THE SPECIFICATIONS AND INFORMATION REGARDING THE PRODUCTS IN THIS MANUAL ARE SUBJECT TO CHANGE WITHOUT NOTICE. ALL STATEMENTS, INFORMATION, AND RECOMMENDATIONS IN THIS MANUAL ARE BELIEVED TO BE ACCURATE BUT ARE PRESENTED WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED. USERS MUST TAKE FULL RESPONSIBILITY FOR THEIR APPLICATION OF ANY PRODUCTS.

THE SOFTWARE LICENSE AND LIMITED WARRANTY FOR THE ACCOMPANYING PRODUCT ARE SET FORTH IN THE INFORMATION PACKET THAT SHIPPED WITH THE PRODUCT AND ARE INCORPORATED HEREIN BY THIS REFERENCE. IF YOU ARE UNABLE TO LOCATE THE SOFTWARE LICENSE OR LIMITED WARRANTY, CONTACT YOUR CISCO REPRESENTATIVE FOR A COPY.

The following information is for FCC compliance of Class A devices: This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio-frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case users will be required to correct the interference at their own expense.

The following information is for FCC compliance of Class B devices: This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If the equipment causes interference to radio or television reception, which can be determined by turning the equipment off and on, users are encouraged to try to correct the interference by using one or more of the following measures:

Reorient or relocate the receiving antenna.

Increase the separation between the equipment and receiver.

Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.

Consult the dealer or an experienced radio/TV technician for help.

Modifications to this product not authorized by Cisco could void the FCC approval and negate your authority to operate the product.

The Cisco implementation of TCP header compression is an adaptation of a program developed by the University of California, Berkeley (UCB) as part of UCB's public domain version of the UNIX operating system. All rights reserved. Copyright © 1981, Regents of the University of California.

NOTWITHSTANDING ANY OTHER WARRANTY HEREIN, ALL DOCUMENT FILES AND SOFTWARE OF THESE SUPPLIERS ARE PROVIDED "AS IS" WITH ALL FAULTS. CISCO AND THE ABOVE-NAMED SUPPLIERS DISCLAIM ALL WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING, WITHOUT LIMITATION, THOSE OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT OR ARISING FROM A COURSE OF DEALING, USAGE, OR TRADE PRACTICE.

IN NO EVENT SHALL CISCO OR ITS SUPPLIERS BE LIABLE FOR ANY INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES, INCLUDING, WITHOUT LIMITATION, LOST PROFITS OR LOSS OR DAMAGE TO DATA ARISING OUT OF THE USE OR INABILITY TO USE THIS MANUAL, EVEN IF CISCO OR ITS SUPPLIERS HAVE BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Cisco and the Cisco Logo are trademarks of Cisco Systems, Inc. and/or its affiliates in the U.S. and other countries. A listing of Cisco's trademarks can be found at www.cisco.com/go/trademarks. Third party trademarks mentioned are the property of their respective owners. The use of the word partner does not imply a partnership relationship between Cisco and any other company.

Any Internet Protocol (IP) addresses and phone numbers used in this document are not intended to be actual addresses and phone numbers. Any examples, command display output, network topology diagrams, and other figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses or phone numbers in illustrative content is unintentional and coincidental.

About this Guide

This document pertains to features and functionality that run on and/or that are related to the Cisco® ASR 5000 Chassis, formerly the Starent Networks ST40.

Conventions Used

The following tables describe the conventions used throughout this documentation.

Icon	Notice Type	Description
	Information Note	Provides information about important features or instructions.
	Caution	Alerts you of potential damage to a program, device, or system.
	Warning	Alerts you of potential personal injury or fatality. May also alert you of potential electrical hazards.
	Electro-Static Discharge (ESD)	Alerts you to take proper grounding precautions before handling a product.

Typeface Conventions	Description
Text represented as a `screen display`	This typeface represents displays that appear on your terminal screen, for example: `Login:`
Text represented as **`commands`**	This typeface represents commands that you enter, for example: **`show ip access-list`** This document always gives the full form of a command in lowercase letters. Commands are not case sensitive.
Text represented as a **`command`** *`variable`*	This typeface represents a variable that is part of a command, for example: **`show card`** *`slot_number`* slot_number is a variable representing the desired chassis slot number.
Text represented as menu or sub-menu names	This typeface represents menus and sub-menus that you access within a software application, for example: Click the **File** menu, then click **New**

Command Syntax Conventions	Description
{ **`keyword`** or *`variable`* }	Required keywords and variables are surrounded by grouped brackets. Required keywords and variables are those components that are required to be entered as part of the command syntax.

Command Syntax Conventions	Description
[**keyword** or *variable*]	Optional keywords or variables, or those that a user may or may not choose to use, are surrounded by square brackets.
|	With some commands there may be a group of variables from which the user chooses one. These are called alternative variables and are documented by separating each variable with a vertical bar (also known as a pipe filter). Pipe filters can be used in conjunction with required or optional keywords or variables. For example: **{ nonce | timestamp }** OR [**count** *number_of_packets* | **size** *number_of_bytes*]

Contacting Customer Support

Use the information in this section to contact customer support.

For New Customers: Refer to the support area of http://www.cisco.com for up-to-date product documentation or to submit a service request. A valid username and password is required to this site. Please contact your local sales or service representative for additional information.

For Existing Customers with support contracts through Starent Networks: Refer to the support area of https://support.starentnetworks.com/ for up-to-date product documentation or to submit a service request. A valid username and password is required to this site. Please contact your local sales or service representative for additional information.

Important: For warranty and repair information, please be sure to include the Return Material Authorization (RMA) tracking number on the outside of the package.

Chapter 1
Command Line Interface Overview

This chapter describes the numerous features in the command line interface (CLI). Included is information about the architecture of the CLI, its command modes and user privileges, how to obtain help within the CLI, and other key items.

The operating system provides the software that controls the overall system logic, control processes, and the CLI. The CLI is a multi-threaded user interface that allows you to manipulate, configure, control, and query the hardware and software components that make up the system and its hosted services. In addition, the CLI can host multiple instances of management and service configuration sessions. This allows multiple users to simultaneously access and manage multiple hosted services.

This section provides the following information about the CLI:

- CLI Structure
- CLI Command Modes
- CLI Administrative Users
- CLI Contexts
- Understanding the CLI Command Prompt
- CLI Command Syntax
- Entering and Viewing CLI Commands
- Obtaining CLI Help
- Exiting the CLI and CLI Command Modes
- Accessing the CLI

CLI Structure

CLI commands are strings of commands or keywords and user-specified arguments that set or modify specific parameters of the system. Commands are grouped by function and the various command modes with which they are associated.

The structure of the CLI is hierarchical. All users begin at a specific entry point into the system, called the Exec (Execute) Mode, and then navigate through the CLI according to their defined user privileges (access level) by using other command modes.

CLI Command Modes

There are two primary CLI command modes:

- **Exec (Execute) Mode:** The Exec mode is the lowest level in the CLI. The Exec mode is where you execute basic commands such as show, and ping. When you log into the CLI, you are placed in this mode by default.
- **Config (Configuration) Mode:** The Config mode is accessible only by users with administrator and security administrator privileges. If you are an administrative user, in this mode you can add and configure contexts and access the configuration sub-modes to configure protocols, interfaces, ports, services, subscribers, and other service-related items.

As explained above, the entry point into the CLI is called Exec Mode. In the initial CLI login, all users are placed into the default local context, which is the CLI's default management context. From this context, administrative users can access the Config Mode and define multiple service contexts.

Refer to the mode entry-path diagrams at the beginning of each mode chapter in the *Command Line Interface Reference*.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

CLI Administrative Users

This section contains information on the administrative user types and privileges supported by the system.

Administrative User Types

There are two types of administrative users supported by the system:

- **Context-level administrative users:** This user type is configured at the context-level and relies on the AAA subsystems for validating usernames and passwords during login. This is true for both administrative user accounts configured locally through a configuration file or on an external RADIUS server. Passwords for these user types are assigned once and are accessible in the configuration file.
- **Local-users:** This user type provides support for ANSI T1.276-2003 password security protection. Local-user account information, such as passwords, password history, and lockout states, is maintained in non-volatile memory on the CompactFlash module and in the Shared Configuration Task (SCT). This information is maintained in a separate file, not in configuration files used by the system. As such, the configured local-user accounts are not visible with the rest of the system configuration.

Local-user and context-level administrative accounts can be used in parallel. However, a mechanism is provided to de-activate context-level administrative user accounts thereby providing access only to local-user accounts.

Authenticating Administrative Users with RADIUS

To authorize users via RADIUS, you must include two RADIUS attributes in the RADIUS Access-Accept message:

- RFC 2865 standard Service-Type
- Starent Vendor-Specific Attribute (VSA) SN1-Admin-Permission.

The default permission is none (0), meaning that service is refused even if properly authenticated via RADIUS.

RADIUS Mapping System

RADIUS server configuration depends on the type of server used and the instructions distributed by the server manufacturer. The following table shows the supported attribute/value mapping system that is constant, regardless of server manufacturer or model:

Table 1. RADIUS Attribute/Value Mapping System

Attribute	Value

Attribute	Value
Framed	2
Administrative (Administrator)	6
NAS_Prompt	7
Authenticate_Only	8
Authorize_Only	17
Inspector	19650516
Security_Admin	19660618

RADIUS Privileges

There are four RADIUS privilege roles. The following table shows the relationship between the privilege roles in the CLI configuration and RADIUS Service-Type.

Table 2. CLI Privilege Roles and RADIUS Service Types

CLI Configuration Parameter	RADIUS Service Type	Show Admin Type
administrator	Security_Admin (19660618)	admin
config_administrator	Administrative (6)	cfgadm
operator	NAS_Prompt (7)	oper
inspector	Inspector (19650516)	inspect

Administrative User Privileges

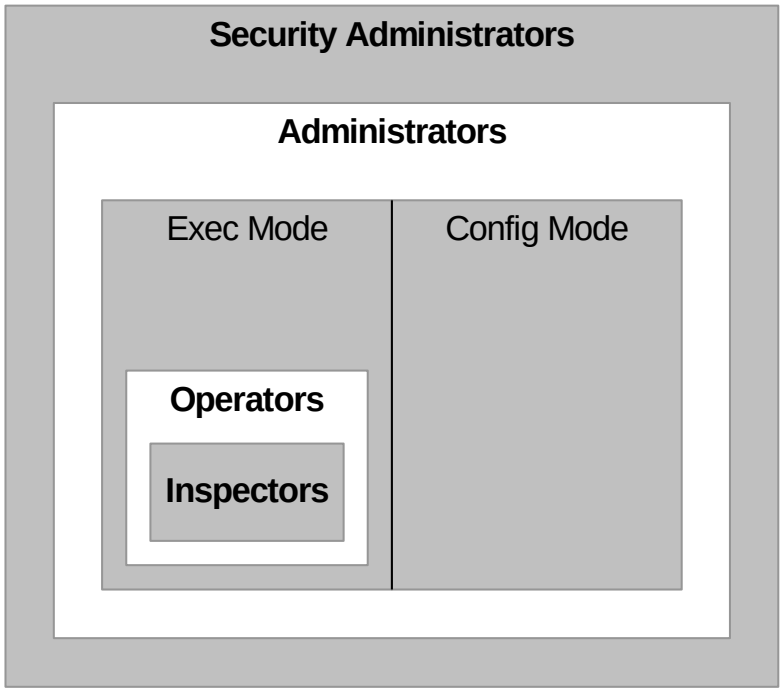
Regardless of the administrative user type, the system supports four user privilege levels:

- **Inspector**: Inspectors are limited to a small number of read-only Exec Mode commands. The bulk of these are show commands for viewing a variety of statistics and conditions. The Inspector cannot execute show configuration commands and does not have the privilege to enter the Config Mode.
- **Operator**: Operators have read-only privileges to a larger subset of the Exec Mode commands. They can execute all commands that are part of the inspector mode, plus some system monitoring, statistic, and fault management functions. Operators do not have the ability to enter the Config Mode.
- **Administrator**: Administrators have read-write privileges and can execute any command in the CLI except for a few security-related commands that can only be configured by Security Administrators. Administrators can configure or modify system settings and can execute all system commands, including those available to the Operators and Inspectors.

- **Security Administrator**: Security Administrators have read-write privileges and can execute all CLI commands, including those available to Administrators, Operators, and Inspectors.

The following figure represents how user privileges are defined in the CLI configuration modes.

Figure 1. User Privileges



Though the privilege levels are the same regardless of user type, the corresponding user type names differ slightly. The following table displays the privilege level to administrative user type mappings:

Table 3. User Privilege to User Type Mapping

User Type as Defined by T1.276-2003	Local-User Level User	Context-Level User
System Security Administrator	Security Administrator	Administrator
Application Security Administrator	Security Administrator	Administrator
System Administrator	Administrator	Config-Administrator
Application Administrator	Administrator	Config-Administrator
Application User/Operator	Operator	Operator
not applicable	Inspector	Inspector

Configure context-level administrative users in the Context Configuration Mode with the **`administrator`**, **`config-administrator`**, **`operator`**, and **`inspector`** commands.

Configure local-user administrative users at the Global Configuration Mode with the **`local-user username`** command.

You can further refine administrative levels to include access to certain features with the following feature-use administrative user options:

- **Lawful Intercept (LI) Administrative User:** To configure and manage LI-related issues, configure at least one administrative user account with LI functionality privileges.

Important: This privilege is available only for context-level administrative users. In addition, to ensure security in accordance with the standards, LI administrative users must access the system through the Secure Shell Protocol (SSH).

- **Enhanced Charging Service (ECS) Administrative User:** To log in and execute ECS-related commands, configure at least one administrative user account with ECS functionality privileges.

All system users can be configured within any context. However, it is recommended that you configure users in the system's management context called local. Refer to sections later in this chapter for additional information about contexts.

Allowed Commands per User Type

With the exception of security administrators, all other management users are limited to a subset of the entire command list as described in the *Command Line Interface Reference*. This section defines the commands allowed for each management user type. As stated previously, inspectors and operators are limited to only a subset of the Exec Mode commands.

Inspector Mode Commands

In the Exec mode, system inspectors can access the following commands:

- abort
- autoconfirm
- context
- crypto-group
- default terminal
- exit
- help
- logs checkpoint
- monitor subscriber
- no logging active

- no logging trace
- no reveal disabled commands
- no timestamps
- no autoconfirm
- ping
- reveal disabled commands
- show (except show snmp communities and show snmp transports)
- sleep
- start crypto security-association
- terminal length
- terminal width
- timestamps
- traceroute

Operator Mode Commands

In the Exec mode, system operators can access all inspector mode commands plus the following commands:

- aaa test
- alarm cutoff
- bulkstats force
- card
- clear (a subset of all clear command variations)
- debug
- dhcp test
- gtpc test
- gtpp interim
- gtpp test
- gtpu test
- gtpv0 test
- host
- logging active
- logging filter
- logging trace
- newcall
- no card
- no debug

- no newcall policy
- port
- ppp echo-test
- radius interim accounting
- radius test
- rlogin
- show access-group
- show access-list
- show access-flow
- show access statistics
- show configuration
- show snmp transports
- ssh
- telnet
- test alarm

Administrator Mode Commands

Administrators can access all system commands except:

Context Config Mode

- config-administrator
- operator
- inspector
- administrator

Global Config Mode

- snmp community
- snmp user
- local-user
- suspend local-user

Exec Mode

- show snmp communities
- clear (all clear command variations)
- show local-user
- password change local-user

Security Administrator Mode Commands

Security administrators can access all system commands.

CLI Contexts

A context is a group of configuration parameters that apply to the ports, interfaces, and protocols supported by the system. You can configure multiple contexts on the system, each of which resides as a separate, logically independent instance on the same physical device. The CLI can host multiple contexts within a single physical device. This allows wireless service providers to use the same system to support:

- Different levels of service
- Multiple wholesale or enterprise customers or customer groups
- Different classes of customers based on defined Class of Service (CoS) parameters
- IP address pools across multiple contexts, thus saving IP address allocation
- Enhanced security

Each defined context operates independently from any other context(s) in the system. Each context contains its own CLI instance, IP routing tables, access filters, compression methods, and other configured data.

By default, a single system-wide context called local, is used exclusively for the management of the system. Think of the local context as the root directory of the system, since you can define and access all other contexts from this point. You cannot delete the local context. From this location in the CLI, you can:

- Create and configure other service contexts that contain different service configurations
- Configure system-wide services such as CORBA and SNMP management interfaces, physical management ports, system messages, and others

Important: The system requires that you define at least one context in addition to the Local context. This isolates system management functions from application or service functions.

Administrative users add contexts through the Global Configuration Mode. A substantial advantage of configuring numerous service contexts is that it allows operators to broadly distribute different subscribers across the system. This greatly enhances the performance of the system and minimizes the loss of sessions should a failure occur.

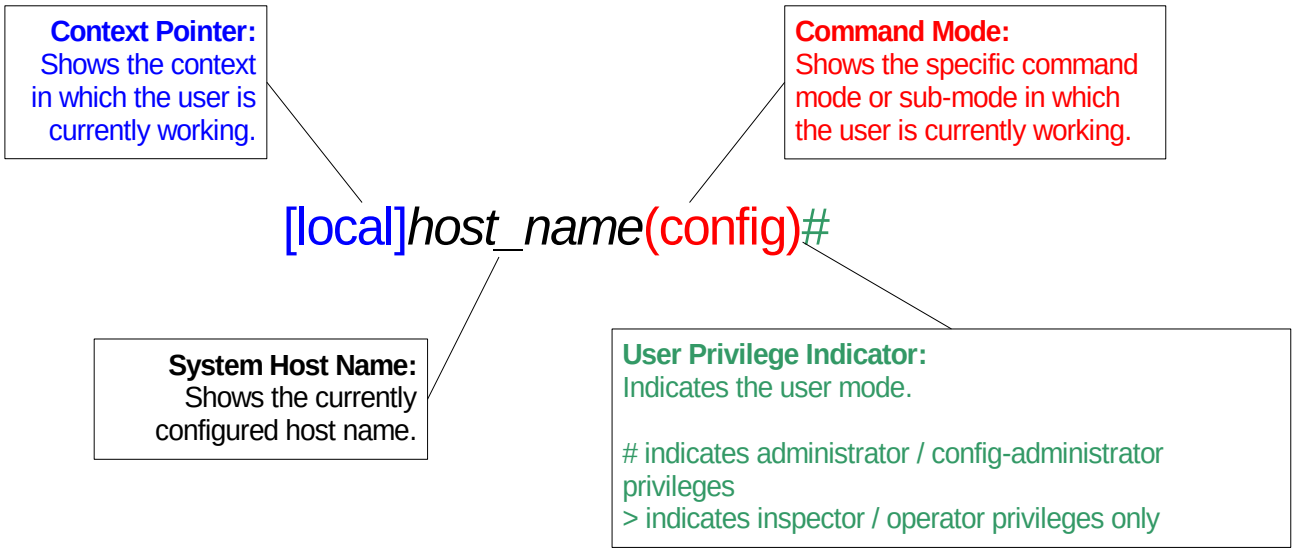
Understanding the CLI Command Prompt

The CLI provides an intuitive command prompt that informs you of:

- Exactly where you are located within the CLI
- The command mode you are using
- Your user privilege level.

The following figure shows the various components of the command prompt.

Figure 2. CLI Command Prompt



CLI Command Syntax

This section describes the components of the CLI command syntax that you should be familiar with prior to using the CLI. These include:

- **Commands**: Specific words that precede, or initiate, a specific function.
- **Keywords**: Specific words that follow a command to more clearly dictate the command's function.
- **Variables**: Alpha, numeric, or alphanumeric values that are user-supplied as part of the command syntax. Sometimes referred to as arguments, these terms further specify the command function.
- **Repetitive keywords (+)**: Specific keyword, that when followed by a plus (+) sign, indicates that more than one of the keywords can be entered within a single command.

Example
In the following example, *slot_number* is the command variable for the **info** keyword:

```
show slot infoslot_number
```

slot_number is a variable representing a particular slot (1 through 48).

Entering and Viewing CLI Commands

This section describes various methods for entering commands into the CLI.

Typing each command keyword, argument, and variable can be time-consuming and increase your chance of making mistakes. The CLI therefore, supports the following features to assist you in entering commands quickly and more accurately. Other features allow you to view the display and review previously entered commands.

Entering Partial CLI Commands

In all of the modes, the CLI recognizes partially-typed commands and keywords, as long as you enter enough characters for the command to be unambiguously recognized by the system. If you do not enter enough characters for the system to recognize a unique command or keyword, it returns a message listing all possible matches for the partial entry.

Example

If you enter the partial command **conf** and press <**Enter**>, you enter the Global Configuration Mode. If you were to enter only **co**, the system would respond with the message:

```
Ambiguous Command
```

CLI Command Auto-completion

Use the command auto-completion feature to automatically complete unique CLI commands. Press the <**Tab**> key after entering enough characters to enable this feature.

Example

[local]*host_name*# sho<Tab>
[local]*host_name*# show

If you do not enter enough characters to allow the CLI to determine the appropriate command to use, the CLI displays all commands that match the characters you entered with auto-completion:

Example

```
[local]host_name# sh<Tab>

show     shutdown

[local]host_name#
```

Enter a question mark (?) after a partial command to display all of the possible matching commands, and their related help text.

Example

```
[local]host_name# sh?

show - Displays information based on a specified argument
```

```
shutdown - Terminates execution of all tasks within the entire chassis

[local]host_name#
```

Using CLI Auto-Pagination

When you enter commands whose expected results exceed the terminal window's vertical display, the auto-pagination function pauses the display each time the terminal window reaches its display limit. Press any key to display the next screen of results.

By default, auto-pagination functionality is disabled. To enable auto-pagination, type the pipe command: **| more**

```
[local]host_name# show configuration | more
```

Important: When auto-pagination is enabled, if a command's output exceeds the terminal window's vertical display parameters, you can exit by entering "**q**". This returns you to the CLI prompt.

Using CLI Autoconfirmation

By default, the system is configured to prompt all administrative users with a confirmation prior to executing certain commands. This functionality serves two purposes:

- Helps ensure that you do not execute an unwanted configuration change.

Example
Saving a configuration:

```
[local]host_name# save configuration

Are you sure ? [Yes | No]:
```

- Indicates potential misspellings of names during configuration. The first time you configure an element name (context, subscribers, services, etc.), the prompt is displayed. The prompt is not displayed for subsequent entries of the name. Therefore, if you see the confirmation prompt after entering the name of a previously configured element, it is likely that you misspelled the name.

Examples
You create context named "newcontext":

```
[local]host_name(config)# context newcontext

Are you sure ? [Yes | No]: yes

[newcontext]host_name(config-ctx)#
```

You revisit the context named “newcontext”:

```
[local]host_name(config)# context newcontext

[newcontext]host_name(config-ctx)#
```

On another occasion, you misspell the context named “newcontext”:

```
[local]host_name(config)# context mewcontext

Are you sure ? [Yes | No]:n

Action aborted

[local]host_name(config)#
```

After aborting the above action, you can again revisit “newcontext”:

```
[local]host_name(config)# context newcontext

[newcontext]host_name(config-ctx)#
```

You can control CLI autoconfirmation at the following levels:

- **Specific administrative user sessions:** To enable or disable autoconfirmation, use the [no] autoconfirm commands while in the Exec mode.
- **All Future Sessions:** To disable or re-enable autoconfirmation for all future sessions, use the [no]autoconfirm commands while in the Global Config mode.
- **For specific commands:** Disable autoconfirmation for various commands that support the -noconfirm keyword, such as the save configuration or card reboot commands.

Regulating the Command Output

For many CLI commands, you can use **| grep** and/or **| more** keywords to regulate or control the command’s output.

Use the | grep keyword to filter through a command’s output for certain expressions or patterns. Only those portions of the output that contain or exclude the pattern are displayed. The | grep has the following syntax:

| grep [-i | -v | --ignore-case | --invert-match] *expression*

Table 4. grep Keywords

Alternative Keyword	Description
-i	Specifies the filtering of the command’s output for a particular expression while ignoring case. Lower case matches the same as upper case.
-v	Specifies the filtering of the command’s output for everything excluding a particular expression.
--ignore-case	The long form of the **-i** option.

Alternative Keyword	Description
--invert-match	The long form of the **-v** option.
expression	Specifies the character pattern to find in the command's output.

Use the **| more** keyword to pause the terminal each time the terminal window reaches its display limit. Press any key to display the next screen. The function of this keyword is identical to the **autoless** command, except that you must manually enter it on a command-by-command basis.

Viewing Command History

To view a history of all commands line by line, simply scroll up or down with the <**up arrow**> and <**down arrow**> cursor keys on the keyboard.

The operating system supports EMACS-style text editing commands. This standard UNIX text editor format allows you to use keyboard-based shortcut keys for maneuvering around the CLI. The following table lists these available shortcut keys.

Table 5. EMACS Shortcut Keystrokes

Shortcut Keys	Description
<Ctrl + p> and <up arrow>	Recalls previous command in the command history
<Ctrl + n> and <down arrow>	Recalls next command in the command history
<Ctrl + f> and <right arrow>	Moves cursor forward by one character in command line
<Ctrl + b> and <left arrow>	Moves cursor backward by one character in command line
<Esc> + <f>	Moves cursor forward by one word in command line
<Esc> + <b>	Moves cursor backward by one word in command line
<Ctrl> + <a>	Moves cursor to the beginning of the command line
<Ctrl> + <e>	Moves cursor to the end of the command line
<Ctrl> + <k>	Deletes the current command line from the insertion point to the end of the line
<Ctrl> + <u>	Deletes the current command line from the insertion point to the beginning of the line
<Ctrl> + <d>	Deletes a single character in the current command line
<Esc> + <d>	Deletes a word in the current command line
<Ctrl> + <c>	Quits editing the current line
<Ctrl> + <l>	Refreshes the display
<Ctrl> + <t>	Transposes (or switches) the two characters surrounding the insertion point

Obtaining CLI Help

The CLI provides context-sensitive help for every command token and keyword available to you. To obtain, use one of these methods:

- **Command Help:** Command help provides assistance for a specific command. Type a question mark (?) at the end of the specific command to accesses help.

Example

```
[local]host_name# test?

test - Performs test on followed mechanism
```

- **Keyword Help:** Keyword help provides assistance in determining the next keyword, argument, or option to use in the command syntax. Enter the command keyword, enter a space, and then type a question mark (?).

Example

```
[local]host_name# test alarm ?

audible - Tests internal audible alarm buzzer on SPC

central-office - Tests specified central office alarm relays on SPIO card

<cr> - newline
```

- **Variable Help:** Variable help provides the correct format, value, or information type for each variable that is part of the command syntax. For commands with variables, enter the command keyword, enter a space, and then type a question mark (?).

Example

```
[local]host_name# show card info ?

<Enter card number as an integer ranging 1 to 48> | - Pipeline <cr> -
Carriage Return or <Enter> key
```

Exiting the CLI and CLI Command Modes

A CLI session is defined as the successful login into the CLI. When you establish a CLI session, you are placed into the system's Exec Mode. Depending upon your user privilege level, you can:

- Use the *local* context to perform system management functions
- Move to an assigned context and work in Exec Mode
- Move to an assigned context as an administrative user and work in Global Configuration Mode or other configuration sub-mode

This section addresses how to properly exit the various modes and the CLI.

Exiting Configuration Sub-modes

To exit a configuration sub-mode and return to the next highest configuration sub-mode or Global Configuration Mode, type the exit command at the system prompt.

Example

```
[context_name]host_name(config-ctx)# exit

[local]host_name(config)#
```

Important: The CLI supports implicit mode-exits when using configuration files. Therefore, configuration files do not have to contain all of the required exit commands for you to leave various sub-config modes.

To exit a sub-mode and return to the Exec Mode, enter the **end** command.

Example

```
[local]host_name(config-ctx)# end

[local]host_name#
```

Exiting Global Configuration Mode

To exit Global Configuration Mode, and return to the Exec Mode prompt, type the **exit** command at the prompt.

Ending a CLI Session

To end a CLI session and exit the CLI, type the **exit** command at the *local* Exec Mode prompt.

