the customer specific dictionaries; **custom1** through **custom10**, to be used to provision/interception for configured LI context.

Usage

Use this command to configure the LI dictionary to be used for LI requirements. LI dictionaries are context specific and will be applicable to provisions / interceptions for configured LI context.

Example

The following command specifies the standard LI dictionary to be used for LI requirements:

```
default lawful-intercept dictionary
```

mobile-ip ha reconnect

Sets the behavior of all HA services to reconnect dropped calls.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
mobile-ip { ha reconnect [ static-homeaddr [ dynamic-pool-allocation ] ] }
```

```
no mobile-ip { ha reconnect [ static-homeaddr [ dynamic-pool-allocation ] ] }
```

static-homeaddr

The home address is a static IP address.

dynamic-pool-allocation

Allows a dynamic pool to accept a static address allocation.

Usage

Use this command to reset the HA behavior for new calls.

Example

```
mobile-ip ha reconnect
```

```
mobile-ip ha reconnect static-homeaddr
```

```
mobile-ip ha reconnect static-homeaddr dynamic-pool-allocation
```

```
no mobile-ip ha reconnect
```

```
no mobile-ip ha reconnect static-homeaddr
```

mag-service

Creates an Mobile Access Gateway (MAG) service or specifies an existing MAG service and enters the MAG service configuration mode for the current context.

Product

HSGW, S-GW

Privilege

Administrator

Syntax

mag-service*service_name* **[-noconfirm]**

no mag-service*service_name*

service_name

Specifies the name of the MAG service. If *service_name* does not refer to an existing service, the new service is created if resources allow.
service_name must be from 1 to 63 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no mag-service *service_name*

Removes the specified MAG service from the context.

Usage

Enter the MAG service configuration mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:
[*context_name*]*hostname*(config-mag-service)#
MAG Service Configuration Mode commands are defined in the MAG Service Configuration Mode Commands chapter.
Use this command when configuring the following eHRPD and PMIP SAE components: HSGW and S-GW.

Example

The following command enters the existing MAG service configuration mode (or creates it if it doesn't already exist) for the service named *mag-service1*:

mag-service *mag-service1*

The following command will remove *mag-service1* from the system:

no mag-service *mag-service1*

map-service

This command creates a Mobile Application Part (MAP) Service instance and enters the MAP Service configuration mode to define or edit the MAP service parameters.

MAP is the SS7 protocol that provides the application layer required by some of the nodes in GPRS/UMTS networks to communicate with each other in order to provide services to mobile phone users. MAP is used by the serving GPRS support node (SGSN) to access SS7 network nodes such as a home location register (HLR) or a radio access network (RAN).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

map-service *srvc_name*

no map-service *srvc_name*

no

Remove the specified MAP service from the configuration for the current context.

srvc_name

A unique string of 1 to 63 alphanumeric characters that identify the specific MAP service.

Usage

Use this command to create, edit, or remove a MAP service configuration.

Important: For details about the commands and parameters, check the MAP Service Configuration Mode chapter.

Example

The following command creates a MAP service named map-1:

```
map-service map-1
```

The following command removes the configuration for a MAP service named map-1 from the configuration for the current context:

```
no map-service map-1
```

mme-hss-service

Creates an Mobility Management Entity (MME)-HSS service or configures an existing MME HSS service and enters the MME-HSS service configuration mode for EPC network in the current context.

Product

MME

Privilege

Administrator

Syntax

mme-hss-service*service_name* **[-noconfirm]**

no mme-hss-service*service_name*

service_name

Specifies the name of the MME HSS service. If *service_name* does not refer to an existing service, the new service is created if resources allow.
service_name must be from 1 to 63 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no mme-hss-service *service_name*

Removes the specified MME HSS service from the context.

Usage

Enter the MME HSS service configuration mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:
[*context_name*]*hostname*(config-mme-hss-service)#
MME HSS Service Configuration Mode commands are defined in the MME HSS Service Configuration Mode Commands chapter.
Use this command when configuring the eGTP SAE component(s); i.e. MME.

Example

The following command enters the existing MME HSS service configuration mode (or creates it if it doesn't already exist) for the service named *mme-hss-service1*:

mme-hss-service *mme-hss-service1*

The following command will remove *mme-hss-service1* from the system:

no mme-hss-service *mme-hss-service1*

mme-service

Creates an Mobility Management Entity (MME) service or configures an existing MME service and enters the MME service configuration mode for EPC networks in the current context.

Product

MME

Privilege

Administrator

Syntax

mme-service*service_name* **[-noconfirm]**

no mme-service*service_name*

no

Removes the specified MME service from the context.

service_name

Specifies the name of the MME service. If *service_name* does not refer to an existing service, the new service is created if resources allow.
service_name must be from 1 to 63 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Enter the MME service configuration mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 8 MME service can be configured on a system which is further limited to a maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:
[*context_name*]*hostname*(config-mme-service)#
MME Service Configuration Mode commands are defined in the MME Service Configuration Mode Commands chapter.

Caution: This is a critical configuration. The MME service can not be configured without this configuration. Any change to this configuration would lead to restarting the MME service and removing or disabling this configuration will stop the MME service.

Example

The following command enters the existing MME service configuration mode (or creates it if it doesn't already exist) for the service named *mme-service1*:

```
mme-service mme-service1
```

The following command will remove *mme-service1* from the system:

```
no mme-service mme-service1
```

mobile-ip

The commands in this section are used for configuring mobile IP parameters.

mobile-ip fa newcall

Configures settings that effect all FA services in the current context.

Product

FA

Privilege

Security Administrator, Administrator

Syntax

```
mobile-ipfa { multiple-dynamic-reg-per-nai | newcallduplicate-home-address {
accept | reject }

no mobile-ipfa { multiple-dynamic-reg-per-nai | newcallduplicate-home-address }
```

no mobile-ip fa { multiple-dynamic-reg-per-nai | newcall duplicate-home-address }

multiple-dynamic-reg-per-nai: Disables all FA services in the current context from simultaneously setting up multiple dynamic home address registrations that have the same NAI.
newcall duplicate-home-address: Reset this option to it's default of reject.

multiple-dynamic-reg-per-nai

This keyword allows all FA services in the current context to simultaneously setup multiple dynamic home address registrations that have the same NAI.

duplicate-home-address { accept | reject }

Default: reject
accept: The new call is accepted and the existing call is dropped.
reject: The new call is rejected with an Admin Prohibited code.

Usage

Use this command to set the behavior of all FA services in the current context.

Example

To configure all FA services to accept new calls and drop the existing call when the new call requests an IP address that is already in use by an existing call, enter the following command:

```
mobile-ip fa newcall duplicate-home-address accept
```

To enable all FA services in the current context to allow all FA services in the current context to simultaneously setup multiple dynamic home address registrations that have the same NAI, enter the following command:

```
mobile-ip fa multiple-dynamic-reg-per-nai
```

mobile-ip ha assignment-table

This command creates a Mobile IP HA assignment table and enters Mobile IP HA Assignment Table Configuration Mode.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

mobile-ip ha assignment-table*atable_name***[-noconfirm]**

no mobile-ip ha assignment-table atable_name

no

This keyword deletes the specified assignment table

atable_name

The name of the MIP HA assignment table to create or edit.

-noconfirm

This keyword specifies that the assignment table should be created with no further confirmation by the user.

Usage

Use this command to create a new MIP HA assignment table or edit an existing MIP HA assignment table.

Important: A maximum of 8 MIP HA assignment tables can be configured per context with a maximum of 8 MIP HA assignment tables across all contexts.

Important: A maximum of 256 non-overlapping hoa-ranges can be configured per MIP HA Assignment table with a maximum of 256 non-overlapping hoa-ranges across all MIP HA Assignment tables.

Example

The following command creates a new MIP HA assignment table name MIPHAtable1 and enters MIP HA Assignment Table configuration mode without asking for confirmation from the user:

```
mobile-ip ha assignment-table MIPHAtable1
```

mobile-ip ha newcall

Configures the behavior of all HA services when duplicate home addresses and duplicate IMSI sessions occur for new calls.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
mobile-iphanewcall { duplicate-home-address { accept | reject } | duplicate-
imsi-session { allow | disallow | global-disallow } }

no mobile-iphanewcall { duplicate-home-address | duplicate-imsi-session }
```

```
no mobile-ip ha newcall { duplicate-home-address | duplicate-imsi-session
}
```

duplicate-home-address: Reset the option to it's default of reject.
duplicate-imsi-session: Reset the option to its default of allow.

```
duplicate-home-address { accept | reject }
```

Default: reject
Configures the HA to either accept or reject new calls if the new call requests a static IP home address that is already assigned to an existing call from an IP address pool in the same destination context.
accept: The new call is accepted and the existing call is dropped.
reject: The new call is rejected with an Admin Prohibited code.

```
duplicate-imsi-session { allow | disallow | global-disallow }
```

Default: allow
Configures the HA to either permit or not permit multiple sessions for the same IMSI.
allow: Allows multiple sessions for the same IMSI.
disallow: If a Mobile node already has an active session and a new sessions is requested using the same IMSI, the currently active session is dropped and the new session is accepted.
global-disallow: Enables HA services in this context to accept a new session and disconnect any other session(s) having the same IMSI being processed in this context. In addition, a request is sent to all other contexts containing HA services to do the same.

Important: In order to ensure a single session per IMSI across all contexts containing HA services, the global-disallow option must be configured in every context.

Usage

Use this command to set the behavior of all HA services for new calls.

Example

To configure all HA services to accept new calls when the new call requests a static IP that is already assigned from an IP pool in the same destination context, enter the following command:

```
mobile-ip ha newcall duplicate-home-address accept
```

To configure all HA services to drop an active call and accept a new one that uses the same IMSI, enter the following command:

```
mobile-ip ha newcall duplicate-imsi-session disallow
```

mobile-ip ha reconnect

Sets the behavior of all HA services to reconnect dropped calls.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
mobile-ip { ha reconnect [ static-homeaddr [ dynamic-pool-allocation ] ] }
```

```
no mobile-ip { ha reconnect [ static-homeaddr [ dynamic-pool-allocation ] ] }
```

static-homeaddr

The home address is a static IP address.

dynamic-pool-allocation

Allows a dynamic pool to accept a static address allocation.

Usage

Use this command to reset the HA behavior for new calls.

Example

```
mobile-ip ha reconnect
```

```
mobile-ip ha reconnect static-homeaddr
```

```
mobile-ip ha reconnect static-homeaddr dynamic-pool-allocation
```

```
no mobile-ip ha reconnect
```

```
no mobile-ip ha reconnect static-homeaddr
```

mpls bgp forwarding

This command globally enables the MPLS BGP forwarding.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] mpls bgp forwarding
```

no

Disables MPLS BGP forwarding configured on the system.

Usage

Use this command to globally enable the MPLS BGP forwarding. By enabling this command, the BGP VPNv4 routes need not have an underlying LSP to forward the IP packets. If this command is not enabled, then the nexthop for the BGP routes must be reachable via LDP.

Caution: This command should be enabled ONLY when all the BGP peering where VPNv4 routes are exchanged are one hop away.

Example

Following command enables the MPLS BGP forwarding on system:

```
mpls bgp forwarding
```

nw-reachability server

This command adds/deletes a reachability-detect server and configures parameters for retrying the failure-detection process. When network reachability is enabled, a ping request is sent to this device. If there is no response after a specified number of retries, the network is deemed failed. Execute this command multiple times to configure multiple network reachability servers.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

nw-reachabilityserver*server_name* **[interval***seconds* **] [local-addr***ip_addr* **] [num-retry***num* **] [remote-addr***ip_addr* **] [timeout***seconds* **]**

nonw-reachabilityserver*server_name*

no

Delete the reference to the specified network reachability server.

server_name

A name for the network device that is sent ping packets to test for network reachability.

interval *seconds*

Default: 60 seconds
Specifies the frequency in seconds for sending ping requests.*seconds* must be an integer from 1 through 3600.

local-addr *ip_addr*

Specifies the IP address to be used as the source address of the ping packets; If this is unspecified, an arbitrary IP address that is configured in the context is used. *ip_addr* must be an IP v4 address in dotted decimal notation.

num-retry *num*

Default: 5
Specifies the number of retries before deciding that there is a network-failure. *num* must be an integer from 0 through 100.

remote-addr *ip_addr*

Specifies the IP address of a network element to use as the destination to send the ping packets for detecting network failure or reachability. *ip_addr* must be an IP v4 address in dotted decimal notation.

timeout *seconds*

Default: 3 seconds

Specifies how long to wait, in seconds, before retransmitting a ping request to the remote address. *seconds* must be an integer from 1 through 10.

Usage

Use this command to set up a network device on a destination network that is used ensure that Mobile IP sessions can reach the required network from the HA.

Important: Refer to the HA configuration mode command **policy nw-reachability-fail** to configure the action that should be taken when network reachability fails.

Important: Refer to the subscriber config mode command **nw-reachability-server** to bind the network reachability to a specific subscriber.

Important: Refer to the **nw-reachability server server_name** keyword of the **ip pool** command in this chapter to bind the network reachability server to an IP pool.

Example

To set a network device called InternetDevice with the IP address of 192.168.100.10 as the remote address that is pinged to determine network reachability and use the address 192.168.200.10 as the origination address of the ping packets sent, enter the following command:

nw-reachability server InternetDevice local-addr *192.168.200.10* remote-addr *192.168.100.10*

network-requested-pdp-context

The commands in this section are used for configuring Network Requested PDDP Context functionality.

network-requested-pdp-context activate

Configures the mobile station(s) (MSs) for which network initiated PDP contexts are supported.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

network-requested-pdp-context activate address*ip_address***dst-context***context_name***imsi***imsi***apn***apn_name*

nonetwork-requested-pdp-context activate{ address*ip_address***dst-context***context_name***}**

no

Disables the system's ability to accept network-requested PDP contexts on the specified interface.

address *ip_address*

Specifies the static IP address of the MS.
ip_address must be expressed in dotted decimal notation.

dst-context *context_name*

Specifies the name of the destination context configured on the system containing the static IP address pool in which the MS's IP address is configured.
context_name must be from 1 to 79 alpha and/or numeric characters and is case sensitive.

imsi *imsi*

Specifies the International Mobile Subscriber Identity (IMSI) of the MS.
imsi must be from 1 to 15 numeric characters.

apn *apn_name*

Specifies the Access Point Name (APN) that is passed to the SGSN by the system.
apn_name must be from 1 to 63 alpha and/or numeric characters and is case sensitive.

Usage

Use this command to specify the MS(s) for which network initiated PDP contexts are supported.
When a packet is received for an MS that does not currently have a PDP context established, the system checks the configuration of this parameter to determine if the destination IP address specified in the packet is specified by this parameter. If the address is not specified, then the system discards the packet. If the address is specified, the system uses the configured IMSI and APN to determine the appropriate SGSN from the Home Location Register (HLR). The system communicates with the HLR through the interworking node configured using the network-requested-pdp-context gsn-map command.
Once the session is established, the destination context specified by this command is used in place of the one either configured within the specified APN template or returned by a RADIUS server during authentication.

This command can be issued multiple times supporting network initiated PDP contexts for up to 1000 configured addresses per system context.

Example

The following command enables support for network initiated PDP contexts for an MS with a static IP address of 20.13.5.40 from a pool configured in the destination context pdn1 with an IMSI of 3319784450 that uses an APN template called isp1:

```
network-requested-pdp-context activate address 20.13.5.40 dst-context
pdn1 imsi 3319784450 apn isp1
```

network-requested-pdp-context gsn-map

Configures the IP address of the interworking node that is used by the system to communicate with the HLR and optionally sets the GTP version to use.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
network-requested-pdp-context gsn-map ip_address [ gtp-version { 0 | 1 } ]

nonetwork-requested-pdp-context gsn-map
```

no

Deletes a previously configured gsn-map node.

ip_address

Specifies the IP address of the gsn-map node.
ip_address must be an IPv4 or IPv6 IP address entered using dotted decimal notation or an IPv6 IP address using colon (:) separated notation.

[gtp-version { 0 | 1 }]

Default: 1
Specifies the gtp version used.

Usage

Communications from the system to the HLR must go through a GSN-map interworking node that performs the protocol conversion from GTPC to SS7.
The UDP port for this communication is 2123.
Support for network requested PDP contexts must be configured within source contexts on the system. Only one gsn-map node can be configured per source context.
The source context also contains the GGSN service configuration that specifies the IP address of the Gn interface. If multiple GGSN services are configured in the source context, one is selected at random for initiating the Network Requested PDP Context Activation procedure.
Communication with the gsn-map node is done over the Gn interface configured for the GGSN service. The IP address of that interface is used as the system's source address.

Example

The following command configures the system to communicate with a gsn-map node having an IP address of 192.168.2.5:

```
network-requested-pdp-context gsn-map 192.168.2.5
```

network-requested-pdp-context hold-down-time

Configures the time duration to that the system will wait after the SGSN rejects an attempt for a network-requested PDP context creation for the subscriber.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

network-requested-pdp-context hold-down-time*time*

time

Default: 60
The time interval is measured in seconds and can be configured to any integer value between 0 and 86400.

Usage

Packets received during this time period would be discarded, rather than being used to cause another network-requested PDP context creation attempt for the same subscriber. After the time period has expired, any subsequent packets received would cause another network-requested PDP context creation procedure to begin.

Example

The following command configures a hold-down-time of 120 seconds:

network-requested-pdp-context hold-down-time *120*

network-requested-pdp-context interval

Configures the minimum amount of time that must elapse between the deletion of a network initiated PDP context and the creation of a new one for the same MS.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

network-requested-pdp-context interval*time*

time

Default: 60
Specifies the minimum amount of time that must pass before the system allows another network-requested PDP context for a specific MS after the previous context was deleted.
time is measured in seconds and can be configured to any integer value from 0 to 86400.

Usage

Once an MS deletes a PDP context that initiated from the network, the system automatically waits the amount of time configured by this parameter before allowing another network initiated PDP context for the same MS.

Example

The following command specifies that the system waits 120 seconds before allowing another network requested PDP context for an MS:

network-requested-pdp-context interval *120*

network-requested-pdp-context sgsn-cache-time

Configures the time duration that the GGSN keeps the SGSN/subscriber pair cached in its local memory.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

network-requested-pdp-context sgsn-cache-time*time*

time

Default: 300
The time interval is measured in seconds and can be configured to any integer value between 0 and 86400.

Usage

For an initial network-requested PDP context creation, the system contacts the HLR (via the GSN-MAP interworking node) to learn which SGSN is currently servicing the subscriber. The system keeps that information in cache memory for the configured time, so that future network-requested PDP context creations for that subscriber can be initiated without having to contact the HLR again.

Example

The following command configures an sgsn-cache-time of 500 seconds:

network-requested-pdp-context sgsn-cache-time *500*

operator

Configures a context-level operator account within the current context.

Product

All

Privilege

Security Administrator

Syntax

operator*user_name* **[encrypted] password***pwd* **[ecs] [expiry-date***date_time* **] [li-administration] [noecs] [timeout-absolute***abs_seconds* **] [timeout-min-absolute***abs_minutes* **] [timeout-idle***idle_seconds* **] [timeout-min-idle***idle_minutes* **]**

no operator*user_name*

no

Removes a previously configured context-level operator account.

user_name

Specifies a name for the account. *user_name* must be from 1 to 32 alpha and/or numeric characters.

[encrypted] password *pwd*

Specifies the password to use for the user which is being given context-level operator privileges within the current context. The **encrypted** keyword indicates the password specified uses encryption.
The password specified as *pwd* must be from 1 to 63 alpha and/or numeric characters without encryption and must be from 1 to 127 alpha and/or numeric characters when encryption has been indicated.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

ecs

Default: ACS-specific configuration commands not allowed.
Permits the specific user to access ACS-specific configuration commands from Executive mode only.

expiry-date *date_time*

The date and time that this account expires. Enter the date and time in the format YYYY:MM:DD:HH:mm or YYYY:MM:DD:HH:mm:ss.
Where YYYY is the year, MM is the month, DD is the day of the month, HH is the hour, mm is minutes, and ss is seconds.

li-administration

Permits this user to execute Lawful Intercept commands.

Important: Users who have Lawful Intercept privileges are only given those privileges when connected to the system through a Secure Shell (SSH). If this user connects through a Telnet session or through the console port, Lawful Intercept privileges are not enabled.

noecs

Default: Enabled.
Prevents the specific user to access ACS-specific configuration commands.

timeout-absolute abs_seconds

Default: 0
This keyword is obsolete. It has been left in place for backward compatibility. If used a warning is issued and the value entered is rounded to the nearest whole minute.
Specifies the maximum amount of time, in seconds, the context-level operator may have a session active before the session is forcibly terminated. abs_seconds must be a value in the range from 0 through 300000000.
The special value 0 disables the absolute timeout.

timeout-min-absolute abs_minutes

Default: 0
Specifies the maximum amount of time, in minutes, the context-level operator may have a session active before the session is forcibly terminated. abs_minutes must be a value in the range from 0 through 300000000.
The special value 0 disables the absolute timeout.

timeout-idle *idle_seconds*

Default: 0
This keyword is obsolete. It has been left in place for backward compatibility. If used a warning is issued and the value entered is rounded to the nearest whole minute.
Specifies the maximum amount of idle time, in seconds, the context-level operator may have a session active before the session is terminated. idle_seconds must be an integer from 0 through 300000000.
The special value 0 disables the idle timeout.

timeout-min-idle idle_minutes

Default: 0
Specifies the maximum amount of idle time, in minutes, the context-level operator may have a session active before the session is terminated. idle_minutes must be a value in the range from 0 through 300000000.
The special value 0 disables the idle timeout.

Usage

Create new context-level operator or modify existing operator's options, in particular, the timeout values. Operator users have read-only privileges. They can maneuver across multiple contexts, but cannot perform configuration operations. Refer to the Command Line Interface Overview chapter of this guide for more information.

Important: A maximum of 128 administrative users and/or subscribers may be locally configured per context.

Example

The following command creates a context-level operator account called *user1* with ACS parameter control:

```
operator user1 password secretPassword ecs
```

The following command removes a previously configured context-level operator account called user1:

```
no operator user1
```

optimize pdsn inter-service-handoff

Controls the optimization of the system's handling of inter-PDSN handoffs.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
optimize pdsn inter-service-handoff

[ default | no ] optimize pdsn inter-service-handoff
```

default

Resets the command to it's default setting of enabled.

no

Disables the feature.

Usage

When more than one PDSN service is defined in a context, each PDSN-Service acts as an independent PDSN. When a Mobile Node (MN) moves from one PDSN service to another PDSN service, by rule, it is an inter-PDSN handoff. This command optimizes PDSN handoffs between PDSN Services that are defined in the same context in the system.

The default for this parameter is enabled. The no keyword disables this functionality.

When enabled, the system treats handoffs happening between two PDSN services in the same context as an inter-PDSN handoff. Existing PPP session states and connection information is reused. If the inter-PDSN handoff requires a PPP restart, then PPP is restarted. The optimized inter-service-handoff may not restart the PPP during handoffs allowing the MN to keep the same IP address for the Simple IP session.

Example

```
optimize pdsn inter-service-handoff
```

pdg-service

Creates a new PDG service or specifies an existing PDG service and enters the PDG Service Configuration Mode. A maximum of 16 PDG services can be created. This limit applies per ASR 5000 chassis and per context.

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

pdg-service *name*

no pdg-service *name*

pdg-service *name*

Specifies the name of a new or existing PDG service.
name must be from 1 to 63 alpha and/or numeric characters and must be unique across all FNG services within the same context and across all contexts.

no pdg-service *name*

Deletes the specified PDG service.

Usage

Use this command in Context Configuration Mode to create a new PDG service or modify an existing one. Executing this command enters the PDG Service Configuration Mode.

Example

The following command configures an PDG service named *pdg_service_1* and enters the PDG Service Configuration Mode:

pdg-service *pdg_service_1*

pdif-service

Creates a new, or specifies an existing, PDIF service and enters the PDIF Service Configuration Mode.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

[no] pdif-service *name* **[-noconfirm]**

name

Specifies the name of a new or existing PDIF service. *name* must be from 1 to 63 alpha and/or numeric characters.

Usage

Use this command to create a new or enter an existing PDIF service.
Entering this command results in the following prompt:
[*context_name*]*hostname*(config-pdif-service)#
PDIF Service Configuration Mode commands are defined in the PDIF Service Configuration Mode Commands chapter.

Example

The following command configures a PDIF service called *pdif2* and enters the PDIF Service Configuration Mode:

pdif-service *pdif2*

pdsn-service

Creates/deletes a packet data service or specifies an existing PDSN service for which to enter the packet data service configuration mode for the current context.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

pdsn-service*name*

no pdsn-service*name*

no

Indicates the packet data service specified is to be removed.

name

Specifies the name of the PDSN service to configure. If *name* does not refer to an existing service, the new service is created if resources allow. *name* must be from 1 to 63 alpha and/or numeric characters.

Usage

Enter the PDSN service configuration mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (i.e. resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Example

The following command will enter the PDSN service configuration mode creating the service *sampleService*, if necessary.

pdsn-service *sampleService*

The following command will remove *sampleService* as being a defined PDSN service.

no pdsn-service *sampleService*

pgw-service

Creates an P-GW service or specifies an existing P-GW service and enters the P-GW service configuration mode for the current context.

Product

P-GW

Privilege

Administrator

Syntax

pgw-service*service_name* **[-noconfirm]**

no pgw-service*service_name*

service_name

Specifies the name of the P-GW service. If *service_name* does not refer to an existing service, the new service is created if resources allow.
service_name must be from 1 to 63 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no pgw-service *service_name*

Removes the specified P-GW service from the context.

Usage

Enter the P-GW service configuration mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:
[*context_name*]*hostname*(config-pgw-service)#
P-GW Service Configuration Mode commands are defined in the P-GW Service Configuration Mode Commands chapter.
Use this command when configuring the following eHRPD and SAE components: P-GW.

Example

The following command enters the existing P-GW service configuration mode (or creates it if it doesn't already exist) for the service named *pgw-service1*:

pgw-service *pgw-service1*

The following command will remove *pgw-service1* from the system:

no pgw-service *pgw-service1*

policy

Enters an existing accounting policy or creates a new one where accounting parameters are configured.

Product

HSGW, P-GW, S-GW

Privilege

Administrator

Syntax

[no] policy accounting *name*

no

Removes the specified accounting policy from the context.

name

Specifies the name of the existing or new accounting policy. *name* must be from 1 to 63 alpha and/or numeric characters.

Usage

Use this command to enter the Accounting Policy Configuration mode to edit an existing accounting policy or configure an new policy.
Entering this command results in the following prompt:
[*context_name*]*hostname*(config-accounting-policy)#
Accounting Policy Configuration Mode commands are defined in the Accounting Policy Configuration Mode Commands chapter.

Example

The following command enters the Accounting Policy Configuration Mode for a policy named acct5:

policy accounting *acct5*

policy-group

This command deletes/creates and enters the Policy-Group configuration mode within the current destination context for flow-based traffic policing to a subscriber session flow.

Product

PDSN, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

[no] policy-group name *policy_group*

no

Deletes configured policy group within the context.

policy_group

Specifies the name of Policy-Group and can consist of from 1 to 15 alpha and/or numeric characters in length and is case sensitive.

Usage

Use this command to form a policy group from a set of configured Policy-Maps. A policy group supports up to 16 policies for a subscriber session flow.

Example

Following command configures a policy group policy_group1 for a subscriber session flow.

```
policy-group name policy_group1
```

policy-map

This command deletes/creates and enters the Traffic Policy-Map configuration mode within the current destination context to configure the flow-based traffic policing for a subscriber session flow.

Product

PDSN, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

[no] policy-map name *policy_name*

no

Deletes configured Policy-Map within the context.

policy_name

Specifies the name of Policy-Map and must consist of from 1 to 15 alpha and/or numeric characters in length and is case sensitive.

Usage

Use this command to enter Traffic Policy-Map configuration mode and to set the Class-Map and corresponding traffic flow treatment to traffic policy for a subscriber session flow.

Example

Following command configures a policy map policy1 w where other flow treatments is configured.

policy-map name *policy1*

ppp

Configures point-to-point protocol parameters for the current context.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

ppp { acfc { receive { allow | deny } | transmit { apply | ignore | reject} } | auth-retrysuppress-aaa-auth | chap fixed-challenge-length*length* **| dormantsend-lcp-terminate | echo-max-retransmissions***num_retries* **| echo-retransmit-timeout***msec* **| first-lcp-retransmit-timeout***milliseconds* **| lcp-authentication-discard retry-alternate***num_discard*| **lcp-authentication-reject retry-alternate | lcp-start-delay***delay* **| lcp-terminateconnect-state | lcp-terminate mip-lifetime-expiry | lcp-terminate mip-revocation | max-authentication-attempts***num* **| max-configuration-nak***num* **| max-retransmissions***number* **| max-terminate***number* **| mru***packet_size* **| negotiate default-value-options | peer-authentication***user_name* **[encrypted] password***password* **] | pfc { receive { allow | deny } | transmit { apply | ignore | reject} } | reject-peer-authentication | renegotiation retain-ip-address|retransmit-timeout***milliseconds* **}**

no ppp { auth-retrysuppress-aaa-auth | chap fixed-challenge-length | dormant send-lcp-terminate | lcp-authentication-descard retry-alternate*num_discard* **| lcp-authentication-reject retry-alternate | lcp-start-delay | lcp-terminateconnect-state | reject-peer-authentication | renegotiation retain-ip-address }**

default lcp-authentication-descard retry-alternate*num_discard*

---

default

Restores the system defaults for the specific command/keyword.

---

no ppp {auth-retry suppress-aaa-auth | chap fixed-challenge-length | dormant send-lcp-terminate |lcp-authentication-discard retry-alternate *num_discard* **| lcp-authentication-reject retry-alternate | lcp-start-delay | lcp-terminate connect-state | lcp-terminate mip-lifetime-expiry | lcp-terminate mip-revocation | negotiate default-value-options | reject-peer-authentication | renegotiation retain-ip-address}**

Disables, deletes, or resets the specified option.
In case of **no ppp renegotiation retain-ip-address,** the initially allocated IP address will be released and a new IP address will be allocated during PPP renegotiation.

---

acfc { receive { allow | deny } | transmit { apply | ignore | reject} }

Configures PPP Address and Control Field Compression (ACFC) parameters.
receive { **allow** | **deny** }
Default: allow

This keyword specifies whether to allow Address and Control Field Compressed PPP packets received from the Peer. During LCP negotiation, the local PPP side indicates whether it can handle ACFC compressed PPP packets.
When allow is specified, the local PPP side indicates that it can process ACFC compressed PPP packets and compressed packets are allowed. When deny is specified, the local PPP side indicates that it cannot handle ACFC compressed packets and compressed packets are not allowed.
transmit { **apply** | **ignore** | **reject**}
Default: ignore
Specifies how Address and Control Field Compression should be applied for PPP packets transmitted to the Peer. During LCP negotiation, the Peer indicates whether it can handle ACFC compressed PPP packets. When apply is specified, if the peer requests ACFC, the request is accepted and ACFC is applied for transmitted PPP packets. When ignore is specified, if the peer requests ACFC, the request is accepted, but ACFC is not applied for transmitted PPP packets. When reject is specified, if the peer requests ACFC, the request is rejected and ACFC is not applied to transmitted packets.

auth-retry suppress-aaa-auth

Default: **no auth-retry suppress-aaa-auth**
This option does not allow PPP authentication retries to the AAA server after the AAA server has already authenticated a session. PPP locally stores the username and password, or challenge response, after a successful PPP authentication. If the Mobile Node retries the PAP request or CHAP-Response packet to the PDSN, PPP locally compares the incoming username, password or Challenge Response with the information stored from the previous successful authentication. If it matches, PAP ACK or CHAP Success is sent back to the Mobile Node, without performing AAA authentication. If the incoming information does not match with what is stored locally, then AAA authentication is attempted. The locally stored PPP authentication information is cleared once the session reaches a connected state.

Important: This option is not supported in conjunction with the GGSN product.

chap fixed-challenge-length *length*

Default: Disabled. PAP CHAP uses a random challenge length.
Normally PPP CHAP uses a random challenge length from 17 to 32 bytes. This command allows you to configure a specific fixed challenge length of from 4 through 32 bytes.
length must be an integer from 4 through 32.

dormant send-lcp-terminate

Indicates a link control protocol (LCP) terminate message is enabled for dormant sessions.

Important: This option is not supported in conjunction with the GGSN product.

echo-max-retransmissions num_retries

Default: 3
Configures the maximum number of retransmissions of LCP ECHO_REQ before a session is terminated in an always-on session.
num_retries must be a value in the range of 1 to 16.

echo-retransmit-timeout msec

Default: 3000

Configures the timeout, in milliseconds, before trying LCP ECHO_REQ for an always-on session.
msec must be a value in the range of 100 to 5000.

first-lcp-retransmit-timeout *milliseconds*

Default: 3000
Specifies the number of milliseconds to wait before attempting to retransmit control packets. This value configures the first retry. All subsequent retries are controlled by the value configured for the ppp **retransmit-timeout** keyword.
milliseconds must be a value in the range 100 through 5000.

lcp-authentication-discard retry-alternate *num_discard*

Default: Disabled.
This keyword sets the number of discards up to which authentication option is discarded during LCP negotiation and retries starts to allow alternate authentication option.
num_discard must be an integer from 0 through 5. Recommended value is 2.

lcp-authentication-reject retry-alternate

Default: Disabled. No alternate authentication option will be retried.
The action that is taken if the authentication option is rejected during LCP negotiation and retry the allowed alternate authentication option.

lcp-start-delay *delay*

Default: 0
The delay in milliseconds before link control protocol (LCP) is started. *delay* must be an integer from 0 through 5000.

lcp-terminate connect-state

This option enables sending an LCP terminate message to the Mobile Node when a PPP session is disconnected if the PPP session was already in a connected state.
Note that if the no keyword is used with this option, the PDSN must still send LCP Terminate in the event of an LCP/PCP negotiation failure or PPP authentication failure, which happens during connecting state.

Important: This option is not supported in conjunction with the GGSN product.

lcp-terminate mip-lifetime-expiry

This option configures the PDSN to send a LCP Terminate Request when a MIP Session is terminated due to MIP Lifetime expiry (default).
Note that if the no keyword is used with this option, the PDSN does not send a LCP Terminate Request when a MIP session is terminated due to MIP Lifetime expiry.

lcp-terminate mip-revocation

This option configures the PDSN to send a LCP Terminate Request when a MIP Session is terminated due to a Revocation being received from the HA (default).
Note that if the no keyword is used with this option, the PDSN does not send a LCP Terminate Request when a MIP session is terminated due to a Revocation being received from the HA.

max-authentication-attempts *num*

Default: 1
Configures the maximum number of time the PPP authentication attempt is allowed.
num must be an integer in the range from 1 through 10.

max-configuration-nak *num*

Default: 10
This command configures the maximum number of consecutive configuration REJ/NAKs that can be sent during CP negotiations, before the CP is terminated.
num must be an integer in the range from 1 through 20.

max-retransmission *number*

Default: 5
Specifies the maximum number of times control packets will be retransmitted. *number* must be a value from 1 to 16.

max-terminate *number*

Default: 2
Sets the maximum number of PPP LCP Terminate Requests transmitted to the Mobile Node. *number* must be an integer from 0 through 16.

Important: This option is not supported in conjunction with the GGSN product.

mru *packet_size*

Default: 1500
Specifies the maximum packet size that can be received in bytes. *packet_size* must be an integer from 128 to 1500.

negotiate default-value-options

Default: Disabled
Enable the inclusion of configuration options with default values in PPP configuration requests.
The PPP standard states that configuration options with default values should not be included in Configuration Request (LCP, IPCP etc) packets. If the option is missing in the Configuration Request, the peer PPP assumes the default value for that configuration option.
When negotiate default-value-options is enabled, configuration options with default values are included in the PPP configuration Requests.

peer-authenticate *user_name* **[[encrypted] password** *password* **]**

Specifies the user name and an optional password required for point-to-point protocol peer connection authentications. *user_name* must be from 1 to 63 alpha and/or numeric characters. The keyword **password** is optional and if specified *password* must be from 1 to 63 alpha and/or numeric characters. The password specified must be in an encrypted format if the optional keyword **encrypted** was specified. The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

pfc { receive { allow | deny } | transmit { apply | ignore | reject} }

Configures Protocol Field Compression (PFC) parameters.
receive { **allow** | **deny** }
Default: allow
This keyword specifies whether to allow Protocol Field Compression (PFC) for PPP packets received from the Peer. During LCP negotiation, the local PPP side indicates whether it can handle Protocol Field Compressed PPP packets.
When allow is specified, the peer is allowed to request PFC during LCP negotiation. When deny is specified, the Peer is not allowed to request PFC during LCP negotiation.
transmit { **apply** | **ignore** | **reject**}
Default: ignore
This keyword specifies how Protocol field Compression should be applied for PPP packets transmitted to the Peer. During LCP negotiation, the Peer indicates whether it can handle PFC compressed PPP packets.
When apply is specified, if the peer requests PFC, it is accepted and PFC is applied for transmitted PPP packets. When ignore is specified, If the peer requests PFC, it is accepted but PFC is not applied for transmitted packets. When reject is specified, all requests for PCF from the peer are rejected.

reject-peer-authentication

Default: Enabled
If disabled, re-enables the system to reject peer requests for authentication.

renegotiation retain-ip-address

Default: Enabled
If enable retain the currently allocated IP address for the session during PPP renegotiation (Simple IP) between FA and Mobile node.
If disabled, the initially allocated IP address will be released and a new IP address will be allocated during PPP renegotiation.

retransmit-timeout *milliseconds*

Default: 3000
Specifies the number of milliseconds to wait before attempting to retransmit control packets.
milliseconds must be a value in the range 100 through 5000.

Usage

Modify the context PPP options to ensure authentication and communication for PPP sessions have fewer dropped sessions.

Example

The following commands set various PPP options.

```
ppp dormant send-lcp-terminate

ppp max-retransmission 3

ppp peer-authenticate user1 password secretPwd

ppp peer-authenticate user1
```

ppp retransmit-timeout *1000*

The following command disables the sending of LCP terminate messages for dormant sessions.

no ppp dormant send-lcp-terminate

ppp magic-number

This command manages magic number checking during LCP Echo message handling.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
ppp magic-number receive ignore
```

```
[ no | default ] ppp magic-number receive ignore
```

no

Disable the specified behavior.

default

Restores the system defaults for the specific command/keyword.

receive ignore

Default: Disabled.
Ignores the checking of magic number at PDSN during LCP Echo message handling.
If a valid magic numbers were negotiated for the PPP endpoints during LCP negotiation and LCP Echo Request/Response have invalid magic numbers, enabling of this command will ignore the checking of magic number during LCP Echo message handling.

Usage

Use this command to allow the system to ignore invalid magic number during LCP Echo Request/Response handling.

Example

The following command allows the invalid magic number during LCP Echo Request/Response negotiation:

```
ppp magic-number receive ignore
```

ppp statistics

This command changes the manor in which some PPP statistics are calculated.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
ppp statistics success-sessions { lcp-max-retry | misc-reasons | remote-terminated}

no ppp statistics success-sessions { lcp-max-retry | misc-reasons | remote-terminated}
```

no

Disable the specified behavior.

lcp-max-retry

Alters statistics calculations so that statistic ppp successful session is the sum of successful sessions and lcp-max-retry.

misc-reasons

Alters statistics calculations so that statistic ppp successful session is the sum of successful sessions and misc-reasons.

remote-terminated

Alters statistics calculations so that statistic ppp successful session is the sum of successful sessions and remote-terminated.

Usage

Use this command to alter how certain PPP statistics are calculated.

Caution: Use caution when using this command. This command alters the way that some PPP statistics are calculated. Please consult your designated service representative before using this command

Example

The following command alters the statistic ppp successful session so that it displays the sum of successful sessions and lcp-max-retry:

```
ppp statistics success-sessions lcp-max-retry
```

The following command disables the alteration of the statistic ppp successful session:

```
no ppp statistics success-sessions lcp-max-retry
```

proxy-dns intercept-list

Enters the HA Proxy DNS Configuration Mode and defines a name of a redirect rules list for the domain name servers associated with a particular FA or group of FAs.

Important: HA Proxy DNS Intercept is a license-enabled feature.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

[no] proxy-dns intercept-list *name*

no

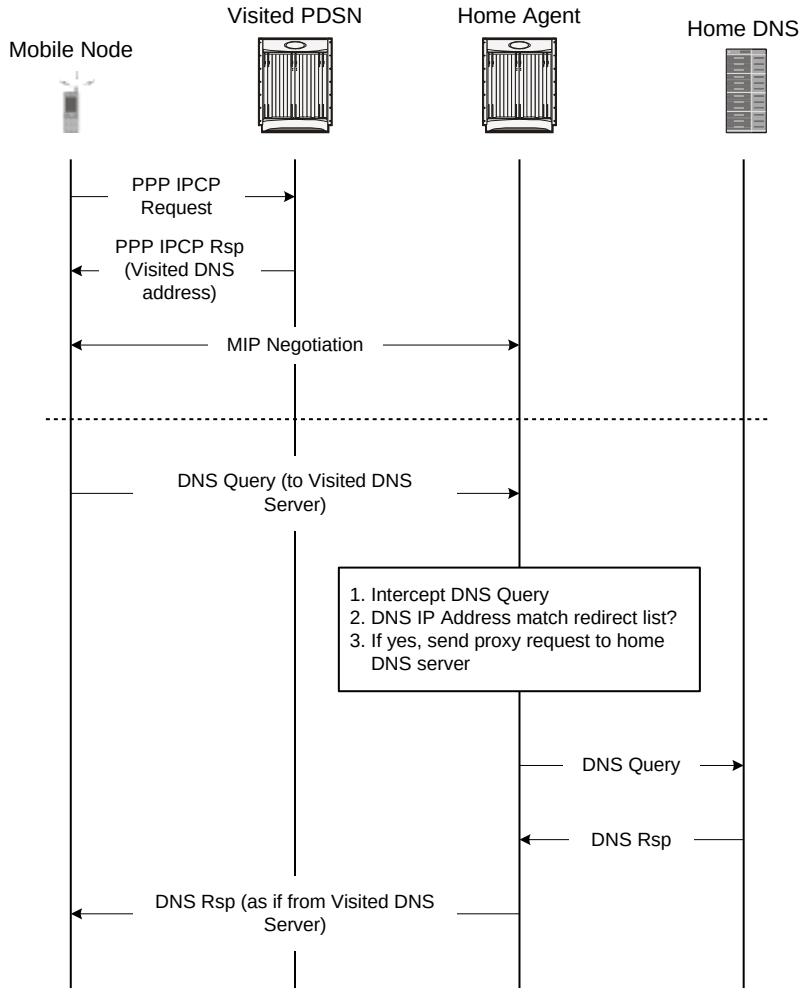
Removes the intercept list from the system.

proxy-dns intercept-list *name*

Defines the rules list and enters the Proxy DNS Configuration Mode.
name must be a string from 1 to 63 characters in length.

Usage

Use this command to define a name for a list of rules pertaining to the IP addresses associated with the foreign network's DNS. Up to 128 rules of any type can be configured per rules list.
Upon entering the command, the system switches to the HA Proxy DNS Configuration Mode where the lists can be defines. Up to 64 separate rules lists can be configured in a single AAA context.
This command and the commands in the HA Proxy DNS Configuration Mode provide a solution to the Mobile IP problem that occurs when a MIP subscriber, with a legacy MN or MN that does not support IS-835D, receives a DNS server address from a foreign network that is unreachable from the home network. The following flow shows the steps that occur when this feature is enabled:



By configuring the Proxy DNS feature on the Home Agent, the foreign DNS address is intercepted and replaced with a home DNS address while the call is being handled by the home network.

Example

The following command creates a proxy DNS rules list named *list1* and places the CLI in the HA Proxy DNS Configuration Mode:

```
proxy-dns intercept-list list1
```

radius accounting

Configures the current context's RADIUS accounting function options.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius accounting { archive[stop-only]| deadtime*dead_minutes*| **detect-dead-server { consecutive-failures***count*| **keepalive | response-timeout***seconds***} | interim interval***seconds*| **max-outstanding***msgs*| **max-pdu-size***octets*| **max-retries***tries*| **max-transmissions***trans*| **timeout***idle_seconds*| **unestablished-sessions }**

no radius accounting { archive | detect-dead-server | interim interval| max-transmissions| unestablished-sessions }

default radius accounting { deadtime| detect-dead-server | interim interval*seconds*| **max-outstanding| max-pdu-size | max-retries| max-transmissions| timeout }**

no

Removes earlier configuration for the specified keyword.

default

Configures this command with the default settings.

archive [stop-only]

Default: enabled
Enables archiving of RADIUS Accounting messages in the system after the accounting message has exhausted retries to all available RADIUS Accounting servers. All RADIUS Accounting messages generated by a session are delivered to the RADIUS Accounting server in serial. That is, previous RADIUS Accounting messages from the same call must be delivered and acknowledged by the RADIUS Accounting server before the next RADIUS Accounting message is sent to the RADIUS Accounting server.
stop-only specifies archiving of STOP accounting messages only.

deadtime *dead_minutes*

Default: 10
Specifies the number of minutes to wait before attempting to communicate with a server which has been marked as unreachable. *dead_minutes* must be an integer from 0 through 65535.

detect-dead-server { consecutive-failures *count* **| keepalive | response-timeout** *seconds* **}**

consecutive-failures *count*: Default: 4. Specifies the number of consecutive failures, for each AAA manager, before a server is marked as unreachable. *count* must be an integer from 0 through 1000.

keepalive: Enables the AAA server alive-dead detect mechanism based on sending keepalive authentication messages to all authentication servers. Default is disabled.
response-timeout *seconds*: Specifies the number of seconds for each AAA manager to wait for a response to any message before a server is detected as failed, or in a down state. *seconds* must be an integer from 1 through 65535.

Important: If both **consecutive-failures** and **response-timeout** are configured, then both parameters have to be met before a server is considered unreachable, or dead.

interim interval *seconds*

Default: Disabled
Specifies the time interval (in seconds) for sending accounting INTERIM-UPDATE records. *seconds* must be an integer from 50 through 40000000.

Important: If RADIUS is used as the accounting protocol for the GGSN product, other commands are used to trigger periodic accounting updates. However, these commands would cause RADIUS STOP/START packets to be sent as opposed to INTERIM-UPDATE packets. Also note that accounting interim interval settings received from a RADIUS server take precedence over those configured on the system.

max-outstanding *msgs*

Default: 256
Specifies the maximum number of outstanding messages a single AAA manager instance will queue. *msgs* must be an integer from 1 through 4000.

max-pdu-size *octets*

Default: 4096
Specifies the maximum sized packet data unit which can be accepted/generated in bytes (octets). *octets* must be an integer from 512 through 4096.

max-retries *tries*

Default: 5
Specifies the maximum number of times communication with a AAA server will be attempted before it is marked as unreachable and the detect dead servers consecutive failures count is incremented. *tries* must be an integer from 0 through 65535.
Once the maximum number of retries is reached this is considered a single failure for the consecutive failures count for detecting dead servers.

max-transmissions *trans*

Default: Disabled
Sets the maximum number of transmissions for a RADIUS Accounting message before the message is declared as failed. *trans* must be an integer from 1 through 65535.

timeout *seconds*

Default: 3
Specifies the amount of time to wait for a response from a RADIUS server before retransmitting a request. *seconds* must be an integer from 1 through 65535.

unestablished-sessions

Indicates RADIUS STOP events are to be generated for sessions which were initiated but never fully established.

Usage

Manage the RADIUS accounting options according to the RADIUS server used for the context.

Example

The following commands specify accounting options.

```
radius accounting detect-dead-server consecutive-failures 5
radius accounting max-pdu-size 1024
radius accounting timeout 16
```

The following commands disable/clear the options.

```
no radius accounting interim interval 10
no radius accounting unestablished-sessions
```

radius accounting algorithm

This command specifies the fail-over/load-balancing algorithm to select the RADIUS accounting server(s) to which accounting data must be sent.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius accounting algorithm { first-n *n* **| first-server | round-robin }**

default radius accounting algorithm

default

Configures this command with the default settings.
Default: first-server

first-n *n*

Default: 1 (Disabled)
Specifies that the AGW must send accounting data to *n* (more than one) AAA servers based on their priority. The full set of accounting data is sent to each of the *n* AAA servers. Response from any one of the servers would suffice to proceed with the call. On receiving an ACK from any one of the servers, all retries are stopped.
n is the number of AAA servers to which accounting data will be sent, and must be an integer from 2 through 128.

first-server

Specifies that the context must send accounting data to the RADIUS server with the highest configured priority. In the event that this server becomes unreachable, accounting data is sent to the server with the next-highest configured priority. This is the default algorithm.

round-robin

Specifies that the context must load balance sending accounting data among all of the defined RADIUS servers. Accounting data is sent in a circular queue fashion on a per Session Manager task basis, where data is sent to the next available server and restarts at the beginning of the list of configured servers. The order of the list is based upon the configured relative priority of the servers.

Usage

Use this command to specify the algorithm to select the RADIUS accounting server(s) to which accounting data must be sent.

Example

The following command specifies to use the round-robin algorithm to select the RADIUS server:

```
radius accounting algorithm round-robin
```

radius accounting apn-to-be-included

Configures the APN name to be included for RADIUS accounting.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
radius accounting apn-to-be-included { gi | gn }

default radius accounting apn-to-be-included
```

default

Configures this command with the default settings.

gi

Specifies the usage of Gi APN name in the RADIUS accounting request. Gi APN represents the APN received in the Create PDP context request message from the SGSN.

gn

Specifies the usage of Gn APN name in the RADIUS accounting request. Gn APN represents the APN selected by the GGSN.

Usage

Use this command to configure the APN name for RADIUS Accounting. This can be set to either gi or gn.

Example

The following command specifies the usage of Gn APN name in the RADIUS accounting request:

```
radius accounting apn-to-be-included gn
```

radius accounting billing-version

This command configures billing-system version of RADIUS accounting servers.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius accounting billing-version *version*

default radius accounting billing-version

default

Configures this command with the default setting.
Default: 0

version

Specifies the billing-system version, and must be an integer from 0 through 4294967295.

Usage

Use this command to configure the billing-system version of RADIUS accounting servers.

Example

The following command configures the billing-system version of RADIUS accounting servers as 10:

radius accounting billing-version *10*

radius accounting gtp trigger-policy

This command configures the RADIUS accounting trigger policy for GTP messages.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
radius accounting gtp trigger-policy [ standard | ggsn-preservation-mode ]

default radius accounting gtp trigger-policy
```

default

Resets the RADIUS accounting trigger policy to standard behavior for GTP session.

standard

This keyword sets the RADIUS accounting trigger policy to standard behavior which is configured for GTP session for GGSN service.

ggsn-preservation-mode

This keyword sends RADIUS Accounting Start when the GTP message with private extension of preservation mode is received from SGSN.

Important: This is a customer-specific keyword and needs customer-specific license to use this feature. For more information on GGSN preservation mode, refer GGSN Service Mode Commands chapter.

Usage

Use this command to set the trigger policy for the AAA accounting for a GTP session.

Example

The following command sets the RADIUS accounting trigger policy for GTP session to standard:

```
default radius accounting gtp trigger-policy
```

radius accounting ha policy

Configures the RADIUS accounting policy for HA sessions.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
radius accounting ha policy { session-start-stop | custom1-aaa-res-mgmt }
```

session-start-stop

Specifies to send Accounting Start when the session is connected, and send Accounting Stop when the session is disconnected. This is the default behavior.

custom1-aaa-res-mgmt

Accounting Start/Stop messages are generated to assist special resource management done by AAA servers. It is similar to the session-start-stop accounting policy, except for the following differences:

- Accounting Start is also generated during MIP session handoffs.
- No Accounting stop is generated when an existing session is overwritten and the new session continues to use the IP address assigned for the old session.
- Accounting Start is generated when a new call overwrites an existing session.

Usage

Use this command to set the behavior of the AAA accounting for an HA session.

Example

Use the following command to set the HA accounting policy to **custom1-aaa-res-mgmt**:

```
radius accounting ha policy custom1-aaa-res-mgmt
```

radius accounting interim volume

This command configures the volume of uplink and downlink volume octet counts that triggers RADIUS interim accounting.

Product

GGSN, PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
radius accounting interim volume { downlink bytes uplink bytes | total bytes |
uplink bytes downlink bytes }

no radius accounting interim volume
```

no

Disables volume based RADIUS accounting.

downlink *bytes* **uplink** *bytes*

Specifies the downlink to uplink volume limit for RADIUS Interim accounting, in bytes.
bytes must be an integer from 100000 through 4000000000.

total *bytes*

Specifies the total volume limit for RADIUS interim accounting in bytes.
bytes must be an integer from 100000 through 4000000000.

uplink *bytes* **downlink** *bytes*

Specifies the uplink to downlink volume limit for RADIUS interim accounting in bytes.
bytes must be an integer from 100000 through 4000000000.

Usage

Use this command to trigger RADIUS interim accounting based on the volume of uplink and downlink bytes.

Example

The following command triggers RADIUS interim accounting when the total volume of uplink and downlink bytes reaches *110000*:

```
radius accounting interim volume total 110000
```

radius accounting ip remote-address

This command configures IP remote address-based RADIUS accounting parameters.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

`[ no ] radius accounting ip remote-address { collection | list` *`list_id`* **`}`**

`no`

Removes earlier configuration for the specified keyword.

`collection`

Enables collecting and reporting Remote-Address-Based accounting in RADIUS Accounting. This should be enabled in the AAA Context. It is disabled by default.

`list` *`list_id`*

Enters the Remote Address List configuration mode. This mode configures a list of remote addresses that can be referenced by the subscriber's profile.
`list_id` must be an integer from 1 through 65535.

Usage

This command is used as part of the Remote Address-based Accounting feature to both configure remote IP address lists and enable the collection of accounting data for the addresses in those lists on a per-subscriber basis.
Individual subscriber can be associated to remote IP address lists through the configuration/specification of an attribute in their local or RADIUS profile. (Refer to the **`radius accounting`** command in the Subscriber Configuration mode.) When configured/specified, accounting data is collected pertaining to the subscriber's communication with any of the remote addresses specified in the list.
Once this functionality is configured on the system and in the subscriber profiles, it must be enabled by executing this command with the collection keyword.

Example

```
radius accounting ip remote-address collection
```

radius accounting keepalive

Configures the keepalive authentication parameters for the RADIUS accounting server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius accounting keepalive { calling-station-id *id* **| consecutive-response** *number* **| framed-ip-address** *ip_address* **| interval** *seconds* **| retries** *number* **| timeout** *seconds* **| username** *name* **}**

no radius accounting keepalive framed-ip-address

default radius accounting keepalive { calling-station-id | consecutive-response | interval | retries | timeout | username }

no

Removes configuration for the specified keyword.

default

Configures this command with the default settings.

calling-station-id *id*

Configures the Calling-Station-Id to be used for the keepalive authentication.
id must be an alpha and/or numeric string of 1 through 15 characters in length.
Default: 000000000000000

consecutive-response *number*

Configures the number of consecutive authentication response after which the server is marked as reachable.
number must be an integer from 1 through 5.
Default: 1

framed-ip-address *ip_address*

Configures the framed-ip-address to be used for the keepalive accounting.
ip_address must be specified using the standard IPv4 dotted decimal notation.

interval *seconds*

Configures the time interval between the two keepalive access requests.
Default: 30 seconds

retries *number*

Configures the number of times the keepalive access request to be sent before marking the server as unreachable.

number must be an integer from 3 through 10.
Default: 3

timeout *seconds*

Configures the time interval between each keepalive access request retries.
seconds must be an integer from 1 through 30.
Default: 3

username *name*

Configures the username to be used for the authentication.
name must be an alpha and/or numeric string of 1 through 127 characters in length.
Default: Test-Username

Usage

Configures the keepalive authentication parameters for the RADIUS accounting server.

Example

The following command sets the username for the radius keepalive access requests:

```
radius accounting keepalive username Test-Username2
```

The following command sets the number of retries to 4.

```
radius accounting keepalive retries 4
```

radius accounting rp

Configures the current context's RADIUS accounting R-P originated call options.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
radius accounting rp { handoff-stop { immediate | wait-active-stop } | tod
minute hour | trigger-event { active-handoff | active-start-param-change |
active-stop } | trigger-policy { airlink-usage [ counter-rollover ] | custom [
active-handoff | active-start-param-change | active-stop ] | standard } |
trigger-stop-start }

no radius accounting rp { tod minute hour | trigger-event { active-handoff |
active-start-param-change | active-stop } | trigger-stop-start }

default radius accounting rp { handoff-stop | trigger-policy }
```

no

Removes earlier configuration for the specified keyword.

default

Configures this command with the default settings.

handoff-stop { immediate | wait-active-stop }

Default: **wait-active-stop**
Specifies the behavior of generating accounting STOP when handoff occurs.

- **immediate**: Indicates that accounting STOP should be generated immediately on handoff, i.e. not to wait active-stop from the old PCF.
- **wait-active-stop**: Indicates that accounting STOP is generated only when active-stop received from the old PCF when handoff occurs.

tod *minute hour*

Specifies the time of day a RADIUS event is to be generated for accounting. Up to four different times of the day may be specified through separate commands.
minute must be an integer from 0 through 59.
hour must be an integer from 0 through 23.

trigger-event { active-handoff | active-start-param-change | active-stop }

Default:**active-handoff**: Disabled
active-start-param-change: Enabled
active-stop: Disabled
Configures the events for which a RADIUS event is generated for accounting as one of the following:

- **active-handoff**: Disables a single R-P event (and therefore a RADIUS accounting event) when an Active PCF-to-PFC Handoff occurs. Instead, two R-P events occur (one for the Connection Setup, and the second for the Active-Start).
- **active-start-param-change**: Disables an R-P event (and therefore a RADIUS accounting event) when an Active-Start is received from the PCF and there has been a parameter change.
- **active-stop**: Disables an R-P event (and therefore a RADIUS accounting event) when an Active-Stop is received from the PCF.

Important: This keyword has been obsoleted by the **trigger-policy** keyword. Note that if this command is used, if the context configuration is displayed, radius accounting rp configuration is represented in terms of the trigger-policy.

trigger-policy { airlink-usage [counter-rollover] | custom [active-handoff | active-start-param-change | active-stop] | standard }

Default:**airlink-usage**: Disabled
custom:
active-handoff = Disabled
active-start-param-change = Disabled
active-stop = Disabled
standard: Enabled
Configures the overall accounting policy for R-P sessions as one of the following:

- **airlink-usage [counter-rollover]**: Designates the use of Airlink-Usage RADIUS accounting policy for R-P, which generates a start on Active-Starts, and a stop on Active-Stops.

If the **counter-rollover** option is enabled, the system generates a STOP/START pair before input/output data octet counts (or input/output data packet counts) become larger than (2^32 - 1) in value. This setting is used to guarantee that a 32-bit octet count in any STOP message has not wrapped to larger than 2^32 thus ensuring the accuracy of the count. The system, may, at its discretion, send the STOP/START pair at any time, so long as it does so before the 32-bit counter has wrapped. Note that a STOP/START pair is never generated unless the subscriber RP session is in the Active state, since octet/packet counts are not accumulated when in the Dormant state.

- **custom**: Specifies the use of custom RADIUS accounting policy for R-P. The custom policy can consist of the following:
- **active-handoff**: Enables a single R-P event (and therefore a RADIUS accounting event) when an Active PCF-to-PFC Handoff occurs. Normally two R-P events will occur (one for the Connection Setup, and the second for the Active-Start).
- **active-start-param-change**: Enables an R-P event (and therefore a RADIUS accounting event) when an Active-Start is received from the PCF and there has been a parameter change.

Important: Note that a custom trigger policy with only **active-start-param-change** enabled is identical to the **standard** trigger-policy.

- **active-stop**: Enables an R-P event (and therefore a RADIUS accounting event) when an Active-Stop is received from the PCF.

Important: If the **radius accounting rp trigger-policy custom** command is executed without any of the optional keywords, all custom options are disabled.

- **standard**: Specifies the use of Standard RADIUS accounting policy for R-P in accordance with IS-835B.

trigger-stop-start

Specifies that a stop/start RADIUS accounting pair should be sent to the RADIUS server when an applicable R-P event occurs.

Usage

Use this command to configure the events for which a RADIUS event is sent to the server when the accounting procedures vary between servers.

Example

The following command enables an R-P event (and therefore a RADIUS accounting event) when an Active-Stop is received from the PCF:

```
radius accounting rp trigger-event active-stop
```

The following command generates the STOP only when active-stop received from the old PCF when handoff occurs:

```
default radius accounting rp handoff-stop
```

radius accounting server

Configures RADIUS accounting server(s) in the current context for accounting.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius [mediation-device] accounting server *ip_address* **[encrypted] key** *value* **[acct-on { enable | disable }] [acct-off { enable | disable }] [max** *msgs* **] [oldports] [port** *port_number* **] [priority** *priority* **] [type { mediation-device | standard }] [admin-status { enable | disable }] [-noconfirm]**

no radius [mediation-device] accounting server *ip_address* **[oldports | port** *port_number* **]**

no

Removes the server or server port(s) specified from the list of configured servers.

mediation-device

Enables mediation-device specific AAA transactions use to communicate with this RADIUS server.

Important: If this option is not used, the system, by default, enables standard AAA transactions.

ip_address

Specifies the IP address of the accounting server. *ip_address* must be specified in dotted decimal notation for IPv4 or colon notation for IPv6. A maximum of 128 RADIUS servers can be configured per context. This limit includes accounting and authentication servers.

[encrypted] key*value*

Specifies the shared secret key used to authenticate the client to the servers. The **encrypted** keyword indicates the key specified is encrypted. The key *value* must be a string of 1 to 15 alpha and/or numeric characters or a string of 1 to 30 alpha and/or numeric characters when encrypted.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **key** keyword is the encrypted version of the plaint text key. Only the encrypted key is saved as part of the configuration file.

acct-on { enable | disable }

Default: **disable**
Enables and disables sending of the Accounting-On message when a new RADIUS server is added to the configuration.
When enabled, the Accounting-On message is sent when a new RADIUS server is added in the configuration. However, if for some reason the Accounting-On message cannot be sent at the time of server configuration

(for example, if the interface is down), then the message is sent as soon as possible. Once the Accounting-On message is sent, if it is not responded to after the configured RADIUS accounting timeout, the message is retried the configured number of RADIUS accounting retries. Once all retries have been exhausted, the system no longer attempts to send the Accounting-On message for this server.

acct-off { enable | disable }

Default: **enable**
Disables and enables the sending of the Accounting-Off message when a RADIUS server is removed from the configuration.
The Accounting-Off message is sent when a RADIUS server is removed from the configuration, or when there is an orderly shutdown. However, if for some reason the Accounting-On message cannot be sent at this time, it is never sent. The Accounting-Off message is sent only once, regardless of how many accounting retries are enabled.

max *msgs*

Default: 0
Specifies the maximum number of outstanding messages that may be allowed to the server. *msgs* must be an integer from 1 through 256.

oldports

Sets the UDP communication port to the out of date standardized default for RADIUS communications to 1646.

port *port_number*

Default: 1813
Specifies the port number to use for communications. *port_number* must be an integer from 0 through 65535.

priority *priority*

Default: 1000
Specifies the relative priority of this accounting server. The priority is used in server selection for determining which server to send accounting data to. *priority* must be an integer from 1 through 1000, where 1 is the highest priority. When configuring two or more servers with the same priority you will be asked to confirm that you want to do this. If you use the **-noconfirm** option, you are not asked for confirmation and multiple servers could be assigned the same priority.

type { mediation-device | standard }

Default: **standard**
mediation-device: Obsolete keyword.
Specifies the type of AAA transactions to use to communicate with this RADIUS server.
standard: Use standard AAA transactions.

admin-status { enable | disable }

Enables or disables the RADIUS { authentication | accounting | charging } server functionality and saves the status setting in the configuration file to re-establish the set status at reboot.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

This command is used to configure the RADIUS accounting servers with which the system is to communicate for accounting.
Up to 128 RADIUS servers can be configured per context. The servers can be configured as Accounting, Authentication, charging servers, or any combination thereof.

Example

radius accounting server *1.2.3.4* **key** *sharedKey* **port** *1024* **max** *127*

radius accounting server *1.2.5.6* **encrypted key** *scrambledKey* **oldports priority***10*

no radius accounting server *1.2.5.6*

Following command sets the accounting server with mediation device transaction for AAA server 1.2.4.6:

radius mediation-device accounting server *1.2.3.4* **key** *sharedKey* **port** *1024* **max** *127*

radius algorithm

Configures the RADIUS authentication server selection algorithm for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius algorithm { first-server | round-robin }

default radius algorithm

default

Configures this command with the default settings.

first-server | round-robin

Default: **first-server**
first-server: Authentication data is sent to the first available server based upon the relative priority of each configured server.
round-robin: Authentication data is sent in a circular queue fashion on a per Session Manager task basis where data is sent to the next available server and restarts at the beginning of the list of configured servers. The order of the list is based upon the configure relative priority of the servers.

Usage

Set the context's RADIUS server selection algorithm to ensuring proper load distribution through the servers available.

Example

radius algorithm first-server

radius algorithm round-robin

radius allow

Sets the system behavior for allowing subscriber sessions when RADIUS accounting and/or authentication is unavailable.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] radius allow { accounting-down | authentication-down }
```

no

Removes earlier configuration for the specified keyword.

authentication-down

Default: Disabled
Allows sessions while authentication is not available (down).

accounting-down

Default: Enabled
Allows sessions while accounting is unavailable (down).

Usage

Allow sessions during system troubles when the risk of IP address and/or subscriber spoofing is minimal. The denial of sessions may cause dissatisfaction with subscribers at the cost/expense of verification and/or accounting data.

Example

```
radius allow authentication-down

no radius allow authentication-down

radius allow accounting-down

no radius allow accounting-down
```

radius attribute

Configures the system's RADIUS identification parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius attribute { nas-identifier id | nas-ip-address address primary_address [
backupsecond_address ] [ nexthop-forwarding-address nexthop_address ] [ vlan
vlan_id ] [ mpls-label input in_label_value output out_label_value1
out_label_value1  ] }
```

no radius attribute { nas-identifier | nas-ip-address }

default radius attribute nas-identifier

---

no

Removes earlier configuration for the specified keyword.

---

default

Configures this command with the default settings.

---

nas-identifier *id*

Specifies the attribute name by which the system will be identified in Access-Request messages. *id* must be a case-sensitive alpha and/or numeric string of 1 through 32 characters in length.

---

nas-ip-address address *primary_address*

Specifies the AAA interface IP address(es) to used to identify the system. Up to two addresses can be configured.
primary_address : The IP address of the primary interface to use in the current context. This must be specified in dotted decimal notation for IPv4 or colon notation for IPv6.

---

backup *second_address*

Specifies the IP address of the secondary interface to use in the current context. This must be in dotted decimal notation for IPv4 or colon notation for IPv6.

---

mpls-label input *in_label_value* **| output** *out_label_value1* **[** *out_label_value2* **]**

This command configures the traffic from the specified AAA client NAS IP address to use the specified MPLS labels.

- *in_label_value* is the MPLS label that identifies inbound traffic destined for the configured NAS IP address.

- *out_label_value1* & *out_label_value2* identify the MPLS labels to be added to the packets sent from the specified NAS IP address.
- *out_label_value1* is the inner output label.
- *out_label_value2* is the outer output label.

MPLS label values must be an integer from 16 to 1048575.

nexthop-forwarding-address *nexthop_address*

Configures the next hop IP address for this NAS IP address.
nexthop_address must be an IPv4 address or an IPv6 address in standard format.

vlan *vlan_id*

Configures VLAN ID to be associated with the next-hop IP address.
vlan_id must be an integer from 1 through 4094.

Usage

This is necessary for NetWare Access Server usage such as the system must be identified to the NAS.
The system supports the concept of the active nas-ip-address. The active nas-ip-address is defined as the current source ip address for RADIUS messages being used by the system. This is the content of the nas-ip-address attribute in each RADIUS message.
The system will always have exactly one active nas-ip-address. The active nas-ip-address will start as the primary nas-ip-address. However, the active nas-ip-address may switch from the primary to the backup, or the backup to the primary. The following events will occur when the active nas-ip-address is switched:

- All current in-process RADIUS accounting messages from the entire system are cancelled. The accounting message is re-sent, with retries preserved, using the ne w active nas-ip-address. Acct-Delay-Time, however, is updated to reflect the time that has occurred since the accounting event. The value of Event-Timestamp is preserved.
- All current in-process RADIUS authentication messages from the entire system are cancelled. The authentication message is re-sent, with retries preserved, using the new active nas-ip-address. The value of Event-Timestamp is preserved.
- All subsequent in-process RADIUS requests uses the new active nas-ip-address.

The system uses a revertive algorithm when transitioning active NAS IP addresses as described below:

- If the configured primary nas-ip-address transitions from UP to DOWN, and the backup nas-ip-address is UP, then the active nas-ip-address switches from the primary to the backup nas-ip-address
- If the backup nas-ip-address is active, and the primary nas-ip-address transitions from DOWN to UP, then the active nas-ip-address switches from the backup to the primary nas-ip-address

Example

```
radius attribute nas-ip-address 1.2.3.4
no radius attribute nas-identifier sampleID
```

radius authenticate

Enables (allows) and disables (prevents) the authentication of user names that are blank or empty. This is enabled by default.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] radius authenticate null-username
```

default

Configures this command with the default settings for authenticating, sending Access-Request messages to the AAA server, all user names, including NULL user names.

no

Disables sending an Access-Request message to the AAA server for user names (NAI) that are blank.

Usage

Use this command to disable, or re-enable, sending Access-Request messages to the AAA server for user names (NAI) that are blank (NULL).

Example

To disable sending Access-Request messages for user names (NAI) that are blank, enter the following command:

```
no radius authenticate null-username
```

To re-enable sending Access-Request messages for user names (NAI) that are blank, enter the following command:

```
radius authenticate null-username
```

radius authenticate apn-to-be-included

Configures the APN name to be included for RADIUS authentication.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default ] radius authenticate apn-to-be-included { gi | gn }
```

default

Configures this command with the default settings.

gi

Specifies the usage of Gi APN name in the RADIUS authentication request. Gi APN represents the APN received in the Create PDP context request message from the SGSN.

gn

Specifies the usage of Gn APN name in the RADIUS authentication request. Gn APN represents the APN selected by the GGSN.

Usage

Use this command to configure the APN name for RADIUS authentication. This can be set to either gi or gn.

Example

The following command specifies the usage of Gn APN name in the RADIUS authentication request.

```
radius authenticate apn-to-be-included gn
```

radius authenticator-validation

Enables (allows) and disables (prevents) the MD5 authentication of RADIUS user. This is enabled by default.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] radius authenticator-validation
```

no

Disables MD5 authentication validation for an Access-Request message to the AAA server.

default

Enables MD5 authentication validation for an Access-Request message to the AAA server.

no

Disable sending an Access-Request message to the AAA server for usernames (NAI) that are blank.

Usage

Use this command to disable, or re-enable, sending Access-Request messages to the AAA server for MD5 validation.

Example

To disable MD5 authentication validation for Access-Request messages for usernames (NAI), enter the following command:

```
no radius authenticator-validation
```

To enable MD5 authentication validation for Access-Request messages for usernames (NAI), enter the following command:

```
radius radius authenticator-validation
```

radius change-authorize-nas-ip

Defines the NAS IP address and UDP port on which the current context will listen for Change of Authorization (COA) messages and Disconnect Messages (DM). If the NAS IP address is not defined with this command, any COA or DM messages from the RADIUS server are returned with a Destination Unreachable error.

Product

PDSN, FA, HA, GGSN, LNS

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] radius change-authorize-nas-ip ip_address [ encrypted ] key value [ port
port ] [ event-timestamp-window window ] [ no-nas-identification-check] [ no-
reverse-path-forward-check ] [ mpls-label input in_label_value | output
out_label_value1 [ out_label_value2 ]
```

no

Deletes the NAS IP address information which disables the system from receiving and responding to COA and DM messages from the RADIUS server.

ip_address

Specifies the NAS IP address of the current context's AAA interface that was defined with the **radius attribute** command.
ip_Address can either be an IPv4 address expressed in dotted decimal notation, or an IPv6 address expressed in colon notation.

[encrypted] key*value*

Specifies the shared secret key used to authenticate the client to the servers. The **encrypted** keyword indicates the key specified is encrypted. The key *value* must be a string of 1 to 15 alpha and/or numeric characters or a string of 1 to 30 alpha and/or numeric characters when encrypted.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **key** keyword is the encrypted version of the plain text key. Only the encrypted key is saved as part of the configuration file.

port *port*

Default: 3799
The UDP port on which to listen for COA and DM messages.

event-timestamp-window *window*

Default: 300 seconds
window must be an integer from 0 through 4294967295.
When a COA or DM request is received with an event-time-stamp, if the current-time is greater than received-pkt-event-time-stamp plus event-time-stamp-window, the packet is silently discarded
When a COA or DM request is received without the event-timestamp attribute, the packet is silently discarded.

If *window* is specified as 0 (zero), this feature is disabled; the event-time-stamp attribute in COA or DM messages is ignored and the event-time-stamp attribute is not included in NAK or ACK messages.

no-nas-identification-check

Disables the context from checking the NAS Identifier/ NAS IP Address while receiving the CoA/DM requests.
By default this check is enabled.

no-reverse-path-forward-check

Disables the context from checking whether received COA or DM packets are from one of the AAA servers configured in the current context. Only the src-ip address in the received COA or DM request is validated and the port and key are ignored.
reverse-path-forward-check is enabled by default.
When reverse-path-forward-check is disabled, CoA and DM messages are accepted from any AAA server.

mpls-label input *in_label_value* **| output** *out_label_value1* **[** *out_label_value2* **]**

This command configures COA traffic to use the specified MPLS labels.

- *in_label_value* is the MPLS label that identifies inbound COA traffic.
- *out_label_value1* & *out_label_value2* identify the MPLS labels to be added to COA response.
- *out_label_value1* is the inner output label.
- *out_label_value2* is the outer output label.

MPLS label values must be an integer from 16 to 1048575.

Usage

Use this command to enable the current context to listen for COA and DM messages.
Any one of the following RADIUS attributes may be used to identify the subscriber:

- **3GPP-IMSI:** The IMSI of the subscriber. It may include the 3GPP-NSAPI attribute to delete a single PDP context rather than all of the PDP contexts of the subscriber when used with the GGSN product.
- **Framed-IP-address:** The IP address of the subscriber.
- **Acct-Session-Id:** Identifies a subscriber session or PDP context;

Important: For the GGSN product, the value for Acct-Session-Id that is mandated by 3GPP is used instead of the special value for Acct-Session-Id that we use in the RADIUS messages we exchange with a RADIUS accounting server.

Important: When this command is used in conjunction with the GGSN, CoA functionality is not supported.

Example

Specify the IP address *192.168.100.10* as the NAS IP address, a key value of *123456* and use the default port of *3799*, by entering the following command:

```
radius change-authorize-nas-ip 192.168.100.10 key 123456
```

Following disables the nas-identification-check for the above parameters:

```
radius change-authorize-nas-ip 192.168.100.10 key 123456 no-nas-
identification-check
```

radius charging

Configures basic RADIUS options for Active Charging Services.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no | default] radius charging { deadtime *dead_minutes* **| detect-dead-server { consecutive-failures** *count* **| response-timeout** *seconds* **} | max-outstanding** *msgs* **| max-retries** *tries* **| max-transmissions** *transmissions* **| timeout** *idle_seconds* **}**

no

Removes configuration for the specified keyword.

default

Configures this command with the default settings.

deadtime *dead_minutes*

Default: 10
Specifies the number of minutes to wait before attempting to communicate with a server which has been marked as unreachable. *dead_minutes* must be an integer from 0 through 65535.

detect-dead-server { consecutive-failures *count* **| response-timeout** *seconds***}**

consecutive-failures *count*: Default: 4. Specifies the number of consecutive failures, for each AAA manager, before a server is marked as unreachable. *count* must be an integer from 0 through 1000.
response-timeout *seconds*: Specifies the number of seconds for each AAA manager to wait for a response to any message before a server is detected as failed, or in a down state.

max-outstanding *msgs*

Default: 256
Specifies the maximum number of outstanding messages a single AAA manager instance will queue. *msgs* must be an integer from 1 through 4000.

max-retries *tries*

Default: 5
Specifies the maximum number of times communication with a AAA server will be attempted before it is marked as unreachable and the detect dead servers consecutive failures count is incremented. *tries* must be an integer from 0 through 65535.

max-transmissions *transmissions*

Default: Disabled

Sets the maximum number of re-transmissions for RADIUS authentication requests. This limit is used in conjunction with the **max-retries** for each server.
When failing to communicate with a RADIUS sever, the subscriber is failed once all of the configured RADIUS servers have been exhausted or once the configured number of maximum transmissions is reached. For example, if 3 servers are configured and if the configured max-retries is 3 and max-transmissions is 12, then the primary server is tried 4 times (once plus 3 retries), the secondary server is tried 4 times, and then a third server is tried 4 times. If there is a fourth server, it is not tried because the maximum number of transmissions (12) has been reached.
transmissions must be an integer from 1 through 65535.

timeout *idle_seconds*

Default: 3
Specifies the number of seconds to wait for a response from the RADIUS server before re-sending the messages. *idle_seconds* must be an integer from 1 through 65535.

Usage

Manage the basic Charging Service RADIUS options according to the RADIUS server used for the context.

Example

radius charging detect-dead-server consecutive-failures *6*

radius charging timeout *300*

radius charging accounting algorithm

This command specifies the fail-over/load-balancing algorithm to be used for selecting RADIUS servers for charging services.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
radius charging accounting algorithm { first-n n | first-server | round-robin }
```

first-n *n*

Default: 1 (Disabled)
Specifies that the AGW must send accounting data to *n* (more than one) AAA servers based on their priority. Response from any one of the *n* AAA servers would suffice to proceed with the call. The full set of accounting data is sent to each of the *n* AAA servers.
n is the number of AAA servers to which accounting data will be sent, and must be an integer from 2 through 128.

first-server

Specifies that the context must send accounting data to the RADIUS server with the highest configured priority. In the event that this server becomes unreachable, accounting data is sent to the server with the next-highest configured priority. This is the default algorithm.

round-robin

Specifies that the context must load balance sending accounting data among all of the defined RADIUS servers. Accounting data is sent in a circular queue fashion on a per Session Manager task basis, where data is sent to the next available server and restarts at the beginning of the list of configured servers. The order of the list is based upon the configured relative priority of the servers.

Usage

Use this command to specify the accounting algorithm to use to select RADIUS servers for charging services configured in the current context.

Example

The following command specifies to use the round-robin algorithm to select the RADIUS server:

```
radius charging accounting algorithm round-robin
```

radius charging accounting server

Configures RADIUS charging accounting servers in the current context for Active Charging Services prepaid accounting.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius charging accounting server ip_address [ encrypted ] key value [ max msgs
] [ max-rate max_rate ] [ oldports ] [ port port_number ] [ priority priority ]
[ admin-status { enable | disable } ] [ -noconfirm ]

no radius charging accounting server ip_address [ oldports | port port_number ]
```

no

Removes the server or server port(s) specified from the list of configured servers.

ip_address

Specifies IP address of the accounting server. *ip_address* must be specified using the standard IPv4 dotted decimal notation. A maximum of 128 RADIUS servers can be configured per context. This limit includes accounting and authentication servers.

[encrypted] key*value*

Specifies the shared secret key used to authenticate the client to the servers. The **encrypted** keyword indicates the key specified is encrypted. The key *value* must be a string of 1 to 15 alpha and/or numeric characters, or when encrypted a string of 1 to 30 alpha and/or numeric characters.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **key** keyword is the encrypted version of the plaint text key. Only the encrypted key is saved as part of the configuration file.

max *msgs*

Default: 0
Specifies the maximum number of outstanding messages that may be allowed to the server.
msgs must be integer from 0 through 4000.

max-rate *max_rate*

Default: Disabled
Specifies the rate (number of messages per second), at which the authentication messages should be sent to the RADIUS server.
max_rate must be an integer from 1 through 1000.

oldports

Sets the UDP communication port to the out of date standardized default for RADIUS communications to 1646.

port *port_number*

Default: 1813
Specifies the port number to use for communications. *port_number* must be an integer from 0 through 65535.

priority *priority*

Default: 1000
Specifies the relative priority of this accounting server. The priority is used in server selection for determining which server to send accounting data to. *priority* must be a value in the range 1 through 1000 where 1 is the highest priority.

admin-status { enable | disable }

Enables or disables the RADIUS { authentication | accounting | charging } server functionality and saves the status setting in the configuration file to re-establish the set status at reboot.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

This command is used to configure the RADIUS charging accounting server(s) with which the system is to communicate for Active Charging Services prepaid accounting requests.

Example

Up to 128 AAA servers can be configured per context when the system is functioning as a PDSN and/or HA. Up to 16 servers are supported per context when the system is functioning as a GGSN.

```
radius charging accounting server 1.2.3.4 key sharedKey port 1024 max 127
```

```
radius charging accounting server 1.2.5.6 encrypted key scrambledKey
oldports priority10 ]
```

```
no radius charging accounting server 1.2.5.6
```

radius charging algorithm

Configures the RADIUS authentication server selection algorithm for Active Charging Services for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius charging algorithm { first-server | round-robin }

default radius charging algorithm
```

default

Configures this command with the default settings.
Default: first-server

first-server

Accounting data is sent to the first available server based upon the relative priority of each configured server.

round-robin

Accounting data is sent in a circular queue fashion on a per Session Manager task basis where data is sent to the next available server and restarts at the beginning of the list of configured servers. The order of the list is based upon the configured relative priority of the servers.

Usage

Set the context's RADIUS server selection algorithm for Active Charging Services to ensure proper load distribution through the servers available.

Example

```
radius algorithm first-server

radius algorithm round-robin
```

radius charging server

Configures the RADIUS charging server(s) in the current context for Active Charging Services prepaid authentication.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius charging server *ip_address* **[encrypted] key** *value* **[max** *msgs* **] [max-rate** *max_rate* **] [oldports] [port** *port_number* **] [priority** *priority* **] [admin-status { enable | disable }] [-noconfirm]**

no radius charging server *ip_address* **[oldports | port** *port_number* **]**

---

no

Removes the server or server port(s) specified from the list of configured servers.

---

ip_address

Specifies the IP address of the server. *ip_address* must be specified using the standard IPv4 dotted decimal notation. A maximum of 128 RADIUS servers can be configured per context. This limit includes accounting and authentication servers.

[encrypted] key*value*

Specifies the shared secret key used to authenticate the client to the servers. The **encrypted** keyword indicates the key specified is encrypted. The key *value* must be a string of 1 to 15 alpha and/or numeric characters, or when encrypted a string of 1 to 30 alpha and/or numeric characters.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **key** keyword is the encrypted version of the plain text key. Only the encrypted key is saved as part of the configuration file.

---

max *msgs*

Default: 256
Specifies the maximum number of outstanding messages that may be allowed to the server.
msgs must be an integer from 0 through 4000.

---

max-rate *max_rate*

Default: Disabled
Specifies the rate (number of messages per second), at which the authentication messages should be sent to the RADIUS server.
max_rate must be an integer from 1 through 1000.

---

oldports

Sets the UDP communication port to the old default for RADIUS communications to 1645.

port*port_number*

Default: 1812
Specifies the port number to use for communications. *port_number* must be an integer from 0 through 65535.

priority *priority*

Default: 1000
Specifies the relative priority of this accounting server. The priority is used in server selection for determining which server to send accounting data to. *priority* must be a value in the range 1 through 1000 where 1 is the highest priority.

admin-status { enable | disable }

Enables or disables the RADIUS { authentication | accounting | charging } server functionality and saves the status setting in the configuration file to re-establish the set status at reboot.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

This command is used to configure the RADIUS charging server(s) with which the system is to communicate for Active Charging Services prepaid authentication requests.

Example

Up to 128 AAA servers can be configured per context when the system is functioning as a PDSN and/or HA. Up to 16 servers are supported per context when the system is functioning as a GGSN.

```
radius charging server 1.2.3.4 key sharedKey port 1024 max 127

radius charging server  1.2.5.6 encrypted key scrambledKey oldports
priority 10 ]

no radius server 1.2.5.6
```

radius dictionary

This command configures the RADIUS dictionary for RADIUS prepaid charging.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius dictionary *dictionary*

default radius dictionary

default

Configures this command with the default setting.

dictionary *dictionary*

Specifies the dictionary to use.
The possible values are described in the following table.

Table 17.

Dictionary	Description
3gpp	This dictionary consists of all the attributes in the standard dictionary, and all of the attributes specified in 3GPP 32.015.
3gpp2	This dictionary consists of all the attributes in the standard dictionary, and all of the attributes specified in IS-835-A.
3gpp2-835	This dictionary consists of all the attributes in the standard dictionary, and all of the attributes specified in IS-835.
custom*XX*	These are customized dictionaries. For information on custom dictionaries, please contact your local service representative. *XX* is the integer value of the custom dictionary. ***Important:*** RADIUS dictionary *custom23* should be used in conjunction with Active Charging Service (ACS). Refer to the *Enhanced Charging Service Configuration and Reference Guide* for more information.
standard	This dictionary consists only of the attributes specified in RFC 2865, RFC 2866, and RFC 2869.
starent	This dictionary consists of all the attributes in the starent-vsa1 dictionary and incorporates additional VSAs by using a two-byte VSA Type field. This dictionary is the master-set of all of the attributes in all of the dictionaries supported by the system.

Dictionary	Description
starent-835	This dictionary consists of all of the attributes in the starent-vsa1-835 dictionary and incorporates additional VSAs by using a two-byte VSA Type field. This dictionary is the master-set of all of the attributes in all of the -835 dictionaries supported by the system.
starent-vsa1	This dictionary consists not only of the 3gpp2 dictionary, but also includes vendor-specific attributes (VSAs) as well. The VSAs in this dictionary support a one-byte wide VSA Type field in order to support certain RADIUS applications. The one-byte limit allows support for only 256 VSAs (0 - 255). This is the default dictionary.
starent-vsa1-835	This dictionary consists not only of the 3gpp2-835 dictionary, but also includes vendor-specific attributes (VSAs) as well. The VSAs in this dictionary support a one-byte wide VSA Type field in order to support certain RADIUS applications. The one-byte limit allows support for only 256 VSAs (0 - 255). This is the default dictionary.

Usage

Use this command to assign the RADIUS dictionary according to the RADIUS server used for the context.

Example

The following command sets *custom23* as dictionary for prepaid charging:

```
radius dictionary custom23
```

radius group

This command has been deprecated and is replaced by AAA Server Group configurations. See the *AAA Server Group Configuration Mode Commands* chapter.

radius ip vrf

This command associates the default AAA group with a Virtual Routing and Forwarding (VRF) Context instance for GRE tunnel interface configuration. By default the VRF is NULL, which means that default AAA group is associated with global routing table.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius ip vrf *vrf_name*

no radius ip vrf

no

Removes/disassociates configured IP Virtual Routing and Forwarding (VRF) context instance.

vrf_name

Specifies the name of a pre-configured VRF context instance.
vrf_name is name of a pre-configured virtual routing and forwarding (VRF) context configured in Context configuration mode through **ip vrf** command.

Usage

Use this command to associate/disassociate a pre-configured VRF context for a GRE tunnel interface.
By default the VRF is NULL, which means that default AAA group is associated with global routing table.

Example

Following command associates VRF context instance *GRE_vrf1* with this AAA group:
radius ip vrf *GRE_vrf1*

radius keepalive

Configures the keepalive authentication parameters for the RADIUS server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[default] radius keepalive [calling-station-id *id* **| consecutive-response** *number* **| encrypted | interval** *seconds* **| password | retries** *number* **| timeout** *seconds* **| username** *name* **| valid-response access-accept [access-reject]]**

default

Configures this command with the default settings.

calling-station-id *id*

Configures the Calling-Station-Id to be used for the keepalive authentication. *id* must be an alpha and/or numeric string of 1 through 15 characters in length.
Default: 000000000000000

consecutive-response *number*

Configures the number of consecutive authentication response after which the server is marked as reachable. *number* must be integer from 1 through 5.
Default: 1

encrypted password

Designates use of encryption for the password. *password* must be an alpha and/or numeric string of 1 through 64 characters in length.
Default: Test-Password

interval *seconds*

Configures the time interval between the two keepalive access requests.
Default: 30 seconds

password

Configures the password to be used for the authentication. *password* must be an alpha and/or numeric string of 1 through 64 characters in length.
Default: Test-Password

retries *number*

Configures the number of times the keepalive access request to be sent before marking the server as unreachable. *number* must be an integer from 3 through 10.
Default: 3

timeout *seconds*

Configures the time interval between each keepalive access request retries. *seconds* must be an integer from 1 through 30.
Default: 3 seconds

username *name*

Configures the username to be used for the authentication. *name* must be an alpha and/or numeric string of 1 through 127 characters in length.
Default: Test-Username

valid-response access-accept [*access-reject* **]**

Configures the valid response for the authentication request.
If *access-reject* is configured, then both access-accept and access-reject are considered as success for the keepalive authentication request.
If *access-reject* is not configured, then only access-accept is considered as success for the keepalive access request.
Default: **keepalive valid-response access-accept**

Usage

Configures the keepalive authentication parameters for the RADIUS server.

Example

The following command sets the user name for the RADIUS keepalive access requests:

```
radius keepalive username Test-Username2
```

The following command sets the number of retries to 4.

```
radius keepalive retries 4
```

radius mediation-device

See the **radius accounting server** command.

radius probe-interval

Configures the interval duration between two RADIUS authentication probes.

Product

GGSN, HA

Privilege

Security Administrator, Administrator

Syntax

radius probe-interval *seconds*

default radius probe-interval

default

Configures this command with the default settings.

seconds

Default: 3
Specifies the amount of time in seconds to wait before sending another probe authentication request to a RADIUS server. *seconds* must be an integer from 1 through 65535.

Usage

Use this command for Home Agent Geographical Redundancy (HAGR) support to set the duration between two authentication probes to the RADIUS serve.

Example

Following command sets the authentication probe interval to 30 seconds.

radius probe-interval *30*

radius probe-max-retries

Configures the number of retries for RADIUS authentication probe response.

Product

GGSN, HA

Privilege

Security Administrator, Administrator

Syntax

radius probe-max-retries *retries*

default radius probe-max-retries

default

Configures this command with the default settings.

retries

Default: 5
Specifies the number of retries for RADIUS authentication probe response before the authentication is declared as failed.
retries must be an integer from 1 through 65535.

Usage

Use this command for Interchassis Session Recovery (ICSR) support to set the number of attempts to send RADIUS authentication probe without a response before the authentication is declared as failed.

Example

The following command sets the maximum number of retries to *6*:

radius probe-max-retries *6*

radius probe-timeout

Configures the timeout duration to wait for a response for RADIUS authentication probes.

Product

GGSN, HA

Privilege

Security Administrator, Administrator

Syntax

radius probe-timeout *idle_seconds*

default radius probe-timeout

default

Configures this command with the default settings.

idle_seconds

Default: 3
Specifies the number of seconds to wait for response from the RADIUS server before resending the authentication probe.
idle_seconds must be an integer from 1 through 65535.

Usage

Use this command for Interchassis Session Recovery (ICSR) support to set the duration to wait for response before re-sending the RADIUS authentication probe to the RADIUS server.

Example

The following command sets the authentication probe timeout to 120 seconds:
radius probe-timeout ***120***

radius server

Configures RADIUS authentication server(s) in the current context for authentication.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius server *ip_address* **[encrypted] key** *value* **[max** *msgs* **] [max-rate** *max_rate* **] [oldports] [port** *port_number* **] [priority** *priority* **] [probe | no-probe] [probe-username** *user_name* **] [probe-password [encrypted] password** *password* **] [type { mediation-device | standard }] [admin-status { enable | disable }] [-noconfirm]**

no radius server *ip_address* **[oldports | port** *port_number* **]**

no

Removes the server or server port(s) specified from the list of configured servers.

ip_address

Specifies the IP address of the server. *ip_address* must be specified in dotted decimal notation for IPv4 or colon notation for IPv6. A maximum of 128 RADIUS servers can be configured per context. This limit includes accounting and authentication servers.

[encrypted] key*value*

Specifies the shared secret key used to authenticate the client to the servers. The **encrypted** keyword indicates the key specified is encrypted. The key *value* must be a string of 1 to 15 alpha and/or numeric characters or a string of 1 to 30 alpha and/or numeric characters when encrypted.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **key** keyword is the encrypted version of the plain text key. Only the encrypted key is saved as part of the configuration file.

max *msgs*

Default: 256
Specifies the maximum number of outstanding messages that may be allowed to the server.
msgs must be an integer from 0 through 4000.

max-rate *max_rate*

Specifies the rate (number of messages per second), at which the authentication messages should be sent to the RADIUS server.
max_rate must be an integer from 1 through 1000.
Default: disabled

oldports

Sets the UDP communication port to the old default for RADIUS communications to 1645.

port *port_number*

Default: 1812
Specifies the port number to use for communications.
port_number must be an integer from 1 through 65535.

priority *priority*

Default: 1000
Specifies the relative priority of this accounting server. The priority is used in server selection for determining which server to send accounting data to. *priority* must be a value in the range 1 through 1000 where 1 is the highest priority. When configuring two or more servers with the same priority you will be asked to confirm that you want to do this. If you use the **-noconfirm** option, you are not asked for confirmation and multiple servers could be assigned the same priority.

probe

Enable probe messages to be sent to the specified RADIUS server.

no-probe

Disable probe messages from being sent to the specified RADIUS server. This is the default behavior.

probe-username *username*

The user name sent to the RADIUS server to authenticate probe messages. *user_name* must be an alpha and/or numeric string of 1 through 127 characters in length.

probe-password [encrypted] password *password*

The password sent to the RADIUS server to authenticate probe messages.
encrypted: This keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.
password *password*: Specifies the probe-user password for authentication. *password* must be an alpha and/or numeric string of 1 through 63 characters in length.

type { mediation-device | standard }

Specifies the type of transactions the RADIUS server accepts.
mediation-device: Specifies mediation-device specific AAA transactions. This device is available if you purchased a transaction control services license. Contact your local sales representative for licensing information.
standard - Specifies standard AAA transactions. (Default)

admin-status { enable | disable }

Enables or disables the RADIUS { authentication | accounting | charging } server functionality and saves the status setting in the configuration file to re-establish the set status at reboot.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

This command is used to configure the RADIUS authentication server(s) with which the system is to communicate for authentication.
Up to 128 RADIUS servers can be configured per context. The servers can be configured as Accounting, Authentication, charging servers, or any combination thereof.

Example

radius server *1.2.3.4* **key** *sharedKey* **port** *1024* **max** *127*

radius server *1.2.5.6* **encrypted key** *scrambledKey* **oldports priority** *10*

no radius server *1.2.5.6*

route-access-list extended

This command configures an access list for filtering routes based on a specified range of IP addresses.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

route-access-listextended*identifier* **{ deny | permit } ip { *network_parameter* } { *mask_parameter* }**

no route-access-listextended*identifier* **{ deny | permit } ip { *network_parameter* } { *mask_parameter* }**

---

no

Deletes the specified route access list.

---

identifier

A value to identify the route access list.
identifier must be an integer from 100 through 999.

---

deny

Deny routes that match the specified criteria.

---

permit

Permit routes that match the specified criteria.

---

network_parameter

This specifies the network portion of the route to match. The network portion of the route is mandatory and must be expressed in one of the following ways:
ip_address wildcard_mask: A network address and wildcard mask expressed in IPv4 dotted decimal notation. (192.168.100.0 0.0.0.255)
any : Match any network address.
host *network_address* : Match the specified network address exactly. *network_address* must be an IPv4 address specified in dotted decimal notation.

---

mask_parameter

This specifies the mask portion of the route to match. The mask portion of the route is mandatory and must be expressed in one of the following ways;
mask_address wildcard_mask: A mask address and wildcard mask expressed in IPv4 dotted decimal notation. (255.255.255.0 0.0.0.255)
any : Match any network mask.
host *mask_address* : Match the specified mask address exactly. *mask_address* must be an IPv4 address specified in dotted decimal notation.

Usage

Use this command to create an extended route-access-list that matches routes based on network addresses and masks.

Example

Use the following command to create an extended route-access-list:

```
route-access-list extended 100 permit ip 192.168.100.0 0.0.0.255
255.255.255.0 0.0.0.255
```

route-access-list named

This command configures an access list for filtering routes based on a network address and net mask.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

route-access-listnamed*list_name* **{ deny | permit } { *ip_address*/*mask* | any } [exact-match]**

no route-access-listnamed*list_name* **{ deny | permit } { *ip_address*/*mask* | any } [exact-match]**

no

Deletes the specified route access list.

list_name

A name that identifies the route access list. *list_name* must be a string of 1 through 79 alphanumeric characters in length.

deny

Deny routes that match the specified criteria.

permit

Permit routes that match the specified criteria.

ip_address/*mask*

The IP address (in dotted-decimal notation) and the number of subnet bits, representing the subnet mask in shorthand. This variable must be entered in the dotted-decimal notation/subnet bits format (1.1.1.1/24).

any

Match any route.

exact-match

Match the IP address prefix exactly.

Usage

Use this command to create route-access lists that specify routes that are accepted.

Example

Use the following command to create a route access list named list27 that permits routes that match 192.168.1.0/24 exactly:

```
route-access-list named list27 permit 192.168.1.0/24 exact-match
```

To delete the list, use the following command:

```
no route-access-list named list27 permit 192.168.1.0/24 exact-match
```

route-access-list standard

This command configures an access-list for filtering routes based on network addresses.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

route-access-liststandard*identifier* **{ permit | deny } { *ip_addresswildcard_mask* | any | host***network_address* }**

no route-access-liststandard*identifier* **{ permit | deny } { *ip_addresswildcard_mask* | any | host***network_address* }**

no

Deletes the specified route access list.

identifier

This is a value that identifies the route-access-list. This must be an integer from 1 through 99.

deny

Deny routes that match the specified criteria.

permit

Permit routes that match the specified criteria.

ip_address wildcard_mask

The IP address and subnet mask to match for routes. Both *ip_address* and *wildcard_mask* must be entered in IPv4 dotted decimal notation. (192.168.100.0 255.255.255.0)

any

Match any route.

host *network_address*

Routes must match the specified network address as if it had a 32-bit network mask. *network_address* must be an IPv4 address specified in dotted decimal notation.

Usage

Use this command to create route-access-lists that specify routes that are accepted.

Example

Use the following command to create a route access list with an identifier of 10 that permits routes:

```
route-access-list standard 10 permit 192.168.1.0 255.255.255.0
```

To delete the list, use the following command:

```
no route-access-list standard 10 permit 192.168.1.0 255.255.255.0
```

route-map

This command creates a route-map that is used by the routing features and enters Route-map Configuration mode. A route-map allows redistribution of routes. A routemap has a list of match and set commands associated with it. The match commands specify the conditions under which redistribution is allowed and the set commands specify the particular redistribution actions to be performed if the criteria specified by match commands are met. Route-maps are used for detailed control over route distribution between routing processes. Up to eight route-maps can be created in each context. Refer to the Route-map Configuration mode commands for more information.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

route-map*map_name* **{ deny | permit }** *seq_number*

no route-map*map_name*

no

Deletes the specified route-map.

map_name

The name of the route-map to create or edit. This is a string of characters from 1 through 69 characters long.

deny

If the deny parameter is specified and the match command criteria are met, the route is not redistributed and any other route maps with the same map name are not examined. Set commands have no affect on deny route-maps.

permit

If the permit parameter is specified, and the match criteria are met, the route is redistributed as specified by set actions. If the match criteria are not met, the next route map with the same name is tested.

seq_number

The sequence number that indicates the position a new route map is to have in the list of route maps already configured with the same name. Route maps with the same name are tested in ascending order of their sequence numbers. This must be an integer from 1 through 65535.

Usage

Use this command to create route maps that allow redistribution of routes based on specified criteria and set parameters for the routes that get redistributed. The chassis supports a maximum of 64 route maps per context.

Example

To create a route map named map1 that permits routes that match the specified criteria, use the following command:

```
route-map map1 permit 10
```

To delete the route-map, enter the following command:

```
no route-map map1 permit 10
```

router

This command enables the OSPF routing functionality and enters the OSPF Configuration mode. Refer to the OSPF Configuration Mode Commands chapter for details on OSPF Configuration mode commands.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

router {ospf | bgp*as_number***}**

no router {ospf | bgp*as_number***}**

no

Disables the specified routing support in the current context.

ospf

Enable OSPF routing in this context and enter OSPF Configuration mode.

bgp *as_number*

Enable a BGP routing service for this context and assign it the specified AS number. *as_number* must be an integer from 1 through 65535.

Important: BGP routing is supported only for use with the HA.

Usage

Use this command to enable and configure OSPF and BGP routing in the current context.

Important: You must obtain and install a valid OSPF or BGP-4 feature use license key to use OSPF and BGP routing features. Refer to the System Administration and Configuration Guide for details on obtaining and installing feature use license keys.

Example

The following command enables the OSPF routing functionality and enters the OSPF Configuration mode:

```
router ospf
```

The following command enables a BGP routing service with an AS number of 100, and enters the BGP configuration mode:

```
router bgp 100
```

server

Configures remote server access protocols for the current context. This command is used to enter the specified protocols configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
server { ftpd | named | sshd | telnetd | tftpd }
no server { ftpd | named | sshd | telnetd | tftpd } [ kill ]
```

no

Disables the specified service.

ftpd

Enters the ftpd server configuration mode.

Important: The FTPD server can only be configured in the local context.

named

Starts the named server.

sshd

Enters the sshd server configuration mode.

Important: The SSH server allows only three unsuccessful login attempts before closing a login session attempt.

telnetd

Enters the telnetd server configuration mode.

Important: The TELNET server allows only three unsuccessful login attempts before closing a login session attempt.

tftpd

Enters the tftpd server configuration mode.

Important: The TFTPDD server can only be configured in the local context.

kill

Indicates all instances of the server are to be stopped.
This option only works with the **ftpd**, **sshd, telnetd, and tftpd** commands.

Usage

Enter the context configuration mode for the appropriate, previously defined context, to set the server option(s). Repeat the command as needed to enable/disable more than one option server daemon.

Example

```
server ftpd

server named

no server tftpd

server sshd

server telnetd

no server telnetd kill
```

service-redundancy-protocol

Configures Interchassis Session Redundancy services for the current context. This command is used to enter the service redundancy protocol configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
service-redundancy-protocol
```

Usage

Enter the configuration mode to set the service redundancy protocol options.

Example

The following command enters service redundancy protocol mode.

```
service-redundancy-protocol
```

sgw-service

Creates an S-GW service or specifies an existing S-GW service and enters the S-GW service configuration mode for the current context.

Product

S-GW

Privilege

Administrator

Syntax

sgw-service*service_name* **[-noconfirm]**

no sgw-service*service_name*

service_name

Specifies the name of the S-GW service. If *service_name* does not refer to an existing service, the new service is created if resources allow.
service_name must be from 1 to 63 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no sgw-service *service_name*

Removes the specified S-GW service from the context.

Usage

Enter the S-GW service configuration mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:
[*context_name*]*hostname*(config-sgw-service)#
S-GW Service Configuration Mode commands are defined in the S-GW Service Configuration Mode Commands chapter.
Use this command when configuring the following SAE components: S-GW.

Example

The following command enters the existing S-GW service configuration mode (or creates it if it doesn't already exist) for the service named *sgw-service1*:

sgw-service *sgw-service1*

The following command will remove *spgw-service1* from the system:

no sgw-service *sgw-service1*

sgsn-service

This command creates an SGSN service instance and enters the SGSN Service Configuration Mode. This mode configures or edits the configuration for an SGSN service which controls the SGSN functionality.

An SGSN mediates access to GPRS/UMTS network resources on behalf of user equipment (UE) and implements the packet scheduling policy between different QoS classes. It is responsible for establishing the packet data protocol (PDP) context with the GGSN.

Important: For details about the commands and parameters, check the SGSN Service Configuration Mode chapter.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sgsn-service *srvc_name*

no sgsn-service *srvc_name*

no

Remove the configuration for the specified SGSN service from the configuration of the current context.

srvc_name

A unique string of 1 to 63 alphanumeric characters that identify the specific SGSN service.

Usage

Use this command to create, edit, or remove an SGSN service

Example

The following command creates an SGSN service named sgsn1 in the current context:

```
sgsn-service sgsn1
```

The following command removes the sgsn service named sgsn1 from the configuration for the current context:

```
no sgsn-service sgsn1
```

sgtp-service

This command creates an SGTP service instance and enters the SGTP Service Configuration Mode. This mode configures the GPRS Tunneling Protocol (GTP) related settings required by the SGSN to support GTP-C (control plane) messaging and GTP-U (user data plane) messaging.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sgtp-service *svc_name*

no sgtp-service *svc_name*

no

Remove the configuration for the specified SGTP service from the configuration of the current context.

svc_name

A unique string of 1 to 63 alphanumeric characters that identify the specific SGTP service.

Usage

Use this command to create, edit, or remove an SGTP service

Example

The following command creates an SGTP service named *sgtp1* in the current context:

sgtp-service *sgtp1*

The following command removes the sgsn service named *sgtp1* from the configuration for the current context:

no sgtp-service *sgtp1*

ssh

Generates public and private keys for use with the configured SSH server for the current context and sets the public/private key pair to specified values.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ssh { generate key | key *data* **length** *octets* **} [type { v1-rsa | v2-rsa | v2-dsa }]**

no ssh key [type { v1-rsa | v2-rsa | v2-dsa }]

no ssh key [type { v1-rsa | v2-rsa | v2-dsa }]

This command clears configured SSH keys. If type is not specified, all SSH keys are cleared.

generate key

This command generates a public/private key pair which is to be used by the SSH server. The generated key pair is in use until the command is issued again.

key *data* **length** *octets*

This command sets the public/private key pair to be used by the system where *data* is the encrypted key and *length* is the length of the encrypted key in octets. *data* must be an alpha and/or numeric string of 1 to 1023 characters and *octets* must be a value in the range of 0 through 65535.

[type { v1-rsa | v2-rsa | v2-dsa }]

Specifies the type of SSH key to generate. If type is not specified, all three key types types are generated.
v1-rsa: SSH v1 RSA host key only
v2-rsa: SSH v2 DSA host key only
v2-dsa: SSH v2 RSA host key only

Important: For maximum security, it is recommended that only SSH v2 be used. **v2-rsa** is the recommended key type.

Usage

Generate secure shell keys for use in public key authentication.

Example

ssh generate key

ssh key *g6j93fw59cx* **length** *128*

subscriber

Configures the specified subscriber for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

subscriber { default | name*user_name* **}**

no subscriber { default | name*user_name* **}**

no

Indicates the subscriber specified is to be removed from the list of allowed users for the current context.

default | name *user_name*

default: enters the subscriber configuration mode for the context's default subscriber settings.
name *user_name*: specifies the user which is to be allowed to use the services of the current context. user_name must be from 1 to 127 alpha and/or numeric characters.

Usage

Enter the subscriber configuration mode for actual users as well as for a default subscriber for the current context.

Important: A maximum of 128 subscribers and/or administrative users may be locally configured per context.

Example

subscriber default

no subscriber default

subscriber name *user1*

no subscriber name *user1*

threshold

The commands in this section set context level threshold parameters.

threshold available-ip-pool-group

Configures context-level thresholds for IP pool utilization for the system.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold available-ip-pool-group*low_thresh***[clear***high_thresh***]**

low_thresh

Default: 10
The low threshold IP pool utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
low_thresh can be configured to any integer value between 0 and 100.

clear *high_thresh*

Default: 10
The high threshold IP pool utilization percentage that maintains a previously generated alarm condition. If the utilization percentage rises above the high threshold within the polling interval, a clear alarm will be generated.
high_thresh can be configured to any integer value between 0 and 100. The default is 10

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

When IP address pools are configured on the system, they can be assigned to a group. IP address pool utilization thresholds generate alerts or alarms based on the utilization percentage of all IP address contained in the pool group during the specified polling interval.
All configured public IP address pools that were not assigned to a group are treated as belonging to the same group. Individual configured static or private pools are each treated as their own group.
Alerts or alarms are triggered for IP address pool utilization based on the following rules:

- **Enter condition:** Actual IP address utilization percentage per pool group £ Low Threshold
- **Clear condition:** Actual IP address utilization percentage per pool group > High Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
The following table describes the possible methods for configuring IP pool utilization thresholds:

Table 18.

Method	Description

Method	Description
Context-level	A single IP pool utilization threshold can be configured for all IP pool groups within a given system context. If a single threshold is configured for all pool groups, separate alerts or alarms can be generated for each group. This command configures that threshold.
IP address pool-level	Each individual IP address pool can be configured with its own threshold. Thresholds configured for individual pools take precedence over the context-level threshold that would otherwise be applied (if configured). In the event that two IP address pools belonging to the same pool group are configured with different thresholds, the system uses the pool configuration that has the greatest low threshold for that group.

Example

The following command configures a context-level IP pool utilization low threshold percentage of 10 and a high threshold of 35 for an system using the Alarm thresholding model:

```
threshold available-ip-pool-group 10 clear 35
```

threshold ha-service init-rrq-rcvd-rate

Set an alarm or alert based on the average number of calls setup per second for an HA service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold ha-service init-rrq-rcvd-rate*high_thresh***[clear***low_thresh***]**

no threshold ha-service init-rrq-rcvd-rate

no

Deletes the alert or alarm.

high_thresh

Default: 0
The high threshold average number of calls setup per second must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 1000000.

clear *low_thresh*

Default:0
The low threshold average number of calls setup per second that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 1000000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the average number of calls setup per second is equal to or less than a specified number of calls per second.
Alerts or alarms are triggered for the number of calls setup per second based on the following rules:

- **Enter condition:** Actual number of calls setup per second > High Threshold
- **Clear condition:** Actual number of calls setup per second £ Low Threshold

Example

The following command configures a number of calls setup per second threshold of 1000 and a low threshold of 500 for a system using the Alarm thresholding model:

threshold ha-service init-rrq-rcvd-rate *1000* **clear** *500*

threshold ip-pool-free

Set an alarm or alert based on the percentage of IP addresses that are unassigned in an IP pool. This command affects all IP pools in the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold ip-pool-free*low_thresh***[clear***high_thresh***]**

low_thresh

Default: 0
The low threshold percentage of addresses available in an IP pool that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100.

clear *high_thresh*

Default:0
The high threshold percentage of addresses available in an IP pool that maintains a previously generated alarm condition. If the utilization percentage rises above the high threshold within the polling interval, a clear alarm will be generated. It may be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

Use this command to set an alert or an alarm when the number of unassigned IP addresses in any pool is equal to or less than a specified percentage of the total number of addresses in the pool.
Alerts or alarms are triggered for percentage of IP address pool free based on the following rules:

- **Enter condition:** Actual percentage of IP addresses free per pool £ Low Threshold
- **Clear condition:** Actual percentage of IP addresses free per pool > High Threshold

Important: This command is overridden by the settings of the **alert-threshold** keyword of the **ip pool** command.

Example

The following command configures a context-level IP pool percentage of IP addresses that are unused low threshold percentage of 10 and a high threshold of 35 for an system using the Alarm thresholding model:

```
threshold ip-pool-free 10 clear 35
```

threshold ip-pool-hold

Set an alert based on the percentage of IP addresses from an IP pool that are on hold. This command affects all IP pools in the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold ip-pool-hold*high_thresh***[clear***low_thresh***]**

high_thresh

Default: 0
The high threshold percentage of addresses on hold in an IP pool that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100.

clear *low_thresh*

Default:0
The low threshold percentage of addresses on hold in an IP pool that maintains a previously generated alarm condition. If the utilization percentage rises below the low threshold within the polling interval, a clear alarm will be generated. It may be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the percentage of IP addresses on hold in any pool is equal to or greater than a specified percentage of the total number of addresses in the pool.
Alerts or alarms are triggered for percentage of IP address pool addresses on hold based on the following rules:

- **Enter condition:** Actual percentage of IP addresses on hold per pool > High Threshold
- **Clear condition:** Actual percentage of IP addresses on hold per pool £ Low Threshold

Important: This command is overridden by the settings of the **alert-threshold** keyword of the **ip pool** command.

Example

The following command configures a context-level IP pool percentage of IP addresses that are on hold high threshold percentage of 10 and a low threshold of 35 for an system using the Alarm thresholding model:

```
threshold ip-pool-hold 35 clear 10
```

threshold ip-pool-release

Set an alert based on the percentage of IP addresses from an IP pool that are in the release state. This command affects all IP pools in the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold ip-pool-release*high_thresh***[clear***low_thresh***]**

high_thresh

Default: 0
The high threshold percentage of addresses in the release state in an IP pool that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100.

clear *low_thresh*

Default:0
The low threshold percentage of addresses in the release state in an IP pool that maintains a previously generated alarm condition. If the utilization percentage rises below the low threshold within the polling interval, a clear alarm will be generated. It may be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

Use this command to set an alert or an alarm when the number of IP addresses the release state in any pool is equal to or greater than a specified percentage of the total number of addresses in the pool.
Alerts or alarms are triggered for percentage of IP address pool addresses in the release state based on the following rules:

- **Enter condition:** Actual percentage of IP addresses in the release state per pool > High Threshold
- **Clear condition:** Actual percentage of IP addresses in the release state per pool £ Low Threshold

Important: This command is overridden by the settings of the **alert-threshold** keyword of the **ip pool** command.

Example

The following command configures a context-level IP pool percentage of IP addresses that are in the release state high threshold percentage of 35 and a low threshold of 10 for an system using the Alarm thresholding model:

```
threshold ip-pool-release 35 clear 10
```

threshold ip-pool-used

This command sets an alert based on the percentage of IP addresses that have been assigned from an IP pool. This command affects all IP pools in the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold ip-pool-used*high_thresh***[clear***low_thresh***]**

high_thresh

Default: 0
The high threshold percentage of addresses assigned from an IP pool that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100.

clear *low_thresh*

Default:0
The low threshold percentage of addresses assigned from an IP pool that maintains a previously generated alarm condition. If the utilization percentage rises above the high threshold within the polling interval, a clear alarm will be generated. It may be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

Use this command to set an alert or an alarm when the number of IP addresses assigned from any pool is equal to or greater than a specified percentage of the total number of addresses in the pool.
Alerts or alarms are triggered for percentage of IP address pool addresses used based on the following rules:

- **Enter condition:** Actual percentage of IP addresses used per pool > High Threshold
- **Clear condition:** Actual percentage of IP addresses used per pool £ Low Threshold

Important: This command is overridden by the settings of the **alert-threshold** keyword of the **ip pool** command.

Example

The following command configures a context-level IP pool percentage of IP addresses that are used high threshold percentage of 35 and a low threshold of 10 for an system using the Alarm thresholding model:

```
threshold ip-pool-used 35 clear 10
```

threshold monitoring

Enables thresholding.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] threshold monitoring available-ip-pool-group
```

no

Disables threshold monitoring for the specified value.

available-ip-pool-group

Enables threshold monitoring for IP pool thresholds at the context level and the IP address pool-level. Refer to the **threshold available-ip-pool-group** command, the threshold ip-pool-x commands and the alert-threshold keyword of the **ip pool** command for additional information on these values.

Usage

Thresholding on the system is used to monitor the system for conditions that could potentially cause errors or outage. Typically, these conditions are temporary (i.e high CPU utilization, or packet collisions on a network) and are quickly resolved. However, continuous or large numbers of these error conditions within a specific time interval may be indicative of larger, more severe issues. The purpose of thresholding is to help identify potentially severe conditions so that immediate action can be taken to minimize and/or avoid system downtime.

Thresholding reports conditions using one of the following mechanisms:

- **SNMP traps:** SNMP traps have been created that indicate the condition (high threshold crossing and/or clear) of each of the monitored values. Complete descriptions and other information pertaining to these traps is located in the starentMIB(8164).starentTraps(2) section of the SNMP MIB Reference.

The generation of specific traps can be enabled or disabled on the system allowing you to view only those traps that are most important to you.

- **Logs:** The system provides a facility called threshold for which active and event logs can be generated. As with other system facilities, logs are generated Log messages pertaining to the condition of a monitored value are generated with a severity level of WARNING.
- **Alarm System:** High threshold alarms generated within the specified polling interval are considered "outstanding" until a the condition no longer exists and/or a condition clear alarm is generated.

"Outstanding" alarms are reported to through the system's alarm subsystem and are viewable through the system's CLI.

The following table indicates the reporting mechanisms supported by each of the above models.

Table 19. Thresholding Reporting Mechanisms by Model

Model	SNMP Traps	Logs	Alarm System

Model	SNMP Traps	Logs	Alarm System
Alert	X	X	
Alarm	X	X	X

Refer to the **threshold poll** command in Global Configuration Mode Commands for information on configuring the polling interval over which IP address pool utilization is monitored.

Example
the following command enables threshold monitoring for IP pool thresholds at the context level and the IP address pool-level:

```
threshold monitoring available-ip-pool-group
```

threshold pdsn-service init-rrq-rcvd-rate

Set an alarm or alert based on the average number of calls setup per second for a PDSN service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
threshold pdsn-service init-rrq-rcvd-ratehigh_thresh [ clear low_thresh ]

no threshold pdsn-service init-rrq-rcvd-rate
```

no

Deletes the alert or alarm.

high_thresh

Default: 0
The high threshold average number of calls setup per second must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 1000000.

clear *low_thresh*

Default:0
The low threshold average number of calls setup per second that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 1000000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the average number of calls setup per second is equal to or less than a specified number of calls per second.
Alerts or alarms are triggered for the number of calls setup per second based on the following rules:

- **Enter condition:** Actual number of calls setup per second > High Threshold
- **Clear condition:** Actual number of calls setup per second £ Low Threshold

Example

The following command configures a number of calls setup per second threshold of 1000 and a low threshold of 500 for a system using the Alarm thresholding model:

```
threshold pdsn-service init-rrq-rcvd-rate 1000 clear 500
```

udr-module active-charging-service

This command creates the User Data Record (UDR) module and enters the UDR Module Active Charging Service Configuration Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
udr-module active-charging-service
```

Usage

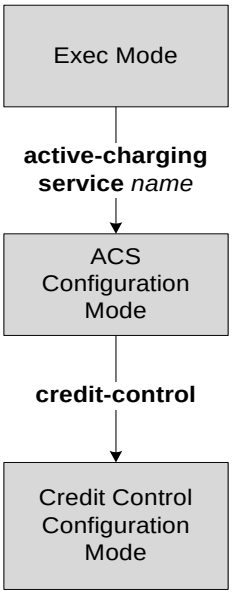
Use this command to create the UDR module for the context, and configure the UDR module for active charging service records. You must be in a non-local context when specifying this command, and you must use the same context when specifying the EDR module command.

Example

```
udr-module active-charging-service
```

Chapter 38
Credit Control Configuration Mode Commands

The Credit Control Configuration Mode is used to configure prepaid services for Diameter/RADIUS applications.



apn-name-to-be-included

This command configures whether the virtual or real APN name is sent in Credit Control Application messaging.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
apn-name-to-be-included { gn | virtual }

default apn-name-to-be-included
```

default

Configures the default option for this command.
Default: **gn**

gn

Sends Gn APN name in the CCA messages.

virtual

Sends virtual APN name, if configured in the APN Configuration Mode, in the CCA messages.

Usage

Use this command to configure the APN information in CCA messages. Virtual APN name can be set to be sent in CCA messages if it is configured in the APN Configuration Mode.

Example

The following command sets the virtual APN name to be sent in CCA message:

```
apn-name-to-be-included virtual
```

diameter dictionary

This command configures the Diameter Credit Control dictionary for the Active Charging Service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
diameter dictionary { dcca-custom1 | dcca-custom10 | dcca-custom11 | dcca-
custom12 | dcca-custom13 | dcca-custom14 | dcca-custom15 | dcca-custom16 | dcca-
custom17 | dcca-custom18 | dcca-custom19 | dcca-custom2 | dcca-custom20 | dcca-
custom3 | dcca-custom4 | dcca-custom5 | dcca-custom6 | dcca-custom7 | dcca-
custom8 | dcca-custom9 | standard }

default diameter dictionary
```

default

Configures the default setting.
Default: standard dictionary

dcca-custom1 ... dcca-custom20

Specifies a custom Diameter dictionary.

standard

Specifies the standard Diameter dictionary.
Default: Enabled

Usage

Use this command to select the Diameter dictionary for Active Charging Service.

Example

The following command selects the standard Diameter dictionary:

```
diameter dictionary standard
```

diameter gsu-with-only-infinite-quota

This command configures whether to accept/reject CCA messages that contain **Granted-Service-Unit** AVP with only infinite quota grants from the server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
diameter gsu-with-only-infinite-quota { accept-credit-control-answer | reject-credit-control-answer }

default diameter gsu-with-only-infinite-quota
```

default

Configures the default setting.
Default: **reject-credit-control-answer**

accept-credit-control-answer

Specifies to accept the Credit-Control-Answer message.

reject-credit-control-answer

Specifies to reject the Credit-Control-Answer message.

Usage

Use this command to accept/reject CCA messages that contain **Granted-Service-Unit** AVP with only infinite quota grants from the server.

Example

The following command specifies to accept CCA with **Granted-Service-Unit** AVP containing only Infinite quota:

```
diameter gsu-with-only-infinite-quota accept-credit-control- answer
```

The following command configures to reject Granted-Service-Unit that contains only Infinite quota:

```
diameter gsu-with-only-infinite-quota reject-credit-control- answer
```

diameter ignore-returned-rulebase-id

This command configures to accept/ignore rulebase ID in **Rulebase-Id** AVP returned by the Diameter server in CCA message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] diameter ignore-returned-rulebase-id
```

default

Configures the default setting.
Default: accept

no

Specifies to accept the rulebase ID received from Diameter server in CCA.

Usage

Use this command to ignore/accept rulebase ID returned from the Diameter server in CCA.

Example

This following command specifies to ignore rulebase ID returned from Diameter server in CCA:

```
diameter ignore-returned-rulebase-id
```

diameter mscc-per-ccr-update

This command configures sending single/multiple **Multiple-Services-Credit-Control** (MSCC) AVP in CCR-U messages.

Important: This command is only available in StarOS 8.3 and later.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
diameter mscc-per-ccr-update { multiple | single }

default diameter mscc-per-ccr-update
```

default

Configures the default setting.
Default: **multiple**

multiple

Specifies sending multiple **Multiple-Services-Credit-Control** AVP in a single CCR-U message.

single

Specifies sending only one **Multiple-Services-Credit-Control** AVP in a CCR-U message.

Usage

Use this command to configure sending single/multiple **Multiple-Services-Credit-Control** AVP in CCR-U messages.

Example

The following command configures sending a single MSCC AVP in CCR-U messages:

```
diameter mscc-per-ccr-update single
```

diameter origin host

This command is obsolete. See the **`diameter origin endpoint`** command.

diameter origin endpoint

This command configures the Diameter Credit Control Origin Endpoint.

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter origin endpoint *endpoint_name* **[realm** *realm_name* **]**

no diameter origin endpoint

no

Removes the Diameter Credit Control Origin Endpoint configuration.

endpoint_name

Specifies the Diameter Credit Control Origin Endpoint.
endpoint_name must be the endpoint's name, and an alpha and/or numeric string of 1 through 63 characters in length.

realm *realm_name*

Specifies the Diameter Credit Control Realm ID.
realm_name must be a string of 1 through 127 characters in length.

Usage

Use this command to configure the Diameter Credit Control Origin Endpoint.
The endpoint to configure should be pre-configured. For information on creating and configuring a Diameter endpoint, in the Context Configuration Mode, see the **diameter endpoint** command.

Example

The following command configures a Diameter Credit Control Origin Endpoint named *test*:
diameter origin endpoint *test*

diameter peer-select

This command configures the Diameter credit control primary and secondary hosts for DCCA.

Product

All

Privilege

Security Administrator, Administrator

Syntax

In StarOS 8.x:

diameter peer-select peer *peer_name* **[realm** *realm_name* **] [secondary-peer** *sec_peer_name* **[realm** *realm_name* **]] [imsi-based start-value** *imsi_start_value* **end-value** *imsi_end_value* **]**

no diameter peer-select [imsi-based start-value *imsi_start_value* **end-value** *imsi_end_value* **]**

In StarOS 9.0 and later for UMTS deployments:

diameter peer-select peer *peer_name* **[realm** *realm_name* **] [secondary-peer** *sec_peer_name* **[realm** *realm_name* **]] [imsi-based { [prefix | suffix]** *imsi/prefix/suffix_start_value* **} [to** *imsi/prefix/suffix_end_value* **]]**

no diameter peer-select [imsi-based { [prefix | suffix] *imsi/prefix/suffix_start_value* **} [to** *imsi/prefix/suffix_end_value* **]**

---

no

Removes previously configured Diameter credit control peer selection setting.

---

peer *peer_name*

Specifies the primary host name.
peer_name must be an alpha and/or numeric string of 1 through 63 characters in length, and can contain punctuation characters.

---

imsi-based start-value *imsi_start_value* **end-value** *imsi_end_value*

Available only in StarOS 8.3 and earlier releases.
Specifies peer selection based on International Mobile Subscriber Identification (IMSI) range.
start-value *imsi_start_value* specifies the start of range in integer value of IMSI, and **end-value** *imsi_end_value* specifies the end of range in integer value of IMSI.

---

imsi-based { [prefix | suffix] *imsi/prefix/suffix_start_value* **} [to** *imsi/prefix/suffix_end_value* **]**

In this release, available only for UMTS deployments.
Specifies peer selection based on IMSI prefix or suffix or IMSI range.
prefix: Specifies the prefix range
suffix: Specifies the suffix range

imsi/prefix/suffix_start_value: Specifies the IMSI/prefix/suffix start value. *prefix/suffix* must be IMSI prefix/suffix, and must be an integer from 1 through 15 characters in length.
imsi/prefix/suffix_end_value: Specifies the IMSI/prefix/suffix end value. *prefix/suffix* must be IMSI prefix/suffix, and must be an integer from 1 through 15 characters in length, and must be greater than the start value.

Important: If prefix/suffix is used, the lengths of both start and end prefix/suffix must be equal. If the **prefix** or **suffix** keyword is not specified, it will be considered as suffix.

realm *realm_name*

The *realm_name* must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters. The realm may typically be a company or service name.

secondary-peer *sec_peer_name*

Specifies a name for the secondary host to be used for failover processing. When the route-table does not find an AVAILABLE route, the secondary host performs a failover processing if the **diameter session failover** command is set.
sec_peer_name must be an alpha and/or numeric string of 1 through 63 characters in length, and can contain punctuation characters.

Usage

Use this command to configure Diameter credit control host selection.
If the **diameter peer-select** command is not configured, and if multiple peers are configured in the endpoint, the available peers configured in the endpoint are automatically chosen in a load-balanced round-robin manner.
In StarOS 9.0 and later, a prefix or suffix of IMSI or IMSI range can be configured. If prefix or suffix keyword is not specified, it will be considered as suffix. Up to 64 peer selects can be configured. At any time either prefix or suffix mode can be used in one DCCA config. If the prefix/suffix mode is used, the start and end prefix/suffix lengths must be equal.
StarOS 9.0 and later supports peer selection using prefix or suffix of IMSI or IMSI range. Subscribers are now assigned to a primary OCS instance based on the value of the IMSI prefix or suffix of a length of 1 to 15 digits. If the prefix or suffix keyword is not specified, it will be considered as suffix. Up to 64 peer selects can be configured. At a time either prefix or suffix mode can be used in one DCCA config. If prefix or suffix mode is used, the lengths of all prefix/suffix must be equal.
Each primary OCS may have a designated secondary OCS in case of failure of the primary. It will be the responsibility of the GGSN to use the appropriate secondary OCS in case of primary failure. The secondary OCS for each primary OCS will be one of the existing set of OCSs.

Example

The following command configures a Diameter credit control peer named *test* and the realm *companyx*:
diameter peer-select peer *test* realm *companyx*
The following command configures IMSI-based Diameter credit control peer selection in the IMSI range of *1234567890* to *1234567899*:
diameter peer-select peer *star* imsi-based start-value *1234567890* end-value *1234567899*
The following command configures IMSI-based DCCA peer selection with IMSI suffix of *100* through *200*:

```
diameter peer-select peer test_peer realm test_realm secondary-peer
test_sec_realm realm test_realm2 imsi-based suffix 100 to 200
```

diameter pending-timeout

This command configures the maximum time period to wait for response from a Diameter peer.

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter pending-timeout *duration*

default diameter pending-timeout

default

Disables DCCA resending message at pending-timeout.

duration

Specifies the timeout duration in seconds.
duration must be an integer from 1 through 300.

after-expiry-try-secondary-host

This keyword is deprecated. This can now be managed using the **retry-after-tx-expiry** and **go-offline-after-tx-expiry** keywords in the **failure-handling** command.

Usage

Use this command to set the maximum time for Diameter credit control to receive a response from its peer. DCCA refers to this as the Tx Timer. Typically, this should be configured to a value smaller than the response-timeout value of Diameter Endpoint Configuration Mode. That value is typically too large for DCCA's purposes.
If DCCA gets a “no available routes” error before pending-timeout expires, then DCCA tries to send to the secondary host (if one has been configured). If DCCA gets no response and pending-timeout expires, then DCCA either tries the secondary host or gives up. This can now be managed using the **failure-handling** command.
If routing has failed, i.e., the attempt to the primary host, as well as, the attempt to the secondary host (if that has been configured), then the processing configured by the **failure-handling** CLI command is performed.
The routing (i.e., returning a good response, no response or an error response such as "no available routes") is controlled by Diameter Endpoint Configuration Mode. That uses a watchdog timer (called Tw Timer) to attempt a different route to a host. Multiple routes could be attempted. If there's no response before the endpoint's configured response-timeout expires, then "no available routes" is the routing result. The routing logic remembers the status of routes, so it can return "no available routes" immediately, without using any timers.
The default case will disable DCCA resending message at Tx (pending-timeout). So messages are retried only at Tw (device watchdog timeout) by diabase or at response-timeout by DCCA.

Example

The following command configures a Diameter Credit Control Pending Timeout of *20*:

diameter pending-timeout *20*

diameter result-code

This command enables sending GTP Create-PDP-Context-Rsp message with cause code based on the DCCA result code.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
diameter result-code { authorization-rejected | user-unknown } use-gtp-cause-code { authentication-failure | no-resource-available }

default diameter result-code { authorization-rejected | user-unknown } use-gtp-cause-code
```

authorization-rejected

Result code received as DIAMETER_AUTHORIZATION_REJECTED(5003).

user-unknown

Result code received as DIAMETER_USER_UNKNOWN(5030).

use-gtp-cause-code

Cause code to be sent in GTP response.

authentication-failure

To send GTP cause code GTP_USER_AUTHENTICATION_FAILED in GTP response.

no-resource-available

To send GTP cause code GTP_NO_RESOURCES_AVAILABLE in GTP response (default cause code).

Usage

On receiving result-code as AUTHORIZATION-REJECTED or DIAMETER_USER_UNKNOWN from DCCA server, the cause code can either be sent as GTP_NO_RESOURCE_AVAILABLE or GTP_AUTHENTICATION_FAILED in GTP create-PDP-Context response message, based on this CLI configuration. By default, GTP_NO_RESOURCE_AVAILABLE is sent.

Example

The following command sets the deny cause as user authentication failure when the CCA-Initial has the result code DIAMETER_AUTHORIZATION_REJECTED(5003):

```
diameter result-code authorization-rejected use-gtp-cause-code authentication-failure
```

diameter send-ccri

This command configures when to send CCR-Initial for the subscriber session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
diameter send-ccri { session-start | traffic-start }

default diameter send-ccri
```

default

Configures the default setting.
Default: session-start

session-start

Specifies to send CCR-I when the PDP context is being established (on receiving Create-PDP-Context-Request).

traffic-start

Specifies to delay sending CCR-I until the first data packet received from the subscriber.

Usage

Use this command to configure when to send CCR-Initial for the subscriber session.

Example

The following command configures to send CCR-I on traffic detection and not on context creation:

```
diameter send-ccri traffic-start
```

diameter session failover

This command enables/disables Diameter Credit Control Session Failover. When enabled, the secondary peer is used in the event the main peer is unreachable.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] diameter session failover
```

default

Configures the default setting.
Default: Depends on the **failure-handling** configuration

no

If the primary server is not reachable, failover is not triggered and the session is torn down. No failover action is taken.

Usage

Use this command to enable/disable Diameter Credit Control Session Failover.
The **failure-handling** configuration comes into effect only if **diameter session failover** is present in the configuration. The failover can be overridden by the server in the response message, and it takes precedence.

Example

The following command enables Diameter Credit Control Session Failover:

```
diameter session failover
```

end

Returns the CLI prompt to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec mode.

exit

Exits the current mode and returns to the Active Charging Service Configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the Active Charging Service Configuration mode.

failure-handling

This command configures the Diameter Credit Control Failure Handling (CCFH) behavior in the event of communication failure with the prepaid server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
failure-handling { initial-request | terminate-request | update-request } {
continue [ go-offline-after-tx-expiry | retry-after-tx-expiry ] | retry-and-
terminate [ retry-after-tx-expiry ] | terminate }

default failure-handling [ initial-request | terminate-request | update-request
]
```

`default failure-handling [ initial-request | terminate-request | update-request ]`

Configures the default CCFH setting:
`initial-request`: The default setting is **`terminate`**.
`update-request`: The default setting is **`retry-and-terminate`**.
`terminate-request`: The default setting is **`retry-and-terminate`**.

`initial-request`

Specifies the message type as CCR-Initial.

`terminate-request`

Specifies the message type as CCR-Terminate.

`update-request`

Specifies the message type as CCR-Update.

`continue`

Specifies the CCFH setting as continue. The online session is converted into offline session. The associated PDP Context is established (new sessions) or not released (ongoing sessions).

`retry-and-terminate`

Specifies the CCFH setting as retry-and-terminate. The user session will continue for the duration of one retry attempt with the prepaid server. In case there is no response from both primary and secondary servers the session is torn down.

`terminate`

Specifies the CCFH setting as terminate. All type of sessions (initial or update) are terminated in case of failure.

`go-offline-after-tx-expiry`

Specifies to start offline charging after Tx expiry.

`retry-after-tx-expiry`

Specifies to retry after Tx expiry. Enables secondary-host, if up, to take over after Tx expiry.

Usage

Use this command to select the CCFH behavior. The specified behavior is used for sessions when no behavior is specified by the prepaid server. By default, the CCFH is taken care at response-timeout except for terminate setting.
If the Credit-Control-Failure-Handling AVP is received from the server, the received setting will be applied to all the message types.
The following table indicates the CCFH behavior for the combination of different CCFH settings, and the corresponding CLI commands.

CCFH Setting	CLI Command	Behavior at Tx	Behavior at RT	Secondary is Up	Secondary is Down
Initial-request Message Type					
Continue	**`initial-request continue`**	N/A	Continue	Secondary takes over after RT	Offline after another RT. No more quota requests are performed for any rating group within the session after DCCA failure (even if connectivity to DCCA is restored)
	`initial-request continue go-offline-after-tx-expiry`	Offline	N/A	Offline at Tx	Offline at Tx
	`initial-request continue retry-after-tx-expiry`	Continue	N/A	Secondary takes over after Tx	Offline after another Tx
Retry-and-terminate	**`initial-request retry-and-terminate`**	N/A	Retry	Secondary takes over after RT	Terminate after another RT
	`initial-request retry-and-terminate retry-after-tx-expiry`	Retry	N/A	Secondary takes over after Tx	Terminate after another Tx
Terminate	**`initial-request terminate`**	Terminate	N/A	Terminate after Tx	Terminate after Tx
Update-request Message Type					
Continue	**`update-request continue`**	N/A	Continue	Secondary takes over after RT	Offline after another RT

CCFH Setting	CLI Command	Behavior at Tx	Behavior at RT	Secondary is Up	Secondary is Down
	update-request continue go-offline-after-tx-expiry	Offline	N/A	Offline at Tx	Offline at Tx
	update-request continue retry-after-tx-expiry	Continue	N/A	Secondary takes over after Tx	Offline after another Tx
Retry-and-terminate	**update-request retry-and-terminate**	N/A	Retry	Secondary takes over after RT	Sends CCR-T after another RT
	update-request retry-and-terminate retry-after-tx-expiry	Retry	N/A	Secondary takes over after Tx	Sends CCR-T after another Tx
Terminate	**update-request terminate**	Terminate	N/A	Sends CCR-T after Tx	Sends CCR-T after Tx
Terminate-request Message Type					
Continue	**terminate-request continue**	N/A	Retry	CCR-T is sent to secondary after RT	Terminate after another RT
	terminate-request continue go-offline-after-tx-expiry	Retry	N/A	CCR-T is sent to secondary after Tx	Terminate after another Tx
	terminate-request continue retry-after-tx-expiry	Retry	N/A	CCR-T is sent to secondary after Tx	Terminate after another Tx
Retry-and-terminate	**terminate-request retry-and-terminate**	N/A	Retry	CCR-T is sent to secondary after RT	Terminate after another RT
	terminate-request retry-and-terminate retry-after-tx-expiry	Retry	N/A	CCR-T is sent to secondary after Tx	Terminate after another Tx
Terminate	**terminate-request terminate**	Terminate	N/A	Terminate after Tx	Terminate after Tx

Example

The following command sets the Credit Control Failure Handling behavior for initial request message type to retry-and-terminate:

```
failure-handling initial-request retry-and-terminate
```

mode

This command configures the Prepaid Credit Control mode to RADIUS or Diameter.

Product

All

Privilege

Security Administrator, Administrator

Syntax

mode { diameter | radius }

default mode

default

Configures the default prepaid credit control mode.
Default: Diameter

diameter

Enables Diameter Credit Control Application (DCCA) for prepaid charging.

radius

Enables RADIUS Credit Control for prepaid charging.

Usage

Use this command to configure the prepaid charging application mode between Diameter or RADIUS credit control.