Accessing the CLI

Access the CLI through the following methods:

- Local login through a Console port using the RS-232 serial cable supplied with the card
- Remote login using Telnet and Secure Shell (SSH) access to the CLI through any IP interface on the system.

Important: Even though you can access the CLI remotely through any available IP interface, it is recommended that management traffic be isolated from network traffic by using one of the SPIO card management interfaces. You can use remote login methods only after the system has been configured to support the various access methods.

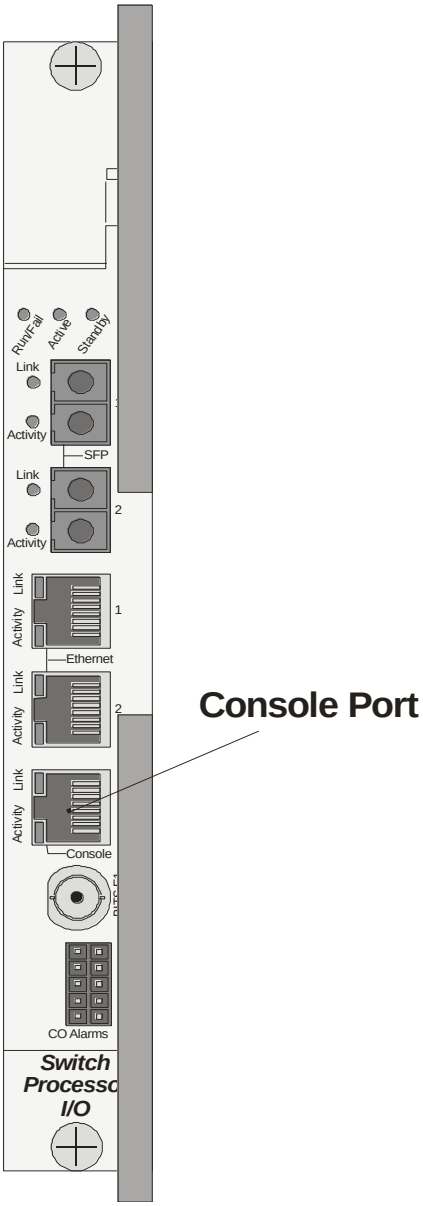
Important: Multiple CLI sessions are supported, but the number of sessions is dependent on the amount of available memory. The Resource Manager reserves enough resources so that as a minimum, seven CLI sessions are assured. One of the CLI sessions is always reserved for use exclusively by a CLI session on an SPIO console interface. Additional CLI sessions beyond the pre-reserved set are permitted if sufficient SPC resources are available. If the Resource Manager is unable to reserve additional resources, you are prompted whether to allow the system to create the new CLI session, even without the reserved resources.

Important: Multiple CLI sessions are supported, but the number of sessions is dependent on the amount of available memory. The Resource Manager reserves enough resources so that as a minimum, 15 CLI sessions are assured. One of the CLI sessions is always reserved for use exclusively by a CLI session on an SPIO console interface. Additional CLI sessions beyond the pre-reserved set are permitted if sufficient SMC resources are available. If the Resource Manager is unable to reserve additional resources, you are prompted whether to allow the system to create the new CLI session, even without the reserved resources.

Accessing the CLI Locally Using the Console Port

This section provides instructions for accessing the CLI locally through the console port.

Figure 3. Console Port



Access the console port with the RJ-45-to-DB-9 serial (EIA-232) cable that is shipped with the Switch Processor Input/Output (SPIO)Connect to a workstation that has a communications application that accesses the workstation's serial port, such as Minicom for Linux or HyperTerminal® for MicroSoft Windows®.

Each of the two SPIO Line Cards installed in the system provides a console port for accessing the CLI. The CLI is only accessible from the SPIO that is active—typically the SPIO installed in chassis slot 24.

For normal operation, the SPC or SMC in chassis slot 8 serves as the active processing card for the system. The SPIO that corresponds to this SPC or SMC is installed in slot 24. For the processing card in chassis slot 9, the corresponding SPIO is installed in slot 25.

Important: In the event of an SPC or SMC switchover, in which processes are switched from the processing card in slot 8 that was previously active to the redundant processing card in slot 9, the SPIO in slot 24 continues to serve as the active SPIO. Therefore, the console port is still accessible through that SPIO.

Follow the instructions below to connect to the console port.

1. Connect the RJ-45 end of the cable to the port labeled *Console*.
2. Connect the DB-9 end of the cable to the serial port on the workstation.
3. Configure the communications application to support the following:

Parameter	Setting
Baud Rate	115,200 bps
Data Bits	8
Parity	None
Stop Bits	1
Flow Control	None

Important: To change the configuration defined in the table above, modify the **`terminal`** command located in the Global configuration mode.

4. At the terminal window, press **Enter**.
5. If no configuration file is present (that is, this is the first time the system is powered), the CLI prompts you as to whether or not you want to use the Quick Setup Wizard. If the system was configured previously, you are prompted to enter a username and password.

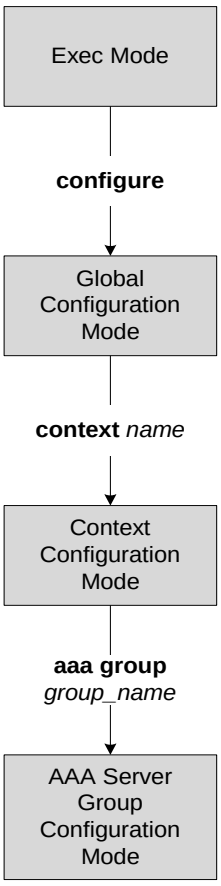
Remotely Accessing the CLI

To remotely access the CLI through a defined management interface, you must first configure the remote access method (such as Telnet or SSH).

You can find examples of how to configure this in the *Getting Started* chapter.

Chapter 2
AAA Server Group Configuration Mode Commands

The AAA Server Group Configuration Mode is used to create and manage the Diameter/RADIUS server groups within the context or system. AAA server group facilitates management of group (list) of servers at per subscriber/APN/realm level for AAA functionality.



diameter accounting

This command configures Diameter accounting parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter accounting { dictionary { aaa-custom1 | aaa-custom10 | aaa-custom2 | aaa-custom3 | aaa-custom4 | aaa-custom5 | aaa-custom6 | aaa-custom7 | aaa-custom8 | aaa-custom9 | nasreq | rf-plus } | endpoint *endpoint_name* **| hd-mode fall-back-to-local | hd-storage-policy** *hd_policy* **| max-retries** *tries* **| max-transmissions** *transmissions* **| request-timeout** *duration* **| server** *host_name* **priority** *priority* **}**

default diameter accounting { dictionary | hd-mode | max-retries | max-transmissions | request-timeout }

no diameter accounting { endpoint | hd-mode | hd-storage-policy | max-retries | max-transmissions | server *host_name* **}**

---

no diameter accounting { endpoint | hd-mode | hd-storage-policy | max-retries | max-transmissions | server *host_name* **}**

endpoint: Removes the configured accounting endpoint, and the default accounting server configured in the default AAA group will be used.
hd-mode: Sends records to the Diameter server, if all Diameter servers are down or unreachable, then copies records to the local HDD and periodically retries the Diameter server.
hd-storage-policy: Disables use of the specified HD storage policy.
max-retries: Disables the configured retry attempts for Diameter accounting in the current AAA group.
max-transmissions: Disables the configured maximum transmission attempts for Diameter accounting in the current AAA group.
server *host_name*: Removes the configured Diameter host *host_name* from this AAA server group for Diameter accounting.

---

default diameter accounting { dictionary | hd-mode| max-retries | max-transmissions | request-timeout }

dictionary: Sets the context's dictionary as the system default.
hd-mode: Sends records to the Diameter server, if all Diameter servers are down or unreachable, then copies records to the local HDD and periodically retries the Diameter server.
max-retries: Sets the retry attempts for Diameter accounting in the current AAA group to default 0 (disable).
max-transmissions: Sets the configured maximum transmission attempts for Diameter accounting in the current AAA group to default 0 (disable).
request-timeout: Sets the timeout duration, in seconds, for Diameter accounting requests in the current AAA group to default 20.

dictionary { aaa-custom1 | aaa-custom10 | aaa-custom2 | aaa-custom3 | aaa-custom4 | aaa-custom5 | aaa-custom6 | aaa-custom7 | aaa-custom8 | aaa-custom9 | nasreq | rf-plus }

Specifies the Diameter accounting dictionary.
aaa-custom1 ... aaa-custom10: The custom dictionaries. Even though the CLI syntax supports several custom dictionaries, not necessarily all of them have been defined. If a custom dictionary that has not been implemented is selected, the default dictionary will be used.
nasreq: nasreq dictionary—the dictionary defined by RFC 4005.
rf-plus: RF Plus dictionary.

endpoint *endpoint_name*

Enables Diameter to be used for accounting, and specifies which Diameter endpoint to use.
endpoint_name must be a string of 1 through 63 characters in length.

hd-mode fall-back-to-local

Specifies that records be copied to the local HDD if the diameter server is down or unreachable. CDF/CGF will pull the records through SFTP.

hd-storage-policy *hd_policy*

Associates the specified HD Storage policy with the AAA group.
hd_policy must be the name of a configured HD Storage policy, and must be a string of 1 through 63 alpha and/or numeric characters in length.
HD Storage policies are configured through the Global Configuration Mode.
This and the **hd-mode** command are used to enable the storage of Rf Diameter Messages to HDD in case all Diameter Servers are down or unreachable.

max-retries *tries*

Specifies how many times a Diameter request should be retried with the same server, if the server fails to respond to a request.
tries specifies the maximum number of retry attempts, and must be an integer from 1 through 1000.
Default: 0

max-transmissions *transmissions*

Specifies the maximum number of transmission attempts for a Diameter request. Use this in conjunction with the **max-retries** *tries* option to control how many servers will be attempted to communicate with.
transmissions must be an integer from 1 through 1000.
Default: 0

request-timeout *duration*

Specifies the number of seconds the system will wait for a response from a Diameter server before re-transmitting the request.
duration specifies the number of seconds, and must be an integer from 1 through 3600.
Default: 20

server *host_name* **priority** *priority*

Specifies the current context Diameter accounting server's host name and priority.
host_name specifies the Diameter host name, and must be a string of 1 through 63 characters in length.

priority specifies the relative priority of this Diameter host. The priority is used in server selection. The priority must be an integer from 1 through 1000.

Usage

Use this command to manage the Diameter accounting options according to the Diameter server used for the context.

Example

The following command configures the Diameter accounting dictionary:

```
diameter accounting dictionary <dictionary>
```

The following command configures the Diameter endpoint:

```
diameter accounting endpoint <endpoint_name>
```

The following commands configure Diameter accounting options:

```
diameter accounting max-retries <tries>
```

```
diameter accounting max-transmissions <transmissions>
```

```
diameter accounting request-timeout <duration>
```

```
diameter accounting server <host_name> priority <priority>
```

The following commands disable/clear the options:

```
no diameter accounting endpoint
```

```
no diameter accounting server <host_name>
```

diameter authentication

This command configures Diameter authentication parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter authentication { dictionary { aaa-custom1 | aaa-custom10 | aaa-custom11 | aaa-custom12 | aaa-custom13 | aaa-custom14 | aaa-custom15 | aaa-custom16 | aaa-custom17 | aaa-custom18 | aaa-custom19 | aaa-custom2 | aaa-custom20 | aaa-custom3 | aaa-custom4 | aaa-custom5 | aaa-custom6 | aaa-custom7 | aaa-custom8 | aaa-custom9 | nasreq } | endpoint *endpoint_name* **| max-retries** *tries* **| max-transmissions** *transmissions* **| redirect-host-avp { just-primary | primary-then-secondary } | request-timeout** *duration* **| server** *host_name* **priority** *priority* **}**

default diameter authentication { dictionary | max-retries | max-transmissions | redirect-host-avp | request-timeout }

no diameter authentication { endpoint | max-retries | max-transmissions | server *host_name* **}**

---

no diameter authentication { endpoint | max-retries | max-transmissions | server }*host_name*

dictionary: Sets the context's dictionary as the system default.
endpoint: Removes the configured authentication endpoint, and the default server configured in default AAA group will be used.
max-retries: Disables the configured retry attempts for Diameter authentication in the current AAA group.
max-transmissions: Disables the configured maximum transmission attempts for Diameter authentication in the current AAA group.
server *host_name*: Removes the configured Diameter host *host_name* from this AAA server group for Diameter authentication.

---

default diameter authentication { dictionary | max-retries | max-transmissions | redirect-host-avp | request-timeout }

max-retries: Sets the retry attempts for Diameter authentication requests in the current AAA group to default 0 (disable).
max-transmissions: Sets the configured maximum transmission attempts for Diameter authentication in the current AAA group to default 0 (disable).
redirect-host-avp: Sets the redirect choice to default (just-primary).
request-timeout: Sets the timeout duration, in seconds, for Diameter authentication requests in the current AAA group to default 20.

---

dictionary { aaa-custom1 | aaa-custom10 | aaa-custom11 | aaa-custom12 | aaa-custom13 | aaa-custom14 | aaa-custom15 | aaa-custom16 | aaa-custom17 | aaa-custom18 | aaa-custom19 | aaa-custom2 | aaa-custom20 | aaa-custom3

| aaa-custom4 | aaa-custom5 | aaa-custom6 | aaa-custom7 |aaa-custom8 | aaa-custom9 | nasreq }

Specifies the Diameter authentication dictionary.
aaa-custom1 ... aaa-custom20: The custom dictionaries. Even though the CLI syntax supports several custom dictionaries, not necessarily all of them have been defined. If a custom dictionary that has not been implemented is selected, the default dictionary will be used.

Important: **aaa-custom11** dictionary is only available in StarOS 8.1 and later releases. **aaa-custom12** to **aaa-custom20** dictionaries are only available in StarOS 9.0 and later releases.

nasreq: nasreq dictionary—the dictionary defined by RFC 4005.

endpoint *endpoint_name*

Enables Diameter to be used for authentication, and specifies which Diameter endpoint to use.
endpoint_name must be a string of 1 through 63 characters in length.

max-retries *tries*

Specifies how many times a Diameter authentication request should be retried with the same server, if the server fails to respond to a request.
tries specifies the maximum number of retry attempts, and must be an integer from1 through 1000.
Default: 0

max-transmissions *transmissions*

Specifies the maximum number of transmission attempts for a Diameter authentication request. Use this in conjunction with the "**max-retries** *tries*" option to control how many servers will be attempted to communicate with.
transmissions specifies the maximum number of transmission attempts, and must be an integer from 1 through 1000.
Default: 0

diameter authentication redirect-host-avp { just-primary | primary-then-secondary }

Specifies whether to use just one returned AVP, or use the first returned AVP as selecting the primary host and the second returned AVP as selecting the secondary host.
just-primary: Redirect only to primary host.
primary-then-secondary: Redirect to primary host, if fails then redirect to the secondary host.
Default: just-primary

request-timeout *duration*

Specifies how long the system will wait for a response from a Diameter server before re-transmitting the request.
duration specifies the number of seconds the system will wait for a response from a Diameter server before re-transmitting the request, and must be an integer from 1 through 3600.
Default: 20 seconds

server *host_name* **priority** *priority*

Specifies the current context Diameter authentication server's host name and priority.

host_name specifies the Diameter authentication server's host name, and must be a string of 1 through 63 characters in length.
priority specifies the relative priority of this Diameter host. The priority is used in server selection. The priority must be an integer from 1 through 1000.

Usage

Use this command to manage the Diameter authentication options according to the Diameter server used for the context.

Example

The following command configures the Diameter authentication dictionary:

diameter authentication dictionary *<dictionary>*

The following command configures the Diameter endpoint:

diameter authentication endpoint *<endpoint_name>*

The following commands configure Diameter authentication options:

diameter authentication max-retries *<tries>*

diameter authentication max-transmissions *<transmissions>*

diameter authentication redirect-host-avp primary-then-secondary

diameter authentication server *<host_name>* **priority** *<priority>*

diameter authentication request-timeout *<duration>*

The following commands disable/clear the options:

no diameter authentication endpoint

no diameter authentication server *<host_name>*

diameter authentication failure-handling

This command configures the failure handling for Diameter authentication requests and Diameter EAP requests.

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter authentication failure-handling { authorization-request | eap-request | eap-termination-request } { request-timeout action { continue | retry-and-terminate | terminate } | result-code *start_result_code* **{ [to** *end_result_code* **] action { continue | retry-and-terminate | terminate } } }**

no diameter authentication failure-handling { authorization-request | eap-request | eap-termination-request } result-code *start_result_code* **[to** *end_result_code* **]**

default diameter authentication failure-handling { authorization-request | eap-request | eap-termination-request } request-timeout action

no

Disables Diameter authentication failure handling.

default

Configures the default Diameter authentication failure handling setting.

authorization-request

Specifies that failure handling must be performed on Diameter authorization request (AAR/AAA) messages.

eap-request

Specifies configuring failure handling for EAP requests.

eap-termination-request

Specifies configuring failure handling for EAP termination requests.

request-timeout action { continue | retry-and-terminate | terminate }

Specifies the action to be taken for failures:

- **continue**: Continues session
- **retry-and-terminate**: First retries, if it fails then terminates the session
- **terminate**: Terminates session

result-code *start_result_code* **[to** *end_result_code* **] action { continue | retry-and-terminate | terminate }**

start_result_code: Specifies the result code number, must be an integer from 1 through 65535.
to *end_result_code*: Specifies the upper limit of a range of result codes. **to** *end_result_code* must be greater than *start_result_code*.
action { continue | retry-and-terminate | terminate }: Specifies the action to be taken for failures:

- **continue**: Continues
- **retry-and-terminate**: First retries, if it fails then terminates
- **terminate**: Terminates

Usage

Use this command to configure error handling for Diameter EAP, EAP-termination, and authorization requests. Specific actions (continue, retry-and-terminate, or terminate) can be associated with each possible result-code. Ranges of result codes can be defined with the same action, or actions can be specific on a per-result code basis.

Example

The following commands configure result codes *5001, 5002, 5004,* and *5005* to use "action continue" and result code *5003* to use "action terminate":

diameter authentication failure-handling eap-request result-code *5001* **to** *5005* **action continue**

diameter authentication failure-handling eap-request result-code *5003* **action terminate**

diameter dictionary

This command is deprecated and is replaced by the **diameter accounting dictionary** and **diameter authentication dictionary** commands. See the diameter accounting and diameter authentication commands respectively.

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

radius ip vrf

This command associates the specific AAA group with a Virtual Routing and Forwarding (VRF) Context instance for GRE tunnel interface configuration. By default the VRF is NULL, which means that AAA group is associated with global routing table.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius ip vrf *vrf_name*

no radius ip vrf

no

Removes/disassociates configured IP Virtual Routing and Forwarding (VRF) context instance.

vrf_name

Specifies the name of a pre-configured VRF context instance.
vrf_name is the name of a pre-configured virtual routing and forwarding (VRF) context configured in Context configuration mode through **ip vrf** command.

Usage

Use this command to associate/disassociate a pre-configured VRF context for a GRE tunnel interface.
By default the VRF is NULL, which means that AAA group is associated with global routing table.

Example

The following command associates VRF context instance *GRE_vrf1* with this AAA group:

radius ip vrf *GRE_vrf1*

radius

This command configures basic RADIUS options.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius { deadtime *minutes* **| detect-dead-server { consecutive-failures** *count* **| response-timeout** *seconds* **} | dictionary** *dictionary* **| max-outstanding** *messages* **| max-retries** *tries* **| max-transmissions** *transmissions* **| strip-domain { authentication-only | accounting-only } | timeout** *idle_seconds* **}**

default radius { deadtime | detect-dead-server | dictionary | max-outstanding | max-retries | max-transmissions | timeout }

no radius { detect-dead-server | max-transmissions | strip-domain }

no

Removes configuration for the specified keyword.

default

Configures default setting for the specified keyword.

dictionary *dictionary*

Specifies which dictionary to use. The following table describes the possible values for *dictionary*.

Dictionary	Description
custom*XX*	These are dictionaries that can be customized to fit your needs. Customization information can be attained by contacting your local service representative. *XX* is the integer value of the custom dictionary.
standard	This dictionary consists only of the attributes specified in RFC 2865, RFC 2866, and RFC 2869.
3gpp	This dictionary consists not only of all of the attributes in the standard dictionary, but also all of the attributes specified in 3GPP 32.015.
3gpp2	This dictionary consists not only of all of the attributes in the standard dictionary, but also all of the attributes specified in IS-835-A.
3gpp2-835	This dictionary consists not only of all of the attributes in the standard dictionary, but also all of the attributes specified in IS-835.
starent-vsa1	This dictionary consists not only of the 3GPP2 dictionary, but also includes Starent Networks vendor-specific attributes (VSAs) as well. The VSAs in this dictionary support a one-byte wide VSA Type field in order to support certain RADIUS applications. The one-byte limit allows support for only 256 VSAs (0 - 255). This is the default dictionary.

Dictionary	Description
starent-vsa1-835	This dictionary consists not only of the 3gpp2-835 dictionary, but also includes Starent Networks vendor-specific attributes (VSAs) as well. The VSAs in this dictionary support a one-byte wide VSA Type field in order to support certain RADIUS applications. The one-byte limit allows support for only 256 VSAs (0 - 255). This is the default dictionary.
starent	This dictionary consists of all of the attributes in the starent-vsa1 dictionary and incorporates additional Starent Networks VSAs by using a two-byte VSA Type field. This dictionary is the master-set of all of the attributes in all of the dictionaries supported by the system.
starent-835	This dictionary consists of all of the attributes in the starent-vsa1-835 dictionary and incorporates additional Starent Networks VSAs by using a two-byte VSA Type field. This dictionary is the master-set of all of the attributes in all of the -835 dictionaries supported by the system.

deadtime *minutes*

Specifies the number of minutes to wait before changing the state of a RADIUS server from "Down" to "Active". *minutes* must be an integer from 0 through 65535.
Default: 10

Important: This parameter should be set to allow enough time to remedy the issue that originally caused the server's state to be changed to "Down". After the deadtime timer expires, the system returns the server's state to "Active" regardless of whether or not the issue has been fixed.

Important: For a complete explanation of RADIUS server states, refer to the *RADIUS Server State Behavior* appendix in the *AAA Interface Administration and Reference*.

detect-dead-server { consecutive-failures *count* **| keepalive | response-timeout** *seconds* **}**

consecutive-failures *count*: Specifies the number of consecutive failures, for any AAA Manager, before a server's state is changed from "Active" to "Down". *count* must be an integer from 1 through 1000.
Default: 4.
keepalive: Enables the AAA server alive-dead detect mechanism based on sending keepalive authentication messages to all authentication servers. Default is disabled.
response-timeout *seconds*: Specifies the number of seconds, for any AAA Manager, to wait for a response to any message before a server's state is changed from "Active" to "Down". *seconds* must be an integer from 1 through 65535.

Important: If both **consecutive-failures** and **response-timeout** are configured, then both parameters must be met before a server's state is changed to "Down".

Important: The "Active" or "Down" state of a RADIUS server as defined by the system, is based on accessibility and connectivity. For example, if the server is functional but the system has placed it into a "Down" state, it could be the result of a connectivity problem. When a RADIUS server's state is changed to "Down", a trap is sent to the management station and the **deadtime** timer is started.

max-outstanding *messages*

Specifies the maximum number of outstanding messages a single AAA Manager instance will queue.
messages must be an integer from 1 through 4000.
Default: 256

max-retries *tries*

Specifies the maximum number of times communication with a AAA server will be attempted before it is marked as "Not Responding", and the detect dead server's consecutive failures count is incremented.
tries must be an integer from 0 through 65535.
Default: 5

max-transmissions *transmissions*

Sets the maximum number of re-transmissions for RADIUS authentication requests. This limit is used in conjunction with **max-retries** parameter for each server.
When failing to communicate with a RADIUS sever, the subscriber is failed once all of the configured RADIUS servers have been exhausted, or once the configured number of maximum transmissions is reached. For example, if three servers are configured and if the configured max-retries is 3 and max-transmissions is 12, then the primary server is tried four times (once plus three retries), the secondary server is tried four times, and then a third server is tried four times. If there is a fourth server, it is not tried because the maximum number of transmissions (12) has been reached.
transmissions must be an integer from 1 through 65535.
Default: Disabled

strip-domain { authentication-only | accounting-only }

Specifies that the domain must be stripped from the user name prior to authentication or accounting.
By default, strip-domain configuration will be applied to both authentication and accounting messages, if configured.
When the argument **authentication-only** or **accounting-only** is present, **strip-domain** is applied only to the specified RADIUS message types.

timeout *idle_seconds*

Specifies the number of seconds to wait for a response from the RADIUS server before re-sending the messages.
idle_seconds must be an integer from 1 through 65535.
Default: 3

Usage

Use this command to configure the basic RADIUS parameters according to the RADIUS server used for the context.

Example

The following command configures the RADIUS timeout parameter to 300 seconds.

radius timeout *300*

radius accounting

This command configures the current context's RADIUS accounting parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius accounting { archive [stop-only] | deadtime *minutes* **| detect-dead-server { consecutive-failures** *count* **| keepalive | response-timeout** *seconds* **} | interim interval** *seconds* **| max-outstanding** *messages* **| max-pdu-size** *octets* **| max-retries** *tries* **| max-transmissions** *transmissions* **| timeout** *idle_seconds* **}**

default radius accounting { deadtime | detect-dead-server | max-outstanding | max-pdu-size | max-retries | max-transmissions | timeout }

no radius accounting { archive | detect-dead-server | interim interval | max-transmissions }

no

Removes configuration for the specified keyword.

default

Configures the default setting for the specified keyword.

archive [stop-only]

Enables archiving of RADIUS accounting messages in the system after the accounting message has exhausted retries to all available RADIUS accounting servers. All RADIUS accounting messages generated by a session are delivered to the RADIUS accounting server in serial. That is, previous RADIUS accounting messages from the same call must be delivered and acknowledged by the RADIUS accounting server before the next RADIUS accounting message is sent to the RADIUS accounting server.
stop-only specifies archiving of only STOP accounting messages.
Default: enabled

deadtime *minutes*

Specifies the number of minutes to wait before changing the state of a RADIUS server from "Down" to "Active".
minutes must be an integer from 0 through 65535.
Default: 10 minutes

Important: This parameter should be set to allow enough time to remedy the issue that originally caused the server's state to be changed to "Down". After the deadtime timer expires, the system returns the server's state to "Active" regardless of whether or not the issue has been fixed.

Important: For a complete explanation of RADIUS server states, refer to the *RADIUS Server State Behavior* Appendix in the *AAA Interface Administration and Reference*.

detect-dead-server { consecutive-failures *count* **| keepalive | response-timeout** *seconds* **}**

consecutive-failures *count*: Specifies the number of consecutive failures, for any AAA Manager, before a server's state is changed from "Active" to "Down". *count* must be an integer from 1 through 1000.
Default: 4
keepalive: Enables the AAA server alive-dead detect mechanism based on sending keepalive authentication messages to all authentication servers. Default: disabled
response-timeout *seconds*: Specifies the number of seconds, for any AAA Manager, to wait for a response to any message before a server's state is changed from "Active" to "Down". *seconds* must be an integer from 1 through 65535.

Important: If both **consecutive-failures** and **response-timeout** are configured, then both parameters must be met before a server's state is changed to "Down".

Important: The "Active" or "Down" state of a RADIUS server as defined by the system, is based on accessibility and connectivity. For example, if the server is functional but the system has placed it into a "Down" state, it could be the result of a connectivity problem. When a RADIUS server's state is changed to "Down", a trap is sent to the management station and the deadtime timer is started.