Example

The following command specifies to use RADIUS prepaid credit control application:

mode radius

pending-traffic-treatment

This command controls the pass/drop treatment of traffic while waiting for definitive credit information from the server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
pending-traffic-treatment { { { forced-reauth | trigger | validity-expired }
drop | pass } | { { noquota | quota-exhausted } buffer | drop | pass } }

default pending-traffic-treatment { forced-reauth | noquota | quota-exhausted |
trigger | validity-expired }
```

default

Configures the default setting.
Default: drop

forced-reauth

Sets the Diameter credit control pending traffic treatment to forced reauthorization.

trigger

Sets the Diameter credit control pending traffic treatment to trigger.

validity-expired

Sets the Diameter credit control pending traffic treatment to validity expired.

noquota

Sets the Diameter credit control pending traffic treatment to no quota.

quota-exhausted

Sets the Diameter credit control pending traffic treatment to quota exhausted.

buffer

Specifies to tentatively count/time traffic, and then buffer traffic pending arrival of quota. Buffered traffic will be forwarded and fully charged against the quota when the quota is eventually obtained and the traffic passed.

drop

Specifies to drop any traffic when there is no quota present.

pass

Specifies to pass all traffic more or less regardless of quota state.

Usage

Use this command to set the Diameter credit control pending traffic treatment while waiting for definitive credit information from the server.

This CLI command is different than the **failure-handling** CLI command, which specifies behavior in the face of an actual timeout or error, as opposed to the behavior while waiting. See also the **buffering-limit** CLI command in Active Charging Service Configuration Mode.

Example

The following command sets the Diameter credit control pending traffic treatment to drop any traffic when there is no quota present:

```
pending-traffic-treatment noquota drop
```

quota

This command is used to set various time-based quotas in the prepaid credit control service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

{ default | no } quota { holding-time | validity-time }

holding-time *holding_time*

Specifies the Quota Holding Time (QHT).
holding_time must be an integer from 1 through 4000000000.

validity-time *validity_time*

Specifies the validity lifetime of the quota.
validity_time must be an integer from 1 through 65535.

Usage

Use this command to set the prepaid credit control quotas.

Example

The following command sets the prepaid credit control request holding time to *30000* seconds:
quota holding-time *30000*

quota request-trigger

This command is used to set the action on packets used from request trigger on crossing threshold limit of subscriber quota in the prepaid credit control service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
quota request-trigger { exclude-packet-causing-trigger | include-packet-causing-trigger }

{ default | no } quota request-trigger
```

default

Configures the default setting.
Default: Disabled

no

Disables time threshold for prepaid credit control quota.

exclude-packet-causing-trigger

Default: Disabled
This option excludes the packets causing threshold limit violation trigger in accounting.

include-packet-causing-trigger

Default: Disabled
This option includes the packets causing threshold limit violation trigger in accounting.

Usage

Use this command to set the action of packets causing threshold limit violation for prepaid credit control quotas.

Example

The following command sets the system to exclude the packets causing threshold limit triggers from accounting of prepaid credit of a subscriber:

```
quota request-trigger exclude-packet-causing-trigger
```

quota time-threshold

This command configures the time threshold limit for subscriber quota in the prepaid credit control service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

quota time-threshold { *abs_time_value* | percent *percent_value* }

{ default | no } quota time-threshold

default

Configures the default setting.
Default: Disabled

no

Disables time threshold for prepaid credit control quota.

abs_time_value

Default: 0 (Disabled)
Specifies the absolute threshold time in seconds for configured time quota in prepaid credit control charging. *abs_time_value* must be an integer from 1 through 86400. To disable this assign 0.

percent *percent_value*

Specifies the time threshold value in percentage of configured time quota in DCCA.
percent_value must be an integer from 1 through 100.

Usage

Use this command to set the time threshold for prepaid credit control quotas.

Example

The following command sets the prepaid credit control time threshold to *400* seconds:
quota time-threshold *400*

quota units-threshold

This command is used to set the unit threshold limit for subscriber quota in the prepaid credit control service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

quota unit-threshold { *abs_unit_value* | percent *percent_value* }

{ default | no } quota units-threshold

default

Configures the default setting.
Default: Disabled

no

Disables unit threshold for DCCA quota.

abs_unit_value

Default: 0 (Disabled)
Specifies the absolute threshold value in units for the configured units quota in prepaid credit control application.
abs_unit_value must be an integer from 1 through 4000000000. To disable this assign 0.

percent *percent_value*

Specifies the time threshold value in percentage of configured units quota in DCCA.
percent_value must be an integer from 1 through 100.

Usage

Use this command to set the units threshold for prepaid credit control quotas.

Example

The following command sets the prepaid credit control time threshold to *160400* units:
quota units-threshold *160400*

quota volume-threshold

This command is used to set the volume threshold limit for subscriber quota in the prepaid credit control service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

quota volume-threshold { *abs_vol_value* | percent *percent_value* }

{ default | no } quota volume-threshold

default

Configures the default setting.
Default: Disabled

no

Disables volume threshold for prepaid credit control quota.

abs_vol_value

Default: 0 (Disabled)
Specifies the absolute threshold volume in bytes to configured volume quota in prepaid credit control.
abs_vol_value must be an integer from 1 through 4000000000. To disable this assign 0.

percent *percent_value*

Specifies the volume threshold value in percentage of configured volume quota in prepaid credit control.
percent_value must be an integer from 1 through 100.

Usage

Use this command to set the volume threshold for prepaid credit control quotas.

Example

The following command sets the prepaid credit control volume threshold to *160400* bytes:
quota volume-threshold *160400*

radius usage-reporting-algorithm

This command configures the usage reporting algorithm for RADIUS prepaid using DCCA.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius usage-reporting-algorithm { cumulative | relative }

default radius usage-reporting-algorithm

default

Configures the default setting.
Default: Cumulative

cumulative

Specifies that the total accumulated usage of quota be reported in every accounting interim.

relative

Specifies that the quota usage be reported per accounting interim. I.e., since the previous usage report.

Usage

Use this command to configure the usage reporting algorithm for RADIUS prepaid using DCCA.

Example

The following command configures the usage reporting algorithm for RADIUS prepaid using DCCA to *relative*:

radius usage-reporting-algorithm relative

timestamp-rounding

This command configures how to convert exact time into the units that are used in quotas.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

timestamp-rounding { ceiling | floor | roundoff }

default timestamp-rounding

default

Sets the default timestamp-rounding setting.
Default: **roundoff**

ceiling

This keyword round-off to the smallest integer greater than the fraction.
If the fractional part of the seconds is greater than 0, then this keyword adds 1 to the number of seconds and discard the fraction.

floor

This keyword always discards the fractional part of the second.

roundoff

This keyword sets the fractional part of the seconds to nearest integer value. If fractional value is greater than or equal to 0.5 it adds 1 to the number of seconds and discards the fractional part of second.

Usage

Use this command to configure how to convert exact time into the units that are used in quotas for CCA charging.
The specified rounding will be performed before system attempts any calculation. For example using round-off, if the start time is 1.4, and the end time is 1.6, then the calculated duration will be 1 (i.e., 2 – 1 = 1).

Example

The following command sets the CCA timestamp to nearest integer value second; i.e. 34:12.23 to 34:12.00:
timestamp-rounding roundoff

trigger type

This command enables or disables triggering a credit reauthorization when the named values in the subscriber session changes.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] trigger type { cellid | lac | qos | rat | sgsn } +
default trigger type
```

default

Sets the default trigger type setting.

no

Removes the previously configured trigger type.

cellid

Sets the trigger based on change in cell identity or service area code (SAC)

lac

Sets the trigger based on change in Location Area Code.

qos

Sets the trigger based on change in the Quality of Service (QoS).

rat

Sets the trigger based on change in the Radio Access Technology (RAT).

sgsn

Sets the trigger based on change in the IP address of SGSN.

+

Indicates that more than one of the previous keywords can be entered within a single command.

Usage

Use this command to set the credit control reauthorization trigger.

Example

The following command selects a credit control trigger as **lac**:

```
trigger type lac
```

usage-reporting

This command configures the ACS Credit Control usage reporting type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
usage-reporting quotas-to-report based-on-grant

default usage-reporting quotas-to-report
```

default

Configures the default setting.
Default: Disabled

Usage

Use this command to configure reporting usage only for granted quota. On issuing this command, the **Used-Service-Unit** AVP will report quotas based on grant i.e, only the quotas present in the **Granted-Service-Unit** AVP.
With this command only the units for which the quota was granted by the DCCA server will be reported irrespective of the reporting reason.

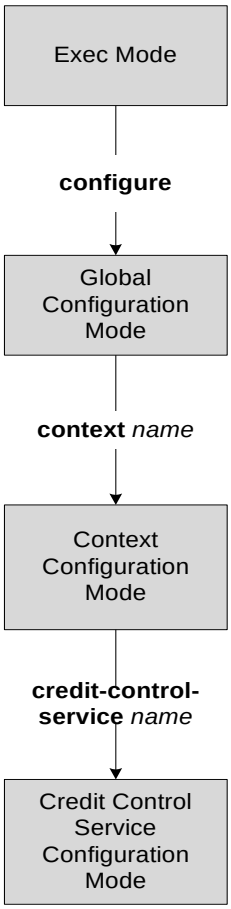
Example

The following command configures to report usage based only on granted quota:

```
usage-reporting quotas-to-report based-on-grant
```

Chapter 39
Credit Control Service Configuration Mode Commands

The Credit Control Service Configuration Mode is used to create and manage Credit Control Service.



diameter dictionary

This command configures the Diameter dictionary to be used for this Credit Control Service instance.

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter dictionary { custom1 | standard }

default diameter dictionary

default

Configures the default setting.

dictionary { custom1 | standard }

Specifies the Diameter dictionary to be used.
custom1: Specifies the custom dictionary **custom1**.
standard: Specifies the standard dictionary.

Usage

Use this command to configure the Diameter dictionary to be used for this Credit Control Service instance.

Example

The following command configures the standard Diameter dictionary:
diameter dictionary standard

diameter endpoint

This command configures the Diameter Credit Control Interface Endpoint.

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter endpoint *endpoint_name*

{ default | no } diameter endpoint

default

Configures the default setting.

no

Removes the previous Diameter endpoint configuration.

endpoint_name

Specifies the Diameter endpoint name.
endpoint_name must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to configure the Diameter Credit Control Interface Endpoint

Example

The following command configures the Diameter Credit Control Interface Endpoint named *test135*:
diameter endpoint *test135*

end

This command exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec mode.

exit

This command exits the current configuration mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

failure-handling

This command configures the Diameter failure handling behavior.

Product

All

Privilege

Security Administrator, Administrator

Syntax

failure-handling { initial-request | terminate-request | update-request } { diameter-result-code *result_code* **[to** *result_code* **] | peer-unavailable | request-timeout } action { continue | retry-and-continue | retry-and-terminate | terminate }**

{ default | no } failure-handling { initial-request | terminate-request | update-request } { diameter-result-code *result_code* **[to** *result_code* **] | peer-unavailable | request-timeout }**

default

Configures the default setting.

no

Removes the previous failure handling configuration.

initial-request | terminate-request | update-request

initial-request: Specifies failure handling for Initial Request.
terminate-request: Specifies failure handling for Terminate Request.
update-request: Specifies failure handling for Update Request.

diameter-result-code | peer-unavailable | request-timeout

diameter-result-code *result_code* **[to** *result_code* **]**: Specifies Diameter result code(s) for failure handling.
result_code must be an integer from 3000 through 9999.
to *result_code*: Specifies the range of Diameter result codes.
peer-unavailable: Specifies failure handling for peer being unavailable.
request-timeout: Specifies failure handling for request timeouts.

action { continue | retry-and-continue | retry-and-terminate | terminate }

Specifies the failure handling action.
continue: Continue the session without credit control.
retry-and-continue: Retry and, even if credit control is not available, continue.
retry-and-terminate: Retry and then terminate.
terminate: Terminate the session.

Usage

Use this command to configure the Diameter failure handling behavior.

Example

The following command configures initial request failure handling behavior for Diameter result codes *3001* to *4001* with terminate action:

failure-handling initial-request diameter-result-code *3001* to *4001* action terminate

request timeout

This command configures the timeout period for Diameter requests.

Product

All

Privilege

Security Administrator, Administrator

Syntax

request timeout *timeout*

{ default | no } request timeout

default

Configures the default setting.

no

Removes the previous request timeout configuration.

timeout

Specifies the timeout period in seconds, and must be an integer from 1 through 300.

Usage

Use this command to configure the Diameter request timeout value, after which the request is deemed to have failed. This timeout is an overall timeout, and encompasses all retries with the server(s).

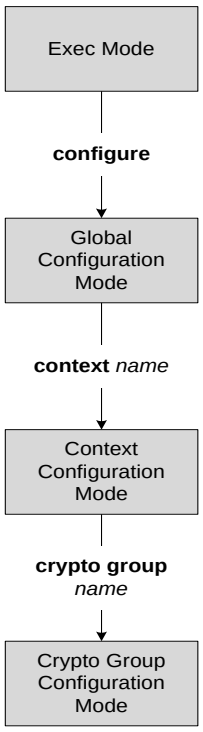
Example

The following command configures the timeout period to *150* seconds:

request timeout *150*

Chapter 40
Crypto Group Configuration Mode Commands

The Crypto Group Configuration Mode is used to configure crypto (tunnel) groups for providing fail-over redundancy for IPSec tunnels to packet data networks (PDNs).



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the context configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the context configuration mode.

match address

Associates an access control list (ACL) to the crypto group.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

match address *acl_name* **[** *preference* **]**

no match address *acl_name*

no

Deletes a previously configured ACL association.

acl_name

The name of the ACL being matched to the crypto group.

preference

The priority of the ACL.
The ACL preference is factored when a single packet matches the criteria of more than one ACL. *preference* can be configured to any integer value from 0 to 4294967295. "0" is the highest priority. If multiple ACLs are assigned the same priority, the last one entered will be used first.

Important: The priorities are only compared for ACLs matched to other groups or to policy ACLs (those applied to the entire context).

Usage

IP ACLs are associated with crypto groups using this command. Both the crypto group and the ACLs must be configured in the same context.
ISAKMP crypto maps can then be associated with the crypto group. This allows user traffic matching the rules of the ACL to be handled according to the policies configured as part of the crypto map.

Example

The following command associates an ACL called *corporate_acl* to the crypto group:

```
match address corporate_acl
```

match ip pool

Matches the specified IP pool to the current crypto group. This command can be used multiple times to match more than one IP pool.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

match ip pool pool-name *pool_name*

no match ip pool pool-name *pool_name*

no

Delete the matching statement for the specified IP pool from the crypto group.

pool_name

The name of an existing IP pool that should be matched.

Usage

Use this command to set the names of IP pools that should be matched in the current crypto group.

Example

The following command sets a rule for the current crypto group that will match an IP pool named **ippool1**:

```
match ip pool pool-name ippool1
```

switchover

Configures the fail-over properties for the crypto group as part of the Redundant IPSec Fail-Over feature.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
switchover auto [ do-not-revert ]

no switchover auto
```

no

Disables the automatic switchover of tunnels. This applies to both primary-to-secondary and secondary-to-primary switches.

auto

Default: Enabled
Allows the automatic switchover of tunnels.

do-not-revert

Default: Disabled
Disables the automatic switchover of secondary tunnels to primary tunnels.

Usage

This command configures the fail-over options for the Redundant IPSec Fail-over feature.
If the automatic fail-over options are disabled, tunneled traffic must be manually switched to the alternate tunnel (or manually activated if no alternate tunnel is configured and available) using the following command in the Exec Mode:
crypto-group group_name activate { primary | secondary }
For a definition of this command, see the **crypto-group** section of the Exec Mode Commands chapter of this guide.

Example

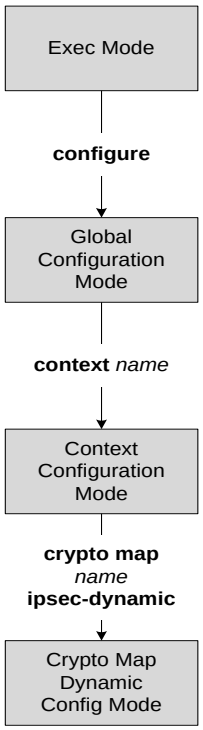
The following command disables the automatic secondary-to-primary switchover:

```
switchover auto do-not-revert
```

Chapter 41
Crypto Map Dynamic Configuration Mode Commands

The Crypto Map Dynamic Configuration Mode is used to configure IPSec tunnels that are created as needed to facilitate subscriber sessions using Mobile IP or L2TP.

Modification(s) to an existing dynamic crypto map configuration will not take effect until the related security association has been cleared. Refer to the clear crypto security-association command located in the Exec Mode Commands chapter of the Command Line Interface Reference for more information.



end

Returns the CLI prompt to to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the DYnamic Crypto Map configuration mode and returns to the context configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the context configuration mode.

set

Configures parameters for the dynamic crypto map.

Product

PDSN, HA, GGSN, PDIF

Privilege

Security Administrator, Administrator

Syntax

set { control-dont-fragment { clear-bit | copy-bit | set-bit } | isakmp natt [keepalive *time*] **| pfs { group1 | group2 | group5} | phase1-idtype { id-key-id | ipv4-address }** [mode { aggressive | main }] **| phase2-idtype { ipv4-address | ipv4-address-subnet} | security-association lifetime { keepalive | kilo-bytes** *kbytes* **| seconds** *secs* **} | transform-set** *transform_name* **[transform-set** *transform_name2 ...* **transform-set** *transform_name6* **] }**
no set { pfs | security-association lifetime {keepalive | kilo-bytes | seconds } | phase1-idtype | phase2-idtype | transform-set *transform_name* **[transform-set** *transform_name2 ...* **transform-set** *transform_name6* **] }**

---

no

Deletes the specified parameter or resets the specified parameter to the default value.

---

control-dont-fragment { clear-bit | copy-bit | set-bit }

Controls the don't fragment (DF) bit in the outer IP header of the IPsec tunnel data packet. Options are:

- **clear-bit**: Clears the DF bit from the outer IP header (sets it to 0).
- **copy-bit**: Copies the DF bit from the inner IP header to the outer IP header. This is the default action.
- **set-bit**: Sets the DF bit in the outer IP header (sets it to 1).

---

isakmp natt [keepalive *time*]

Enable IPSec NAT Traversal.
keepalive *time*: The time to keep the NAT connection alive in seconds. *time* must be an integer of from 1 through 3600 seconds.
must be an integer of from 1 through 3600 seconds.

---

pfs { group1 | group2 | group5 }

Specifies the modp Oakley group (also known as the Diffie-Hellman (D-H) group) that is used to determine the length of the base prime numbers that are used for Perfect Forward Secrecy (PFS).

- **group1** : Diffie-Hellman Group1 (768-bit modp)
- **group2** :- Diffie-Hellman Group2 (1024-bit modp)
- **group5** :- Diffie-Hellman Group5 (1536-bit modp)

---

phase1-idtype { id-key-id | ipv4-address } [mode { aggressive | main }]

Sets the IKE negotiations Phase 1 payload identifier.

Default: ipv4-address
id-key-id: Use ID_KEY_ID as the Phase 1 payload identifier.
ipv4-address: Use IPV4_ADDR as the Phase 1 payload identifier.
mode { aggressive | main }: Specify the IKE mode.

phase2-idtype { ipv4-address | ipv4-address-subnet }

Sets the IKE negotiations Phase 2 payload identifier.
Default: ipv4-address-subnet
ipv4-address: Use IPV4_ADDR as the Phase 2 payload identifier.
ipv4-address-subnet: Use IPV4_ADDR_SUBNET as the Phase 2 payload identifier.

security-association lifetime { keepalive | kilo-bytes *kbytes* **| seconds** *secs* **}**

Defaults:

- keepalive: Disabled
- **kilo-bytes:** 4608000 kbytes
- **seconds:** 28800 seconds

This keyword specifies the parameters that determine the length of time an IKE Security Association (SA) is active when no data is passing through a tunnel. When the lifetime expires, the tunnel is torn down. Whichever parameter is reached first expires the SA lifetime.

- **keepalive** : The SA lifetime expires only when a keepalive message is not responded to by the far end.
- **kilo-bytes** kbytes : This specifies the amount of data in kilobytes to allow through the tunnel before the SA lifetime expires. kbytes must be an integer from 2560 through 4294967294.
- **seconds** secs : The number of seconds to wait before the SA lifetime expires. secs must be an integer from 1200 through 86400.

Important: If the dynamic crypto map is being used in conjunction with Mobile IP and the Mobile IP renewal timer is less than the crypto map's SA lifetime (either in terms of kilobytes or seconds), then the **keepalive** parameter **must** be configured.

transform-set *transform_name* **[transform-set** *transform_name2 ...*
transform-set *transform_name6* **]**

This keyword specifies the name of a transform set configured in the same context that will be associated with the crypto map. Refer to the command *crypto ipsec transform-set* for information on creating transform sets.
You can repeat this keyword up to 6 times on the command line to specify multiple transform sets.
trasnform_name is the name of the transform set and must be an alpha and/or numeric string from 1 to 127 characters and is case sensitive.

Usage

Use this command to set parameters for a dynamic crypto map.

Example

The following command sets the PFS group to Group1:

```
set pfs group1
```

The following command sets the SA lifetime to 50000 KB:

```
set security-association lifetime kilo-bytes 50000
```

The following command sets the SA lifetime to 10000 seconds:

```
set security-association lifetime seconds 10000
```

The following command enables the SA to re-key when the tunnel lifetime expires:

```
set security-association lifetime keepalive
```

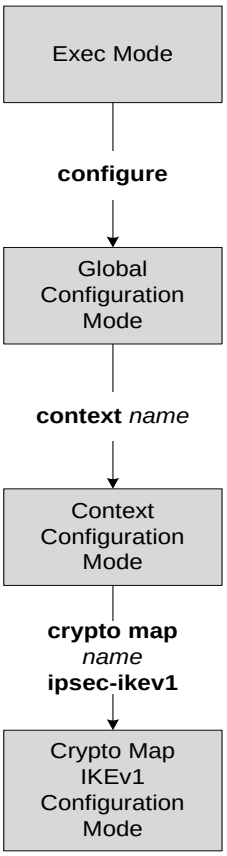
The following command defines transform sets tset1 and tset2.

```
set transform-set tset1 transform-set tset2
```

Chapter 42
Crypto Map IKEv1 Configuration Mode Commands

The Crypto Map IKEv1 Configuration Mode is used to configure properties for IPSec tunnels that will be created using the Internet Key Exchange (IKE) that operates within the framework of the Internet Key Exchange version 1 (IKEv1).

Modification(s) to an existing IKEv1 crypto map configuration will not take effect until the related security association has been cleared. Refer to the clear crypto security-association command located in the Exec Mode Commands chapter of the Command Line Interface Reference for more information.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the context configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the context configuration mode.

match address

Matches or associates the crypto map to an access control list (ACL) configured in the same context.

Product

PDSN, HA, GGSN, SCM

Privilege

Security Administrator, Administrator

Syntax

match address *acl_namepriority*

no match address

no

Removes a previously matched ACL.

acl_name

The name of the ACL that the crypto map is to be matched with.
acl_name can be from 1 to 79 alpha and/or numeric characters and is case sensitive.

priority

Default: 0
Specifies the preference of the ACL. The ACL preference is factored when a single packet matches the criteria of more than one ACL.
The preference can be configured to any integer value from 0 to 4294967295. “0” is the highest priority.

Important: The priorities are only compared for ACLs matched to other crypto maps or to policy ACLs (those applied to the entire context).

Usage

ACLs matched to crypto maps are referred to as crypto ACLs. Crypto ACLs define the criteria that must be met in order for a subscriber data packet to routed over an IPSec tunnel.
Prior to routing, the system examines the properties of each subscriber data packet. If the packet properties match the criteria specified in the crypto ACL, the system will initiate the IPSec policy dictated by the crypto map.

Example

The following command sets the crypto map ACL to the ACL named *ACLlist1* and sets the crypto maps priority to the highest level.

```
match address ACLlist1 0
```

match crypto group

Matches or associates the crypto map a crypto group configured in the same context.

Product

PDSN, HA, GGSN, SCM

Privilege

Security Administrator, Administrator

Syntax

```
match crypto group group_name { primary | secondary }
no match crypto group group_name
```

no

Deletes a previously configured crypto group association.

group_name

The name of the crypto group and can consist of from 1 to 127 alpha and/or numeric characters in length and is case sensitive.

primary

Specifies that the policies configured as part of this crypto map will be used for the primary tunnel in the Redundant IPSec Tunnel Failover feature.

secondary

Specifies that the policies configured as part of this crypto map will be used for the secondary tunnel in the Redundant IPSec Tunnel Failover feature.

Usage

Use this command to dictate the primary and secondary tunnel policies used for the Redundant IPSec Tunnel Failover feature.
At least two policies must be configured to use this feature. One policy must be configured as the primary, the other as the secondary.

Example

The following command associates the crypto map to a crypto group called *group1* and dictates that it will serve as the primary tunnel policy:

```
match crypto group group1 primary
```

match ip pool

Matches the specified IP pool to the current IKEv1 crypto map. This command can be used multiple times to change more than one IP pool.

Product

PDSN, HA, GGSN, SCM

Privilege

Security Administrator, Administrator

Syntax

match ip pool pool-name *pool_name*

no match ip pool pool-name *pool_name*

no

Delete the matching statement for the specified IP pool from the crypto map.

pool_name

The name of an existing IP pool that should be matched.

Usage

Use this command to set the names of IP pools that should be matched in the current crypto map.

Important: If an IP address pool that is matched to a IKEv1 crypto map is resized, removed, or added, the corresponding security association must be cleared in order for the change to take effect. Refer to the **clear crypto** command in the Exec mode for information on clearing security associations.

Example

The following command sets a rule for the current crypto map that will match an IP pool named *ippool1*:

match ip pool pool-name *ippool1*

set

Configures parameters for the dynamic crypto map.

Product

PDSN, HA, GGSN, SCM

Privilege

Security Administrator, Administrator

Syntax

set { control-dont-fragment { clear-bit | copy-bit | set-bit } | ikev1 natt [keepalive *time* **] | pfs { group1 | group2 | group5 } |** phase1-idtype { id-key-id | ipv4-address [mode { aggressive | main }] | **phase2-idtype { ipv4-address | ipv4-address-subnet } | security-association lifetime { disable-phase2-rekey | keepalive | kilo-bytes** *kbytes* **| seconds** *secs* **}** transform-set *transform_name* **[transform-set** *transform_name2 ...* **transform-set** *transform_name6* **]**
no set { ikev1 natt | pfs | phase1-idtype | **phase2-idtype | security-association lifetime { disable-phase2-rekey | keepalive | kilo-bytes | seconds } |** transform-set *transform_name* **[transform-set** *transform_name2 ...* **transform-set** *transform_name6* **]**

---

control-dont-fragment { clear-bit | copy-bit | set-bit }

Controls the don't fragment (DF) bit in the outer IP header of the IPsec tunnel data packet. Options are:

- **clear-bit**: Clears the DF bit from the outer IP header (sets it to 0).
- **copy-bit**: Copies the DF bit from the inner IP header to the outer IP header. This is the default action.
- **set-bit** : Sets the DF bit in the outer IP header (sets it to 1).

---

ikev1 natt [keepalive *time* **]**

Specifies IKE parameters.
natt: Enables IPSec NAT Traversal.
keepalive *time*: The time to keep the NAT connection alive in seconds. *time* must be an integer of from 1 through 3600 seconds.

---

pfs { group1 | group2 | group5 }

Specifies the modp Oakley group (also known as the Diffie-Hellman (D-H) group) that is used to determine the length of the base prime numbers that are used for Perfect Forward Secrecy (PFS).

- **group1** : Diffie-Hellman Group1 (768-bit modp)
- **group2** :- Diffie-Hellman Group2 (1024-bit modp)
- **group5** :- Diffie-Hellman Group5 (1536-bit modp)

---

phase1-idtype { id-key-id | ipv4-address [mode { aggressive | main }]

Sets the IKE negotiations Phase 1 payload identifier. Default: id-key-id
id-key-id: ID KEY ID
ipv4-address: ID IPV4 Address

- mode: Configures IKE mode

- aggressive: IKE negotiation mode: AGGRESSIVE
- main: IKE negotiation mode: MAIN

phase2-idtype { ipv4-address | ipv4-address-subnet }

Sets the IKE negotiations Phase 2 payload identifier. Default: ipv4-address-subnet
ipv4-address: Use IPV4_ADDR as the Phase 2 payload identifier.
ipv4-address-subnet: Use IPV4_ADDR_SUBNET as the Phase 2 payload identifier.

security-association lifetime { disable-phase2-rekey | keepalive | kilo-bytes *kbytes* **| seconds** *secs* **}**

Defaults:
- **disable-phase2-rekey**: Rekeying is enabled by default
- **keepalive**: Disabled
- **kilo-bytes:** 4608000 kbytes
- **seconds:** 28800 seconds

This keyword specifies the parameters that determine the length of time an IKE Security Association (SA) is active when no data is passing through a tunnel. When the lifetime expires, the tunnel is torn down. Whichever parameter is reached first expires the SA lifetime.
- **disable-phase2-rekey** : If this keyword is specified, when the lifetime expires, the Phase2 SA is not rekeyed.
- **keepalive** : The SA lifetime expires only when a keepalive message is not responded to by the far end.
- **kilo-bytes** kbytes : This specifies the amount of data in kilobytes to allow through the tunnel before the SA lifetime expires. kbytes must be an integer from 2560 through 4294967294.
- **seconds** secs : The number of seconds to wait before the SA lifetime expires. secs must be an integer from 1200 through 86400.

Important: If the dynamic crypto map is being used in conjunction with Mobile IP and the Mobile IP renewal timer is less than the crypto map's SA lifetime (either in terms of kilobytes or seconds), then the **keepalive** parameter **must** be configured.

transform-set *transform_name* **[transform-set** *transform_name2 ...*
transform-set *transform_name6* **]**

This keyword specifies the name of a transform set configured in the same context that will be associated with the crypto map. Refer to the command **crypto ipsec transform-set** for information on creating transform sets.
You can repeat this keyword up to 6 times on the command line to specify multiple transform sets.
transform_name is the name of the transform set and must be an alpha and/or numeric string from 1 to 127 characters and is case sensitive.

no

Deletes the specified parameter or resets the specified parameter to the default value.

Usage

Use this command to set parameters for a dynamic crypto map.

Example

The following command sets the PFS group to Group1:

```
set pfs group1
```

The following command sets the SA lifetime to 50000 KB:

```
set security-association lifetime kilo-bytes 50000
```

The following command sets the SA lifetime to 10000 seconds:

```
set security-association lifetime seconds 10000
```

The following command enables the SA to re-key when the tunnel lifetime expires:

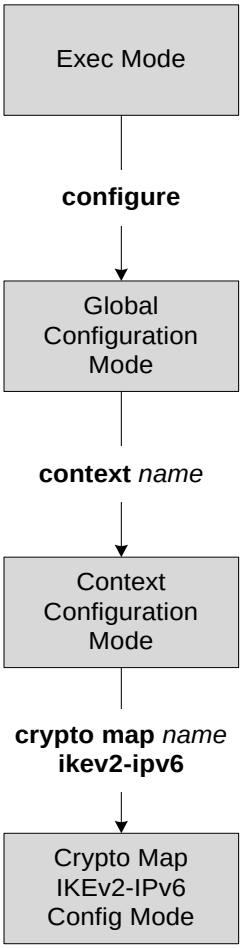
```
set security-association lifetime keepalive
```

The following command defines transform sets tset1 and tset2.

```
set transform-set tset1 transform-set tset2
```

Chapter 43
Crypto Map IKEv2-IPv6 Configuration Mode Commands

The Crypto Map IKEv2-IPv6 Configuration Mode is used to configure an IKEv2 IPsec policy for secure X3 interface tunneling between a P-GW and a lawful intercept server.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

authentication

Configures the subscriber authentication method used for the P-GW lawful intercept service.

Product

P-GW

Privilege

Administrator

Syntax

authentication pre-shared-key { encrypted key *value* **| key** *value* **}**

pre-shared-key { encrypted key *value* **| key** *value* **}**

Specifies that a pre-shared key is to be used for authenticating a subscriber in the PDIF service.
encrypted key *value*: Specifies that the pre-shared key used for authentication is encrypted. *value* must be between 1 and 255 alpha and/or numeric characters.
key *value*: Specifies that the pre-shared key used for authentication is clear text. *value* must be between 1 and 255 alpha and/or numeric characters.

Usage

Use this command to specify the type of authentication performed for subscribers attempting to access the P-GW service using this crypto map.

Example

The following command sets the authentication method to an open key value of *6d79706173776f7264*:

```
authentication pre-shared-key key 6d79706173776f7264
```

control-dont-fragment

Controls the don’t fragment (DF) bit in the outer IP header of the IPsec tunnel data packet.

Product

P-GW

Privilege

Administrator

Syntax

```
control-dont-fragment { clear-bit | copy-bit | set-bit }
```

{ clear-bit | copy-bit | set-bit }

clear-bit: Clears the DF bit from the outer IP header (sets it to 0).
copy-bit: Copies the DF bit from the inner IP header to the outer IP header. This is the default action.
set-bit: Sets the DF bit in the outer IP header (sets it to 1).

Usage

A packet is encapsulated in IPsec headers at both ends. The new packet can copy the DF bit from the original unencapsulated packet into the outer IP header, or it can set the DF bit if there is not one in the original packet. It can also clear a DF bit that it does not need.

Example

The following command sets the DF bit in the outer IP header:

```
control-dont-fragment set-bit
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec Mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

```
exit
```

Usage

Returns to the previous mode.

ikev2-ikesa

Configures parameters for the IKEv2 IKE Security Associations within this crypto template.

Product

P-GW

Privilege

Administrator

Syntax

ikev2-ikesa { max-retransmissions *number* **| rekey | setup-timer** *sec* **}**

default ikev2-ikesa { max-retransmissions | rekey | setup-timer }

no ikev2-ikesa rekey

default

Restores the selected keyword to its default value.

no ikev2-ikesa

Disables a previously enabled parameter.

max-retransmissions *number*

Default: 5
Specifies the maximum number of retransmissions of an IKEv2 IKE exchange request if a response has not been received. *number* must be an integer from 1 to 8.

rekey

Specifies if IKESA rekeying should occur before the configured lifetime expires (at approximately 90% of the lifetime interval). Default is not to re-key.

setup-timer *sec*

Default: 60
Specifies the number of seconds before a IKEv2 IKE Security Association, that is not fully established, is terminated. *sec* must be an integer from 1 to 3600.

Usage

Use this command to configure parameters for the IKEv2 IKE Security Associations within this crypto template.

Example

The following command configures the maximum number of IKEv2 IKESA request retransmissions to 7:

```
ikev2-ikesa max-retransmissions 7
```

match

Matches or associates the crypto map to an access control list (ACL) configured in the same context.

Product

P-GW

Privilege

Administrator

Syntax

match address *acl_name* **[** *priority* **]**

no match address

no

Removes a previously matched ACL.

acl_name

The name of the ACL that the crypto map is to be matched with.
acl_name can be from 1 to 79 alpha and/or numeric characters and is case sensitive.

priority

Default: 0
Specifies the preference of the ACL. The ACL preference is factored when a single packet matches the criteria of more than one ACL.
The preference can be configured to any integer value from 0 to 4294967295. “0” is the highest priority.

Important: The priorities are only compared for ACLs matched to other crypto maps or to policy ACLs (those applied to the entire context).

Usage

ACLs matched to crypto maps are referred to as crypto ACLs. Crypto ACLs define the criteria that must be met in order for a subscriber data packet to routed over an IPSec tunnel.
Prior to routing, the system examines the properties of each subscriber data packet. If the packet properties match the criteria specified in the crypto ACL, the system will initiate the IPSec policy dictated by the crypto map.

Example

The following command sets the crypto map ACL to the ACL named *acl-list1* and sets the crypto maps priority to the highest level.

```
match address acl-list1 0
```

payload

Creates a new, or specifies an existing, crypto template payload and enters the Crypto Template Payload Configuration Mode.

Product

P-GW

Privilege

Administrator

Syntax

payload *name* **match ipv6**

no payload *name*

name

Specifies the name of a new or existing crypto template payload. *name* must be from 1 to 127 alpha and/or numeric characters.

match ipv6

Filters IPSec IPv6 Child Security Association creation requests for subscriber calls using this payload. Further filtering can be performed by applying the following:

Usage

Use this command to create a new or enter an existing crypto template payload. The payload mechanism is a means of associating parameters for the Security Association (SA) being negotiated.
Two payloads are required: one each for MIP and IKEv2. The first payload is used for establishing the initial Child SA Tunnel Inner Address (TIA) which will be torn down. The second payload is used for establishing the remaining Child SAs. Note that if there is no second payload defined with home-address as the *ip-address-allocation* then no MIP call can be established, just a Simple IP call.
Currently, the only available match is for ChildSA, although other matches are planned for future releases.
Entering this command results in the following prompt:
[*ctxt_name*]*hostname*(cfg-crypto-<*name*>-ikev2-tunnel-payload)#
Crypto Template IKEv2-IPv6 Payload Configuration Mode commands are defined in the Crypto Template IKEv2-IPv6 Payload Configuration Mode Commands chapter.

Example

The following command configures a crypto template payload called *payload5* and enters the Crypto Template IKEv2-IPv6 Payload Configuration Mode:

```
payload payload5 match ipv6
```

peer

Configures the IP address of a peer IPsec server.

Product

P-GW

Privilege

Administrator

Syntax

peer *ip_address*

no peer

no

Removes the configured peer server IP address.

ip_address

Specifies the IP address of a peer IPsec server. *ip_address* must be specified in IPv4 dotted decimal notation or IPv6 colon separated notation.

Usage

Use this command to specify a peer IPsec peer server. The IPsec peer server can also be the Lawful Intercept server.

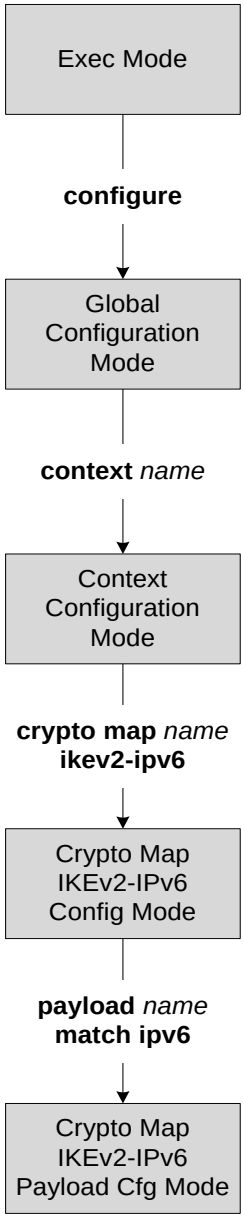
Example

The following command configures the system to recognize an IPsec peer server with an IPv6 address of *fe80::200:f8ff:fe21:67cf*:

```
peer fe80::200:f8ff:fe21:67cf
```

Chapter 44
Crypto Map IKEv2-IPv6 Payload Configuration Mode Commands

The Crypto Map IKEv2-IPv6 Payload Configuration Mode is used to assign the correct IPsec transform-set from a list of up to four different transform-sets, and to assign Mobile IP addresses.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec Mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Returns to the previous mode.

ipsec

Configures the IPsec transform set to be used for this crypto template payload.

Product

P-GW

Privilege

Administrator

Syntax

ipsec transform-set list *name*

no ipsec transform-set list

list *name*

Specifies the context configured IPsec transform set name to be used in the crypto template payload. This is a space-separated list. From 1 to 4 transform sets can be entered. *name* must be from 1 to 127 alpha and/or numeric characters.

Usage

Use this command to list the IPsec transform set(s) to use in this crypto template payload.

Example

The following command configures IPsec transform sets named *ipset1* and *ipset2* to be used in this crypto template payload:

```
ipsec transform-set list ipset1 ipset2
```

lifetime

Configures the number of seconds for IPsec Child SAs derived from this crypto template payload to exist.

Product

P-GW

Privilege

Administrator

Syntax

lifetime *sec* **[kilobytes** *kbytes* **]**

default lifetime

default

Returns the lifetime value to the default setting of 86400.

sec

Default: 86400
Specifies the number of seconds for IPsec Child Security Associations derived from this crypto template payload to exist. *sec* must be an integer from 60 to 604800.

kilobytes *kbytes*

Specifies lifetime in kilo-bytes for IPsec Child Security Associations derived from this Crypto Map. *kbytes* must be an integer value from 1 to 2147483648.

Usage

Use this command to configure the number of seconds for IPsec Child Security Associations derived from this crypto template payload to exist.

Example

The following command configures the IPsec child SA lifetime to be 120 seconds:

```
lifetime 120
```

rekey

Configures child security association rekeying.

Product

P-GW

Privilege

Administrator

Syntax

```
rekey [ keepalive ]
```

`[ default | no ] rekey`

`default`

Returns the feature to the default setting of disabled.

`no`

Disables this feature.

`keepalive`

If specified, a session will be rekeyed even if there has been no data exchanged since the last rekeying operation. By default rekeying is only performed if there has been data exchanged since the previous rekey.

Usage

Use this command to enable or disable the ability to rekey IPsec Child SAs after approximately 90% of the Child SA lifetime has expired. The default, and recommended setting, is not to perform rekeying. No rekeying means the PDIF will not originate rekeying operations and will not process CHILD SA rekeying requests from the MS.

Example

The following command disables rekeying:

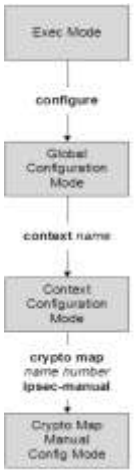
```
no rekey
```

Chapter 45
Crypto Map Manual Configuration Mode Commands

The Crypto Map Manual Configuration Mode is used to configure static IPSec tunnel properties.

Modification(s) to an existing crypto map manual configuration will not take effect until the related security association has been cleared. Refer to the clear crypto security-association command located in the Exec Mode Commands chapter of the Command Line Interface Reference for more information.

Important: Because manual crypto map configurations require the use of static security keys (associations), they are not as secure as crypto maps that rely on dynamically configured keys. Therefore, it is recommended that they only be used for testing purposes.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the context configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the context configuration mode.

match address

Matches or associates the crypto map to an access control list (ACL) configured in the same context.

Product

PDSN, HA, GGSN, PDIF

Privilege

Security Administrator, Administrator

Syntax

match address *acl_name* [*priority*]
no match address

---

no

Removes a previously matched ACL.

---

acl_name

The name of the ACL that the crypto map is to be matched with.
acl_name can be from 1 to 47 alpha and/or numeric characters and is case sensitive.

---

priority

Default: 0
Specifies the preference of the ACL. The ACL preference is factored when a single packet matches the criteria of more than one ACL.
The preference can be configured to any integer value from 0 to 4294967295. “0” is the highest priority.

Important: The priorities are only compared for ACLs matched to other crypto maps or to policy ACLs (those applied to the entire context).

Usage

ACLs matched to crypto maps are referred to as crypto ACLs. Crypto ACLs define the criteria that must be met in order for a subscriber data packet to routed over an IPSec tunnel.
Prior to routing, the system examines the properties of each subscriber data packet. If the packet properties match the criteria specified in the crypto ACL, the system will initiate the IPSec policy dictated by the crypto map.

Example

The following command sets the crypto map ACL to the ACL named **ACLlist1** and sets the crypto maps priority to the highest level.

```
match address ACLlist1 0
```

set control-dont-fragment

Controls the don't fragment (DF) bit in the outer IP header of the IPsec tunnel data packet.

Product

PDSN, HA, GGSN, PDIF

Privilege

Security Administrator, Administrator

Syntax

set control-dont-fragment { clear-bit | copy-bit | set-bit }
default **set control-dont-fragment { clear-bit | copy-bit | set-bit }**

clear-bit

Clears the DF bit from the outer IP header (sets it to 0).

copy-bit

Copies the DF bit from the inner IP header to the outer IP header. This is the default action.

default

Sets / Restores default value assigned to a specified parameter.

set-bit

Sets the DF bit in the outer IP header (sets it to 1).

Usage

Use this command to clear, copy, or set the don't fragment (DF) bit in the outer IP header of the IPsec tunnel data packet.

Example

The following command sets the DF bit in the outer IP header.

```
set control-dont-fragment set-bit
```

set peer

Configures the IP address of the peer security gateway that the system will establish the IPSec tunnel with.

Product

PDSN, HA, GGSN, PDIF

Privilege

Security Administrator, Administrator

Syntax

```
set peer gw_address
no set peer
```

no

Removes a previously configured peer address.

gw_address

The IP address of the peer security gateway with which the IPSec tunnel will be established.

Usage

Once the manual crypto map is fully configured and applied to an interface, the system will establish an IPsec tunnel with the security gateway specified by this command.
Because the tunnel relies on statically configured parameters, once created, it never expires; it exists until its configuration is deleted.

Example

The following command configures a security gateway address of 192.168.1.100 for the crypto map to establish a tunnel with.

```
set peer 192.168.1.100
```

set session-key

Configures session key parameters for the manual crypto map.

Product

PDSN, HA, GGSN, PDIF

Privilege

Security Administrator, Administrator

Syntax

set session-key { inbound | outbound } { ah *ah_spi* **[encrypted] key** *ah_key* **| esp** *esp_spi* **[encrypted] cipher** *encryption_key* **[encrypted] authenticator** *auth_key* **}**
no set session-key { inbound | outbound }

---

no

Removes previously configured session key information.

---

inbound

Specifies that the key(s) will be used for tunnels carrying data sent by the security gateway.

---

outbound

Specifies that the key(s) will be used for tunnels carrying data sent by the system.

---

ah *ah_spi*

Configures the following session key information for the Authentication Header (AH) protocol:
ah_spi: The security parameter index (SPI) used to identify the AH security association (SA) between the system and the security gateway.
The SPI can be configured to any integer value from 256 to 4294967295.

---

encrypted

Indicates the key provided is encrypted.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **key**, **cipher**, and/or **authenticator** keyword is the encrypted version of the plain text key. Only the encrypted key is saved as part of the configuration file.

---

key *ah_key*

Configures the following session key information for the Authentication Header (AH) protocol:
ah_key: The key used by the system to de/encapsulate IP packets using the AH protocol.
The key must be entered as either a string or a hexadecimal number beginning with “0x”.

---

esp *esp_spi*

Configures security parameter index (SPI) for the Encapsulating Security Payload (ESP) protocol. The SPI is used to identify the ESP security association (SA) between the system and the security gateway.
esp_spi : The SPI value. It can be configured to any integer value from 256 to 4294967295.

cipher *encryption_key*

Specifies the key used by the system to de/encrypt the payloads of IP packets using the ESP protocol. *encryption_key* must be entered as either a string or a hexadecimal number beginning with “0x”.

authenticator *auth_key*

Specifies the key used by the system to authenticate the IP packets once encryption has been performed. *auth_key* must be entered as either a string or a hexadecimal number beginning with “0x”.

Usage

Manual crypto maps rely on the use of statically configured keys to establish IPSec tunnels. This command allows the configuration of the static keys.
Identical keys must be configured on both the system and the security gateway in order for the tunnel to be established.
This command can be entered up to two time for the same crypto map: once to configure inbound key properties, and once to configure outbound key properties.

Example

The following command configures a manual crypto map with the following session key properties:

- Keys are for tunnels initiated by the system to the security gateway.
- ESP will be used with an SPI of 310.
- Encryption key is sd23r9skd0fi3as.
- Authentication key is sfd23408imi9yn.

```
set session-key outbound esp 310 cipher sd23r9skd0fi3as authenticator
sfd23408imi9yn
```

set transform-set

Configures the name of a transform set that the crypto map is associated with.

Product

PDSN, HA, GGSN, PDIF

Privilege

Security Administrator, Administrator

Syntax

set transform-set *transform_name*
no set transform-set

no

Removes a previously configured transform set association.

transform_name

Specifies the name of the transform set and must be an alpha and/or numeric string from 1 to 127 characters and is case sensitive.

Usage

System transform sets contain the IPSec policy definitions for crypto maps. Refer to the command *crypto ipsec transform-set* for information on creating transform sets.

Important: Transform sets must be configured prior to configuring session key information for the crypto map.

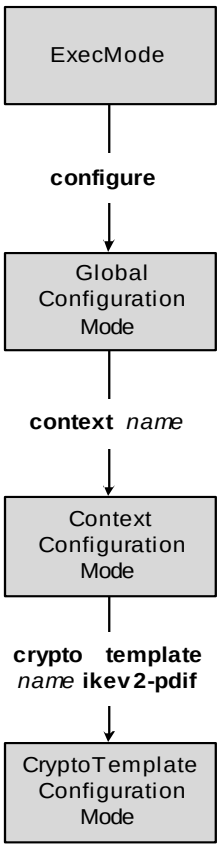
Example

The following command associates a transform set named esp_tset with the crypto map:

```
set transform-set esp_tset
```

Chapter 46
Crypto Template Configuration Mode Commands

The Crypto Template Configuration Mode is used to configure an IKEv2 IPsec policy. It includes most of the IPsec parameters and IKEv2 parameters for cryptographic and authentication algorithms etc. A security gateway service will not function without a configured crypto template. Only one crypto template can be configured per service.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

authentication

Configures the subscriber authentication method used for the PDIF service.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

authentication { eap-profile *name* **[second-phase eap-profile** *name* **] | gateway { encrypted key** *value* **| key** *value* **} | pre-shared-key { encrypted key** *value* **| key** *value* **} }**

eap-profile *name* **[second-phase eap-profile** *name* **]**

Specifies that authentication is to be performed using a named EAP profile. *name* must be from 1 to 127 alpha and/or numeric characters. Entering this keyword places the CLI in the EAP Authentication Configuration Mode.
A second-phase eap profile name is only required for installations using multiple authentication. *name* must be from 1 to 127 alpha and/or numeric characters.

gateway { encrypted key *value* **| key** *value* **}**

Specifies the pre-shared gateway key used for gateway authentication.
encrypted key *value*: Specifies that the pre-shared key used for authentication is encrypted. *value* must be between 1 and 255 alpha and/or numeric characters.
key *value*: Specifies that the pre-shared key used for authentication is clear text. *value* must be between 1 and 255 alpha and/or numeric characters.

pre-shared-key { encrypted key *value* **| key** *value* **}**

Specifies that a pre-shared key is to be used for authenticating a subscriber in the service.
encrypted key *value*: Specifies that the pre-shared key used for authentication is encrypted. *value* must be between 1 and 255 alpha and/or numeric characters.
key *value*: Specifies that the pre-shared key used for authentication is clear text. *value* must be between 1 and 255 alpha and/or numeric characters.

Usage

Use this command to specify the type of authentication performed for subscribers attempting to access the service using this crypto template.
Entering the **authentication eap-profile** command results in the following prompt:
[*context_name*]*hostname*(cfg-crypto-tmpl-eap-key)#
EAP Authentication Configuration Mode commands are defined in the “EAP Authentication Configuration Mode Commands” chapter.

Example

The following command enables authentication via an EAP profile named *eap23* for subscribers using the service with this crypto template:

```
authentication eap-profile eap23
```

certificate

Used to bind an X.509 trusted certificate to a crypto template.

Product

PDIF

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

certificate name *name*

no certificate

no

Removes any applied certificate or prevents the certificate from being included in the Auth Exchange response payload.

name *name*

An alpha and/or numeric string of 1 - 127 characters.

Usage

Can be used to bind an X.509 certificate to a template, or include or exclude it from the Auth Exchange response payload.

Example

Use the following example to prevent a certificate from being included in the Auth Exchange payload:

```
no certificate
```

control-dont-fragment

Controls the don’t fragment (DF) bit in the outer IP header of the IPsec tunnel data packet.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
control-dont-fragment { clear-bit | copy-bit | set-bit }
```

Usage

Options are:
clear-bit: Clears the DF bit from the outer IP header (sets it to 0).
copy-bit: Copies the DF bit from the inner IP header to the outer IP header. This is the default action.
set-bit: Sets the DF bit in the outer IP header (sets it to 1).

Usage

A packet is encapsulated in IPsec headers at both ends. The new packet can copy the DF bit from the original unencapsulated packet into the outer IP header, or it can set the DF bit if there is not one in the original packet. It can also clear a DF bit that it does not need.

Example

The following command sets the DF bit in the outer IP header:

```
control-dont-fragment set-bit
```

default

Restores the default values for the selected parameter.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
default { authentication gateway | certificate | dns-handling | dos cookie-
challenge detect-dos-attack | ikev2-ikesa { ignore-rekeying-requests |
keepalive-user-activity | max-retransmission | mobike | policy error-
notification | rekey | retransmission-timeout | setup-timer } | keepalive | nai
| natt }
```

`authentication gateway`

Configures the default pre-shared gateway key used for authentication.

`certificate`

Configures the system to remove the certificate for a given crypto template.

`dns-handling`

Configures the system to use normal dns handling.

`dos cookie-challenge detect-dos-attack`

Configures the system to disable any Denial of Service attacks.

`Ikev2-ikesa { ignore-rekeying-requests | keepalive | max-retransmission | mobike | policy error-notification | rekey | retransmission-timeout | setup-timer }`

Configures the system to use the following ikev2-ikesa defaults:
`ignore-rekeying-requests:` Ignore any IKE_SA rekeying requests received.
`keepalive-user-activity:` Keepalive messages received from peer will not reset the user inactivity timer.
`max-retransmission:` Set the number of IKEv2 IKE exchange request retransmissions if the corresponding response has not been received. Deault is 5.
`mobike.` Set MOBIKE to disable.
`policy error-notification:` Set the default policy error notification method to send error notify messages to the MS.
`rekey:` Set the default rekeying of IKE_SA to disabled.
`retransmission-timeout:` Set the maximum number of milliseconds to elapse before an IKEv2 IKE exchange request is retransmitted if the corresponding IKEv2 IKE exchange response has not been received to 500.
`setup timer:` Set the number of seconds to elapse before a non-fully-established IKEv2 IKE SA is terminated to 60.

keepalive

Enable Dead Peer Detection for all SAs derived from this crypto template.

nai

Set the default NAI parameters to be used for the crypto template (IDr) to none

natt

Enable NAT-T initiation for all SAs derived from this crypto template.

Usage

Use these commands to restore default parameters.

Example

Use the following command to disable MOBIKE by default:

```
default mobike
```

dns-handling

Adds a custom option to define the ways a DNS address is returned based on proscribed circumstances described below.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
[ default ] dns-handling { normal | custom }
```

default

Configures the default condition as **normal**. By default, PDIF always returns the DNS address in the config payload in the second authentication phase if one is received from either the configuration or the HA.

normal

This is the default action. PDIF always returns the DNS address in the config payload in the second authentication phase if one is received from either the configuration or the HA.

custom

Configures the PDIF to behave as described in the Usage section below.

Usage

During IKEv2 session setup, MS may or may not include INTERNAL_IP4_DNS in the Config Payload (CP). PDIF may obtain one or more DNS addresses for the subscriber in DNS NVSE from a proxy-MIP Registration Reply message. If Multiple Authentication is used, these DNS addresses may be also received in Diameter AVPs during the first authentication phase, or in RADIUS attributes in the Access Accept messages during the second authentication phase.

In **normal** mode, by default PDIF always returns the DNS address in the config payload in the second authentication phase if one is received from either the configuration or the HA.

In **custom** mode, depending on the number of INTERNAL_IP4_DNS, PDIF supports the following behaviors:

- If MS includes no INTERNAL_IP4_DNS in Config Payload: PDIF doesn't return any INTERNAL_IP4_DNS option to MS, whether or not PDIF has received one(s) in DNS NVSE from HA or from local configurations.
- If MS requests one or more INTERNAL_IP4_DNS(s) in Config Payload, and if P-MIP NVSE doesn't contain any DNS address or DNS address not present in any config, PDIF omits INTERNAL_IP4_DNS option to MS in the Config Payload.
- And if P-MIP NVSE includes one DNS address (a.a.a.a / 0.0.0.0), then PDIF sends one INTERNAL_IP4_DNS option in Config Payload back to the MS.
- If Primary DNS is a.a.a.a and Secondary DNS is 0.0.0.0, then a.a.a.a is returned (i.e. only one instance of DNS attribute present in the config payload).

- If Primary DNS is 0.0.0.0 and Secondary DNS is a.a.a.a, then a.a.a.a is returned (i.e. only one instance of DNS attribute present in the config payload). PDIF does not take 0.0.0.0 as a valid DNS address that can be assigned to the MS.
- And if P-MIP NVSE includes two DNS addresses (a.a.a.a and b.b.b.b) or configurations exists for these two addresses, then PDIF sends two INTERNAL_IP4_DNSs in the CP for the MS (typically known as primary and secondary DNS addresses).

Example

The following configuration applies the **custom** dns-handling mode:

```
dns-handling custom
```

dos cookie-challenge notify-payload

Configure the cookie challenge params for IKEv2 INFO Exchange notify payloads for the given crypto template.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
dos cookie-challenge notify-payload [ half-open-sess-count { start integer |
stop integer } ] default cookie-challenge detect-dos-attack
```

```
no cookie-challenge detect-dos-attack
```

default

Default is to disabled condition.

no

Prevents Denial of Service cookie transmission. This is the default condition.

half-open-sess-count *start* | *stop*

The **half-open-sess-count** is the number of half-open sessions per IPsec manager. A session is defined as half-open if a PDIF has responded to an IKEv2 INIT Request with an IKEv2 INIT Response, but no further message was received on that particular IKE SA.

- start - The functionality will start when the current half-open-sess-count exceeds the start count. The start count is an integer from 0 to 100000.
- stop - The functionality will stop when the current half-open-sess-count drops below the stop count. The stop count number is an integer from 0 to 100000. It is always less than or equal to the start count number

Important: The start count value 0 is a special case whereby this feature is always enabled. In this event, both **Start** and **Stop** must be 0.

Usage

This feature (which is disabled by default) helps prevent malicious Denial of Service attacks against the server by sending a challenge cookie. If the response from the sender does not incorporate the expected cookie data, the packets are dropped.

Example

The following example configures the cookie challenge to begin when the half-open-sess-count reaches 50000 and stops when it drops below 20000:

```
dos cookie-challenge notify-payload half-open-sess-count start 50000 stop
20000
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec Mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Returns to the previous mode.

ikev2-ikesa

Configures parameters for the IKEv2 IKE Security Associations within this crypto template.

Product

PDIF

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

ikev2-ikesa { keepalive-user-activity | max-retransmissions *number* **| retransmission-timeout** *msec* **| policy error-notification [invalid-message-id | invalid-syntax] rekey | setup-timer** *sec* **| transform-set list** *name* **}**

default ikev2-ikesa { max-retransmissions | policy error-notification [invalid-message-id | invalid-syntax] rekey | retransmission-timeout | setup-timer }

no ikev2-ikesa { keepalive-user-activity | list *name* **| policy error-notification [invalid-message-id | invalid-syntax] | rekey }**

no ikev2-ikesa

Disables a previously enabled parameter.

keepalive-user-activity

Default is no keepalive-user-activity. Activate to reset the user inactivity timer when keepalive messages are received from peer.

max-retransmissions *number*

Default: 5
Specifies the maximum number of retransmissions of an IKEv2 IKE exchange request if a response has not been received. *number* must be an integer from 1 to 8.

policy error-notification

Default is to enable. Default policy is to generate an IKEv2 Invalid Message ID error when PDIF receives an out-of-sequence packet.

retransmission-timeout *msec*

Default: 500
Specifies the timeout period in milliseconds before a retransmission of an IKEv2 IKE exchange request is sent (if the corresponding response has not been received). *msec* must be and integer from 300 to 15000.

rekey

Specifies if IKESA rekeying should occur before the configured lifetime expires (at approximately 90% of the lifetime interval). Default is not to re-key.

setup-timer *sec*

Default: 16
Specifies the number of seconds before a IKEv2 IKE Security Association, that is not fully established, is terminated. *sec* must be an integer from 1 to 3600.

transform-set list *name*

Specifies the name of context-level configured IKEv2 IKE Security Association transform set. *name* must be an existing IKEv2 IKESA Transform Set and be from 1 to 127 alpha and/or numeric characters.

list

A space-separated list of IKEv2-IKESA SA transform sets to be used for deriving IKEv2 IKE Security Associations from this crypto template. A minimum of one transform-set is required; maximum configurable is six.

Usage

Use this command to configure parameters for the IKEv2 IKE Security Associations within this crypto template.

Example

The following command configures the maximum number of IKEv2 IKESA request retransmissions to *7*:

```
ikev2-ikesa max-retransmissions 7
```

The following command configures the IKEv2 IKESA request retransmission timeout to *400*:

```
ikev2-ikesa retransmission-timeout 400
```

The following command configures the IKEv2 IKESA transform set list name to *ikesa43*:

```
ikev2-ikesa transform-set list ikesa43
```

keepalive

Configures keepalive or dead peer detection for security associations used within this crypto template.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

keepalive [interval *sec* **] [timeout** *sec* **] [num-retry** *num* **]**

```
default keepalive [ interval ] [ timeout ] [ num-retry ]
```

```
no keepalive
```

no

Disables keepalive messaging.

interval *sec*

Default: 10
Specifies the amount of time in seconds that must elapse before the next keepalive request is sent. *sec* must be an integer from 10 to 3600.

timeout *sec*

Default: 10
Specifies the amount of time in seconds that the system will wait without receiving a reply before retrying the keepalive request. *sec* must be an integer from 10 to 3600.

num-retry *num*

Default: 2
Specifies the number of times the system will retry a non-responsive peer before defining the peer as off-line or out-of-service. *num* must be an integer from 1 to 100.

Usage

Use this command to set parameters associated with determining the availability of peer servers.

Example

The following command sets a keepalive interval to three minutes, the timeout to 30 seconds, and the retry attempts number to *5*:

```
keepalive interval 180 timeout 30 num-retry 5
```

nai

Configures the NAI parameters to be used for the crypto template IDr.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

[default | no] nai idr *name***id-type {rfc822-addr | fqdn | ip-addr | key-id }**

Default

Configures the default command **no nai idr**. As a result, the default behavior is for the PDIF-service IP address to be sent as the IDr value of type ID_IP_ADDR.

no

no nai idr configures the value whereby the PDIF service IP address is sent as the IDr value with the type ID_IP_ADDR. This is the default condition.

idr *name*

name is a string of up to 79 alpha and/or numeric characters.

id-type { rfc822-addr | fqdn | ip-addr | key-id }

Configures the NAI IDr **id-type** parameter. If no id-type is specified, then rfc822-addr is assumed.
rfc822-addr configures NAI Type ID_RFC822_ADDR
fqdn configures NAI Type ID_FQDN
ip-addr configures NAI Type ID_IP_ADDR
key-id configures NAI Type ID_KEY_ID

Usage

The configured IDr is sent from the PDIF to the MS in the first IKEv2 AUTH response.

Example

The following command configures the NAI IDr to the default condition.

```
no naiidr
```

natt

Configures Network Address Translation - Traversal (NAT-T) for all security associations associated with this crypto template. This feature is disabled by default.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] natt [ send-keepalive ]
```

no

Disables NAT-T for all security associations associated with this crypto template.

send-keepalive

Sends NAT-Traversal keepalive messages.

Usage

Use this command to configure NAT-T for security associations within this crypto template.

Example

The following command disables NAT-T for this crypto template:

```
no natt
```

payload

Creates a new, or specifies an existing, crypto template payload and enters the Crypto Template Payload Configuration Mode.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

payload *name* **match childsa [match { ipv4 | ipv6 }]**

no payload *name*

name

Specifies the name of a new or existing crypto template payload. *name* must be from 1 to 127 alpha and/or numeric characters.

match childsa [match { ipv4 | ipv6 }

Filters IPSec Child Security Association creation requests for subscriber calls using this payload. Further filtering can be performed by applying the following:
ipv4: Configures this payload to be applicable to IPSec Child Security Association requests for IPv4.
ipv6: Configures this payload to be applicable to IPSec Child Security Association requests for IPv6.

Usage

Use this command to create a new or enter an existing crypto template payload. The payload mechanism is a means of associating parameters for the Security Association (SA) being negotiated.
Two payloads are required: one each for MIP and IKEv2. The first payload is used for establishing the initial Child SA Tunnel Inner Address (TIA) which will be torn down. The second payload is used for establishing the remaining Child SAs. Note that if there is no second payload defined with home-address as the *ip-address-allocation* then no MIP call can be established, just a Simple IP call.
Currently, the only available match is for ChildSA, although other matches are planned for future releases.
Omitting the second match parameter for either IPv4 or IPv6 will make the payload applicable to all IP address pools.
Entering this command results in the following prompt:
[*context_name*]*hostname*(cfg-crypto-tmpl-ikev2-tunnel-payload)#
Crypto Template Payload Configuration Mode commands are defined in the Crypto Template Payload Configuration Mode Commands chapter.

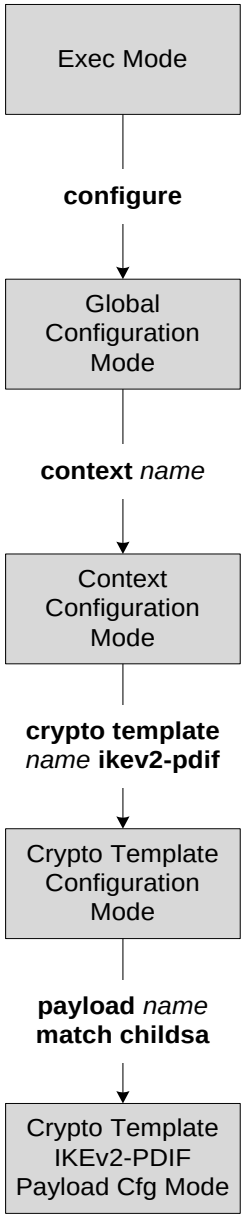
Example

The following command configures a crypto template payload called *payload5* and enters the Crypto Template Payload Configuration Mode:

```
payload payload5 match childsa
```

Chapter 47
Crypto Template IKEv2-PDIF Payload Configuration Mode Commands

The Crypto Template IKEv2-PDIF Payload Configuration Mode is used to assign the correct IPsec transform-set from a list of up to four different transform-sets, and to assign Mobile IP addresses. There should be two payloads configured. The first must have a dynamic addressing scheme as this is how the ChildSA gets a TIA address. The second payload supplies the ChildSA with a HoA, which is the default setting for *ip-address-allocation*.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

default

Sets or restores the default value for the specified parameter.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
default { ignore-rekeying-requests | ip-address-allocation lifetime | maximum-child-sa | rekey | tsi | tsr }
```

ignore-rekeying-requests

Configures the system to ignore IPSec SA rekey requests.

ip-address-allocation

Configures the crypto map payload IP address allocation scheme to be the home address.

lifetime

Con figures the default lifetime for IPSec Child SAs derived from this crypto template. **lifetime:** 86400 seconds.

maximum-child-sa

Configures the maximum number of IPSec Child SAs to be derived from an IKEv2 IKE SA by default. **maximum-child-sa:** 1

rekey

Configures the system to disable Child SA rekeying.

tsi

Configures the default TSi payload to be that of the mobile endpoint.

tsr

Configures the default IKEv2 Responder Traffic Selector payload options.

Usage

Configures system defaults

Example

Use the following configuration to set the TSi payload start-address to be that of the Mobile endpoint:

```
default tsi
```

default

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec Mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Returns to the previous mode.

ignore-rekeying-requests

Ignores CHILD SA rekey requests from the PDIF.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
ignore-rekeying-requests
```

Usage

Prevents creation of a CHILD SA based on this crypto template.

ip-address-allocation

Configures IP address allocation for subscribers using this crypto template payload. Configure two payloads per crypto template. The first must have a dynamic address to assign a TIA to the ChildSA. The second payload is configured after a successful MIP initiation and can use the default HoA option.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
ip-address-allocation { dynamic | home-address | static }

default ip-address-allocation
```

dynamic

Specifies that the IP address for the subscriber is allocated from a dynamic IP pool.

home-address

Specifies that the IP address for the subscriber is allocated by the Home Agent. This is the default setting for this command.

static

Specifies that the IP address for the subscriber is a static simple IP address.

Usage

Use this command to configure how ChildSA payloads are allocated IP addresses for this crypto template.

Example

The following command is for the first ChildSA and will ensure that it gets a TIA address from an IP address pool:

```
ip-address-allocation dynamic
```

The following command is for the second ChildSA and will ensure that it gets a HoA address from the HA:

```
default ip-address-allocation
```

ipsec

Configures the IPsec transform set to be used for this crypto template payload.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

ipsec transform-set list *name*

no ipsec transform-set list

list *name*

Specifies the context configured IPsec transform set name to be used in the crypto template payload. This is a space-separated list. From 1 to 4 transform sets can be entered. *name* must be from 1 to 127 alpha and/or numeric characters.

Usage

Use this command to list the IPsec transform set(s) to use in this crypto template payload.

Example

The following command configures IPsec transform sets named *ipset1* and *ipset2* to be used in this crypto template payload:

```
ipsec transform-set list ipset1 ipset2
```

lifetime

Configures the number of seconds for IPsec Child SAs derived from this crypto template payload to exist.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

lifetime *sec*

default lifetime

sec

Default: 86400
Specifies the number of seconds for IPsec Child Security Associations derived from this crypto template payload to exist. *sec* must be an integer from 60 to 86400.

Usage

Use this command to configure the number of seconds for IPsec Child Security Associations derived from this crypto template payload to exist.

Example

The following command configures the IPsec child SA lifetime to be 120 seconds:

```
lifetime 120
```

maximum-child-sa

Configures the maximum number of IPsec child security associations that can be derived from a single IKEv2 IKE security association.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

maximum-child-sa *num*

default maximum-child-sa

num

Default: 1
Specifies the maximum number of IPsec child security associations that can be derived from a single IKEv2 IKE security association. *num* must be 1.

Usage

Use this command to configure the maximum number of IPsec child security associations that can be derived from a single IKEv2 IKE security association.

Example

The following command configures the maximum number of child SAs to 1:

```
maximum-child-sa 1
```

rekey

Configures Child security association rekeying.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] rekey [ keepalive ]
```

no

Disables this feature.

keepalive

If specified, a session will be rekeyed even if there has been no data exchanged since the last rekeying operation. By default rekeying is only performed if there has been data exchanged since the previous rekey.