Important: For a complete explanation of RADIUS server states, refer to the *RADIUS Server State Behavior* Appendix in the *AAA Interface Administration and Reference*.

interim interval *seconds*

Specifies the time interval, in seconds, for sending accounting INTERIM-UPDATE records.
seconds must be an integer from 50 through 40000000.
Default: Disabled

Important: If RADIUS is used as the accounting protocol for the GGSN product, other commands are used to trigger periodic accounting updates. However, these commands would cause RADIUS STOP/START packets to be sent as opposed to INTERIM-UPDATE packets. Also, note that accounting interim interval settings received from a RADIUS server take precedence over those configured on the system.

max-outstanding *messages*

Specifies the maximum number of outstanding messages a single AAA Manager instance will queue.
messages must be an integer from 1 through 4000.
Default: 256

max-pdu-size *octets*

Specifies the maximum sized packet data unit which can be accepted/generated, in bytes (octets).
octets must be an integer from 512 through 2048.
Default: 2048

max-retries *tries*

Specifies the maximum number of times communication with a AAA server will be attempted before it is marked as "Not Responding" and the detect dead server consecutive failures count is incremented.
tries must be an integer from 0 through 65535.
Default: 5
Once the maximum number of retries is reached this is considered a single failure for the consecutive failures count for detecting dead servers.

max-transmissions *transmissions*

Sets the maximum number of transmissions for a RADIUS accounting message before the message is declared as failed.
transmissions must be an integer from 1 through 65535.
Default: Disabled

timeout *seconds*

Specifies the amount of time to wait for a response from a RADIUS server before retransmitting a request.
seconds must be an integer from 1 through 65535.
Default: 3

Usage

Use this command to configure RADIUS accounting options according to the RADIUS server used for the context.

Example

The following command configures the accounting timeout parameter to 16 seconds.

```
radius accounting timeout  16
```

radius accounting apn-to-be-included

This command specifies the APN name inclusion for RADIUS accounting.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
radius accounting apn-to-be-included { gi | gn }

default radius accounting apn-to-be-included
```

default

Configures the default setting.

gi

Specifies the use of Gi APN name in RADIUS accounting request. Gi APN represents the APN received in the Create PDP context request message from SGSN.

gn

Specifies the use of Gn APN name in RADIUS accounting request. Gn APN represents the APN selected by the GGSN.

Usage

Use this command to specify the APN name to be included for RADIUS accounting.

Example

The following command configures the gn APN name to be included for RADIUS accounting:

```
radius accounting apn-to-be-included gn
```

radius accounting algorithm

This command specifies the fail-over/load-balancing algorithm to select the RADIUS accounting server(s) to which accounting data must be sent.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius accounting algorithm { first-n *n* **| first-server | round-robin }**

default radius accounting algorithm

default

Configures the default setting.
Default: **first-server**

first-n *n*

Default: 1 (Disabled)
Specifies that the AGW must send accounting data to *n* (more than one) AAA servers based on their priority. The full set of accounting data is sent to each of the *n* AAA servers. Response from any one of the servers would suffice to proceed with the call. On receiving an ACK from any one of the servers, all retries are stopped.
n is the number of AAA servers to which accounting data will be sent, and must be an integer from 2 through 128.

first-server

Specifies that the context must send accounting data to the RADIUS server with the highest configured priority. In the event that this server becomes unreachable, accounting data is sent to the server with the next-highest configured priority. This is the default algorithm.

round-robin

Specifies that the context must load balance sending accounting data among all of the defined RADIUS servers. Accounting data is sent in a circular queue fashion on a per Session Manager task basis, where data is sent to the next available server and restarts at the beginning of the list of configured servers. The order of the list is based upon the configured relative priority of the servers.

Usage

Use this command to specify the algorithm to select the RADIUS accounting server(s) to which accounting data must be sent.

Example

The following command configures to use the round-robin algorithm for RADIUS accounting server selection:

```
radius accounting algorithm round-robin
```

radius accounting billing-version

This command configures billing-system version of RADIUS accounting servers.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius accounting billing-version *version*

default radius accounting billing-version

default

Configures the default setting.
Default: 0

version

Specifies the billing-system version, and must be an integer from 0 through 4294967295.

Usage

Use this command to configure the billing-system version of RADIUS accounting servers.

Example

The following command configures the billing-system version of RADIUS accounting servers as 10:

radius accounting billing-version *10*

radius accounting gtp trigger-policy

This command configures the RADIUS accounting trigger policy for GTP messages.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
radius accounting gtp trigger-policy [ standard | ggsn-preservation-mode ]

default radius accounting gtp trigger-policy
```

default

Resets the RADIUS accounting trigger policy to standard behavior for GTP session.

standard

This keyword sets the RADIUS accounting trigger policy to standard behavior which is configured for GTP session for GGSN service.

ggsn-preservation-mode

This keyword sends RADIUS Accounting Start when the GTP message with private extension of preservation mode is received from SGSN.

Important: This is a customer-specific keyword and needs customer-specific license to use this feature. For more information on GGSN preservation mode, refer to the *GGSN Service Mode Commands* chapter.

Usage

Use this command to set the trigger policy for the AAA accounting for a GTP session.

Example

The following command sets the RADIUS accounting trigger policy for GTP session to standard:

```
default radius accounting gtp trigger-policy
```

radius accounting ha policy

Configures the RADIUS accounting policy for HA sessions.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
radius accounting ha policy { custom1-aaa-res-mgmt | session-start-stop }

default radius accounting ha policy
```

default

Configures the default setting.

session-start-stop

Specifies sending Accounting Start when the Session is connected, and sending Accounting Stop when the session is disconnected. This is the default behavior.

custom1-aaa-res-mgmt

Accounting Start/Stop messages are generated to assist special resource management done by AAA servers. It is similar to the session-start-stop accounting policy, except for the following differences:

- Accounting Start is also generated during MIP session handoffs.
- No Accounting stop is generated when an existing session is overwritten and the new session continues to use the IP address assigned for the old session.
- Accounting Start is generated when a new call overwrites an existing session.

Usage

Use this command to configure the AAA accounting behavior for an HA session.

Example

The following command configures the HA accounting policy to *custom1-aaa-res-mgmt*:

```
radius accounting ha policy custom1-aaa-res-mgmt
```

radius accounting interim

This command configures the volume of uplink and downlink volume octet counts that trigger RADIUS interim accounting, and configures the time period between the sending of interim accounting records.

Product

GGSN, PDSN, HA, HSGW

Privilege

Security Administrator, Administrator

Syntax

radius accounting interim { interval *seconds* **| volume { downlink** *bytes* **uplink** *bytes* **| total** *bytes* **| uplink** *bytes* **downlink** *bytes* **} }**

no radius accounting interim volume

no

Disables RADIUS interim accounting.

interval *seconds*

Specifies the time interval, in seconds, between sending interim accounting records. *seconds* must be an integer from 50 through 40,000,000.

volume { downlink *bytes* **uplink** *bytes* **| total** *bytes* **| uplink** *bytes* **downlink** *bytes* **}**

downlink *bytes* **uplink** *bytes*: Specifies the downlink to uplink volume limit, in bytes, for RADIUS Interim accounting. *bytes* must be an integer from 100,000 through 4,000,000,000.
total *bytes*: Specifies the total volume limit, in bytes, for RADIUS interim accounting. *bytes* must be an integer from 100,000 through 4,000,000,000.
uplink *bytes* **downlink** *bytes*: Specifies the uplink to downlink volume limit, in bytes, for RADIUS interim accounting. *bytes* must be an integer from 100,000 through 4,000,000,000.

Usage

Use this command to trigger RADIUS interim accounting based on the volume of uplink and downlink bytes and/or to configure the time interval between the sending of interim accounting records.

Example

The following command triggers RADIUS interim accounting when the total volume of uplink and downlink bytes reaches *110000*:

radius accounting interim volume total *110000*

The following command sets the interval between sending interim accounting records to 3 minutes (180 seconds):

radius accounting interim interval *180*

radius accounting ip remote-address

This command configures IP remote address-based RADIUS accounting parameters.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

`[ no ] radius accounting ip remote-address { collection | list` *`list_id`* **`}`**

`no`

Removes configuration for the specified keyword.

`collection`

Enables collecting and reporting Remote-Address-Based accounting in RADIUS Accounting. This should be enabled in the AAA Context. It is disabled by default.

`list` *`list_id`*

Enters the Remote Address List Configuration mode. This mode configures a list of remote addresses that can be referenced by the subscriber's profile.
`list_id` must be an integer from 1 through 65535.

Usage

This command is used as part of the Remote Address-based Accounting feature to both configure remote IP address lists and enable the collection of accounting data for the addresses in those lists on a per-subscriber basis.
Individual subscriber can be associated to remote IP address lists through the configuration/specification of an attribute in their local or RADIUS profile. (Refer to the **`radius accounting`** command in the Subscriber Configuration mode.) When configured/specified, accounting data is collected pertaining to the subscriber's communication with any of the remote addresses specified in the list.
Once this functionality is configured on the system and in the subscriber profiles, it must be enabled by executing this command with the collection keyword.

Example

```
radius accounting ip remote-address collection
```

radius accounting keepalive

Configures the keepalive authentication parameters for the RADIUS accounting server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no | default] radius accounting keepalive { calling-station-id *id* **| consecutive-response** *number* **| framed-ip-address** *ip_address* **| interval** *seconds* **| retries** *number* **| timeout** *seconds* **| username** *name* **}**

no

Removes configuration for the specified keyword.

default

Configures the default setting for the specified keyword.

calling-station-id *id*

Configures the Calling-Station-Id to be used for the keepalive authentication.
id must be an alpha and/or numeric string of 1 through 15 characters in length.
Default: 000000000000000

consecutive-response *number*

Configures the number of consecutive authentication response after which the server is marked as reachable.
number must be an integer from 1 through 10.
Default: 1

framed-ip-address *ip_address*

Configures the framed-ip-address to be used for the keepalive accounting.
ip_address must be specified using the standard IPv4 dotted decimal notation.

interval *seconds*

Configures the time interval between the two keepalive access requests.
Default: 30 seconds

retries *number*

Configures the number of times the keepalive access request to be sent before marking the server as unreachable.
number must be an integer from 3 through 10.
Default: 3

timeout *seconds*

Configures the time interval between each keepalive access request retries.
seconds must be an integer from 1 through 30.
Default: 3 seconds

username *name*

Configures the user name to be used for authentication.
name must be an alpha and/or numeric string of 1 through 127 characters in length.
Default: Test-Username

Usage

Use this command to configure the keepalive authentication parameters for the RADIUS accounting server.

Example

The following command sets the user name for RADIUS keepalive access requests to *Test-Username2*:

```
radius accounting keepalive username Test-Username2
```

The following command sets the number of RADIUS accounting keepalive retries to *4*.

```
radius accounting keepalive retries 4
```

radius accounting pdif trigger-policy

Configures the policy for generating START/STOP pairs in overflow condition.

Product

PDIF

Privilege

Administrator, Security Administrator

Syntax

```
[ default ] radius accounting pdif trigger-policy { standard | counter-rollover
}
```

default

The default option configures the "standard" policy.

standard

Applies a policy as defined by the standards.

counter-rollover

If the counter-rollover option is enabled, the system generates a STOP/START pair before input/output data octet counts (or input/output data packet counts) become larger than (2^32 - 1) in value. This setting is used to guarantee that a 32-bit octet count in any STOP message has not wrapped to larger than 2^32 thus ensuring the accuracy of the count. The system may, at its discretion, send the STOP/START pair at any time, so long as it does so before the 32-bit counter has wrapped.

Usage

Used to define the policy for dealing with overflow packet counts.

Example

Use the following example to set the default policy to *standard*.

```
default radius accounting pdif trigger-policy
```

radius accounting rp

Configures the RADIUS accounting R-P originated call options.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
radius accounting rp { handoff-stop { immediate | wait-active-stop } | tod
minute hour | trigger-event { active-handoff | active-start-param-change |
active-stop } | trigger-policy { airlink-usage [ counter-rollover ] | custom [
active-handoff | active-start-param-change | active-stop ] | standard } |
trigger-stop-start }

no radius accounting rp { tod minute hour | trigger-event { active-handoff |
active-start-param-change | active-stop } | trigger-stop-start }

default radius accounting rp { handoff-stop | trigger-policy }
```

no

Removes earlier configuration for the specified keyword.

default

Sets the default configuration for the specified keyword.

handoff-stop { immediate | wait-active-stop }

Specifies the behavior of generating accounting STOP when handoff occurs.

- **immediate**: Indicates that accounting STOP should be generated immediately on handoff, i.e. not to wait active-stop from the old PCF.
- **wait-active-stop**: Indicates that accounting STOP is generated only when active-stop received from the old PCF when handoff occurs.

Default: **wait-active-stop**

tod *minute hour*

Specifies the time of day a RADIUS event is to be generated for accounting. Up to four different times of the day may be specified through individual commands.
minute must be an integer from 0 through 59.
hour must be an integer from 0 through 23.

trigger-event { active-handoff | active-start-param-change | active-stop }

active-start-param-change: Enabled
active-stop: Disabled
Configures the events for which a RADIUS event is generated for accounting as one of the following:

- **active-handoff**: Disables a single R-P event (and therefore a RADIUS accounting event) when an Active PCF-to-PFC Handoff occurs. Instead, two R-P events occur (one for the Connection Setup, and the second for the Active-Start)
- **active-start-param-change**: Disables an R-P event (and therefore a RADIUS accounting event) when an Active-Start is received from the PCF and there has been a parameter change.
- **active-stop**: Disables an R-P event (and therefore a RADIUS accounting event) when an Active-Stop is received from the PCF.

Default: **active-handoff**: Disabled

Important: This keyword has been obsoleted by the **trigger-policy** keyword. Note that if this command is used, if the context configuration is displayed, radius accounting rp configuration is represented in terms of the trigger-policy.

trigger-policy { airlink-usage [counter-rollover] | custom [active-handoff | active-start-param-change | active-stop] | standard }

Default: **airlink-usage**: Disabled
custom:
active-handoff = Disabled
active-start-param-change = Disabled
active-stop = Disabled
standard: Enabled
Configures the overall accounting policy for R-P sessions as one of the following:

- **airlink-usage [counter-rollover]**: Specifies the use of Airlink-Usage RADIUS accounting policy for R-P, which generates a start on Active-Starts, and a stop on Active-Stops.
- If the **counter-rollover** option is enabled, the system generates a STOP/START pair before input/output data octet counts (or input/output data packet counts) become larger than (2^32 - 1) in value. This setting is used to guarantee that a 32-bit octet count in any STOP message has not wrapped to larger than 2^32 thus ensuring the accuracy of the count. The system, may, at its discretion, send the STOP/START pair at any time, so long as it does so before the 32-bit counter has wrapped. Note that a STOP/START pair is never generated unless the subscriber RP session is in the Active state, since octet/packet counts are not accumulated when in the Dormant state.
- **custom** : Specifies the use of custom RADIUS accounting policy for R-P. The custom policy can consist of the following:
- **active-handoff**: Enables a single R-P event (and therefore a RADIUS accounting event) when an Active PCF-to-PFC Handoff occurs. Normally two R-P events will occur (one for the Connection Setup, and the second for the Active-Start)
- **active-start-param-change**: Enables an R-P event (and therefore a RADIUS accounting event) when an Active-Start is received from the PCF and there has been a parameter change.

  Important: Note that a custom trigger policy with only **active-start-param-change** enabled is identical to the **standard** trigger-policy.

- **active-stop**: Enables an R-P event (and therefore a RADIUS accounting event) when an Active-Stop is received from the PCF.

Important: If the **radius accounting rp trigger-policy custom** command is executed without any of the optional keywords, all custom options are disabled.

- **standard**: Specifies the use of Standard RADIUS accounting policy for R-P in accordance with IS-835B.

trigger-stop-start

Specifies that a stop/start RADIUS accounting pair should be sent to the RADIUS server when an applicable R-P event occurs.

Usage

Use this command to configure the events for which a RADIUS event is sent to the server when the accounting procedures vary between servers.

Example

The following command enables an R-P event (and therefore a RADIUS accounting event) when an Active-Stop is received from the PCF:

```
radius accounting rp trigger-event active-stop
```

The following command generates the STOP only when active-stop received from the old PCF when handoff occurs:

```
default radius accounting rp handoff-stop
```

radius accounting server

For accounting, this command configures the RADIUS accounting server(s) in the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius [mediation-device] accounting server *ip_address* **[encrypted] key** *value* **[acct-on { enable | disable }] [acct-off { enable | disable }] [max** *messages* **] [oldports] [port** *port_number* **] [priority** *priority* **] [type standard] [admin-status { enable | disable }] [-noconfirm]**

no radius [mediation-device] accounting server *ip_address* **[oldports | port** *port_number* **]**

no

Removes the server or server port(s) specified from the list of configured servers.

mediation-device

Enables mediation-device specific AAA transactions use to communicate with this RADIUS server.

Important: If this option is not used, by default the system enables standard AAA transactions.

ip_address **[port** *port_number* **]**

Specifies the IP address of the accounting server. *ip_address* must be specified using the standard IPv4 dotted decimal notation or colon notation for IPv6. A maximum of 1600 RADIUS servers per context/system and 128 servers per server group can be configured. This limit includes accounting and authentication servers.
port *port_number* specifies the port number to use for communications. *port_number* must be an integer from 0 through 65535. Default is 1813.

Important: Same RADIUS server IP address and port can be configured in multiple RADIUS server group within a context.

[encrypted] key *value*

Specifies the shared secret key used to authenticate the client to the servers. The **encrypted** keyword indicates the key specified is encrypted. The key *value* must be an alpha and/or numeric string of 1 through 15 characters, or when encrypted an alpha and/or numeric string of 1 through 30 characters.
The **encrypted** keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **key** keyword is the encrypted version of the plaint text key. Only the encrypted key is saved as part of the configuration file.

acct-on { enable | disable }

Enables and disables sending of the Accounting-On message when a new RADIUS server is added to the configuration.
When this is enabled, the Accounting-On message is sent when a new RADIUS server is added in the configuration. However, if for some reason the Accounting-On message cannot be sent at the time of server configuration (for example; if the interface is down), then the message is sent as soon as possible. Once the Accounting-On message is sent, if it is not responded to after the configured RADIUS accounting timeout, the message is retried the configured number of RADIUS accounting retries. Once all retries have been exhausted, the system no longer attempts to send the Accounting-On message for this server.
Default: disable

acct-off { enable | disable }

Disables and enables the sending of the Accounting-Off message when a RADIUS server is removed from the configuration.
The Accounting-Off message is sent when a RADIUS server is removed from the configuration, or when there is an orderly shutdown. However, if for some reason the Accounting-On message cannot be sent at this time, it is never sent. The Accounting-Off message is sent only once, regardless of how many accounting retries are enabled.
Default: enable

max *messages*

Specifies the maximum number of outstanding messages that may be allowed to the server.
messages must be an integer from 1 through 256.
Default: 0

oldports

Sets the UDP communication port to the out of date standardized default for RADIUS communications to 1646.

priority *priority*

Specifies the relative priority of this accounting server. The priority is used in server selection for determining which server to send accounting data to.
priority must be an integer from 1 through 1000, where 1 is the highest priority. When configuring two or more servers with the same priority you will be asked to confirm that you want to do this. If you use the **-noconfirm** option, you are not asked for confirmation and multiple servers could be assigned the same priority.
Default: 1000

type { mediation-device | standard }

mediation-device: Obsolete keyword.
Specifies the type of AAA transactions to use to communicate with this RADIUS server.
standard: Use standard AAA transactions.
Default: **standard**

admin-status { enable | disable }

Configures the admin-status for the RADIUS accounting server.
enable: Enables the RADIUS accounting server.
disable: Disables the RADIUS accounting server.

-noconfirm

Specifies that the command must execute without any prompts and confirmation from the user.

Usage

Use this command to configure the RADIUS accounting servers with which the system must communicate for accounting.
Up to 1600 RADIUS servers per context/system and 128 servers per server group can be configured. The servers can be configured as Accounting, Authentication, Charging servers, or any combination thereof.

Example

The following command sets the accounting server with mediation device transaction for AAA server *1.2.3.4*:

radius mediation-device accounting server *1.2.3.4* **key** *sharedKey* **port** *1024* **max** *127*

radius algorithm

This command configures the RADIUS authentication server selection algorithm for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius algorithm { first-server | round-robin }

default radius algorithm
```

default

Configures the default setting.
Default: **first-server**

first-server

Accounting data is sent to the first available server based upon the relative priority of each configured server.

round-robin

Accounting data is sent in a circular queue fashion on a per Session Manager task basis where data is sent to the next available server and restarts at the beginning of the list of configured servers. The order of the list is based upon the configure relative priority of the servers.

Usage

Use this command to configure the context's RADIUS server selection algorithm to ensure proper load distribution amongst the available servers.

Example

The following command configures to use the round-robin algorithm for RADIUS server selection:

```
radius algorithm round-robin
```

radius allow

This command configures the system behavior for allowing subscriber sessions when RADIUS accounting and/or authentication is unavailable.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] radius allow { authentication-down | accounting-down }
```

no

Specifies that the specified option is to be disabled.

authentication-down

Allows sessions while authentication is not available (down).
Default: Disabled

accounting-down

Allows sessions while accounting is unavailable (down).
Default: Enabled

Usage

Allow sessions during system troubles when the risk of IP address and/or subscriber spoofing is minimal. The denial of sessions may cause dissatisfaction with subscribers at the cost/expense of verification and/or accounting data.

Example

The following command configures the RADIUS server to allow the sessions while accounting is unavailable.

```
radius allow accounting-down
```

radius attribute

Configures the system's RADIUS identification parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius attribute { nas-identifier id | nas-ip-address address primary_address [
backup secondary_address ] [ nexthop-forwarding-address nexthop_address ] [
mpls-label input in_label_value | output out_label_value1 [ out_label_value2 ] [
vlan vlan_id ] ] }

no radius attribute { nas-identifier | nas-ip-address }

default radius attribute nas-identifier
```

no

Removes configuration for the specified keyword.

default

Configures the default setting.

nas-identifier *id*

Specifies the attribute name by which the system will be identified in Access-Request messages. *id* must be a case-sensitive alpha and/or numeric string of 1 through 32 characters in length.

nas-ip-address address *primary_address*

Specifies the AAA interface IP address(es) used to identify the system. Up to two addresses can be configured.
primary_address: The IP address of the primary interface to use in the current context. This must be specified using the standard IPv4 dotted decimal notation.

backup *secondary_address*

backup: The IP address of the secondary interface to use in the current context. This must be specified using the standard IPv4 dotted decimal notation.

nexthop-forwarding-address *nexthop_address*

Configures next hop IP address for this NAS IP address. It optionally sets the RADIUS client to provide VLAN ID and nexthop forwarding address to system when running in single nexthop gateway mode. *nexthop_address* must be specified using the standard IPv4 dotted decimal notation.

Important: To define more than one NAS IP address per context, in Global Configuration Mode use the **aaa large-configuration** command. If enabled, for a PDSN a maximum of 400 and for a GGSN a maximum of 800 NAS IP addresses/NAS identifiers (1 primary and 1 secondary per Server group) can be configured per context.

mpls-label input *in_label_value* **| output** *out_label_value1* **[** *out_label_value2* **]**

Configures the traffic from the specified RADIUS client NAS IP address to use the specified MPLS labels.

- *in_label_value* is the MPLS label that will identify inbound traffic destined for the configured NAS IP address.
- *out_label_value1* and *out_label_value2* identify the MPLS labels to be added to packets sent from the specified NAS IP address.
- *out_label_value1* is the inner output label.
- *out_label_value2* is the outer output label.

MPLS label values must be an integer from 16 to 1048575.

vlan *vlan_id*

This optional keyword sets the RADIUS client to provide VLAN ID with nexthop forwarding address to system when running in single nexthop gateway mode.
vlan_id must be a pre-configured VLAN ID and must be an integer from 1 through 4096. It is the VLAN ID to be provided to the system in RADIUS attributes.
This option is available only when nexthop-forwarding gateway is also configured with nexthop-forwarding-address *nexthop_address* keyword and **aaa-large configuration** is enabled at Global Configuration level.

Usage

This is necessary for NetWare Access Server usage such as the system must be identified to the NAS.
The system supports the concept of the active nas-ip-address. The active nas-ip-address is defined as the current source ip address for RADIUS messages being used by the system. This is the content of the nas-ip-address attribute in each RADIUS message.
The system will always have exactly one active nas-ip-address. The active nas-ip-address will start as the primary nas-ip-address. However, the active nas-ip-address may switch from the primary to the backup, or the backup to the primary. The following events will occur when the active nas-ip-address is switched:

- All current in-process RADIUS accounting messages from the entire system are cancelled. The accounting message is re-sent, with retries preserved, using the ne w active nas-ip-address. Acct-Delay-Time, however, is updated to reflect the time that has occurred since the accounting event. The value of Event-Timestamp is preserved.
- All current in-process RADIUS authentication messages from the entire system are cancelled. The authentication message is re-sent, with retries preserved, using the new active nas-ip-address. The value of Event-Timestamp is preserved.
- All subsequent in-process RADIUS requests uses the new active nas-ip-address.

The system uses a revertive algorithm when transitioning active NAS IP addresses as described below:

- If the configured primary nas-ip-address transitions from UP to DOWN, and the backup nas-ip-address is UP, then the active nas-ip-address switches from the primary to the backup nas-ip-address.

- If the backup nas-ip-address is active, and the primary nas-ip-address transitions from DOWN to UP, then the active nas-ip-address switches from the backup to the primary nas-ip-address.

Example

```
radius attribute nas-ip-address 1.2.3.4
```

```
no radius attribute nas-identifier  sampleID
```

radius authenticate

This command configures RADIUS authentication related parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius authenticate { apn-to-be-included { gi | gn } | null-username }

default radius authenticate { apn-to-be-included | null-username }

no radius authenticate null-username
```

default

Configures the default setting.

no radius authenticate null-username

Disables sending an Access-Request message to the AAA server for user names (NAI) that are blank.

apn-to-be-included

Specifies the APN name to be included for RADIUS authentication.
gi: Specifies the usage of Gi APN name in RADIUS authentication request. Gi APN represents the APN received in the Create PDP Context request message from SGSN.
gn: Specifies the usage of Gn APN name in RADIUS authentication request. Gn APN represents the APN selected by the GGSN.

null-username

Specifies attempting RADIUS authentication even if the provided user name is NULL (empty).
Default: Enables authenticating, sending Access-Request messages to the AAA server, all user names, including NULL user names.

Usage

Use this command to disable, or re-enable, sending Access-Request messages to the AAA server for usernames (NAI) that are blank (NULL).

Example

To disable sending Access-Request messages for user names (NAI) that are blank, enter the following command:

```
no radius authenticate null-username
```

To re-enable sending Access-Request messages for user names (NAI) that are blank, enter the following command:

```
radius authenticate null-username
```

radius authenticator-validation

This command enables (allows) and disables (prevents) the MD5 authentication of RADIUS user. MD5 authentication is enabled by default.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] radius authenticator-validation
```

no

Disables MD5 authentication validation for an Access-Request message to the AAA server.

Usage

Use this command to disable or re-enable, sending Access-Request messages to the AAA server for MD5 validation.

Example

To disable MD5 authentication validation for Access-Request messages for usernames (NAI), enter the following command:

```
no radius authenticator-validation
```

To enable MD5 authentication validation for Access-Request messages for user names (NAI), enter the following command:

```
radius authenticator-validation
```

radius charging

This command configures basic RADIUS options for Active Charging Service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no | default] radius charging { deadtime *dead_minutes* **| detect-dead-server { consecutive-failures** *count* **| response-timeout** *seconds* **} | max-outstanding** *messages* **| max-retries** *tries* **| max-transmissions** *transmissions* **| timeout** *idle_seconds* **}**

---

no

Removes configuration for the specified keyword.

---

default

Configures the default setting for the specified keyword.

---

deadtime *dead_minutes*

Specifies the number of minutes to wait before attempting to communicate with a server that has been marked as unreachable.
dead_minutes must be an integer from 0 through 65535.
Default: 10

---

detect-dead-server { consecutive-failures *count* **| response-timeout** *seconds* **}**

consecutive-failures *count*: Specifies the number of consecutive failures, for each AAA Manager, before a server is marked as unreachable.
count must be an integer from 1 through 1000.
Default: 4
response-timeout *seconds*: Specifies the number of seconds for each AAA Manager to wait for a response to any message before a server is detected as failed, or in a down state.
seconds must be an integer from 1 through 65535.

---

max-outstanding *messages*

Specifies the maximum number of outstanding messages a single AAA Manager instance will queue.
messages must be an integer from 1 through 4000.
Default: 256

---

max-retries *tries*

Specifies the maximum number of times communication with a AAA server will be attempted before it is marked as unreachable, and the detect dead servers consecutive failures count is incremented.
tries must be an integer from 0 through 65535.

Default: 5

max-transmissions *transmissions*

Sets the maximum number of re-transmissions for RADIUS authentication requests. This limit is used in conjunction with the **max-retries** parameter for each server.
When failing to communicate with a RADIUS sever, the subscriber is failed once all of the configured RADIUS servers have been exhausted or once the configured number of maximum transmissions is reached. For example, if three servers are configured and if the configured max-retries is 3 and max-transmissions is 12, then the primary server is tried four times (once plus three retries), the secondary server is tried four times, and then a third server is tried four times. If there is a fourth server, it is not tried because the maximum number of transmissions (12) has been reached.
transmissions must be an integer from 1 through 65535.
Default: Disabled

timeout *idle_seconds*

Specifies the number of seconds to wait for a response from the RADIUS server before re-sending the messages.
idle_seconds must be an integer from 1 through 65535.
Default: 3

Usage

Use this command to manage the basic Charging Service RADIUS options according to the RADIUS server used for the context.

Example

```
radius charging detect-dead-server consecutive-failures 6
radius charging timeout 300
```

radius charging accounting algorithm

This command specifies the fail-over/load-balancing algorithm to be used for selecting RADIUS servers for charging services.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
radius charging accounting algorithm { first-n  n  | first-server | round-robin
}
```

first-n *n*

Specifies that the AGW must send accounting data to *n* (more than one) AAA servers based on their priority. Response from any one of the *n* AAA servers would suffice to proceed with the call. The full set of accounting data is sent to each of the *n* AAA servers.
n is the number of AAA servers to which accounting data will be sent, and must be an integer from 2 through 128.
Default: 1 (Disabled)

first-server

Specifies that the context must send accounting data to the RADIUS server with the highest configured priority. In the event that this server becomes unreachable, accounting data is sent to the server with the next-highest configured priority. This is the default algorithm.

round-robin

Specifies that the context must load balance sending accounting data among all of the defined RADIUS servers. Accounting data is sent in a circular queue fashion on a per Session Manager task basis, where data is sent to the next available server and restarts at the beginning of the list of configured servers. The order of the list is based upon the configured relative priority of the servers.

Usage

Use this command to specify the accounting algorithm to use to select RADIUS servers for charging services configured in the current context.

Example

The following command configures to use the round-robin algorithm for RADIUS server selection:

```
radius charging accounting algorithm round-robin
```

radius charging accounting server

Configures RADIUS charging accounting servers in the current context for Active Charging Service Prepaid Accounting.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius charging accounting server *ip_address* **[encrypted] key** *value* **[max** *messages* **] [oldports] [port** *port_number* **] [priority** *priority* **] [admin-status { enable | disable }] [-noconfirm]**

no radius charging accounting server *ip_address* **[oldports | port** *port_number* **]**

no

Removes the server or server port(s) specified from the list of configured servers.

ip_address

Specifies the IP address of the accounting server. *ip_address* must be specified using the standard IPv4 dotted decimal notation. A maximum of 128 RADIUS servers can be configured per context. This limit includes accounting and authentication servers.

[encrypted] key *value*

Specifies the shared secret key used to authenticate the client to the servers. The **encrypted** keyword indicates the key specified is encrypted. The key *value* must be an alpha and/or numeric string of 1 through 15 characters, or an alpha and/or numeric string of 1 through 30 characters when encrypted.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **key** keyword is the encrypted version of the plaint text key. Only the encrypted key is saved as part of the configuration file.

max *messages*

Specifies the maximum number of outstanding messages that may be allowed to the server. *messages* must be an integer from 0 through 4000.
Default: 0

oldports

Sets the UDP communication port to the out of date standardized default for RADIUS communications to 1646.

port *port_number*

Specifies the port number to use for communication.
port_number must be an integer from 0 through 65535.

Default: 1813

priority *priority*

Specifies the relative priority of this accounting server. The priority is used in server selection for determining which server to send accounting data to. *priority* must be an integer from 1 through 1000, where 1 is the highest priority.
Default: 1000

admin-status { enable | disable }

Enables or disables the RADIUS authentication/accounting/charging server functionality and saves the status setting in the configuration file to re-establish the set status at reboot.

-noconfirm

Specifies that the command must execute without any prompts and confirmation from the user.

Usage

This command is used to configure the RADIUS charging accounting server(s) with which the system is to communicate for Active Charging Service Prepaid Accounting requests.

Example

Up to 128 AAA servers can be configured per context when the system is functioning as a PDSN and/or HA. Up to 16 servers are supported per context when the system is functioning as a GGSN.

```
radius charging accounting server 1.2.3.4 key sharedKey port 1024
max 127

radius charging accounting server 1.2.5.6 encrypted key scrambledKey
oldports priority 10 ]

no radius charging accounting server 1.2.5.6
```

radius charging algorithm

Specifies the RADIUS authentication server selection algorithm for Active Charging Service for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius charging algorithm { first-server | round-robin }

default radius charging algorithm
```

default

Configures the default setting.
Default: **first-server**

first-server

Accounting data is sent to the first available server based upon the relative priority of each configured server.

round-robin

Accounting data is sent in a circular queue fashion on a per Session Manager task basis where data is sent to the next available server and restarts at the beginning of the list of configured servers. The order of the list is based upon the configured relative priority of the servers.

Usage

Use this command to configure the context's RADIUS server selection algorithm for Active Charging Service to ensure proper load distribution amongst the available servers.

Example

```
radius algorithm first-server

radius algorithm round-robin
```

radius charging server

Configures the RADIUS charging server(s) in the current context for Active Charging Service Prepaid Authentication.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius charging server ip_address [ encrypted ] key value [ max messages ] [
oldports ] [ port port_number ] [ priority priority ] [ admin-status { enable |
disable } ] [ -noconfirm ]

no radius charging server ip_address [ oldports | port port_number ]
```

no

Removes the server or server port(s) specified from the list of configured servers.

ip_address

Specifies the IP address of the server. *ip_address* must be specified using the standard IPv4 dotted decimal notation. A maximum of 128 RADIUS servers can be configured per context. This limit includes accounting and authentication servers.

[encrypted] key *value*

Specifies the shared secret key used to authenticate the client to the servers. The **encrypted** keyword indicates the key specified is encrypted. The key *value* must be an alpha and/or numeric string of 1 through 15 alpha characters, or an alpha and/or numeric string of 1 through 30 characters when encrypted.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **key** keyword is the encrypted version of the plain text key. Only the encrypted key is saved as part of the configuration file.

max *messages*

Specifies the maximum number of outstanding messages that may be allowed to the server. *messages* must be an integer from 0 through 4000.
Default: 256

oldports

Sets the UDP communication port to the old default for RADIUS communications to 1645.

port *port_number*

Specifies the port number to use for communications.
port_number must be an integer from 1 through 65535.
Default: 1812

priority *priority*

Specifies the relative priority of this accounting server. The priority is used in server selection for determining which server to send accounting data to.
priority must be an integer from 1 through 1000, where 1 is the highest priority.
Default: 1000

admin-status { enable | disable }

Enables or disables the RADIUS authentication, accounting, or charging server functionality and saves the status setting in the configuration file to re-establish the set status at reboot.

-noconfirm

Specifies that the command must execute without any prompts and confirmation from the user.

Usage

This command is used to configure the RADIUS charging server(s) with which the system is to communicate for Active Charging Service Prepaid Authentication requests.

Example

Up to 128 AAA servers can be configured per context when the system is functioning as a PDSN and/or HA. Up to 16 servers are supported per context when the system is functioning as a GGSN.

```
radius charging server 1.2.3.4 key sharedKey port 1024 max 127

radius charging server 1.2.5.6 encrypted key scrambledKey oldports
priority 10 ]

no radius server 1.2.5.6
```

radius ip vrf

This command associates the specific AAA group with a Virtual Routing and Forwarding (VRF) Context instance for GRE tunnel interface configuration. By default the VRF is NULL, which means that AAA group is associated with global routing table.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius ip vrf *vrf_name*

no radius ip vrf

no

Removes/disassociates configured IP Virtual Routing and Forwarding (VRF) context instance.

vrf_name

Specifies the name of a pre-configured VRF context instance.
vrf_name is the name of a pre-configured virtual routing and forwarding (VRF) context configured in Context configuration mode through **ip vrf** command.

Usage

Use this command to associate/disassociate a pre-configured VRF context for a GRE tunnel interface.
By default the VRF is NULL, which means that AAA group is associated with global routing table.

Example

The following command associates VRF context instance *GRE_vrf1* with this AAA group:

radius ip vrf *GRE_vrf1*

radius keepalive

This command configures the RADIUS keepalive authentication parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[default] radius keepalive [calling-station-id *id* **| consecutive-response** *number* **| encrypted | interval** *seconds* **| password | retries** *number* **| timeout** *seconds* **| username** *name* **| valid-response access-accept [access-reject]]**

default

Configures the default setting for the specified keyword.

calling-station-id *id*

Specifies the Calling-Station-Id to be used for the keepalive authentication.
id must be an alpha and/or numeric string of 1 through 15 characters in length.
Default value is 000000000000000.

consecutive-response *number*

Specifies the number of consecutive authentication responses after which the server is marked as reachable.
number must be an integer from 1 through 5.
Default: 1

encrypted password

Specifies encrypting the password.
password must be an alpha and/or numeric string of 1 through 64 characters in length.
Default password: Test-Password

interval *seconds*

Specifies the time interval, in seconds, between two keepalive access requests.
Default: 30 seconds

password

Specifies the password to be used for authentication.
password must be an alpha and/or numeric string of 1 through 64 characters in length.
Default password: Test-Password

retries *number*

Specifies the number of times the keepalive access request to be sent before marking the server as unreachable.
number must be an integer from 3 through 10.
Default: 3

timeout *seconds*

Specifies the time interval between keepalive access request retries.
seconds must be an integer from 1 through 30.
Default: 3 seconds

username *name*

Specifies the user name to be used for authentication. *name* must be an alpha and/or numeric string of 1 through 127 characters in length.
Default: Test-Username

valid-response access-accept [*access-reject* **]**

Specifies the valid response for the authentication request.
If *access-reject* is configured, then both access-accept and access-reject are considered as success for the keepalive authentication request.
If *access-reject* is not configured, then only access-accept is considered as success for the keepalive access request.
Default: **keepalive valid-response access-accept**

Usage

Use this command to configure the keepalive authentication parameters for the RADIUS server.

Example

The following command configures the user name for RADIUS keepalive access requests to *Test-Username2*:

```
radius keepalive username Test-Username2
```

The following command configures the number of RADIUS keepalive retries to *4*:

```
radius keepalive retries 4
```

radius mediation-device

See the radius accounting server command.

radius probe-interval

This command configures the time interval between two RADIUS authentication probes.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius probe-interval *seconds*

default radius probe-interval

default

Configures the default setting.

seconds

Specifies the number of seconds to wait before sending another probe authentication request to a RADIUS server.
seconds must be an integer from 1 through 65535.
Default: 60

Usage

Use this command for Interchassis Session Recovery (ICSR) support to set the duration between two authentication probes to the RADIUS server.

Example

The following command sets the RADIUS authentication probe interval to 30 seconds.

radius probe-interval *30*

radius probe-max-retries

This command configures the number of retries for RADIUS authentication probe response.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius probe-max-retries *retries*

default radius probe-max-retries

default

Configures the default setting.

retries

Specifies the number of retries for RADIUS authentication probe response before the authentication is declared as failed.
retries must be an integer from 0 through 65535.
Default: 5

Usage

Use this command for Home Agent Geographical Redundancy (HAGR) support to set the number of attempts to send RADIUS authentication probe without a response before the authentication is declared as failed.

Example

The following command configures the maximum number of retries to *6* seconds.

radius probe-max-retries *6*

radius probe-timeout

This command configures the timeout duration for HAGR to wait for a response for RADIUS authentication probes.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius probe-timeout *idle_seconds*

default radius probe-timeout

default

Configures the default setting.

idle_seconds

Specifies the number of seconds to wait for a response from the RADIUS server before re-sending the authentication probe.
idle_seconds must be an integer from 0 through 65535.
Default: 3

Usage

Use this command for Home Agent Geographical Redundancy (HAGR) support to set the time duration to wait for response before re-sending the RADIUS authentication probe to the RADIUS server.

Example

The following command sets the authentication probe timeout to *120* seconds:

radius probe-timeout *120*

radius server

This command configures RADIUS authentication server(s) in the current context for authentication.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius server *ip_address* **[encrypted] key** *value* **[max** *messages* **] [oldports] [port** *port_number* **] [priority** *priority* **] [probe | no-probe] [probe-username** *username* **] [probe-password [encrypted] password** *password* **] [type { mediation-device | standard }] [admin-status { enable | disable }] [-noconfirm]**

no radius server *ip_address* **[oldports | port** *port_number* **]**

no

Removes the server or server port(s) specified from the list of configured servers.

ip_address **port** *port_number*

Specifies the IP address and port number of the server.
ip_address: Must be specified using the standard IPv4 dotted decimal notation. A maximum of 1600 RADIUS servers per context/system and 128 servers per Server group can be configured. This limit includes accounting and authentication servers.
port *port_number*: Specifies the port number to use for communications. *port_number* must be an integer from 1 through 65535. Default: 1812.

Important: Same RADIUS server IP address and port can be configured in multiple RADIUS server group within a context.

[encrypted] key *value*

Specifies the shared secret key used to authenticate the client to the servers. The **encrypted** keyword indicates the key specified is encrypted. The key *value* must be an alpha and/or numeric string of 1 through 15 characters, or an alpha and/or numeric string of 1 through 30 characters when encrypted.
The **encrypted** keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **key** keyword is the encrypted version of the plain text key. Only the encrypted key is saved as part of the configuration file.

max *messages*

Specifies the maximum number of outstanding messages that may be allowed to the server. *messages* must be an integer from 0 through 4000.
Default: 256

oldports

Sets the UDP communication port to the old default for RADIUS communications to 1645.

priority *priority*

Specifies the relative priority of this accounting server. The priority is used in server selection for determining which server to send accounting data to.
priority must be an integer from 1 through 1000, where 1 is the highest priority. When configuring two or more servers with the same priority you will be asked to confirm that you want to do this. If you use the **-noconfirm** option, you are not asked for confirmation and multiple servers could be assigned the same priority.
Default: 1000

probe

Enable probe messages to be sent to the specified RADIUS server.

no-probe

Disable probe messages from being sent to the specified RADIUS server. This is the default behavior.

probe-username *username*

The username sent to the RADIUS server to authenticate probe messages. *username* must be an alpha and/or numeric string of 1 through 127 characters in length.

probe-password [encrypted] password *password*

The password sent to the RADIUS server to authenticate probe messages.
encrypted: This keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.
password *password*: Specifies the probe-user password for authentication. *password* must be an alpha and/or numeric string of 1 through 63 characters in length.

type { mediation-device | standard }

Specifies the type of transactions the RADIUS server accepts.
mediation-device: Specifies mediation-device specific AAA transactions. This device is available if you purchased a transaction control services license. Contact your local sales representative for licensing information.
standard: Specifies standard AAA transactions. (Default)

admin-status { enable | disable }

Enables or disables the RADIUS authentication, accounting, or charging server functionality and saves the status setting in the configuration file to re-establish the set status at reboot.

-noconfirm

Specifies that the command must execute without any prompts and confirmation from the user.

Usage

This command is used to configure the RADIUS authentication server(s) with which the system is to communicate for authentication.
Up to 1600 RADIUS servers per context/system and 128 servers per Server group can be configured. The servers can be configured as accounting, authentication, charging servers, or any combination thereof.

Example

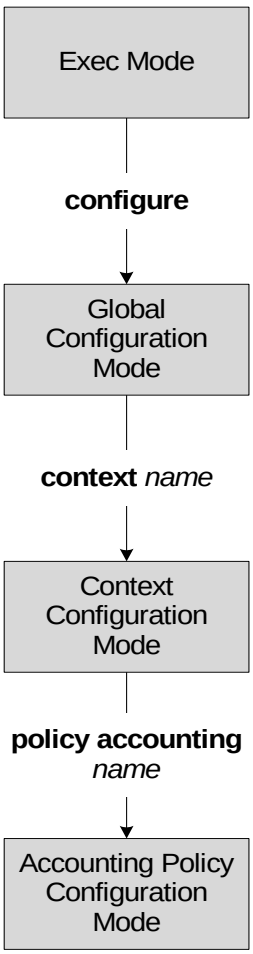
radius server *1.2.3.4* **key** *sharedKey* **port** *1024* **max** *127*

radius server *1.2.5.6* **encrypted key** *scrambledKey* **oldports priority** *10*

no radius server *1.2.5.6*

Chapter 3
Accounting Policy Configuration Mode Commands

The Accounting Policy Configuration Mode is used to define the accounting method, mode, and event trigger responses for the accounting policy supporting the Rf (off-line charging) interface.



accounting-event-trigger

Configures the response to specific event triggers for this policy. Multiple event instances can be configured.

Product

HSGW, P-GW, S-GW

Privilege

Administrator

Syntax

accounting-event-trigger { flow-information-change | interim-timeout | location-change } action { interim | stop-start }

[default | no] accounting-event-trigger { flow-information-change | interim-timeout | location-change }

default

Returns the command to its default setting of interim for the **action** keyword (for all events).

no

Removes the specified event trigger configuration from this policy.

flow-information-change

Specifies that the action is initiated upon indication of a change in the flow information.

interim-timeout

Specifies that the action is initiated upon expiration of the interim interval.

location-change

Specifies that the action is initiated upon indication of

action { interim | stop-start }

Default: interim
Specifies the action initiated upon the occurrence of an event.
interim: Specifies that an interim ACR is sent.
stop-start: Soecifies that a stop-start ACR is sent.

Usage

Use the is command to configure that action taken upon the occurrence on an accounting event trigger.

Example

The following command configures the policy to send a stop-start ACR upon indication of an interim timeout:

```
accounting-event-trigger interim-timeout
```

accounting-level

Configures the type of accounting performed by this profile.

Product

HSGW, P-GW, S-GW

Privilege

Administrator

Syntax

```
accounting-level { flow | pdn | pdn-qci | qci | sdf | subscriber }

default accounting-level
```

default

Returns the command to the default setting of subscriber-based accounting.

flow

Specifies that flow-based accounting is to be used for this accounting profile. Accounting Request (ACR) Start messages include an AVP with the following EPS information:

- PDN identifier
- QCI for which accounting is done
- Charging rule name for which accounting is being done
- AF charging identifier (included if PCRF has provided a charging identifier to correlate AF generated information)
- Flow description for the flows
- User Equipment information if available (ESN/MEID)
- Address of HSGW/SGW
- Address of the PGW (if available), one or more instances

pdn

Specifies that PDN-based accounting is to be used for this accounting profile. Accounting Request (ACR) Start messages include an AVP with the following EPS information:

- Addresses allocated to the UE in this PDN
- PDN identifier
- User Equipment information if available (ESN/MEID)
- Address of HSGW/SGW
- Address of the PGW (if available), one or more instances

pdn-qci

Specifies that PDN-QCI accounting is to be used for this accounting profile. Accounting Request (ACR) Start messages include an AVP with the following EPS information:

- Addresses allocated to the UE in this PDN

- PDN identifier
- QCI for which accounting is done
- User Equipment information if available (ESN/MEID)
- Address of HSGW/SGW
- Address of the PGW (if available), one or more instances

qci

Specifies that QCI-based accounting is to be used for this accounting profile. Accounting Request (ACR) Start messages include an AVP with the following EPS information:

- QCI for which accounting is done
- User Equipment information if available (ESN/MEID)
- Address of HSGW/SGW
- Address of the PGW (if available), one or more instances

sdf

Specifies that service data flow accounting is to be used for this accounting profile. Accounting Request (ACR) Start messages include an AVP with the following EPS information:

subscriber

Specifies that subscriber-based accounting is to be used for this accounting profile. Accounting Request (ACR) Start messages include an AVP with the following EPS information:

- User Equipment information if available (ESN/MEID)
- Address of HSGW/SGW
- Address of the PGW (if available), one or more instances

Usage

Use this command to specify the type of accounting performed by this profile.

Example

The following command sets the accounting type for this profile to flow-based:

```
accounting-level flow
```

accounting-mode

Configures the accounting mode for this profile.

Product

HSGW, P-GW, S-GW

Privilege

Administrator

Syntax

```
accounting-mode normal

default accounting-mode
```

default

Returns the accounting mode for this profile to its default setting of “normal”.

normal

Specifies that “normal” (start/interim/stop) accounting will be performed for this profile.

Usage

Use this command to set the accounting mode for this profile.

cc profile

Configures a charging characteristics profile, within the accounting profile configuration, for CDR generation.

Product

S-GW

Privilege

Administrator

Syntax

cc profile *index* **{ buckets** *num* **| interval** *seconds* **| tariff time1** *min hrs* **[time2** *min hrs...***time4** *min hrs* **] | volume { downlink** *octets* **{ uplink** *octets* **} | total** *octets* **| uplink** *octets* **{ downlink** *octets* **} } }**

default cc profile *index*

no cc profile *index* **{ buckets | interval | tariff | volume }**

default

Returns all profile features, for the specified profile index, to their default settings.

no

Returns the specified feature to its default setting.

profile *index*

Specifies a billing type to be applied to this profile. *index* must be one of the following:
1: Hot billing
2: Flat billing
4: Prepaid billing
8: Normal billing

buckets *num*

Default: 4
Specifies the number of container changes in the S-GW CDR due to QoS changes or tariff times. *num* must be an integer value from 1 to 4. If an accounting policy is not configured, this value is 4.

interval *seconds*

Default: disabled
Specifies a time interval for closing the charging record if the minimum volume thresholds are satisfied. *seconds* must be an integer valse from 60 to 40000000.

tariff time1 *min hrs* **[time2** *min hrs...***time4** *min hrs* **]**

Specifies time-of-day values used to determine when a container is closed in the charging records.
time1 *min hrs*: Specifies the first time-of-day value used to close the current container in the charging record. *min* must be an integer value from 0 to 59. *hrs* must be an integer value from 0 to 23.

time2 *min hrs*...time4 *minutes hours*: Specifies the second, third and fourth time-of-day values used to close containers in the charging record. *min* must be an integer value from 0 to 59. *hrs* must be an integer value from 0 to 23.

volume { downlink *octets* **{ uplink** *octets* **} | total** *octets* **| uplink** *octets* **{ downlink** *octets* **} }**

Specifies octet volume thresholds for the generation of interim CDRs.
downlink *octets*: Sets the threshold limit for the number of downlink octets that must be reached before the charging record is closed. *octets* must be an interger value from 100000 to 40000000000.
total *octets*: Sets the threshold limit for the total number of octets that must be reached before the charging record is closed. *octets* must be an interger value from 100000 to 40000000000.
uplink *octets*: Sets the threshold limit for the number of uplink octets that must be reached before the charging record is closed. *octets* must be an interger value from 100000 to 40000000000.

Usage

Use this command to set charging characteristics that directly affect the CDR generation on the S-GW.

Example

The following command creates a hot billing profile with a total octet volume threshold set to 500,000:

```
cc profile 1 volume total 500000
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

operator-string

Configures a text string to be included with accounting messages sent by this policy.

Product

HSGW, P-GW, S-GW

Privilege

Administrator

Syntax

operator-string *string*

no operator-string

no

Removes the operator string from this policy.

string

Specifies a text string that is included with accounting messages originating from this policy. *string* must be from 1 to 63 alpha and/or numeric characters.

Usage

Use this command to create a text string to be included with accounting messages originating from this policy.

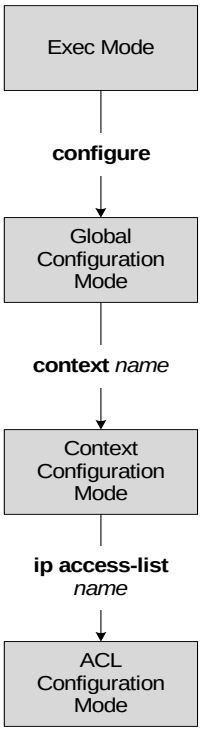
Example

The following command creates the text string “pgw_local” to be included with accounting messages originating from this policy:

```
operator-string pgw_local
```

Chapter 4
ACL Configuration Mode Commands

The Access Control List Configuration Mode is used to create and manage IP access privileges.



deny/permit (by source IP address masking)

Used to filter subscriber sessions based on the IP address mask sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

{ deny | permit } [log] *source_address source_wildcard*

after { deny | permit } [log] *source_address source_wildcard*

before { deny | permit } [log] *source_address source_wildcard*

no { deny | permit } [log] *source_address source_wildcard*

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.

- **deny**: Indicates the rule, when matched, drops the corresponding packets.
- **permit**: Indicates the rule, when matched, allows the corresponding packets.

log

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

Usage

Define a rule when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of filtering rules as it does not require a rule for each source and destination pair.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide.

Example

The following command defines two rules with the second logging filtered packets:

```
permit 1.2.3.0 0.0.0.31

deny log 1.2.4.0 0.0.0.15
```

The following sets the insertion point before the first rule defined above:

```
before permit 1.2.3.0 0.0.0.31
```

The following command sets the insertion point after the second rule defined above:

```
after deny log 1.2.4.0 0.0.0.15
```

The following deletes the first rule defined above:

```
no permit 1.2.3.0 0.0.0.31
```

deny/permit (any)

Used to filter subscriber sessions based on any packet received. This command is also used to set the access control list insertion point.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
{ deny | permit } [ log ] any

after { deny | permit } [ log ] any

before { deny | permit } [ log ] any

no { deny | permit } [ log ] any
```

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.

- **deny**: Indicates the rule, when matched, drops the corresponding packets.
- **permit**: Indicates the rule, when matched, allows the corresponding packets.

log

Default: packets are not logged.

Indicates all packets which match the filter are to be logged.

`any`

Indicates all packets will match the filter regardless of source and/or destination.

Usage

Define a catch all rule to place at the end of the list of rules.

Important: It is suggested that any rule which is added to be a catch all should also have the **`log`** option specified. The logged packets may be used to determine if the current list of rules is adequate or needs modification to ensure proper security. The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide.

Example

The following commands define two rules with the second logging filtered packets:

```
permit any
deny log any
```

The following sets the insertion point before the first rule defined above:

```
before permit any
```

The following command sets the insertion point after the second rule defined above:

```
after deny log any
```

The following deletes the first rule defined above:

```
no permit any
```

deny/permit (by host IP address)

Used to filter subscriber sessions based on the targeted host IP address sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

{ deny | permit } [log] host *source_host_address*

after { deny | permit } [log] host *source_host_address*

before { deny | permit } [log] host *source_host_address*

no { deny | permit } [log] host *source_host_address*

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.

- **deny**: Indicates the rule, when matched, drops the corresponding packets.
- **permit**: Indicates the rule, when matched, allows the corresponding packets.

log

Default: packets are not logged.

Indicates all packets which match the filter are to be logged.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

Usage

Define a rule when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rules to be very clear and concise.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide.

Example

The following commands define two rules with the second logging filtered packets:

```
permit host 1.2.3.4
deny log host 1.2.3.5
```

The following sets the insertion point before the first rule defined above:

```
before permit host 1.2.3.4
```

The following command sets the insertion point after the second rule defined above:

```
after deny log host 1.2.3.5
```

The following deletes the first rule defined above:

```
no permit host 1.2.3.4
```

deny/permit (by source ICMP packets)

Used to filter subscriber sessions based on the internet control message protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

{ deny | permit } [log] icmp { *source_address source_wildcard* | any | host *source_host_address* } { *dest_address dest_wildcard* | any | host *dest_host_address* } [*icmp_type* [*icmp_code*]]

after { deny | permit } [log] icmp { *source_address source_wildcard* | any | host *source_host_address* } { *dest_address dest_wildcard* | any | host *dest_host_address* } [*icmp_type* [*icmp_code*]]

before { deny | permit } [log] icmp { *source_address source_wildcard* | any | host *source_host_address* } { *dest_address dest_wildcard* | any | host *dest_host_address* } [*icmp_type* [*icmp_code*]]

no { deny | permit } [log] icmp { *source_address source_wildcard* | any | host *source_host_address* } { *dest_address dest_wildcard* | any | host *dest_host_address* } [*icmp_type* [*icmp_code*]]

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.