Usage

Use this command to enable or disable the ability to rekey IPsec Child SAs after approximately 90% of the Child SA lifetime has expired. The default, and recommended setting, is not to perform rekeying. No rekeying means the PDIF will not originate rekeying operations and will not process CHILD SA rekeying requests from the MS.

Example

The following command disables rekeying:

```
no rekey
```

tsi

Configures the IKEv2 Initiator Traffic Selector (TSI) payload address options.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

tsi start-address { any { end-address any } | endpoint { end-address *endpoint* **} }**

any { end-address any }

Configures the TSi payload to allow all all IP addresses.

endpoint { end-address *endpoint* **}**

Configures the TSi payload start-address to be that of the Mobile endpoint. This is the default value. *endpoint* is the mobile endpoint netmask.

Usage

On receiving a successful IKE_SA_INIT Response from PDIF, the MS sends an IKE_ AUTH Request for the first EAP-AKA authentication. If the MS is capable of doing multiple-authentication, it includes the MULTI_AUTH_SUPPORTED Notify payload in the IKE_AUTH Request. MS also includes an IDi payload containing the NAI, SA, TSi, TSr, and CP (requesting IP address and DNS address) payloads.

Example

Use the following example to configure a TSi payload that allows all addresses:

```
tsi start-address any end-address any
```

tsr

Configures the IKEv2 Responder Traffic Selector (TSr) payload address options.

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

tsi start-address *<ipv4 address>* **end-address***<ipv4 address>*

start-address*<ipv4 address>*

Configures the TSi payload to include the TSr start IPv4 address of an address range for the Phase 1 multiple traffic selector feature.

end-address *<ipv4 address>*

Configures the TSi payload start-address to include the TSr end IPv4 address of an address range for the Phase 1 multiple traffic selector feature.

Usage

As part of Phase 1 of the Multiple Traffic Selector feature, this command is used to specify an IPv4 address range in the single TSr payload that the PDG/TTG returns in the last IKE_AUTH message. This TSr is Child SA-specific.

Example

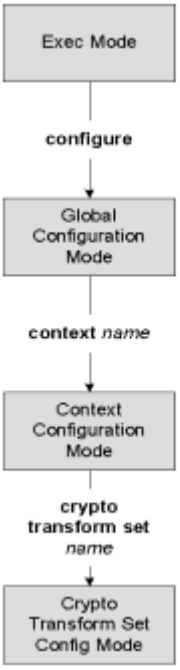
Use the following example to configure a TSr payload that specifies an IPv4 address range for the payload:

tsr start-address *<ipv4 address>* **end-address** *<ipv4 address>*

Chapter 48
Crypto Transform Set Configuration Mode Commands

The Crypto Transform Set Configuration Mode is used to configure properties for system transform sets.

Transform Sets are used to define IPSec security associations (SAs). IPSec SAs specify the IPSec protocols to use to protect packets.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the context configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the context configuration mode.

mode

Configures the IPSec encapsulation mode.

Product

PDSN, HA, GGSN, PDIF, SCM

Privilege

Security Administrator, Administrator

Syntax

```
mode { transport | tunnel }
```

transport

Default: Disabled
Specifies that the transform set only protects the upper layer protocol data portions of an IP datagram, leaving the IP header information unprotected.

Important: This mode should only be used if the communications end-point is also the cryptographic end-point.

tunnel

Default: Enabled
Specifies that the transform set protects the entire IP datagram as displayed in the following figure.
This mode should be used if the communications end-point is different from the cryptographic end-point as in a VPN.

Usage

This command specifies the encapsulation mode for the transform set.

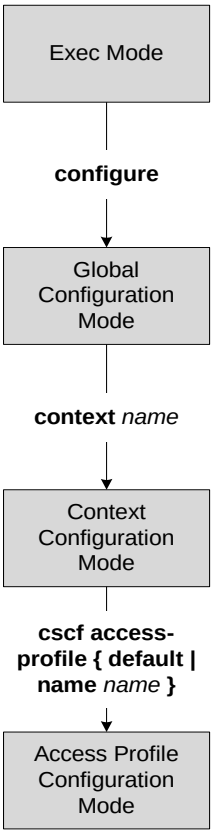
Example

The following command configures the transforms set's encapsulation mode to transport:

```
mode transport
```

Chapter 49
CSCF Access Profile Configuration Mode Commands

The Access Profile Configuration Mode is used to set commands supporting the use of signaling compression, authentication, and SIP timers for subscribers accessing the system from varying network types.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

access-security-type

Sets the type of access security for a P-CSCF/A-BG.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] access-security-type ipsec-3gpp-cscf
```

no

Disables the selected access security type.

ipsec-3gpp-cscf

Security mechanism 3GPP/3GPP2 IPSec.

Usage

Use this command to enable or disable an access security type for a P-CSCF or A-BG.

Example

Enables 3GPP/3GPP2 IPSec access security on P-CSCF or A-BG:

```
access-security-type ipsec-3gpp-cscf
```

Disables 3GPP/3GPP2 IPSec access security on P-CSCF or A-BG:

```
no access-security-type ipsec-3gpp-cscf
```

authentication

Sets the authentication method to use for subscribers using this access profile.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] authentication { aka-v1 | md5 }
```

no

Disables the selected authentication type.

aka-v1 | md5

aka-v1: Specifies that the AKA-v1 algorithm will be used for subscribers using this access profile.
md5: Specifies that the MD5 algorithm will be used for subscribers using this access profile. This is the default setting for this command.

Usage

Use this command to set the authentication method used for subscribers using this access profile.

Example

The following command sets the authentication type for subscribers using this access profile to **md5**:

```
authentication md5
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

sigcomp

Enables signalling compression for the Access Profile.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] sigcomp [ force ]
```

no

Disables signalling compression for the Access Profile.

force

Specifies that signaling compression is to be forced for the access type. When this feature is enabled, messages received by the P-CSCF/A-BG that are not compressed are rejected.

Usage

Use this command to enable signalling compression for the specific Access Profile.

timeout

Sets timeout values for CSCF and SIP transactions for subscribers using this Access Profile.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
timeout sip { 3gpp-d sec | 3gpp-t1 msec | 3gpp-t2 sec | 3gpp-t4 sec | d sec |
invite-expiry sec | t1 msec | t2 sec | t4 sec }

default timeout sip { 3gpp-d | 3gpp-t1 | 3gpp-t2 | 3gpp-t4 | d | invite-expiry |
t1 | t2 | t4 }
```

sip { 3gpp-d *sec* **| 3gpp-t1** *msec* **| 3gpp-t2** *sec* **| 3gpp-t4** *sec* **| d** *sec* **| invite-expiry** *sec* **| t1** *msec* **| t2** *sec* **| t4** *sec* **}**

Sets transaction and expiry timers for SIP.

3gpp-d *sec*: This time is used to control the retransmission of 200OK messages to INVITEs after an ACK is sent. The ACK transaction is cleared after this period. This timer is applicable only for unreliable transport.
sec must be an integer from 0 to 2147483646.
Default: 64*T1 (128 seconds, recommended minimum)

3gpp-t1 *msec*: This timer is used to control the time interval between each retransmission. The interval doubles after each retransmission. This is used by P-CSCF/A-BG only when it sending message toward the UE. Example: T1, 2T1, 4T2, etc. This timer is applicable only for unreliable transport.
msec must be an integer from 0 to 2147483646.
Default: 2000 ms (2 secs, recommended minimum).

3gpp-t2 *sec*: This timer is used to control the period for which the request continues to get retransmitted. This is used by P-CSCF/A-BG only when it sending message toward the UE. This timer is applicable both for reliable and unreliable transport.
sec must be an integer from 0 to 2147483646.
Default: 16 seconds (recommended minimum).

3gpp-t4 *sec*: This timer is used to control the period for which the final response to non-invite transaction should be buffered. The buffered response for the retransmitted non-invite request should be sent within that interval. This timer is applicable only for unreliable transport.
sec must be an integer from 0 to 2147483646.
Default: 17 seconds (recommended minimum).

d *sec*: This time is used to control the retransmission of 200OK to INVITE after ACK is sent. The ACK transaction will be cleared after this interval. This timer is applicable only for unreliable transport.
sec must be an integer from 0 to 2147483646.
Default: 64*T1 (32 seconds, recommended minimum)

invite-expiry *sec*: This timer is used by SIP while acting as UA Role and no final response is received for the INVITE request sent. This timer is applicable for both reliable and unreliable transport.
sec must be an integer from 0 to 2147483646.
Default: 100 seconds (recommended minimum).

t1 *msec*: Specifies the time interval (in milliseconds) between each retransmission. The interval doubles after each retransmission, for example: T1, 2T1, 4T2, etc. This timer is applicable only for unreliable transport.

msec must be an integer from 0 to 2147483646.
Default: 500 milliseconds (recommended minimum).
t2 *sec*: This timer is used to control the period for which the request keeps getting retransmitted. This timer is applicable both for reliable and unreliable transport.
sec must be an integer from 0 to 2147483646. The recommended minimum value for this parameter is 4 seconds.
Default: 64*T1 (32 seconds)
t4 *sec*: This timer is used to control the period for which the final response to non-invite transaction should be buffered so as to send the buffered response for the retransmitted non-invite request within that interval. This timer is applicable only for unreliable transport.
sec must be an integer from 0 to 2147483646.
Default: 5 seconds (recommended minimum).

default

Sets/restores default value assigned for specified parameter.

Usage

Use this command to configure SIP Stack timers and CSCF service specific timers for subscriber traffic using this Access Profile.

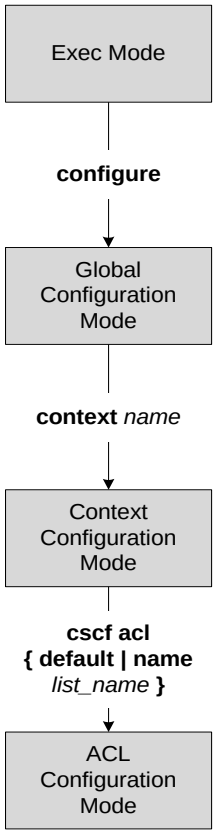
Example

The following command sets the SIP d timer to *64* seconds:

```
timeout sip d 64
```

Chapter 50
CSCF ACL Configuration Mode Commands

The CSCF ACL (Access Control List) Configuration Mode is used to configure session permissions (permit/deny access) within the system.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

after

Places the CSCF ACL entry at the bottom or end of the ACL. Use this command in conjunction with the **permit** and/or **deny** commands.

Product

SCM

Privilege

Administrator

Syntax

after

Usage

Add this command before the **permit** and/or **deny** commands to place the entry at the end of the ACL.

before

Places the CSCF ACL entry at the beginning or top of the ACL. Use this command in conjunction with the **permit** and/or **deny** commands.

Product

SCM

Privilege

Administrator

Syntax

before

Usage

Add this command before the **permit** and/or **deny** commands to place the entry at the beginning of the ACL.

deny

Configures the system to deny subscriber sessions based on criteria matching the received packet.

Product

SCM

Privilege

Administrator

Syntax

deny { any | destination aor *aor* **| log { any | destination aor** *aor* **| source { address** *ip_address* **| aor** *aor* **} | source { address** *ip_address* **| aor** *aor* **} }**

no deny { any | destination aor *aor* **| source { address** *ip_address* **| aor** *aor* **} }**

any

Filters all CSCF sessions.

destination aor *aor*

Filters sessions based on the destination AoR. *aor* must be an existing AoR from 1 to 79 characters in length.

Important: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

log { any | destination aor *aor* **| source { address** *ip_address* **| aor** *aor* **} }**

Enables logging for CSCF sessions meeting the criteria specified in the ACL. The logs can be viewed by executing the **logging filter active facility acl-log** command in the Exec mode. Specifies the criteria that packets will be compared against. The following criteria is supported:

- **any**
- **destination aor** *aor*
- **source address** *ip_address*
- **source aor** *aor*

source { address *ip_address* **| aor** *aor* **}**

Filters session based on the source IP address or AoR.

- *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
- *aor* must be an existing AoR from 1 to 79 characters in length.

Important: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

no deny { any | destination aor *aor* **| source { address** *ip_address* **| aor** *aor* **} }**

Removes specified filter criteria.

Usage

Specifies the subscriber sessions to deny based on the criteria specified.

Example

The following command denies access to subscribers with a source address of *1.2.3.4*:

deny source address *1.2.3.4*

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

permit

Configures the system to allow subscriber sessions based on criteria matching the received packet.

Product

SCM

Privilege

Administrator

Syntax

permit { any | destination aor *aor* **| log { any | destination aor** *aor* **| source { address** *ip_address* **| aor** *aor* **} | source { address** *ip_address* **| aor** *aor* **} }**

no permit { any | destination aor *aor* **| source { address** *ip_address* **| aor** *aor* **}}**

any

Filters all CSCF sessions.

destination aor *aor*

Filters sessions based on the destination AoR.
aor must be an existing AoR from 1 to 79 characters in length.

Important: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

log { any | destination aor *aor* **| source { address** *ip_address* **| aor** *aor* **}}**

Enables logging for CSCF sessions meeting the criteria specified in the ACL. The logs can be viewed by executing the **logging filter active facility acl-log** command in the Exec mode.
Specifies the criteria that packets will be compared against. The following criteria is supported:

- **any**
- **destination aor** *aor*
- **source address** *ip_address*
- **source aor** *aor*

source { address *ip_address* **| aor** *aor* **}**

Filters session based on the source IP address or AoR.

- *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
- *aor* must be an existing AoR from 1 to 79 characters in length.

Important: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

no permit { any | destination aor *aor* **| source { address** *ip_address* **| aor** *aor* **} }**

Removes specified filter criteria.

Usage

Specifies the subscriber sessions to permit based on the criteria specified.

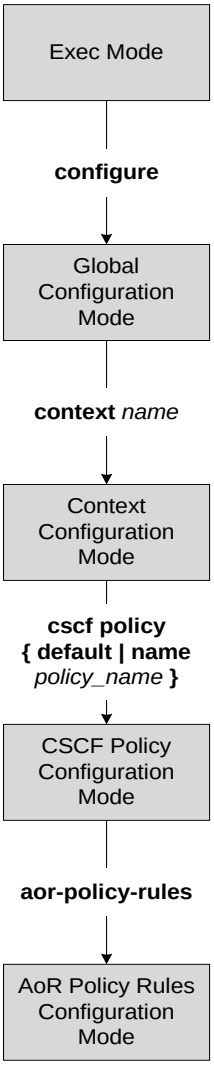
Example

The following command permits access to subscribers with a destination AoR of *$.@abc123.com*

permit destination aor *$.@abc123.com*

Chapter 51
CSCF AoR Policy Rules Configuration Mode Commands

The CSCF AoR Policy Rules Configuration Mode is used to manage AoR policy profiles within the system. Both default and user-defined profiles can be managed in this mode.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

after

Places the CSCF policy entry at the bottom or end of the policy list. Use this command in conjunction with the **aor** command.

Product

SCM

Privilege

Administrator

Syntax

after

Usage

Add this command before the **aor** command to place the entry at the end of the policy list.

aor

Configures an AoR profile and enters the AoR Profile Configuration Mode.

Product

SCM

Privilege

Administrator

Syntax

[no] aor *aor_name*

no

Removes the AoR profile from the system.

aor_name

Specifies a name for the AoR profile.
aor_name must be from 1 to 79 alpha and/or numeric characters in length.

Usage

Use this command to create or modify an AoR profile and enter the CSCF Policy Rules Configuration Mode. Entering this command results in the following prompt:
[*context_name*]*hostname*(config-*aor_name*-aor)#
CSCF Policy Rules Configuration Mode commands are defined in the CSCFPolicy Rules Configuration Mode Commands chapter of this guide.

Example

The following command creates an AoR profile named *aor5* and enters the AoR Profile Configuration Mode:

aor *aor5*

before

Places the CSCF policy entry at the top or beginning of the policy list. Use this command in conjunction with the **aor** command.

Product

SCM

Privilege

Administrator

Syntax

before

Usage

Add this command before the **aor** command to place the entry at the beginning of the policy list.

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

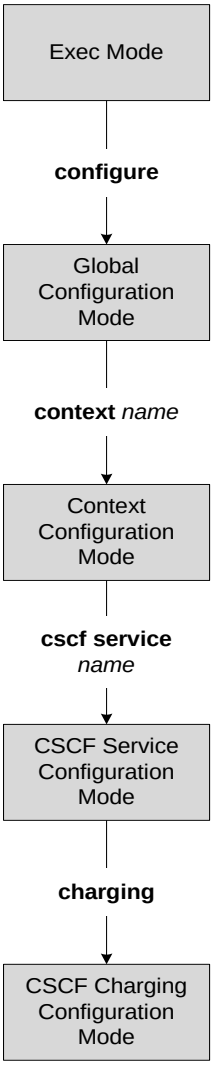
exit

Usage

Return to the previous mode.

Chapter 52
CSCF Charging Configuration Mode Commands

The CSCF Charging Configuration Mode is used to manage CSCF service policy profiles within the system.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exclude

Configures the service to exclude SIP requests from the Rf charging configuration.

Product

SCM

Privilege

Administrator

Syntax

[no] exclude { custom *sip_method* **| invite | notify | register | subscribe | update | message** }

no

Removes the exclusion of the specified SIP request message type.

custom *sip_method*

Specifies CUSTOM SIP requests that are to be excluded from Rf charging.
sip_method can be a name of any SIP method and be from 1 to 31 alpha and/or numeric characters.

invite

Specifies that INVITE SIP requests are to be excluded from Rf charging.

notify

Specifies that NOTIFY SIP requests are to be excluded from Rf charging.

register

Specifies that REGISTER SIP requests are to be excluded from Rf charging.

subscribe

Specifies that SUBSCRIBE SIP requests are to be excluded from Rf charging.

update

Specifies that UPDATE SIP requests are to be excluded from Rf charging.

message

Specifies that MESSAGE SIP requests are to be excluded from Rf charging.

Usage

Use this command to exclude specific SIP requests from Rf charging.

Example

The following command configures the service to exclude SIP REGISTER requests from Rf charging:

```
exclude register
```

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

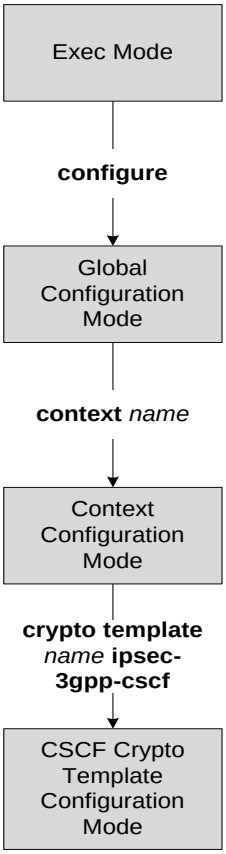
exit

Usage

Return to the previous mode.

Chapter 53
CSCF Crypto Template Configuration Mode Commands

The CSCF Crypto Template Configuration Mode is used to configure a P-CSCF IPsec policy. It includes most of the IPsec parameters and Internet Key Exchange version 1 (IKEv1) parameters for cryptographic and authentication algorithms etc. A P-CSCF service will not support IPSec without a configured crypto template. Only one crypto template can be configured per P-CSCF service.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec Mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Returns to the previous mode.

ipsec

Configures parameters for the 3GPP/3GPP2 P-CSCF security associations within this crypto template.

Product

SCM

Privilege

Security Administrator, Administrator

Syntax

ipsec transform-set list *list_name*

transform-set list *name*

transform-set: Specifies a context-level IPSec security association transform set to be used for deriving 3GPP/3GPP2 P-CSCF security associations from this crypto template.
list *list_name:* A space separated list of 3GPP/3GPP2 P-CSCF security association transform sets. *list_name* must be an existing 3GPP/3GPP2 P-CSCF transform set and be from 1 to 127 alpha and/or numeric characters.

Important: A minimum of one transform set is required. A maximum of four transform sets may be specified.

Usage

Use this command to configure parameters for the 3GPP/3GPP2 P-CSCF security associations within this crypto template.

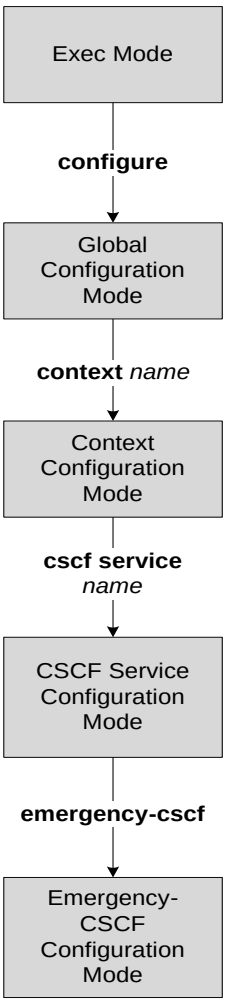
Example

The following command configures the 3GPP/3GPP2 P-CSCF transform set list name to *ikev1list1*:

ipsec transform-set list *ikev1list1*

Chapter 54
CSCF Emergency-CSCF Configuration Mode Commands

The Emergency-CSCF Configuration Mode is used to set commands supporting the role of the CSCF service as an Emergency CSCF.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

privacy

Enables privacy support on the E-CSCF.

Product

SCM

Privilege

Administrator

Syntax

```
[ no | default ] privacy
```

no | default

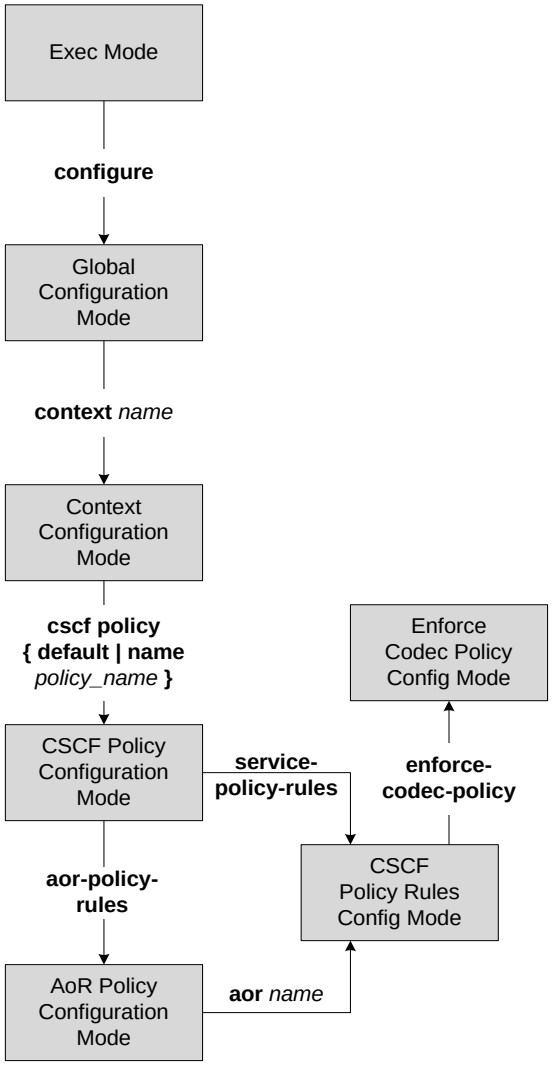
Removes privacy support from the E-CSCF.

Usage

Use this command to enable privacy support for Emergency CSCF service.

Chapter 55
CSCF Enforce Codec Policy Configuration Mode Commands

The CSCF Enforce Codec Policy Configuration Mode is used to manage audio and video codec policies within the system. The parameters defined in this chapter are derived from IETF RFC 3551: “RTP Profile for Audio and Video Conferences with Minimal Control”.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

dynamic-codec

Creates a list of dynamic codecs supported by the system.

Product

SCM

Privilege

Administrator

Syntax

dynamic-codec { audio *encoding_name* **| video** *encoding_name* **} [** *clock_rate* **] [** *channels* **]**

default dynamic-codec

no dynamic-codec [*encoding_name* **] [** *clock_rate* **] [** *channels* **]**

---

audio *encoding_name* **| video** *encoding_name*

audio *encoding_name:* Specifies the encoding name of the dynamic audio codec added to the allowed codec list. *encoding_name* must be from 1 to 49 alpha and/or numeric characters.
video *encoding_name:* Specifies the encoding name of the dynamic video or audio-video codec added to the allowed codec list. *encoding_name* must be from 1 to 49 alpha and/or numeric characters.

[*clock_rate* **] [** *channels* **]**

clock_rate: Specifies the sampling rate of the codec. *clock_rate* must be an integer from 0 to 1000000.
channels: Specifies the number of channels required by the codec. *channels* must be an integer from 1 to 1000000.
Valid dynamic audio codecs:

Encoding Name	Clock Rate (Hz)	Channels
G726-40	8,000	1
G726-32	8,000	1
G726-24	8,000	1
G726-16	8,000	1
G729D	8,000	1
G729E	8,000	1
GSM-EFR	8,000	1
L8	Variable	Variable
RED	See RFC3551	
VDVI	Variable	1

Valid dynamic video codecs:

Encoding Name	Clock Rate (Hz)
H263-1998	90,000

`default`

Specifies that the default list of dynamic codecs is added to the allowed codecs list. Default dynamic codecs: H263 and AMR.

`no dynamic-codec [ encoding_name ] [ clock_rate ] [ channels ]`

Specifies that all dynamic codecs are removed from the allowed codecs list. If an *`encoding_name`* is specified, then only the codec specified by the *`encoding_name`* is removed. Furthermore, if a supporting *`clock_rate`* and/or *`channels`* are specified, then only the *`encoding_name`* with the specified *`clock_rate`* and/or *`channels`* is removed.

Usage

Use this commands to create a list of supported dynamic audio and video codecs in the system. When a request is received by the CSCF, the SDP fields in the message are checked to determine the codec being used. The codec in the SDP fields must match a codec in the allowed codec list or the CSCF rejects the request.

Example

The following command adds the GSM-EFR codec to the allowed dynamic codec list:

`dynamic-codec` *`GSM-EFR`*

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

static-codec

Creates a list of static codecs supported by the system.

Product

SCM

Privilege

Administrator

Syntax

static-codec { audio *payload_type* **| video** *payload_type* **}**

default static-codec

no static-codec [*payload_type* **]**

audio *payload_type* **| video** *payload_type*

audio *payload_type:* Specifies the audio codec added to the allowed codecs list. *payload_type* must be an integer from 0 to 95. Default value is 5.
Valid static audio codecs:

0: PCMU	7: LPC	14: MPA	21: unassigned
1: reserved	8: PCMA	15: G728	22: unassigned
2: reserved	9: G722	16: DVI4	23: unassigned
3: GSM	10: L16	17: DVI4	
4: G723	11: L16	18: G729	
5: DVI4	12: QCELP	19: reserved	
6: DVI4	13: CN	20: unassigned	

video *payload_type:* Specifies the video or audio-video codec added to the allowed codecs list. *payload_type* must be an integer from 0 to 95. Default value is 5.
Valid static video codecs:

24: unassigned	28: nv	32: MPV	72-76: reserved
25: CelB	29: unassigned	33: MP2T	77-95: unassigned
26: JPEG	30: unassigned	34: H263	
27: unassigned	31: H261	35-71: unassigned	

default

Specifies that the default list of static codecs is added to the allowed codecs list.
The default static codec is 5: DVI4.

no static-codec [*payload_type* **]**

Specifies that all static codecs are removed from the allowed codecs list. If a *payload_type* is specified, then only the codec specified by the *payload_type* is removed.

Usage

Use this commands to create a list of supported static audio and video codecs in the system. When a request is received by the CSCF, the SDP fields in the message are checked to determine the codec being used. The codec in the SDP fields must match a codec in the allowed codec list or the CSCF rejects the request.

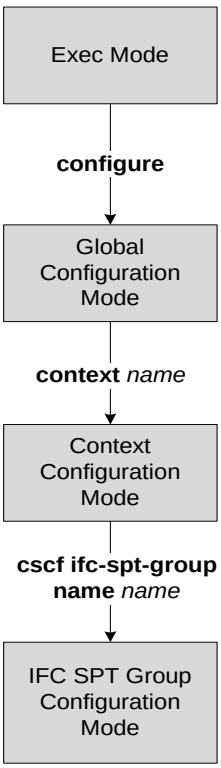
Example

The following command adds the G729 audio codec to the allowed codecs list:

static-codec *18*

Chapter 56
CSCF IFC SPT Group Mode Commands

The CSCF iFC SPT Group Configuration Mode is used to associate individual SPT conditions with an Initial Filter Criteria (iFC) Service Point Trigger (SPT) group.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

spt-condition

Assigns iFC SPT conditions to an existing iFC SPT group.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

`[ no ] spt-condition name` *`cond_name`*

`no`

Removes the specified CSCF iFC SPT condition from the iFC SPT group.

`spt-condition name` *`cond_name`*

Specifies the name of an existing iFC SPT condition.
`cond_name` must be from 1 to 39 alpha and/or numeric characters in length.

Usage

Use this command to associate individual SPT conditions with an iFC SPT group.

Important: An iFC SPT group may be associated with multiple SPT conditions.

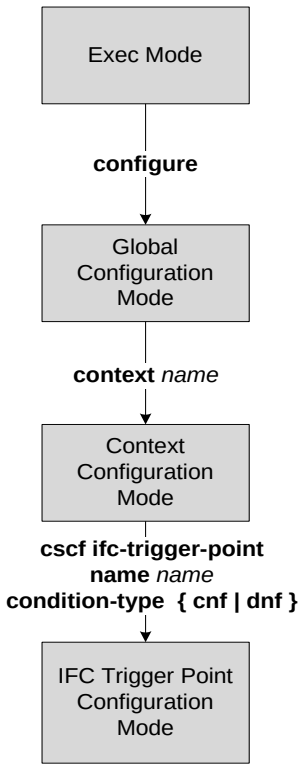
Example

The following command assigns cond2 to an iFC SPT group:

`spt-condition name` *`cond2`*

Chapter 57
CSCF IFC Trigger Point Mode Commands

The CSCF iFC Trigger Point Configuration Mode is used to associate an Initial Filter Criteria (iFC) Service Point Trigger (SPT) group with an iFC trigger point.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

spt-group

Assigns an existing iFC SPT group to an iFC trigger point.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

[no] spt-group name *group_name*

no

Removes the specified CSCF iFC SPT group from the iFC trigger point.

spt-group name *group_name*

Specifies the name of an existing iFC SPT group.
group_name must be from 1 to 39 alpha and/or numeric characters in length.

Important: An iFC SPT group can be assigned to more than one iFC trigger point.

Usage

Use this command to associate an iFC SPT group with an iFC trigger point.

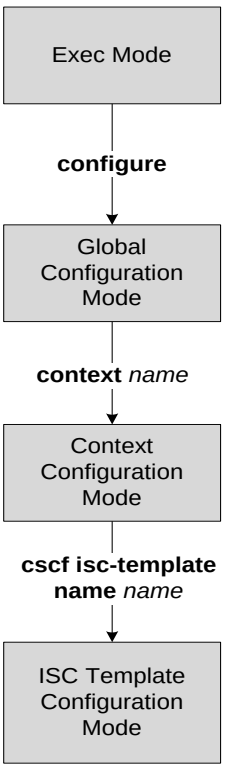
Example

The following command assigns an iFC SPT group named *group2* to an iFC trigger point:

spt-group name *group2*

Chapter 58
CSCF ISC Template Configuration Mode Commands

The CSCF ISC Template Configuration Mode is used to configure the IMS Service Control (ISC) interface within the system.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

cnsa

Core Network Service Authorization (CNSA) related commands used to create media profile and service ids.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

cnsa { media-profile-id *profile_id* **| service-id** *service_id* **[** *service_id* **]...[** *service_id* **] }**

no cnsa { media-profile-id | service-id [*service_id* **] [** *service_id* **]...[** *service_id* **] }**

media-profile *profile_id*

Specifies the cnsa media profile id.
profile_id must be an integer from 0 to 10.
The media profile id is assigned to a service policy using the **cnsa-media-profile** command under CSCF Service configuration.

Important: You can only create one media profile id per ISC template.

service-id *service_id*

Specifies the cnsa service id(s). These ids represent URN parameters which are ICSI (IMS Communication Service Identifier) values that are mapped to a service profile through a media profile id.
service_id must be from 1 to 79 alpha and/or numeric characters.

no cnsa { media-profile-id | service-id [*service_id* **] [** *service_id* **]... [** *service_id* **] }**

Removes a media profile or service id(s).

Usage

Use this command to configure cnsa media profile ids and service ids. Information for core network authorization is received from HSS. It contains a list of service ids and a media profile id. Since the media profile id is an integer value, the S-CSCF needs to have a static database that contains the mapping between the integer value and the subscribed media profile. The media profile id is assigned to this service policy using the **cnsa-media-profile** command under CSCF Service configuration.
The S-CSCF selects the service profile based on the media profile id set and the policies, such as enforce-codec-policy and video-sessions, will be matched with the incoming request. Other policies, if configured, will be ignored in this scenario.

Example

The following command defines the media profile id as 2:

```
cnsa media-profile-id 2
```

The following command defines several service ids:

```
cnsa service-id xxx:exampletelephony.version1 xxx:abc.com
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

filter-criteria

Configure the filter criteria to be used by this template.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

`[ no ] filter-criteria name` *`criteria_name`*

`no`

Removes the specified filter criteria.

`name` *`criteria_name`*

Specifies the name of existing filter criteria to be used by this template. The particular criteria applied to a subscriber will be based on the priority parameter.
`criteria_name` must be from 1 to 39 alpha and/or numeric characters in length.

Important: Filter criteria can be assigned to more than one ISC template.

Usage

Use this command to configure the filter criteria to be used by this template.

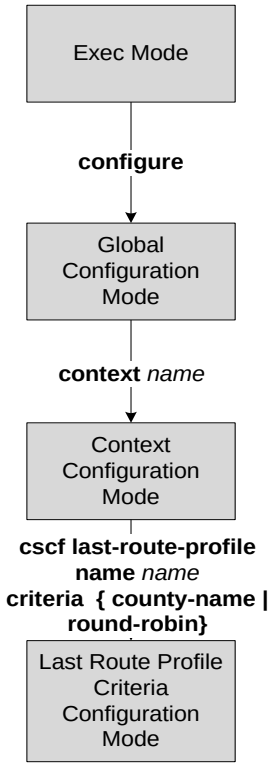
Example

The following command identifies the filter criteria *`criteria1`*:

`filter-criteria name` *`criteria1`*

Chapter 59
CSCF Last Route Profile Criteria Configuration Mode Commands

The CSCF Last Route Profile Criteria Configuration Mode is used to configure county names and assign them Last Routing Option (LRO) numbers to be used by the CSCF last route profile. The S-CSCF forwards emergency call packets to the correct Public Safety Answering Point (PSAP) based on this criteria, which it receives from a peer server.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

county-name

Configure county names and assign them Last Routing Option (LRO) numbers to be used by the CSCF last route profile.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

county-name *county_name* **lro-number** *value*

[no] county-name *county_name*

county_name

Specifies the county name.
county_name must be from 1 to 79 alpha and/or numeric characters in length.

lro-number *value*

Specifies an existing LRO number.
value can be a maximum of ten digits in length.

no county-name *county_name*

Removes the specified county name.

Usage

Use this command to configure county names and assign them LRO numbers.

Important: You may configure up to 100 county names.

Example

The following command creates a county name called *norfolk* and assigns it an LRO number of *8884384357*:

county-name *norfolk* **lro-number** *8884384357*

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

lro-number

Configure the Last Routing Option (LRO) numbers to be used by the CSCF last route profile.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

lro-number *value*

lro-number *value*

Specifies the LRO number.
value can be a maximum of ten digits in length.

no

Removes the specified LRO number.

Usage

Use this command to configure LRO numbers.

Important: You may configure up to 100 LRO numbers.

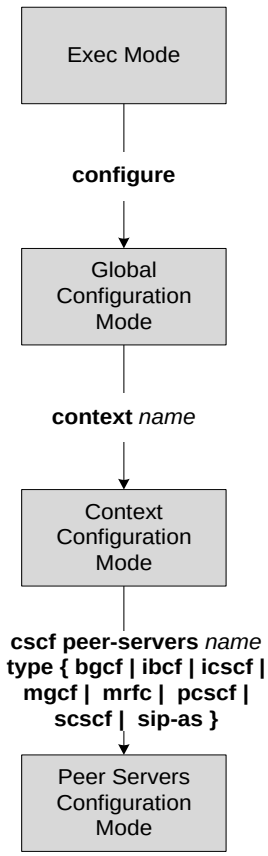
Example

The following command creates an LRO number set at *8884384357*:

lro-number *8884384357*

Chapter 60
CSCF Peer Servers Configuration Mode Commands

The CSCF Peer Servers Configuration Mode is used to configure peer servers (for next-hop session routes) within the system.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

hunting-method

Configures the method by which servers in this group are contacted.

Product

SCM

Privilege

Administrator

Syntax

hunting-method { round-robin | sequence-on-failure | weighed }

default hunting-method

round-robin | sequence-on-failure | weighed

Specifies the hunting method for the servers in this group.
round-robin: Specifies that the servers will be used in round-robin fashion. This is the default setting.
sequence-on-failure: Specifies that the servers will be used sequentially if a failure occurs on a server (i.e., first peer server is always used, except on failure, during which next peer server in the list will be used).
weighed: Specifies that the peer servers in this group have a set "weight" that determines use as compared to the other like-configured peer servers. The actual weight of the peer server is configured in the **server** command in this mode.

default

Specifies that the servers will be used in round-robin fashion.

Usage

Use this command to configure the method that is used by the system to connect to servers in this group.

Example

The following command sets the hunting method for servers in this group to contact sequentially only when a server fails:

hunting-method sequence-on-failure

server

Configures the name, IP address, and port of servers belonging to this group and enters the Server Configuration Mode.

Product

SCM

Privilege

Administrator

Syntax

server *name* **{ address** *ip_address* **| domain** *domain_name* **} [port** *number* **] [transport { tcp | udp }] [weight** *number* **]**

no server *name*

name

Specifies a name for the server. *name* must be from 1 to 79 alpha and/or numeric characters in length.

address *ip_address*

Specifies the IP address of the server. *ip_address* is expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

domain *domain_name*

Specifies the domain name of the peer server. *domain_name* must be from 1 to 255 alpha and/or numeric characters in length.

port *number*

Specifies the port number of the server.
number must be an integer value from 1 to 65535.

transport { tcp | udp }

Specifies the transport type (TCP or UDP).

weight *number*

Default: 5
Specifies a weighted number for the specific peer server for load balancing purposes. *number* must be an integer value from 1 to 10. Higher weight implies larger server capability (and more routed requests).

Important: This keyword is only valid if the **weighed** keyword is applied to the **hunting-method** command in this mode.

no server *name*

Removes the specified server from the group.

Usage

Use this command to configure servers belonging to this group and enter the Server Configuration Mode. Entering this command results in the following prompt:
[*context_name*]*hostname*(config-*server_name*-peer-server)#
Server Configuration Mode commands are defined in the CSCF Peer Server Monitoring Configuration Mode Commands chapter.

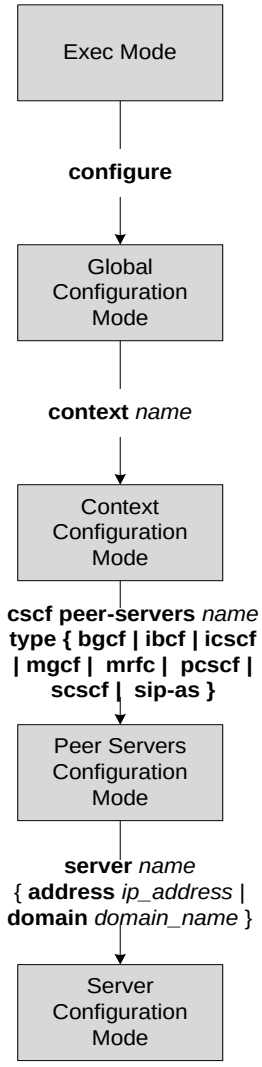
Example

The following command configures a server named *scscf5* with an IP address of *1.2.3.4* and a port number of *5060*:

```
server scscf5 address 1.2.3.4 port 5060
```

Chapter 61
CSCF Peer Server Monitoring Configuration Mode Commands

The CSCF Peer Server Monitoring Configuration Mode is used to configure an individual peer server's monitoring parameters and operational mode. It also associates a network session template with the server.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

ims-capable

Indicates whether the peer server belongs to a 3GPP/IMS network or a non-IMS network such as the Internet. This command is used to determine at the S-CSCF whether SIP signaling inter-working is needed when the calls are forwarded to external networks.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

```
[ no ] ims-capable
```

no

Removes the identification of "IMS capable" from the selected peer server.

Usage

Use this command to identify a peer server as IMS capable allowing the S-CSCF to use SIP signalling inter-working when forwarding calls to non-IMS capable networks.

lro-selection-profile

Binds a CSCF last route profile with the peer server.

Product

SCM

Privilege

Administrator

Syntax

lro-selection-profile name *profile_name*

no lro-selection-profile

lro-selection-profile name *profile_name*

profile_name must be an existing CSCF last route profile and be from 1 to 79 alpha and/or numeric characters.

no lro-selection-profile

Removes CSCF last route profile from the peer server group.

Usage

Use this command to identify a CSCF last route profile to use for finding the correct Public Safety Answering Point (PSAP) during emergency calls.

Example

The following command assigns a CSCF last route profile named *lro1* to the peer server group:

lro-selection-profile name *lro1*

The following command removes a CSCF last route profile from the peer server group:

no lro-selection-profile

mode

Sets the peer server mode to either active or standby. By default, peer servers are in active mode.

Product

SCM

Privilege

Administrator

Syntax

```
mode { active | standby }
```

active

Defines the mode of the CSCF peer server as active.

standby

Defines the mode of the CSCF peer server as standby.

Usage

Use this command to set the peer server mode to either active or standby.

Example

The following command sets the peer server's mode to standby:

```
mode standby
```

monitor-status

Sets parameters for monitoring the status of peer servers.

Product

SCM

Privilege

Administrator

Syntax

monitor-status [monitor-interval *seconds* **] [monitor-message options] [monitor-response-timer** *seconds* **]**

no monitor-status

monitor-interval *seconds*

Default: 30
Specifies the interval that peer server monitoring will occur.
seconds must be an integer from 1 to 65535.

monitor-message options

Specifies that SIP message (OPTIONS) are to be sent periodically after each monitoring interval.

monitor-response-timer *seconds*

Default: 180
Specifies the interval that the CSCF will wait for responses from the peer server.
seconds must be an integer from 1 to 65535.

no

Disables peering server status monitoring.

Usage

Use this command to set parameters for monitoring the status of a peer server.

Example

The following command sets the monitoring interval to three minutes (*180* seconds) and the response timer to six minutes (*360* seconds):

monitor-status monitor-interval *180* **monitor-response-timer** *360*

nw-session-template

Specifies a session template for sessions terminating from the peer server group.

Product

SCM

Privilege

Administrator

Syntax

nw-session-template name *template-name*

no nw-session-template

name *template-name*

template-name must be an existing session template created in the Session Template Configuration Mode.

no

Removes session template from the peer server group.

Usage

Use this command to identify a session template to use for sessions terminating from the peer server group.

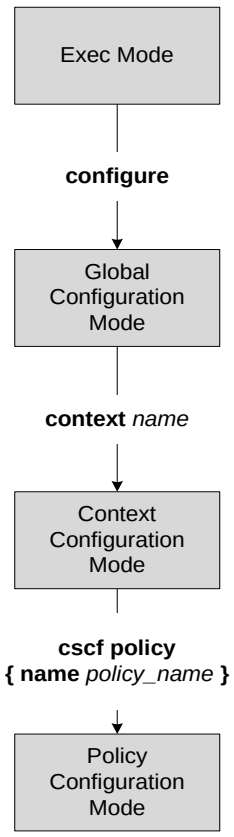
Example

The following command identifies a session template named *template-25* to use for sessions terminating from the peer server group:

nw-session-template *template-25*

Chapter 62
CSCF Policy Configuration Mode Commands

The CSCF Policy Configuration Mode is used to manage AoR policy profiles within the system. User-defined profiles can be managed in this mode.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

aor-policy-rules

Specifies that the newly created policy is an AoR policy and enters the AoR Policy Rules Configuration Mode.

Product

SCM

Privilege

Administrator

Syntax

```
aor-policy-rules
```

Usage

Use this command to create an AoR policy group and enter the AoR Policy Rules Configuration Mode.
Entering this command results in the following prompt:
[*context_name*]*hostname*`(config-aor-policy)#`
AoR Policy Configuration Mode commands are defined in the *CSCF AoR Policy Rules Configuration Mode Commands* chapter.

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

service-policy-rules

Specifies that the newly created policy is a service policy and enters the Service Policy Rules Configuration Mode.

Product

SCM

Privilege

Administrator

Syntax

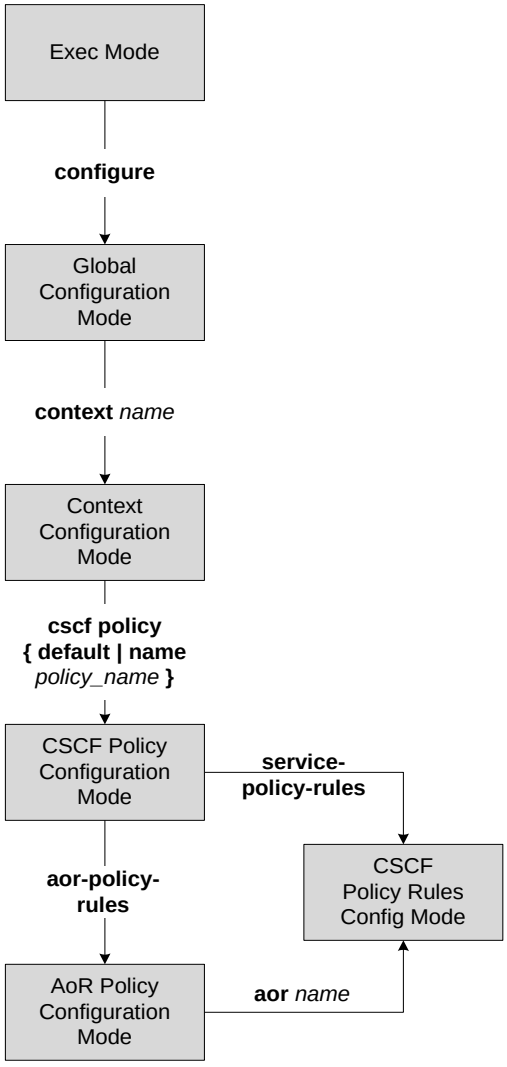
service-policy-rules

Usage

Use this command to create a service policy group and enter the CSCF Policy Rules Configuration Mode. Entering this command results in the following prompt:
[*context_name*]*hostname*`(config-service-policy)#`
Service Policy Rule Configuration Mode commands are defined in the *CSCF Policy Rules Configuration Mode Commands* chapter.

Chapter 63
CSCF Policy Rules Configuration Mode Commands

The CSCF Policy Rules Configuration Mode is used to manage CSCF AoR and service policy profiles within the system.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

allow-noauth

Configures the policy to allow unauthenticated access. Default is disabled.

Product

SCM

Privilege

Administrator

Syntax

```
[ default | no ] allow-noauth
```

default | no

Disables the allow-noauth functionality for this policy.

Usage

Use this command to allow access to subscribers without authenticating them.

allow-unsecure

Configures the policy to allow access to the system without a security association. Default is disabled.

Product

SCM

Privilege

Administrator

Syntax

```
[ default | no ] allow-unsecure
```

default | no

Disables the allow-unsecure functionality for this policy.

Usage

Use this command to enable the policy to provide subscriber access to system without a security association.

authorization

Configures the policy to allow early bandwidth authorization. Default is disabled.

Product

SCM

Privilege

Administrator

Syntax

```
[ default | no ] authorization early-bandwidth
```

default | no

Disables the early bandwidth authorization functionality for this policy.

Usage

Use this command to enable the policy to provide early bandwidth authorization.

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

enforce-codec-policy

Enters the Enforce Codec Policy Command Mode where allowed static and dynamic codec lists are managed.

Product

SCM

Privilege

Administrator

Syntax

```
[ default | no ] enforce-codec-policy
```

default | no

Disables the codec policy.

Usage

Use this command to enter the Enforce Codec Policy Configuration Mode.
Entering this command results in the following prompt:
[*context_name*]*hostname*`(config-policy-enforce-codec)#`
CSCF Enforce Codec Policy Mode commands are defined in the *Enforce Codec Policy Configuration Mode Commands* chapter in this guide.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

max-cscf-concurrent-sessions

Configures the maximum number of concurrent sessions allowed per subscriber.

Product

SCM

Privilege

Administrator

Syntax

max-cscf-concurrent-sessions *number*

default max-cscf-concurrent-sessions

number

Default: 5
Specifies the number of concurrent sessions allowed per subscriber for this policy. *number* must be an integer from 1 to 100.

default

Resets defaults for this command.

Usage

Use this command to set the maximum number of allowed sessions per subscriber for this policy.
If enabled, the **subscriber-policy-override** command in the CSCF Service Configuration Mode overrides the service-level policy.

Example

The following command sets the maximum number of concurrent sessions for a subscriber using this policy to 7:

max-cscf-concurrent-sessions 7

policy

Configures the overload response for this policy. When the P-CSCF/A-BG becomes congested, this overload policy is used to reject subsequent sessions or redirect them to another server.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

policy overload { redirect *address1* **[weight** *weight1* **] [** *address2* **[weight** *weight2* **]] ... | reject [use-reject-code { admin-prohibited | insufficient-resources }] }**

default policy overload

no policy overload redirect *address1*[*address2*] **...**

redirect *address1* **[weight** *weight1* **] [** *address2* **[weight** *weight2* **]] ...**

Specifies that upon policy overload, the system will redirect the session to another CSCF.
address1 must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
weight *weight1*: Defines the priority of the redirect address.
weight1 must be an integer from 1 to 10. Default is 1.

reject [use-reject-code { admin-prohibited | insufficient-resources }]

Specifies that upon policy overload, the system will reject the session. This is the default setting.
use-reject-code: Specifies that a reject code will be returned upon policy overload.

- admin-prohibited: Specifies that the "admin-prohibited" reject code will be returned upon policy overload.
- insufficient-resources: Specifies that the "insufficient resources" reject code will be returned upon policy overload. This is the default reject code.

default policy overload

Resets defaults for this command.

no policy overload redirect *address1* **[** *address2* **] ...**

Removes configured policy overload redirect address(es).

Usage

Use this command to define the response to an overload condition on the P-CSCF/A-BG using this AoR policy.

Example

The following command configures the policy overload response to redirect to a series of CSCFs with IP address of *1.2.3.4*, *1.2.3.5*, and *1.2.3.6* with respective priorities (weights) of *1*, *3*, and *2*:

policy overload redirect *1.2.3.4* **weight** *1* *1.2.3.5* **weight** *3* *1.2.3.6* **weight** *2*

qos

Configures QoS bandwidth settings for uplink and downlink.

Product

SCM

Privilege

Administrator

Syntax

qos bandwidth { downlink| uplink } [peak *value* **]**

bandwidth { downlink| uplink }

downlink: Configures the downlink bandwidth.
uplink: Configures the uplink bandwidth.

peak *value*

Peak value of bandwidth in kilobits per second (kbit/s).
value must be an integer from 1 to 99999999.

Usage

The P-CSCF/A-BG fills the required bandwidth for downlink and uplink from the Session Description Protocol (SDP) in the message when communicating with an external policy server via Rx/Tx/Gq. Use this command to configure the peak uplink and downlink bandwidth to be used when the SDP does not contain bandwidth.

Example

Set the peak uplink bandwidth to *256* kbit/s:

qos bandwidth uplink peak *256*

video-sessions

Configures the policy to allow video bearers. Default is disabled.

Product

SCM

Privilege

Administrator

Syntax

```
[ default | no ] video-sessions
```

default | no

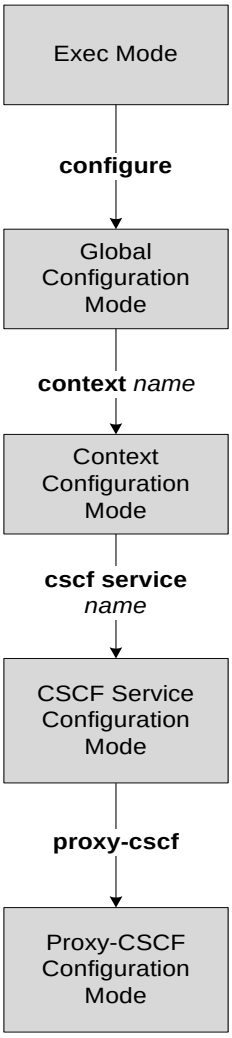
Disables the “allow video sessions” feature.

Usage

Use this command to allow video session via this policy.

Chapter 64
CSCF Proxy-CSCF Configuration Mode Commands

The Proxy-CSCF Configuration Mode is used to enable Diameter policy control within the service.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

allow

Enables the function to allow IMS interworking with RFC3261 SIP User Agents.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] allow rfc3261-ua-interworking
```

no

Disables the interworking capability.

Usage

Use this command to enable the P-CSCF/A-BG to allow IMS interworking with RFC3261 SIP User Agents.

diameter

This command:

- configures the Diameter dictionary used in this function.
- configures the policy control origin endpoint used in this function.
- enables the selection of a Diameter policy control peer server providing Rx/Tx/Gq applications for this service.
- configures the Diameter requested timeout value used in this function.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

diameter location-info { dictionary { e2custom01 | e2custom02 | e2custom03 | e2custom04 | e2custom05 | e2custom06 | e2custom07 | e2custom08 | e2custom09 | e2standard } | origin endpoint endpoint_name | peer-select peer *peer_name* **[peer-realm** *realm_name* **] [secondary-peer** *peer_name* **[sec-peer-realm** *realm_name* **]] | request-timeout** *sec***}**

diameter policy-control { dictionary { Gq-custom | Gq-standard | Rq-custom| Rx-rel8 | **Rx-standard | Tx-standard | custom01 | custom02 | custom03 | custom04 | custom05 | custom06 | custom07 | custom08 | custom09 } | origin endpoint endpoint_name | peer-select peer** *peer_name* **[peer-realm** *realm_name* **] [secondary-peer** *peer_name* **[sec-peer-realm** *realm_name* **]] |** request-timeout *sec* **}**

default diameter { location-info | policy-control } { **dictionary** | request-timeout }

no diameter { location-info | policy-control } [origin endpoint | peer-select]

location-info

Defines the E2 interface for location information.

dictionary { e2custom01...e2custom09 | e2standard }

custom01...custom09: Specifies that a customer-specific (custom) dictionary is to be used for expansion and behaviors.
e2standard: Specifies that the E2-Standard-Dictionary is to be used.

policy-control

Defines external policy control.

dictionary { Gq-custom | Gq-standard | Rq-custom| Rx-rel8 | Rx-standard | Tx-standard | custom01...custom09 }

Gq-custom: Specifies that the Gq Operax dictionary is to be used.
Gq-standard: Specifies that the Gq standard dictionary is to be used.
Rq-custom: Specifies that the Rq custom dictionary is to be used.
Rx-rel8: Specifies that the Rx Release 8 dictionary is to be used.
Rx-standard: Specifies that the Rx standard dictionary is to be used.
Tx-standard: Specifies that the Tx standard dictionary is to be used.
custom01...custom09: Specifies that a customer-specific (custom) dictionary is to be used.

origin endpoint *endpoint_name*

Specifies the Diameter location-info or policy control endpoint name.
endpoint_name must be the endpoint's name and an alpha and/or numeric string of 1 through 63 characters in length.

peer-select peer *peer_name*

Specifies the name of the Diameter location-info or policy control peer server.
peer_name must be from 1 to 63 alpha and/or numeric characters in length.
Diameter peer servers are configured through the **diameter endpoint** command in the Context Configuration Mode. The **diameter endpoint** command is a generic command and can be found in theCisco ASR 5000 Series Command Line Interface Reference.

peer-realm *realm_name*

Specifies the realm name for which the Diameter location-info or policy control peer server has responsibility.
realm_name must be from 1 to 63 alpha and/or numeric characters in length.

Important: If this keyword is not configured, the system defaults to the realm name configured for the selected peer server.

secondary-peer *peer_name*

Specifies the name of the secondary Diameter location-info or policy control peer server.
peer_name must be from 1 to 63 alpha and/or numeric characters in length.

sec-peer-realm *realm_name*

Specifies the realm name for which the secondary Diameter location-info or policy control peer server has responsibility.
realm_name must be from 1 to 63 alpha and/or numeric characters in length.

Important: If this keyword is not configured, the system defaults to the realm name configured for the selected peer server.

request-timeout *sec*

Specifies the Diameter location-info or policy control requested timeout value in seconds.
sec must be an integer from 1 to 300.
Default: 10

default diameter { location-info | policy-control } { dictionary | request-timeout }

Sets the Diameter's location-info or policy control dictionary or requested timeout value as the default.

no diameter { location-info | policy-control } [origin endpoint | peer-select]

Removes the Diameter location-info or policy control origin endpoint or Diameter peer from the service.

Usage

Use this command to:

- define the Diameter dictionary to use for the service.
- specify the Diameter origin endpoint.
- specify a Diameter location-info or policy control peer server to support Rx/Tx/Gq applications.
- specify the Diameter requested timeout value for this service.

Example

The following command configures the system to use the Tx standard Diameter dictionary for this service:

```
diameter policy-control dictionary Tx-standard
```

The following command sets the Diameter location-info origin endpoint to *test*:

```
diameter location-info origin endpoint test
```

The following command selects a Diameter policy control peer server with a name of *diam-2* and a realm name of *realm-6*:

```
diameter policy-control peer-select peer diam-2 peer-realm realm-6
```

emergency-sessions

Configures the function to allow anonymous and/or non-emergency registered subscribers to initiate emergency sessions. The addition of 3GPP IM CN XML body in 380 response messages can also be allowed.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
emergency-sessions [ 3gpp-ims-xml-body | anonymous [ 3gpp-ims-xml-body ] [ non-emergency-registered ] | non-emergency-registered [ 3gpp-ims-xml-body ] ]

[ default | no ] emergency-sessions
```

3gpp-ims-xml-body

Allow 3GPP IM CN XML body to be added in 380 response messages.

anonymous

Allow anonymous subscribers to initiate emergency sessions.

non-emergency-registered

Allow non-emergency registered subscribers to initiate emergency sessions.

default

Specifies that anonymous and non-emergency registered emergency sessions are allowed and 3GPP IM CN XML body is added in 380 response messages.

no

Disallows anonymous and/or non-emergency registered emergency sessions and does not add 3GPP IM CN XML body in 380 response messages.

Usage

Use this command to configure the function to allow anonymous and/or non-emergency registered subscribers to initiate emergency sessions. The addition of 3GPP IM CN XML body in 380 response messages can also be allowed.

Example

The following command configures the function to allow only non-emergency registered subscribers to initiate emergency sessions:

```
emergency-sessions non-emergency-registered
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

interrogating-cscf-role

Enables the function to also perform as an Interrogating-CSCF.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] interrogating-cscf-role
```

no

Disables the Interrogating-CSCF role in this function.

Usage

Use this command to enable the P-CSCF/A-BG to also perform as an Interrogating-CSCF.

Important: All Interrogating-CSCF functions have been moved to the Serving-CSCF exclusively in v10.0 and beyond.

message-max-size

Configures the maximum message body size in MESSAGE method.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

message-max-size *limit*

[default | no] message-max-size

limit

Default: 1024
Configures the maximum SIP message size limit in bytes for any SIP message buffer.
limit must be an integer from 512 to 65535.

Important: Message body size should be less than the max-sipmsg-size set in the CSCF Service Configuration Mode.

default | no

Returns/sets the maximum SIP message size to 1024 bytes.

Usage

Use this command to configure the maximum SIP message size for any SIP message buffer.

Example

The following command limits the SIP message size to *4000* bytes:

message-max-size *4000*

network-id

Configures the Network Identifier.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

[no] network-id *id*

id

The Network Identifier of the entity.
id must be from 1 to 79 alpha and/or numeric characters in length.

no

Removes the configured Network Identifier of the entity.

Usage

The Network Identifier is used by the P-CSCF or A-BG to fill the P-Visited-Network-ID header.

Example

Sets the Network Identifier to *pcscf01.company.com:*

network-id *pcscf01.company.com*

peer-sbc

Configures peer Session Border Controller (SBC) addresses from where the P-CSCF/A-BG service can receive requests.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

[no] peer-sbc *ip_address*

ip_address

Specifies the IP address of a peer SBC for this P-CSCF/A-BG service.
ip_address is expressed in standard dotted decimal notation for IPv4 or colon notation for IPv6.

no

Removes the IP address of a peer SBC from this P-CSCF/A-BG service.

Usage

Use this command to specify peer Session Border Controller (SBC) addresses from where the P-CSCF/A-BG service can receive requests.

Important: This command must be entered multiple times if more than one SBC is present.

Example

The following commands identify three peer SBCs for a single P-CSCF/A-BG service:

```
peer-sbc 200.6.2.3
peer-sbc 200.6.2.10
peer-sbc 200.6.2.11
```

The following command removes the peer SBC with IP address *200.6.2.10* from the P-CSCF/A-BG service:

```
no peer-sbc 200.6.2.10
```

plmn-id

Configures location specific mobile network identifiers used to help translate local emergency and service-related numbers. Default is disabled.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

plmn-id mcc *code* **mnc** *code*

no plmn-id

mcc *code*

Specifies the Mobile Country Code for the mobile access network. *code* must be a three-digit integer from 200 to 999.

mnc *code*

Specifies the Mobile Network Code for the mobile access network. *code* must be a two or three-digit integer from 00 to 999.

no plmn-id

Removes the access network configuration for this P-CSCF/A-BG service.

Usage

Use this command to help match location specific emergency/service numbers when configuring translations. The **mcc** and **mnc** values are compared against those received in p-access-network-info headers as per 3GPP TS 24.229. If **mnc** is not provided in the criteria only **mcc** is compared.

Example

The following command identifies the mobile network with a MCC of *123* and a MNC of *12*:

plmn-id mcc *123* **mnc** *12*

reg-service-route

Enables the function to use service routes when routing re-registrations.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] reg-service-route
```

no

Disables the ability to use service routes for re-registration.

Usage

Use this command to enable the P-CSCF/A-BG service to use service routes when routing re-registrations.

reliable-prov-resp

Enables/disables the reliability of provisional responses feature.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
reliable-prov-resp { mandatory | optional }

[ no ] reliable-prov-resp
```

mandatory | optional

mandatory: Both inbound and outbound will request reliability.
optional(default): Reliability is imposed by inbound side. Only if inbound call requests reliability will outbound also request reliability.

no

Disables the reliability of provisional responses feature.

Usage

Use this command to enable/disable the reliability of provisional responses feature.

Example

The following command sets the reliability of provisional responses feature to mandatory:

```
reliable-prov-resp mandatory
```

The following command disables the reliability of provisional responses feature:

```
no reliable-prov-resp
```

restoration-procedure

Enables the P-CSCF/A-BG service to reject with a 504 response when it receives 3xx, 480, or “no response” to service request. This feature is disabled by default.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] restoration-procedure
```

no

Disables restoration procedure on the P-CSCF/A-BG service.

Usage

Restoration procedure is intended to handle unreachability of service-route header content. Enabling this command allows the P-CSCF/A-BG service to reject with a 504 response when it receives 3xx, 480, or “no response” to service request.

Example

Enables restoration procedure on the P-CSCF/A-BG service:

```
restoration-procedure
```

Disables restoration procedure on the P-CSCF/A-BG service:

```
no restoration-procedure
```

security-parameters

Enters the Security Configuration Mode in which Denial of Service (DOS) prevention commands can be configured.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

security-parameters

Usage

Use this command to enter the Security Configuration Mode.
Entering this command results in the following prompt:

```
[context_name]hostname(config-security-parameters)#
```

Security Configuration Mode commands are defined in the *CSCF Security Configuration Mode Commands* chapter in this guide.

sigcomp

Enables signaling compression for the P-CSCF/A-BG service and enters the Signaling Compression Configuration Mode.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] sigcomp
```

no

Disables signaling compression for the P-CSCF/A-BG service.

Usage

Use this command to enable signaling compression for the P-CSCF/A-BG service and enter the CSCF Signaling Compression Configuration Mode.
Entering this command results in the following prompt:

```
[context_name]hostname(config-sigcomp)#
```

Signaling Compression Configuration Mode commands are defined in the *CSCF Signaling Compression Configuration Mode Commands* chapter in this guide.

sip-header

Enable SIP P-Access-Network-Info (PANI) or P-User-Database (PUD) header insertion for the P-CSCF/A-BG service.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] sip-header insert { p-access-network-info | p-user-database }
```

p-access-network-info

Inserts PANI header in received request/response.

p-user-database

Inserts PUD header in SIP (REGISTER) message and Invite from I-CSCF to S-CSCF.

no

Disables SIP PANI or PUD header insertion for the P-CSCF/A-BG service.

Usage

Enabling this command allows PANI header insertion in received requests/responses on the P-CSCF or A-BG. In addition, it allows PUD header insertion in SIP (REGISTER) message and Invite from I-CSCF to S-CSCF.

Important: Use the **access-type** command to configure a ue-ip-address-range per access type. CSCF Service Configuration Mode commands are defined in the *CSCF Service Configuration Mode Commands* chapter in this guide.

sip-param

Enable the addition of “integrity-protected” parameter in the authorization header of a SIP (REGISTER) message for the P-CSCF/A-BG service.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] sip-param insert integrity-protected
```

no

Disables the addition of “integrity-protected” parameter in the authorization header of a SIP (REGISTER) message for the P-CSCF/A-BG service.

Usage

Enabling this command allows the P-CSCF or A-BG to add the “integrity-protected” parameter in the authorization header of a SIP (REGISTER) message. The parameter will be used by the S-CSCF to decide which authentication mode to use to authenticate the user.

Example

Enables the addition of **integrity-protected** parameter:

```
sip-param insert integrity-protected
```

Disables the addition of **integrity-protected** parameter:

```
no sip-param insert integrity-protected
```

store-session-path

Enables the P-CSCF or A-BG to store and process the session path information, which includes the Route list, Record-Route list, Service-Route list, and ViaList.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] store-session-path
```

no

Disables the storing of session path information by the P-CSCF or A-BG. In addition, the P-CSCF/A-BG will not overwrite the Route list, Record-Route list, Service-Route list, or ViaList in the in-dialog request and responses.

Usage

Enabling this command allows the P-CSCF or A-BG to store and process the session path information.

Example

Enables the storage and processing of session path information:

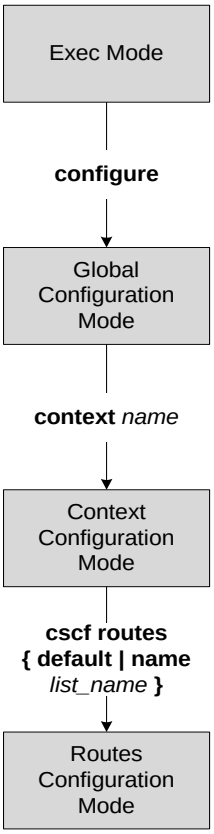
```
store-session-path
```

Disables the storage and processing of session path information:

```
no store-session-path
```

Chapter 65
CSCF Routes Configuration Mode Commands

The CSCF Routes Configuration Mode is used to configure session forwarding within the system.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

after

Places the CSCF route entry at the bottom or end of the route list. Use this command in conjunction with the **route** command.

Product

SCM (P-CSCF, S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

after

Usage

Add this command before the **route** command to place the entry at the end of the route list.

before

Places the CSCF route entry at the top or beginning of the route list. Use this command in conjunction with the **route** command.

Product

SCM (P-CSCF, S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

before

Usage

Add this command before the **route** command to place the entry at the beginning of the route list.

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

route

Configure the routing parameters for the context.

Product

SCM (P-CSCF, S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

route { domain *name* **| local { icscf | pcscf | scscf } | nexthop-address** *address* **| peer-servers** *group_name* **| vpn** *name* **} [[mod-req-uri] base-criteria** *criteria* **[filter-criteria1** *criteria* **] [filter-criteria2** *criteria* **]] [log]**

no route { domain *name* **| local { icscf | pcscf | scscf } | nexthop-address** *address* **| peer-servers** *group_name* **| vpn** *name* **} base-criteria** *criteria* **[filter-criteria1** *criteria* **] [filter-criteria2** *criteria* **]**

domain *name*

Specifies a valid next-hop domain name. *name* must be from 1 to 79 alpha and/or numeric characters in length.

local { icscf | pcscf | scscf }

Specifies a local interrogating, serving, or proxy call/session control function to which all calls processed by the context will be routed.

nexthop-address *ip_address*

Specifies a next-hop address.
ip_address must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

peer-servers *group_name*

Specifies a configured peer server group.
group_name must be the name of a configured peer server group on this system.

vpn *name*

Specifies a configured VPN context on the system.
name must be a configured context name.

mod-req-uri

Specifies that a route lookup should be performed and the request URI modified.

base-criteria *criteria*

Specifies the base criteria that packets will be compared against. The following criteria is supported:

- **access-type** *type*: Filters sessions based on a specific access-type used by the subscriber. Possible access types are:

- **3gpp-geran**: 3GPP Access Type
- **3gpp-utran-fdd**: 3GPP Access Type
- **3gpp-utran-tdd**: 3GPP Access type
- **3gpp2-1x**: 3GPP2 Access Type
- **3gpp2-1x-hrpd**: 3GPP2 Access Type
- **3gpp2-umb**: 3GPP2-UMB
- **adsl**: FixedLine Access Type
- **adsl2**: FixedLine Access Type
- **adsl2p**: FixedLine Access Type ADSL2+
- **docsis**: DOCSIS
- **gshdsl**: Fixed Line Access Type G.SHDSL
- **hdsl**: Fixed Line Access Type
- **hdsl2**: Fixed Line Access Type
- **idsl**: Fixed Line Access Type
- **ieee-80211**: WLAN Access Type
- **ieee-80211a**: WLAN Access Type
- **ieee-80211b**: WLAN Access Type
- **ieee-80211g**: WLAN Access Type
- **ieee-80216e**: Wireless MAN Access Type
- **radsl**: Fixed Line Access Type
- **sdsl**: Fixed Line Access Type
- **vdsl**: Fixed Line Access Type
- **any**: Filters all CSCF sessions.
- **carrier-id** *name*: Filters sessions based on the carrier's ID. *name* must be from 1 to 79 alpha and/or numeric characters in length.
- **destination aor** *aor*: Filters sessions based on the destination AoR. *aor* must be an existing AoR from 1 to 79 characters in length.

Important: The destination aor and carried-id criteria cannot occur in the same route rule.

- **plmn-id mcc** *mcc_code* **mnc** *mnc_code*: Filters sessions based on the mobile country and network codes. *mcc_code* must be a three-digit integer from 200 to 999. *mnc_code* must be a two or three-digit integer from 00 to 999.
- **source address** *ip_address*: Filters sessions based on source IP address. *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
- **source aor** *aor*: Filters sessions based on the source AoR. *aor* must be an existing AoR from 1 to 79 characters in length.
- **time-of-day**: Filters sessions based on the time of the day. Additional filter criteria for **time-of-day** is as follows:

- **day-of-month** *day*: Filters session based on the day of the month. *day* must be an integer from 1 to 31.
- **day-of-week** *day*: Filters session based on the day of the week. *day* must be an integer from 1 to 7 with 1 signifying Sunday and 7 signifying Saturday.
- **start** *date/time* **[end** *date/time* **]**: Filters sessions based on a start time to, optionally, an end time during the day. *date/time* must be integers in either of the following formats: YYYY:MM:DD:HH:mm or YYYY:MM:DD:mm:ss. YYYY: year range 2005 to 2099 MM: months (integer range 1 to 12) DD: days (integer range 1 to 31) HH: hours (integer range 0 to 23) mm: minutes (integer range 0 to 59) ss: seconds (integer range 0 to 59)
- **week-of-month** *week*: Filters sessions based on the week of the month. *week* must be an integer from 1 to 5.

Important: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

filter-criteria1 *criteria*

Specifies the filter criteria that packets that have passed the base criteria will be compared against. The following criteria is supported:

- **access-type** *type*: Filters sessions based on a specific access-type used by the subscriber. Possible access types are:
- **3gpp-geran**: 3GPP Access Type
- **3gpp-utran-fdd**: 3GPP Access Type
- **3gpp-utran-tdd**: 3GPP Access type
- **3gpp2-1x**: 3GPP2 Access Type
- **3gpp2-1x-hrpd**: 3GPP2 Access Type
- **3gpp2-umb**: 3GPP2-UMB
- **adsl**: FixedLine Access Type
- **adsl2**: FixedLine Access Type
- **adsl2p**: FixedLine Access Type ADSL2+
- **docsis**: DOCSIS
- **gshdsl**: Fixed Line Access Type G.SHDSL
- **hdsl**: Fixed Line Access Type
- **hdsl2**: Fixed Line Access Type
- **idsl**: Fixed Line Access Type
- **ieee-80211**: WLAN Access Type
- **ieee-80211a**: WLAN Access Type
- **ieee-80211b**: WLAN Access Type
- **ieee-80211g**: WLAN Access Type
- **ieee-80216e**: Wireless MAN Access Type
- **radsl**: Fixed Line Access Type

- **sdsl**: Fixed Line Access Type
- **vdsl**: Fixed Line Access Type
- **any**: Filters all CSCF sessions.
- **carrier-id** *name*: Filters sessions based on the carrier's ID. *name* must be from 1 to 79 alpha and/or numeric characters in length.
- **destination aor** *aor*: Filters sessions based on the destination AoR. *aor* must be an existing AoR from 1 to 79 characters in length.

Important: The destination aor and carried-id criteria cannot occur in the same route rule.

- **plmn-id mcc** *mcc_code* **mnc** *mnc_code*: Filters sessions based on the mobile country and network codes. *mcc_code* must be a three-digit integer from 200 to 999. *mnc_code* must be a two or three-digit integer from 00 to 999.
- **source address** *ip_address*: Filters sessions based on source IP address. *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
- **source aor** *aor*: Filters sessions based on the source AoR. *aor* must be an existing AoR from 1 to 79 characters in length.
- **time-of-day**: Filters sessions based on the time of the day. Additional filter criteria for **time-of-day** is as follows:
- **day-of-month** *day*: Filters session based on the day of the month. *day* must be an integer from 1 to 31.
- **day-of-week** *day*: Filters session based on the day of the week. *day* must be an integer from 1 to 7 with 1 signifying Sunday and 7 signifying Saturday.
- **start** *date/time* **[end** *date/time* **]**: Filters sessions based on a start time to, optionally, an end time during the day. *date/time* must be integers in either of the following formats: YYYY:MM:DD:HH:mm or YYYY:MM:DD:mm:ss. YYYY: year range 2005 to 2099 MM: months (integer range 1 to 12) DD: days (integer range 1 to 31) HH: hours (integer range 0 to 23) mm: minutes (integer range 0 to 59) ss: seconds (integer range 0 to 59)
- **week-of-month** *week*: Filters sessions based on the week of the month. *week* must be an integer from 1 to 5.

Important: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

filter-criteria2 *criteria*

Specifies the filter criteria that packets that have passed the base criteria and filter-criteria1 will be compared against. The following criteria is supported:

- **access-type** *type*: Filters sessions based on a specific access-type used by the subscriber. Possible access types are:
- **3gpp-geran**: 3GPP Access Type
- **3gpp-utran-fdd**: 3GPP Access Type
- **3gpp-utran-tdd**: 3GPP Access type
- **3gpp2-1x**: 3GPP2 Access Type

- **3gpp2-1x-hrpd**: 3GPP2 Access Type
- **3gpp2-umb**: 3GPP2-UMB
- **adsl**: FixedLine Access Type
- **adsl2**: FixedLine Access Type
- **adsl2p**: FixedLine Access Type ADSL2+
- **docsis**: DOCSIS
- **gshdsl**: Fixed Line Access Type G.SHDSL
- **hdsl**: Fixed Line Access Type
- **hdsl2**: Fixed Line Access Type
- **idsl**: Fixed Line Access Type
- **ieee-80211**: WLAN Access Type
- **ieee-80211a**: WLAN Access Type
- **ieee-80211b**: WLAN Access Type
- **ieee-80211g**: WLAN Access Type
- **ieee-80216e**: Wireless MAN Access Type
- **radsl**: Fixed Line Access Type
- **sdsl**: Fixed Line Access Type
- **vdsl**: Fixed Line Access Type
- **any**: Filters all CSCF sessions.
- **carrier-id** *name*: Filters sessions based on the carrier's ID. *name* must be from 1 to 79 alpha and/or numeric characters in length.
- **destination aor** *aor*: Filters sessions based on the destination AoR. *aor* must be an existing AoR from 1 to 79 characters in length.

Important: The destination aor and carried-id criteria cannot occur in the same route rule.

- **plmn-id mcc** *mcc_code* **mnc** *mnc_code*: Filters sessions based on the mobile country and network codes. *mcc_code* must be a three-digit integer from 200 to 999. *mnc_code* must be a two or three-digit integer from 00 to 999.
- **source address** *ip_address*: Filters sessions based on source IP address. *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
- **source aor** *aor*: Filters sessions based on the source AoR. *aor* must be an existing AoR from 1 to 79 characters in length.
- **time-of-day**: Filters sessions based on the time of the day. Additional filter criteria for **time-of-day** is as follows:
- **day-of-month** *day*: Filters session based on the day of the month. *day* must be an integer from 1 to 31.
- **day-of-week** *day*: Filters session based on the day of the week. *day* must be an integer from 1 to 7 with 1 signifying Sunday and 7 signifying Saturday.

- **start** *date/time* **[end** *date/time* **]**: Filters sessions based on a start time to, optionally, an end time during the day. *date/time* must be integers in either of the following formats: YYYY:MM:DD:HH:mm or YYYY:MM:DD:mm:ss. YYYY: year range 2005 to 2099 MM: months (integer range 1 to 12) DD: days (integer range 1 to 31) HH: hours (integer range 0 to 23) mm: minutes (integer range 0 to 59) ss: seconds (integer range 0 to 59)
- **week-of-month** *week*: Filters sessions based on the week of the month. *week* must be an integer from 1 to 5.

Important: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

log

Enables logging for CSCF sessions meeting the criteria specified in the ACL. The logs can be viewed by executing the **logging filter active facility cscf-acl-log** command in the Exec mode.

no route { domain *name* **| local { icscf | pcscf | scscf } | nexthop-address** *address* **| peer-servers** *group_name* **| vpn** *name* **} base-criteria** *criteria* **[filter-criteria1** *criteria* **] [filter-criteria2** *criteria* **]**

Removes the specified routing parameters for the CSCF service.

Usage

Use this command to configure routing parameters for the service.

Important: Use the **before** or **after** command to place the route entry in the route list.

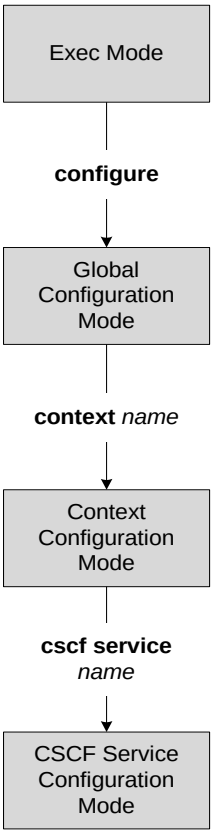
Example

The following command is placed at the end of the route list and routes sessions to a peer server group named *icscf_peer5*, filters sessions with a base criteria of the source address (*1.2.3.4*) and a filter criteria of the destination AoR (*$.@test.com*):

after route peer-servers *icscf_peer5* **base-criteria source address** *1.2.3.4* **filter-criteria1 destination aor** *$.@test.com*

Chapter 66
CSCF Service Configuration Mode Commands

The CSCF Service Configuration Mode is used to create and manage CSCF services within the current context.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

access-service

Configures the name of the P-CSCF/A-BG access service from which the system receives requests and sends responses. The access service lets the core service know where a packet needs to be routed.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

access-service name *name*

no access-service [name *name* **]**

name *name*

Specifies the name of the P-CSCF/A-BG access service from which the system receives requests and sends responses.
name must be from 1 to 63 alpha and/or numeric characters.

Important: This command should only be issued in the core service configuration, however, multiple access services may be configured per core service.

no

Removes the access service.

Usage

Use this command to identify the name of the P-CSCF/A-BG access service from which the system receives requests and sends responses from/to the UEs. This command is used in systems that deploy two P-CSCF/A-BG services in bridging (Back-to-Back User Agent) mode configurations where an access service P-CSCF/A-BG faces the UE network and a core P-CSCF/A-BG faces the public network.

Example

The following command identifies the P-CSCF/A-BG access service named to the CSCF/A-BG core service:

access-service name *HA3*

access-type

Specifies the access types for IMS core.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

access-type { 3gpp-geran | 3gpp-utran-fdd | 3gpp-utran-tdd | 3gpp2-1x | 3gpp2-1x-hrpd | 3gpp2-umb | adsl | adsl2 | adsl2p | docsis | gshdsl | hdsl | hdsl2 | idsl | ieee-80211 | ieee-80211a | ieee-80211b | ieee-80211g | ieee-80216e | radsl | sdsl | vdsl } access-profile { default | name *access_profile_name* **} | ue-ip-address-range name** *ue_ip_name* **{ address** *ip_address_mask* **| range** *start_ip_address end_ip_address* **}**

access-profile {default | name *access_profile_name* **}**

Associates an access type with a CSCF access profile. Different access types can refer to the same access profile.

ue-ip-address-range name *ue_ip_name* **{ address** *ip_address_mask* **| range** *start_ip_address end_ip_address* **}**

Configures UE IP address/range for a specific access type.
ue_ip_name must be from 1 to 79 alpha and/or numeric characters.
address *ip_address_mask*: Specifies a combined IP address subnet mask bits to indicate what IP addresses the specific access-type applies to. *ip_address_mask* must be specified using the form "IP Address/Mask Bits" where the IP address must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6, and the mask bits are a numeric value, which is the number of bits in the subnet mask.
range *start_ip_address end_ip_address*: Configure UE IP range for specific access-type.

- *start_ip_address* specifies the beginning of the range of addresses.
- *end_ip_address* specifies the end of the range of addresses .
- *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

no access-type { 3gpp-geran | 3gpp-utran-fdd | 3gpp-utran-tdd | 3gpp2-1x | 3gpp2-1x-hrpd | 3gpp2-umb | adsl | adsl2 | adsl2p | docsis | gshdsl | hdsl | hdsl2 | idsl | ieee-80211 | ieee-80211a | ieee-80211b | ieee-80211g | ieee-80216e | radsl | sdsl | vdsl } [access-profile | ue-ip-address-range [name *ue_ip_name* **]]**

Removes the specified access type from a CSCF access profile or UE IP address/range.

Usage

Use this command to associated the access types for a specified CSCF access profile or UE IP address/range name.

Important: Use the **sip-header** command to enable SIP P-Access-Network-Info (PANI) header insertion. CSCF Proxy-CSCF Configuration Mode commands are defined in the *CSCF Proxy-CSCF Configuration Mode Commands* chapter in this guide.

Example

The following command identifies the access type adsl and assigns it to access profile *ap1*:

access-type adsl access-profile name *ap1*

allow-dereg

Allows the CSCF to send de-registration requests. Feature is disabled by default.

Product

SCM

Privilege

Administrator

Syntax

```
[ no ] allow-dereg
```

no

Disables the feature.

Usage

Use this command to allow the CSCF service to send de-registration requests.
If the UE stops sending keepalive packets, which ends the connection between the UE and the proxy, UE information is cleared from the Proxy-CSCF (P-CSCF) or Access Border Gateway (A-BG). If de-registration requests are enabled, any UE-related information that is shared with the Serving-CSCF (S-CSCF) will also be cleared.

bind

Binds the CSCF service to a logical IP interface and specifies the maximum number of sessions that can access this service over the specified interface.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
bind address ip_address [ access-ipsec-crypto-template template ] [ cscf-
hostname host_name ] [ max-sessions max# ] [ port number ] [ reserved-call-
capacity percentage] [ transport tcp ] [ use-serviceport-towards-network ]

no bind address
```

address *ip_address*

Specifies the IP address of the interface to which the service is being bound.
ip_address must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

access-ipsec-crypto-template *template*

Specifies the name of an existing IPSec CSCF crypto template to be used for accessing CSCF service by user equipment. Valid only for P-CSCF or A-BG.
template must be an existing IPSec CSCF crypto template and be from 1 to 127 alpha and/or numeric characters.

Important: The IPSec CSCF crypto template should be configured in the same context in which the P-CSCF is configured.

cscf-hostname *host_name*

Specifies the local host name of the CSCF service.
host_name must be an existing CSCF service name and be from 1 to 127 alpha and/or numeric characters.
Configuring this keyword associates the CSCF service with the AOR domain configured in the **default-aor-domain** command and uses the domain name in SIP headers.

Important: If this keyword is not configured, SIP headers will contain the IP address of the CSCF service instead of the domain name.

max-sessions *max#*

Default: 500,000
Specifies the maximum number of sessions managed by this service on this interface.
max# must be configured to any integer value from 0 to 500,000.

Important: The total session capacity of the system is 500,000. **max-sessions** is also limited by the capacity in the license generated for the service. If licenses for PDSN/GGSN/HA are generated for *x* number of sessions, then the license for the CSCF service will be generated at 500,000-*x*. Hardware configuration and installed features can also affect the maximum number of sessions that can be supported.

port *number*

Default: 5060
Specifies the UDP port number.
number must be an integer value from 1 to 65534.

reserved-call-capacity *percentage*

Default: 10
Specifies the call capacity percentage per session manager (sessmgr).
percentage must be an integer value from 1 to 50.

transport tcp

Enables TCP transport for the address.

use-serviceport-towards-network

Enables use of service port for sending and receiving UDP messages from network elements.

no bind address

Removes the binding of the service to a specified interface.

Usage

Use this command to associated the service with a specific logical IP address. This command also configures the identity of the CSCF in SIP headers as either the domain name of the CSCF service or the IP address.

Important: Multiple keywords can be used per bind command.

Example

The following command binds the CSCF service to a logical interface with an IP address of *1.2.3.4* and sets the maximum number of supported sessions for this interface at *250000*:

```
bind address 1.2.3.4 max-sessions 250000
```

charging

Enables Rf charging in this CSCF service for SIP messages.

Product

SCM

Privilege

Administrator

Syntax

```
[ default | no ] charging
```

default

Enables Rf charging in this CSCF service for SIP messages.

no

Disables Rf charging for this service.

Usage

Use this command to enable the RF charging feature in this service and enter the CSCF Charging Configuration Mode.
Entering this command results in the following prompt:

```
[context_name]hostname(config-cscf-charging)#
```

CSCF Charging Configuration Mode commands are defined in the *CSCF Charging Configuration Mode Commands* chapter in this guide.

cnsa-media-profile

Configures the media profile id to be set for a previously created service policy.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

[no] cnsa-media-profile *profile_id* **cscf-service-policy** *policy_name* **content-type { application-3gpp-ims-xml | application-pidf-diff-xml | application-pidf-partial-xml | application-pidf-xml | application-reginfo-xml | application-sdp | application-xml | message-sipfrag | multipart-mixed | multipart-related | text-plain }**

---

no

Removes the media profile from the service policy.

---

cnsa-media-profile *profile_id*

Specifies the media profile id.
profile_id must be an integer from 0 to 10 and be an existing media profile id in the system. CNSA media profile ids are created and maintained in the CSCF ISC Template Configuration Mode.

---

cscf-service-policy *policy_name*

Assigns the media profile id to a service policy.
policy_name must be from 1 to 63 alpha and/or numeric characters and be an existing policy name in the system. Service policies are created and maintained in the CSCF Policy Configuration Mode.

---

content-type { application-3gpp-ims-xml | application-pidf-diff-xml | application-pidf-partial-xml | application-pidf-xml | application-reginfo-xml | application-sdp | application-xml | message-sipfrag | multipart-mixed | multipart-related | text-plain }

Specifies the content type(s).
application-3gpp-ims-xml - format for exchanging information in SIP Requests and Responses as used within the 3GPP IM CN Subsystem
application-pidf-diff-xml - contains changed presence elements. Contains full presence document when there are many changes
application-pidf-partial-xml - contains only changed parts of PIDF-based presence information
application-pidf-xml - XML MIME entity that contains presence information
application-reginfo-xml - used in Notifications to SIP user agents about registration expiry
application-sdp - SDP session description
application-xml - content type for generic xml documents
message-sipfrag - contains subsets of well formed SIP messages
multipart-mixed - intended for use when the body parts are independent and need to be bundled in a particular order
multipart-related - intended for compound objects consisting of several inter-related body parts

text-plain - plain text

Important: You may specify multiple types of content.

Usage

Use this command to assign a media profile id to a service policy. The policies defined in the service policy apply to all subscribers using this service.
CNSA media profile ids are created and maintained in the CSCF ISC Template Configuration Mode. Service policies are created and maintained in the CSCF Policy Configuration Mode.

Example

The following command defines the media profile id as *2* and assigns it to *serv_policy3* with plain text content type.

cnsa-media-profile *2* **cscf-service-policy** *serv_policy3* **content-type** *text-plain*

core-service

Configures a core service if:

- CSCF services are run in bridging (Back-to-Back User Agent) mode
- A-BG is an Application-level Gateway (ALG) for Network Address Translation (NAT)

By default, no core-service name will be present.

Product

SCM (CSCF, A-BG)

Privilege

Administrator

Syntax

[no] core-service name *service_name*

no

Removes the core service.

core-service name *service_name*

Specifies the name of the core service.
service_name must be from 1 to 80 alpha and/or numeric characters.

Usage

Use this command to assign a core service to the CSCF/A-BG service.

Example

The following command identifies the core service:

core-service name *service1*

default-aor-domain

Configures the domain name of the service.

Product

SCM

Privilege

Administrator

Syntax

[no] default-aor-domain *alias*

no

Removes the domain name from the service.

default-aor-domain *alias*

Specifies the domain name for the service.
alias is the name of the domain for this service and must be from 1 to 79 alpha and/or numeric characters in length.

Usage

Use this command to define the domain name of the service.

Example

The following command defines the domain name of the CSCF service as *business.com*

default-aor-domain *business.com*

emergency-cscf

Enables the Emergency-CSCF for the service and enters the Emergency-CSCF Configuration Mode. Default is disabled.

Product

SCM

Privilege

Administrator

Syntax

```
[ no ] emergency-cscf
```

no

Disables the E-CSCF for the service.

Usage

Use this command to enable the Emergency-CSCF feature and enter the Emergency-CSCF Configuration Mode.
Entering this command results in the following prompt:

```
[context_name]hostname(config-cscf-service-emergency-cscf)#
```

Emergency-CSCF Configuration Mode commands are defined in the *CSCF Emergency-CSCF Configuration Mode Commands* chapter in this guide.

Important: Only one function (P-CSCF, S-CSCF, E-CSCF, SIP Proxy, or A-BG) can be enabled per service.

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

history-info

Enables the addition of the history-info header to SIP requests in order to capture request URI information. By default, this command is disabled.

Product

SCM

Privilege

Administrator

Syntax

```
[ default | no ] history-info
```

default | no

Disables the inclusion of the history-info header.

Usage

Use this command to include the history-info header in SIP requests to capture the request URI information for routing or translation.

interface

Enables interface SIP statistic collection.

Product

SCM

Privilege

Administrator

Syntax

```
[ no ] interface statistics sip
```

default | no

Disables interface SIP statistic collection for this service.

Usage

Use this command to enable the collection of interface SIP statistics in this service.

ipv4-ipv6-interworking

Allows the P-CSCF to provide IPv4-IPv6 interworking when UEs are IPv6-only and the IMS core network is IPv4-only. Feature is disabled by default.

Product

SCM (P-CSCF)

Privilege

Administrator

Syntax

```
[ no ] ipv4-ipv6-interworking
```

no

Disables the feature.

Usage

Use this command to allow IPv4-IPv6 interworking functionality.

keepalive

Configures the CSCF to receive and respond to different types of keep-alive requests.

Product

SCM

Privilege

Administrator

Syntax

keepalive [expire-timer *sec* **[max-retry** *num* **] | max-retry** *num* **[expire-timer** *sec* **] | method { crlf | stun } [expire-timer** *sec* **[max-retry** *num* **] | max-retry** *num* **[expire-timer** *sec* **]]]**

default keepalive [expire-timer | max-retry [expire-timer] | method [expire-timer | max-retry]]

no keepalive [method { crlf | stun }]

expire-timer *sec*

Default: 29
This value is used according to timed-keepalives parameter present in Path header. UEs are expected to send keepalive messages according to this time interval.
sec must be an integer from 24 to 150.

max-retry *num*

Default: 3
Specifies the maximum number of times the CSCF waits for the UE to send a keepalive request before it deletes the user information.
num must be an integer from 1 to 10.

method { crlf | stun }

Default: both methods enabled.
Specifies the method of keepalive messages supported by the CSCF.
crlf: "\r\n" string (CRLF packets) sent by UE
stun: STUN protocol messages (rfc3489-bis)

default keepalive [expire-timer | max-retry [expire-timer] | method [expire-timer | max-retry]]

Returns the command to the default settings. All methods are enabled by default. See keywords above for specific defaults.

no keepalive [method { crlf | stun }]

Disables the specified method of keepalive messages.

Usage

Use this command to configure how the CSCF manages keepalive requests.

Example

The following example sets the expire timer to *40* and the maximum retry parameter to *5*:

```
keepalive expire-timer 40 max-retry 5
```

li-packet-cable

Enables the lawful intercept packet cable feature and configures Diameter for Lawful Intercept.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

li-packet-cable diameter { dictionary li-standard | origin endpoint *endpoint_name* **| peer-select peer** *peer_name* **[peer-realm** *peer_realm* **] [secondary-peer** *sec_peer_name* **] [sec-peer-realm** *sec_peer_realm* **] }**

default li-packet-cable diameter dictionary

no li-packet-cable diameter { origin endpoint | peer-select }

dictionary li-standard

Configures the li-standard Diameter dictionary.

origin endpoint *endpoint_name*

Specifies the Diameter endpoint.
endpoint_name must be a string of 1 through 63 characters in length.

peer-select peer *peer_name*

Specifies the Diameter lawful intercept peer.
peer_name must be a string of 1 through 63 characters in length.

peer-realm *peer_realm*

Specifies the Diameter lawful intercept peer realm.
peer_realm must be a string of 1 through 63 characters in length.

secondary-peer *sec_peer_name*

Specifies the Diameter lawful intercept secondary peer.
sec_peer_name must be a string of 1 through 63 characters in length.

sec-peer-realm *sec_peer_realm*

Specifies the Diameter lawful intercept secondary peer realm.
sec_peer_realm must be a string of 1 through 63 characters in length.

default li-packet-cable diameter dictionary

Configures the li-standard Diameter dictionary.

no li-packet-cable diameter { origin endpoint | peer-select }

Disables Diameter Lawful Intercept for the specified function.

Usage

Use this command to enable the lawful intercept packet cable feature and configure Diameter for Lawful Intercept.

Example

The following command defines a Diameter lawful intercept peer named *li-peer1*:

li-packet-cable diameter peer-select peer *li-peer1*

max-sipmsg-size

Configures the maximum SIP message size.

Product

SCM

Privilege

Administrator

Syntax

max-sipmsg-size *limit*

[default | no] max-sipmsg-size

limit

Default: 4096
Configures the SIP message size limit in bytes.
limit must be an integer from 1024 to 65535.

Important: Maximum SIP message size should be more than the message-max-size set in the CSCF Proxy-CSCF Configuration Mode.

default | no

Returns/sets the maximum SIP message size to 4096 bytes.

Usage

Use this command to configure the maximum SIP message size.

Example

The following command limits the SIP message size to *4500* bytes:

max-sipmsg-size *4500*

media-bridging

Enables SDP modification that terminate media on CSCF. Feature is disabled by default.

Product

SCM (P-CSCF)

Privilege

Administrator

Syntax

```
[ no ] media-bridging
```

no

Disables the feature.

Usage

Use this command to allow termination of media on CSCF.

nat-policy

Configures a NAT (Network Address Translation) policy for the service if the CSCF service is performing one of the following functions:

- CSCF services are run in bridging (Back-to-Back User Agent) mode
- A-BG is an Application-level Gateway (ALG) for NAT

Product

SCM(CSCF, A-BG)

Privilege

Administrator

Syntax

nat-policy *policy_name* { **private-address** { **address** *ip_address_mask* | **default** | **range** *start_ip_address end_ip_address* } | **bridge-network** { **address** *ip_address_mask* | **range** *start_ip_address end_ip_address* }

no nat-policy *policy_name*

---

nat-policy *policy_name*

Specifies a name for the NAT policy.
policy_name must be from 1 to 79 alpha and/or numeric characters.

---

private-address { address *ip_address_mask* **| default|range** *start_ip_address end_ip_address* **}**

Specifies the private-address policy type for nat-pool.
address *ip_address_mask*: Address for nat-policy policy type for nat-pool. Specifies a combined IP address subnet mask bits to indicate what IP addresses the specific policy type applies to.
ip_address_mask must be specified using the form "IP Address/Mask Bits" where the IP address must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6, and the mask bits are a numeric value, which is the number of bits in the subnet mask.
default: Default for nat-policy policy type for nat-pool. Default is defined as the address range specified by rfc1918.

- 10.0.0.0 - 10.255.255.255 (10/8 prefix)
- 172.16.0.0 - 172.31.255.255 (172.16/12 prefix)
- 192.168.0.0 - 192.168.255.255 (192.168/16 prefix)

range *start_ip_address end_ip_address*: Range for nat-policy policy type for nat-pool.

- *start_ip_address* specifies the beginning of the range of addresses.
- *end_ip_address* specifies the end of the range of addresses .
- *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

---

bridge-network { address *ip_address_mask* **| range** *start_ip_address end_ip_address* **}**

Specifies the bridge-network policy type for S-CSCF bridging.

address *ip_address_mask*: Address for bridge-network policy type for S-CSCF bridging. Specifies a combined IP address subnet mask bits to indicate what IP addresses the specific policy type applies to. *ip_address_mask* must be specified using the form "IP Address/Mask Bits" here the IP address must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6, and the mask bits are a numeric value, which is the number of bits in the subnet mask.
range *start_ip_address end_ip_address*: Range for bridge-network policy type for S-CSCF bridging.

- *start_ip_address* specifies the beginning of the range of addresses.
- *end_ip_address* specifies the end of the range of addresses .
- *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

no nat-policy *policy_name*

Removes the specified NAT policy from the service.

Usage

Generally, if a SIP packet has a VIA address (physical address that identifies where the service is located) different from the Source address, ALG functionality is invoked. Even if the VIA and Source addresses are the same, however, this command allows the ALG functionality to be started. For ALG to start, the VIA address should belong to one of the nat-policy address ranges.

Example

The following command identifies the NAT policy named *policy1* with a private-address policy type of *10.10.10.10 255.255.255.0*:

nat-policy *policy1* **private-address address** *10.10.10.10 255.255.255.0*

The following command identifies the NAT policy named *policy2* with a private-address range policy type of *172.162.23.23 172.162.23.230*:

nat-policy *policy2* **private-address address** *172.162.23.23 172.162.23.230*

The following command identifies the NAT policy named *policy3* with a default policy type:

nat-policy *policy3* **private-address default**

nat-pool

Configures a NAT (Network Address Translation) pool for the service if the CSCF service is performing one of the following functions:

- P-CSCF services are run in bridging (Back-to-Back User Agent) mode
- A-BG is an Application-level Gateway (ALG) for NAT

By default, no nat-pool name will be present.

Product

SCM(P-CSCF, A-BG)

Privilege

Administrator

Syntax

`[ no ] nat-pool name` *`pool_name`*

`no`

Removes the NAT pool from the service.

`nat-pool name` *`pool_name`*

Specifies the name of an existing NAT pool.
`pool_name` must be from 1 to 32 alpha and/or numeric characters.

Important: NAT pools are created in Context Configuration Mode with the **`ip pool`** command.

Usage

Use this command to assign a NAT pool to the P-CSCF/A-BG service.

Example

The following command identifies the NAT pool:

`nat-pool name` *`pool2`*

policy

Enables or disables early media support in P-CSCF and configures the congestion control threshold values that are to be monitored on this CSCF service.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
policy { allow-early-media | threshold congestion-control [ system-cpu-utilization percent ] [ tolerance percent ] }

[ default | no ] policy { allow-early-media | threshold congestion-control tolerance }
```

allow-early-media

Default: Enabled
Allows early media by doing QoS commit during QoS Authorization in P-CSCF.

threshold congestion-control

Enables congestion-control.

system-cpu-utilization *percent*

Default: 80
The average percent utilization of a CPU in a PSC/PSC2 running the CSCF service as measured in 10 second intervals.
percent can be configured to any integer value from 0 to 100. This value becomes the upper threshold for triggering the CPU-based congestion for CSCF services.

tolerance *percent*

Default: 5
The percentage under a configured threshold that dictates the point at which the condition is cleared.
percent is an integer value from 1 to 25.

default

Returns the command to the default settings. See keywords above for specific defaults.

no

Disables the functionality.

Usage

Use this command to set QoS support during either the initial SDP response or the 200OK response to the INVITE. When this CLI is enabled, QoS commit is done during initial SDP answer. When disabled, QoS commit is done during 200OK INVITE. By default, this command is enabled.
In addition, thresholds dictate the conditions for which congestion control is to be enabled and establish limits for defining the state of the CSCF service (congested or clear). The tolerance parameter establishes the threshold at which the condition is cleared.

Important: When congestion is triggered, new CSCF calls are not rejected.

Example
The following command sets the upper threshold for CPU utilization for triggering congestion control at *90%*.

```
policy threshold congestion-control system-cpu-utilization 90
```

The following command sets the tolerance to its default value of *5*.

```
default policy threshold congestion-control tolerance
```

policy-name

Assigns a previously created service policy to this service.

Product

SCM

Privilege

Administrator

Syntax

policy-name *name*

no policy-name

policy-name *name*

Specifies the name of the service policy being assigned to this service.
name must be from 1 to 79 alpha and/or numeric characters and be an existing policy name in the system.
Service policies are created and maintained in the CSCF Policy Configuration Mode.

no

Remove the assigned service policy from this service.

Usage

Use this command to assign a service policy to this service. The policies defined in the service policy apply to all subscribers using this service. Service policies are created and maintained in the CSCF Policy Configuration Mode.

Example

The following command assigns a service policy named *serv_policy3* to this service:

policy-name *serv_policy3*

proxy-cscf

Enables the Proxy-CSCF for the service and enters the Proxy-CSCF Configuration Mode. Default is disabled.

Product

SCM (P-CSCF)

Privilege

Administrator

Syntax

```
[ no ] proxy-cscf
```

no

Disables the P-CSCF for the service.

Usage

Use this command to enable the Proxy-CSCF feature and enter the Proxy-CSCF Configuration Mode. Entering this command results in the following prompt:

```
[context_name]hostname(config-cscf-service-proxy-cscf)#
```

Proxy-CSCF Configuration Mode commands are defined in the *CSCF Proxy-CSCF Configuration Mode Commands* chapter in this guide.

Important: The Proxy-CSCF is a license-enabled function of the Session Control Manager. Only one function (P-CSCF, S-CSCF, E-CSCF, SIP Proxy, or A-BG) can be enabled per service.

recurse-on-redirect-resp

Enables the 3xx recursion feature. If enabled, the service will send further invites to the contacts specified upon receiving a 3xx redirect response. Default is disabled.

Product

SCM

Privilege

Administrator

Syntax

```
[ no ] recurse-on-redirect-resp
```

no

Disables the 3xx recursion feature.

Usage

When enabled and on receipt of a 3xx response, the service will collect the SIP URIs present in the Contact header(s) of 3xx and recursively contact each one of them until the call succeeds. The contacts are tried serially. There is a maximum implementation limit of 50 URIs. Each contact, in turn, can send a 3xx response. The service will honor them and append the new contacts. When disabled, the service treats a 3xx response as the final failure response and declares the call attempt “failed”. By default, this feature is disabled.

Example

Enable recursion on 3xx:

```
recurse-on-redirect-resp
```

Disable recursion on 3xx:

```
no recurse-on-redirect-resp
```

reject-on-cnsa-failure

Enables rejection of messages on Core Network Service Authorization failure. Default is disabled.

Product

SCM

Privilege

Administrator

Syntax

```
[ no ] reject-on-cnsa-failure
```

no

Disables the rejection of messages on Core Network Service Authorization failure.

Usage

Enables rejection of messages on Core Network Service Authorization failure. By default, this feature is disabled.
In a mobile originating case, S-CSCF checks for the presence of P-Preferred-Service (PPS) header. If the header is present, media profile authentication is successful and if the incoming ICSI (IMS Communication Service Identifier) value also matches with one of the values in the service_id list, then the request will be forwarded after replacing the PPS header with PAS (P-Asserted-Service). If media profile authentication fails, S-CSCF will check reject-on-cnsa-failure. If enabled, then call is rejected with 403 message. If disabled, a default ICSI is selected from the service_id list and will be put into PAS while forwarding the request by the S-CSCF on service authentication failure.
In PPS is not received by the S-CSCF and media profile authentication is successful, an ICSI from the service_id list, if present, is selected and will be added in PAS header. If media profile authentication fails, reject-on-cnsa-failure is checked. If enabled, call is rejected with 403 message. If disabled, PAS header is added if service_id list is present with an ICSI value.

Example

Enable rejection of messages on Core Network Service Authorization failure:

```
reject-on-cnsa-failure
```

Disable rejection of messages on Core Network Service Authorization failure:

```
no reject-on-cnsa-failure
```

release-call-on-media-loss

Release call on detection of media loss.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
release-call-on-media-loss media-type audio

no release-call-on-media-loss
```

no

Disables the release of SIP calls upon the detection of media loss.

Usage

Use this command to enable the release of SIP calls upon the detection of media loss.

Example

Enables the release of SIP calls upon the detection of media loss:

```
release-call-on-media-loss media-type audio
```

Enables the release of SIP calls upon the detection of media loss:

```
no release-call-on-media-loss
```

rfc3261-proxy

Enables RFC3261 proxy (SIP Proxy) for this service and enters the SIP Proxy Configuration Mode. Default is disabled.

Product

SCM (SIP Proxy)

Privilege

Administrator

Syntax

```
[ default | no ] rfc3261-proxy
```

default | no

Disables RFC3261 proxy in this service.

Usage

Use this command to enable the Sip Proxy feature and enter the SIP Proxy Configuration Mode. Entering this command results in the following prompt:

```
[context_name]hostname(config-cscf-service-rfc3261-proxy)#
```

SIP Proxy Configuration Mode commands are defined in the *CSCF SIP Proxy Configuration Mode Commands* chapter in this guide.

Important: The SIP Proxy is a license-enabled function of the Session Control Manager. Only one function (P-CSCF, S-CSCF, E-CSCF, SIP Proxy, or A-BG) can be enabled per service.

serving-cscf

Enables Serving-CSCF for the service and enters the Serving-CSCF Command Mode. Default is disabled.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

```
[ no ] serving-cscf
```

no

Disables S-CSCF for the service.

Usage

Use this command to enable the Serving-CSCF feature and enter the Serving-CSCF Configuration Mode. Entering this command results in the following prompt:

```
[context_name]hostname(config-cscf-service-serving-cscf)#
```

Serving-CSCF Configuration Mode commands are defined in the *CSCF Serving-CSCF Configuration Mode Commands* chapter in this guide.

Important: The Serving-CSCF is a license-enabled function of the Session Control Manager. Only one function (P-CSCF, S-CSCF, E-CSCF, SIP Proxy, or A-BG) can be enabled per service.

serving-cscf-list

Configure a list of Serving CSCFs and their capabilities.

Product

SCM

Privilege

Administrator

Syntax

```
[ no ]serving-cscf-list server { address address | domain domain } { capability value | port num { capability value } }

no trusted-domain-entity address
```

server { address *address* | domain *domain* }

Specifies the S-CSCF server.
address *address*: IP addresses must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
domain *domain*: Domain names must be entered using from 1 to 80 alpha and/or numeric characters.

capability *value*

Specifies the capability of the S-CSCF server. *value* is assigned by the Service Provider and may be an integer from 1 to 999999.

port *num*

Specifies the port at which service is provided by the S-CSCF server. *num* may be an integer from 1 to 65535.

no

Removes an entry from this list.

Usage

Use this command to configure a list of Serving CSCFs and their capabilities..

Important: This command can be entered multiple times to identify multiple Serving CSCFs.

Example

The following command adds a S-CSCF with an IP address of *1.2.3.4* and a capability value of *75* to this service's list:

```
serving-cscf-list server address 1.2.3.4 capability 75
```

session-timer

Configures the session expiry for sessions (Session will expire at the configured value unless refreshed.) and the minimum number of seconds in a session timer (session-expires) value the system will allow.

Product

SCM

Privilege

Administrator

Syntax

session-timer { min-se *sec* **[session-expires** *sec* **] | session-expires** *sec* **[min-se** *sec* **] }**

default session-timer [min-se] [session-expires]

no session-timer

min-se *sec*

Default: 90
Specifies the minimum number of seconds the system will allow a session-expires value in a session request. *sec* must be an integer value between 90 and the value of the **session-expires** command.

session-expires *sec*

Default: 1800 (30 minutes)
Specifies the number of seconds a session is allowed exist before it expires. *sec* must be an integer value between 90 and 18000.

default session-timer [min-se] [session-expires]

Returns the command to the default settings.

no

Disables the session timer.

Usage

Use this command to set a session expiry value for all invites generated by the SCM and a minimum value for a session request session timer the system will allow. If a session is requested with a timer of less than this command's value, the system will reject the request with a "422 Session Interval Too Small" response code.

Example

The following command sets the session expiry for all session generated by the SCM to 60 minutes:

session-timer session-expires *3600*

The following command sets the minimum session lifetime value for the service to *270* seconds:

session-timer min-se *270*

strict-outbound

When enabled, the CSCF rejects registration without outbound parameters from an already registered AoR (the AoR would have included outbound parameters in a previous registration). When disabled, the CSCF allows registration without outbound parameters from the previously registered AoR.

Product

SCM

Privilege

Administrator

Syntax

```
[ no ] strict-outbound
```

no

Disables the feature. This is the default behavior.

Usage

Use this command to reject registration from a previously registered AoR if the AoR fails to register with outbound parameters but included them in the previous registration.

subscriber-policy-override

Configures the system to allow the subscriber-based policy to override the service-based policy. Default is disabled.

Product

SCM

Privilege

Administrator

Syntax

```
[ default | no ] subscriber-policy-override
```

default | no

Removes the subscriber policy override from the service.

Usage

By default, if a conflict occurs between the subscriber-based policy and the service-based policy, the service policy takes precedence. Use this command to override the default behavior of the system and allow the subscriber-based policy to overrule the service policy.

subscription

Enables the registration event package for the service and configures a system-wide subscription lifetime for all subscribers to the service.

Product

SCM

Privilege

Administrator

Syntax

```
subscription package reg [ lifetime { default sec | max sec [ default sec ] |
min sec [ max sec ] [ default sec ] } ]

[ default | no ] subscription package reg
```

package reg lifetime { default *sec* **| max** *sec* **| min** *sec* **}**

default *sec*: Specifies the default amount of time that a subscription can exist on the system. *sec* must be an integer from 60 to max sec -1. Default is 3761. default sec must be < or = to max sec and > or = to min sec.
The following keywords are specific to the S-CSCF functionality:
max *sec*: Specifies the maximum amount of time that a subscription can exist on the system. *sec* must be an integer from 60 to 2147483646. Default is 86400. max sec must be > or = to min sec.
min *sec*: Specifies the minimum amount of time that a subscription can exist on the system. *sec* must be an integer from 60 to max sec -1. Default is 60. min sec must be < or = to max sec.

default

Returns the command to the default settings.

no

Disables the registration event package for the service.

Usage

Use this command to enable the registration event package for the service and control the amount of time subscriptions are allowed to exist on this service.
The system responds to subscriptions in the following manner:
Using default values:

- If a subscription with an expiration value lower than the service's minimum (60) is received, the service will respond with a 423 Interval Too Small message.
- If a subscription with an expiration value higher than the service's maximum (2147483646) is received, the service will automatically reduce the expiration value to the default value.

If a subscription is received missing the "Expires" value, or the value is malformed, the service will automatically respond with 3761 in the 200OK message.

Example

The following command configures the maximum subscription lifetime to *43200* (12 hours):

subscription package reg lifetime max *43200*

tcp-proxy

Enables SIP TCP proxy for the CSCF service.

Product

SCM

Privilege

Administrator

Syntax

tcp-proxy [port *port_number* **]**

no tcp-proxy

port *port_number*

Default: 5062
Specifies the port used for SIP TCP proxy connections.
port_number must be an integer from 1 to 65534.

no

Disables SIP TCP proxy for the CSCF service

Usage

Use this command to enable SIP TCP proxy for the CSCF service.

Example

Enables SIP TCP proxy for the CSCF service on port *5062*:

tcp-proxy port*5062*

Disables SIP TCP proxy for the CSCF service:

no tcp-proxy

threshold

Configures the number of route failures that will trigger an alarm.

Product

SCM

Privilege

Administrator

Syntax

threshold route-failures *high_thresh* **[clear** *low_thresh* **]**

default threshold route-failures

route-failures *high_thresh*

Default: 5
The high threshold number of route failures that must be met or exceeded within the polling interval to generate an alert or alarm. *high_thresh* can be configured to any integer value between 0 and 60000.

clear *low_thresh*

Default: 5
The low threshold number of route failures that must be met or exceeded within the polling interval to clear an alert or alarm. *low_thresh* can be configured to any integer value between 0 and 60000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

default threshold route-failures

Returns the command to the default settings.

Usage

Use this command to set an alert or an alarm when the number of route failures exceeds the configured level. Alerts or alarms are triggered for the number of registration reply errors on the following rules:

- Enter condition: Actual number of route failures > High Threshold
- Clear condition: Actual number of route failures £ Low Threshold

Example

The following command configures a route failures threshold of *1000* and a low threshold of *500* for a system using the Alarm thresholding model:

threshold route-failures *1000* **clear** *500*

timeout

Sets timeout values for CSCF and SIP transactions.

Product

SCM

Privilege

Administrator

Syntax

```
timeout { hss-wait sec | no-answer sec | policy-interface sec | sip { 3gpp-d sec
| 3gpp-t1 msec | 3gpp-t2 sec | 3gpp-t4 sec | d sec | idle-tcp-connection msec |
invite-expiry sec | t1 msec | t2 sec | t4 sec } }
```

```
timeout { hss-wait | no-answer | policy-interface | sip { 3gpp-d | 3gpp-t1 |
3gpp-t2 | 3gpp-t4 | d | idle-tcp-connection msec | invite-expiry | t1 | t2 | t4
} }
```

hss-wait *sec*

Default: 5
This timer is used by S-CSCF with HSS interface for timeout.
sec must be an integer from 0 to 2147483646.

no-answer *sec*

Default: 100
This timer is specially used for No-Answer Call Feature executed by S-CSCF. The timer will be started as soon as 180 Ringing response is received and No-Answer call feature is enabled. The value of this timer should be always less than INVITE Timeout used by DC-SIP.
sec must be an integer from 0 to 2147483646.

policy-interface *sec*

Default: 5
This timer is used by the P-CSCF/A-BG with Policy interface for timeout.
sec must be an integer from 0 to 2147483646.

sip { 3gpp-d *sec* **| 3gpp-t1** *msec* **| 3gpp-t2** *sec* **| 3gpp-t4** *sec* **| d** *sec* **| idle-tcp-connection** *msec* **| invite-expiry** *sec* **| t1** *msec* **| t2** *sec* **| t4** *sec* **}**

Sets transaction and expiry timers for SIP.

- **3gpp-d** *sec*: This timer is used to control the retransmission of 200OK messages to INVITEs after an ACK is sent. The ACK transaction is cleared after this period. This timer is applicable only for unreliable transport. *sec* must be an integer from 0 to 2147483646. Default: 64*T1 (128 seconds, recommended minimum)
- **3gpp-t1** *msec*: This timer is used to control the time interval between each retransmission. The interval doubles after each retransmission. This is used by P-CSCF/A-BG only when it sending message toward the UE. Example: T1, 2T1, 4T2, etc. This timer is applicable only for unreliable

transport. *msec* must be an integer from 0 to 4294967294. Default: 2000 ms (2 secs, recommended minimum).

- **3gpp-t2** *sec*: This timer is used to control the period for which the request continues to get retransmitted. This is used by P-CSCF/A-BG only when it sending message toward the UE. This timer is applicable both for reliable and unreliable transport. *sec* must be an integer from 0 to 2147483646. Default: 16 seconds (recommended minimum).
- **3gpp-t4** *sec*: This timer is used to control the period for which the final response to non-invite transaction should be buffered. The buffered response for the retransmitted non-invite request should be sent within that interval. This timer is applicable only for unreliable transport. *sec* must be an integer from 0 to 2147483646. Default: 17 seconds (recommended minimum).
- d *sec*: This timer is used to control the retransmission of 200OK to INVITE after ACK is sent. The ACK transaction will be cleared after this interval. This timer is applicable only for unreliable transport. *sec* must be an integer from 0 to 2147483646. Default: 64*T1 (32 seconds, recommended minimum)
- idle-tcp-connection *msec*: This timer is used for closing idle TCP connections. If there is not activity in the TCP connection for the configuration duration, then the connection will be closed. *msec* must be an integer from 1000 (recommended minimum) to 4294967294. Default: 42000 milliseconds .
- invite-expiry *sec*: This timer is used by SIP while acting as UA Role and no final response is received for the INVITE request sent. This timer is applicable for both reliable and unreliable transport. *sec* must be an integer from 0 to 2147483646. Default: 100 seconds (recommended minimum).
- **t1** *msec*: Specifies the time interval (in microseconds) between each retransmission. The interval doubles after each retransmission, for example: T1, 2T1, 4T2, etc. This timer is applicable only for unreliable transport. *msec* must be an integer from 0 to 2147483646. Default: 500 milliseconds (recommended minimum).
- **t2** *sec*: This timer is used to control the period for which the request keeps getting retransmitted. This timer is applicable both for reliable and unreliable transport. *sec* must be an integer from 0 to 2147483646. The recommended minimum value for this parameter is 4 seconds. Default: 64*T1 (32 seconds)
- **t4** *sec*: This timer is used to control the period for which the final response to non-invite transaction should be buffered so as to send the buffered response for the retransmitted non-invite request within that interval. This timer is applicable only for unreliable transport. *sec* must be an integer from 0 to 2147483646. Default: 5 seconds (recommended minimum).

default

Returns the command to the default settings.

Usage

Use this command to configure SIP Stack timers and CSCF service specific timers.

Example

The following command sets the SIP d timer to *64* seconds:

```
timeout sip d 64
```

transport-switching

Sets the message size that triggers a transport protocol switch.

Product

SCM

Privilege

Administrator

Syntax

transport-switching policy protocol tcp trigger msg-size *size*

default transport-switching policy protocol tcp trigger msg-size

policy protocol tcp trigger msg-size *size*

Default: 1300
Specifies the size of the SIP message beyond which transport changes to TCP.
size can be configured to any integer value between 1300 and 65535.

default

Returns the size of the SIP message beyond which transport changes to TCP to 1300 bytes.

Usage

Use this command to configure the size of the SIP message beyond which transport changes to TCP.

Example

Switch to TCP transport protocol when the SIP message size is *4000* bytes or more:

transport-switching policy protocol tcp trigger msg-size *4000*

trusted-domain-entity

Adds trusted network nodes (or entities) to a table used by this service to identify those nodes that can be trusted with subscriber information.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

trusted-domain-entity *address* **[foreign-network]**

no trusted-domain-entity *address*

trusted-domain-entity *address*

Specifies the IP address of the network node identified as a trusted entity by this service. *address* must be either an IP address or a domain name. IP addresses must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6. Domain names must be entered using from 1 to 80 alpha and/or numeric characters.

foreign-network

Entity belongs to Foreign Network.

no

Removes an entry from this service's trusted domain table.

Usage

Use this command to identify to the service the network entities that can be trusted with subscriber information by this service.

Important: This command can be entered multiple times to identify multiple trusted network entities.

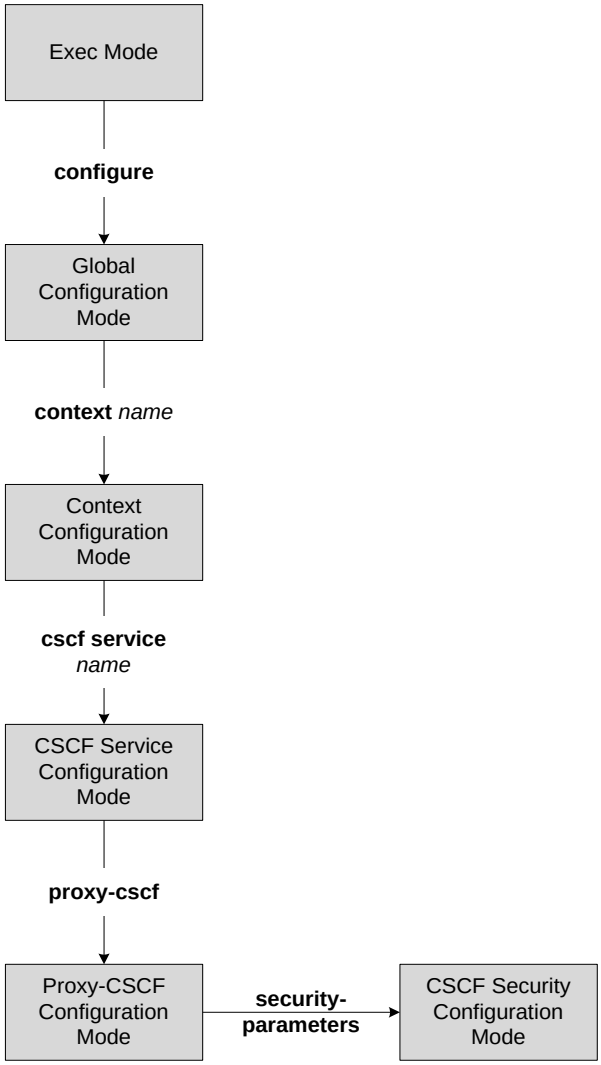
Example

The following command adds a network node with an IP address of *1.2.3.4* to this service's trusted domain table:

trusted-domain-entity *1.2.3.4*

Chapter 67
CSCF Security Configuration Mode Commands

The CSCF Security Configuration Mode is used to configure Denial of Service (DOS) prevention commands.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

auth-failure-weight

Sets a severity number for authorization failures used in calculating a value for determining when to suspend registration attempts.

Important: The system will ignore the configuration of this command unless the **dos-prevention** command has been enabled.

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator

Syntax

auth-failure-weight *weight*

default auth-failure-weight

weight

Default: 1
Assigns a weight to an authorization failure. Defines the severity of a single authorization failure. *weight* must be an integer from 1 to 5.

default

Sets /restores the default value assigned to the specified command.

Usage

Use this command to define the severity of an authorization failure. This parameter is used in calculating the current number of authorization failures to compare to the **per-aor-failure-limit** and the **per-ip-failure-limit**. Configuring this command with a lower number causes the system to suspend registration attempts with repeated authorization failures much sooner than when configured with a higher number.

Example

The following command assigns a weight of *3* to an authorization failure:

auth-failure-weight *3*

bad-request-weight

Sets a severity number for bad registration requests used in calculating a value for determining when to suspend registration attempts.

Important: The system will ignore the configuration of this command unless the **dos-prevention** command has been enabled.

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator

Syntax

bad-request-weight *weight*

default bad-request-weight

weight

Default: 2
Assigns a weight to a bad registration request. Defines the severity of a single bad request.
weight must be an integer from 1 to 5.

default

Sets /restores the default value assigned to the specified command.

Usage

Use this command to define the severity of bad registration request. This parameter is used in calculating the current number of request failures to compare to the **per-aor-failure-limit** and the **per-ip-failure-limit**. Configuring this command with a lower number causes the system to suspend registration attempts with repeated request failures much sooner than when configured with a higher number.

Example

The following command assigns a weight of *3* to a bad registration request:

bad-request-weight *3*

dos-prevention

Enables the denial of service prevention feature.

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] dos-prevention
```

`[ default | no ]`

Disables the denial of service prevention feature.

Usage

Use this command to enable the denial of service prevention feature. The default value for this command is disabled. When this command is enabled, the commands in this mode are enabled with default values configured.

Important: This command must be enabled before configuring other commands in this mode.

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the previous mode.

forking-contact-limit

Sets a limit on the number of contacts a user ID can register with the system.

Important: The system will ignore the configuration of this command unless the **dos-prevention** command has been enabled.

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator

Syntax

forking-contact-limit *limit*

default forking-contact-limit

limit

Default: 0
Sets the maximum number of contacts a user ID can register with the system. 0 specifies that unlimited contacts can be registered per user ID.
limit must be an integer from 0 to 10.

default

Sets /restores the default value assigned to the specified command.

Usage

Use this command to limit the number of contacts a user ID can register with the system.

Example

The following command limits all users to *2* registered contacts on the system:

forking-contact-limit *2*

greylist-duration

Configures the amount of time an AoR or IP address remains on a “grey list” after having crossed the registration authorization limit or the bad registration request limit.

Important: The system will ignore the configuration of this command unless the **dos-prevention** command has been enabled.

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator

Syntax

greylist-duration *time*

default greylist-duration

time

Default: 10
Defines the time, in minutes, that an AoR or IP address remains on a “grey list”.
time must be an integer from 5 to 1,440.

default

Sets /restores the default value assigned to the specified command.

Usage

Use this command to specify the amount of time AoRs or IP addresses remain on a “grey list” after having crossed the registration authorization limit or the bad registration request limit. Limits are described in the **per-aor-failure-limit** command and the **per-ip-failure-limit** command.

Example

The following command sets the duration AoRs or IP addresses remain on a “grey list” to *30* minutes:

greylist-duration *30*

per-aor-failure-limit

Sets a failure limit that, when exceeded, causes the suspension of registration attempts for the offending AoR.

Important: The system will ignore the configuration of this command unless the **dos-prevention** command has been enabled.

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator

Syntax

per-aor-failure-limit *limit*

default per-aor-failure-limit

limit

Default: 200
Defines the threshold for registration failures based on a calculation using weighted multipliers defined in **auth-failure-weight** and **bad-request-weight**.
limit must be an integer from 5 to 10,000.

default

Sets /restores the default value assigned to the specified command.

Usage

Use this command to set a failure limit for registration attempts from an identified AoR. The following calculation determines when this threshold is reached for a specific AoR:
Current authorization failures ÷ **auth-failure-weight** = current failures per AoR
or
Total bad registration requests ÷ **bad-request-weight** = current failures per AoR
If **auth-failure-weight** = *2* and **bad-request-weight** = *1*, and the **per-aor-failure-limit** = *100*, then the tolerance for registration authentication failures = 50 per AoR and the tolerance for bad registration requests = 100 per AoR.
When an AoR reaches the failure limit, it is added to a "grey list" for a period of time as defined by the **greylist-duration** command.

Example

The following command sets the AoR failure limit to *300*:

per-aor-failure-limit *300*

per-ip-failure-limit

Sets a failure limit that, when exceeded, causes the suspension of registration attempts for the offending IP address.

Important: The system will ignore the configuration of this command unless the **dos-prevention** command has been enabled.

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator

Syntax

per-ip-failure-limit *limit*

default per-ip-failure-limit

limit

Default: 100
Defines the threshold for registration failures based on a calculation using weighted multipliers defined in **auth-failure-weight** and **bad-request-weight**.
limit must be an integer from 5 to 10,000.

default

Sets /restores the default value assigned to the specified command.

Usage

Use this command to set a failure limit for registration attempts from an identified IP address. The following calculation determines when this threshold is reached for any IP address:
Current authorization failures ÷ **auth-failure-weight** = current failures per AoR
or
Total bad registration requests ÷ **bad-request-weight** = current failures per AoR
If **auth-failure-weight** = *2* and **bad-request-weight** = *1*, and the **per-ip-failure-limit** = *200*, then the tolerance for registration authentication failures = 100 per each IP address and the tolerance for bad registration requests = 200 per each IP address.
When an IP address reaches the failure limit, it is added to a "grey list" for a period of time as defined by the **greylist-duration** command.

Example

The following command sets the IP address registration failure limit to *200*:

per-ip-failure-limit *200*

threshold-rate

Configures the rate per second at which the system must receive bad requests before it considers the requests a DoS attack.

Important: The system will ignore the configuration of this command unless the **dos-prevention** command has been enabled.

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator

Syntax

threshold-rate *rate*

default threshold-rate

rate

Default: 1
Specifies the rate per second that the system must receive bad requests to determine that it is under a DoS attack.
rate must be an integer from 1 to 1,000.

default

Sets /restores the default value assigned to the specified command.

Usage

Use this command to specify the threshold rate for bad requests. For example, if a malicious user sends bad requests at a rate of 5 per second and this parameter is set to 10, the system will not consider itself under a DoS attack.

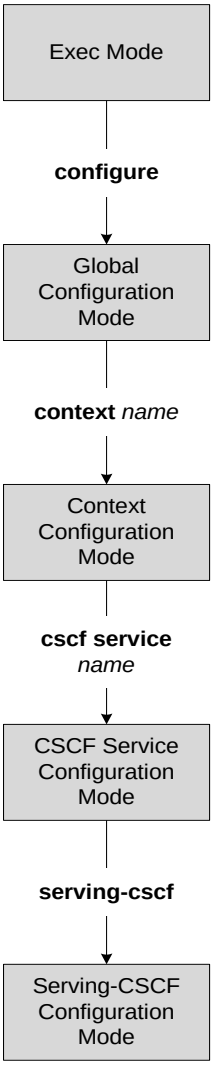
Example

The following command sets the threshold rate to *5* bad requests per second:

threshold-rate *5*

Chapter 68
CSCF Serving-CSCF Configuration Mode Commands

The Serving-CSCF Configuration Mode is used to set various commands supporting the role of the CSCF service as a Serving CSCF.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

3gpp

Enables/disables functionality related to 3GPP Release 8 support. This command is disabled by default.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

```
[ default | no ] 3gpp Rel8
```

default | no

Disables 3GPP Release 8 support.

Usage

Use this command to configure the S-CSCF to support 3GPP Release 8 functionality.

alias-indication

Enables/disables alias indication functionality, a collaborative information exchange between the S-CSCF and HSS. This command is disabled by default.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
[ default | no ] alias-indication
```

default | no

Disables alias indication functionality between the S-CSCF and HSS.

Usage

Use this command to display alias information from the HSS.
If both the HSS and the S-CSCF support this feature, Alias Group IDs will be displayed in the output of the **show subscribers cscf-only full** command.

Important: 3GPP Release 8 support must be enabled.

allow

Enables the function to allow IMS interworking with RFC3261 SIP User Agents.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

```
[ no ] allow rfc3261-ua-interworking
```

no

Disables the interworking capability.

Usage

Use this command to enable the S-CSCF to allow IMS interworking with RFC3261 SIP User Agents.

authentication

Configures the authentication method used by the S-CSCF service.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
authentication { aka-v1 value | allow-noauth [ invite | re-register| register ]
| allow-noipauth [ invite | re-register| register ] | allow-unsecure | aor-auth
| md5 value }

no authentication { aka-v1 | allow-noauth [ invite | re-register| register ] |
allow-noipauth [ invite | re-register| register ] | allow-unsecure | aor-auth |
md5 }
```

aka-v1 *value*

Specifies that AKA-v1 algorithm is used as the authentication type when accessing the CSCF service. *value* specifies a preference - the lower the value, the higher the preference. *value* must be an integer from 1 to 1000.

Important: In order to change a priority level, you must remove the original value and configure a new one.

allow-noauth [invite | re-register| register]

Specifies that access to the S-CSCF service is allowed if authentication fails.
invite: Specifies that access to the S-CSCF service is allowed if authentication fails on INVITE requests only.
re-register: Specifies that access to the S-CSCF service is allowed if authentication fails on RE-REGISTER requests when the request is integrity-protected only.
registration: Specifies that access to the S-CSCF service is allowed if authentication fails on REGISTER requests only.

allow-noipauth [invite | re-register| register]

Specifies that access to the S-CSCF service is allowed if early IMS-based IP authentication fails.
invite: Specifies that access to the S-CSCF service is allowed if early IMS-based IP authentication fails on INVITE requests only.
re-register: Specifies that access to the S-CSCF service is allowed if authentication fails on RE-REGISTER requests when the request is integrity-protected only.
registration: Specifies that access to the S-CSCF service is allowed if early IMS-based IP authentication fails on REGISTER requests only.

allow-unsecure

Specifies that un-secure access is allowed to the S-CSCF service.

aor-auth

Specifies that authentication is based on the AoR when accessing the S-CSCF service.

md5 *value*

Specifies that the MD5 algorithm is used as the authentication type for accessing the S-CSCF service. *value* specifies a preference - the lower the value, the higher the preference. *value* must be an integer from 1 to 1000.

Important: In order to change a priority level, you must remove the original value and configure a new one.

no authentication { aka-v1 | allow-noauth [invite | re-register| register] | allow-noipauth [invite | re-register| register] | allow-unsecure | aor-auth | md5 }

Disables the specified authentication method for the S-CSCF service.

Usage

Use this command to configure the authentication method used by the S-CSCF service.

Important: The S-CSCF supports multiple authorization schemes, but this requires disabling all authorization configured in the S-CSCF service so that it will send "Unknown" in the Sip-Authorization-Scheme AVP. This allows the HSS to dictate authorization. The following commands disable all authorization configured in the S-CSCF service to allow HSS to control authorization:

```
authentication allow-noipauth

allow rfc3261-ua-interworking

no authentication aka-v1

no authentication md5
```

Example

The following command configures the authentication method used by the S-CSCF service to MD5 with a preference of *3*:

```
authentication md5 3
```

diversion-info

Enabling this command prompts the service to add a diversion header (draft-levy-sip-diversion-08) when the call is diverted to a different endpoint due to a call feature. By default, diversion-info is disabled.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
[ default | no ] diversion-info
```

default | no

The service will not add a diversion header.

Usage

Use this command to enable the service to add a diversion header to call setup packets when calls are diverted due to the application of call features.

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

ims-restoration

Enables/disables IMS restoration procedures. This feature is disabled by default.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
[ default | no ] ims-restoration
```

default | no

Disables IMS restoration procedures on the S-CSCF service.

Usage

Use this command to enable IMS REGISTER and INVITE restoration procedures defined in 3GPP TS 23.820.

interrogating-cscf-role

Enables the function to also perform as an Interrogating-CSCF.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

```
[ no ] interrogating-cscf-role
```

no

Disables the Interrogating-CSCF role in this function.

Usage

Use this command to enable the S-CSCF to also perform as an Interrogating-CSCF.

local-call-features

Enables/disables local call features. This command is disabled by default.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

```
[ default | no ] local-call-features
```

default | no

Disables local call features for this S-CSCF.

Usage

Use this command to enable local call features.

network-id

Configures the Network Identifier.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

network-id *id*

[no] network-id

id

The Network Identifier of the entity.
id must be from 1 to 79 alpha and/or numeric characters in length.

no network-id

Removes the configured Network Identifier of the entity.

Usage

The Network Identifier is used to compare with the P-Visited-Network-ID header received from P-CSCF to decide home or roaming subscriber at S-CSCF service.

Example

Sets the Network Identifier to *pcscf01.company.com:*

network-id *pcscf01.company.com*

policy

Configures the policy for Served User Routing in this S-CSCF service.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

[default | no] policy allow p-served-user-routing

`allow p-served-user-routing`

Enables Served User Routing functionality for this S-CSCF.

`default | no`

Disables Served User Routing functionality for this S-CSCF.

Usage

Use this command to enable/disable the policy for Served User Routing.

Example

The following command enables Served User Routing on this service:

policy allow p-served-user-routing

The following command disables Served User Routing on this service:

no policy allow p-served-user-routing

registration

Configures a registration lifetime for all subscribers to the service.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

registration lifetime { default *sec* **| max** *sec* **| min** *sec* **}**

default registration lifetime

{ max *sec* **|** min *sec* **|** default *sec* **}**

max *sec*: Specifies the maximum amount of time that a registration can exist on the system. *sec* must be an integer from 60 to 2147483646. Default is 86400. max *sec* must be > or = to min *sec*.
min *sec*: Specifies the minimum amount of time that a registration can exist on the system. *sec* must be an integer from 60 to **max** *sec* -1. Default is 60. min *sec* must be < or = to max *sec*.
default *sec*: Specifies the default amount of time that a registration can exist on the system. *sec* must be an integer from 60 to **max** *sec* -1. Default is 3761. default *sec* must be < or = to max *sec* and > or = to min *sec*.

default registration lifetime

Returns the command to the default settings.

Usage

Use this command to control the amount of time registrations are allowed to exist on this service.
The system responds to registrations in the following manner:
Using default values:

- If a registration with an expiration value lower than the service's minimum (60) is received, the service will respond with a 423 Interval Too Small message.
- If a registration with an expiration value higher than the service's maximum (2147483646) is received, the service will automatically reduce the expiration value to the default value.
- If a registration is received missing the "Expires" value, or the value is malformed, the service will automatically respond with 3761 in the 200OK message.

Example

The following command configures the maximum registration lifetime to *43200* (12 hours):

registration lifetime max *43200*

reliable-prov-resp

Enables/disables the reliability of provisional responses feature.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
reliable-prov-resp { mandatory | optional }

no reliable-prov-resp
```

mandatory | optional

mandatory: Both inbound and outbound will request reliability.
optional (default): Reliability is imposed by inbound side. Only if inbound call requests reliability will outbound also request reliability.

no

Disables the reliability of provisional responses feature.

Usage

Use this command to enable/disable the reliability of provisional responses feature.