- **deny**: Indicates the rule, when matched, drops the corresponding packets.
- **permit**: Indicates the rule, when matched, allows the corresponding packets.

log

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in dotted decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. The type can be any integer value between 0 and 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered. The type can be any integer value between 0 and 255.

Usage

Define a rule to block ICMP packets which can be used for address resolution and possible be a security risk. The IP filtering allows flexible controls for pairs of individual hosts or groups by IP masking which allows the filtering of entire subnets if necessary.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide.

Example

The following commands define two rules with the second logging filtered packets:

```
permit icmp host 1.2.3.4 any 168

deny log icmp 1.2.3.0 0.0.0.31 host 1.2.4.16 168 11
```

The following sets the insertion point before the first rule defined above:

```
before permit icmp host 1.2.3.4 any 168
```

The following command sets the insertion point after the second rule defined above:

```
after deny log icmp 1.2.3.0 0.0.0.31host 1.2.4.16 168 11
```

The following deletes the first rule defined above:

```
no permit icmp host 1.2.3.4 any 168
```

deny/permit (by IP packets)

Used to filter subscriber sessions based on the internet protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
{ deny | permit } [ log ] ip { source_address source_wildcard | any | host
source_host_address } { dest_address dest_wildcard | any | host
dest_host_address } [ fragment ] [ protocol num ]

after { deny | permit } [ log ] ip { source_address source_wildcard | any | host
source_host_address } { dest_address dest_wildcard | any | host
dest_host_address } [ fragment ] [ protocol num ]

before { deny | permit } [ log ] ip { source_address source_wildcard | any |
host source_host_address } { dest_address dest_wildcard | any | host
dest_host_address } [ fragment ] [ protocol num ]

no { deny | permit } [ log ] ip { source_address source_wildcard | any | host
source_host_address } { dest_address dest_wildcard | any | host
dest_host_address } [ fragment ] [ protocol num ]
```

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.

- **deny**: Indicates the rule, when matched, drops the corresponding packets.
- **permit**: Indicates the rule, when matched, allows the corresponding packets.

log

Default: Packets are not logged.
Indicates all packets which match the filter are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in dotted decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

fragment

Indicates packet filtering is to be applied to IP packet fragments only.

protocol *num*

Indicates that the packet filtering is to be applied to a specific protocol number.
num can be any integer ranging from 0 to 255.

Important: This keyword is not applicable to a SPIO interface. Instead, you must specify the type of protocol packets for which you want to deny/permit processing on a SPIO. For example, **deny icmp**, **deny tcp**, or **deny udp**.

Usage

Block IP packets when the source and destination are of interest.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide.

Example

The following commands define two rules with the second logging filtered packets:

```
permit ip host 1.2.3.4 any fragment

deny log ip 1.2.3.0 0.0.0.31 host 1.2.4.16
```

The following sets the insertion point before the first rule defined above:

```
before permit ip host 1.2.3.4 any fragment
```

The following command sets the insertion point after the second rule defined above:

```
after deny log ip 1.2.3.0 0.0.0.31 host 1.2.4.16
```

The following deletes the first rule defined above:

```
no permit ip host 1.2.3.4 any fragment
```

deny/permit (by TCP/UDP packets)

Used to filter subscriber sessions based on the transmission control protocol/user datagram protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

{ deny | permit } [log] { tcp | udp } { { *source_address source_wildcard* | any | host *source_host_address* } [eq *source_port* | gt *source_port* | lt *source_port* | neq *source_port*] } { { *dest_address dest_wildcard* | any | host *dest_host_address* } [eq *dest_port* | gt *dest_port* | lt *dest_port* | neq *dest_port* | range *start_port end_port*] }

after { deny | permit } [log] { tcp | udp } { { *source_address source_wildcard* | any | host *source_host_address* } [eq *source_port* | gt *source_port* | lt *source_port* | neq *source_port*] } { { *dest_address dest_wildcard* | any | host *dest_host_address* } [eq *dest_port* | gt *dest_port* | lt *dest_port* | neq *dest_port* | range *start_port end_port*] }

before { deny | permit } [log] { tcp | udp } { { *source_address source_wildcard* | any | host *source_host_address* } [eq *source_port* | gt *source_port* | lt *source_port* | neq *source_port*] } { { *dest_address dest_wildcard* | any | host *dest_host_address* } [eq *dest_port* | gt *dest_port* | lt *dest_port* | neq *dest_port* | range *start_port end_port*] }

no { deny | permit } [log] { tcp | udp } { { *source_address source_wildcard* | any | host *source_host_address* } [eq *source_port* | gt *source_port* | lt *source_port* | neq *source_port*] } { { *dest_address dest_wildcard* | any | host *dest_host_address* } [eq *dest_port* | gt *dest_port* | lt *dest_port* | neq *dest_port* | range *start_port end_port*] }

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.

- **deny**: Indicates the rule, when matched, drops the corresponding packets.
- **permit**: Indicates the rule, when matched, allows the corresponding packets.

log

Default: Packets are not logged.
Indicates all packets which match the filter are to be logged.

tcp | udp

Specifies the filter is to be applied to IP based transmission control protocol or the user datagram protocol.

- **tcp**: Filter applies to TPC packets.
- **udp**: Filter applies to UDP packets.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in dotted decimal notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be an integer value from 0 through 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be an integer value from 0 through 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be an integer value from 0 through 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be an integer value from 0 through 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be an integer value from 0 through 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered.
dest_port must be an integer value from 0 through 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered.
dest_port must be an integer value from 0 through 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered.
dest_port must be an integer value from 0 through 65535.

range *start_port end_port*

Specifies a range of ports to be matched.
start_port must be an integer from 0 through 65535, and must be less than the *end_port* value.
end_port must be an integer from 0 through 65535, and must be greater than the *start_port* value.

Important: This option is supported in PDIF Release 8.3.

Usage

Block IP packets when the source and destination are of interest but for only a limited set of ports.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide.

Example

The following commands define four rules with the second and fourth rules logging filtered packets:

```
permit tcp host 1.2.3.4 any
deny log udp 1.2.3.0 0.0.0.31 host 1.2.4.16
permit tcp host 1.2.3.64 gt 1023 any
deny log udp 1.2.3.0 0.0.0.31 1.2.4.127 0.0.0.127
```

The following sets the insertion point before the first rule defined above:

```
before permit tcp host 1.2.3.4 any
```

The following command sets the insertion point after the second rule defined above:

```
after deny log udp 1.2.3.0 0.0.0.31 host 1.2.4.16
```

The following deletes the third rule defined above:

```
no permit tcp host 1.2.3.64 gt 1023 any
```

end

Exits the ACL configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

Example

end

exit

Exits the ACL configuration mode and returns to the context configuration mode.

Privilege

Security Administrator, Administrator

Product

All

Syntax

exit

Usage

Return to the context configuration mode.

Example

exit

readdress server

Alter the destination address and port number in TCP or UDP packet headers to redirect packets to a different server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

readdress server *redirect_address* **[port** *port_no* **] { tcp | udp } { {** *source_address source_wildcard* **| any | host** *source_host_address* **} [eq** *source_port* **| gt** *source_port* **| lt** *source_port* **| neq** *source_port* **] } { {** *dest_address dest_wildcard* **| any | host** *dest_host_address* **} [eq]** *dest_port* **| gt** *dest_port* **| lt** *dest_port* **| neq** *dest_port* **] }**

after readdress server *redirect_address* **[port** *port_no* **] { tcp | udp } { {** *source_address source_wildcard* **| any | host** *source_host_address* **} [eq** *source_port* **| gt** *source_port* **| lt** *source_port* **| neq** *source_port* **] } { {** *dest_address dest_wildcard* **| any | host** *dest_host_address* **} [eq]** *dest_port* **| gt** *dest_port* **| lt** *dest_port* **| neq** *dest_port* **] }**

before readdress server *redirect_address* **[port** *port_no* **] { tcp | udp } { {** *source_address source_wildcard* **| any | host** *source_host_address* **} [eq** *source_port* **| gt** *source_port* **| lt** *source_port* **| neq** *source_port* **] } { {** *dest_address dest_wildcard* **| any | host** *dest_host_address* **} [eq]** *dest_port* **| gt** *dest_port* **| lt** *dest_port* **| neq** *dest_port* **] }**

no readdress server *redirect_address* **[port** *port_no* **] { tcp | udp } { {** *source_address source_wildcard* **| any | host** *source_host_address* **} [eq** *source_port* **| gt** *source_port* **| lt** *source_port* **| neq** *source_port* **] } { {** *dest_address dest_wildcard* **| any | host** *dest_host_address* **} [eq]** *dest_port* **| gt** *dest_port* **| lt** *dest_port* **| neq** *dest_port* **] }**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

redirect_address

The IP address to which the IP packets are redirected. TCP or UDP packet headers are rewritten to contain the new destination address. This must be an IPv4 address specified in dotted decimal notation.

port *port_no*

The number of the port at the redirect address where the packets are sent. TCP or UDP packet headers are rewritten to contain the new destination port number.

tcp | udp

Specifies the redirect is to be applied to the IP based transmission control protocol or the user datagram protocol.

- **tcp**: Redirect applies to TCP packets.
- **udp**: Redirect applies to UDP packets.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in dotted decimal notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be an integer value from 0 through 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be an integer value from 0 through 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be an integer value from 0 through 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be an integer value from 0 through 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be an integer value from 0 through 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered. *dest_port* must be an integer value from 0 through 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered. *dest_port* must be an integer value from 0 through 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered. *dest_port* must be an integer value from 0 through 65535.

Usage

Use this command to define a rule that redirects packets to a different destination address. The TCP and UDP packet headers are modified with the new destination address and destination port.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide.

Important: Prior to Release 8.3, for packets received from the packet data network destined for a subscriber's UE, the system applied logic to reset the source address of a packet to the original destination address of the input packet before applying the outbound access control list (ACL). In Release 8.3 and higher, the system reverses the order and applies the outbound ACL before resetting the source address. This change impacts all current readdress server rules in inbound IPv4 ACLs.

Important: After upgrading to Release 8.3, for every readdress server rule in an inbound IPv4 ACL, customers must now add a permit rule to an outbound ACL that explicitly permits packets from the readdress rule's redirect address and port number. If customers omit this permit rule, the system will reject all packets destined for the subscriber's UE from the readdress rule's redirect address and port number.

Example

The following command defines a rule that redirects packets to the server at 192.168.10.4, UDP packets coming from any host with a destination of any host are matched:

```
readdress server 192.168.10.4 udp any any
```

The following sets the insertion point before the rule defined above:

```
before readdress server 192.168.10.4 udp any any
```

The following command sets the insertion point after the first rule defined above:

```
after readdress server 192.168.10.4 udp any any
```

The following deletes the rule defined above:

```
no readdress server 192.168.10.4 udp any any
```

redirect context (by IP address masking)

Used to redirect subscriber sessions based on the IP address mask sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect context *context_id* **[log]** *source_address source_wildcard*

after redirect context *context_id* **[log]** *source_address source_wildcard*

before redirect context *context_id* **[log]** *source_address source_wildcard*

no redirect context *context_id* **[log]** *source_address source_wildcard*

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

Usage

Define a rule when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of redirect rules as it does not require a rule for each source and destination pair.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide.

Important: Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of 23 and the source IP and wildcard of 192.168.22.0 and 0.0.0.31:

```
redirect context 23 198.162.22.0 0.0.0.31
```

The following sets the insertion point before the rule defined above:

```
before redirect context 23 198.162.22.0 0.0.0.31
```

The following command sets the insertion point after the first rule defined above:

```
after redirect context 23 198.162.22.0 0.0.0.31
```

The following deletes the first rule defined above:

```
no redirect context 23 198.162.22.0 0.0.0.31
```

- redirect context (by IP address masking)

redirect context (any)

Used to redirect subscriber sessions based on any packet received. This command is also used to set the access control list insertion point.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect context *context_id* **[log] any**

after redirect context *context_id* **[log] any**

before redirect context *context_id* **[log] any**

no redirect context *context_id* **[log] any**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

any

Indicates all packets will match the redirect regardless of source and/or destination.

Usage

Define a catch all rule to place at the end of the list of rules to provide explicit handling of rules which do not fit any other criteria.

Important: It is suggested that any rule which is added to be a catch all should also have the log option specified. The logged packets may be used to determine if the current list of rules is adequate or needs modification to ensure proper security.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide.

Important: Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of 23 and any source IP:

```
redirect context 23 any
```

The following sets the insertion point before the rule defined above:

```
before redirect context 23 any
```

The following command sets the insertion point after the first rule defined above:

```
after redirect context 23 any
```

The following deletes the first rule defined above:

```
no redirect context 23 any
```

redirect context (by host IP address)

Used to redirect subscriber sessions based on the targeted host IP address sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect context *context_id* **[log] host** *source_ip_address*

after redirect context *context_id* **[log] host** *source_ip_address*

before redirect context *context_id* **[log] host** *source_ip_address*

no redirect context *context_id* **[log] host** *source_ip_address*

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

Usage

Define a rule when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rules to be very clear and concise.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide.

Important: Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of 23 and a host IP address of 192.168.200.11:

```
redirect context 23 host 192.168.200.11
```

The following sets the insertion point before the rule defined above:

```
before redirect context 23 host 192.168.200.11
```

The following command sets the insertion point after first the rule defined above:

```
after redirect context 23 host 192.168.200.11
```

The following deletes the first rule defined above:

```
no redirect context 23 host 192.168.200.11
```

redirect context (by source ICMP packets)

Used to redirect subscriber sessions based on the internet control message protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect context *context_id* **[log] icmp {** *source_address source_wildcard* **| any | host** *source_host_address* **} {** *dest_address dest_wildcard* **| any | host** *dest_host_address* **} [** *icmp_type* **[** *icmp_code* **]]**

after redirect context *context_id* **[log] icmp {** *source_address source_wildcard* **| any | host** *source_host_address* **} {** *dest_address dest_wildcard* **| any | host** *dest_host_address* **} [** *icmp_type* **[** *icmp_code* **]]**

before redirect context *context_id* **[log] icmp {** *source_address source_wildcard* **| any | host** *source_host_address* **} {** *dest_address dest_wildcard* **| any | host** *dest_host_address* **} [** *icmp_type* **[** *icmp_code* **]]**

no redirect context *context_id* **[log] icmp {** *source_address source_wildcard* **| any | host** *source_host_address* **} {** *dest_address dest_wildcard* **| any | host** *dest_host_address* **} [** *icmp_type* **[** *icmp_code* **]]**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in dotted decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. The type can be any integer value between 0 and 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered. The type can be any integer value between 0 and 255.

Usage

Define a rule to block ICMP packets which can be used for address resolution and possibly be a security risk. The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide.

Important: Also note that “redirect” rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of 23, and ICMP packets coming from the host with the IP address 198.162.100.25:

```
redirect context 23 icmp host 192.168.100.25
```

The following sets the insertion point before the rule defined above:

```
before redirect context 23 icmp host 192.168.100.25
```

The following command sets the insertion point after the first rule defined above:

```
after redirect context 23 icmp host 192.168.100.25
```

The following deletes the first rule defined above:

```
no redirect context 23 icmp host 192.168.100.25
```

redirect context (by IP packets)

Used to redirect subscriber sessions based on the internet protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect context context_id [ log ] ip { source_address source_wildcard | any |
host source_host_address } { dest_address dest_wildcard | any | host
dest_host_address } [ fragment ] [ protocol num ]

after redirect context context_id [ log ] ip { source_address source_wildcard |
any | host source_host_address } { dest_address dest_wildcard | any | host
dest_host_address } [ fragment ] [ protocol num ]

before redirect context context_id [ log ] ip { source_address source_wildcard |
any | host source_host_address } { dest_address dest_wildcard | any | host
dest_host_address } [ fragment ] [ protocol num ]

no redirect context context_id [ log ] ip { source_address source_wildcard | any
| host source_host_address } { dest_address dest_wildcard | any | host
dest_host_address } [ fragment ] [ protocol num ]
```

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in dotted decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

fragment

Indicates packet redirection is to be applied to IP packet fragments only.

protocol *num*

Indicates that the packet filtering is to be applied to a specific protocol number.
num can be any integer ranging from 0 to 255.

Usage

Block IP packets when the source and destination are of interest.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide.

Important: Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of 23, and IP packets coming from the host with the IP address 198.162.100.25, and fragmented packets for any destination are matched:

```
redirect context 23 ip host 198.162.100.25 any fragment
```

The following sets the insertion point before the rule defined above:

```
before redirect context 23 ip host 198.162.100.25 any fragment
```

The following command sets the insertion point after the first rule defined above:

```
after redirect context 23 ip host 198.162.100.25 any fragment
```

The following deletes the first rule defined above:

```
no redirect context 23 ip host 198.162.100.25 any fragment
```

redirect context (by IP packets)

redirect context (by TCP/UDP packets)

Used to redirect subscriber sessions based on the transmission control protocol/user datagram protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect context context_id [ log ] { tcp | udp } { { source_address
source_wildcard | any | host source_host_address } [ eq source_port | gt
source_port | lt source_port | neq source_port ] } { { dest_address
dest_wildcard | any | host dest_host_address } [ eq dest_port | gt dest_port |
lt dest_port | neq dest_port ] }

after redirect context context_id [ log ] { tcp | udp } { { source_address
source_wildcard | any | host source_host_address } [ eq source_port | gt
source_port | lt source_port | neq source_port ] } { { dest_address
dest_wildcard | any | host dest_host_address } [ eq dest_port | gt dest_port |
lt dest_port | neq dest_port ] }

before redirect context context_id [ log ] { tcp | udp } { { source_address
source_wildcard | any | host source_host_address } [ eq source_port | gt
source_port | lt source_port | neq source_port ] } { { dest_address
dest_wildcard | any | host dest_host_address } [ eq dest_port | gt dest_port |
lt dest_port | neq dest_port ] }

no redirect context context_id [ log ] { tcp | udp } { { source_address
source_wildcard | any | host source_host_address } [ eq source_port | gt
source_port | lt source_port | neq source_port ] } { { dest_address
dest_wildcard | any | host dest_host_address } [ eq dest_port | gt dest_port |
lt dest_port | neq dest_port ] }
```

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

tcp | udp

Specifies the redirect is to be applied to IP based transmission control protocol or the user datagram protocol.

- **tcp**: Redirect applies to TPC packets.
- **udp**: Redirect applies to UDP packets.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in dotted decimal notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be configured to any integer value from 0 to 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be an integer value from 0 through 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be an integer value from 0 through 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be an integer value from 0 through 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be an integer value from 0 through 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered. *dest_port* must be an integer value from 0 through 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered. *dest_port* must be an integer value from 0 through 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered. *dest_port* must be an integer value from 0 through 65535.

Usage

Block IP packets when the source and destination are of interest but for only a limited set of ports.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide. Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of 23, and UDP packets coming from any host are matched:

```
redirect context 23 udp any
```

The following sets the insertion point before the rule defined above:

```
before redirect context 23 udp any
```

The following command sets the insertion point after the first rule defined above:

```
after redirect context 23 udp any
```

The following deletes the rule defined above:

```
no redirect context 23 udp any
```

redirect css delivery-sequence

This is a restricted command. In StarOS 9.0 and later, this command is obsoleted.

redirect css service (any)

Used to redirect subscriber sessions based on any packet received. This command is also used to set the access control list insertion point.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* **[log] any**

after redirect css service *svc_name* **[log] any**

before redirect css service *svc_name* **[log] any**

no redirect css service *svc_name* **[log] any**

after

Indicates all rule definitions defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definitions which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging all** command to display the names of all configured charging services.
svc_name must be a string from 1 through 15 characters in length.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

any

Indicates all packets will match the redirect regardless of source and/or destination.

Usage

Define a catch all rule definitions to place at the end of the list of rule definitions to provide explicit handling of rule definitions which do not fit any other criteria.

Important: It is suggested that any rule definition which is added to be a catch all should also have the **log** option specified. The logged packets may be used to determine if the current list of rule definitions is adequate or needs modification to ensure proper security.

Important: A maximum of 16 rule definitions can be configured per ACL.

Important: Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service with the name *chgsvc1* and any source IP:

```
redirect css service chgsvc1 any
```

The following sets the insertion point before the rule definition above:

```
before redirect service chgsvc1 any
```

The following command sets the insertion point after the first rule definitions above:

```
after redirect service chgsvc1 any
```

The following deletes the first rule definition above:

```
no redirect service chgsvc1 any
```

redirect css service (by host IP address)

Used to redirect subscriber sessions based on the targeted host IP address sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* **[log] host** *source_host_address*

after redirect css service *svc_name* **[log] host** *source_host_address*

before redirect css service *svc_name* **[log] host** *source_host_address*

no redirect css service *svc_name* **[log] host** *source_host_address*

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
svc_name must be a string from 1 through 15 characters in length.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

Usage

Define a rule definition when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rule definitions to be very clear and concise.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service with the name *chgsvc1* and a host IP address of *192.168.200.11*:

```
redirect css service chgsvc1 host 192.168.200.11
```

The following sets the insertion point before the rule definition above:

```
before redirect css service chgsvc1 host 192.168.200.11
```

The following command sets the insertion point after the first rule definition above:

```
after redirect css service chgsvc1 host 192.168.200.11
```

The following deletes the first rule definition above:

```
no redirect css service chgsvc1 host 192.168.200.11
```

redirect css service (by ICMP packets)

Used to redirect subscriber sessions based on the internet control message protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect css service svc_name [ log ] icmp { any | host source_host_address |
source_address source_wildcard } { any | host dest_host_address | dest_address
dest_wildcard } [ icmp_type [ icmp_code ]

before redirect css service svc_name [ log ] icmp { any | host
source_host_address | source_address source_wildcard } { any | host
dest_host_address | dest_address dest_wildcard } [ icmp_type [ icmp_code ]

after redirect css service svc_name [ log ] icmp { any | host
source_host_address | source_address source_wildcard } { any | host
dest_host_address | dest_address dest_wildcard } [ icmp_type [ icmp_code ]

no redirect css service svc_name [ log ] icmp { any | host source_host_address |
source_address source_wildcard } { any | host dest_host_address | dest_address
dest_wildcard } [ icmp_type [ icmp_code ]
```

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
svc_name must be a string from 1 through 15 characters in length.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in dotted decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. The type can be any integer value between 0 and 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered. The type can be any integer value between 0 and 255.

Usage

Define a rule definition to block ICMP packets which can be used for address resolution and possibly be a security risk.
The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that “redirect” rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and ICMP packets coming from the host with the IP address *198.162.100.25*:

```
redirect css service chgsvc1 icmp host 192.168.200.11
```

The following sets the insertion point before the rule definition above:

```
before redirect css service chgsvc1 icmp host 192.168.200.11
```

The following command sets the insertion point after the first rule definition above:

after redirect css service *chgsvc1* **icmp host** *192.168.200.11*

The following deletes the first rule definition above:

no redirect css service *chgsvc1* **icmp host** *192.168.200.11*

redirect css service (by IP packets)

Used to redirect subscriber sessions based on the internet protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* **[log] ip { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [fragment]**

after redirect css service *svc_name* **[log] ip { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [fragment]**

before redirect css service *svc_name* **[log] ip { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [fragment]**

no redirect css service *svc_name* **[log] ip { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [fragment]**

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition that exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
svc_name must be a string from 1 through 15 characters in length.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in dotted decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

fragment

Indicates packet redirection is to be applied to IP packet fragments only.

Usage

Block IP packets when the source and destination are of interest.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and IP packets coming from the host with the IP address *198.162.100.25*, and fragmented packets for any destination are matched:

```
redirect css service chgsvc1 ip host 198.162.100.25 any fragment
```

The following sets the insertion point before the rule definition above:

```
before redirect css service chgsvc1 ip host 198.162.100.25 any fragment
```

The following command sets the insertion point after the first rule definition above:

```
after redirect css service chgsvc1 ip host 198.162.100.25 any fragment
```

The following deletes the first rule definition above:

```
no redirect css service chgsvc1 ip host 198.162.100.25 any fragment
```

redirect css service (by source IP address masking)

Used to redirect subscriber sessions based on the IP address mask sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* **[log]** *source_address source_wildcard*

after redirect css service *svc_name* **[log]** *source_address source_wildcard*

before redirect css service *svc_name* **[log]** *source_address source_wildcard*

no redirect css service *svc_name* **[log]** *source_address source_wildcard*

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
svc_name must be a string from 1 through 15 characters in length.

log

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

Usage

Define a rule definition when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of filtering rule definitions as it does not require a rule definition for each source and destination pair.

Important: A maximum of 16 rule definitions can be configured per ACL.

Example

The following command defines a rule definition to redirect packets to a charging service named *chgsvc1*:

```
redirect css service chgsvc1 1.2.3.0 0.0.0.31
```

redirect css service (by TCP/UDP packets)

Used to redirect subscriber sessions based on the transmission control protocol/user datagram protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect css service svc_name [ log ] { tcp | udp } { { source_address
source_wildcard | any | host source_host_address } [ eq source_port | gt
source_port | lt source_port | neq source_port | range start_source_port
end_source_port ] } { { dest_address dest_wildcard | any | host
dest_host_address } [ eq dest_port | gt dest_port | lt dest_port | neq dest_port
| range start_dest_port end_dest_port ] }

after redirect css service svc_name [ log ] { tcp | udp } { { source_address
source_wildcard | any | host source_host_address } [ eq source_port | gt
source_port | lt source_port | neq source_port | range start_source_port
end_source_port ] } { { dest_address dest_wildcard | any | host
dest_host_address } [ eq dest_port | gt dest_port | lt dest_port | neq dest_port
| range start_dest_port end_dest_port ] }

before redirect css service svc_name [ log ] { tcp | udp } { { source_address
source_wildcard | any | host source_host_address } [ eq source_port | gt
source_port | lt source_port | neq source_port | range start_source_port
end_source_port ] } { { dest_address dest_wildcard | any | host
dest_host_address } [ eq dest_port | gt dest_port | lt dest_port | neq dest_port
| range start_dest_port end_dest_port ] }

no redirect css service svc_name [ log ] { tcp | udp } { { source_address
source_wildcard | any | host source_host_address } [ eq source_port | gt
source_port | lt source_port | neq source_port | range start_source_port
end_source_port ] } { { dest_address dest_wildcard | any | host
dest_host_address } [ eq dest_port | gt dest_port | lt dest_port | neq dest_port
| range start_dest_port end_dest_port ] }
```

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
svc_name must be a string from 1 through 15 characters in length.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

tcp | udp

Specifies the redirect is to be applied to IP based transmission control protocol or the user datagram protocol.

- **tcp**: Redirect applies to TPC packets.
- **udp**: Redirect applies to UDP packets.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in dotted decimal notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be configured to any integer value from 0 to 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

range *start_source_port end_source_port*

Specifies that all source TCP ports within a specific range are to be filtered.
start_source_port is the initial port in the range and *end_source_port* is the final port in the range.
Both *start_source_port* and *end_source_port* can be configured to any integer value from 0 to 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

range *start_dest_port end_dest_port*

Specifies that all destination TCP ports within a specific range are to be filtered.
start_dest_port is the initial port in the range and *end_dest_port* is the final port in the range.
Both *start_dest_port* and *end_dest_port* can be configured to any integer value from 0 to 65535.

Usage

Block IP packets when the source and destination are of interest but for only a limited set of ports.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that “redirect” rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and UDP packets coming from any host are matched:

```
redirect css service chgsvc1 udp any
```

The following sets the insertion point before the rule definition above:

```
before redirect css service chgsvc1 udp any
```

The following command sets the insertion point after the first rule definition above:

after redirect css service *chgsvc1* **udp any**

The following command deletes the rule definition above:

no redirect css service *chgsvc1* **udp any**

redirect css service (for downlink, any)

Used to redirect subscriber sessions based on any packet received in the downlink (from the Mobile Node) direction. This command is also used to set the access control list insertion point.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* **[log] downlink any**

after redirect css service *svc_name* **[log] downlink any**

before redirect css service *svc_name* **[log] downlink any**

no redirect css service *svc_name* **[log] downlink any**

after

Indicates all rule definitions defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
svc_name must be a string from 1 through 15 characters in length.

downlink

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

any

Indicates all packets will match the redirect regardless of source and/or destination.

Usage

Define a catch all rule definition to place at the end of the list of rule definitions to provide explicit handling of rule definitions which do not fit any other criteria.

Important: It is suggested that any rule definition which is added to be a catch all should also have the **log** option specified. The logged packets may be used to determine if the current list of rule definitions is adequate or needs modification to ensure proper security.

Important: A maximum of 16 rule definitions can be configured per ACL.

Important: Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service with the name *chgsvc1* and any source IP:

```
redirect css service chgsvc1 downlink any
```

The following sets the insertion point before the rule definition above:

```
before redirect service chgsvc1 downlink any
```

The following command sets the insertion point after the first rule definition above:

```
after redirect service chgsvc1 downlink any
```

The following deletes the first rule definition above:

```
no redirect service chgsvc1 downlink any
```

redirect css service (for downlink, by host IP address)

Used to redirect subscriber sessions based on the targeted host IP address in the downlink (from the Mobile Node) direction.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* **[log] downlink host** *source_host_address*

before redirect css service *svc_name* **[log] downlink host** *source_host_address*

after redirect css service *svc_name* **[log] downlink host** *source_host_address*

no redirect css service *svc_name* **[log] downlink host** *source_host_address*

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
svc_name must be a string from 1 through 15 characters in length.

downlink

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

Usage

Define a rule definition when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rule definitions to be very clear and concise.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service with the name *chgsvc1and* a host IP address of *192.168.200.11*:

```
redirect service chgsvc1 downlink host 192.168.200.11
```

The following sets the insertion point before the rule definition above:

```
before redirect service chgsvc1 downlink host 192.168.200.11
```

The following command sets the insertion point after the first rule definition above:

```
after redirect service chgsvc1 downlink host 192.168.200.11
```

The following deletes the first rule definition above:

```
no redirect service chgsvc1 downlink host 192.168.200.11
```

redirect css service (for downlink, by ICMP packets)

Used to redirect subscriber sessions based on the internet control message protocol packets in the downlink (from the Mobile Node) direction.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect css service svc_name [ log ] downlink icmp { any | host
source_host_address | source_address source_wildcard } { any | host
dest_host_address | dest_address dest_wildcard } [ icmp_type [ icmp_code ]

after redirect css service svc_name [ log ] downlink icmp { any | host
source_host_address | source_address source_wildcard } { any | host
dest_host_address | dest_address dest_wildcard } [ icmp_type [ icmp_code ]

before redirect css service svc_name [ log ] downlink icmp { any | host
source_host_address | source_address source_wildcard } { any | host
dest_host_address | dest_address dest_wildcard } [ icmp_type [ icmp_code ]

no redirect css service svc_name [ log ] downlink icmp { any | host
source_host_address | source_address source_wildcard } { any | host
dest_host_address | dest_address dest_wildcard } [ icmp_type [ icmp_code ]
```

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
svc_name must be a string from 1 through 15 characters in length.

downlink

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in dotted decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. The type can be any integer value between 0 and 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered. The type can be any integer value between 0 and 255.

Usage

Define a rule definition to block ICMP packets which can be used for address resolution and possibly be a security risk.
The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that “redirect” rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and ICMP packets coming in the downlink (from the Mobile Node) direction from the host with the IP address 192.168.100.25:

```
redirect css service chgsvc1 downlink icmp host 192.168.100.25
```

The following sets the insertion point before the rule definition above:

before redirect css service *chgsvc1* **downlink icmp host** *192.168.100.25*

The following command sets the insertion point after the first rule definition above:

after redirect css service *chgsvc1* **downlink icmp host** *192.168.100.25*

The following deletes the first rule definition above:

no redirect css service *chgsvc1* **downlink icmp host** *192.168.100.25*

redirect css service (for downlink, by IP packets)

Used to redirect subscriber sessions based on the internet protocol packets in the downlink (from the Mobile Node) direction.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect css service svc_name [ log ] downlink ip { any | host
source_host_address | source_address source_wildcard } { any | host
dest_host_address | dest_address dest_wildcard } [ fragment ]

after redirect css service svc_name [ log ] downlink ip { any | host
source_host_address | source_address source_wildcard } { any | host
dest_host_address | dest_address dest_wildcard } [ fragment ]

before redirect css service svc_name [ log ] downlink ip { any | host
source_host_address | source_address source_wildcard } { any | host
dest_host_address | dest_address dest_wildcard } [ fragment ]

no redirect css service svc_name [ log ] downlink ip { any | host
source_host_address | source_address source_wildcard } { any | host
dest_host_address | dest_address dest_wildcard } [ fragment ]
```

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
svc_name must be a string from 1 through 15 characters in length.

downlink

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in dotted decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

fragment

Indicates packet redirection is to be applied to IP packet fragments only.

Usage

Block IP packets when the source and destination are of interest.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and downlink IP packets coming from the host with the IP address *198.162.100.25*, and fragmented packets for any destination are matched:

```
redirect css service chgsvc1 downlink ip host 198.162.100.25 any fragment
```

The following sets the insertion point before the rule definition above:

```
before redirect css service chgsvc1 downlink ip host 198.162.100.25 any
fragment
```

The following command sets the insertion point after the first rule definition above:

```
after redirect css service chgsvc1 downlink ip host 198.162.100.25 any
fragment
```

The following deletes the first rule definition above:

```
no redirect css service chgsvc1 downlink ip host 198.162.100.25 any
fragment
```

redirect css service (for downlink, by source IP address masking)

Used to redirect subscriber sessions based on the IP address mask sent by the source in the downlink (from the Mobile Node) direction.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* **[log] downlink** *source_address source_wildcard*

after redirect css service *svc_name* **[log] downlink** *source_address source_wildcard*

before redirect css service *svc_name* **[log] downlink** *source_address source_wildcard*

no redirect css service *svc_name* **[log] downlink** *source_address source_wildcard*

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

`css service` *`svc_name`*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **`show active-charging service all`** command to display the names of all configured charging services.
`svc_name` must be a string from 1 through 15 characters in length.

`downlink`

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

`log`

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

`source_address`

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *`source_wildcard`* parameter.

`source_wildcard`

This option is used in conjunction with the *`source_address`* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *`source_address`* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *`source_address`* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

Usage

Define a rule definition when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of filtering rule definitions as it does not require a rule definition for each source and destination pair.

Important: A maximum of 16 rule definitions can be configured per ACL.

Example

The following command defines a rule definition to redirect packets to a charging service named *`chgsvc1`*:

`redirect css service` *`chgsvc1`* **`downlink`** *`1.2.3.0 0.0.0.31`*

redirect css service (for downlink, by TCP/UDP packets)

Used to redirect subscriber sessions to a charging service based on the transmission control protocol/user datagram protocol packets in the downlink (from the Mobile Node) direction.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* **[log] downlink { tcp | udp } { { *source_address source_wildcard* | **any** | **host** *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | **range** *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dest_port* | **range** *start_dest_port end_dest_port*] }**

after redirect css service *svc_name* **[log] downlink { tcp | udp } { { *source_address source_wildcard* | **any** | **host** *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | **range** *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dest_port* | **range** *start_dest_port end_dest_port*] }**

before redirect css service *svc_name* **[log] downlink { tcp | udp } { { *source_address source_wildcard* | **any** | **host** *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | **range** *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dest_port* | **range** *start_dest_port end_dest_port*] }**

no redirect css service *svc_name* **[log] downlink { tcp | udp } { { *source_address source_wildcard* | **any** | **host** *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | **range** *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dest_port* | **range** *start_dest_port end_dest_port*] }**

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
svc_name must be a string from 1 through 15 characters in length.

downlink

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

tcp | udp

Specifies the redirect is to be applied to IP based transmission control protocol or the user datagram protocol.

- **tcp**: Redirect applies to TPC packets.
- **udp**: Redirect applies to UDP packets.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in dotted decimal notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be configured to any integer value from 0 to 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

range *start_source_port end_source_port*

Specifies that all source TCP ports within a specific range are to be filtered.
start_source_port is the initial port in the range and *end_source_port* is the final port in the range.
Both *start_source_port* and *end_source_port* can be configured to any integer value from 0 to 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

range *start_dest_port end_dest_port*

Specifies that all destination TCP ports within a specific range are to be filtered.
start_dest_port is the initial port in the range and *end_dest_port* is the final port in the range.
Both *start_dest_port* and *end_dest_port* can be configured to any integer value from 0 to 65535.

Usage

Block IP packets when the source and destination are of interest but for only a limited set of ports.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and UDP packets coming from any host are matched:

redirect css service *chgsvc1* **downlink udp any**

The following sets the insertion point before the rule definition above:

before redirect css service *chgsvc1* **downlink udp any**

The following command sets the insertion point after the first rule definition above:

after redirect css service *chgsvc1* **downlink udp any**

The following deletes the rule definition above.
no redirect css service *chgsvc1* **downlink udp any**

redirect css service (for uplink, any)

Used to redirect subscriber sessions based on any packet received in the uplink (to the Mobile Node) direction. This command is also used to set the access control list insertion point.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect css service svc_name [ log ] uplink anyafter redirect css service svc_name [ log ] uplink anybefore redirect css service svc_name [ log ] uplink anyno redirect css service svc_name [ log ] uplink any
```

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
svc_name must be a string from 1 through 15 characters in length.

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

any

Indicates all packets will match the redirect regardless of source and/or destination.

Usage

Define a catch all rule definition to place at the end of the list of rule definitions to provide explicit handling of rule definitions which do not fit any other criteria.

Important: It is suggested that any rule definition which is added to be a catch all should also have the **log** option specified. The logged packets may be used to determine if the current list of rule definitions is adequate or needs modification to ensure proper security.

Important: A maximum of 16 rule definitions can be configured per ACL.

Important: Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service with the name *chgsvc1* and any source IP:

```
redirect css service chgsvc1 uplink any
```

The following sets the insertion point before the rule definition above:

```
before redirect css service chgsvc1 uplink any
```

The following command sets the insertion point after the first rule definition above:

```
after redirect css service chgsvc1 uplink any
```

The following deletes the first rule definition above:

```
no redirect css service chgsvc1 uplink any
```

redirect css service (for uplink, by host IP address)

Used to redirect subscriber sessions based on the targeted host IP address in the uplink (to the Mobile Node) direction.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* **[log] uplink host** *source_host_address*

after redirect css service *svc_name* **[log] uplink host** *source_host_address*

before redirect css service *svc_name* **[log] uplink host** *source_host_address*

no redirect css service *svc_name* **[log] uplink host** *source_host_address*

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

after

Indicates all rule definitions defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

`css service` *`svc_name`*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **`show active-charging service all`** command to display the names of all configured charging services.
`svc_name` must be a string from 1 through 15 characters in length.

`uplink`

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

`log`

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

`host`

Specifies that the rule definition applies to a specific host as determined by its IP address.

`source_host_address`

The IP address of the source host to filter against expressed in dotted decimal notation.

Usage

Define a rule definition when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rule definitions to be very clear and concise.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service with the name *`chgsvc1`* and a host IP address of *`192.168.200.11`*:

`redirect service` *`chgsvc1`* **`uplink host`** *`192.168.200.11`*

The following sets the insertion point before the rule definition above:

`before redirect service` *`chgsvc1`* **`uplink host`** *`192.168.200.11`*

The following command sets the insertion point after the first rule definition above:

`after redirect service` *`chgsvc1`* **`uplink host`** *`192.168.200.11`*

The following deletes the first rule definition above:

`no redirect service` *`chgsvc1`* **`uplink host`** *`192.168.200.11`*

redirect css service (for uplink, by ICMP packets)

Used to redirect subscriber sessions based on the internet control message protocol packets in the uplink (to the Mobile Node) direction.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect css service svc_name [ log ] uplink icmp { any | host
source_host_address | source_address source_wildcard } { any | host
dest_host_address | dest_address dest_wildcard } [ icmp_type [ icmp_code ]

after redirect css service svc_name [ log ] uplink icmp { any | host
source_host_address | source_address source_wildcard } { any | host
dest_host_address | dest_address dest_wildcard } [ icmp_type [ icmp_code ]

before redirect css service svc_name [ log ] uplink icmp { any | host
source_host_address | source_address source_wildcard } { any | host
dest_host_address | dest_address dest_wildcard } [ icmp_type [ icmp_code ]

no redirect css service svc_name [ log ] uplink icmp { any | host
source_host_address | source_address source_wildcard } { any | host
dest_host_address | dest_address dest_wildcard } [ icmp_type [ icmp_code ]
```

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
svc_name must be a string from 1 through 15 characters in length.

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in dotted decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. The type can be any integer value between 0 and 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered. The type can be any integer value between 0 and 255.

Usage

Define a rule definition to block ICMP packets which can be used for address resolution and possibly be a security risk.
The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that “redirect” rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and ICMP packets in the uplink (to the Mobile Node) direction from the host with the IP address *198.162.100.25*:

```
redirect css service chgsvc1 uplink icmp host 192.168.100.25
```

The following sets the insertion point before the rule definition above:

before redirect css service *chgsvc1* **uplink icmp host** *192.168.100.25*

The following command sets the insertion point after the first rule definition above:

after redirect css service *chgsvc1* **uplink icmp host** *192.168.100.25*

The following deletes the first rule definition above:

no redirect css service *chgsvc1* **uplink icmp host** *192.168.100.25*

redirect css service (for uplink, by IP packets)

Used to redirect subscriber sessions based on the internet protocol packets in the uplink (to the Mobile Node) direction.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect css service svc_name [ log ] uplink ip { any | host source_host_address
| source_address source_wildcard } { any | host dest_host_address | dest_address
dest_wildcard } [ fragment ]

after redirect css service svc_name [ log ] uplink ip { any | host
source_host_address | source_address source_wildcard } { any | host
dest_host_address | dest_address dest_wildcard } [ fragment ]

before redirect css service svc_name [ log ] uplink ip { any | host
source_host_address | source_address source_wildcard } { any | host
dest_host_address | dest_address dest_wildcard } [ fragment ]

no redirect css service svc_name [ log ] uplink ip { any | host
source_host_address | source_address source_wildcard } { any | host
dest_host_address | dest_address dest_wildcard } [ fragment ]
```

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

`css service` *`svc_name`*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **`show active-charging service all`** command to display the names of all configured charging services.
`svc_name` must be a string from 1 through 15 characters in length.

`uplink`

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

`log`

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

`source_address`

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *`source_wildcard`* parameter.

`source_wildcard`

This option is used in conjunction with the *`source_address`* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *`source_address`* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *`source_address`* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

`any`

Specifies that the rule definition applies to all packets.

`host`

Specifies that the rule definition applies to a specific host as determined by its IP address.

`source_host_address`

The IP address of the source host to filter against expressed in dotted decimal notation.

`dest_host_address`

The IP address of the destination host to filter against expressed in dotted decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

fragment

Indicates packet redirection is to be applied to IP packet fragments only.

Usage

Block IP packets when the source and destination are of interest.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and uplink IP packets going to the host with the IP address *198.162.100.25*, and fragmented packets for any destination are matched:

```
redirect css service chgsvc1 uplink ip host 198.162.100.25 any fragment
```

The following sets the insertion point before the rule definition above:

```
before redirect css service chgsvc1 uplink ip host 198.162.100.25 any
fragment
```

The following command sets the insertion point after the first rule definition above:

```
after redirect css service chgsvc1 uplink ip host 198.162.100.25 any
fragment
```

The following command deletes the first rule definition above:

```
no redirect css service chgsvc1 uplink ip host 198.162.100.25 any
fragment
```

redirect css service (for uplink, by source IP address masking)

Used to redirect subscriber sessions based on the IP address mask sent by the source in the uplink (to the Mobile Node) direction.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* **[log] uplink** *source_address source_wildcard*

after redirect css service *svc_name* **[log] uplink** *source_address source_wildcard*

before redirect css service *svc_name* **[log] uplink** *source_address source_wildcard*

no redirect css service *svc_name* **[log] uplink** *source_address source_wildcard*

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
svc_name must be a string from 1 through 15 characters in length.

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

log

Default: packets are not logged.

Indicates all packets which match the filter are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Usage

Define a rule definition when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of filtering rule definitions as it does not require a rule definition for each source and destination pair.

Example

The following command defines a rule definition to redirect packets to a charging service named *chgsvc1*:

```
redirect css service chgsvc1 uplink 1.2.3.0 0.0.0.31
```

redirect css service (for uplink, by TCP/UDP packets)

Used to redirect subscriber sessions to a charging service based on the transmission control protocol/user datagram protocol packets in the uplink (to the Mobile Node) direction.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *svc_name* **[log] uplink { tcp | udp } { { *source_address source_wildcard* | **any** | *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | **range** *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dest_port* | **range** *start_dest_port end_dest_port*] }**

after redirect css service *svc_name* **[log] uplink { tcp | udp } { { *source_address source_wildcard* | **any** | *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | **range** *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dest_port* | **range** *start_dest_port end_dest_port*] }**

before redirect css service *svc_name* **[log] uplink { tcp | udp } { { *source_address source_wildcard* | **any** | *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | **range** *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dest_port* | **range** *start_dest_port end_dest_port*] }**

no redirect css service *svc_name* **[log] uplink { tcp | udp } { { *source_address source_wildcard* | **any** | *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | **range** *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dest_port* | **range** *start_dest_port end_dest_port*] }**

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
svc_name must be a string from 1 through 15 characters in length.

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

tcp | udp

Specifies the redirect is to be applied to IP based transmission control protocol or the user datagram protocol.

- **tcp**: Redirect applies to TPC packets.
- **udp**: Redirect applies to UDP packets.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in dotted decimal notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be configured to any integer value from 0 to 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be configured to any integer value from 0 to 65535.

range *start_source_port end_source_port*

Specifies that all source TCP ports within a specific range are to be filtered.
start_source_port is the initial port in the range and *end_source_port* is the final port in the range.
Both *start_source_port* and *end_source_port* can be configured to any integer value from 0 to 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.

dest_port must be configured to any integer value from 0 to 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered.
dest_port must be configured to any integer value from 0 to 65535.

range *start_dest_port end_dest_port*

Specifies that all destination TCP ports within a specific range are to be filtered.
start_dest_port is the initial port in the range and *end_dest_port* is the final port in the range.
Both *start_dest_port* and *end_dest_port* can be configured to any integer value from 0 to 65535.

Usage

Block IP packets when the source and destination are of interest but for only a limited set of ports.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and UDP packets coming from any host are matched:

```
redirect css service chgsvc1 uplink udp any
```

The following sets the insertion point before the rule definition above:

```
before redirect css service chgsvc1 uplink udp any
```

The following command sets the insertion point after the first rule definition above:

```
after redirect css service chgsvc1 uplink udp any
```

The following deletes the rule definition above:

```
no redirect css service chgsvc1 uplink udp any
```

redirect nexthop (by IP address masking)

Used to redirect subscriber sessions based on the IP address mask sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **}** **[log]** *source_address source_wildcard*

after redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log]** *source_address source_wildcard*

before redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log]** *source_address source_wildcard*

no redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log]** *source_address source_wildcard*

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop *nexthop_addr*

The directly connected IP address to which the IP packets are forwarded.

`context` *`context_id`*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **`show context all`** command to display context names and context IDs.

`interface` *`interface_name`*

The name of the logical interface to which the packets should be redirected. *`interface_name`* must be an alpha and/or numeric string from 1 to 79 characters in length.

`log`

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

`source_address`

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *`source_wildcard`* parameter.

`source_wildcard`

This option is used in conjunction with the *`source_address`* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *`source_address`* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *`source_address`* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

Usage

Define a rule when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of redirect rules as it does not require a rule for each source and destination pair.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide.

Important: Also note that “redirect” rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the next hop host at 192.168.10.4, the context with the context ID of 23 and the source IP and wildcard of 192.168.22.0 and 0.0.0.31:

```
redirect nexthop 192.168.10.4 context 23 198.162.22.0 0.0.0.31
```

The following sets the insertion point before the rule defined above:

```
before redirect nexthop 192.168.10.4 context 23 198.162.22.0 0.0.0.31
```

The following command sets the insertion point after the first rule defined above:

```
after redirect nexthop 192.168.10.4 context 23 198.162.22.0 0.0.0.31
```

The following deletes the first rule defined above:

```
no redirect nexthop 192.168.10.4 context 23 198.162.22.0 0.0.0.31
```

redirect nexthop (any)

Used to redirect subscriber sessions based on any packet received. This command is also used to set the access control list insertion point.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] any**

after redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] any**

before redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] any**

no redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] any**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop *nexthop_addr*

The directly connected IP address to which the IP packets are forwarded.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface *interface_name*

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alpha and/or numeric string from 1 to 79 characters in length.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

any

Indicates all packets will match the redirect regardless of source and/or destination.

Usage

Define a catch all rule to place at the end of the list of rules to provide explicit handling of rules which do not fit any other criteria.

Important: It is suggested that any rule which is added to be a catch all should also have the **log** option specified. The logged packets may be used to determine if the current list of rules is adequate or needs modification to ensure proper security.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide.

Important: Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the next hop host at 192.168.10.4, the context with the context ID of 23 and any source IP:

```
redirect nexthop 192.168.10.4 context 23 any
```

The following sets the insertion point before the rule defined above:

```
before redirect nexthop 192.168.10.4 context 23 any
```

The following command sets the insertion point after the first rule defined above:

```
after redirect nexthop 192.168.10.4 context 23 any
```

The following deletes the first rule defined above:

```
no redirect nexthop 192.168.10.4 context 23 any
```

redirect nexthop (by host IP address)

Used to redirect subscriber sessions based on the targeted host IP address sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] host** *source_ip_address*

after redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] host** *source_ip_address*

before redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] host** *source_ip_address*

no redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] host** *source_ip_address*

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop *nexthop_addr*

The directly connected IP address to which the IP packets are forwarded.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface *interface_name*

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alpha and/or numeric string from 1 to 79 characters in length.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

Usage

Define a rule when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rules to be very clear and concise.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide.

Important: Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the next hop host at 192.168.10.4, the context with the context ID of 23 and a host IP address of 192.168.200.11:

```
redirect nexthop 192.168.10.4 context 23 host 192.168.200.11
```

The following sets the insertion point before the rule defined above:

```
before redirect nexthop 192.168.10.4 context 23 host 192.168.200.11
```

The following command sets the insertion point after the first rule defined above:

```
after redirect nexthop 192.168.10.4 context 23 host 192.168.200.11
```

The following deletes the first rule defined above:

```
no redirect nexthop 192.168.10.4 context 23 host 192.168.200.11
```

redirect nexthop (by source ICMP packets)

Used to redirect subscriber sessions based on the internet control message protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **}** **[log] icmp {** *source_address source_wildcard* **| any | host** *source_host_address* **}** **{** *dest_address dest_wildcard* **| any | host** *dest_host_address* **} [** *icmp_type* **[** *icmp_code* **]]**

after redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] icmp {** *source_address source_wildcard* **| any | host** *source_host_address* **} {** *dest_address dest_wildcard* **| any | host** *dest_host_address* **} [** *icmp_type* **[** *icmp_code* **]]**

before redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] icmp {** *source_address source_wildcard* **| any | host** *source_host_address* **} {** *dest_address dest_wildcard* **| any | host** *dest_host_address* **} [** *icmp_type* **[** *icmp_code* **]]**

no redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] icmp {** *source_address source_wildcard* **| any | host** *source_host_address* **} {** *dest_address dest_wildcard* **| any | host** *dest_host_address* **} [** *icmp_type* **[** *icmp_code* **]]**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop *nexthop_addr*

The directly connected IP address to which the IP packets are forwarded.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface *interface_name*

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alpha and/or numeric string from 1 through 79 characters in length.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in dotted decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. The type can be any integer value between 0 and 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered. The type can be any integer value between 0 and 255.

Usage

Define a rule to block ICMP packets which can be used for address resolution and possible be a security risk. The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide.

Important: Also note that “redirect” rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the next hop host at 192.168.10.4, the context with the context ID of 23, and ICMP packets coming from the host with the IP address 198.162.100.25:

redirect nexthop *192.168.10.4* **context** *23* **icmp host** *192.168.100.25*

The following sets the insertion point before the rule defined above:

before redirect nexthop *192.168.10.4* **context** *23* **icmp host** *192.168.100.25*

The following command sets the insertion point after the first rule defined above:

after redirect nexthop *192.168.10.4* **context** *23* **icmp host** *192.168.100.25*

The following deletes the first rule defined above:

no redirect nexthop *192.168.10.4* **context** *23* **icmp host** *192.168.100.25*

redirect nexthop (by IP packets)

Used to redirect subscriber sessions based on the internet protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **}** **[log] ip { source_address source_wildcard | any | host** *source_host_address* **} {** *dest_address dest_wildcard* **| any | host** *dest_host_address* **} [fragment] [protocol** *num* **]**

after redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] ip { source_address source_wildcard | any | host** *source_host_address* **} {** *dest_address dest_wildcard* **| any | host** *dest_host_address* **} [fragment] [protocol** *num* **]**

before redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] ip { source_address source_wildcard | any | host** *source_host_address* **} {** *dest_address dest_wildcard* **| any | host** *dest_host_address* **} [fragment] [protocol** *num* **]**

no redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] ip { source_address source_wildcard | any | host** *source_host_address* **} {** *dest_address dest_wildcard* **| any | host** *dest_host_address* **} [fragment] [protocol** *num* **]**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop *nexthop_addr*

The directly connected IP address to which the IP packets are forwarded.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface *interface_name*

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alpha and/or numeric string from 1 through 79 characters in length.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in dotted decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

fragment

Indicates packet redirection is to be applied to IP packet fragments only.

protocol *num*

Indicates that the packet filtering is to be applied to a specific protocol number.
num can be any integer ranging from 0 to 255.

Usage

Block IP packets when the source and destination are of interest.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide.

Important: Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the next hop host at 192.168.10.4, the context with the context ID of 23, and IP packets coming from the host with the IP address 198.162.100.25, and fragmented packets for any destination are matched:

```
redirect nexthop 192.168.10.4 context 23 ip host 198.162.100.25 any
fragment
```

The following sets the insertion point before the rule defined above:

```
before redirect nexthop 192.168.10.4 context 23 ip host 198.162.100.25
any fragment
```

The following command sets the insertion point after the first rule defined above:

```
after redirect nexthop 192.168.10.4 context 23 ip host 198.162.100.25 any
fragment
```

The following deletes the first rule defined above:

```
no redirect nexthop 192.168.10.4 context 23 ip host 198.162.100.25 any
fragment
```

redirect nexthop (by TCP/UDP packets)

Used to redirect subscriber sessions based on the transmission control protocol/user datagram protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **}** **[log] { tcp | udp } { { ***source_address source_wildcard* **| any | host** *source_host_address* **} [eq** *source_port* **| gt** *source_port* **| lt** *source_port* **| neq** *source_port* **] } { { ***dest_address dest_wildcard* **| any | host** *dest_host_address* **}** **[eq** *dest_port* **| gt** *dest_port* **| lt** *dest_port* **| neq** *dest_port* **] }**

after redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] { tcp | udp } { { ***source_address source_wildcard* **| any | host** *source_host_address* **} [eq** *source_port* **| gt** *source_port* **| lt** *source_port* **| neq** *source_port* **] } { { ***dest_address dest_wildcard* **| any | host** *dest_host_address* **} [eq** *dest_port* **| gt** *dest_port* **| lt** *dest_port* **| neq** *dest_port* **] }**

before redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] { tcp | udp } { { ***source_address source_wildcard* **| any | host** *source_host_address* **} [eq** *source_port* **| gt** *source_port* **| lt** *source_port* **| neq** *source_port* **] } { { ***dest_address dest_wildcard* **| any | host** *dest_host_address* **} [eq** *dest_port* **| gt** *dest_port* **| lt** *dest_port* **| neq** *dest_port* **] }**

no redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] { tcp | udp } { { ***source_address source_wildcard* **| any | host** *source_host_address* **} [eq** *source_port* **| gt** *source_port* **| lt** *source_port* **| neq** *source_port* **] } { { ***dest_address dest_wildcard* **| any | host** *dest_host_address* **}** **[eq** *dest_port* **| gt** *dest_port* **| lt** *dest_port* **| neq** *dest_port* **] }**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop *nexthop_addr*

The directly connected IP address to which the IP packets are forwarded.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface *interface_name*

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alpha and/or numeric string from 1 through 79 characters in length.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

tcp | udp

Specifies the redirect is to be applied to IP based transmission control protocol or the user datagram protocol.