Example

The following command sets the reliability of provisional responses feature to mandatory:

```
reliable-prov-resp mandatory
```

sifc

Enables Shared Initial Filter Criteria (SiFC) functionality. This command is disabled by default.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
[ default | no ] sifc
```

default | no

Disables shared iFC functionality for this S-CSCF.

Usage

Use this command to configure the S-CSCF to share iFC functionality.
If both the HSS and the S-CSCF support this feature, subsets of iFC may be shared by several service profiles. The HSS downloads the unique identifiers of the shared iFC sets to the S-CSCF. The S-CSCF uses a locally administered database to map the downloaded identifiers onto the shared iFC sets.
If the S-CSCF does not support this feature, the HSS will not download identifiers of shared iFC sets.

sip-header

Enable SIP P-User-Database (PUD) header insertion for the S-CSCF service.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

```
[ no ] sip-header insert p-user-database
```

p-user-database

Inserts PUD header in SIP (REGISTER) message and Invite from I-CSCF to S-CSCF.

no

Disables SIP PUD header insertion for the S-CSCF service.

Usage

Enabling this command allows PUD header insertion in SIP (REGISTER) message and Invite from I-CSCF to S-CSCF.

sip-request

Configures SIP Request-related configuration in this S-CSCF service.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

sip-request re-route { **max-attempts** *attempts* | **response-code** *code* }

default sip-request re-route max-attempts

no sip-request re-route response-code *code*

re-route

Specify SIP Request re-route related configuration.

max-attempts *attempts*

Specifies the maximum number of re-route attempts that a S-CSCF should allow for a given call before passing the negative response upstream.
attempts must be an integer from 1 to 10.
Default: 2

response-code *code*

Specifies the list of Response codes that will be considered as re-routable responses to a call attempt.
code must be a three-digit integer from 400 to 699.

Important: You may configure a maximum of five response code values per S-CSCF service.

default sip-request re-route max-attempts

Specifies a maximum number of two re-route attempts that a S-CSCF should allow for a given call before passing the negative response upstream.

no sip-request re-route response-code *code*

Disables the specified Response code.

Usage

Use this command to configure:

- list of Response codes that will be considered as re-routable responses to a call attempt.
- the maximum number of re-route attempts that a S-CSCF should allow for a given call before passing the negative response upstream.

Example

The following command configures the maximum number of re-route attempts to *5*:

```
sip-request re-route max-attempts 5
```

tas

Configures the S-CSCF to perform Telephony Application Server (TAS) functions.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

```
[ default | no ] tas
```

default | no

Disables the TAS feature for this S-CSCF.

Usage

Use this command to configure the S-CSCF to perform TAS functions.

tas-service

Identifies the name of the service configured on the system performing Telephony Application Server (TAS) functions.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

tas-service *name*

no tas-service

name

Specifies the name of the service configured on the system performing TAS functions. *name* must be from 1 to 63 alpha and/or numeric characters and be an existing service.

no

Removes the TAS name from the S-CSCF configuration.

Usage

Use this command to identify the name of the service configured on the system performing TAS functions

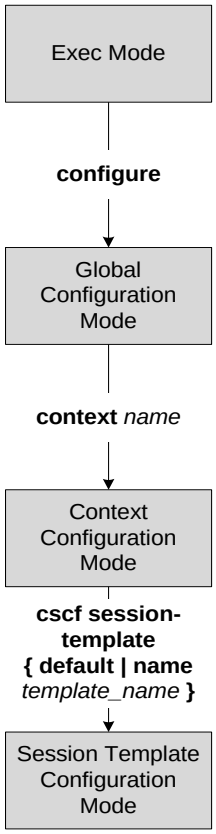
Example

The following command identifies the TAS service name as *scscf3*:

tas-service *scscf3*

Chapter 69
CSCF Session Template Configuration Mode Commands

The CSCF Session Template Configuration Mode is used to classify users and/or domains (AoRs) within the system.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

inbound-cscf-acl

Configures the ACL to use for inbound sessions using this template.

Product

SCM

Privilege

Administrator

Syntax

inbound-cscf-acl { default | name *acl_name* **}**

no inbound-cscf-acl name *acl_name*

default | name *acl_name*

default: Specifies that the default ACL should be used for inbound sessions using this template.
name *acl_name*: Specifies an existing ACL to use for inbound sessions using this template. *acl_name* must be the name of an existing ACL.

no inbound-cscf-acl name *acl_name*

Removes the ACL from this template.

Usage

Use this command to identify an ACL to use on inbound sessions using this template.

Example

The following command sets the inbound ACL for this template to an ACL named *acl_in22*:

inbound-cscf-acl name *acl_in22*

outbound-cscf-acl

Configures the ACL to use for outbound sessions using this template.

Product

SCM

Privilege

Administrator

Syntax

outbound-cscf-acl { default | name *acl_name* **}**

no outbound-cscf-acl name *acl_name*

default | name *acl_name*

default: Specifies that the default ACL should be used for outbound sessions using this template.
name *acl_name*: Specifies an existing ACL to use for outbound sessions using this template. *acl_name* must be the name of an existing ACL.

no outbound-cscf-acl name *acl_name*

Removes the ACL from this template.

Usage

Use this command to identify an ACL to use on outbound sessions using this template.

Example

The following command sets the outbound ACL for this template to an ACL named *acl_out22*:

outbound-cscf-acl name *acl_out22*

policy-profile

Configures an AoR policy group to be used for sessions using this template.

Product

SCM

Privilege

Administrator

Syntax

policy-profile { default | name *profile_name* **}**

no policy-profile name *profile_name*

default | name *profile_name*

default: Specifies that the default policy group will be used for sessions using this template.
name *profile_name*: Specifies an existing policy group. *profile_name* must be an existing CSCF policy group.

no policy-profile name *profile_name*

Removes the policy group from the template.

Usage

Use this command to specify a policy group for the template.

Example

The following command specifies that a policy group called *aor_grp1* will be used for sessions using this template:

policy-profile name *aor_grp1*

route-list

Configures a route group to be used for sessions using this template.

Product

SCM

Privilege

Administrator

Syntax

route-list { default | name *group_name* **}**

no route-list name *group_name*

default | name *group_name*

default: Specifies that the default route group will be used for sessions using this template.
name *group_name*: Specifies an existing route group. *group_name* must be an existing peer server group.

no route-list name *group_name*

Removes the route group from this template.

Usage

Use this command to specify a route group for the template.

Example

The following command specifies an accounting server group called *route_grp2* that will be used for sessions using this template:

route-list name *route_grp2*

translation-list

Configures a translation list to be used for sessions using this template.

Product

SCM

Privilege

Administrator

Syntax

translation-list { default | name *list_name* **}**

no translation-list name *list_name*

default | name *list_name*

default: Specifies that the default translation list will be used for sessions using this template.
name *list_name*: Specifies an existing translation list. *list_name* must be an existing translation list.

no translation-list name *list_name*

Removes the translation list from this template.

Usage

Use this command to specify a translation list for the template.

Example

The following command specifies a translation list called *trans_list6*:

translation-list name *trans_list6*

urn-service-list

Configures an URN service list to be used for sessions using this template.

Product

SCM

Privilege

Administrator

Syntax

urn-service-list { default | name *list_name* **}**

no urn-service-list name *list_name*

default | name *list_name*

default: Specifies that the default URN service list will be used for sessions using this template.
name *list_name*: Specifies an existing URN service list name. *list_name* must be from 1 to 79 alpha and/or numeric characters and be an existing URN service list.

no urn-service-list name *list_name*

Removes the service list from this template.

Usage

Use this command to specify a URN service list for this template. URN service lists are configured in the URN Service List Configuration Mode.

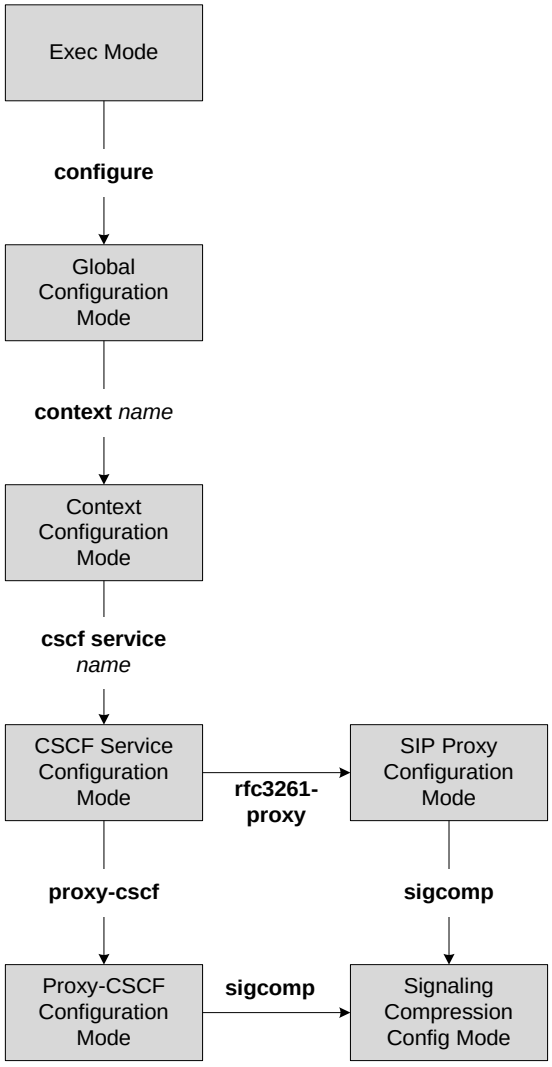
Example

The following command specifies that a URN service list named *urn_list5* will be used for sessions using this template:

urn-service-list name *urn_list5*

Chapter 70
CSCF Signalling Compression Configuration Mode Commands

The CSCF Signalling Compression Configuration Mode is used to set memory allocation parameters in support of SIP signalling compression. More information regarding signalling compression refer to the IETF RFC 3320 “Signaling Compression (SigComp)”.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

compression-mode

Configures the dynamic compression mode to be used while sending a SigComp message. Simple dynamic mode is the default.

Product

SCM

Privilege

Administrator

Syntax

```
compression-mode { multiple-dynamic | simple-dynamic | static | update-dynamic }

default compression-mode
```

multiple-dynamic | simple-dynamic | static | update-dynamic

Default: simple-dynamic
multiple-dynamic: A maximum of four dynamic states will be created per compartment. The dynamic states are updated for each message by deleting the oldest dynamic state and creating the new one. The dynamic states will be updated in FIFO (First In, First Out) order.
simple-dynamic: Only one dynamic state will be created per compartment. The same state will be used for compression.
static: No dynamic states will be created. Only static dictionary will be used for compression.
update-dynamic: Only one dynamic state will be created per compartment, but the dynamic state will be updated for every new message.

default compression-mode

Returns the dynamic compression mode to simple dynamic.

Usage

Use this command to configure the dynamic compression mode to be used.

Example

The following command sets the compression mode to multiple dynamic:

```
compression-mode multiple-dynamic
```

The following command completely disables the creation of dynamic states for compression:

```
compression-mode static
```

decompression-memory-size

Sets the amount of memory available for decompressing one SigComp message. A portion of the allocated memory is used to buffer the message before it is decompressed. The memory is allocated for each SigComp message and is reclaimed once decompression is completed.

Product

SCM

Privilege

Administrator

Syntax

```
decompression-memory-size { 128k | 16k | 32k | 64k | 8k }

default decompression-memory-size
```

128k | 16k | 32k | 64k | 8k

Default: **8k**
Specifies the amount of memory (in kilobytes) to allocate for decompressing one SigComp message.

default

Returns the command to the default settings.

Usage

Use this command to set the memory size used to decompress a single SigComp message.

Example

The following command sets the memory size for decompressing SigComp messages to 16k:

```
decompression-memory-size 16k
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

state-memory-size

Sets the memory allocated to a compartment for the creation of state. Compartments are application-specific groupings of messages that relate to a peer endpoint. The system allocates memory per compartment. The memory is reclaimed when the system determines that the compartment is no longer required.

Product

SCM

Privilege

Administrator

Syntax

```
state-memory-size { 4k | 8k }

default state-memory-size
```

`4k | 8k`

Default: **`4k`**
Specifies the amount of memory to allocate to a compartment for the creation of state.

`default`

Returns the command to the default settings.

Usage

Use this command to specify a memory size allocated to message groupings for the creation of state.

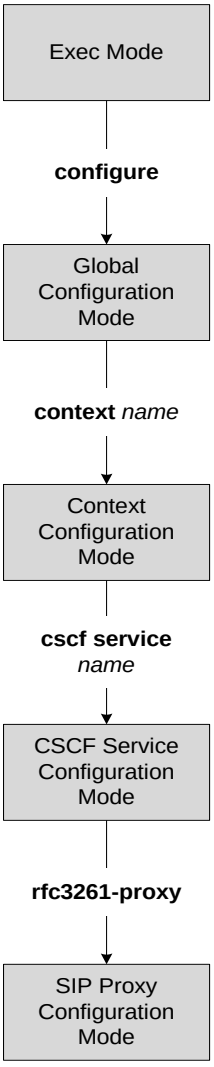
Example

The following command sets the state memory size to **`8k`**:

```
state-memory-size 8k
```

Chapter 71
CSCF SIP Proxy Configuration Mode Commands

The SIP Proxy Configuration Mode is used to set various commands supporting the role of the CSCF service as a RFC3261-compliant SIP proxy server.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

alias-indication

Enables/disables alias indication functionality, a collaborative information exchange between the CSCF and HSS. This command is disabled by default.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
[ default | no ] alias-indication
```

default | no

Disables alias indication functionality between the CSCF and HSS.

Usage

Use this command to display alias information from the HSS.
If both the HSS and the CSCF support this feature, Alias Group IDs will be displayed in the output of the **show subscribers cscf-only full** command.

as-call

Enabling this command causes request-URIs in INVITE messages to be updated with the result of the translation before being passed to an Application Server. This command is disabled by default.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
[ default | no ] as-call invite-request-uri update
```

default | no

The translation result is ignored.

Usage

Use this command to update the request-URI in INVITE messages with the result of the translation before passing it to an AS.

authentication

Configures the authentication method used by the CSCF service.

Product

SCM (SIP Proxy)

Privilege

Administrator

Syntax

```
authentication { aka-v1 value | allow-noauth [ invite | re-register| register ]
| allow-noipauth [ invite | re-register| register ] | allow-unsecure | aor-auth
| md5 value }

no authentication { aka-v1 | allow-noauth [ invite | re-register| register ] |
allow-noipauth [ invite | re-register| register ] | allow-unsecure | aor-auth |
md5 }
```

aka-v1 *value*

Specifies that AKA-v1 algorithm is used as the authentication type when accessing the CSCF service. *value* specifies a preference - the lower the value, the higher the preference. *value* must be an integer from 1 to 1000.

Important: In order to change a priority level, you must remove the original value and configure a new one.

allow-noauth [invite | re-register| register]

Specifies that access to the CSCF service is allowed if authentication fails.
invite: Specifies that access to the CSCF service is allowed if authentication fails on INVITE requests only.
re-register: Specifies that access to the CSCF service is allowed if authentication fails on RE-REGISTER requests when the request is integrity-protected only.
registration: Specifies that access to the CSCF service is allowed if authentication fails on REGISTER requests only.

allow-noipauth [invite | re-register| register]

Specifies that access to the CSCF service is allowed if early IMS-based IP authentication fails.
invite: Specifies that access to the CSCF service is allowed if early IMS-based IP authentication fails on INVITE requests only.
re-register: Specifies that access to the CSCF service is allowed if authentication fails on RE-REGISTER requests when the request is integrity-protected only.
registration: Specifies that access to the CSCF service is allowed if early IMS-based IP authentication fails on REGISTER requests only.

allow-unsecure

Specifies that un-secure access is allowed to the CSCF service.

aor-auth

Specifies that authentication is based on the AoR when accessing the CSCF service.

md5 *value*

Specifies that the MD5 algorithm is used as the authentication type for accessing the CSCF service. *value* specifies a preference - the lower the value, the higher the preference. *value* must be an integer from 1 to 1000.

Important: In order to change a priority level, you must remove the original value and configure a new one.

no authentication { aka-v1 | allow-noauth [invite | re-register| register] | allow-noipauth [invite | re-register| register] | allow-unsecure | aor-auth | md5 }

Disables the specified authentication method for the CSCF service.

Usage

Use this command to configure the authentication method used by the CSCF service.

Important: The S-CSCF supports multiple authorization schemes, but this requires disabling all authorization configured in the S-CSCF service so that it will send "Unknown" in the Sip-Authorization-Scheme AVP. This allows the HSS to dictate authorization. The following commands disable all authorization configured in the S-CSCF service to allow HSS to control authorization:

```
authentication allow-noipauth

allow rfc3261-ua-interworking

no authentication aka-v1

no authentication md5
```

Example

The following command configures the authentication method used by the CSCF service to MD5 with a preference of *3*:

```
authentication md5 3
```

diversion-info

Enabling this command prompts the service to add a diversion header (draft-levy-sip-diversion-08) when the call is diverted to a different endpoint due to a call feature. By default diversion-info is disabled.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
[ default | no ] diversion-info
```

default | no

The service will not add a diversion header.

Usage

Use this command to enable the service to add a diversion header to call setup packets when calls are diverted due to the application of call features.

emergency-sessions

Configures the function to allow anonymous and/or non-emergency registered subscribers to initiate emergency sessions. The addition of 3GPP IM CN XML body in 380 response messages can also be allowed.

Product

SCM (SIP Proxy)

Privilege

Administrator

Syntax

```
emergency-sessions [ 3gpp-ims-xml-body | anonymous [ 3gpp-ims-xml-body ] [ non-emergency-registered ] | non-emergency-registered [ 3gpp-ims-xml-body ] ]

[ default | no ] emergency-sessions
```

3gpp-ims-xml-body

Allow 3GPP IM CN XML body to be added in 380 response messages.

anonymous

Allow anonymous subscribers to initiate emergency sessions.

non-emergency-registered

Allow non-emergency registered subscribers to initiate emergency sessions.

default

Specifies that anonymous and non-emergency registered emergency sessions are allowed and 3GPP IM CN XML body is added in 380 response messages.

no

Disallows anonymous and/or non-emergency registered emergency sessions and does not add 3GPP IM CN XML body in 380 response messages.

Usage

Use this command to configure the function to allow anonymous and/or non-emergency registered subscribers to initiate emergency sessions. The addition of 3GPP IM CN XML body in 380 response messages can also be allowed.

Example

The following command configures the function to allow only non-emergency registered subscribers to initiate emergency sessions:

```
emergency-sessions non-emergency-registered
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

ims-restoration

Enables/disables IMS restoration procedures. This feature is disabled by default.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
[ default | no ] ims-restoration
```

default | no

Disables IMS restoration procedures on the CSCF service.

Usage

Use this command to enable IMS REGISTER and INVITE restoration procedures defined in 3GPP TS 23.820.

registration

Configures a registration lifetime for all subscribers to the service.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

registration lifetime { default *sec* **| max** *sec* **| min** *sec* **}**

default registration lifetime

{ max *sec* **| min** *sec* **| default** *sec* **}**

default *sec*: Specifies the default amount of time that a registration can exist on the system. *sec* must be an integer from 60 to **max** *sec* -1. Default is 3761. default *sec* must be < or = to max *sec* and > or = to min *sec*.
max *sec*: Specifies the maximum amount of time that a registration can exist on the system. *sec* must be an integer from 60 to 2147483646. Default is 86400. max *sec* must be > or = to min *sec*.
min *sec*: Specifies the minimum amount of time that a registration can exist on the system. *sec* must be an integer from 60 to **max** *sec* -1. Default is 60. min *sec* must be < or = to max *sec*.

default registration lifetime

Returns the command to the default settings.

Usage

Use this command to control the amount of time registrations are allowed to exist on this service.
The system responds to registrations in the following manner:
Using default values:

- If a registration with an expiration value lower than the service's minimum (60) is received, the service will respond with a 423 Interval Too Small message.
- If a registration with an expiration value higher than the service's maximum (2147483646) is received, the service will automatically reduce the expiration value to the default value.
- If a registration is received missing the "Expires" value, or the value is malformed, the service will automatically respond with 3761 in the 200OK message.

Example

The following command configures the maximum registration lifetime to *43200* (12 hours):

registration lifetime max *43200*

reliable-prov-resp

Enables/disables the reliability of provisional responses feature.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
reliable-prov-resp { mandatory | optional }

no reliable-prov-resp
```

mandatory | optional

mandatory: Both inbound and outbound will request reliability.
optional (default): Reliability is imposed by inbound side. Only if inbound call requests reliability will outbound also request reliability.

no

Disables the reliability of provisional responses feature.

Usage

Use this command to enable/disable the reliability of provisional responses feature.

Example

The following command sets the reliability of provisional responses feature to mandatory:

```
reliable-prov-resp mandatory
```

The following command disables the reliability of provisional responses feature:

```
no reliable-prov-resp
```

sifc

Enables Shared Initial Filter Criteria (SiFC) functionality. This command is disabled by default.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
[ default | no ] sifc
```

default | no

Disables shared iFC functionality for this SIP Proxy.

Usage

Use this command to configure the SIP Proxy to share iFC functionality.
If both the HSS and the SIP Proxy support this feature, subsets of iFC may be shared by several service profiles. The HSS downloads the unique identifiers of the shared iFC sets to the SIP Proxy. The SIP Proxy uses a locally administered database to map the downloaded identifiers onto the shared iFC sets.
If the SIP Proxy does not support this feature, the HSS will not download identifiers of shared iFC sets.

sigcomp

Enables signaling compression for the SIP Proxy service and enters the Signaling Compression Configuration Mode.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
[ no ] sigcomp
```

no

Disables signaling compression for the CSCF service.

Usage

Use this command to enable signaling compression for the SIP Proxy service and enter the CSCF Signaling Compression Configuration Mode.
Entering this command results in the following prompt:

```
[context_name]hostname(config-sigcomp)#
```

Signaling Compression Configuration Mode commands are defined in the CSCF Signaling Compression Configuration Mode Commands chapter in this guide.

tas

Configures the SIP Proxy to perform Telephony Application Server (TAS) functions.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
[ default | no ] tas
```

default | no

Disables the TAS feature for this SIP Proxy.

Usage

Use this command to configure the SIP Proxy to perform TAS functions.

tas-service

Identifies the name of the service configured on the system performing Telephony Application Server (TAS) functions.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

tas-service *name*

[default | no] tas-service

name

Specifies the name of the service configured on the system performing TAS functions. *name* must be from 1 to 63 alpha and/or numeric characters and be an existing service.

default | no

Removes the TAS name from the SIP Proxy configuration.

Usage

Use this command to identify the name of the service configured on the system performing TAS functions. The ims-sh-service commands are defined in the Context Configuration Mode Commands chapter in this guide.

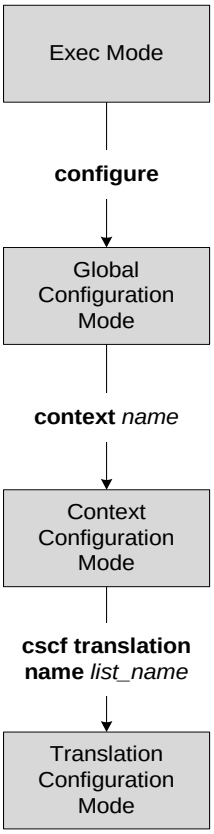
Example

The following command identifies the TAS service name as *scscf3*:

tas-service *scscf3*

Chapter 72
CSCF Translation Configuration Mode Commands

The CSCF Translation Configuration Mode is used to configure session re-addressing within the system.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

after

Places the CSCF translation entry at the bottom or end of the translation list. Use this command in conjunction with the **uri-readdress** command.

Product

SCM

Privilege

Administrator

Syntax

after

Usage

Add this command before the **uri-readdress** command to place the entry at the end of the translation list.

before

Places the CSCF translation entry at the top or beginning of the translation list. Use this command in conjunction with the **uri-readdress** command.

Product

SCM

Privilege

Administrator

Syntax

before

Usage

Add this command before the **uri-readdress** command to place the entry at the beginning of the translation list.

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

uri-readdress

Configures readdress criteria for URI translations.

Product

SCM

Privilege

Administrator

Syntax

uri-readdress type *trans_type* **[log] { base-criteria** *criteria* **} [filter-criteria1** *criteria* **] [filter-criteria2** *criteria* **]**

no uri-readdress type *trans_type* **{ base-criteria** *criteria* **} [filter-criteria1** *criteria* **] [filter-criteria2** *criteria* **]**

---

type *trans_type*

Specifies that the translation list (*trans_type*) entry is to be identified as one of the following:
blocking-cid: Identifies the translation list entry type as “call ID blocking”.
cancel-blocking-cid: Identifies the translation list entry type as “cancel call ID blocking”.
cancel-cid: Identifies the translation list entry type as “cancel call ID display”.
cancel-cw: Identifies the translation list entry type as “cancel call-waiting”.
cfbl-off: Identifies the translation list entry type as “call forward busy line off”.
cfbl-on: Identifies the translation list entry type as “call forward busy line on”.
cfna-off: Identifies the translation list entry type as “call forward no answer off”.
cfna-on: Identifies the translation list entry type as “call forward no answer on”.
cfu-off: Identifies the translation list entry type as “call forward unconditional off”.
cfu-on: Identifies the translation list entry type as “call forward unconditional on”.
cid: Identifies the translation list entry type as “call ID display”.
cw-off: Identifies the translation list entry type as “call-waiting off”.
cw-on: Identifies the translation list entry type as “call-waiting on”.
directory-assistance: Identifies the translation list entry type as “directory assistance”.
emergency: Identifies the translation list entry type as “emergency”.
international: Identifies the translation list entry type as “international”.
local: Identifies the translation list entry type as “local”.
long-distance: Identifies the translation list entry type as “long-distance”.
none: Identifies the translation list entry type as “any”.
operator-assistance: Identifies the translation list entry type as “operator assistance”.
premium-service: Identifies the translation list entry type as “premium service”.
service: Identifies the translation list entry type as “special service”.
tollfree: Identifies the translation list entry type as “toll free”.

---

log

Enables logging for CSCF sessions meeting the readdress criteria for URI translations.

---

base-criteria *criteria*

Specifies the base criteria that packets will be compared against. The following criteria is supported:

- **any**: Filters all CSCF sessions.

- **destination aor** *aor*: Filters sessions based on the destination AoR. *aor* must be an existing AoR from 1 to 79 characters in length.

Important: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

- **plmn-id mcc** *mcc_code* **mnc** *mnc_code*: Filters sessions based on the mobile country and network codes. *mcc_code* must be a three-digit integer from 200 to 999. *mnc_code* must be either a two or three-digit integer from 00 to 999 or **any** (any MNC code).
- **source address** *ip_address*: Filters sessions based on source IP address. *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
- **source aor** *aor*: Filters sessions based on the source AoR. *aor* must be an existing AoR from 1 to 79 characters in length.

filter-criteria1 *criteria*

Specifies the filter criteria that packets that have passed the base criteria will be compared against. The following criteria is supported:

- **any**: Filters all CSCF sessions.
- **destination aor** *aor*: Filters sessions based on the destination AoR. *aor* must be an existing AoR from 1 to 79 characters in length.

Important: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

- **plmn-id mcc** *mcc_code* **mnc** *mnc_code*: Filters sessions based on the mobile country and network codes. *mcc_code* must be a three-digit integer from 200 to 999. *mnc_code* must be either a two or three-digit integer from 00 to 999 or **any** (any MNC code).
- **source address** *ip_address*: Filters sessions based on source IP address. *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
- **source aor** *aor*: Filters sessions based on the source AoR. *aor* must be an existing AoR from 1 to 79 characters in length.

filter-criteria2 *criteria*

Specifies the filter criteria that packets that have passed the base criteria and filter criteria1 will be compared against. The following criteria is supported:

- **any**: Filters all CSCF sessions.
- **destination aor** *aor*: Filters sessions based on the destination AoR. *aor* must be an existing AoR from 1 to 79 characters in length.

Important: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

- **plmn-id mcc** *mcc_code* **mnc** *mnc_code*: Filters sessions based on the mobile country and network codes. *mcc_code* must be a three-digit integer from 200 to 999. *mnc_code* must be either a two or three-digit integer from 00 to 999 or **any** (any MNC code).

- **source address** *ip_address*: Filters sessions based on source IP address. *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
- **source aor** *aor*: Filters sessions based on the source AoR. *aor* must be an existing AoR from 1 to 79 characters in length.

no uri-readdress type *trans_type* **{ base-criteria** *criteria* **} [filter-criteria1** *criteria* **] [filter-criteria2** *criteria* **]**

Remove the readdress configuration.

Usage

Use this command to readdress URIs based on specified criteria and enters the URI Readdress Configuration Mode. Readdressing can be used for:

- **Mobility**: When roaming in a visited domain.
- **Service Aliases**: Resolving well-known addresses via SIP-AS.
- **Number Translation**: Adding or deleting prefixes such as +1 to/from PSTN numbers.
- **Voice VPNs**: Using inter-office extensions to dial remote offices.

Entering this command results in the following prompt:
[*context_name*]*hostname*(config-uri-readdress)#
URI readdress commands are defined in the CSCF URI Readdress Configuration Mode Commands chapter of this reference.

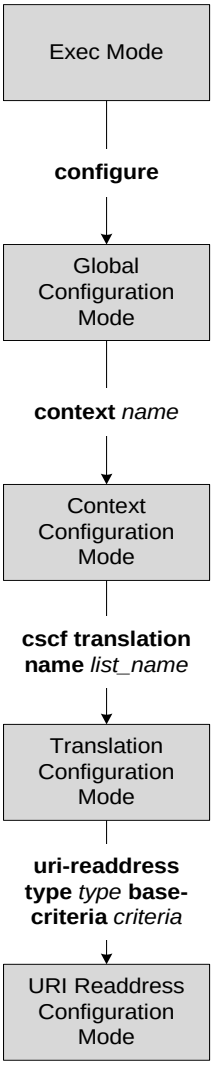
Example

The following command readdresses sessions to a domain named *service.com*, filters sessions with a base criteria of the source address (*1.2.3.4*) and a filter criteria of the destination AoR (*$.@test.com*):

```
uri-readdress type service base-criteria source address 1.2.3.4 filter-
criteria1 destination aor $.@test.com
```

Chapter 73
CSCF URI Readdress Configuration Mode Commands

The URI Readdress Configuration Mode is used to set URI translations.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

action

Adjusts a target address to route sessions to appropriate locations.

Product

SCM

Privilege

Administrator, Config-administrator

Syntax

action { add*string***| delete***num_chars***| modify***string***} position***num***target { destination | source } { aor | domain | user }**

no action

---

add *string* **| delete** *num_chars* **| modify** *string*

add *string*: Adds a specified string to a location indicated by the **position** keyword for the targeted source or destination address component (aor, domain, or user). *string* must be from 1 to 79 alpha and/or numeric characters.
delete *num_chars*: Deletes a number of characters starting from a location specified by the **position** keyword for the targeted source or destination address component (aor, domain, or user). *num_chars* must be an integer from 1 to 79.
modify *string*: Modifies a specified string in a location starting with the **position** keyword for the targeted source or destination address component (aor, domain, or user). The number of characters in the *string* variable will replace the same number in the address. *string* must be from 1 to 79 alpha and/or numeric characters.

---

position *num*

Specifies the position in the target string where the action is to occur. *num* must be an integer from 1 to 79.

---

target { destination | source }

Species that the action is to occur within the source or destination address.

---

aor | domain | user

aor: Specifies that the action is applied to AoRs in the targeted source or destination address.
domain: Specifies that the action is applied to domains in the targeted source or destination address.
user: Specifies that the action is applied to users in the targeted source or destination address.

---

no

Disables target address to route sessions.

Usage

Use this command to manipulate SIP packets matching the criteria in the uri-readdress command.

Example

The following command prepends a "+1" to a destination AoR:

```
action add +1 position 1 target destination aor
```

The following command removes the first two characters from the destination AoR:

```
action delete 2 position 1 target destination aor
```

The following command replaces characters 2 through 4 with the characters "abc" in the destination AoR:

```
action modify abc position 2 target destination aor
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

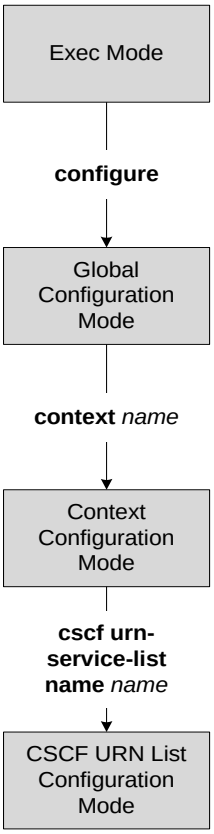
exit

Usage

Return to the previous mode.

Chapter 74
CSCF URN List Configuration Mode Commands

The CSCF URN List Configuration Mode is used to map URNs to URIs for emergency and local call services.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

cscf-urn-service-mapping

Adds an entry to the service URN mapping table that maps uniform resource names (URNs) to URIs in order to direct specific service-oriented identifiers to the proper location in a network. The table is used after CSCF translation if the result is a local service.

Product

SCM

Privilege

Administrator

Syntax

[no] cscf-urn-service-mapping urn *urn* **uri** *uri*

no

Removes an entry from the service URN mapping table.

urn *urn*

Specifies the URN to be routed via a URL to the appropriate destination. *urn* must be from 1 to 79 alpha and/or numeric characters.

uri *uri*

Specifies the URI used to route the URN to the appropriate location. *uri* must be from 1 to 79 alpha and/or numeric characters.

Usage

Use this command to add an entry to the service URN mapping table that routes a translated URN to a URI for local services.

Important: Service URN mapping tables are limited to 30 URN to URI mapping entries.

Example

The following command map URN *business* to URI *corp@123.45.678.9:5020* and adds it to the service URN mapping table:

cscf-urn-service-mapping urn *business* **uri** *corp@123.45.678.9:5020*

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

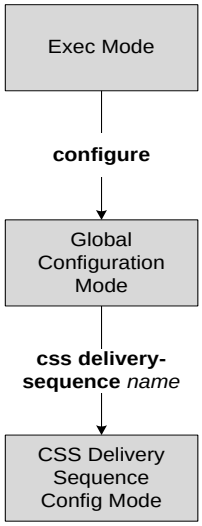
Usage

Return to the previous mode.

Chapter 75
CSS Delivery Sequence Configuration Mode Commands

The CSS Delivery Sequence Configuration Mode is used to configure the order in which traffic is delivered to Content Service Steering (CSS) services and their associated content servers.

Important: This is a restricted configuration mode. In StarOS 9.0 and later, this configuration mode is deprecated.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

This is a restricted command. In StarOS 9.0 and later, this command is deprecated.

exit

This is a restricted command. In StarOS 9.0 and later, this command is deprecated.

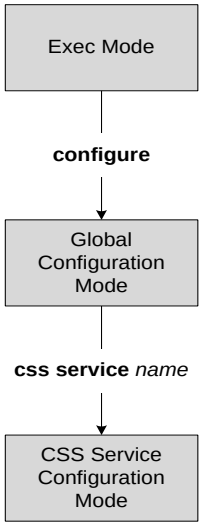
redirect service (any)

This is a restricted command. In StarOS 9.0 and later, this command is deprecated.

Chapter 76
CSS Service Configuration Mode Commands

The CSS Service Configuration Mode is used to configure properties for Content Service Steering (CSS) services. A CSS service binds a set of delivery interfaces to a service name and specifies a recovery mechanism.

Important: This is a restricted configuration mode. In StarOS 9.0 and later, this configuration mode is deprecated.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

This is a restricted command. In StarOS 9.0 and later, this command is deprecated.

exit

This is a restricted command. In StarOS 9.0 and later, this command is deprecated.

recovery

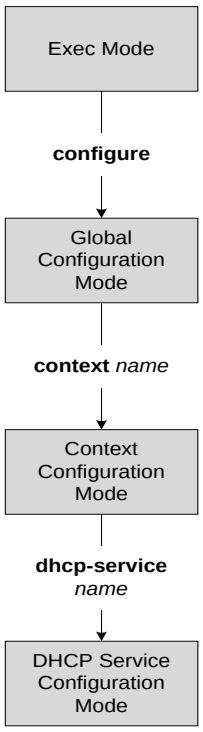
This is a restricted command. In StarOS 9.0 and later, this command is deprecated.

server-interface

This is a restricted command. In StarOS 9.0 and later, this command is deprecated.

Chapter 77
DHCP Service Configuration Mode Commands

The Dynamic Host Control Protocol (DHCP) Configuration Mode is used to create and manage DHCP service instances for the current context.



bind

This command binds the DHCP service to a logical IP interface facilitating the system's connection to the DHCP server. This command also configures traffic from the specified DHCP service bind address to use the specified Multiple Protocol Label Switching (MPLS) labels.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
bind address ip_address [ nexthop-forwarding-address nexthop_ip_address [ mpls-
label input in_mpls_label_value output out_mpls_label_value1 [
out_mpls_label_value2 ]]]

no bind address ip_address
```

no

Removes a previously configured binding.

ip_address

Specifies the IP address of an interface in the current context through which the communication with the DHCP server occurs. *ip_address* must be expressed in dotted decimal notation.

nexthop-forwarding-address *nexthop_ip_address*

Specifies the next hop gateway address for in MPLS network to which the packets with MPLS labels will be forwarded.
nexthop_ip_address must be expressed in IPv4/IPv6 notation.

mpls-label input *in_mpls_label_value*

This keywork specifies the MPLS label to identify inbound traffic destined for the configured DHCP service bind address *ip_address*.
in_mpls_label_value is the MPLS label that will identify inbound traffic destined for the configured DHCP service and must be an integer from 16 through 1048575.

Important: This keyword is license-enabled and available with valid MPLS feature license only.

Caution: For DHCP over MPLS feature to work in StarOS 9.0 onward **dhcp ip vrf** command must be configured in DHCP service. Without **dhcp ip vrf** command the DHCP service using MPLS labels will not be started and as a part of DHCP over MPLS configuration in StarOS 9.0 onward this keyword is a critical parameter for the DHCP-Service. Any change in its value will result in DHCP-service restart and clearing of the existing calls.

output *out_mpls_label_value1* **[** *out_mpls_label_value2* **]**

This keyword adds the MPLS label to the outbound traffic sent from the configured DHCP service bind address *ip_address*. The labels *out_mpls_label_value1* and *out_mpls_label_value2* identify the MPLS labels to be added to packets sent from the specified dhcp service bind address. *out_mpls_label_value1* is the inner output label and must be an integer from 16 through 1048575. *out_mpls_label_value2* is the outer output label and must be an integer from 16 through 1048575.

Important: This keyword is license-enabled and available with valid MPLS feature license only.

Usage

Use this command to associate or tie the DHCP service to a specific logical IP address previously configured in the current context and bound to a port. Once bound, the logical IP address or interface is used in the giaddr field of the DHCP packets.
When this command is executed, the DHCP service is started and begins the process of requesting addresses from the DHCP server and storing them in cache memory for allocation to PDP contexts.
This command can also be used to configure MPLS labels for inbound and outbound traffic through this DHCP address.
Only one interface can be bound to a service.
For DHCP over MPLS feature to work in StarOS 9.0 onward **dhcp ip vrf** command must be configured in DHCP service. Without **dhcp ip vrf** command the DHCP service using MPLS labels will not be started.

Caution: As a part of DHCP over MPLS configuration **mpls-label input** keyword in **bind address** command is also a critical parameter for the DHCP-Service. Any change in its value will result in DHCP-service restart and clearing of the existing calls.

Example

The following command binds the DHCP service to the interface with an IP address of 192.168.1.210:

```
bind address 192.168.1.210
```

default

Restores DHCP service parameters to their factory default settings.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
default { dhcp { deadtime | detect-dead-server { consecutive-failures } |
server-selection-algorithm } | lease-duration | max-retransmissions |
retransmission-timeout | T1-threshold | T2-threshold }
```

dhcp { deadtime | detect-dead-server { consecutive-failures } | server-selection-algorithm }

Restores the following DHCP parameters to their respective default settings:

- **deadtime** : Default 10 minutes
- **detect-dead-server** { **consecutive-failures** } : Default 5
- **server-selection-algorithm** : Default First-server

lease-duration

Restores the lease-duration parameter to its default setting of 86400 seconds.

max-retransmissions

Restores the max-retransmissions parameter to its default setting of 5.

retransmission-timeout

Restores the retransmission-timeout parameter to its default setting of 3000 milli-seconds.

T1-threshold

Restores the T1-threshold parameter to its default setting of 50%.

T2-threshold

Restores the T2-threshold parameter to its default setting of 88%.

Usage

After system parameters have been modified, this command is used to set/restore specific parameters to their default values.

Example

The following command restores the dhcp deadtime parameter to its default setting of 10 minutes:

```
default dhcp deadtime
```

dhcp client-identifier

This command configures behavior relating to inclusion of client identifier DHCP option in DHCP messages.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
dhcp client-identifier { msisdn | none }

default dhcp client-identifier
```

default

Sets the behavior of DHCP client identifier to default; i.e. not to include client identifier option in any DHCP message.

msisdn

Default: disabled
Specifies that subscriber's MSISDN be included in client-identifier option of the relevant DHCP messages.

Important: This keyword is GGSN license controlled.

none

Default: enabled
Specifies that DHCP client-identifier option would not be included in any DHCP messages. This is the default behavior.

Usage

Use this command to configure behavior relating to inclusion or exclusion of DHCP client identifier option from DHCP messages.

Example

The following command specifies that DHCP client-identifier option be excluded from DHCP messages:

```
dhcp client-identifier none
```

dhcp deadtime

Configures the amount of time that the system waits prior to re-communicating with a DHCP server that was previously marked as down.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
dhcp deadtime max_time
```

max_time

Default: 10 minutes
Specifies the maximum amount of time to wait before communicating with DHCP server that were previously unreachable.
max_time is measured in minutes and can be configured to any integer value from 1 to 65535.

Usage

If the system is unable to communicate with a configured DHCP server, after a pre-configured number of failures the system marks the server as being down.
This command specifies the amount of time that the system waits prior to attempting to communicate with the downed server.

Important: If all DHCP servers are down, the system will immediately treat all DHCP servers as active, regardless of the deadtime that is specified.

Refer to the **dhcp detect-dead-server** and **max-retransmissions** commands for additional information on the process the system uses to mark a server as down.

Example

The following command configures the system to wait 20 minutes before attempting to re-communicate with a dhcp server that was marked as down:

```
dhcp deadtime 20
```

dhcp detect-dead-server

Configures the number of consecutive communication failures that could occur before the system marks a DHCP server as down.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
dhcp detect-dead-server consecutive-failures max_number
```

consecutive-failures *max_number*

Default: 5
Specifies the number of failures that could occur before marking a DHCP server as down.
max_number could be configured to any integer value from 1 to 1000.

Usage

This command works in conjunction with the *max-retransmissions* parameter to set a limit to the number of communication failures that can occur with a configured DHCP server.
The *max-retransmissions* parameter limits the number of attempts to communicate with a server. Once that limit is reached, the system treats it as a single failure. This parameter limits the number of consecutive failures that can occur before the system marks the server as down and communicate with the server of next highest priority.
If all of the configured servers are down, the system ignores the detect-dead-server configuration and attempt to communicate with highest priority server again.
If the system receives a message from a DHCP server that was previously marked as down, the system immediately treats it as being active.

Example

The following command configures the system to allow 8 consecutive communication failures with a DHCP server before it marks it as down:

dhcp detect-dead-server consecutive-failures *8*

dhcp ip vrf

This command provides the DHCP-over-MPLS support and associates the specific DHCP service with a pre-configured Virtual Routing and Forwarding (VRF) Context instance for virtual routing and forwarding.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
dhcp ip vrf vrf_name

no dhc ip vrf
```

no

Removes/disassociates configured IP Virtual Routing and Forwarding (VRF) context instance.

vrf_name

Specifies the name of a pre-configured VRF context instance to be associated with a DHCP service. *vrf_name* is name of a pre-configured virtual routing and forwarding (VRF) context configured in context configuration mode and associated with the IP Pool used by the DHCP service.

Usage

Use this command to enable the DHCP-over-MPLS support and to associate/disassociate a pre-configured VRF context to a DHCP service for this feature.
By default the VRF is NULL, which means that DHCP service is bound with binding address given by **bind address** command only.
VRF is not a critical parameter for the DHCP Service but bind address is a critical parameter for DHCP Service, and while starting DHCP Service, if this command is configured, then the bind address should be present in that VRF, and If this command is not configured, bind address should be present in the context where DHCP Service is configured.
For DHCP over MPLS feature to work in StarOS 9.0 onward this command must be configured in DHCP service. Without this command the DHCP service using MPLS labels will not be started.

Caution: As a part of this configuration **mpls-label input** keyword in **bind address** command is also a critical parameter for the DHCP-Service. Any change in its value will result in DHCP-service restart and clearing of the existing calls.

Example

Following command associates VRF context instance *dhcp_vrf1* with this DHCP service:

```
dhcp ip vrf dhcp_vrf1
```

dhcp server

Configures DHCP servers with which the DHCP service is to communicate.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
dhcp server ip_address [ priority priority ]
no dhcp server ip_address
```

no

Deletes a previously configured DHCP server.

ip_address

Specifies the IP address of the DHCP server expressed in dotted decimal notation.

priority *priority*

Specifies the priority of the server if multiple servers are configured.
priority can be configured to any integer value from 1 to 1000. 1 is the highest priority.

Usage

Use this command to configure the DHCP server(s) that the system is to communicate with. Multiple servers can be configured each with their own priority. Up to 20 DHCP servers can be configured.
All DHCP messages are sent/received on UDP port 67.

Important: If a server is removed, all calls having an IP address allocated from the server will be released.

Example

The following command configures a DHCP server with an IP address of 192.168.1.200 and a priority of 1:

```
dhcp server 192.168.1.200 priority 1
```

dhcp server selection-algorithm

Specifies the algorithm used to select DHCP servers with which to communicate when multiple servers are configured.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
dhcp server selection-algorithm { first-server | round-robin }
```

first-server

Default: Enabled
Selects the first-server algorithm to be used. This algorithm dictates that the system select the DHCP servers according to their priority starting with the highest priority server. The system communicates with the server of the next highest priority only when the previous server is unreachable.

round-robin

Default: Disabled
Selects the round-robin algorithm to be used. This algorithm dictates that the system communicates with the servers in a circular queue according to the server's configured priority starting with the highest priority server. The next request is communicated with the next highest priority server, and so on until all of the servers have been used. At this point, the system starts from the highest priority server.

Usage

Use this command to determine how configured DHCP servers are utilized by the system.

Example

The following command configures the DHCP service to use the round-robin selection algorithm:

```
dhcp server selection-algorithm round-robin
```

end

Exits the context configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the context configuration mode and returns to the global configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the global configuration mode.

lease-duration

Configures the minimum and maximum allowable lease times that are accepted in responses from DHCP servers.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
lease-duration min min_time max max_time
```

min *min_time*

Default: 600
Specifies the minimum acceptable lease time.
min_time is measured in seconds and can be configured to any integer value from 600 to 3600.

max *max_time*

Default: 86400
Specifies the maximum acceptable lease time.
max_time is measured in seconds and can be configured to any integer value from 10800 to 4294967295.

Usage

To reduce the call setup time, the system requests IP addresses from the DHCP server in blocks rather than on a call-by-call basis. Each address received has a corresponding lease time, or time that it is valid. The values configured by command represent the minimum and maximum times that the system allows and negotiates for the lease(s).
If the DHCP server responds with values that are out of the range specified by the min and max values, the system accumulates warning statistics. Responses that fall below the minimum value are rejected by the system and the system contacts the DHCP server with the next highest priority. Responses that are greater than the maximum value are accepted.
When half of the lease time has expired, the system automatically requests a lease renewal from the DHCP server. This is configured using the **T1-threshold** command.

Example

The following command configures the minimum allowable lease time for the system to be 1000 and the maximum to be 36000:

```
lease-duration min 1000 max 36000
```

max-retransmissions

Configures the maximum number of times that the system attempts to communicate with unresponsive DHCP server before it is considered a failure.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
max-retransmissions max_number
```

max_number

Default: 5
Specifies the maximum number of re-attempts the system tries when no response is received from a DHCP server.
max_number can be configured to any integer value from 1 to 20.

Usage

This command works in conjunction with the *dhcp detect-dead-server* parameter to set a limit to the number of communication failures that can occur with a configured DHCP server.
When the value specified by this parameter is met, a failure is logged. The *dhcp detect-dead-server* parameter specifies the number of consecutive failures that could occur before the server is marked as down.
In addition, the **retransmission-timeout** command controls the amount of time between re-tries.

Example

The following command configures the maximum number of times the system re-attempts communication with a DHCP server that is unresponsive to 5:

```
max-retransmissions 5
```

retransmission-timeout

Configures the amount of time that must pass with no response before the system re-attempts to communicate with the DHCP server.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
retransmission-timeout time
```

time

Default: 10000
Specifies the time that the system waits before retrying to communicate with the DHCP server.
time is measured in milliseconds and can be configured to any integer value from 100 to 20000.

Usage

This command works in conjunction with the **max-retransmissions** command to establish a limit on the number of times that communication with a DHCP server is attempted before a failure is logged. This parameter specifies the time between retries.

Example

The following command configures a retry timeout of 1000 milliseconds:

```
retransmission-timeout 1000
```

T1-threshold

Configures the DHCP T1 timer as a percentage of the allocated IP address lease.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
T1-threshold percentage
```

percentage

Default: 50%
The percentage of the allocated IP address lease time at which the DHCP call-line state is changed to "RENEWING". It can be configured to any integer value from 40 to 66%.

Usage

This command is used to identify the time at which a subscriber must renew their DHCP lease as a percentage of the overall lease time. (Refer to the **lease-duration** command in this chapter for information on configuring the IP address lease period.)
For example, if the lease-duration was configured to have a maximum value of 12000 seconds, and this command is configured to 40%, then the subscriber would enter the RENEWING state after 4800 seconds.

Example

The following command configures the T1 threshold to 40%:

```
T1-threshold 40
```

T2-threshold

Configures the DHCP T2 timer as a percentage of the allocated IP address lease.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
T2-threshold percentage
```

percentage

Default: 88%
The percentage of the allocated IP address lease time at which the DHCP call-line state is changed to "REBINDING". It can be configured to any integer value from 67 to 99%.

Usage

This command is used to identify the time at which a subscriber re-binds their DHCP leased IP address as a percentage of the overall lease time. (Refer to the **lease-duration** command in this chapter for information on configuring the IP address lease period.)
For example, if the lease-duration was configured to have a maximum value of 12000 seconds, and this command is configured to 70%, then the subscriber would enter the REBINDING state after 8400 seconds.

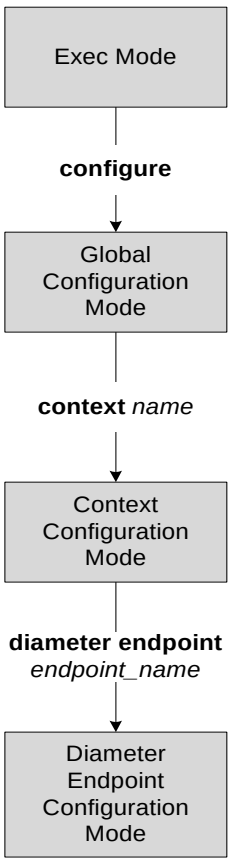
Example

The following command configures the T1 threshold to 70%:

```
T2-threshold 70
```

Chapter 78
Diameter Endpoint Configuration Mode Commands

Diameter Endpoint Configuration Mode is accessed from the Context Configuration Mode. The base Diameter protocol operation is configured in the Diameter Endpoint Configuration Mode.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

cea-timeout

This command configures the Capabilities-Exchange-Answer (CEA) message timeout duration for Diameter sessions.

Product

All

Privilege

Security Administrator, Administrator

Syntax

cea-timeout *timeout*

default cea-timeout

default

Configures the default CEA timeout setting.
Default: 30 seconds

timeout

Specifies the timeout duration, in seconds, to make the system wait for this duration for CEA message. *timeout* must be an integer from 1 through 120.

Usage

Use this command to configure the CEA timer, i.e., how long to wait for the Capabilities-Exchange-Answer message.

Example

The following command sets the Diameter CEA timeout to *16* seconds:
cea-timeout *16*

connection retry-timeout

This command configures the Diameter Connection Retry Timeout parameter.

Product

All

Privilege

Security Administrator, Administrator

Syntax

connection retry-timeout *timeout*

default connection retry-timeout

default

Configures the default Connection Retry Timeout setting.
Default: 30 seconds

timeout

Specifies the connection retry timeout duration, in seconds, and must be an integer from 1 through 3600.

Usage

Use this command to configure the Diameter Connection Retry Timeout parameter.

Example

The following command sets the Diameter Connection Retry Timer to *120* seconds:

connection retry-timeout *120*

connection timeout

This command configures the Diameter Connection Timeout parameter.

Product

All

Privilege

Security Administrator, Administrator

Syntax

connection timeout *timeout*

default connection timeout

default

Configures the default Diameter Connection Timeout setting.
Default: 30 seconds

connection timeout *timeout*

timeout specifies the connection timeout duration, in seconds, and must be an integer from 1 through 30.

Usage

Use this command to configure the Diameter Connection Timeout parameter.

Example

The following command sets Diameter connection timeout to *16* seconds:

connection timeout *16*

device-watchdog-request

This command manages transport failure algorithm and configures the number of Device Watchdog Requests (DWRs) that will be sent before a connection is closed.

Product

All

Privilege

Security Administrator, Administrator

Syntax

device-watchdog-request max-retries *retry_count*

default device-watchdog-request max-retries

default

Configures the default setting.
Default: 1

retry_count

Specifies the maximum number of DWRs, and must be an integer from 1 through 10.

Usage

Use this command to configure the number of DWRs to be sent before closing the connection from a Diameter endpoint.

Example

The following command sets the DWRs to *3*:

device-watchdog-request max-retries ***3***

dpa-timeout

This command configures the Disconnect-Peer-Answer (DPA) message timeout duration for Diameter session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

dpa-timeout *timeout*

default dpa-timeout

default

Configures the default DPA message timeout setting.
Default: 30 seconds

timeout

Specifies the DPA message timeout duration, in seconds, and must be an integer from 1 through 60.

Usage

Use this command to set the timer for DPA message timeout during Diameter connection session. This makes the system wait for this duration for DPA message.

Example

The following command sets the Diameter DPA timeout to *16* seconds:
dpa-timeout *16*

end

This command returns the CLI prompt to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec mode.

exit

This command exits the Diameter Endpoint Configuration mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

max-outstanding

This command specifies the maximum number of Diameter messages that any application can send to any one peer, awaiting responses.

Product

All

Privilege

Security Administrator, Administrator

Syntax

max-outstanding *messages*

{ default | no } max-outstanding

no

Disables the maximum outstanding messages configuration.

default

Configures the default setting.
Default: 256

messages

Specifies the maximum outstanding peer transmit window size setting, and must be an integer from 1 through 4096.

Usage

Use this command to set the unanswered Diameter messages that any application may send to any one peer, awaiting responses. An application will not send any more Diameter messages to that peer until it has disposed of at least one of those queued messages. It disposes a message by either receiving a valid response or by discarding the message due to no response.

Example

The following command sets the Diameter maximum outstanding messages setting to *1024*:

max-outstanding *1024*

origin address

This command has been deprecated. See the origin host and origin realm commands.

origin host

This command sets the origin host for the Diameter endpoint.

Product

All

Privilege

Security Administrator, Administrator

Syntax

origin host *host_name* **address** *ip_address* **[port** *port_number* **] [accept-incoming-connections] [address** *ip_address_secondary* **]**

no origin host *host_name* **address** *ip_address* **[port** *port_number* **]**

no

Removes the origin host configuration.

host_name

Specifies the host name to bind the Diameter endpoint.
host_name must be the local Diameter host name, and must be a string of 1 through 255 characters in length.

address *ip_address*

Specifies the IP address to bind the Diameter endpoint. This address must be one of the addresses of a chassis interface configured within the context in which Diameter is configured.
ip_address must either be an IPv4 address expressed in dotted decimal notation, or an IPv6 address expressed in colon notation.

port *port_number*

Specifies the port number for the Diameter endpoint (on inbound connections).
port_number must be an integer from 1 through 65535.

accept-incoming-connections

Specifies to accept inbound connection requests for the specified host.

address *ip_address_secondary*

Specifies the secondary bind address for the Diameter endpoint. This address must be one of the addresses of a chassis interface configured within the context in which Diameter is configured.
ip_address_secondary must either be an IPv4 address expressed in dotted decimal notation, or an IPv6 address expressed in colon notation.

Usage

Use this command to set the bind address for the Diameter endpoint.

Diameter agent on chassis listens to standard TCP port 3868 and also supports the acceptance of any incoming TCP connection from external server.
The command **origin host** *host-name* must be entered exactly once. Alternatively, the **origin host** *host-name* **address** *ip_address* **[port** *port_number* **]** command may be entered one or more times. The host names should be unique across all endpoints within the context. The address values or address/port combinations should be unique across all endpoints within the context.

Example
The following command sets the origin host name to *test* and the IP address to *1.1.1.1*:
origin host *test* address *1.1.1.1*

origin realm

This command configures the realm to use in conjunction with the origin host.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] origin realm *realm_name*

no

Removes the origin realm configuration.

realm_name

Specifies the realm to bind the Diameter endpoint. The realm is the Diameter identity. The originator's realm must be present in all Diameter messages. The origin realm can typically be a company or service name. *realm_name* must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage

Use this command to set the realm for the Diameter endpoint.
Diameter agent on chassis listens to standard TCP port 3868 and also supports the acceptance of any incoming TCP connection from external server.

Example

The following command sets the origin realm to *companyx*:
origin realm *companyx*

peer

This command specifies a peer address for the Diameter endpoint.

Product

All

Privilege

Security Administrator, Administrator

Syntax

peer *peer_name* **[realm** *realm_name* **] { address** *ip_address* **[[port** *port_number* **] [connect-on-application-access] [send-dpr-before-disconnect disconnect-cause** *disconnect_cause* **] [sctp]] + | fqdn** *fqdn* **[[port** *port_number* **] [send-dpr-before-disconnect disconnect-cause** *disconnect_cause* **]] }**

no peer *peer_name* **[realm** *realm_name* **]**

no

Removes the specified peer configuration.

peer_name

Specifies the peer's name.
peer_name must be an alpha and/or numeric string of 1 through 63 characters in length, and allows punctuation characters.

realm *realm_name*

Specifies the realm of this peer.
realm_name must be an alpha and/or numeric string of 1 through 127 characters in length. The realm name can be a company or service name.

address *ip_address*

Specifies the Diameter peer IP address. This address must be the IP address of the device the chassis is communicating with.
ip_address can either be an IPv4 address expressed in dotted decimal notation, or an IPv6 address expressed in colon notation.

fqdn *fqdn*

Specifies the Diameter peer fully qualified domain name (FQDN).
fqdn must be an alpha and/or numeric string of 1 through 127 characters in length.

port *port_number*

Specifies the port number for this Diameter peer.
port_number must be an integer from 1 through 65535.

connect-on-application-access

Specifies to activate peer on first application access.

send-dpr-before-disconnect

Specifies to send Disconnect-Peer-Request (DPR).

disconnect-cause

Specifies to send Disconnect-Peer-Request to the specified peer with the specified disconnect reason. The disconnect cause must be an integer from 0 through 2, for one of the following:

- REBOOTING(0)
- BUSY(1)
- DO_NOT_WANT_TO_TALK_TO_YOU(2)

sctp

To use Stream Control Transmission Protocol (SCTP) for this peer.

+

Indicates that more than one of the previous keywords can be entered within a single command.

Usage

Use this command to add a peer to the Diameter endpoint.

Example

The following command adds the peer named *test* with IP address *1.1.1.1* using port *126*:

peer *test* address *1.1.1.1* port *126*

response-timeout

This command configures the Response Timeout parameter.

Product

All

Privilege

Security Administrator, Administrator

Syntax

response-timeout *timeout*

default response-timeout

default

Configures the default Response Timeout setting.
Default: 60 seconds

timeout

Specifies the response timeout duration, in seconds, and must be an integer from 1 through 300.

Usage

Use this command to configure the Response Timeout parameter.

Example

The following command sets the response timeout to *100* seconds:
response-timeout *100*

route-entry

This command creates an entry in the route table for Diameter peer.

Product

All

Privilege

Security Administrator, Administrator

Syntax

route-entry { [host *host_name* **] [peer** *peer_id* **[weight** *priority* **]] [realm** *realm_name* **{ application credit-control peer** *peer_id* **[weight** *value* **] | peer** *peer_id* **[weight** *value* **] }] }**

no route-entry { [host *host_name* **] [peer** *peer_id* **] [realm** *realm_name* **{ application credit-control peer** *peer_id* **| peer** *peer_id* **}] }**

no

Disables the specified route-entry table configuration.

host *host_name*

Specifies the Diameter server's host name.
host_name must be an alpha and/or numeric string of 1 through 63 characters in length.

realm *realm_name*

Specifies the realm name. The realm may typically be a company or service name.
realm_name must be an alpha and/or numeric string of 1 through 127 characters in length.

application credit-control

Specifies the credit control application, i.e. DCCA or RADIUS.

peer *peer_id*

Specifies the peer ID of Diameter endpoint route.
peer_id must be an alpha and/or numeric string of 1 through 63 characters in length.

weight *priority*

Default: 10
Specifies the priority for a peer in the route table.
The peer with the highest weight is used. If multiple peers have the highest weight, selection is by round-robin mechanism.
priority must be an integer from 0 through 255.

Usage

Use this command to create a route table for Diameter application.

When a Diameter client starts to establish a session with a realm/application, the system searches the route table for the best match. If an entry has no host specified, then the entry is considered to match the requested value. Similarly, if an entry has no realm or application specified, then the entry is considered to match any such requested value. The best match algorithm is to prefer specific matches for whatever was requested, i.e., either realm/application or host/realm/application. If there are no such matches, then system looks for route table entries that have wildcards.

Example

The following command creates a route entry with the host name *dcca_host1* and peer ID *dcca_peer* with priority weight of *10*:

route-entry host *dcca_host1* peer *dcca_peer* weight *10*

route-failure

This command controls how action after failure or recovery after failure is performed for the route table.

Product

GGSN, ECS

Privilege

Security Administrator, Administrator

Syntax

```
route-failure { deadtime seconds | recovery-threshold percent percentage |
result-code result_code | threshold counter }

default route-failure { deadtime | recovery-threshold | threshold }

no route-failure result-code result_code
```

no

Disables the route-failure configuration.

default

Configures the default setting for the specified parameter.

deadtime *seconds*

Specifies the time duration, in seconds, for which system keeps the route FAILED status. When this time expires, the system changes the status to AVAILABLE.
seconds must be the deadtime duration, in seconds, and must be an integer from 1 through 86400.
Default: 60 seconds

recovery-threshold percent *percentage*

Specifies how to reset the failure counter when provisionally changing the status from FAILED to AVAILABLE.
For example, if a failure counter of 16 caused the status to change to FAILED. After the configured deadtime expires, the status changes to AVAILABLE. If this keyword is configured with 75 percent, the failure counter will be reset to 12, i.e., 75 percent of 16.
percentage must be the value in percentage of the counter which caused FAILED, and must be an integer from 1 through 99.
Default: 90 percent

result-code *result_code*

Configures which answer messages are to be treated as failures, in addition to requests that time out.
Up to 16 different result codes can be specified.
result_code must be an integer from 0 through 4,294,967,295.
Default: N/A

threshold *counter*

Configures the number of errors that causes the status to become FAILED.
counter must be an integer from 0 through 4,294,967,295.
The error counter begins at zero, and whenever there is a good response it decrements (but not below zero) or increments (but not above this threshold) whenever there is a good response.
Default: 16

Usage

Use this command to control how failure/recovery is performed for the route table. After a session is established, it is possible for the session to encounter errors or Diameter redirection messages that cause the Diameter protocol to re-use the route table to switch to a different route.
Each Diameter client within the chassis maintains counters relating to the status of each of its connections to different hosts (when the destination is realm/application without a specific host, the host name is kept as “”, i.e., blank).
Moreover, those counters are further divided according to which peer is used to reach each host. Each Diameter client maintains a status of each peer-to-host combination. Under normal good conditions the status will be AVAILABLE, while error conditions might cause the status to be FAILED.
Only combinations that are AVAILABLE will be used. If none are AVAILABLE, then system attempts the secondary peer if failover is configured and system can find an AVAILABLE combination there. If nothing is AVAILABLE, system uses a FAILED combination.

Example

The following command configures the time duration for route failure to *90* seconds:
route-failure deadtime ***90***

tls

This command enables/disables the Transport Layer Security (TLS) support between a Diameter client and Diameter server node.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

tls { certificate *certificate* **| password** *password* **| privatekey** *private_key* **}**

default tls

default

Configures the default setting.
Default: Disables the TLS support at Diameter endpoint.

certificate *certificate*

Specifies the certificate for TLS support.
certificate must be an encrypted certificate, and must be an alpha and/or numeric string of 700 through 900 characters in length.

password *password*

Specifies the password for TLS support.
password must be an encrypted password, and must be an alpha and/or numeric string of 6 through 50 characters in length.

privatekey *private_key*

Specifies the private key for TLS support.
private_key must be an encrypted key, and must be an alpha and/or numeric string of 900 through 1500 characters in length.

Usage

Use this command to configure TLS support between a Diameter client and Diameter server node. By default, TLS is disabled.

Important: Both the Diameter client and server must be configured with TLS enabled or TLS disabled; otherwise, the Diameter connection will be rejected.

Example

The following commands enable the TLS between a Diameter client and Diameter server node:

```
tls certificate "-----BEGIN CERTIFICATE-----
\nMIICGDCCAYECAgEBMA0GCSqGSIb3DQEBBAUAMFcxCzAJBgNVBAYTA1VTMRMwEQYD\nVQQKEwpSVEZN

```

use-proxy

This command enables/disables Diameter proxy for the Diameter endpoint.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] use-proxy
```

no

Disables Diameter proxy for the current endpoint.
This command at endpoint level will actually equip an application to use Diameter proxy to route all its messages to external peer.

Usage

By default, the use-proxy configuration is disabled.
This command equips an application to use Diameter proxy to route all its messages to external peer. The proxy acts as an application gateway for Diameter. It gets the configuration information at process startup and decides which Diameter peer has to be contacted for each application. It establishes the peer connection upon finding no peer connection already exists.
Each proxy task will automatically select one of the host names configured with the **origin host** CLI command. Multiple proxy tasks will not use the same host names, so there should be at least as many host names as proxy tasks. Otherwise, some proxy tasks will not be able to perform Diameter functionality. The chassis automatically selects which proxy tasks are used by which managers (i.e., ACSMgrs/SessMgrs), without verifying whether the proxy task is able to perform Diameter functionality.
To be able to run this command, the Diameter proxy must be enabled. In the Global Configuration Mode, see the **require diameter-proxy** CLI command.

Example

The following command enables Diameter proxy for the current endpoint:

```
use-proxy
```

The following command disables Diameter proxy for the current endpoint:

```
no use-proxy
```

watchdog-timeout

This command configures the Watchdog Timeout parameter.

Product

All

Privilege

Security Administrator, Administrator

Syntax

watchdog-timeout *timeout*

{ default | no } watchdog-timeout

no

Disables the watchdog timeout configuration.

default

Configures the default watchdog timeout setting.
Default: 30 seconds

timeout

Specifies the timeout duration, in seconds, and must be an integer from 6 through 30.

Usage

Use this command to configure the Watchdog Timeout parameter for the Diameter endpoint. If this timer expires before getting a response from the destination, other route to the same destination is tried, as long as the retry count setting has not been exceeded (see the device-watchdog-request CLI command) and as long as the response timer has not expired (see the response-timeout CLI command).

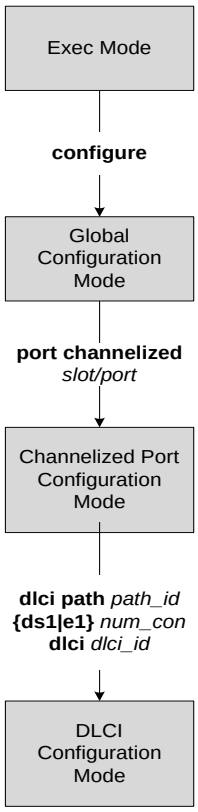
Example

The following command sets the watchdog timeout setting to *15* seconds:

watchdog-timeout *15*

Chapter 79
DLCI Configuration Mode Commands

The DLCI configuration mode provides the commands to configure, bind and manage the DLCI associated with a specific port defined in the parent configuration mode, Channelized Port configuration mode.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

bind link

This command configures an association (binds) between an IP interface or a pre-configured routing SS7/Frame Relay link and the specific port being configured with the Channelized Port configuration commands.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

bind link peer-nsei*nse_id***ns-vci***ns-vc_id*

no bind link peer-nsei*nse_id***ns-vci***ns-vc_id*

peer-nsei *nse_id*

Defines the end-point network service entity identifier (NSEI). The NSEI must be an integer from 0 to 65535.

ns-vc-id *ns-vc_id*

Defines the network service virtual circuit identifier (NSVCI). The NSVCI must be an integer from 0 to 65535.

no

Deletes the bind configuration from the Operator Policy.

Usage

Bind this port to network service entity 2 and network service VC 234.

Example

bind link peer-nsei *2* **ns-vci** *234*

end

Exits this sub-configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`end`

Usage

Change the mode and return to the Exec mode.

exit

Exits the this sub-configuration mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the previous configuration mode.

shaping

Defines egress traffic shaping to control flow for this DLCI.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

shaping*type*

default shaping

shaping *type*

The following types of shaping provide flow management:

- **cir:** Commited Info Rate
- **cir-eir:** Commited Info Rate with Excess Rate
- **ppr:** Peak Packet Rate
- **wfq:** Weighted Fair Queuing

default

Resets the DLCI configuration to the system default.

Usage

Use this command to identify the type of signal shaping to be used on the DLCI.

Example

shaping *cir*

shutdown

Terminates all processes supporting the port or blocks the shutting down of the port. Conversely, this command with the **no** keyword enables the port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

shutdown

no shutdown

no

Enables the port's administrative state. When omitted the card is shutdown (removed from service).