- **tcp**: Redirect applies to TPC packets.
- **udp**: Redirect applies to UDP packets.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in dotted decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in dotted decimal notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be an integer value from 0 through 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be an integer value from 0 through 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be an integer value from 0 through 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be an integer value from 0 through 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.

- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be an integer value from 0 through 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered.
dest_port must be an integer value from 0 through 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered.
dest_port must be an integer value from 0 through 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered.
dest_port must be an integer value from 0 through 65535.

Usage

Block IP packets when the source and destination are of interest but for only a limited set of ports.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide.

Important: Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the next hop host at 192.168.10.4, the context with the context ID of 23, and UDP packets coming from any host are matched:

```
redirect nexthop 192.168.10.4 context 23 udp any
```

The following sets the insertion point before the rule defined above:

```
before redirect nexthop 192.168.10.4 context 23 udp any
```

The following command sets the insertion point after the first rule defined above:

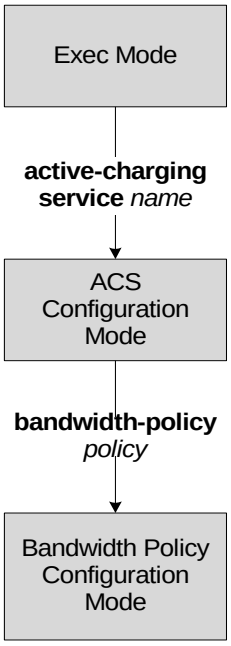
```
after redirect nexthop 192.168.10.4 context 23 udp any
```

The following deletes the first rule defined above:

```
no redirect nexthop 192.168.10.4 context 23 udp any
```

Chapter 5
ACS Bandwidth Policy Configuration Mode Commands

The ACS Bandwidth Policy Configuration Mode is used to create and manage ACS bandwidth policies.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

This command returns the CLI prompt to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to change to the Exec mode.

exit

This command exits the ACS Bandwidth Policy Configuration Mode and returns the CLI prompt to the ACS Configuration Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the ACS Configuration Mode.

flow limit-for-bandwidth

This command configures the ACS Bandwidth-Policy Flow Limit-for-bandwidth configuration.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

flow limit-for-bandwidth id *bandwidth_id* **group-id** *group_id*

no flow limit-for-bandwidth id *bandwidth_id*

no

Removes the specified bandwidth policy configuration.

id *bandwidth_id*

Specifies the ACS Bandwidth-Policy ID.
bandwidth_id must be an integer from 1 through 65535.

group-id *group_id*

Specifies the ACS Bandwidth-Policy Group ID.
group_id must be an integer from 1 through 65535.

Usage

Use this command to configure the ACS Bandwidth-Policy Flow Limit-for-bandwidth configuration.

Example

The following command configures the Flow Limit-for-Bandwidth configuration with bandwidth policy ID *test123* and group ID *123*:

flow limit-for-bandwidth id *test123* **group-id** *123*

group-id

This command configures the ACS Bandwidth-Policy Group ID.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

group-id *group_id* **direction { downlink | uplink } peak-data-rate** *bps* **peak-burst-size** *bytes* **violate-action { discard | lower-ip-precedence } [committed-data-rate** *bps* **committed-burst-size** *bytes* **[exceed-action { discard | lower-ip-precedence }]]**

{ default | no } group-id *group_id* **direction { downlink | uplink }**

default

Configures default settings for the specified group ID.

no

Removes configuration for the specified group ID.

group_id

Specifies the group ID.
group_id must be an integer from 1 through 65535.

direction { downlink | uplink }

Specifies the direction for which bandwidth will be controlled.

peak-data-rate *bps*

Specifies peak data rate in bits per second.
bps must be an integer from 1 through 4294967295.
Default: 0

peak-burst-size *bytes*

Specifies peak burst size in bytes.
bytes must be an integer from 1 through 4294967295.
Default: 0

violate-action { discard | lower-ip-precedence }

Specifies the action to be taken if Peak Data Rate is surpassed.
discard: Specifies to discard the packet
lower-ip-precedence: Specifies to lower IP precedence of the packet

committed-data-rate *bps*

Specifies the committed Data Rate in bits per second. This can also be used to specify GBR in NCQoS (without the exceed-action).
bps must be an integer from 1 through 4294967295.
Default: 0

committed-burst-size *bytes*

Specifies the committed burst size in bytes.
bytes must be an integer from 1 through 4294967295.
Default: 0

exceed-action { discard | lower-ip-precedence }

Specifies the action to be taken if Committed Data Rate is surpassed.
discard: Specifies to discard the packet.
lower-ip-precedence: Specifies to lower IP precedence of the packet.

Usage

Use this command to configure the ACS Bandwidth-Policy Group ID.

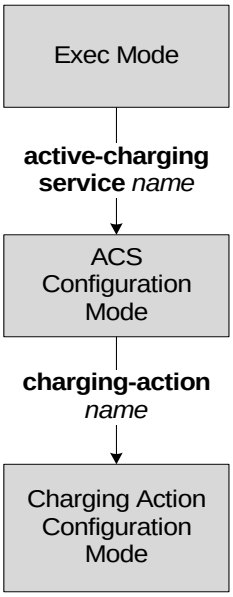
Example

The following command configures the group ID *111* to control bandwidth in the downlink direction specifying peak data rate of *10000* bits per second and peak burst size of *10000* bytes while specifying the action to be taken on violation as discard:

```
group-id 111 direction downlink peak-data-rate 10000 peak-burst-size
10000 violate-action discard
```

Chapter 6
ACS Charging Action Configuration Mode Commands

The ACS Charging Action Configuration Mode is used to create and manage Charging Action services.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

billing-action

This command configures billing actions for packets that match ruledefs.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
billing-action { edr edr_format_name [ wait-until-flow-ends ] | egcdr | exclude-from-udrs | radius | rf } +

no billing-action [ edr | egcdr | exclude-from-udrs | radius | rf ] +
```

no

Disables billing-action configuration for the charging action.
Specifying one of the optional keywords disables that functionality. If you want to disable all billing-action functionality, do not specify any of the optional keywords.

edr *edr_format_name* **[wait-until-flow-ends]**

Enables EDR billing for packets matching this charging action.
edr_format_name must be the name of an existing EDR format, and must be a string of 1 through 63 characters in length.

Important: If the EDR format name supplied here is not configured in the EDR Format Configuration Mode, or has been deleted, the system accepts it without applying any EDR format for the billing action in this ACS service.

If this option is configured, the system generates an EDR immediately when a packet is received and it matches a ruledef that is associated with this charging action. Other events configured for flow end-condition, flow action, termination, and/or session control also creates the triggers for EDR generation.
wait-until-flow-ends: By default, the EDR is generated immediately after a ruledef hit results in this charging action. When this keyword is specified, no EDR is generated on a ruledef hit. When the flow ends, an attempt is made to generate an EDR with the format specified.

egcdr

Enables eG-CDRs billing for packets matching this charging action.
If this option is configured, system generates an eG-CDR when the subscriber session ends or an interim trigger condition occurs. The interim triggers are configurable in the ACS Rulebase Configuration Mode. In addition, whenever there is an SGSN-to-SGSN handoff the system treats that as a trigger.
To generate an eG-CDR the **accounting-mode** CLI command in the APN Configuration Mode must be configured with the "none" option.
The format of enhanced G-CDRs is controlled by the **inspector** CLI command in the Context Configuration Mode.

exclude-from-udrs

By default, statistics are accumulated on a per content ID basis for possible inclusion in UDRs. The **exclude-from-udrs** keyword causes the system to not include the packet's statistics in UDRs.
When this option is disabled, (the default setting) UDRs will be generated based on the udr format declared in the rulebase.
Default: Disabled.

radius

Enables billing action as RADIUS CDRs for packets matching this charging action, and the data packet statistics will be included in the postpaid RADIUS accounting.
Default: Disabled.

rf

Enables Rf accounting.
Rf accounting is applicable only for dynamic and predefined rules that are marked for it. Dynamic rules have a field offline-enabled to indicate this. To mark a predefined rule as offline-enabled, use this keyword and the **billing-records** CLI in the ACS Rulebase Configuration Mode.

Usage

Use this command to enable an EDR, eG-CDR and/or RADIUS CDR type of billing for content matching this charging action.

Example

The following command enables the EDR billing type with EDR format *charge1_format*:

```
billing-action edr charge1_format
```

cca charging

This command enables Credit Control Application and configures RADIUS/Diameter prepaid charging behavior.

Product

All

Privilege

Security Administrator, Administrator

Syntax

cca charging credit [preemptively-request | rating-group *coupon_id* **]**

{ default | no } dcca charging

no

Disables RADIUS/Diameter Prepaid Credit Control Charging.

default

Disables RADIUS/Diameter Prepaid Credit Control Charging.

credit

Specifies RADIUS/Diameter Prepaid Credit Control Charging Credit behavior.

preemptively-request

Specifies RADIUS/Diameter prepaid credit preemptively requested charging credit behavior. If this option is used, a quota is requested for the specific type of content during the session initialization.

rating-group *coupon_id*

Specifies the coupon ID used in prepaid charging as rating-group which maps to the coupon ID for prepaid customer.
coupon_id must be an integer from 0 through 65535.
This option also assigns different content-types for the same charging action depending upon whether prepaid is enabled or not.

Important: This rating-group overrides the content ID, if present in the same charging-action for the prepaid customer in DCCA. But only the content IDs will be used in eG-CDRs irrespective of the presence of rating-group in that charging-action.

Usage

Use this command to configure RADIUS/Diameter Prepaid Credit Control Charging behavior.
This command selects reservation based credit control. A CCR-Initial is used to reserve quota upon the first traffic, then a series of CCR-updates are issued as the traffic proceeds and quota dwindles. A CCR-Terminate is issued at the end of the session or at the end of the quota-hold-time.

Example

The following is an example of this command:

```
cca charging credit
```

charge-units

This command configures the unit amount counters for RADIUS/DCCA charging calculation.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

charge-units *units*

{ default | no } charge-units

no

Disables the charge-units configuration.

default

Configures the default setting.
Default: 0; disables the counter, same as **no charge-units**

units

Sets the service-specific fixed unit counter per content ID for RADIUS/DCCA charging.
units is the value set for charging unit, and must be an integer from 1 through 65535.

Usage

This command configures the unit amount counters for charging calculation on per content ID basis for different protocols and packets regardless of packet direction (uplink or downlink).

Important: For more information on content ID, refer to the **if-protocol** command in the *ACS Ruledef Configuration Mode Commands* chapter.

Example

The following command sets the charging unit to *1024*:

charge-unit *1024*

charge-volume

This command configures how the volume amount counter for eG-CDR and DCCA charging are calculated.

Product

All

Privilege

Security Administrator, Administrator

Syntax

charge-volume { *protocol* { bytes | packet-length | packets } [downlink | uplink] | constant *value* }

{ no | default } charge-volume

---

no

Disables the charge-volume configuration.

---

default

Configures the default setting.
Default: **charge-volume ip bytes**

---

protocol

Specifies the charge volume method for the specific rule definition.
protocol must be one of the following:

- **dns**: Charge volume for DNS
- **ftp-control**: Charge volume for FTP-Control
- **ftp-data**: Charge volume for FTP-Data
- **http**: Charge volume for HTTP
- **icmp**: Charge volume for ICMP
- **imap**: Charge volume for Internet Message Access Protocol (IMAP)
- **ip**: Charge volume for IP
- **mms**: Charge volume for MMS
- **pop3**: Charge volume for POP3
- **rtp**: Charge volume for RTP
- **rtsp**: Charge volume for RTSP
- **sdp**: Charge volume for SDP
- **secure-http**: Charge volume for secure-https
- **sip**: Charge volume for SIP
- **smtp**: Charge volume for SMTP
- **tcp**: Charge volume for TCP

- **udp**: Charge volume for UDP
- **wsp**: Charge volume for WSP
- **wtp**: Charge volume for WTP

bytes

Sets charge volume for bytes.

packet-length

Sets charge volume for packet length.

packets

Sets charge volume for packets.

constant *units*

This sets the fixed increment value for charging.
units is the value set for charging, and must be an integer from 0 through 65535.
If **constant** *3* is configured for every invocation of this Charging Action, the system adds 3 to the downlink/uplink volume counter, depending on the direction of packet.

Usage

This command provides the method for charging volume calculation for different protocols and packets.
For information on supported protocols see the *ACS Ruledef Configuration Mode Commands* chapter.
If **charge-volume rtp packets** is configured, system computes volume amounts for different options for RTP as follows:

Volume	Description
Volume amount	Total (downlink and uplink) RTP packets
Volume amount uplink	Uplink RTP packets
Volume amount downlink	Downlink RTP packets
Volume amount uplink packets	Uplink RTP packets
Volume amount downlink packets	Downlink RTP packets
Volume amount uplink bytes	Uplink RTP bytes
Volume amount downlink bytes	Downlink RTP bytes

Important: Whenever service counts volume, it counts all packets that the relevant analyzers accepted.

Important: If a TCP packet is routed to the HTTP analyzer but there is no HTTP payload, then the TCP statistics will be updated but the HTTP statistics will not be updated (except for the "packets ignored by the HTTP analyzer" statistic).

Example

Following command sets the charging volume of downlink packets for RTP:

```
charge-volume rtp packets downlink
```

content-filtering processing server-group

This command enables/disables content filtering in the charging action.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

```
content-filtering processing server-group

{ default | no } content-filtering processing
```

default

Configures the default setting.
Default: content filtering configured for the rulebase is attempted

no

Specifies to bypass content filtering.
This configuration should only be specified for charging actions that are performed when known safe sites are being accessed.

Usage

Use this command to enable/disable content filtering in the charging action.
This command works as second level filter to process the HTTP/WAP GET request with ICAP after ruledef matching. The first level filtering is in the rulebase configuration. This CLI command is only effective when the rulebase is configured with content-filtering mode server-group.

Example

The following command enables content filtering in the current charging action:

```
content-filtering processing server-group
```

content-id

This command specifies an optional content ID to use in the generated billing records, as well as the AVP used by the credit control application, such as the Rating-Group AVP for use by DCCA.

Product

All

Privilege

Security Administrator, Administrator

Syntax

content-id *content_id*

no content-id

no

Removes the content ID configuration from the charging action.

content_id

content_id is the content ID specified for credit control service in an active charging service, and must be an integer from 1 through 65535.

Usage

This command specifies an optional content ID to use in the generated billing records. This identifier assists the carrier's billing post processing and also used by credit-control system to use independent quotas for different value of **content-id**.
If the specified Ruledef uses the **if-protocol** command to select a value for content ID, then the *content_id* specified through this command is not used for billing record generation.

Important: For more information on **content-id**, refer to the **if-protocol** command in the *ACS Ruledef Configuration Mode Commands* chapter.

Example

The following command sets the content ID in the current charging action to *23*:

content-id *23*

end

This command returns the CLI prompt to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec Mode.

exit

This command exits the ACS Charging Action Configuration Mode and returns to the ACS Configuration Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the ACS Configuration Mode.

flow action

This command specifies the actions for packets that match a rule definition. This command also specifies action on packet and flow for Session Control functionality.

Product

All

Privilege

Security Administrator, Administrator

Syntax

flow action { conditional user-agent end-token *end_token_name* **| discard [downlink | uplink] | readdress [server** *ip_address* **] [port** *port_number* **] | terminate-flow | terminate-session }**

no flow action

---

no

Disables the flow action configured in this charging action.

---

conditional user-agent end-token *end_token_name*

Conditionally redirects the HTTP packets matched to a configured user-agent to a specified URL. The user agent is configured using the **redirect user-agent** command in the ACS Configuration Mode.
end_token_name must be an alpha and/or numeric string of 1 through 32 characters in length, and is configured with this command to end the redirection condition.

---

discard [downlink | uplink]

Discards the packet associated with this charging action.

- **downlink**: Discards only downlink packets.
- **uplink**: Discards only uplink packets.

---

readdress { server *ip_address* **[port** *port_number* **] | port** *port_number***}**

Specifies the re-address server's IP address/port number for this charging action. Enables readdressing of packets based on the destination IP address in the packets.
ip_address must be the re-address server's IP address, and must be an IPv4 address.
port_number must be the re-address server's port number, and must be an integer from 1 through 65535.

---

terminate-flow

Specifies the flow action to terminate flow.
Terminates the TCP connection gracefully between the subscriber and external server and sends a TCP FIN to the subscriber and a TCP RST to the server. If the flow does not use TCP, this option simply discard the packets. This option is used for flows that use TCP only.

---

terminate-session

Specifies the flow action to terminate session.

When a rule pointing to a charging action configured with the terminate-session keyword is hit, then the corresponding session will be terminated.

Usage

Use this command to set the flow actions; e.g. discard, terminate, or conditional redirect.
When a re-address server is configured for a charging action, the **show configuration** command will display the readdress related configuration only if server address is configured. The **show configuration verbose** command will display the readdress sever if configured, else will display "no flow action".

Example

The following command sets the flow action to terminate:

```
flow-action terminate-flow
```

flow action redirect-url

This command specifies the redirection of URL for packets that matches a rule definition. This command also specifies the redirect-URL action on packet and flow for Session Control functionality.

Product

All

Privilege

Security Administrator, Administrator

Syntax

flow action redirect-url *url* **/%3furl=** *dynamic_field* **[clear-quota-retry-timer]**

{ default | no } flow action redirect-url

no

Disables the configured flow action in this charging action.

default

Disables the flow action and forward the packets normally.

redirect-url *url* **/%3furl=** *dynamic_field*

Redirects the HTTP packets matched to this Ruledef to the specified URL.
url must be a string size of from 1 through 511 characters in "http://search.com/subtarg/%3furl=#*HTTP.URL*#" format.
%3furl=: specifies the delimiter "?url=" between URLs.
Note that user cannot supply "?" through CLI so %3f is the value for "?".
dynamic_field indicates the dynamic fields for redirect URLs.
Dynamic fields must be enclosed in '#'. Up to 16 dynamic fields are allowed in the redirect string.
Allowed dynamic fields are:

- #BEARER.CALLED-STATION-ID#
- #BEARER.CALLING-STATION-ID#
- #BEARER.NAS-IP-ADDRESS#
- #BEARER.USER-NAME#
- #BEARER.ACCT-SESSION-ID#
- #BEARER.CORRELATION-ID#
- #BEARER.RULEBASE#
- #BEARER.SERVED-BSA-ADDR#
- #BEARER.SERVICE-NAME#
- #BEARER.SUBSCRIBER-ID#
- #BEARER.MSISDN#
- #HTTP.URL#
- #HTTP.URI#

- #HTTP.HOST#
- #RTSP.URI#
- #WSP.URL#

clear-quota-retry-timer

This option resets the Credit Control Application quota retry timer for specific subscriber upon redirection.

Usage

Use this command to set the redirection of URL as flow actions upon matching of a Ruledef.
This CLI can be used to redirect SIP requests as well. The following is a sample configuration:

```
configure
   active-charging service s1
      charging-action ca_sip_redir
         content-id 10
         flow action redirect-url sip:test@sip.org
         exit
      ruledef sip_req
         sip request packet = TRUE
         exit
      rulebase plan1
         action priority 08 ruledef sip_req charging-action ca_sip_redir
         /* other rules, routing rules for sip, etc */
         end
```

This would mean any SIP request that hits the *sip_req* ruledef, would get redirected to the url given in *ca_sip_redir*. This involves creating a redirection packet with the following response line and "Contact" header in the response.
SIP/2.0 302 Moved Temporarily
302 Moved Temporarily
Most of the header fields are copied directly from the request, so that the mandatory SIP headers are present. If content-length header was seen in the original message, it is replaced in the reply with "Content-Length: 0".

Example

The following command resets quota retry timer upon redirection of flow to HTTP URL *http://search.com/?url=#http://msn.com#*:

flow action redirect-url *http://search.com/%3url=#http://msn.com#* **clear-quota-retry-timer**

flow idle-timeout

This command configures the maximum duration a flow can remain idle after which the system automatically terminates the flow.

Product

All

Privilege

Security Administrator, Administrator

Syntax

flow idle-timeout *idle_timeout*

{ no | default } idle-timeout

no

Disables the idle-timeout configuration; sets the idle-timeout to 0 seconds.

default

Configures the default setting.
Default: 300 seconds

idle-timeout *idle_timeout*

Specifies the maximum duration, in seconds, a flow can remain idle.
idle_timeout must be an integer from 0 through 86400.

Usage

Use this command to configure the maximum duration a flow can remain idle after which the system automatically terminates the flow.

Example

The following command configures the idle-timeout setting to *400* seconds:

flow idle-timeout *400*

flow limit-for-bandwidth

This command enables and configures bandwidth limits for Session Control functionality to the subscriber. Uplink and downlink limits are configured separately.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
flow limit-for-bandwidth { { direction { downlink | uplink } peak-data-rate bps
peak-burst-size bytes violate-action { discard | lower-ip-precedence } [
committed-data-rate bps committed-burst-size bytes [ exceed-action { discard |
lower-ip-precedence } ] ] } | { id id } }

{ default | no } flow limit-for-bandwidth { direction { downlink | uplink } | id
}
```

no

Disable bandwidth control traffic policing for the specified direction for the current subscriber.

default

Resets the bandwidth control policy to default mode.

direction { downlink | uplink }

Specifies the direction of flow downlink/uplink to apply bandwidth limit.
downlink: Flow of data towards subscriber.
uplink: Flow of data from subscriber.

peak-data-rate *bps*

Specifies the peak data-rate for the subscriber, in bps (bits per second).
bps must be an integer from 1 through 4294967295.
Default: 256000

peak burst-size *bytes*

The peak burst size allowed, in bytes.
bytes must be an integer from 1 through 4294967295.
Default: 3000

Important: It is recommended that this parameter be configured to at least the greater of the following two values: 1) 3 times greater than packet MTU for the subscriber connection, OR 2) 3 seconds worth of token accumulation within the “bucket” for the configured peak-data-rate.

violate-action { discard | lower-ip-precedence }

Specifies the action to take on packets that exceed both the committed-data-rate and the peak-data-rate. The following actions are supported:

- **discard**: Discard the packet
- **lower-ip-precedence**: Transmit the packet after lowering the IP precedence

Default: **discard**

committed-data-rate *bps*

The committed data rate (guaranteed-data-rate) in bits per second (bps).
bps must be an integer from 1 through 4294967295.
Default: 144000

committed-burst-size *bytes*

The committed burst size allowed, in bytes.
bytes must be an integer from 1 through 4294967295.
Default: 3000

exceed-action { discard | lower-ip-precedence }

The action to take on the packets that exceed the committed-data-rate but do not violate the peak-data-rate. The following actions are supported:

- **discard**: Discard the packet
- **lower-ip-precedence**: Transmit the packet after lowering the ip-precedence

If exceed-action is not configured, the packets are forwarded.
Default: **lower-ip-precedence**

id *id*

Important: This keyword is only available in StarOS 8.1 and later releases.

Specifies identifier for bandwidth limiting, and must be an integer from 1 through 65535.
This identifier enables traffic policing based on a separate identifier other than content ID. This identifier will always take priority over content ID. If this identifier is not configured, traffic policing will be based on content ID.

Usage

Use this command to limit the bandwidth a subscriber uses in the uplink and downlink directions under Session Control.

Important: If the exceed/violate action is set to "lower-ip-precedence", the TOS value for the outer packet becomes "best effort" for packets that exceed/violate the traffic limits regardless of what the **ip user-datagram-tos copy** command is configured to. In addition, the **lower-ip-precedence** option may also override the **ip qos-dscp** command configuration. Therefore, it is recommended that command not be used when specifying this option.

Details of the QoS Traffic Policing feature is available in the *System Enhanced Feature Configuration Guide*.

Example

The following command sets an uplink peak data rate of *128000* bps and lowers the IP precedence when the committed-data-rate and the peak-data-rate are exceeded:

```
flow limit-for-bandwidth uplink peak-data-rate 128000 violate-action
lower-ip-precedence
```

The following command sets a downlink peak data rate of *256000* bps and discards the packets when the committed-data-rate and the peak-data-rate are exceeded:

```
flow limit-for-bandwidth downlink peak-data-rate 256000 violate-action
discard
```

flow limit-for-flow-type

This command controls the action in the event of number of flows exceeds for a type of flow under Session Control feature.

Product

All

Privilege

Security Administrator, Administrator

Syntax

flow limit-for-flow-type *limit* **over-limit-action** *action_type*

no limit-for-flow-type

no

Disables limit for the total number of flow for a type.

limit

Sets the maximum number of flows of a type exceeding which action triggers.
limit must be an integer from 1 through 4000000000.

over-limit-action *action_type*

Triggers the action of *action_type* on exceeding *limit* for a flow type.
action_type must be one of the following:

- **discard**: Discards the packets
- **redirect-url**: Redirects the flow
- **terminate-flow**: Terminates the flow to which this packet belongs
- **terminate-session**: Terminates the session to which this packet belongs

Usage

Use this command to control the action for the total number of flow of a type.