Usage

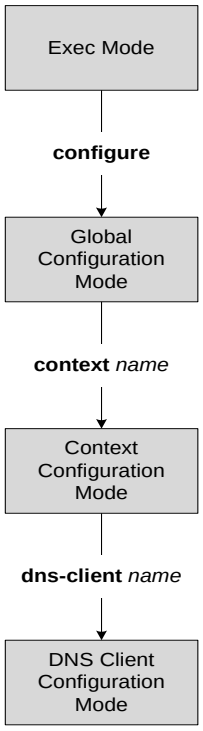
Shut down a port prior to re-cabling and/or other maintenance activities.
This command with the **no** keyword is required to bring a port into service.

Example

shutdownno shutdown

Chapter 80
DNS Client Configuration Mode Commands

The DNS Client Configuration Mode is used to manage the system's DNS interface and caching parameters.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

bind address

Binds the DNS client to a pre-configured logical IP interface.

Product

SCM, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
bind address ip_address [ port number ]

no bind address
```

no

Removes the binding of the client to a specified interface.

ip_address

Specifies the IP address of the interface to which the DNS client is being bound. *ip_address* must be expressed in IPv4 dotted decimal notation.

port *number*

Default: 6011
Specifies the UDP port number of the interface to which the DNS client is being bound. *number* must be an integer value from 1 to 65535.

Usage

Use this command to associated the client with a specific logical IP address.

Example

The following command binds the DNS client to a logical interface with an IP address of *1.2.3.4* and a port number of *6000*:

```
bind address 1.2.3.4 port 6000
```

cache algorithm

Configures the method of use of the DNS VPN and session cache.

Product

SCM, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
cache algorithm { central | local } { FIFO | LRU | LFU }

default cache algorithm { central | local }
```

default

Sets the DNS VPN and session cache method to default setting.

central | local

central: Specifies the central proclet (VPN manager)
local: Specifies the local proclet (session manager)

FIFO | LRU | LFU

FIFO: First in first out. This is the default setting for the central proclet.
LRU: Least recently used. This is the default value for the local proclet.
LFU: Least frequently used.

Usage

Use this command to configure the method by which entries are added and removed from the DNS cache.

Example

The following command configures the cache algorithm for the central proclet to least frequently used (LFU):

```
cache algorithm central lfu
```

cache size

Configures the maximum number of entries allowed in the DNS cache.

Product

SCM, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
cache size { central | local } max_size

default cache size { central | local }
```

default

Sets the maximum number of entries allowed in the DNS cache to default setting.

{ central | local } *max_size*

central *max_size*: Specifies the maximum number of entries allowed in the central proclet cache. *max_size* must be an integer value from 100 to 65535 in length. The default value for the central proclet is 50000.
local *max_size*: Specifies the maximum number of entries allowed in the local proclet cache. *max_size* must be an integer value from 100 to 65535 in length. The default value for the local proclet is 1000.

Usage

Use this command to configure the maximum number of entries allowed in the DNS cache.

Example

The following command configures the cache size of the central proclet to *20000*:

cache size central *20000*

cache ttl

Configures the DNS cache time to live (TTL) for positive and negative responses.

Product

SCM, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
cache ttl { negative | positive } seconds

default cache ttl { negative | positive }

no cache [ ttl { negative | positive } ]
```

no

Disables any or all configured DNS cache parameters.

default

Sets the DNS cache time to live for positive and negative responses to default setting.

{ negative | positive } *seconds*

negative *seconds*: Specifies the time to live for negative responses. *seconds* must be an integer value from 60 to 86400. The default value is 60 seconds.
positive *seconds*: Specifies the time to live for positive responses. *seconds* must be an integer value from 60 to 86400. The default value is 86400 seconds (1 day).

Usage

Use this command to adjust the DNS cache time to live.

Example

The following commands set the TTL DNS cache to *90* seconds for negative responses and *43200* seconds for positive responses:

```
cache ttl negative 90

cache ttl positive 43200
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the previous mode.

resolver

Configure the number of DNS query retries and the retransmission interval once the response timer times out.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
resolver { number-of-retries retries | retransmission-interval time }

default { number-of-retries | retransmission-interval }
```

default

Use this keyword to reset the specified resolver configuration to the default.

number-of-retries *retries*

Configures the number of DNS query retries on DNS response timeout.
retries: enter an integer from 0 to 4. Default is 2 retries.

retransmission-interval *time*

Configures the initial retransmission interval, in seconds, for retransmission after the DNS response timeout. The retransmission interval doubles after each retry when only one server is configured. In case both primary and secondary servers are configured, the retransmission time is doubled for the last retry.
time: enter an integer from 2 to 5. Default is 3 seconds.

Usage

Set the DNS retransmission retries or the retransmission interval. Issue the command twice to configure both parameters, one-at-a-time.

Example

The following command sets the DNS resolver retries to *4*:

```
resolver number-of-retries 4
```

round-robin answer

This command configures the DNS client to return the DNS results in round-robin fashion if multiple results are available for a DNS query.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] round-robin-answers
```

no

Removes the configured round robin method for DNS answer.

default

Disabled the round robin method for DNS answer.

Usage

Use this command to configure the DNS client to return the DNS results in round-robin fashion if multiple results are available for a DNS query.

Example

The following command configures the DNS client to use round robin method for DNS query answers:

```
default ] round-robin-answers
```

Chapter 81
EAP Authentication Configuration Mode Commands

The EAP Authentication Configuration Mode is used to configure the EAP authentication methods for the crypto template.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

eap-aka

Configures shared key values for the EAP-AKA authentication method used by subscribers using this crypto template.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

eap-aka { encrypted key *hex* **| key** *hex* **}**

encrypted key *hex*

Specifies that the shared key is to be encrypted. *hex* must be a 16-character alpha and/or numeric string or a hexadecimal number beginning with “0x”.

key *hex*

Specifies that the shared key is to be transmitted in clear text. *hex* must be a 16-character alpha and/or numeric string or a hexadecimal number beginning with “0x”.

Usage

Use this command to set shared key parameters for subscribers using the EAP-AKA authentication method.

Example

The following command configures a clear-text shared key value for the EAP-AKA method:

```
eap-aka key aa11223344556677
```

eap-gtc

Configures shared key values for the EAP-GTC authentication method used by subscribers using this crypto template.

Product

PDIF, ASN GW

Privilege

Security Administrator, Administrator

Syntax

eap-gtc { encrypted key *value* **| key** *value* **}**

encrypted key *value*

Specifies that the shared key is to be encrypted. *value* must be a 16-character alpha and/or numeric string.

key *value*

Specifies that the shared key is to be transmitted in clear text. *value* must be a 16-character alpha and/or numeric string.

Usage

Use this command to set shared key parameters for subscribers using the EAP-GTC authentication method.

Example

The following command configures a clear-text shared key value for the EAP-GTC method:

```
eap-GTC key aa11223344556677
```

eap-md5

Configures shared key values for the EAP-MD5 authentication method used by subscribers using this crypto template.

Product

PDIF, ASN GW

Privilege

Security Administrator, Administrator

Syntax

eap-md5 { encrypted key *value* **| key** *value* **}**

encrypted key *value*

Specifies that the shared key is to be encrypted. *value* must be a 16-character alpha and/or numeric string.

key *value*

Specifies that the shared key is to be transmitted in clear text. *value* must be a 16-character alpha and/or numeric string.

Usage

Use this command to set shared key parameters for subscribers using the EAP-MD5 authentication method.

Example

The following command configures a clear-text shared key value for the EAP-MD5 method:

```
eap-md5 key aa11223344556677
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec Mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

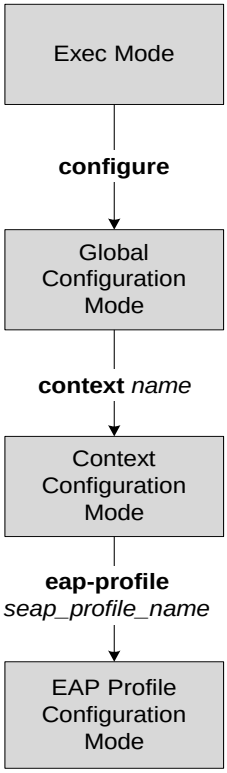
```
exit
```

Usage

Returns to the previous mode.

Chapter 82
EAP Configuration Mode Commands

The EAP Configuration Mode is used to configure parameters comprising an Extensible Authentication Profile used to support EAP authentication on the system.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec Mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Returns to the previous mode.

max-retry

Configures the maximum number of times the system will retry communicating with another EAP device.

Product

PDIF, ASN GW

Privilege

Security Administrator, Administrator

Syntax

max-retry *num*

default max-retry

num

Default: 16
Specifies the number of times to retry EAP communication with another device. *num* must be an integer from 1 to 65535.

Usage

Use this command to set a maximum retry number for communicating with other EAP devices.

Example

The following command sets the maximum number of retries to *50*:

max-retry *50*

mode

Configures the system as one of three types of EAP devices: authenticator pass-through, authenticator server, or peer.

Product

PDIF, ASN GW

Privilege

Security Administrator, Administrator

Syntax

```
mode { authenticator-pass-through | authenticator-server | peer }

default mode
```

default

Configures the default mode of Authenticator-pass-through.

authenticator-pass-through

Configures the system as an authenticator pass-through allowing EAP authentication to be performed by another server.
This is the default setting for this command.

authenticator-server

Configures the system as an authenticator server. This allows the system to respond to EAP requests.

peer

Configures the system as a peer device requiring it to make EAP requests of another server or pass-through device.

Usage

Use this command to configure the system to perform as one of three types of EAP devices and configure settings in an EAP mode. Entering this command results in the following prompt:
[*context_name*]*hostname*(cfg-ctx-eap-profile-mode)
#EAP Mode Configuration Mode commands are defined in the EAP Mode Configuration Mode Commands chapter.

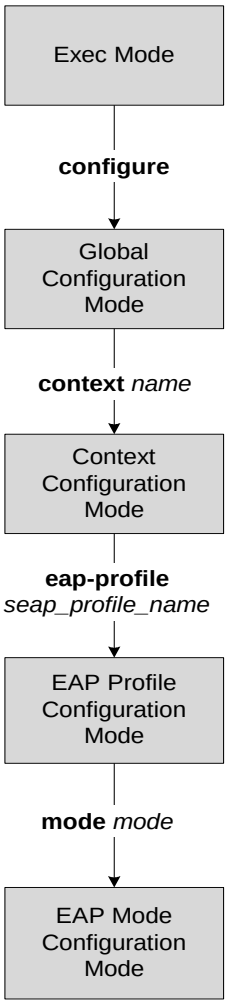
Example

The following command configures the system to perform as an authenticator pass-through:

```
mode authenticator-pass-through
```

Chapter 83
EAP Mode Configuration Mode Commands

The EAP Mode Configuration Mode is used to configure EAP authentication method supported by the system.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec Mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Returns to the previous mode.

method

Configures the EAP method used for authentication.

Product

PDIF, ASN GW

Privilege

Security Administrator, Administrator

Syntax

method { eap-aka | eap-gtc | eap-md5 } [priority *num* **]**

eap-aka | eap-gtc | eap-md5

eap-aka: Specifies that the EAP-AKA method is to be used for authentication.
eap-gtc: Specifies that the EAP-GTC method is to be used for authentication.
eap-md5: Specifies that the EAP-MD5 method is to be used for authentication.

priority *num*

Specifies a priority order for a specific EAP authentication method. *num* must be an integer fro 1 to 65535.

Usage

Use this command to specify the EAP authentication method(s) to use and to place multiple methods in priority order.

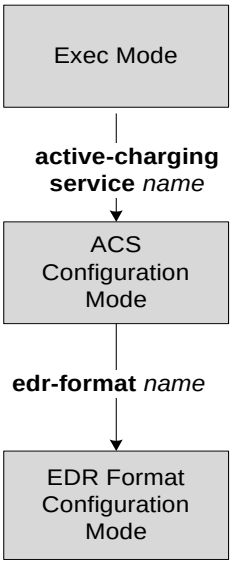
Example

The following command sets EAP-AKA as one of the EAP authentication methods and places it as priority of 3:

```
method eap-aka priority 3
```

Chapter 84
EDR Format Configuration Mode Commands

The EDR Format Configuration Mode enables configuring Event Detail Record (EDR) formats.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

attribute

This command specifies the order of fields in EDRs.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
attribute attribute { [ format { MM/DD/YY-HH:MM:SS | MM/DD/YYYY-HH:MM:SS |
YYYY/MM/DD-HH:MM:SS | YYYYMMDDHHMMSS | seconds } ] [ localtime ] | [ { ip | tcp
} { bytes | pkts } { downlink | uplink } ] priority priority }

no attribute attribute [ priority priority ]
```

no

Removes the specified attribute.

attribute

Specifies the attribute.
attribute must be one of the following:

Attributes	Description
radius-called-station-id	Called Station ID of the mobile handling the flow.
radius-calling-station-id	Calling Station ID of the mobile handling the flow.
radius-fa-nas-identifier	RADIUS NAS identifier of Foreign Agent (FA).
radius-fa-nas-ip-address	RADIUS IP address of Foreign Agent (FA).
radius-nas-identifier	RADIUS NAS identifier.
radius-nas-ip-address	RADIUS NAS IP address. **Note:** This attribute is interchangeable with sn-st16-ip-addr for the user.
radius-user-name	User name associated with the flow.
sn-3gpp2-always-on	This option is obsolete. To configure this attribute see the rule-variable command.
sn-3gpp2-bsid	This option is obsolete. To configure this attribute see the rule-variable command.
sn-3gpp2-esn	This option is obsolete. To configure this attribute see the rule-variable command.
sn-3gpp2-ip-qos	This option is obsolete. To configure this attribute see the rule-variable command.

Attributes	Description
sn-3gpp2-ip-technology	This option is obsolete. To configure this attribute see the rule-variable command.
sn-3gpp2-release-indicator	This option is obsolete. To configure this attribute see the rule-variable command.
sn-3gpp2-service-option	This option is obsolete. To configure this attribute see the rule-variable command.
sn-3gpp2-session-begin	This option is obsolete. To configure this attribute see the rule-variable command.
sn-3gpp2-session-continue	This option is obsolete. To configure this attribute see the rule-variable command.
sn-acct-session-id	Unique session identifier for accounting.

Attributes	Description
sn-app-protocol	Application protocol for the flow. A value indicating the protocol, such as one of the following: • ACS_PROTO_UNKNOWN = 0 • ACS_PROTO_IP=2 • ACS_PROTO_TCP=3 • ACS_PROTO_UDP=4 • ACS_PROTO_HTTP=5 • ACS_PROTO_HTTPS=6 • ACS_PROTO_FTP=7 • ACS_PROTO_FTP_CONTROL=8 • ACS_PROTO_FTP_DATA=9 • ACS_PROTO_WTP=10 • ACS_PROTO_WSP=11 • ACS_PROTO_WTP_WSP_CONNECTION_ORIENTED=12 • ACS_PROTO_WSP_CONNECTION_LESS=13 • ACS_PROTO_DNS=14 • ACS_PROTO_ICMP=15 • ACS_PROTO_POP3=16 • ACS_PROTO_SIP=17 • ACS_PROTO_SDP=18 • ACS_PROTO_SMTP=19 • ACS_PROTO_EMAIL=20 • ACS_PROTO_MMS=21 • ACS_PROTO_FILE_TRANSFER=22 • ACS_PROTO_WWW=23 • ACS_PROTO_RTP=24 • ACS_PROTO_RTSP=25 • ACS_PROTO_ICMPv6=31
sn-cf-category-classification-used	For Category-based Content Filtering, specifies the last classification used by system for the flow, or blank if classification was never successfully performed. For URL Blacklisting, specifies category of the blacklisted URL in the Blacklist database.

Attributes	Description
sn-cf-category-flow-action	For Category-based Content Filtering, specifies the last action taken for the flow, or blank if content filtering was never performed. Following are the possible values: • allow • content-insert • discard • redirect-url • terminate-flow For URL Blacklisting, specifies the last action taken for the flow, or blank if Blacklist matching was never performed. Following are the possible values: • discard • terminate-flow • redirect-url • www-reply-code-terminate-flow
sn-cf-category-policy	Specifies the category policy identifier that was used by Category-based Content Filtering for the flow, or blank if content filtering was never attempted for the flow.
sn-cf-category-rating-type	For Category-based Content Filtering, specifies the type, either “static” or “dynamic” that was last successfully performed for the flow, or blank if content filtering was never successful for the flow. For URL Blacklisting, specifies “blacklisting”.
sn-cf-category-unknown-url	Identifier for unknown URL under content filtering action. It holds either “1” for unknown URLs or “0” for the URLs having static rating in its database.
sn-closure-reason	Reason for the termination of the flow/EDR: • 0: Normal end of flow • 1: End of flow by handoff processing • 2: Subscriber session terminated • 3: Inter-chassis Session Recovery switchover • 12: Completion of transaction
sn-content-label	Identifier of text label for content-id.
sn-correlation-id	RADIUS correlation identifier.
sn-direction	Direction of the first packet for the flow. It has following values: • toMobile: This value appears when direction of first packet is towards mobile node. • fromMobile: This value appears when direction of first packet is towards mobile node. • unknown: This value appears when the original originator of a flow can not be determined (e.g. a flow that is interrupted due to a Inter-chassis Session Recovery switchover).
sn-duration	Duration between the last and first packet for the record.

Attributes	Description
sn-end-time [format *format* **] localtime**	Timestamp for last packet of flow in UTC.
sn-fa-correlation-id	Radius Correlation Identifier of the Foreign Agent (FA).
sn-fa-ip-address	Foreign Agent (FA) IP address
sn-filler-blank	Keeps attributes place blank.
sn-filler-zero	Fills '0' for this attribute place.
sn-flow-id	Flow-id assigned internally by the ACS module to each flow.
sn-format-name	Name of the EDR/UDR format used.
sn-group-id	Sequence group ID of the record.
sn-ha-ip-address	Home Agent (HA) IP address.
sn-nat-binding-timer	Port chunk hold timer.
sn-nat-gmt-offset	GMT offset of the node generating NAT bind record.
sn-nat-ip	NAT IP address of the port chunk.
sn-nat-last-activity-time-gmt	The time when the last flow in a specific NAT set of flows was seen.
sn-nat-port-block-end	Last port number of the port chunk.
sn-nat-port-block-start	Starting port number of the port chunk.
sn-nat-port-chunk-alloc-dealloc-flag	Indicates whether the port chunk is allocated or released.
sn-nat-port-chunk-alloc-time-gmt	Indicates when the port chunk was allocated.
sn-nat-port-chunk-dealloc-time-gmt	Indicates when the port chunk was released.
sn-nat-realm-name	Name of the NAT realm.
sn-nat-subscribers-per-ip-address	Subscriber(s) per NAT IP address.
sn-parent-protocol	Indicates parent protocol of flow.
sn-rulebase	Name of the ACS rulebase applied.
sn-sequence-no	Unique sequence number (per **sn-sequence-group** and **radius-nas-ip-address**) of EDR identifier and linearly increasing in EDR file.
sn-server-port	TCP/UDP port number of the server in a subscriber's data flow.
sn-st16-ip-addr	IP address of the chassis handling this flow.
sn-start-time [format *format* **] localtime**	Timestamp for last packet of flow in UTC.
sn-subscriber-nat-flow-ip	NAT IP address of NAT-enabled subscriber.

Attributes	Description
sn-subscriber-nat-flow-port	NAT port number of NAT-enabled subscriber.
sn-subscriber-port	TCP/UDP port number of the Mobile handling subscriber data flow.
sn-volume-amt { ip | tcp } { bytes | pkts } { uplink | downlink }	Protocol-specific uplink/downlink volume amount in bytes/packets for EDR.
sn-volume-dropped-amt { ip | tcp } { bytes | packets } { downlink | uplink }	Protocol-specific uplink/downlink dropped volume amount in bytes/packets for EDR.
sn-volume-ip-with-rtsp-or-rtp bytes { downlink | priority | uplink }	Shows the collected EDRs that contains the total bytes of an RTSP flow and the RTP flows controlled by it in uplink or downlink direction, or CSV position priority of this field. If **uplink** or **downlink** is not specified it shows the total of both.
transaction-downlink-bytes	Total downlink bytes for the transaction.
transaction-downlink-packets	Total downlink packets for the transaction.
transaction-uplink-bytes	Total uplink bytes for the transaction.
transaction-uplink-packets	Total uplink packets for the transaction.

format { MM/DD/YY-HH:MM:SS | MM/DD/YYYY-HH:MM:SS | YYYY/MM/DD-HH:MM:SS | YYYYMMDDHHMMSS | seconds }

Specifies the timestamp format.

localtime

Specifies timestamps with the local time. By default, timestamps are displayed in GMT.

{ ip | tcp } { bytes | pkts } { downlink | uplink }

Specifies bytes/packets sent/received from/by mobile.

priority *priority*

Specifies the position priority of the value within the EDR record. Lower numbered priorities (across all **attribute**, **event-label**, and **rule-variable**) occur first.
priority must be an integer from 1 through 65535. Up to 50 position priorities (across all **attribute**, **event-label**, and **rule-variable**) can be configured.

Usage

Use this command to set the attributes and priority for EDR file format.
A particular field in EDR format can be entered multiple times at different priorities. While removing the EDR field using the **no attribute** command either you can remove all occurrences of a particular field by specifying the field name or a single occurrence by additionally specifying the optional **priority** keyword.

Example

```
attribute radius-user-name priority 12
```

end

This command returns the CLI prompt to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec mode.

event-label

This command specifies an optional event ID to use in the generated billing records.

Product

All

Privilege

Security Administrator, Administrator

Syntax

event-label *label* **priority** *priority*

no event-label

no

Removes previously configured event label for EDR attribute.

label

Specifies event label for attribute to be used for EDR format.
label must be an alpha and/or numeric string of 1 through 63 characters in length.

priority *priority*

Indicates the CSV position of event ID in EDR record.
priority must be an integer from 1 through 65535.

Usage

Use this command to set the event ID and its position in EDR file format.

Example

event-label *radius_csv1* priority *23*

exit

This command exits the EDR Format Configuration mode and returns to the ACS Configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the ACS Configuration mode.

rule-variable

Specifies the order of fields in the EDR.

Product

All

Privilege

Security Administrator, Administrator

Syntax

rule-variable *protocol rule* **priority** *priority* **[in-quotes]**

no rule-variable *protocol rule* **[priority** *priority* **]**

no

Removes the previously configured rule variable protocol rule and/or priority for EDR attribute.

protocol rule

Specifies the rule variable for EDR format.
protocol must be one of the following with specified rule:

- **bearer 3gpp**: 3GPP bearer-related configuration:
  - **charging-id**
  - **imei**—Populated with IMEI/IMEISV. Only available in StarOS 8.1 and later releases
  - **rat-type**—only available in StarOS 8.1 and later releases
  - **sgsn-address**—only available in StarOS 8.1 and later releases
  - **user-location-information**—only available in StarOS 8.1 and later releases
- **bearer 3gpp2**: 3GPP2 bearer-related configuration:
  - **always-on**
  - **bsid**
  - **esn**
  - **ip-qos**
  - **ip-technology**
  - **release-indicator**
  - **service-option**
  - **session-begin**
  - **session-continue**
- **bearer ggsn-address**: GGSN bearer-related configuration:
- **dns**: Domain Name System (DNS) related configuration:
  - **answer-name**
  - **previous-state**

- **query-name**
- **return-code**
- **state**
- **tid**

- **file-transfer**: File transfer related configuration:
  - **chunk-number**
  - **current-chunk-length**
  - **declared-chunk-length**
  - **declared-file-size**
  - **filename**
  - **previous-state**
  - **state**
  - **transferred-file-size**
- **ftp**: File Transfer Protocol (FTP) related configuration:
  - **client-ip-address**
  - **client-port**
  - **command name**
  - **connection-type**
  - **filename**
  - **pdu-length**
  - **pdu-type**
  - **previous-state**
  - **reply code**
  - **server-ip-address**
  - **server-port**
  - **session-length**
  - **state**
  - **url**
  - **user**
- **http**: Hypertext Transport Protocol (HTTP) related configuration:
  - **attribute-in-data**— dynamic header field in application payload
  - **attribute-in-url**—dynamic header field in URL
  - **content disposition**
  - **content length**
  - **content type**
  - **header-length**
  - **host**

- **payload-length**
- **pdu-length**
- **previous-state**

  - **session-id**
  - **session-length**
  - **state**
  - **uri**
  - **uri sub-part**
  - **user-agent**
- **sdp**: Session Description Protocol (SDP) related configuration:
  - **connection-ip-address**
  - **media-audio-port**
  - **media-video-port**

- **secure-http**: HTTPS related configuration
- **sip**: Session Initiation Protocol (SIP) related configuration:
  - **call-id**
  - **content type**
  - **from**
  - **previous-state**
  - **reply code**
  - **request method**
  - **request packet**
  - **state**
  - **to**
  - **uri**
  - **uri sub-part**
- **smtp**: Simple Mail Transfer Protocol (SMTP) related configuration:
  - **command name**
  - **mail-size**
  - **pdu-length**
  - **previous-state**
  - **recipient**
  - **reply status**
  - **sender**
  - **session-length**
  - **state**
- **tcp**: Transmission Control Protocol (TCP) related configuration:
  - **dst-port**
  - **duplicate**
  - **flag**
  - **out-of-order**
  - **payload-length**
  - **previous-state**
  - **src-port**
  - **state**
- **traffic-type**: Traffic type of flow (voice or non-voice depending upon flow type).
- **udp**: User Datagram Protocol (UDP) related configuration:
  - **dst-port**
  - **src-port**

- **voip-duration**: Duration of voice call, in seconds. For a flow in which voice call end is detected, output will be a non-zero value. For other flows it will be zero.
- **wsp**: Wireless Session Protocol (WSP) related configuration
  - **content type**
  - **host**
  - **pdu-length**
  - **pdu-type**
  - **reply code**
  - **session-length**
  - **tid**
  - **total-length**
  - **url**
  - **user-agent**
- **wtp**: Wireless Transaction Protocol (WTP) related configuration
  - **gtr**—Group Transmission Flag
  - **pdu-length**
  - **pdu-type**
  - **previous-state**
  - **state**
  - **tid**
  - **transaction class**
  - **ttr**—Trailer Transmission flag

Important: For more information on protocol-based rules, see the *Ruledef Configuration Mode Commands* chapter.

priority *priority*

Specifies the CSV position of protocol rule related information in EDR record.
priority must be an integer from 1 through 65,535.

in-quotes

Specifies placing double quotes (“ “) around the specified EDR field in the EDR.

Important: At the present time this keyword is only valid for the MMS protocol **to** and **subject** fields. **rule-variable mms to priority** *priority* **[in-quotes] rule-variable mms subject priority** *priority* **[in-quotes]**

Usage

Use this command to set the rule variables priority for EDR file format.

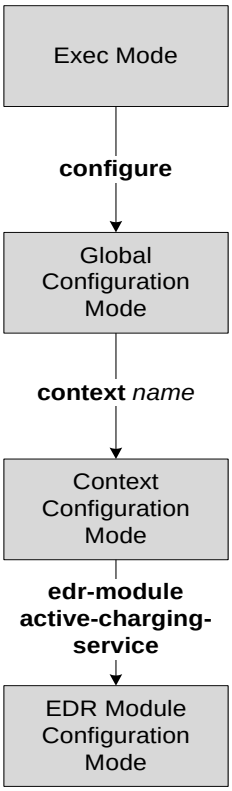
A particular field in an EDR format can be entered multiple times at different priorities. While removing the EDR field using the **no rule-variable** command you can remove all occurrences of a particular field by specifying the field name or a single occurrence by additionally specifying the optional **priority** keyword.

Example

rule-variable tcp dst-port priority *36*

Chapter 85
EDR Module Configuration Mode Commands

To access the EDR Module Configuration Mode, in the Context Configuration Mode, enter the edr-module active-charging-service command.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

cdr

This command configures the EDR/UDR file parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
cdr [ [ push-interval value ] [ push-trigger space-usage-percent
trigger_percentage ] [ remove-file-after-transfer ] [ transfer-mode { pull |
push primary { encrypted-url enc_url | url url } [ via local-context ] [
secondary { encrypted-secondary-url enc_sec_url | url sec_url } ] } ] + | use-
harddisk ]

no cdr [ remove-file-after-transfer | use harddisk ] +

default cdr [ push-interval | push-trigger space-usage-percent | remove-file-
after-transfer | transfer-mode [ push via ] | use harddisk ] +
```

no

Disables the configured CDR storage and CDR file processing in this mode:

- **remove-file-after-transfer**: Retains a copy of the file even after it has been pushed or pulled to another server.
- **use-harddisk**: Disables data storage on the SMC harddisk.

Important: **use-harddisk** keyword is only available on an ASR 5000 chassis.

default

Configures the default settings:

- **push-interval**: 300 seconds
- **push-trigger**: 80 percent
- **remove-file-after-transfer**: Disabled
- **transfer mode**: Pull
- **push via**: LC is used for push
- **use harddisk**: Disabled

Important: **use-harddisk** keyword is available only on the ASR 5000 chassis.

push-interval *value*

Default: 300
Specifies the transfer interval, in seconds, to push EDR and UDR files to an external file server.

value must be an integer from 60 through 3600.

push-trigger space-usage-percent *trigger_percentage*

Default: 80%
Specifies the EDR/UDR disk space utilization percentage, upon reaching which an automatic push is triggered and files are transferred to the configured external server.
trigger_percentage specifies the EDR/UDR disk utilization percentage for triggering push, and must be an integer from 10 through 80.

remove-file-after-transfer

Default: Disabled
Specifies that the system must delete EDR/UDR files after they are transferred to the external file server.

transfer-mode { pull | push primary { encrypted-url *enc_url* **| url** *url* **} [via local-context] [secondary { encrypted-secondary-url** *enc_sec_url* **| secondary-url** *sec_url* **}] }**

Specifies the EDR/UDR file transfer mode—how the EDR and UDR files are transferred to an external file server.

- **pull**: Specifies that the L-ESS is to pull the CDR files.
- **push**: Specifies that the system is to push CDR files to the configured L-ESS.
- **primary encrypted-url** *enc_url*: Specifies the primary URL location in encrypted format to which the system pushes the CDR files. *enc_url* must be the location name in an encrypted format, and must be an alpha and/or numeric string of 1 through 1024 characters in length.
- **primary url** *url*: Specifies the primary URL location to which the system pushes the CDR files. *url* must be an alpha and/or numeric string of 1 through 1024 characters in the //user:password@host:[port]/directory format.
- **via local-context**: Configuration to select LC/SPIO for transfer of CDRs. The system pushes the EDR files via SPIO in the local context.
- **encrypted-secondary-url** *enc_sec_url*: Specifies the secondary URL location in encrypted format to which the system pushes the CDR files when the primary location is unreachable or fails. *enc_sec_url* must be the location name in an encrypted format, and must be an alpha and/or numeric string of 1 through 1024 characters in length.
- **secondary-url** *sec_url*: Specifies the secondary URL location to which the system pushes the CDR files when the primary location is unreachable or fails. *sec_url* must be an alpha and/or numeric string of 1 through 1024 characters in //user:password@host:[port]/directory format.

use-harddisk

Default: Disabled
Specifies that on ASR 5000 chassis the hard disk on the SMC be used to store EDR/UDR files. On configuring to use the hard disk for EDR/UDR storage, EDR/UDR files are transferred from RAMFS on the PSC to the hard disk on the SMC.

Important: **use-harddisk** keyword is only available on ASR 5000 chassis.

+

Indicates that more than one of the previous keywords can be entered within a single command.

Usage

Use this command to configure how the charging data records (CDR) are moved and stored.
Run this command on the ASR 5000 chassis only from the local context. Running this command in any other context will cause a failure and deliver an error message.
The **use-harddisk** keyword is only available on ASR 5000 chassis. This command can be run only in a context where CDRMOD is running. Configuring in any other context will result in failure with the message "Failure: Please Check if CDRMOD is running in this context or not."
This config can be applied either in the EDR/UDR module, but will be applicable both to the EDR and UDR modules. Configuring in one of the modules prevents the configuration to be done in the other module.
If PUSH transfer mode is selected, the L-ESS server URL to which the CDR files need to be transferred to must be specified. The configuration allows a primary and a secondary server to be configured. Configuring the secondary server is optional. Whenever a file transfer to the primary server fails for four consecutive times, the files will be transferred to the secondary server. The transfer will switch back to the original primary server when:

- Four consecutive transfer failures to the secondary server occur
- After switching from the primary server, 30 minutes elapses

When changing **transfer-mode** from pull to push, disable the PULL from L-ESS and then change the transfer mode to push. Make sure that the push server URL configured is accessible from the local context. Also, make sure that the base directory that is mentioned contains udr directory created within it.
When changing **transfer-mode** from push to pull, after changing, enable PULL on the L-ESS. Any of the ongoing PUSH activity will continue till all the scheduled file transfers are completed. If there is no PUSH activity going on at the time of this configuration change, all the PUSH related configuration is nullified immediately.

Example

The following command retains a copy of the data file after it has been transferred to the storage location:

```
no cdr remove-file-after-transfer
```

end

This command returns the CLI prompt to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to change to the Exec mode.

exit

This command exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

file

This command configures EDR file parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

file [charging-service-name { include | omit }] [compression { gzip | none }] [current-prefix *string*] **[delete-timeout***seconds*] **[directory***dir_name*] **[edr-format-name] [exclude-checksum-record] [field-separator { hyphen | omit | underscore }] [file-sequence-number rulebase-seq-num] [headers] [name***file_name*] **[reset-indicator] [rotation [num-records***number*| **time***seconds*| **volume***bytes*] **] [sequence-number { length** *length*| **omit | padded | padded-six-length | unpadded }] [storage-limit***limit*]**[single-edr-format][time-stamp { expanded-format | rotated-format | unix-format }] [trailing-text***string*] **[trap-on-file-delete] [xor-final-record] +**

default file [charging-service-name] [compression] [current-prefix] [delete-timeout] [directory] [edr-format-name] [field-separator] [file-sequence-number] [headers] [name] [reset-indicator] [rotation { num-records | time | volume }] [sequence-number] [storage-limit][time-stamp] [trailing-text] +

---

default

Sets the default configuration.

---

charging-service-name { include | omit }

Specifies the inclusion/exclusion of charging service name in the file name.

- **include**: Sets this command to include the charging service name in EDR file name.
- **omit**: Sets this command to exclude the charging service name in EDR file name.

---

compression { gzip | none }

Specifies compression of EDR files.

- **gzip**: Enables GNU zip compression of the EDR file at approximately 10:1 ratio.
- **none**: Disables Gzip compression.

---

current-prefix *string*

Default: curr
Specifies a string to add to the beginning of the EDR file that is currently being used to store EDR records. *string* must be an alpha and/or numeric string of 1 through 31 characters in length.

---

delete-timeout *seconds*

Default: Disabled

Specifies a time period, in seconds, when completed EDR files are deleted. By default, files are never deleted. *seconds* must be an integer from 3600 through 31536000.

directory *dir_name*

Default: /records/edr
Specifies a subdirectory in the default directory in which to store EDR files. *dir_name* must be an alpha and/or numeric string of 1 through 191 characters in length.

edr-format-name

Specifies creation of separate files for EDRs that have different formats. The EDR format name will be included in the file name.

exclude-checksum-record

Default: Disabled, inserts checksum record into the EDR file header.
When entered, this keyword excludes the final record containing #CHECKSUM followed by the 32-bit Cyclic redundancy check (CRC) of all preceding records from the EDR file.

field-separator [hyphen | omit | underscore]

Specifies the field inclusion/exclusion type of separators between two fields of EDR file name.

- **hyphen**: Specifies the field separator as '-' (hyphen) symbol between two fields.
- **omit**: Removes or omits the field separator between two fields.
- **underscore**: Specifies the field separator as '_' (underscore) symbol between two fields.

file-sequence-number rulebase-seq-num

Specifies that the file name sequence numbers be unique per rulebase and EDR format name combination.

headers

Includes a file header summarizing the record layout.

name *file_name*

Default: edr
Specifies a string to be used as the base file name for EDR files.
file_name must be an alpha and/or numeric string of 1 through 31 characters in length. The file name format is as follows:
base_rulebase_format_sequencenum_timestamp

- base: Specifies type of record in file or contains the operator-specified string. Default: edr
- rulebase: Specifies the name of the Rulebase. EDRs from different Rulebases go into different EDR files.
- format: Specifies the name of the EDR format if **single-edr-format** is specified else the format field (and the trailing underscore) is omitted from the filename.
- sequencenum: This is a 5-digit sequence number to detect the missing file sequence. It is unique among all EDR files on the system.
- timestamp: Contains a timestamp based on file creation time in UTC time in MMDDYYYYHHMMSS format.

EDR files that have not been closed have a string added to the beginning of their filenames.

Filename for an EDR file in CSV format that contains information for rule base named rulebase1 and an EDR schema named edr_schema1 appears as follows:
edr_rulebase1_edr_schema1_00005_01302006143409
If the file name is not configured it will create files for EDRs/UDRs/FDRs (xDRs) with following template with limits to 256 characters:
basename_ChargSvcName_ timestamp_SeqNumResetIndicator_FileSeqNumber

- basename: A global-based configurable text string that is unique per system that uniquely identifies the global location of the system running ECS
- ChargSvcName: A system context-based configurable text string that uniquely identifies a specific context-based charging service
- timestamp: Date and time at the instance of file creation. Date and time in the form of "MMDDYYYYHHmmSS" where HH is a 24-hour value from 00-23
- SeqNumResetIndicator: A one byte counter used to discern the potential for duplicated FileSeqNumber with a range of 0 to 255 which is incremented by a value of 1 for the following conditions:
- Failure of an ECS software process on an individual PSC
- Failure of the system such that a second system takes over. (For example: a backup or standby system put in place according to Interchassis Session Recovery.)
- File Sequence Number (FileSeqNumber) rollover from 999999999 to 0
- FileSeqNumber: Unique file sequence number for the file with 9 digit integer having range from 000000000 to 999999999. It is unique on each system.

File name for a closed xDR file in CSV format that contains information for ECS system *xyz_city1* and charging service name *preapaid2* with timestamp 12311969190000, and file sequence number counter reset indicator to *002* for file sequence number *034939002* appears as follows:
xyz_city1_preapaid2_12311969190000_002_034939002
File name for a running xDR file, not closed, in CSV format that contains information for the same parameters for file sequence number *034939003* prefixed with curr_ and appears as follows:
curr_xyz_city1_preapaid2_12311969190000_002_034939002

---

reset-indicator

Specifies inclusion of the reset indicator counter value from 0 through 255 in EDR file name, and is incremented (by one) whenever any of the following conditions occur:

- an ACSMgr process fails.
- a peer chassis has taken over in compliance with our Interchassis Session Recovery feature.
- the sequence number, see **sequence-number** keyword, has rolled over to zero.

---

rotation { num-records *number* **| time** *seconds* **| volume** *bytes* **}**

Defaults: **num-records**: 1024
time: 3600 seconds
volume: 102400 bytes
Specifies when to close an EDR file and create a new one.
num-records *number*: Specifies the number of records that should be added to the file. When the number of records in the file reaches the specified value, the file is complete. *number* must be an integer 100 through 10240.
time *seconds*: Specifies the period of time to wait before closing the EDR file and creating a new one. *seconds* must be an integer from 30 through 86400.

volume *bytes*: Specifies the maximum size of the EDR file before closing it and creating a new one. *bytes* must be an integer from 51200 to 62914560. (Note, a higher setting may improve the compression ratio when the compression keyword is set to gzip.)

sequence-number { length *length* **| omit | padded | padded-six-length | unpadded }**

Default: **padded**
Specifies including/excluding sequence number in the file name.

- **length** *length*: Includes the sequence number with the specified length. *length* must be the file sequence number length with preceding zeroes in the file name, and must be an integer from 1 through 9.

Important: The **length** configuration is applicable in both EDR and UDR modules. When applied in both modules without the **file udr-seq-num** configuration, the minimum among the two values will come into effect for both the modules. With the **file udr-seq-num** config, each module will use its own value of length.

- **omit**: Excludes the sequence number from the file name.
- **padded**: Includes the padded sequence number with preceding zeros in the file name. This is the default setting.
- **padded-six-length**: Includes the padded sequence number with six preceding zeros in the file name.
- **unpadded**: Includes the unpadded sequence number in the file name.

single-edr-format

Default: Disabled
Creates separate files for EDRs having different formats.

storage-limit *limit*

Default: 33554432
Specifies deleting files when the specified amount of space, in bytes, is used up for EDR/UDR file storage on the PSC's RAM.
On an ASR 5000 chassis, *limit* must be an integer from 10485760 through 536870912.

Important: On an ASR 5000 chassis the total storage limit is 536870912 bytes (512 MB). This limit is for both UDR and EDR files combined.

time-stamp { expanded-format | rotated-format | unix-format }

Specifies the timestamp of when the file was created be included in the file name.

- **expanded-format**: Specifies the UTC MMDDYYYYHHMMSS format.
- **rotated-format**: Specifies the time stamp format to YYYYMMDDHHMMSS format.
- **unix-format**: Specifies the UNIX format of *x.y*, where *x* is the number of seconds since 1/1/1970 and *y* is the fractional portion of the current second that has elapsed.

trailing-text *string*

Specifies the inclusion of arbitrary text string in the file name.

string must be an alpha and/or numeric string of 1 through 30 characters in length.

trap-on-file-delete

Default: Disabled
This keyword instructs the system to send an SNMP notification (trap) when an EDR/UDR file is deleted due to lack of space.

xor-final-record

Default: Disabled
Specifies inserting an xor checksum (in place of the CRC checksum) into the EDR file header if the **exclude-checksum-record** is left at its default setting.

+

More than one of the previous keywords can be entered within a single command.

Usage

Use this command to configure EDR file characteristics.

Example

The following command sets the prefix of the current active EDR file to *Current*:

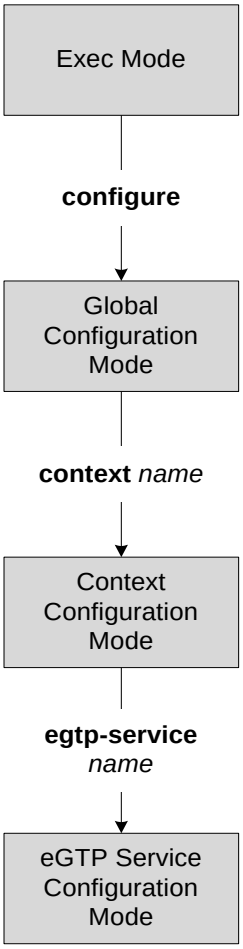
```
file current-prefix Current
```

The following command sets the base file name to *EDRfile*:

```
file name EDRfile
```

Chapter 86
eGTP Service Configuration Mode Commands

The eGTP Service Configuration Mode is used to create and manage eGTP interface types and associated parameters.



associate

Configures an association with a GTP-U service where parameters are applied to the GTP-U data flow.

Product

P-GW

Privilege

Administrator

Syntax

associate gtpu-service *name*

no associate gtpu-service

no

Removes the association to the configured GTP-U service from this service.

gtpu-service *name*

Associates a GTP-U service with this eGTP service. *name* must be from 1 to 63 alpha and/or numeric characters.

Usage

Use this command to associate a GTP-U service with this eGTP service.

Example

The following command associates this eGTP service with a GTP-U service named *gtpu3*:

```
associate gtpu-service gtpu3
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

```
exit
```

Usage

Return to the previous mode.

gtpc

Configure the GPRS Tunneling Protocol Control (GTP-C) plane settings for this service.

Product

MME, P-GW, S-GW

Privilege

Administrator

Syntax

gtpc { bind { ipv4-address *ipv4_address* **[ipv6-address** *ipv6_address* **] | ipv6-address** *ipv6_address* **[ipv4-address** *ipv4_address* **] } | echo-interval** *seconds* **| ip qos-dscp {** *forwarding_type* **} | max-retransmissions** *num* **| retransmission-timeout** *seconds* **}**

no gtpc { bind { ipv4-address *ipv4_address* **[ipv6-address** *ipv6_address* **] | ipv6-address** *ipv6_address* **[ipv4-address** *ipv4_address* **] } | echo-interval }**

default gtpc { echo-interval | ip qos-dscp | max-retransmissions | retransmission-timeout }

---

no

Disables or removes the configured GTP-C setting.

---

default

Resets the specified parameter to its default value.

---

bind { ipv4-address *ipv4_address* **[ipv6-address** *ipv6_address* **] | ipv6-address** *ipv6_address* **[ipv4-address** *iv4p_address* **] }**

Binds the service to an interface with an IPv4 address, IPv6 address or both.
ipv4-address *ipv4_address* **[ipv6-address** *ipv6_address* **]**: Binds this service to the IPv4 address of a configured interface. Optionally, bind the service to a configured interface with an IPv6 address. *ipv4_address* must be entered as a standard IPv4 address in dotted decimal notation. *ipv6_address* must be entered as a standard IPv6 address in colon-separated notation.
ipv6-address *ipv6_address* **[ipv4-address** *ipv4_address* **]**: Binds this service to the IPv6 address of a configured interface. Optionally, bind the service to a configured interface with an IPv4 address. *ip6_address* must be entered as a standard IPv6 address in colon-separated notation. *ipv4_address* must be entered as a standard IPv4 address in dotted decimal notation.

---

echo-interval *seconds*

Default: 60
Configures the duration between the sending of echo messages. *seconds* must be an integer value from 60 to 3600.

---

ip qos-dscp { *forwarding_type* **}**

Default: **af11**

Specifies the IP QoS DSCP per-hop behavior to be marked on the outer header of signalling packets originating from the LTE component. This is a standards-based feature (RFC 2597). The following forwarding types are supported:
af11: Designates the use of Assured Forwarding 11 per-hop behavior
af12: Designates the use of Assured Forwarding 12 per-hop behavior
af13: Designates the use of Assured Forwarding 13 per-hop behavior
af21: Designates the use of Assured Forwarding 21 per-hop behavior
af22: Designates the use of Assured Forwarding 22 per-hop behavior
af23: Designates the use of Assured Forwarding 23 per-hop behavior
af31: Designates the use of Assured Forwarding 31 per-hop behavior
af32: Designates the use of Assured Forwarding 32 per-hop behavior
af33: Designates the use of Assured Forwarding 33 per-hop behavior
af41: Designates the use of Assured Forwarding 41 per-hop behavior
af42: Designates the use of Assured Forwarding 42 per-hop behavior
af43: Designates the use of Assured Forwarding 43 per-hop behavior
be: Designates the use of Best Effort forwarding per-hop behavior
ef: Designates the use of Expedited Forwarding per-hop behavior typically dedicated to low-loss, low-latency traffic.
The assured forwarding behavior groups are listed in the table below.

	Class 1	Class 2	Class 3	Class 4
Low Drop	AF11	AF21	AF31	AF41
Medium Drop	AF12	AF22	AF32	AF42
High Drop	AF13	AF23	AF33	AF43

Traffic marked with a higher class is given priority during congestion periods. If congestion occurs to traffic with the same class, the packets with the higher AF value are dropped first.

max-retransmissions *num*

Default: 4
Configures the maximum number of retries for packets. *num* must be an integer from 0 through 15.

retransmission-timeout *seconds*

Default: 5
Configures the control packet (echo message) retransmission timeout in GTP, in seconds. *seconds* must be an integer value from 1 through 20.

Usage

Use this command to configure GTP-C settings for the current service. This interface assumes the characteristics of an S11 reference point on the S-GW or MME.

Example
The following command binds the service to a GTP-C interface with an IP address of *112.334.556.778*:

```
gtpc bind address 112.334.556.778
```

interface-type

Configures the interface type used by this service.

Product

MME, P-GW, S-GW

Privilege

Administrator

Syntax

```
interface-type { interface-mme | interface-pgw-ingress | interface-sgsn |
interface-sgw-egress | interface-sgw-ingress }
```

{ interface-mme | interface-pgw-ingress | interface-sgsn | interface-sgw-egress | interface-sgw-ingress }

interface-mme: Specifies that the interface has the characteristics of an eGTP MME S11 reference point to/from an S-GW.
interface-pgw-ingress: Specifies that the interface has the characteristics of an eGTP P-GW S5/S8 reference point from an S-GW. The interface assumes the characteristics of either a GTP-C (control Plane) or GTP-U (user plane) reference point.
interface-sgsn: Specifies that the interface has the characteristics of an eGTP S-GW S4 reference point to/from an SGSN.
interface-sgw-egress: Specifies that the interface has the characteristics of an eGTP S-GW S5/S8 reference point to an eGTP P-GW. The interface assumes the characteristics of either a GTP-C (control Plane) or GTP-U (user plane) reference point.
interface-sgw-ingress: Specifies that the interface has the characteristics of:

- an eGTP-C S-GW S11 reference point from the MME.
- an eGTP-U S-GW S1-U reference point from the eNodeB.

Usage

Use this command to specify the type of interface this service uses. By configuring this command, the interface takes on the characteristics of the selected type.

Example

The following command configures the interface bound to this service to maintain the characteristics of an eGTP-C S-GW S11 reference point from an MME:

```
interface-type interface-sgw-ingress
```

validation-mode

Configures the type of validation to be performed on messages received by this service.

Product

P-GW

Privilege

Administrator

Syntax

```
validation-mode { custom1 | standard }

default validation-mode
```

default

Returns the command to the default setting of **standard**.

{ custom1 | standard }

custom1: Specifies that the message should be validated based on a vendor-specific set of mandatort elements.
standard: Specifies that the message should be validated based on the set of mandatort elements as defined in 3GPP 29.274.

Usage

Use this command to specify the type of validation performed on messages received by this service. The information elements contained in messages have mandatory elements and conditional elements. The standard set of elements, as defined by 3GPP 29.274 is checked if this command is set to “standard”. The custom1 setting is for a vendor-specific set of mandatory elements.

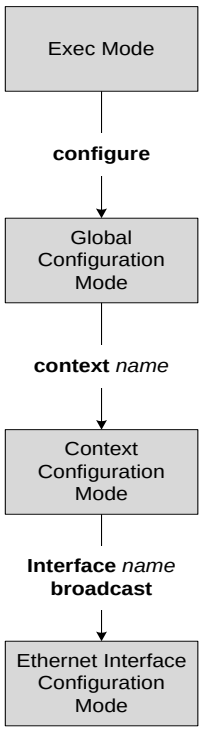
Example

The flowering command sets the validation mode for incoming messages to standard:

```
validation-mode standard
```

Chapter 87
Ethernet Interface Configuration Mode Commands

The Ethernet Interface Configuration Mode is used to create and manage the IP interfaces for addresses, address resolution options, etc.



crypto-map

Applies the specified IPSec crypto-map to this interface.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

crypto-map*map_name* **[secondary-address***sec_ip_addr* **]**

no

Deletes the application of the crypto map on this interface.

map_name

Specifies the name of the crypto map being applied. The name can be from 1 to 127 alpha and/or numeric characters and is case sensitive.

secondary-address *sec_ip_addr*

Applies the crypto map to the secondary address for this interface that is specified by *sec_ip_addr*. *sec_ip_addr* must be specified using the standard IPv4/IPv6 notation.

Usage

In order for ISAKMP and/or manual crypto maps to work, they must be applied to a specific interface using this command. Dynamic crypto maps should **not** be applied to interfaces.
The crypto map must be configured in the same context as the interface.

Example

To apply the IPSEC crypto map named cmap1 to this interface, use the following command:

```
crypto-map cmap1
```

description

Configures the description text for the current interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

description*text*

no description

no

Clears the description for the interface.

text

Specifies the descriptive text to use. *text* must be 0 to 79 alpha and/or numeric characters with no spaces or a quoted string of printable characters

Usage

Set the description to provide useful information on the interface's primary function, services, end users, etc. Any information useful may be provided.

Example

description *sampleInterfaceDescriptiveText*

end

Exits the interface configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the interface configuration mode and returns to the context configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the context configuration mode.

ip

Configures the IP options for the current interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip { access-group *acl_name* **{ in | out } [** *priority-value* **] | address** *ip_address ip_mask* **[secondary | srp-activate] | arp { arpa | timeout** *seconds* **} }**

no ip { access-group *acl_name* **{ in | out } | address** *ip_address* **| arp { arpa | timeout } }**

no

Disables and/or restores the option to the system default.

access-group *acl_name* **{ in | out } [** *priority-value* **]**

acl_name specifies the access control list to be added/removed from the group. The ACL rules must be configured in the same context as the interface.
In Release 8.1 and later, *acl_name* must be an alpha and/or numeric string of 1 through 47 characters in length.
In Release 8.0 and earlier, *acl_name* must be an alpha and/or numeric string of 1 through 79 characters in length.
The direction must also be specified as either inbound or outbound using the keywords **in** and **out**, respectively.
priority-value: Default: 0. If more than one ACL is applied, *priority-value* specifies the priority in which they will be compared against the packet. If not specified, the priority is set to 0. *priority-value* must be an integer from 0 through 4294967295. If access groups in the list have the same priority, the last one entered is used first.

Important: Up to 8 ACLs can be applied to a group provided that the number of rules configured within the ACL(s) does not exceed the 128 rule limit for the interface.

address *ip_address ip_mask* **[secondary | srp-activate]**

Configures the IP address for the interface specifying the networking mask as well. *ip_address* and *ip_mask* must be specified using the standard IPv4/IPv6 notation.
The **secondary** keyword is used to configure a secondary IP address on the interface. This is referred to as multi-homing of the interface.
The **srp-activate** Activates the IP address for Interchassis Session Redundancy.

arp { arpa | timeout *seconds* **}**

Important: These keywords have been replaced by the **R_arp** command in the Global Configuration Mode. For backwards compatibility, however, these keywords are accepted as valid.

Usage

Create and manage the IP interfaces for the associated context.

Example

The following command configures the access group for the current context:

ip access-group *sampleAccessGroup*
ip address *1.2.3.4 0.0.0.128* **secondary**

The following command sets the address resolution protocol timeout.

ip arp timeout *1800*

The following commands remove the associated IP address and disable ARP for the interface, respectively.

no ip address *1.2.3.4***no ip arp arpa**

ip mtu

Configures the Maximum Transmission Unit (MTU) for this IP interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip mtu*mtu-size*

no ip mtu*mtu-size*

no

Deletes the MTU value.

Usage

On ASR 5000 we support IP MTU with a normal interface and point-to-point interface (for OLC port). The maximum MTU size allowed with an OLC port is 1600, the maximum MTU size allowed with an Ethernet port is 2048. The default MTU size is 1500.

Example

The following command sets the MTU value to the default.

ip mtu *1500*

ip ospf authentication-key

This command configures the password for the authentication with neighboring routers.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospfauthentication-key [encrypted] password*auth_key*

no ip ospfauthentication-key

no

Deletes the authentication key.

encrypted

Use this keyword if you are pasting a previously encrypted authentication key into the CLI command.

password *auth_key*

The password to use for authentication. *authentication_key* is a string variable, from 1 through 16 alphanumeric characters, that denotes the authentication password. This variable is entered in clear text format.

Usage

Use this command to set the authentication key used when authenticating with neighboring routers.

Example

To set the authentication key to 123abc, use the following command;

```
ip ospf authentication-key password 123abc
```

Use the following command to delete the authentication key;

```
no ip ospf authentication-key
```

ip ospf authentication-type

This command configures the OSPF authentication method to be used with OSPF neighbors over the logical interface.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
ip ospf authentication-type { message-digest | null | text }
```

```
no ip ospf authentication-type { message-digest | null | text }
```

no

Disable this function.

message-digest

Set the OSPF authentication type to use the message digest (MD) authentication method.

null

Set the OSPF authentication type to use no authentication, thus disabling either MD or clear text methods.

text

Set the OSPF authentication type to use the clear text authentication method.

Usage

Use this command to set the type of authentication to use when authenticating with neighboring routers.

Example

To set the authentication type to use clear text, enter the following command;

```
ip ospf authentication-type text
```

ip ospf cost

This command configures the cost associated with sending a packet over the logical interface.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

ipospfcost*value*

no ipospfcost

no

Disable this function.

value

Default: 10
The cost to assign to OSPF packets. This must be an integer from 1 through 65535.

Usage

Use this command to set the cost associated with routes from the interface.

Example

Use the following command to set the cost to 20;

```
ip ospf cost 20
```

Use the following command to disable the cost setting;

```
no ip ospf cost
```

ip ospf intervals

This command configures the interval or delay type, and the interval or delay time in seconds, for OSPF communications.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospf { dead-interval*value* | **hello-interval***value* | **retransmit-interval***value* | **transmit-delay***value* **}**

no ip ospf { dead-interval | hello-interval | retransmit-interval | transmit-delay }

no

Deletes the value set and returns the value to its default.

dead-interval *value*

Default: 40
The interval, in seconds, that the router should wait, during which time no packets are received and after the router considers a neighboring router to be off-line. *value* must be an integer from 1 through 65535.

hello-interval *value*

Default: 10
The interval, in seconds between sending hello packets. *value* must be an integer from 1 through 65535.

retransmit-interval *value*

Default: 5
The interval, in seconds, between LSA (Link State Advertisement) retransmissions. *value* must be an integer from 1 through 65535.

transmit-delay *value*

Default: 1
The interval, in seconds, that the router should wait before transmitting a packet. *value* must be an integer from 1 through 65535.

Usage

Use this command to set the intervals or delays for OSPF communications.

Example

To set the dead-interval to 100, use the following command;

ip ospf dead-interval *100*
To delete the setting for the dead-interval and reset the dead-interval value to its default of 40, use the following command’

```
no ip ospf dead-interval
```

ip ospf message-digest-key

This command enables the use of MD5-based OSPF authentication.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospfmessage-digest-key*key_id***md5 [encrypted] password***authentication_key**

no ip ospfmessage-digest-key*key_id*

no

Deletes the key.

message-digest-key key_id

Specifies the key identifier number. key_id must be an integer from 1 through 255.

encrypted

Use this if you are pasting a previously encrypted authentication key into the CLI command.

password *authentication_key*

The password to use for authentication. *authentication_key* is a string variable, from 1 through 16 alphanumeric characters, that denotes the authentication password. This variable is entered in clear text format.

Usage

Use this command to create an authentication key that uses MD5-based OSPF authentication.

Example

To create a key with the ID of 25 and a password of 123abc, use the following command;

```
ip ospf message-digest-key 25 md5 password 123abc
```

To delete the same key, enter the following command;

```
no ip ospf message-digest-key 25
```

ip ospf network

Configures the OSPF network type.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
ipospfnetwork { broadcast | non-broadcast | point-to-multipoint | point-to-point }

no ipospfnetwork
```

no

Disable this function.

broadcast

Sets the network type to broadcast.

non-broadcast

Sets the network type to non-broadcast multi access (NBMA).

point-to-multipoint

Sets the network type to point-to-multipoint.

point-to-point

Sets the network type to point-to-point.

Usage

Use this command to specify the OSPF network type.

Example

To set the OSPF network type to broadcast, enter the following command;

```
ip ospf network broadcast
```

To disable the OSPF network type, enter the following command;

```
no ip ospf network
```

ip ospf priority

This command designates the OSPF router priority.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

ipospfpriority*value*

no ipospfpriority*value*

no

Disable this function.

value

The priority value to assign. This must be an integer from 0 through 255.

Usage

Use this command to set the OSPF router priority.

Example

To set the priority to 25, enter the following command:

```
ip ospf priority 25
```

To disable the priority, enter the following command:

```
no ip ospf priority
```

ipv6 access-group

Specifies the name of the ACL group to assign the interface to. You can filter for either inbound or outbound traffic.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

`[no] ipv6 access-group` *`group name`* **`{ in | out } { priority-value`** *`}`*

`no`

Removes a previously configured access group association.

`group_name`

Specifies the name of the access group. group_name must be an alpha and/or numeric string of 1 to 79 characters.

`in`

Applies the filter to the inbound traffic.
Specify a priority_value for the access group from 0 to 4294967295. The lower values indicate a higher priority.

`out`

Applies the filter to the outbound traffic.
Specify a priority-value for the access group from 0 to 4294967295. The lower values indicate a higher priority.

`priority-value`

Default: 0
Specifies the priority of the access group. 0 is the highest priority. If priority-value is not specified the priority is set to 0. priority-value must be a value from 0 to 4294967295.
If access groups in the list have the same priority, the last one entered is used first.

Usage

Use this command to specify the ACL group to assign the interface to. Specify an ACL group name with this command.

Important: Up to 8 ACLs can be applied to a group provided that the number of rules configured within the ACL(s) does not exceed the 128 rule limit for the interface.

Example

Use the following command to associate the group_1 access group with the current IPv6 profile for inbound access:
ipv6 access-group *group_1* **in** *1*

ipv6 address

Specifies the address and subnet mask.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

ipv6 address *ip_address*

ip_address

Specifies an individual host IP address to add to this host pool.
ip_address is the IP address in colon separated notation.

Usage

Configures the IPv6 address and subnet mask for a specific interface.

ipv6 router advertisement

Enables or disables the system to send IPv6 router advertisements.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
[no] ipv6 router advertisement
```

Usage

Enables sending of router advertisements on the interface. All of the pool prefixes in the context (belonging to the interface) will be advertised in the router advertisement.
The router-lifetime in the advertisement is sent as 0 to indicate to the receiver that the sender cannot be a default-router. For all the prefixes (pools), the valid and preferred lifetime are sent as default. The router-advertisement is sent every 600 seconds.
If the pool-prefix is deleted, then an router-advertisement is sent for that particular prefix with the valid and preferred time set to 0.

policy-forward

Configure the system for redirecting the HA packets to new HA during existing HA upgradation.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

policy-forward { icmp unreachable next-hop*ip address* **|unconnected-address next-system***ip address***}**

no policy-forward unconnected-address

no policy-forward unconnected-address

Deletes the policy forwarding configuration for unconnected address for the current interface.

icmp unreachable next-hop *ip address*

Specifies routing of Internet Control Message Protocol (icmp) unreachable is required in overlapping pool configuration. *ip address* must be an IP address expressed in IPv4/IPv6 notation.

unconnected-address next-system *ip address*

Specifies address of next system HA to handle processing during HA upgrade.
ip address must be an IP address expressed in IPv4/IPv6 notation.

Usage

Use this command to set the redirecting policy for IP packets from existing HA to new HA during upgradation. To configure this command both keyword will be in separate interface.

Important: It is a customer specific command.

To configure existing HA system for redirecting the HA packets to new HA during existing HA upgrade enter the following command:

policy-forward unconnected-address next-system *ip address***policy-forward icmp unreachable next-hop** *ip address*

pool-share-protocol

Configure the primary or secondary system for the IP pool sharing protocol and enter IPSP configuration mode.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
pool-share-protocol { primaryaddress|secondaryaddress} [mode {active | inactive
| check-config}]

no pool-share-protocol
```

no pool-share-protocol

Deletes the IP pool sharing protocol information from the current interface.

primary *address*

On the secondary system, define the IP address of an interface on the primary system that has identical IP pools configured for use with the IP pool sharing protocol. *address* must be an IP address expressed in IP v4 dotted decimal notation.

secondary *address*

On the primary system, define the IP address of an interface on the secondary system that has identical IP pools configured for use with the IP pool sharing protocol. *address* must be an IP address expressed in IP v4 dotted decimal notation.

mode {active | inactive | check-config}

This is an optional command to manage the mode for IP pool sharing protocol for primary or secondary HA.
active: Activates the IP pool sharing protocol mode.
inactive: Inactivates the IP pool sharing protocol mode.
check-config: Verify the IP pool sharing protocol configuration.

Usage

Use this command to set the IP address of the primary or secondary system for use with the IP pool sharing protocol and enter ipsp configuration mode. This command must be configured for an interface in each context that has IP pools configured. Refer to the System Administration and Configuration Guide for information on configuring and using the IP pool sharing protocol.

Important: Both the primary and secondary systems must be in the same subnet.

Important: For information on configuring and using IPSP refer to the System Administration and Configuration Guide.

Important: To reserve free addresses on primary HA for this command use reserved-free-percentage command in *IPSP Configuration Mode Commands* of this guide.

Example

To configure a secondary system with an IP address of 192.168.100.10 for use with the IP pool sharing protocol, enter the following command:

pool-share-protocol secondary *192.168.100.10*

To inactivate a secondary system with an IP address of 192.168.100.10 for use with the IP pool sharing protocol, enter the following command:

```
pool-share-protocol secondary 192.168.100.10 mode inactive
```

port-switch-on-L3-fail

This command causes the line card port to which the current interface is bound to switch over to the port on the redundant line card when connectivity to the specified IP address is lost.

Product

All

Privilege

Security Administrator, Administrator

Syntax

port-switch-on-L3-failaddress { *ip_address | ipv6_address* } [minimum-switchover-period*switch_time*] [interval*int_time*] [timeout*time_out*] [num-retry*number*]

no port-switch-on-L3-fail

no

Disable port switchover on failure.

ip_address

The IP address to monitor for connectivity. ‘ ip_address must be in either ipv4 format or IPv6 format

minimum-switchover-period *switch_time*

Default: 120 seconds
After a switchover occurs, another switchover cannot occur until the amount of time specified has elapsed. *switch_time* must be an integer in the range from 1 to 3600.

interval *int_time*

Default: 60 seconds
This specifies how often, in seconds, monitoring packets are sent to the IP address being monitored. *int_time* must be an integer in the range from 1 to 3600.

timeout *time_out*

Default: 3 seconds
This specifies how long to wait without a reply before resending monitoring packets to the IP address being monitored. *time_out* must be an integer in the range from 1 to 10.

num-retry *number*

Default: 5
This value specifies how many times to retry sending monitor packets to the IP address being monitored before performing the switchover operation. *number* must be an integer in the range from 1 to 100.

Usage

Use this command to monitor a destination in your network to test for L3 connectivity. The destination being monitored should be reachable from both the active and standby line cards.

Example

The following command enables port switchover on connectivity failure to the IP address 192.168.10.100 using default values:

```
port-switch-on-L3-fail address 192.168.10.100
```

The following command disables port switchover on connectivity failure:

```
no port-switch-on-L3-fail
```

vlan-map

This command sets a single next-hop IP address so that multiple vlans can use a single next-hop gateway. **vlan-map** is associated with a specific interface.

Product

PDSN, HA, SGSN

Privilege

Security Administrator, Administrator

```
vlan-map next-hop ip_address
```

next-hop *ip_address*

This keyword defines an IP address for the next-hop gateway.
ip_address: Can be either an IPv4 or IPv6 address in standard format.

Usage

Use vlan-map to combine multiple vlan links to go through a single IP address. This feature is used in conjunction with nexthop forwarding and overlapping IP pools.
After configuring the vlan-map, move to the Port Ethernet configuration mode to attach the vlan-map to a specific vlan.

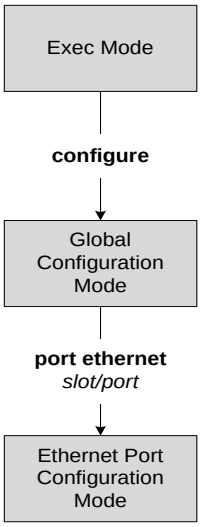
Example

The following command sets an IPv4 for a next-hop gateway.

```
vlan-map next-hop 123.123.123.1
```

Chapter 88
Ethernet Port Configuration Mode Commands

The Ethernet Port Configuration Mode is used to create and manage Ethernet ports and their bindings between contexts.



bind interface

Configures an association (binds) between a virtual IP interface or an SS7 or Frame Relay link to a specific context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

bind interface *interface_name context_name*

no bind interface *interface_name context_name*

no

Indicates the virtual interface specified is to be unbound from the context.

interface_name

Specifies the name of the virtual interface to be bound to the context. *interface_name* must be from 1 to 79 alpha and/or numeric characters.

context_name

Specifies the name of the context to be bound to the virtual port. *context_name* must refer to a previously configured context.

Usage

Bind an interface to a context to allow the context to provide service.

Example

bind interface *sampleVirtual sampleContext*
no bind interface *sampleVirtual sampleContext*

default

Restores the port's default speed and communication mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

default { medium | preferred slot | threshold { *value* } }

medium

Restores the default values for the medium options as follows:

- SPIO and fast ethernet line cards: auto
- Gigabit ethernet line card: auto

preferred slot

Sets the port for non-revertive operation for port redundancy auto-recovery; requiring an administrative user to manually issue a port switch to command to return service to the original port.

threshold { *value* }

Restores the specified port-level threshold parameter to its default value(s). The possible values are:

- **high-activity :** High port activity threshold settings
- **monitoring :** Threshold monitoring configuration settings
- **rx-utilization :** Receive port utilization threshold settings
- **tx-utilization :** Transmit port utilization threshold settings

Usage

Restores port-level parameters to their default values.

Example

default medium

description

Sets the port descriptive text.

Product

All

Privilege

Security Administrator, Administrator

Syntax

description *text*

no description

no

Clears the description for the port.

text

Specifies the descriptive text to use. *text* must be 1 to 79 alpha and/or numeric characters with no spaces or a quoted string using printable characters.

Usage

Set the description to provide useful information on the port's primary function, services, end users, etc. Any information useful may be provided.

Example

description *samplePortDescriptiveText*
description *"This is a sample description"*

end

Exits the port configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the port configuration mode and returns to the global configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the global configuration mode.

flow-control

Enables and disables flow control on the Quad Gig-E linecard (QGLC).

Product

PDSN, SGSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

[no] flow-control

no flow-control

Disables flow control on the specified port

Usage

Flow control is enabled by default on the QGLC and can be disabled using the **no** command on a per-port basis. This command does not work on Fast Ethernet or Gigabit Ethernet line cards (FELC, GELC) which do not support flow control.

ingress-mode

Labels this port as an ingress port.

Product

IPSG

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ingress-mode
```

no

Disables ingress port tag.

Usage

Use this command to label this port in order for the session manager to recognize the interface from which IP data packets are being received. This command should be used in single context configurations. In single context configurations, the ingress port can only be identified if labeled.

link aggregation

Used to aggregate ports on a Quad Gig-E line card (QGLC) and set LACP parameters.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] link aggregation { master | member | group N } [ lacp { active | passive
} ] [ rate { auto | slow | fast } ]

default link-aggregation lacp
```

no

This command deletes the Ethernet port from any group it might be in. If the port was the Master of a group, the whole group would be deleted.

master

This command creates the Master port for the aggregated group.
group N is an integer between 1..1023.

member

This command makes the port a member of the aggregated group.
group N is an integer between 1..1023.

lacp { active | passive }

Configures the Link Aggregation Control Protocol.
active mode sends out LACP packets periodically.
passive mode only responds to LACP packets received.

rate { auto | fast | slow }

Configures the rate at which the LACP sends packet and timeout events.
auto = the rate is controlled by the peer
fast = 1sec
slow = 30sec

default

Configures LACP default settings. Defaults are **active** and **slow**.

Usage

Configure from one to four ports on a QGLC to be in an aggregation group on the chassis to link to an aggregation group on a remote switch. Very large files can be downloaded across all ports in a group, which makes for a faster download when compared to serial downloads over a single link.

Example

The following example configures the port to be the Master for Group 2:

```
link aggregation master group 2
```

media

Configures the port interface type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

media { **rj45** | **sfp** }

rj45 | sfp

rj45: sets the physical interface to RJ-45 connectors.
sfp: sets the physical interface connection to SFP gigabit.

Usage

Set the media option when the physical cabling interface is changed.

Example

The following command sets the physical interface to RJ-45 and SFP, respectively:

media rj45
media sfp

medium

Configures the port speed and communication mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

medium { **auto** | **speed** { **10** | **100** | **1000** } **duplex** { **full** | **half** } }

auto | speed { 10 | 100 | 1000 } duplex { full | half }

Default: **auto**
Optionally sets the speed of the interface and the communication mode.
auto: configures the interface to auto negotiate the interface speed.
speed { **10** | **100** | **1000** }: specifies the speed to use at all times.
duplex { **full** | **half** }: sets the communication mode of the interface to either **full** or **half** duplex.

Important: Ethernet networking rules dictate that if a device whose interface is configured to auto-negotiate is communicating with a device that is manually configured to support full duplex, the first device will negotiate to the manually configured speed of the second device but will only communicate in half duplex mode.

Usage

Set the medium options when the physical interface changes.

Example

The following configures the port's speed and communication mode to be auto negotiated.

```
medium auto
```

The following command configures the port's interface speed to gigabit with full duplex communication.

```
medium speed 1000 duplex full
```

preferred slot

Assigns revertive or non-revertive control to port redundancy auto-recovery.

Default: non-revertive operation

Product

PDSN, FA, HA, SGSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
preferred slot slot#

no preferred slot slot#
```

no

Disables revertive, or auto-recovery, operation for selected port.

slot#

Identifies the physical chassis slot where the line card or SPIO card is installed.

Usage

This command enables or disables revertive port redundancy, wherein after a port failover, when the original port is restored to service (i.e. link up) the system will return service to that port automatically.
Disabled, which is the default setting, causes non-revertive operation; requiring an administrative user to manually issue a port switch to command to return service to the original port.
This command must be issued on a per port basis, allowing you to configure specific ports to be used on individual LCs or SPIO cards. For example, ports 1 through 4 could be configured as “preferred” on the LC in slot 17 while ports 5 through 8 are “preferred” on the LC in slot 33. In this scenario, both LCs would be in an Active operational state while still providing LC and port redundancy for the other.

Important: This command is not supported on all platforms.

Example

```
preferred slot  17
```

shutdown

Terminates all processes supporting the port or blocks the shutting down of the port. Conversely, the port is enabled with the use of the **no** keyword.

Product

All

Privilege

Security Administrator, Administrator

Syntax

shutdown

no shutdown

no

Enables the port. When omitted the card is shutdown (removed from service).

Usage

Shut down a port prior to re-cabling and/or other maintenance activities.
This command is necessary to bring a port into service by enabling it via the **no** keyword.

Example

shutdown
no shutdown

snmp trap link-status

Enables/disables the generation of an SNMP trap for link status changes.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
snmp trap link-status

no snmp trap link-status
```

no

Disables the sending of traps for link status changes.

Usage

Enable link status change traps when a monitoring facility can use the information or if there are trouble shooting activities are in progress.

Example

```
snmp trap link-status
no snmp trap link-status
```

srp virtual-mac-address

Configures the SRP virtual MAC address for the port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

srp virtual-mac-address *MAC_Address*

no srp virtual-mac-address

no

Disables the SRP virtual MAC addressing for Ethernet ports. The block of virtual MAC addresses is not saved.

Usage

The SRP virtual MAC address is applied to the port when the chassis is in SRP ACTIVE state. The default is **no srp virtual-mac-address**.

Important: This command is not supported on all platforms.

Example

srp virtual-mac-address *MAC_Address*

no srp virtual-mac-address

threshold high-activity

Configures thresholds for high port activity for the port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold high-activity *high_thresh* [**clear** *low_thresh*]

high_thresh

Default: 50
The high threshold high port activity percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh can be configured to any integer value between 0 and 100.

clear

Allows the configuration of the low threshold.

low_thresh

Default: 50
The low threshold high port activity percentage that maintains a previously generated alarm condition. If the activity percentage falls below the low threshold within the polling interval, a clear alarm will be generated.
low_thresh can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

High port activity thresholds generate alerts or alarms based on the utilization percentage of each configured port during the specified polling interval. This threshold is configured on a per-port basis.
Alerts or alarms are triggered for high port activity based on the following rules:

- **Enter condition:** Actual percent utilization of a port ³ High Threshold
- **Clear condition:** Actual percent utilization of a port < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command in the Global Configuration Mode Commands chapter of this reference to configure the polling interval and the **threshold monitoring** command in this chapter to enable thresholding for this value.

Example

The following command configures a high port utilization threshold percent of 70 and a low threshold of 50 for an system using the Alarm thresholding model:

```
threshold high-activity 70 clear 50
```

threshold monitoring

Enables thresholding for port-level values.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] threshold monitoring
```

no

Disables threshold monitoring for port-level values. This is the default setting.

Usage

Thresholding on the system is used to monitor the system for conditions that could potentially cause errors or outage. Typically, these conditions are temporary (i.e high-activity) and are quickly resolved. However, continuous or large numbers of these error conditions within a specific time interval may be indicative of larger, more severe issues. The purpose of thresholding is to help identify potentially severe conditions so that immediate action can be taken to minimize and/or avoid system downtime.

Thresholding reports conditions using one of the following mechanisms:

- **SNMP traps:** SNMP traps have been created that indicate the condition (high threshold crossing and/or clear) of each of the monitored values. Complete descriptions and other information pertaining to these traps is located in the starentMIB(8164).starentTraps(2) section of the SNMP MIB Reference.

The generation of specific traps can be enabled or disabled on the system allowing you to view only those traps that are most important to you.

- **Logs:** The system provides a facility called threshold for which active and event logs can be generated. As with other system facilities, logs are generated Log messages pertaining to the condition of a monitored value are generated with a severity level of WARNING.
- **Alarm System:** High threshold alarms generated within the specified polling interval are considered "outstanding" until a the condition no longer exists and/or a condition clear alarm is generated.

"Outstanding" alarms are reported to through the system's alarm subsystem and are viewable through the system's CLI.

The following table indicates the reporting mechanisms supported by each of the above models.

Table 20. Thresholding Reporting Mechanisms by Model

Model	SNMP Traps	Logs	Alarm System
Alert	X	X	
Alarm	X	X	X

This command enables thresholding for port-level values. Refer to the **threshold high-activity, threshold rx-utilization,** and **threshold tx-utilization** commands in this chapter for

information on configuring these values. In addition refer to the **threshold poll** command in the Global Configuration Mode Commands chapter of this reference for information on configuring the polling interval over which these values are monitored.

threshold rx-utilization

Configures thresholds for receive port utilization.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold rx-utilization *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 80
The high threshold receive port utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
The percentage can be configured to any integer value between 0 and 100.

clear

Allows the configuration of the low threshold.

low_thresh

Default: 80
The low threshold receive port utilization percentage that maintains a previously generated alarm condition. If the utilization percentage falls below the low threshold within the polling interval, a clear alarm will be generated.
The percentage can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Receive port utilization thresholds generate alerts or alarms based on the utilization percentage of each configured port in relation to data received during the specified polling interval. This threshold is configured on a per-port basis.

Important: Ports configured for half-duplex do not differentiate between data received and data transmitted. Therefore, to avoid redundant alarms, it is recommended that only the receive **or** transmit utilization threshold be configured.

Alerts or alarms are triggered for receive port utilization based on the following rules:

- **Enter condition:** Actual percent utilization of a port for received data ³ High Threshold
- **Clear condition:** Actual percent utilization of a port for received data < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command in the Global Configuration Mode Commands chapter of this reference to configure the polling interval and the **threshold monitoring** command in this chapter to enable thresholding for this value.

Example
The following command configures a receive port high utilization threshold percent of 70 and a low threshold of 50 for an system using the Alarm thresholding model:

```
threshold rx-utilization 70 clear 50
```

threshold tx-utilization

Configures thresholds for transmit port utilization.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold tx-utilization *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 80
The high threshold transmit port utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
The percentage can be configured to any integer value between 0 and 100.

clear

Allows the configuration of the low threshold.

low_thresh

Default: 80
The low threshold transmit port utilization percentage that maintains a previously generated alarm condition. If the utilization percentage falls below the low threshold within the polling interval, a clear alarm will be generated.
The percentage can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Transmit port utilization thresholds generate alerts or alarms based on the utilization percentage of each configured port in relation to data transmitted during the specified polling interval. This threshold is configured on a per-port basis.

Important: Ports configured for half-duplex do not differentiate between data received and data transmitted. Therefore, to avoid redundant alarms, it is recommended that only the receive **or** transmit utilization threshold be configured.

Alerts or alarms are triggered for transmit port utilization based on the following rules:

- **Enter condition:** Actual percent utilization of a port for transmit data ³ High Threshold
- **Clear condition:** Actual percent utilization of a port for transmit data < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command in the Global Configuration Mode Commands chapter of this reference to configure the polling interval and the **threshold monitoring** command in this chapter to enable thresholding for this value.

Example
The following command configures a transmit port high utilization threshold percent of 70 and a low threshold of 50 for an system using the Alarm thresholding model:

```
threshold tx-utilization 70 clear 50
```

vlan

Creates/deletes a VLAN tag and enters VLAN configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

vlan *tag* **[inline-process] [subscriber-vlan] [-noconfirm]**

no vlan *tag*

no

Deletes the VLAN with the specified tag.

tag

A tag that you specify to identify the VLAN. The tag must be unique and not used by any other VLANs on any other ports in the system. *tag* must be an integer from 1 through 4095.

inline-process

Do not use this keyword. This is a restricted keyword. It sets this VLAN for special processing for packets received from an external inline server.

subscriber-vlan

Designates the VLAN type as a subscriber VLAN. This keyword must be specified if the VLAN is to be associated with specific subscribers. Refer to the ip vlan command in the Subscriber Configuration Mode chapter of this reference for additional information on Subscriber-VLAN associations.

Important: To maintain optimal performance, this keyword should **not** be specified for VLANs that are not to be associated with subscribers.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Virtual LANs (VLANs) provide greater flexibility in the configuration and use of contexts and services. They are configured as “tags” on a per-port basis and allow more complex configurations to be implemented. The VLAN tag allows a single physical port to be bound to multiple logical interfaces that can be configured in different contexts. Therefore, each Ethernet port can be viewed as containing many logical ports when VLAN tags are employed.

Important: VLANs are supported in conjunction with ports on the Ethernet 10/100 and 1000 line cards and on the four-port Quad Gig-E Line Card (QGLC). (VLAN tagging is not supported for SPIO ports.) The system supports the configuration of VLANs as follows:

Important: Ethernet 1000 Line Card/QGLC: 1024 VLANs per card. QGLC supports 511 VLANs per port.

Important: Ethernet 10/100 Line Card: Maximum of 256 VLANs per port and a maximum of 1016 VLANs per Line Card. (VLANs on all the ports of a single 10/100 Line Card can not add up to more than 1016.)

Important: In order to change the type (using/removing the **subscriber-vlan** keyword) for VLANs that are already configured, the VLAN must first be deleted and then reconfigured as desired.

Example

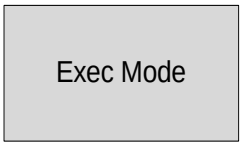
The following example creates a VLAN and assign it the tag of 100:

```
vlan 100
```

Chapter 89
Exec Mode Commands (A-C)

This section includes the commands **aaa test** through **crypto-group**

The Exec Mode is the initial entry point into the command line interface system. Exec mode commands are useful in troubleshooting and basic system monitoring.



aaa test

This command tests AAA functionality between the system and a remote server.

Product

PDSN, HA, GGSN, SGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator

Syntax

aaa test { accounting username *user_name* **| authenticate** *user_name password* **| session** *user_name password* **}**

accounting username *user_name*

Tests RADIUS or GTPP accounting functionality for the specified user.
user_name is the name of a user configured on the RADIUS or CFG server.

Important: GTPP is used only in conjunction with the GGSN or SGSN product.

authenticate *user_name password*

Tests RADIUS authentication functionality for the specified user.
user_name is the name of a user configured on the RADIUS server. *password* is the user's password.

session *user_name password*

Tests both RADIUS authentication and RADIUS or GTPP accounting functionality for the specified user.
user_name is the name of a user configured on the RADIUS server. *password* is the user's password.

Important: GTPP is used only in conjunction with the GGSN or SGSN product.

Usage

This command is used to test RADIUS-based authentication and RADIUS or GTPP accounting. This command may be useful for diagnosing problems with subscribers and access to the system and/or billing data.

Example

The following command verifies accounting for a user called user1:

aaa test accounting username *user1*

The following tests authentication for a user called user1 with a password of abc123:

aaa test authentication *user1 abc123*

The following command will test both accounting and authentication for the user called user1 with a password of abc123:

aaa test session *user1 abc123*

active-charging service

This command creates an active charging service.

Product

ECS

Privilege

Security Administrator, Administrator, Operator

Syntax

active-charging service *ecs_service_name* **[-noconfirm]**

ecs_service_name

Specifies the active charging service name.
service_name must be an alpha and/or numeric string of 1 through 15 characters in length.
If the named service does not exist, it is created, and the CLI mode changes to the Active Charging Service Configuration mode wherein the service can be configured.
If the named service already exists, the CLI mode changes to the Active Charging Service Configuration mode wherein the service can be reconfigured.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create an active charging service on the system. This command can be used directly in Exec-mode after issuing the **require active-charging** command in the Global Configuration mode. This command allows an operator (rather than security administrators and administrators) to configure the Enhanced charging service functionality only.

Important: Operator needs the special CLI privilege for Enhanced charging service functionality to be able to use this CLI command.

Example

The following command creates an active charging service named *test*:

active-charging service *test*

alarm

This command is used to disable the internal audible alarm on the system management card.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
alarm cutoff
```

Usage

Alarm cutoff disables the audible alarm. The alarm may be enabled following this command if an event within the system results in the audible alarm being enabled.

Example

```
alarm cutoff
```

autoconfirm

This command disables or enables confirmation for certain commands. This command affects the current CLI session only.

Important: Use the **autoconfirm** command in the Global Configuration Mode to change the behavior for all future CLI sessions.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
autoconfirm

no autoconfirm
```

Usage

When **autoconfirm** is enabled, certain commands ask you to answer yes or no to confirm that you want to execute the command. When **autoconfirm** is disabled, the confirmation questions never appear. Disabling **autoconfirm** is active for the current session only.
By default **autoconfirm** is enabled.

Example

The following command enables command confirmation:

```
autoconfirm
```

The following command disables command confirmation for the duration of the current CLI session:

```
no autoconfirm
```

bulkstats force

This command is used to manage the system statistics for collection and delivery to the configured server.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
bulkstats force { gather | transfer }
```

gather

Immediately collects the system statistics.

transfer

Immediately send the currently collected statistics to the configured server.

Usage

When the current system statistics are desired immediately as opposed to the normal scheduled collection and delivery intervals issue this command.
Troubleshooting the system may require the review of statistics at times when the scheduled delivery is not timely.

Example

The following causes the chassis to immediately collect system statistics. This would be in anticipation of a transfer command.

```
bulkstats force gather
```

The following command causes the chassis to immediately send all collected statistics to the configured server.

```
bulkstats force transfer
```

card halt

This command halts a card. A card reboot must be issued to bring the card back into service after it is halted.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

card halt*slot_num* **[-force] [-noconfirm]**

slot_num

Indicates the slot number of the card of interest.

-force

Over-rides any warnings to force the card to be halted.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Halt a card to stop the card for maintenance or emergency situations.

Caution: Caution should be taken in using this command as halting a card which has no redundancy card available may cause a service interruption and loss of active sessions.

Caution: The **-force** and **-noconfirm** options should only be used concurrently by experienced users as this will cause an immediate halt regardless of warnings and no confirmation from the user.

Important: This command is not supported on all platforms.

Example

The following command temporarily stops the card in slot *1*.

```
card halt 1
```

The following commands force the card to halt and indicate no confirmation is to take place, respectively.

```
card halt 17 -force -noconfirm
```

```
card halt 17 -noconfirm
```

card lc switch

This is the command for managing the line cards and their active/standby status.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

card lc switch to *target_slot* **[-noconfirm]**

switch to *target_slot*

Indicates the card which is to become the active card specified as *target_slot*.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Line card switch overs change the active/standby status of a line card. This is useful when there is a maintenance activity on the active card which requires removing the card from service.

Caution: Caution should be taken in using this command. Depending on the amount of bandwidth/traffic being switched, some subscribers may experience service interruptions.

Important: This command is not supported on all platforms.

Example

The following command switches the active/standby status of the line cards where one of the cards is in slot *17*. This command only executes after the user provides confirmation of the request.

card lc switch to *17*

The following switches the active/standby status of the line cards where one of the cards is in slot *17*. This command executes immediately with no additional user confirmation.

card lc switch to *17* **-noconfirm**

card lc upgrade

This command upgrades the programmables on the line card.

Product

All

Privilege

Security Administrator, Administrator

Syntax

card lc upgrade*slot_number*

upgrade

Upgrades programmables on the specified card. Must be followed by a slot number of card to upgrade.

Caution: This command should only be used if instructed by or working with Technical Support.

Usage

This command upgrades the linear flash on the line card.

Important: This command is not supported on all platforms.

Example

The following command initiates a lc upgrade:

```
card lc upgrade
```

card psc

This command moves processes from the source PSC to the destination PSC or disables the PSC from accepting any new calls.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

card psc { migratefrom*src_slot***to***dst_slot* **| busy-out } [-noconfirm]**

no card psc busy-out

no card psc busy-out

Disables busy-out. The PSC is re-enabled to accept new calls.

migrate from *src_slot* **to** *dst_slot*

This keyword moves processes from the specified source PSC to the specified destination PSC. The command prompt is returned once the command is initiated. The card migration is completed in background. *src_slot* indicates the source slot number of the card whose processes will be migrated from. *dst_slot* indicates the destination slot number of the card processes will be migrated to.

busy-out

When busy-out is enabled on a PSC, the PSC stops receiving new calls but continues to process calls it currently has until they are completed. The command prompt is returned once the command is initiated. The busy-out procedure is completed in background.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Migrating a packet accelerator card changes the active/standby status of a packet accelerator card. This results in the active sessions/processes being moved to the newly active PSC. This is useful when there is a maintenance activity on the active card which requires removing the card from service.
The destination slot specified must contain a packet accelerator card which is in the standby state for the command to complete successfully.

Caution: Caution should be taken in using this command. Depending on the number of active sessions being migrated, some subscribers may experience service interruptions.

Using busy-out to refuse new calls on a PSC allows you to take a card out of service without any interruptions to the end user. An individual system can be taken completely out of service gracefully by

enabling busy-out on all PSCs and waiting for current calls to complete. The **show card** info command shows if busy-out is enabled.

Important: When a PSC fails, is migrated, or is restarted for any reason busy-out is reset to disabled, the default behavior.

Important: This command is not supported on all platforms.

Example

The following command migrates the active processes from the PSC card in slot *12* to the card in slot *14*. This command only executes after the user provides confirmation of the request.

```
card psc migrate from 12 to 14
```

The following command sets the PSC in slot 1 to stop accepting new calls:

```
card psc busy-out 1
```

card psc upgrade

This command upgrades the programmables on the PSC card.

Product

All

Privilege

Security Administrator, Administrator

Syntax

card psc upgrade*slot_number*

upgrade

Upgrades programmables on the specified card. Must be followed by a slot number of card to upgrade.

Caution: This command should only be used if instructed by or working with Technical Support.

Usage

You can only initiate an upgrade if:

- there is no migration occurring
- the card is active or standby
- there is no online upgrade in progress

Important: The following operations are not allowed while a card is upgrading: change pac edc requirement (config) change card [no] shutdown (config) change card active (config) change card redundancy (config) card halt (exec) card reboot (exec) start an online upgrade

Important: Level unlock operations are ignored while a card is upgrading.

Important: This command is not supported on all platforms.

Example

The following command initiates a PSC upgrade:

```
card psc upgrade
```

card reboot

This performs a reset of the target card. Rebooting a packet processing or line card will result in the card downloading the image from the system management card.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

card reboot*target_slot* **[-force] [-noconfirm]**

target_slot

Indicates the slot number of the card which is the target of the reboot.

-force

Indicates the reboot is to take place ignoring any state or usage warnings that might be generated.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

A reboot is used to reset the card and receive a new download. This may be useful when a card is not responding or when it is necessary to cause the card to reload its image and restart.

Important: Caution should be taken in using this command as rebooting a card which has no redundancy card available may cause a service interruption and loss of active sessions.

Caution: The **-force** and **-noconfirm** options should only be used concurrently by experienced users as this will cause an immediate reboot regardless of warnings and no confirmation from the user.

Important: This command is not supported on all platforms.

Example

The following will cause the card in slot *8* to reboot without any confirmation from the user. The card will not reboot if there are any warnings generated.

```
card reboot 8 -noconfirm
```

The following command will cause the card in slot *8* to reboot regardless of any warnings. The user must provide confirmation prior to this command executing.

card reboot *8* **-force**

The following command will cause the card in slot *8* to reboot regardless of any warnings with no additional user confirmation.

card reboot *8* **-force -noconfirm**

card restart

This performs a soft-reset of the target card causing all application processes to restart.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

card restart*target_slot* **[-force] [-noconfirm]**

target_slot

Indicates the slot number of the card which is the target of the restart.

-force

Indicates the restart is to take place ignoring any state or usage warnings that might be generated.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Restarting a card may be useful when a card is not performing as expected (performance drop, increased response delays, etc.). A restart may be preferred to a reboot as the card becomes available in less time than a reboot.
When this command is issued for an active card, the user is prompted for confirmation unless the -force and/or -noconfirm keywords are used. Because the reboot of standby or redundant cards is non-service impacting, the reboot proceeds immediately after the command execution without user confirmation.

Important: Caution should be taken in using this command as restarting a card which has no redundant card available may cause a service interruption and loss of active sessions.

Important: This command is not supported on all platforms.

Caution: The **-force** and **-noconfirm** options should only be used concurrently by experienced users as this will cause an immediate restart regardless of warnings and no confirmation from the user.

Example

The following will cause the card in slot *8* to restart without any confirmation from the user. The card will not reboot if there are any warnings generated.

```
card restart 8 -noconfirm
```

The following command will cause the card in slot *8* to restart regardless of any warnings. The user must provide confirmation prior to this command executing.

```
card restart 8 -force
```

The following command will cause the card in slot *8* to restart regardless of any warnings with no additional user confirmation.

```
card restart 8 -force -noconfirm
```

card smc

This is command is for managing the switch processor cards and their active/standby status and synchronizing the filesystem between the active device and the standby device.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
cardsmc { switchover | synchronize filesystem [ /flash | /hd | /pcmcia1 | all ]
[ checkonly ] [ reverse ] } [ -noconfirm ]
```

-noconfirm

Executes the command without any additional prompt and confirmation from the user.

switchover

Switches control from the active SMC to the defined standby SMC.

synchronize filesystem [/flash | /hd | /pcmcia1 | all] [checkonly] [reverse]

/flash: Synchronizes only the filesystem on the standby SMC's /flash device.
/hd: Synchronizes only the filesystem on the standby SMC's hard drive.
/pcmcia1: Synchronizes only the filesystem on the standby SMC's /pcmcia1 device.
all: Synchronizes file systems on all available matching local devices (/flash, /pcmcia1).
checkonly: Displays a list of files that could be synchronized, without executing any synchronization actions.
reverse: When used, the specified operation is performed from the standby SMC to the active SMC.

Usage

The switch over of an SMC changes the active/standby status of an SMC card. This is useful when there is a maintenance activity on the active card which requires removing the card from service.
Each SMC contains independent local devices, namely a CompactFlash (/flash) and a PCMCIA card slot (/pcmcia1). Either of these devices may contain system files such as binary software images, configuration text files, boot system files, and others used to control and manage the system. This command allows the files contained on the active (currently managed) SMC to be synchronized, or mirrored, on the like local device(s) contained on the standby SMC.

Important: Only filesystems on matching local devices are synchronized. For example, if the active SMC contains two local devices (/flash and /pcmcia1) and the standby SMC contains only one local device (/flash), then synchronization only occurs on the matching local device (i.e. /flash).

Important: This command is not supported on all platforms.

Example

The following command switches the active/standby status of the switch processor cards. This command only executes after the user provides confirmation of the request.

```
card smc switchover
```

The following command switches the active/standby status of the SMCs and executes immediately with no additional user confirmation:

```
card smc switchover -noconfirm
```

The following command synchronizes the filesystems on all available matching local devices (/flash, /pcmcia1):

```
card smc synchronize filesystem all
```

The following command checks to see what files could be synchronized but no synchronization is performed:

```
card smc synchronize filesystem checkonly
```

card smc upgrade

This command updates the programmables on the SMC.

Product

All

Privilege

Security Administrator, Administrator

Syntax

card smc upgrade*slot_number*

upgrade

Upgrades programmables on the specified card. Must be followed by a slot number of card to upgrade.

Caution: This command should only be used if instructed by or working with Technical Support.

Usage

You can only initiate an upgrade if:

- there is no migration occurring
- the card is active or standby
- there is no online upgrade in progress

Important: The following operations are not allowed while a card is upgrading: change pac edc requirement (config) change card [no] shutdown (config) change card active (config) change card redundancy (config) card halt (exec) card reboot (exec) start an online upgrade

Important: Level unlock operations are ignored while a card is upgrading.

Important: This command is not supported on all platforms.

Example

The following command initiates a PSC upgrade:

```
card psc upgrade
```

Caution: This command should only be used if instructed by or working with Technical Support.

card spio

This is the command for managing the switch processor I/O cards and their active/standby status.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

card spio switch to*slot#* **[-noconfirm]**

slot#

The slot number of the SPIO card that you want to switch to be the active card. The currently active SPIO card is put in standby mode and the SPIO card in the specified slot number is made active.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Switch over changes the active/standby status of a SPIO card. This is useful when there is a maintenance activity on the active card which requires removing the card from service.

Important: This command is not supported on all platforms.

Example

The following command switches the active/standby status of the switch processor I/O cards. This command only executes after the user provides confirmation of the request.

```
card spio switch
```

The following switches the active/standby status of the switch processor I/O cards. This command executes immediately with no additional user confirmation.

```
card lc switch -noconfirm
```

cdr-push

This command initiates manual push of CDR files to L-ESS.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

cdr-push { all | local-filename *file_name* **}**

all

Specifies to push all CDR files to the configured URL.

local-filename *file_name*

Specifies to push the specified file to the configured URL.
file_name must be the absolute path of local file name to push, and must be a string of 1 through 1023 characters in length.

Usage

Use this command to manually push CDR files to the configured L-ESS.
For information on configuring the L-ESS, see the **cdr** command in the EDR Module Configuration Mode Commands/UDR Module Configuration Mode Commands chapters.
On ASR 5000 chassis, run this command only from the local context. If you are in any other context, you will see this failure message: “Failure: Manual PUSH of CDRs supported only in the local context”

Example

The following command pushes all CDR files to the URL:

```
cdr-push all
```

clear

The following commands clear a variety of items including statistics, conditions, alarms, sessions, and files:

clear aaa

This command is used to clear all AAA statistics in the current context.

Product

PDSN, GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear aaa local counters
```

Usage

Clearing the AAA statistics which may be useful when monitoring the statistics manually. Clearing resets the counters to zero.

The keyword **local** is not intended to imply the local context defined for all systems. Rather, the keyword **local** indicates the statistics within the current context are to be cleared.

Example

The following command zeroes out all the AAA statistics in the current context.

```
clear aaa local counters
```

clear active-charging analyzer statistics

This command is used to clear protocol analyzer statistics.

Product

ECS

Privilege

Security Administrator, Administrator, Operator

Syntax

clear active-charging analyzer statistics [name *protocol_name* **] [| { grep** *grep_options* **| more }]**

---

name *protocol_name*

Clears statistics for the specified protocol analyzer.
If this keyword is not specified all statistics are cleared.
protocol_name must be one of the following:

- **dns**
- **file-transfer**
- **ftp**
- **http**
- **icmp**
- **icmpv6**
- **imap**
- **ip**
- **ipv6**
- **mms**
- **p2p [application]**: Peer-to-peer analyzer. The supported applications are:
  - **actsync**
  - **aimini**
  - **applejuice**
  - **ares**
  - **battlefld**
  - **bittorrent**
  - **ddlink**
  - **directconnect**
  - **edonkey**
  - **fasttrack**
  - **feidian**
  - **filetopia**

- freenet
- fring
- gadu_gadu
- gnutella
- halflife2
- hamachivpn
- iax
- imesh
- iptv
- irc
- iskoot
- jabber
- manolito
- msn
- mute
- nimbuzz
- openft
- orb
- oscar
- paltalk
- pando
- pandora
- popo
- pplive
- ppstream
- qq
- qqgame
- qqlive
- quake
- rdp
- secondlife
- skinny
- skype
- slingbox
- sopcast
- soulseek
- steam

- tvants
- tvuplayer
- uusee
- vpnx
- vtun
- warcft3
- winmx
- winny
- wofwarcraft
- xbox
- yahoo
- zattoo

- pop3
- pptp
- rtcp
- rtp
- rtsp
- sdp
- secure-http
- sip
- smtp
- tcp
- tftp
- udp
- wsp
- wtp

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Use this command to clear active charging analyzers.

Example

The following command clears active charging service analyzer information for analyzer named tcp:

```
clear active-charging analyzer statistics name tcp
```

clear active-charging charging-action statistics

This command is used to clear charging action statistics.

Product

ECS

Privilege

Security Administrator, Administrator, Operator

Syntax

clear active-charging charging-action statistics [name*string***] [| { grep***grep_options***| more }]**

name *string*

Clears detailed information for specific protocol analyzer.
string must be the name of an existing charging action.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Use this command to clear active charging action statistics.

Example

The following command clears active charging action statistics information for charging action named **pre-paid**:

```
clear active-charging charging-action statistics name pre-paid
```

clear active-charging content-filtering category statistics

This command is used to clear category-based content filtering statistics for the specified rulebase.

Product

CF

Privilege

Security Administrator, Administrator, Operator

Syntax

clear active-charging content-filtering category statistics [rulebase name*rulebase_name***| all] [| { grep***grep_options***| more }]**

all

Clears the statistics of each and every configured rulebase.

rulebase_name

rulebase_name must be the name of an existing rulebase, and must be an alpha and/or numeric string of 1 through 15 characters in length.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Use this command to category-based content filtering statistics.

Example

The following command clears category-based content filtering statistics information for Rulebase named *cf_rule1*:

clear active-charging content-filtering category statistics rulebase name *cf_rule1*

clear active-charging credit-control statistics

This command clears credit control statistics.

Product

ECS

Privilege

Security Administrator, Administrator, Operator

Syntax

clear active-charging credit-control statistics [group*group_name***]**

group *group_name*

Clears statistics for the specified credit control group. *group_name* must be the name of a credit control group, and must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to clear credit control statistics.

Example

The following command clears statistics information for credit control:

```
clear active-charging credit-control statistics
```

clear active-charging edr-format statistics

Clears the statistics for the specified EDR format.

Product

ECS

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear active-charging edr-format statistics [ name edr_format]
```

name *edr_format*

Specifies name of the EDR format for which you want to clear the statistics.
edr_format must be the name of a configured EDR format, and must be an alpha and/or numeric string of 1 through 63 characters in length.

Important: If an EDR format name is not specified statistics for all EDR formats are cleared.

Usage

Use this command to clear the accumulated statistics for the specified EDR format.

Example

The following command clears the statistics for all EDR formats:

```
clear active-charging edr-format statistics
```

clear active-charging edr-udr-file statistics

This command is used to clear EDR/UDR file related statistics.

Product

ECS

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear active-charging edr-udr-file statistics
```

Usage

Use this command to clear EDR and UDR file statistics.

Example

The following command clears statistical information for EDR and UDR files:

```
clear active-charging edr-udr-file statistics
```

clear active-charging firewall statistics

This command clears Active Charging Stateful Firewall statistics.

Product

FW

Privilege

Security Administrator, Administrator, Operator

Syntax

clear active-charging firewall statistics [callid *call_id* **| domain-name** *domain_name* **| nat-realm** *nat_realm* **| protocol { icmp | ip | other | tcp | udp } | username** *user_name* **] [acsmgr instance** *instance_id* **] [| { grep***grep_options***| more }]**

---

acsmgr instance *instance_id*

Specifies an ACS Manager instance ID.
instance_id must be an integer from 1 through 65535.

---

callid *call_id*

Specifies a Call Identification number.
call_id must be an eight-digit HEX number.

---

domain-name *domain_name*

Specifies a domain name for the statistics.
domain_name must be a string of 1 through 127 characters in length.

---

nat-realm *nat_realm*

Specifies a NAT realm name for the statistics.
nat_realm must be a string of 1 through 31 characters in length.

---

protocol { icmp | ip | other | tcp | udp }

Specifies protocol for the stats.

- **icmp**: ICMP protocol
- **ip**: IP protocol
- **other**: Protocols other than TCP, UDP, and ICMP
- **tcp**: TCP protocol
- **udp**: UDP protocol

---

username *user_name*

Specifies a user name for the statistics.
user_name must be a string of 1 through 127 characters in length.

grep *grep_options* | **more**

Indicates that the output of the command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Use this command to clear Active Charging Stateful Firewall statistics.

Example

The following command clears all Stateful Firewall statistics:

```
clear active-charging firewall statistics
```

clear active-charging firewall track-list

This command clears the list of servers being tracked for involvement in any Denial-of-Service (DOS) attacks.

Product

FW

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear active-charging firewall track-list attacking-servers
```

Usage

Use this command to clear the list of servers being tracked for involvement in any DOS attacks.

Example

The following command clears the list of servers being tracked for involvement in any DOS attacks:

```
clear active-charging firewall track-list attacking-servers
```

clear active-charging fw-and-nat policy statistics

This command clears statistics for all or a specific firewall-and-NAT policy.

Product

FW, NAT

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear active-charging fw-and-nat policy statistics { all | name policy_name } [
| { grepgrep_options| more } ]
```

all

Displays information for all firewall-and-NAT policies configured.

name *policy_name*

Displays information for the specified firewall-and-NAT policy.
policy_name must be the name of a firewall-and-NAT policy, and must be an alpha and/or numeric string of 1 through 63 characters in length.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

Use this command to clear statistics for all or a specific firewall-and-NAT policy.

Example

The following command clears statistics for the firewall-and-NAT policy named *test123*:

```
clear active-charging fw-and-nat policy statistics name test123
```

clear active-charging group-of-ruledefs statistics

This command clears statistical information related to Active Charging Service group of ruledefs.

Product

ECS

Privilege

Security Administrator, Administrator, Operator

Syntax

clear active-charging group-of-ruledefs statistics [name *group_of_ruledefs* **] [| { grep***grep_options***| more }]**

name *group_of_ruledefs*

Specifies name of the group of ruledefs for which statistics must be cleared. *group_of_ruledefs* must be the name of an existing group of ruledefs, and must be a string of 1 through 63 characters in length.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Use this command to clear statistical information related to all or specified Active Charging Service group of ruledefs.

Example

The following command clears statistical information related to the group of ruledefs named *ruldef_group12*:

clear active-charging group-of-ruledefs statistics name *ruledef_group12*

clear active-charging nat statistics

This command clears NAT realm statistics.

Product

NAT

Privilege

Security Administrator, Administrator, Operator

Syntax

clear active-charging nat statistics [nat-realm *nat_realm* **] [| { grep***grep_options***| more }]**

---

clear active-charging nat statistics

This command when issued in the local context clears statistics for all NAT realms in all contexts. When issued in a specific context, this command clears statistics for all NAT realms in that context.

---

clear active-charging nat statistics nat-realm *nat_realm*

This command when issued in the local context clears statistics for the specified NAT realm in all contexts. When issued in a specific context, this command clears statistics for the specified NAT realm in that context.

---

nat-realm *nat_realm*

Specifies the NAT realm's name.
nat_realm must be an alpha and/or numeric string of 1 through 31 characters in length.

---

grep *grep_options* **| more**

Specifies that the command's output be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section in the Command Line Interface Reference.

Usage

Use this command to clear NAT realm statistics.

Example

The following command when issued in the local context, clears NAT realm statistics for NAT realms named *test135* in all contexts:

clear active-charging nat statistics nat-realm *test135*

clear active-charging rulebase statistics

This command clears ACS rulebase statistics.

Product

ECS

Privilege

Security Administrator, Administrator, Operator

Syntax

clear active-charging rulebase statistics [name*rulebase_name* **] [| { grep***grep_options*| **more }]**

rulebase_name

Clears statistics for specified ACS rulebase.
rulebase_name must be the name of an existing rulebase, and must be an alpha and/or numeric string of 1 through 15 characters in length.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Use this command to clear ACS rulebase statistics.

Example

The following command clears statistics for the ACS rulebase named *postpaid*:

clear active-charging rulebase statistics name *postpaid*

clear active-charging ruledef statistics

This command clears ACS rule definition statistics.

Product

ECS

Privilege

Security Administrator, Administrator, Operator

Syntax

clear active-charging ruledef statistics [charging | firewall **| name** *ruledef_name* **] [| { grep** *grep_options* **| more }]**

charging

Clears statistics for all Charging rule definitions configured.

firewall

Clears statistics for all Firewall rule definitions configured.

name *ruledef_name*

Clears statistics for the specified active charging service rule definition.
ruledef_name must be the name of an existing rule definition, and must be an alpha and/or numeric string of 1 through 63 characters in length.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Use this command to clear ACS ruledef statistics.

Example

The following command clears all ruledef statistics:

```
clear active-charging ruledef statistics
```

clear active-charging subsystem

This command is used to clear all Active Charging service information.

Product

ECS

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear active-charging subsystem
```

Usage

Use this command to clear all Active Charging subsystem information.

Example

The following command clears all Active Charging service information:

```
clear active-charging subsystem
```

clear active-charging url-blacklisting statistics

This command clears URL Blacklisting feature related statistics.

Product

CF

Privilege

Security Administrator, Administrator, Operator

Syntax

clear active-charging url-blacklisting statistics [rulebase name *rulebase_name* **] [| { grep***grep_options***| more }]**

rulebase name *rulebase_name*

Clears URL Blacklisting information for the specified rulebase.
rulebase_name must be the name of a rulebase, and must be a string of 1 through 63 characters in length.

grep *grep_options* **| more**

Specifies that the output of the command must be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Use this command to clear URL Blacklisting feature related statistics, optionally for a specific rulebase.

Example

The following command clears URL Blacklisting feature related statistics for *rulebase12*:

```
clear active-charging url-blacklisting statistics rulebase name
rulebase12
```

clear administrator

This command ends the session of an administrative user specified by either user name or session ID.

Product

All

Privilege

Security Administrator, Administrator

Syntax

clear administrator { name*user_name***| session id***id_num***}**

name *user_name*

Identifies the user name of the administrative user.

session id *id_num*

Identifies the ID number of the administrative user session as displayed in the **show administrators session id** command output.

Usage

This command is used to terminate command line interface sessions for other administrative users.

Example

The following command ends the session of the administrative user identified as user1:

clear administrator name *user1*

The following command ends the session of the administrative user with the session ID of 3:

clear administrator session id *3*

clear alarm

Clears outstanding alarm conditions

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

clear alarm { all | chassis | id*num* **| port***slot/port* **| slot***slot* **}**

all

Clear all outstanding alarms

chassis

Clears chassis-wide and fan tray alarms

id *num*

Clears a specific alarm by its internal alarm ID. *num* is the internal alarm identification number.

port *slot/port*

Clears alarms for the specified port. *slot/port* is the port to clear alarms for.*slot* is the slot that the card is installed in and *port* is the port on that card.

slot *slot*

Clears alarms for the specified slot. *slot* is the slot to clear alarms for.

Usage

Use this command to clear outstanding alarm conditions.

Example

To clear all outstanding alarms, use the following command:

```
clear alarm all
```

To clear all alarms for slot 7, enter the following command:

```
clear alarm slot 7
```

clear asngw-service

This command clears the service session statistics of an ASN GW service specified by either service name or trusted peer address.

Product

All

Privilege

Security Administrator, Administrator

Syntax

clearasngw-service statistics [name*svc_name***| peer-address***ip_address***]**

name *svc_name*

Identifies the name of the ASN GW service to clear all service statistics.

peer-address *ip_address*

Identifies the IP address of the ASN GW peer to clear all service statistics.

Usage

This command is used to terminate command line interface sessions for ASN GW services.

Example

The following command clears the service session statistics of ASN GW service named as asn_svc1:

clear asngw-service statistics name *asn_svc1*

clear asnpc-service

This command clears the service session statistics of an ASN paging controller service specified by either ASN PC service name or trusted paging controller peer address.

Product

All

Privilege

Security Administrator, Administrator

Syntax

clearasnpc-service statistics [name*svc_name***| peer-address***ip_address***]**

name *svc_name*

Identifies the name of the ASN PC service to clear all service session statistics.

peer-address *ip_address*

Identifies the IP address of the ASN PC peer to clear all service statistics.

Usage

This command is used to terminate command line interface sessions for ASN PC services.

Example

The following command clears the service session statistics of ASN PC service named as asnpc_svc1:

clear asnpc-service statistics name *asnpc_svc1*

clear apn statistics

Deletes all previously gathered statistics for either a specific APN or all APNs configured with the given context.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

clear apn statistics [name*apn_name***]**

name *apn_name*

Specifies the name of a specific APN configured in the context for which to clear statistics.
apn_name is the name of the APN and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

Usage

Statistics for a single APN can be cleared using the **name** keyword. Statistics for all APNs in the context can be deleted by entering the command with no keywords.
If this command is executed from within the local context with no keywords, statistics will be cleared for every APN configured on the system regardless of context. In addition, if the name keyword is used when executing from within the local context, statistics for all APNs configured with the specified name will be cleared regardless of context.

Example

The following command clears statistics for an apn called isp1:

clear apn statistics *isp1*

clear bcmcs statistics

Clears BCMCS statistics.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator

Syntax

clear bcmcs statistics [pdsn-service *service_name* **]**

pdsn-service *service_name*

Defines a specific PDSN service for which to clear BCMCS-specific statistics. This value must be a string consisting of up to 63 characters.

Usage

Use this command to clear accumulated BCMCS statistics. You may specify an individual PDSN or peer to selectively clear statistics.

Example

clear bcmcs statistics
clear bcmcs statistics pdsn-service ***service_name***

clear blacklisted-gtpu-bind-address

Clears the GTP-U loopback address blacklisted by a specific RNC as defined for a specific IuPS Service configuration.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

clear blacklisted-gtpu-bind-address*ip_address* **rnc-id** *rnc-id* **mcc** *mcc_num* **mnc** *mnc_num* **iups-service** *name*

ip_address

Specifies the IP loopback address that has been blacklisted. This loopback address was originally defined with the **associate-gtpu-bind-addfress** command in the Radio-Network-Controller configuration mode of the IuPS Service.
ip_address must be specified using the standard IPv4 dotted decimal notation.

Usage

This command enables this loopback address to be used for future RAB-assignment requests.

Example

clear blacklisted-gtpu-bind-address ***1.1.1.1*** **rnc-id** ***2*** **mcc** ***123*** **mnc** ***321*** **iups-service** ***iups1***

clear bssap+ statistics

Clears/deletes the statistics for Base Station System Application Part plus in a Gs service sessions.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

clear bssap+ statistics [gs-service *gs_svc_name* **] [vlr { name vlr**_*name* **| isdn-number** *E164_ISDN_Num* **}]**

gs-service *gs_svc_name*

Specifies the name of a specific Gs service to clear the BSSAP+ information.
gs_svc_name is the name of a configured Gs service for which BSSAP+ is applied and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

vlr { name vlr_*name* **| isdn-number** *E164_ISDN_Num* **}**

Specifies the name of the VLR or SS7 address in E.164 ISDN format to clear the BSSAP+ information.
name vlr_*name* is name of the VLR must be an alpha and/or numeric string of 1 to 63 characters.
E164_VLR_num is an ISDN number for VLR per E.164 number plan and must be an numerical string of 1 to 15 digits.

Usage

Use this command to delete or clear the statistics of BSSAP+ application on a system.

Example

The following command clears the information about BSSAP+ in a Gs service named *gssvc1*.

```
clear bssap+ statistics gs-service gssvc1
```

clear bulkstats

Clears counters and accumulated bulk statistics related information.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear bulkstats { counters | data }
```

counters

Clears the counters maintained by the system's "bulkstats" facility.

data

Clears any accumulated data that has not been transferred. This includes any "completed" files that haven't been successfully transferred.

Usage

Once bulk statistics collection is enabled, the system stores the information until the specified transfer criteria is met or until a manual transfer is initiated. The system maintains counters for the "bulkstats" software facility. (Refer to the **data** keyword for the **show bulkstats** command for information on viewing the counters.)

This command can be used to delete bulk statistics information that has been collected but not transferred and/or to clear the counters that have been maintained.

Example

The following command clears bulk statistics-related counters:

```
clear bulkstats counters
```

clear config

This command replaces the active configuration source file with an empty configuration where possible.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
clear config [ -noconfirm ]
```

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Clear the current configuration when a complete over right is desired or if it is necessary to start from an empty configuration.

Important: Clearing the configuration will cause the active configuration source file to be empty and of no use in configuring the system to an active state providing service.

Important: It is suggested that this command only be performed on configurations which have been backed up for easy restoration.

Example

The following command clears the active configuration after the user provides confirmation of the request.

```
clear config
```

The following command clears the active configuration source file immediately with no user confirmation.

```
clear config -noconfirm
```

clear congestion-control statistics

Clears the congestion control statistics for all instances of the specified manager type.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clearcongestion-controlstatistics { a11mgr| asngwmgr | asnpcmgr| hamgr | gtpcmgr
| l2tpmgr| imsimgr}
```

a11mgr

Clears the statistics for all A11 Manager instances.

asngwmgr

Clears the statistics for all ASN GW Manager instances

asnpcmgr

Clears the statistics for all ASN PC-LR Manager instances

hamgr

Clears the statistics for all HA Manager instances.

gtpcmgr

Clears the statistics for all GTPC Manager instances.

l2tpmgr

Clears the statistics for all L2TP Manager instances.

imsimgr

Clears the statistics for all IMSI Manager instances.

Usage

Use this command to statistics for all instances of the specified manager.

Important: When this command is issued in any context other than the local context, only instances of the specified manager for the current context have the statistics cleared. When the current context is the local context, all instances of the specified manager type in all contexts have the statistics cleared.

Example

Clear the statistics for all instances of the A11 manger, by entering the following command:

```
clear congestion-control statistics a11mgr
```

clear content-filtering category statistics

This command clears the Category-based Content Filtering application statistics.

Product

CF

Privilege

Security Administrator, Administrator, Operator

Syntax

clear content-filtering category statistics [facility srdbmgr instance*instance_value***]**

facility srdbmgr instance *instance_value*

Clears logged events for the specified SRDB Manager instance.
instance_value must be an integer from 1 through 8.
In StarOS 9.0 and later, *instance_value* must be an integer from 1 through 10000.

Usage

Use this command to clear all Category-based Content Filtering application statistics, or statistics for a specific SRDB Manager instance.

Example

The following command clears all Category-based Content Filtering application statistics:

```
clear content-filtering category statistics
```

clear crash

The clear crash command removes a specific crash file or all crash files.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

clear crash [list | number*crash_num* **]**

list | number *crash_num*

list: removes all crash files.
number *crash_num*: removes only the crash file specified as *crash_num* which must be within the range of 1 through 30.

Usage

CLear crashes for general maintenance activities in cleaning out old, unused, or files which are of no importance.

Example

The following will remove all crash files.

```
clear crash list
```

The following command will remove only crash file *27*.

```
clear crash number 27
```

clear credit-control statistics

This command is used to clear credit control statistics.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator

Syntax

clear credit-control statistics cc-service *cc_service_name*

cc-service *cc_service_name*

Specifies the credit control service name.
cc_service_name must be an existing Credit Control service, and must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to clear active credit control statistics.

Example

The following command clears the configured credit control statistics for a service named *service1*:

clear credit-control statistics cc-service *service1*

clear crypto

The clear crypto command clears crypto associations or crypto statistics.

Product

PDSN, HA, GGSN, PDG/TTG, PDIF, SCM

Privilege

Security Administrator, Administrator, Operator

Syntax

clear crypto { isakmp [tag*map_name* | **peer***peer_ip*] | **security-association { counters tag***map_name* **[tx | rx] | tag***map_name* | **peer***peer_ip* **} | statistics { ikev2 | ipsec-3gpp-cscf } [service-ip-address** *ip-address* | **service-name** *name* **] }**

isakmp [tag *map_name* | **peer** *peer_ip* **]**

When no keywords are specified, this command clears all of the ISAKMP security associations for the current context.
tag *map_name*: Clears the ISAKMP SAs for the specified crypto map. *map_name* is the name of an existing crytpo map.
peer *peer_ip*: Deletes the ISAKMP SAs for the specified peer. *peer_ip* must be entered in standard IPv4 notation.

security-association { counters map *map_name* **[tx | rx] | tag** *map_name* **| peer** *peer_ip* **}**

counters tag *map_name* **[tx | rx]**: Resets the counters for the specified crypto map. *map_name* is the name of an existing crypto map. **tx** specifies that only the transmit SA counters are reset. **rx** specifies that only the receive SA counters are reset. If neither **tx** or **rx** are specified, both transmit and receive SA counters are reset.
tag *map_name*: Tears down a Security Association (SA) for the specified crypto map. *map_name* is the name of an existing crytpo map.
peer *peer_ip*: Clears the SAs for all tunnels who have the peer at the specified IP address. *peer_ip* must be entered in standard IPv4 notation.

Caution: Modification(s) to an existing crypto map and/or ISAKMP policy configuration will not take effect until the related security association has been cleared.

statistics { ikev2 | ipsec-3gpp-cscf } [service-ip-address *ip-address* **| service-name** *name* **]**

ikev2: Clears global IKEv2 statistics for the current context.
ipsec-3gpp-cscf: Clears global CSCF IPSec statistics for the current context.
service-ip-address *ip-address***:** Clears statistics for the specified service-ip address. **service-name** *name***:** Clears statistics for the specified service name.

Usage

Clear SAs and apply changes to the crypto map or clear the crypto statistics for this context.

Example

The following clears all IKEv2 crypto statistics for the current context:

```
clear crypto statistics ikev2
```

clear cscf service

Resets statistics counters for a specific CSCF service, all CSCF services, or for all services within a specified context (VPN).

Product

SCM

Privilege

Security Administrator, Administrator, Operator

Syntax

clear cscf service { diameter { location-info | policy-control} statistics [service-name *service_name* **| vpn-name** *name* **] | li-packet-cable statistics [service-name** *service_name***] | performance-counters name** *service_name* **| statistics name** *service_name* **{ all | calls | ip-security | message | package-name { message-summary | presence | reg | winfo } | registrations | sigcomp | tcp | vpn-name** *name* **} }**

---

diameter { location-info | policy-control } statistics [service-name *service_name* **| vpn-name** *name* **]**

Clears Diameter (DPECA) statistics on the CSCF Rx interface with the configuration information.
service-name *service_name*: Specifies the name of a CSCF service for which the statistics will be reset. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.
vpn-name *name*: Specifies the name of a context in which all statistics for all services will be reset. *name* must be an existing context and be from 1 to 79 alpha and/or numeric characters.

---

li-packet-cable statistics [service-name *service_name* **]**

Clears Lawful Intercept statistics.
service-name *service_name*: Clears Lawful Intercept statistics for a specific CSCF service configured on this system. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

---

performance-counters name *service_name*

Clears all CSCF performance counters for a specific CSCF service configured on this system. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters

---

statistics name *service_name* **{ all | calls | ip-security | message | package-name { message-summary | presence | reg | winfo } | registrations | sigcomp | tcp | vpn-name** *name* **}**

Clears service statistics for a specific CSCF service configured on this system. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.
all: Clears all CSCFservice statistics.
calls: Clears statistics related to CSCF calls.
ip-security: Clears statistics related to CSCF IPSec.
message: Clears statistics for the SIP method MESSAGE.
package-name: Clears statistics for the associated event package.

- message-summary: Clears statistics for the “message-summary” event package.

- presence: Clears statistics for the “presence” event package.
- reg: Clears statistics for the “reg” event package.
- winfo: Clears statistics for the “watcher-info” event package.

registrations: Clears statistics related to CSCF registrations, re-registrations, and de-registrations.
sigcomp: Clears statistics related to CSCF sigcomp.
tcp: Displays session statistics related to CSCF TCP.
vpn-name *name*: Clears statistics for a specific CSCF service configured in a specific context on this system. *name* must be an existing context and be from 1 to 79 alpha and/or numeric characters.

Important: This keyword must be followed by another statistics-related keyword.

Usage

Use this command to reset statistics counters for CSCF services. This command will reset the counters in the output of the **show cscf service statistics** command.

Important: This command will not clear current registered users and current CSCF sessions.

Example

The following command resets all statistics for a service named *cscf1*:

```
clear cscf service statistics name cscf1 all
```

clear cscf sessions

Clears statistics for CSCF sessions on this system.

Product

SCM

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear cscf sessions { counters { calls | subscription } service service_name |
service service_name { all | aor aor | session-id id  }
```

counters { calls | subscription } service *service_name*

Clears counters for all CSCF sessions matching the filter criteria.
calls: Counters associated with calls in CSCF service.
subscription: Counters associated with subscriptions in CSCF service.
service *service_name*: Counters on specific CSCF service. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

service *service_name* **{ all | aor** *aor* **| session-id** *id* **}**

Clears session information for all CSCF sessions matching the filter criteria.
service *service_name*: Session statistics on specific CSCF service. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

- all: Specifies that session statistics are to be cleared for all sessions on this service.
- aor *aor*: Specifies that session statistics are to be cleared for sessions at this specific AoR. *aor* must be an existing AoR and be from 1 to 79 alpha and/or numeric characters.
- session-id *id*: Specifies that session statistics are to be cleared for sessions with this ID. *id* must be an existing session ID and be from 1 to 63 alpha and/or numeric characters.

Usage

Use this command to clear session information for CSCF sessions.

Example

The following command resets all session statistics for a service named *cscf1*:

```
clear cscf sessions service cscf1 all
```

clear cscf sip

Resets SIP statistics counters for a specific CSCF service, all CSCF services, or for all services within a specified context (VPN) or interface.

Product

SCM

Privilege

Security Administrator, Administrator, Operator

Syntax

clear cscf sip statistics [name *service_name* **[interface { domain name** *domain_name* **| ip address** *ip_address* **} | vpn-name** *name* **]**

name *service_name*

Specifies the name of a CSCF service for which the SIP statistics will be reset. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

interface { domain name *domain_name* **| ip address** *ip_address* **}**

SIP statistics will be reset in this interface.
domain name *domain_name*: Specifies the domain associated with the CSCF service. *domain_name* must be an existing domain and be from 1 to 64 alpha and/or numeric characters.
ip address *ip_address*: Specifies the destination or source ip address associated with the CSCF service.

vpn-name *name*

Specifies the name of a context in which all SIP statistics for all services will be reset. *name* must be an existing context and be from 1 to 79 alpha and/or numeric characters.

Usage

Use this command to reset SIP counters found in the output of the **show cscf sip** command.

Example

The following command resets the SIP statistics for a service named *cscf1*:

clear cscf sip statistics name *cscf1*

clear cscf subscription

Clears all subscriptions for a named service or for individual subscribers within the service.

Product

SCM

Privilege

Security Administrator, Administrator, Operator

Syntax

clear cscf subscription service *service_name* **{ all | from-aor** *subscriber_aor* **to-aor** *resource_aor* **}**

service *service_name*

Specifies the name of a CSCF service for which the subscription(s) will be cleared. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

all | from-aor *subscriber_aor* **to-aor** *resource_aor*

all: Removes all CSCF subscriptions for the specified service.
from-aor *subscriber_aor*: Removes all CSCF subscriptions for a specified subscriber in a specified service.
subscribed-to *resource_aor*: Removes all CSCF subscriptions for a specified subscriber in a specified service with a specified subscribed-to resource AoR.

Usage

Use this command to clear subscriptions to enforce policies. This command initiates a SUBSCRIBE request with Expires as 0 in the corresponding subscription dialog.

Example

The following command clear all subscriptions for a CSCF service named *cscf1*:

```
clear cscf subscription service cscf1 all
```

clear diameter aaa-statistics

This command clears Diameter AAA statistics.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

clear diameter aaa-statistics [all | [group *aaa_group* **] server** *diameter_server* **] [| { grep** *grep_options* **| more }]**

all

Clears all Diameter server statistics.

group *aaa_group*

Clears Diameter server statistics for the specified AAA group.
aaa_group must be the name of a AAA group, and must be a string of 1 through 64 characters in length.

server *diameter_server*

Clears Diameter server statistics for the specified Diameter server.
diameter_server must be the name of a Diameter server, and must be a string of 1 through 64 characters in length.

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified.
A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Use this command to clear Diameter AAA statistics.

Example

The following command clears Diameter server statistics for the specified AAA group:

clear diameter aaa-statistics group *<aaa_group>*

clear diameter statistics

This command clears Diameter statistics.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

clear diameter statistics [[proxy] endpoint *endpoint_name* **[peer-host** *host_id* **[peer-realm** *realm_id* **]]] [| { grep** *grep_options* **| more }]**

---

endpoint *endpoint_name*

Clears endpoint related statistics.
endpoint_name must be the name of an endpoint, and must be a string of 1 through 63 characters in length.

---

proxy

Clears proxy related statistics.

---

peer-host *host_id*

Clears statistics for the specified Diameter peer host ID.
host_id must be the Diameter peer host ID, and must be a string 1 through 255 characters in length.

---

peer-realm *realm_id*

Clears statistics for the specified Diameter peer realm.
realm_id must be the Diameter peer realm ID, and must be a string 1 through 127 characters in length.

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified.
A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Use this command to clear Diameter statistics.

Example

The following command clears all Diameter statistics for the specified endpoint:

clear diameter statistics endpoint *<endpoint_name>*

clear dhcp statistics

Deletes all previously gathered statistics for either a specific DHCP server or all DHCP servers configured within the given context.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator

Syntax

clear dhcp statistics [dhcp-service*svc_name*| **server***ip_address*]

dhcp-service *svc_name*

The name of a specific DHCP service for which to clear statistics.
svc_name is the name of the DHCP service and can be from 1 to 63 alpha and/or numeric characters in length and is case sensitive.

server *ip_address*

Specifies the IP address of a specific DHCP server configured in the context for which to clear statistics.
ip_address must be entered in dotted decimal notation.

Usage

Statistics for a single server can be cleared using the **server** keyword. Statistics for all DHCP servers in the context can be deleted by entering the command with no keywords.
This command can be executed from any context configured on the system.
If this command is executed from within the local context with no keywords, statistics will be cleared for every DHCP server configured on the system regardless of context. In addition, if the server keyword is used when executing from within the local context, statistics for all DHCP servers configured with the specified name will be cleared regardless of context.

Example

The following command clears statistics for all configured DHCP servers within the context:

```
clear dhcp statistics
```

clear dns-client

Clears DNS cache and/or statistics for a specified DNS client.

Product

SCM

Privilege

Security Administrator, Administrator, Operator

Syntax

clear dns-client *name* **{ cache [query-name** *name* **| query-type { A | SRV }] | statistics }**

dns-client *name*

Defines the name of the DNS client whose cache and/or statistics are being cleared. *name* must be an existing DNS client and be from 1 to 255 alpha and/or numeric characters in length.

cache [query-name *name* **| query-type { A | SRV }]**

Specifies that the cache for the defined DNS client is to be cleared.
query-name *name*: Filters DNS results based on the domain name. *name* must be from 1 to 255 characters in length. *name* is the domain name used to perform the DNS query. *name* is different from the actual domain name which is resolved. For example, to resolve the SIP server for *service.com*, the query name is *_sip._udp.service.com* and the query type is **SRV**.
query-type:

- **A**: Filters DNS results based on domain IP address records (A records).
- **SRV**: Filters DNS results based on service host records (SRV records).

statistics

Specifies that statistics for the defined DNS client are to be cleared.

Usage

Use this command to clear DNS cache and/or statistics for a specified DNS client.

Example

The following command clears statistics for a DNS client named *domain1.com*:

clear dns-client *domain1.com* **statistics**

clear egtpc

Clears enhanced GPRS Tunneling Protocol control plane statistics and counters found in show command outputs and bulk statistics associated with all eGTP-C-related services or those defined by the parameters in this command.

Product

MME, P-GW, S-GW

Privilege

Operator

Syntax

clear egtpc statistics [egtp-service *name* **| interface-type { interface-mme | interface-pgw-ingress | interface-sgw-egress | interface-sgw-ingress } | mme-address** *ip_address* **| pgw-address** *ip_address* **| sgw-address** *ip_address* **]**

egtp-service *name*

Clears all statistics and counters associated with a specific eGTP service name. *name* must be an existing eGTP service name and be from 1 to 63 alpha and/or numeric characters.

interface-type { interface-mme | interface-pgw-ingress | interface-sgw-egress | interface-sgw-ingress }

interface-mme: Clears statistics and counters derived from all MME interface types associated with this system.
interface-pgw-ingress: Clears statistics and counters derived from all P-GW ingress interface types associated with this system.
interface-sgw-egress: Clears statistics and counters derived from all S-GW egress interface types associated with this system.
interface-sgw-ingress: Clears statistics and counters derived from all S-GW ingress interface types associated with this system.

mme-address *ip_address*

Clears all statistics and counters derived from a specific MME IP address. *ip_address* must be an existing MME IP address and be specified in dotted decimal notation (for IPv4) or colon-separated notation (for IPv6).

pgw-address *ip_address*

Clears all statistics and counters derived from a specific P-GW IP address. *ip_address* must be an existing P-GW IP address and be specified in dotted decimal notation (for IPv4) or colon-separated notation (for IPv6).

sgw-address *ip_address*

Clears all statistics and counters derived from a specific S-GW IP address. *ip_address* must be an existing S-GW IP address and be specified in dotted decimal notation (for IPv4) or colon-separated notation (for IPv6).

Usage

Use this command to clear running statistics and counters found in show command and bulk statistics outputs for all eGTP-C-related services or for specific interfaces, services, or IP addresses as specified by parameters in this command.

Example

The following command clears eGTP-C statistics and counter associated with all P-GW ingress interfaces configured on this system:

```
clear egtpc statistics interface-type interface-pgw-ingress
```

The following command clears eGTP-C statistics and counter associated with all MME interfaces configured on this system:

```
clear egtpc statistics interface-type interface-mme
```

clear firewall flows

This command is obsolete.

clear firewall ruledef

This command is obsolete.

clear firewall statistics

This command is obsolete.

clear gmm-sm statistics

Deletes all previously gathered GMM-SM statistics within the given context based on the specified criteria.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear gmm-sm statistics [ gmm-only | sm-only ] [ gprs-service srvc_name [ nsei
nse_id | routing-area mcc mcc_id mnc mnc_id lac lac_id rac rac_id ] ] | [ sgsn-
service srvc_name [ rnc mcc mcc_id mnc mnc_id rnc-id rnc_id | routing area mcc
mcc_id mnc mnc_id lac lac_id rac rac_id ] ]
```

gmm-only

Enter this keyword to display only GPRS mobility management (GMM) information for other specified keyword parameters for the current context.

sm-only

Enter this keyword to display only session management (SM) information for other specified keyword parameters for the current context.

gprs-service *srvc_name*

Enter this keyword to display the statistics for the specified GPRS service. The display request can be narrowed by adding additional keywords.
srvc_name must be an alphanumeric string of 1 to 63 alphanumeric characters.

nsei

Enter this keyword to display the GMM/SM session statistics for the identified network service entity (NSEI).

sgsn-service *srvc_name*

Enter this keyword to display the statistics for the specified SGSN service. The display request can be narrowed by adding additional keywords.
srvc_name must be an alphanumeric string of 1 to 63 alphanumeric characters.

rnc

Enter this keyword to fine-tune the display of the GMM/SM session statistics just for the specified (rnc-id) radio network controller (RNC).

rnc-id *rnc_id*

Enter this keyword to identify the specific RNC.
rnc_id must be an integer from 0 through 4095.

routing-area mcc mcc_id mnc mnc_id lac lac_id rac rac_id

Enter the **routing-area** keyword to fine-tune the display of the GMM/SM session statistics for a specified routing area (RA) identified by the MCC, MNC, LAC and RAC.

mcc *mcc_id*

Enter this keyword to specify the mobile country code (MCC) as part of the identification of the RNC or RA. *mcc_id* must be an integer from 100 through 999.

mnc *mnc_id*

Enter this keyword to specify the mobile network code (MNC) as part of the identification of the RNC or RA. *mnc_id* must be an integer from 00 through 999.

lac *lac_id*

Enter this keyword to specify the location area code (LAC) as part of the identification of the RNC or RA. *lac_id* must be an integer from 1 through 65535.

rac *rac_id*

Enter this keyword to specify the routing area code (RAC) as part of the identification of the RNC or RA. *rac_id* must be an integer from 1 through 255.

Usage

Use this command to delete statistics for the GMM/SM session configurations for SGSN services.

Example

The following command deletes GMM/SM statistics for a specific routing area defined for the GPRS service:

```
clear gmm-sm statistics gprs-service gprs1 routing-area mcc 123 mcc 131
lac 24 rac 11
```

The following command clears all collected information for GMM/SM statistics:

```
clear gmm-sm statistics verbose
```

clear gtpc statistics

Deletes all previously gathered GTPC (GTPv0, GTPv1-C, GTPv1-U) statistics within the given context based on the specified criteria.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

clear gtpc statistics [apn*apn_name***] [custom1] [ggsn-service***ggsn_name***] [sgsn-address***sgsn_address***]**

apn *apn_name*

Specifies the name of an APN configured in the context for which to delete GTPC statistics.
apn_name can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

custom1

Clears the statistics of GTP-C messages for preservation mode and free of charge service.
This keyword is customer-specific license enabled and used for Preservation-Mode and Free-of-Charge Service which are enabled under customer-specific license. For more information on this support, contact your local representative.

ggsn-service *ggsn_name*

Specifies the name of a GGSN service configured in the context for which to delete GTPC statistics.
ggsn_name can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

sgsn-address *sgsn_address*

Specifies the IP address of an SGSN for which to delete GTPC statistics.
sgsn_address must be expressed in dotted decimal notation.

Usage

GT-C statistics can be cleared for a single APN, GGSN service, or SGSN. All GTPC statistics in the context can be deleted by entering the command with no keywords.
This command can be executed from any context configured on the system.
If this command is executed from within the local context with no keywords, all GTPC statistics will be cleared regardless of context.
GTPP statistics are not affected by this command.

Example

The following command clears all GTPC statistics within the context:

```
clear gtpc statistics
```

clear gtpp statistics

Deletes all previously gathered GTPP statistics within the given context based for either single or all charging gateway functions (CGFs).

Product

GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

clear gtpp statistics [cgf-address*ip-address***]**

cgf-address *cgf_address*

Deletes statistics for a particular CGF.
cgf_address is the IP address of the CGF for which statistics are to be deleted. It must be expressed in dotted decimal notation

Usage

Statistics for a single CGF can be cleared using the **cgf-address** keyword. Statistics for all CGFs in the context can be deleted by entering the command with no keywords.
This command can be executed from any context configured on the system.
If this command is executed from within the local context with no keywords, statistics will be cleared for every CGF configured on the system regardless of context. In addition, if the cgf-address keyword is used when executing from within the local context, statistics for all CGFs configured with the specified name will be cleared regardless of context.

Example

The following command deletes all GTPP statistics for a CGF with an IP address of 192.168.1.42:

clear gtpp statistics cgf-address *192.168.1.42*

clear gtpp storage-server local file statistics

This command clears AAAproxy GTPP group level statistics for CDRs stored on the local SMC hard disk.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear gtpp storage-server local file statistics [ group name name ]
```

Usage

If executed from the local context, this command clears statistics for all GTPP groups configured on the system. If executed from the context within which the storage servers (SMC hard disk) is configured, statistics are deleted for only that context.

clear gtpp storage-server statistics

Clears statistics for configured GTPP storage servers (GSS).

Product

GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear gtpp storage-server statistics
```

Usage