Example

The following command terminates the flow if total number of flows of a type exceeds *1024*:

flow limit-for-flow-type *1024* **over-limit-action terminate-flow**

ip tos

This command sets the IP Type of Service (ToS) octets being used in the charging action.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
ip tos { af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 |
af42 | af43 | be | ef | lower-bits tos_value } [ uplink | downlink ]

no ip tos [ uplink | downlink ]
```

no

Disables IP ToS being used in the charging action.

af *xx*

Specifies the use of an assured forwarding *xx* PHB.

be

Specifies the use of best effort forwarding PHB.

ef

Specifies the use of expedited forwarding PHB.

lower-bits *tos_value*

Important: In StarOS 8.1 and later releases, this keyword is "**lower-bits** *tos_value*". In StarOS 8.0, it is *tos_value*.

Sets the least-significant 6 bits in the TOS byte with the specified numeric value.
tos_value must be an integer from 0 through 63.

downlink

Specifies the ToS only for downlink packets.

uplink

Specifies the ToS only for uplink packets.

Usage

Use this command to set the IP Type of Service (ToS) octets used in the charging action. If one of the enumerated values is set, the DSCP bits which are the six most-significant bits in the TOS byte are marked. If the integer value is set, it will be written into the six least-significant bits of the TOS byte.

Example

The following command sets the IP ToS to *be* with *downlink*:

```
ip tos be downlink
```

ip vlan

This command configures the VLAN identifier to be associated with the IP address for the session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip vlan *range*

{ default | no } ip vlan

default | no

These options delete or disable the IP VLAN configuration.

range

range must be an integer from 1 through 4094.

Usage

This command configures the subscriber VLAN ID which is used with the assigned address for the subscriber session to receive packets. If the IP pool from which the address is assigned is configured with a VLAN ID, then this subscriber configured VLAN ID overrides it.
Subscriber traffic can be routed to specific VLANs based on the configuration of their user profile. Using this functionality provides a mechanism for routing all traffic from a subscriber over the specified VLAN. All packets destined for the subscriber must also be sent using only IP addresses valid on the VLAN or they will be dropped.

Example

The following command sets the IP VLAN range to go up to *500*:

ip vlan *500*

The following command sets the IP VLAN range back to default.

default ip vlan

nexthop-forwarding-address

This command configures the next-hop forwarding address for this charging action.

Product

All

Privilege

Security Administrator, Administrator

Syntax

nexthop-forwarding-address *ipv4_address*

no nexthop-forwarding-address

no

Removes the next-hop forwarding address, if previously configured.

ipv4_address

ipv4_address must be the next-hop forwarding address for this charging action, and must be specified using the standard IPv4 dotted decimal notation.

Usage

Use this command to configure the next-hop forwarding address for a charging action. When an uplink packet matches a rule and a charging action is applied to it this next-hop forwarding address is used. There are different methods to configure a next-hop forwarding address, they are prioritized as follows:

- The next-hop forwarding address, if configured, in a redirect ACL is used
- Else, the next-hop address configured in the charging action is used
- Else, the next-hop address, if configured, in the IP pool is used

Example

The following command sets the next-hop forwarding address for the current charging action to *1.1.1.1*:

nexthop-forwarding-address *1.1.1.1*

qos-class-identifier

This command sets the QoS Class Identifier.

Product

All

Privilege

Security Administrator, Administrator

Syntax

qos-class-identifier *identifier*

no qos-class- identifier

no

Removes QoS Class Identifier, if previously configured.

identifier

Specifies the QoS Class Identifier, and must be an integer from 1 through 9.

Usage

Use this command to set the QoS Class Identifier.

Example

The following command sets the QoS Class Identifier as *3*:

qos-class-identifier *3*

qos-renegotiate

This command configures the QoS traffic class for the charging action for the Layer 7 QoS Renegotiation feature, enabling triggering QoS renegotiation from an active-charging rule.

Important: This command is controlled by the dynamic-qos-renegotiation license.

Product

All

Privilege

Security Administrator, Administrator

Syntax

qos-renegotiate traffic-class { background | conversational | interactive *priority* **| streaming }**

no qos-renegotiate

no

Removes any previously configured traffic class setting.

background

Specifies the traffic class as Background.
For traffic patterns in which the data transfer is not time-critical (for example e-mail exchange).

conversational

Specifies the traffic class as Conversational.
For traffic patterns in which there is a constant flow of packets.

interactive *priority*

Specifies the traffic class as Interactive.
For traffic patterns in which there is an intermittent flow of packets.
priority specifies the traffic handling priority, and must be an integer from 1 through 3.

streaming

Specifies the traffic class as Streaming.
For traffic patterns in which there is a constant flow of data in one direction, either upstream or downstream.

Usage

Use this command to configure the QoS traffic class for a charging action for the Layer 7 QoS Renegotiation feature, enabling triggering QoS renegotiation from an active-charging rule.
Layer 7 QoS Renegotiation is an extension of the Dynamic QoS Renegotiation feature. Upon matching a particular layer 7 rule, for example the access of a particular URL, the GGSN triggers the renegotiation of the PDP context.

Example

The following command sets the QoS traffic class for the charging action to streaming:

```
qos-renegotiate traffic-class streaming
```

retransmissions-counted

This command enables the charging action to count the number of retransmissions.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] retransmissions-counted
```

no | default

Disables the count retries from the charging action.

Usage

Use this command to enable counting of the number of retransmissions.

Example

The following is an example of this command:

```
retransmissions-counted
```

service-identifier

This command configures the service identifier for a service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

service-identifier *service_id*

no service-identifier

no

Removes any previously configured service ID.

service_id

Specifies the service identifier, and must be an integer from 1 through 65535.

Usage

Use this command to configure the service identifier for a service.

Example

The following command sets the service identifier for a service as *99*:

service-identifier *99*

tft packet-filter

This command configures the packet filter to be sent to the MS.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tft packet-filter *packet_filter_name*

no

Removes the specified packet filter, if previously configured.

packet_filter_name

packet_filter_name specifies the packet filter's name, and must be a string of 1 through 63 characters in length.

Usage

Use this command to configure the packet filter to be sent to the MS. Up to eight packet filters can be specified in a charging action.

Example

The following command configures the packet filter *filter23* to be sent to the MS:

tft packet-filter *filter23*

tos

This command sets the Type of Service (ToS) octets used in the charging action.

Product

All

Privilege

Security Administrator, Administrator

Syntax

tos { af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 | af43 | be | ef | lower-bits *tos_value* **} [downlink | uplink]**

no tos [downlink | uplink]

no

Disables the ToS being used in the charging action.

af *xx*

Specifies the use of an assured forwarding *xx* Per Hop Behavior (PHB).

be

Specifies use of Best Effort forwarding PHB.

ef

Specifies use of Expedited Forwarding PHB.

lower-bits *tos_value*

Important: In StarOS 8.1 and later releases, this keyword is "**lower-bits** *tos_value*". In StarOS 8.0, it is *tos_value*.

Sets the least-significant 6 bits in the TOS byte with the specified numeric value.
value must be an integer from 0 through 63.

downlink

Specifies the ToS only for downlink packets.

uplink

Specifies the ToS only for uplink packets.

Usage

Use this command to set the ToS octets used in the charging action. If one of the enumerated values is set, the DSCP bits which are the six most-significant bits in the TOS byte are marked. If the integer value is set, it will be written into the six least-significant bits of the TOS byte.

Example

The following command sets the ToS to *be* for downlink packets:

```
tos be downlink
```

xheader-insert

This command specifies the extension-header (x-header) format name whose fields are to be inserted in HTTP GET and POST request packets.

Important: This command is license dependent. For more information please contact your local sales representative.

Product

All

Privilege

Security Administrator, Administrator

Syntax

xheader-insert xheader-format *xheader_format_name* **[first-request-only] [-noconfirm]**

no xheader-insert

no

Removes previously configured x-header format name.

xheader-format *format_name*

Enables x-header mode configuration, and specifies name of the x-header format whose fields are to be inserted in the packets.
format_name must be a string of 1 through 63 characters in length.

first-request-only

Specifies x-header insertion only for the first HTTP request in the IP flow. If not configured, the default behavior is insertion for all requests.

-noconfirm

Specifies that the command must execute without any prompts and confirmation from the user.

Usage

Use this command to enable x-header mode, and specify the x-header format name whose fields are to be inserted in HTTP GET and POST request packets.
Also, see **xheader-format** CLI command in the *ACS Configuration Mode Commands* and *ACS X-header Format Configuration Mode Commands* chapters.

Example

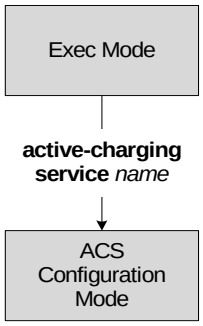
The following command enables x-header mode, and specifies the x-header format name as *test12*:

xheader-insert xheader-format *test12*

Chapter 7
ACS Configuration Mode Commands

The Active Charging Service (ACS) Configuration Mode is used to manage active charging service/enhanced charging service (ECS) configurations. ACS provides flexible, differentiated, and detailed billing to subscribers through Layer 3 through Layer 7 packet inspection and the ability to integrate with back-end billing mediation systems.

Important: In this release only one active charging service can be configured in a system.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

access-ruledef

This command enables creating/configuring/deleting access ruledefs.

Important: This command is only available in StarOS 8.1 and in StarOS 9.0 and later releases, and must be used to configure the Policy-based Stateful Firewall and NAT features.

Product

NAT, FW

Privilege

Security Administrator, Administrator

Syntax

access-ruledef *access_ruledef_name* **[-noconfirm]**

no access-ruledef *access_ruledef_name*

no

Deletes the specified access ruledef, if previously configured, from the active charging service.

access_ruledef_name

Specifies name of the access ruledef.
access_ruledef_name must be a string of 1 through 63 characters in length, and can contain punctuation characters.
If the named access ruledef does not exist, it is created, and the CLI mode changes to the Firewall Ruledef Configuration Mode wherein the ruledef can be configured.
If the named access ruledef already exists, the CLI mode changes to the Firewall Ruledef Configuration Mode for that access ruledef.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete an access ruledef. A ruledef contains different conditions/criteria to permit, drop, or reject a packet/connection/traffic based on one or more parameters. The ruledef name must be unique within the service. Host pool, port map, IMSI pool, and access/firewall, routing, and charging ruledefs must have unique names.

Important: An access ruledef can be referenced by multiple firewall rulebases.

Important: The access ruledefs are different from the ACS ruledefs.

Also see the *Firewall Ruledef Configuration Mode Commands* chapter.

Example

The following command creates an access ruledef named *ruledef1*, and enters the Firewall Ruledef Configuration Mode:

```
firewall ruledef ruledef1
```

bandwidth-policy

This command enables creating/configuring/deleting a bandwidth policy.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

bandwidth-policy *policy_name* **[-noconfirm]**

no bandwidth-policy *policy_name*

no

Deletes the specified bandwidth policy, if previously configured, from the active charging service.

policy_name

Specifies name of the bandwidth policy.
policy_name and must be an alpha and/or numeric string of 1 through 63 characters in length.
If the named bandwidth policy does not exist, it is created, and the CLI mode changes to the ACS Bandwidth Policy Configuration Mode wherein the bandwidth policy can be configured.
If the named bandwidth policy already exists, the CLI mode changes to the ACS Bandwidth Policy Configuration Mode for that bandwidth policy.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete a bandwidth policy.
Also see the *ACS Bandwidth Policy Configuration Mode Commands* chapter.

Example

The following command creates a bandwidth policy named *test73*, and enters the ACS Bandwidth Policy Configuration Mode:

bandwidth-policy *test73*

buffering-limit

This command configures the flow- or session-based packet buffering setting.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

buffering-limit { flow-max-packets *number* **| subscriber-max-packets** *number* **}**

{ default | no } buffering-limit { flow-max-packets | subscriber-max-packets }

default

Configures the default buffering-limit setting.
Default: no limit, other than the maximum amount of available memory

no

Disables the buffering limit configuration.

flow-max-packets *number*

Specifies the maximum number of packets that can be buffered per flow.
number must be an integer from 1 through 255.

subscriber-max-packets *number*

Specifies the maximum number of packets that can be buffered per subscriber.
number must be an integer from 1 through 255.

Usage

Use this command to configure the limits for buffering packets sent by a subscriber, while it is waiting for a response from the Diameter server. Packets need to be buffered for various reasons, such as, waiting for Credit Control Authorization or waiting for the result of a content filtering rating request.

Example

The following command sets the buffering limit per flow to *55*:

buffering-limit flow-max-packets *55*

charging-action

This command enables creating/configuring/deleting an ACS charging action.

Important: A maximum of 2048 charging actions can be configured in the active charging service.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] charging-action` *`charging_action_name`* **`[ -noconfirm ]`**

`no`

Deletes the specified charging action, if previously configured, from the active charging service.

`charging_action_name`

Specifies name of the charging action.
`charging_action_name` must be an alpha and/or numeric string of 1 through 63 characters in length, and can contain punctuation characters.
If the named charging action does not exist, it is created, and the CLI mode changes to the ACS Charging Action Configuration Mode wherein the charging action can be configured.
If the named charging action already exists, the CLI mode changes to the ACS Charging Action Configuration Mode for that charging action.
The charging action's name must be unique in the active charging service. Up to 2048 charging actions can be configured in the active charging service.

`-noconfirm`

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete an ACS charging action.
A charging action represents actions to be taken when a configured rule is matched. Actions could range from generating an accounting record (for example, an EDR) to dropping the IP packet, etc. The charging action will also determine the metering principle—whether to count retransmitted packets and which protocol field to use for billing (L3/L4/L7 etc).
Also see the *ACS Charging Action Configuration Mode Commands* chapter.

Example

The following command creates a charging action named *`action123`* and changes to the ACS Charging Action Configuration Mode:

charging-action *action123*

content-filtering category match-method

This command sets the match method to look up URLs in the Category-based Content Filtering database.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

```
content-filtering category match-method { exact | generic }

default content-filtering category match-method
```

default

Configures the default match-method setting.
Default: **generic**

exact

Specifies the exact-match method, wherein URLs are rated only on exact match with URLs present in the Category-based Content Filtering database.

generic

Specifies the generic match method, wherein normalization, multi-lookups, rollback algorithms are applied to URLs during look up, and URLs are rated on generic match with URLs present in the Category-based Content Filtering database.

Usage

Use this command to set the match method to look up URLs in the Category-based Content Filtering database.

Example

The following command sets the exact-match method to look up URLs in the Category-based Content Filtering database:

```
content-filtering category match-method exact
```

content-filtering category policy-id

This command enables creating/configuring/deleting Content Filtering Category Policies for Category-based Content Filtering support.

Important: A maximum of 64 Content Filtering Category Policies can be configured in the active charging service.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

content-filtering category policy-id *cf_policy_id* **[description [** *description_string* **]] [-noconfirm]**

no content-filtering category policy-id *cf_policy_id*

no

Deletes the specified Content Filtering Category Policy, if previously configured, from the active charging service.

category policy-id *cf_policy_id*

Specifies the Content Filtering Category Policy ID.
cf_policy_id must be an integer from 1 through 4,294,967,295.
If the specified policy ID does not exist, it is created and the CLI mode changes to the Content Filtering Policy Configuration Mode, wherein the policy can be configured.
If the specified policy ID already exists, the CLI mode changes to the Content Filtering Policy Configuration Mode for that policy.

description [*description_string* **]**

Specifies a description for the Content Filtering Category Policy.
description_string must be an alpha and/or numeric string of 1 through 31 characters in length.
Note that both **description** and *description_string* are optional.
"**description** *description_string*" saves *description_string* as the new description.
"**description**" removes the previously specified description.
This description is displayed in the output of the "**show content-filtering category policy-id id** *id*" and "**show active-charging service name** *service_name*" commands.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete a Content Filtering Category Policy.

Also see the *Content Filtering Policy Configuration Mode Commands* chapter.

Example

The following command creates a Content Filtering Policy with the ID *101*, and enters the Content Filtering Policy Configuration Mode:

```
content-filtering category policy-id 101
```

credit-control

This command enables/disables Prepaid Credit Control Configuration Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] credit-control [ group group_name ]
```

no

Disables the specified Prepaid Credit Control Application configuration.

group *group_name*

Important: The **group** keyword is only available in StarOS 8.1 and later releases.

Specifies name of the credit control group.
group_name must be an alpha and/or numeric string of 1 through 63 characters in length.
If the named credit control group does not exist, it is created, and the CLI mode changes to the Credit Control Configuration Mode, wherein the credit control group can be configured.
If the named credit control group already exists, the CLI mode changes to the Credit Control Configuration Mode for that credit control group.
Creating different credit control groups enables applying different credit control configurations (DCCA dictionary, failure-handling, session-failover, Diameter endpoint selection, etc.) to different subscribers on the same system.
Without credit control groups, only one credit control configuration is possible on a system. All the subscribers in the system will have to use the same configuration.

Usage

Use this command to enable/disable Prepaid Credit Control Configuration for RADIUS/Diameter charging mode.
Also see the *Credit Control Configuration Mode Commands* chapter.

Example

The following command enables prepaid credit control accounting to use RADIUS and/or Diameter interface mode.

```
credit-control
```

diameter credit-control

Description This command has been obsoleted, and is replaced by the credit-control command.

edr-format

This command enables creating/configuring/deleting an EDR format specification for the active charging service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

edr-format *edr_format_name* **[-noconfirm]**

no edr-format *edr_format_name*

no

Deletes the specified EDR format, if previously configured, from the active charging service.

edr_format_name

Specifies name of the EDR format.
edr_format_name must be a string of 1 through 63 characters in length.
If the named EDR format does not exist, it is created, and the CLI mode changes to the EDR Format Configuration Mode wherein the EDR format can be configured.
If the named EDR format already exists, the CLI mode changes to the EDR Format Configuration Mode for that EDR format.
The EDR format name must be unique in the active charging service. Up to 256 combined total EDR plus UDR formats can be configured in the active charging service.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete an ACS EDR format.
Also see the *EDR Format Configuration Mode Commands* chapter.

Example

The following command creates an EDR format named *edr_format1*:

edr-format *edr_format1*

end

This command returns the CLI prompt to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to change to the Exec mode.

exit

This command exits the ACS Configuration Mode and returns the CLI prompt to the Global Configuration Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the Global Configuration Mode.

firewall dos-protection

This command configures Stateful Firewall protection for subscribers from Denial-of-Service (DoS) attacks.

Important: In StarOS 8.1 and later releases, for Rulebase-based Stateful Firewall this command is available in the ACS Rulebase Configuration Mode, and for Policy-based Stateful Firewall in the Firewall-and-NAT Policy Configuration Mode. In StarOS 8.3, this command is available in the ACS Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] firewall dos-protection { all | flooding { icmp | tcp-syn | udp } | ftp-bounce | ip-unaligned-timestamp | mime-flood | seq-number-out-of-range | seq-number-prediction | source-router | teardrop | winnuke }

default firewall dos-protection
```

no

Disables protection for subscribers from the specified DoS attack(s).

default

Configures the default DOS protection setting.

all

Enables protection against all DoS attacks supported by Stateful Firewall.

flooding { icmp | tcp-syn | udp }

Enables protection against specified flooding attacks:

- **icmp**: Enables protection against ICMP Flood attack.
- **tcp-syn**: Enables protection against TCP Syn Flood attack.
- **udp**: Enables protection against UDP Flood attack.

ftp-bounce

Enables protection against FTP Bounce attacks.

ip-unaligned-timestamp

Enables protection against IP Unaligned Timestamp attacks.

mime-flood

Enables protection against Multiple Internet Mail Extension (MIME) Header Flooding attacks.

seq-number-out-of-range

Enables protection against Out-of-Range Sequence attacks.

seq-number-prediction

Enables protection against TCP Sequence Prediction attacks.

source-router

Enables protection against attacks caused by loose source routing.

teardrop

Enables protection against Teardrop attacks.

winnuke

Enables protection against WIN-NUKE attacks.

Usage

Use this command to enable Stateful Firewall protection from different types of DoS attacks. This command can be configured multiple times for different DoS attacks.

Example

The following command enables protection from all DoS attacks supported by the Stateful Firewall:

```
firewall dos-protection all
```

firewall flooding

This command configures Stateful Firewall protection from packet flooding attacks.

Important: In StarOS 8.1 and later releases, for Rulebase-based Stateful Firewall this command is available in the ACS Rulebase Configuration Mode, and for Policy-based Stateful Firewall in the Firewall-and-NAT Policy Configuration Mode. In StarOS 8.3, this command is available in the ACS Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall flooding { { protocol { icmp | tcp-syn | udp } packet limit packets } |
{ sampling-interval interval } }

default firewall flooding { { protocol { icmp | tcp-syn | udp } packet limit } |
{ sampling-interval } }
```

default

Configures the default setting.

protocol { icmp | tcp-syn | udp }

Specifies the transport protocol:

- **icmp**: Configuration for ICMP protocol.
- **tcp-syn**: Configuration for TCP-SYN packet limit.
- **udp**: Configuration for UDP protocol.

packet limit *packets*

Specifies the maximum number of specified packets a subscriber can receive during a sampling interval.
packets is the maximum number of packets allowed during a sampling interval, and must be an integer from 1 through 4294967295.
Default: 1000 packets per sampling-interval

sampling-interval *interval*

Specifies the flooding sampling interval in seconds.
interval must be an integer from 1 through 60.
Default: 1 second
The maximum sampling-interval configurable is 60 seconds.

Usage

Use this command to configure the maximum number of ICMP, TCP-SYN, / UDP packets allowed to prevent the packet flooding attacks to the host.

Example

The following command ensures a subscriber will not receive more that *1000* ICMP packets per sampling interval:

```
firewall flooding protocol icmp packet limit 1000
```

The following command ensures a subscriber will not receive more than *1000* UDP packets per sampling interval on different 5-tuples. That is, if an attacker is sending lot of UDP packets on different ports or using different spoofed IPs, those packets will be limited to *1000* packets per sampling interval. This way only "suspected" malicious packets are limited and not "legitimate" packets.

```
firewall flooding protocol udp packet limit 1000
```

The following command ensures a subscriber will not receive more than 1000 TCP-Syn packets per sampling interval.

```
firewall flooding protocol tcp-syn packet limit 1000
```

The following command specifies a flooding sampling interval of *1* second:

```
firewall flooding sampling-interval 1
```

firewall flow-recovery

This command configures Stateful Firewall Flow Recovery feature.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall flow-recovery { { downlink [timeout *timeout* **] } | { uplink [timeout** *timeout* **] } }**

{ default | no } firewall flow-recovery { downlink | uplink }

default

Configures the default flow-recovery setting.
Default: Downlink and uplink flow recovery enabled, 300 seconds

no

Disables the flow recovery configuration.

downlink | uplink

Specifies the packets:

- **downlink**: Enables flow recovery for packets from downlink direction.
- **uplink**: Enables flow recovery for packets from uplink direction.

timeout *timeout*

Specifies the Stateful Firewall Flow Recovery Timeout setting, in seconds.
timeout must be an integer from 1 through 86400.
Default: 300 seconds

Usage

Use this command to configure Stateful Firewall Flow Recovery feature.

Important: NAT flows will not be recovered.

Example

The following command configures Stateful Firewall Flow Recovery for packets in downlink direction with a timeout setting of *600* seconds:

firewall flow-recovery downlink timeout *600*

firewall icmp-destination-unreachable-message-threshold

This command configures a threshold on the number of ICMP error messages sent by the subscriber for a particular data flow.

Important: In StarOS 8.1 and later releases, for Rulebase-based Stateful Firewall this command is available in the ACS Rulebase Configuration Mode, and for Policy-based Stateful Firewall in the Firewall-and-NAT Policy Configuration Mode. In StarOS 8.3, this command is available in the ACS Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall icmp-destination-unreachable-message-threshold *messages* **then-block-server**

{ default | no } firewall icmp-destination-unreachable-message-threshold

default

Configures the default setting.
Default: No limit

no

Disables the threshold configuration.

messages

Specifies the number of ICMP error messages sent by the subscriber for a particular data flow. *messages* must be an integer value from 1 through100.

Usage

Use this command to configure a threshold on the number of ICMP error messages sent by the subscriber for a particular data flow. After the threshold is reached, it is assumed that the server is not reacting properly to the error messages, and further downlink traffic to the subscriber on the unwanted flow is blocked.
Some servers that run QChat ignore the ICMP error messages (Destination Port Unreachable and Host Unreachable) from the mobiles. So the mobiles continue to receive the unwanted UDP traffic from the QChat servers, and their batteries get exhausted quickly.

Example

The following command configures a threshold of *10* ICMP error messages:

firewall icmp-destination-unreachable-message-threshold *10* **then-block-server**

firewall max-ip-packet-size

This command configures the maximum IP packet size allowed over Stateful Firewall.

Important: In StarOS 8.1 and later releases, for Rulebase-based Stateful Firewall this command is available in the ACS Rulebase Configuration Mode, and for Policy-based Stateful Firewall in the Firewall-and-NAT Policy Configuration Mode. In StarOS 8.3, this command is available in the ACS Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall max-ip-packet-size *packet_size* **protocol { icmp | non-icmp }**

default firewall max-ip-packet-size protocol { icmp | non-icmp }

default

Configures the default maximum IP packet size setting.
Default: 65535 bytes (for both ICMP and non-ICMP)

packet_size

Specifies the maximum packet size.
packet_size must be an integer from 30000 through 65535.

protocol { icmp | non-icmp }

Specifies the transport protocol:

- **icmp**: Configuration for ICMP protocol.
- **non-icmp**: Configuration for protocols other than ICMP.

Usage

Use this command to configure the maximum IP packet size allowed for ICMP and non-ICMP packets to prevent packet flooding attacks to the host. Packets exceeding the configured size will be dropped for “Jolt Attack” and “Ping-Of-Death Attack”.

Example

The following command allows a maximum packet size of *60000* for ICMP protocol:

firewall max-ip-packet-size *60000* **protocol icmp**

firewall mime-flood

This command configures Stateful Firewall protection from mime-flood attacks.

Important: In StarOS 8.1 and later releases, for Rulebase-based Stateful Firewall this command is available in the ACS Rulebase Configuration Mode, and for Policy-based Stateful Firewall in the Firewall-and-NAT Policy Configuration Mode. In StarOS 8.3, this command is available in the ACS Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall mime-flood { http-headers-limit *max_limit* **| max-http-header-field-size** *max_size* **}**

default firewall mime-flood { http-headers-limit | max-http-header-field-size }

default

Configures the default setting for the specified firewall mime flood configuration.

http-headers-limit *max_limit*

Specifies the maximum number of headers allowed in an HTTP packet. If the number of HTTP headers in a page received is more than the specified limit, the request will be denied.
max_limit must be an integer from 1 through 256.
Default: 16

max-http-header-field-size *max_size*

Specifies the maximum header field size allowed in the HTTP header, in bytes. If the size of HTTP header in the received page is more than the specified number of bytes, the request will be denied.
max_size must be an integer from 1 through 8192.
Default: 4096 bytes

Usage

Use this command to configure the maximum number of headers allowed in an HTTP packet, and the maximum header field size allowed in the HTTP header to prevent the mime flooding attacks.

Example

The following command sets the maximum number of headers allowed in an HTTP packet to *100*:

```
firewall mime-flood http-headers-limit 100
```

The following command sets the maximum header field size allowed in the HTTP header to *1000* bytes:

firewall mime-flood max-http-header-field-size *1000*

firewall nat-alg

This command enables/disables NAT Application Level Gateways (ALGs).

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] firewall nat-alg { all | ftp | rtsp }
```

default

Configures the default setting.
Default:

- **ftp**: Enabled
- **rtsp**: Disabled

no

Disables all/specified NAT ALG configuration. When disabled, the ALG(s) would not do any payload translation for NATd calls.

all | ftp | rtsp

Specifies the NAT ALG to enable/disable.

- **all**: Enables/disables all of the following NAT ALGs.
- **ftp**: Enables/disables File Transfer Protocol (FTP) NAT ALG.
- **rtsp**: Enables/disables Real Time Streaming Protocol (RTSP) ALG.

Usage

Use this command to enable/disable NAT ALGs.
To enable NAT ALG processing, in addition to this configuration, ensure that the routing rule for that particular protocol is added in the rulebase.

Example

The following command enables FTP NAT ALG:

```
firewall nat-alg ftp
```

The following command disables FTP NAT ALG:

```
no firewall nat-alg ftp
```

The following command enables FTP NAT ALG, and disables PPTP, RTSP NAT ALGs:

```
default firewall nat-alg all
```

firewall no-ruledef-matches

This command configures the default action for packets when no firewall ruledef matches.

Important: In StarOS 8.1 and later releases, this command is available in the ACS Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall no-ruledef-matches { downlink | uplink } action { deny [ charging-
action charging_action_name ] | permit }

default firewall no-ruledef-matches { downlink | uplink } action
```

default

Configures the default action for packets with no firewall ruledef match.
Default: uplink direction: permit, downlink direction: deny

downlink | uplink

Specifies the packet type:

- **downlink**: Downlink packets with no firewall ruledef match.
- **uplink**: Uplink packets with no firewall ruledef match.

action { deny [charging-action *charging_action_name* **] | permit }**

Specifies the default action for packets with no firewall ruledef match.

- **permit**: Permit specified packets.
- **deny [charging-action** *charging_action_name* **]**: Deny specified packets.
- Optionally, an ACS charging action can be specified.

  charging_action_name must be the name of an ACS charging action, and must be a string of 1 through 63 characters in length.

Usage

Use this command to configure the default action to be taken on packets with no firewall ruledef matches. If, for deny action, the optional charging action is configured, the action taken depends on what is configured in the charging action. For the firewall rule, the “flow action”, “billing action”, and “content ID” of the charging action will be used to take action. If flow exists, flow statistics are updated.

Example

The following command sets Stateful Firewall to permit downlink packets with no ruledef matches:

```
firewall no-ruledef-matches downlink action permit
```

firewall port-scan

This command configures the Port Scan Detection algorithm.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall port-scan { connection-attempt-success-percentage { non-scanner | scanner } *percentage* | inactivity-timeout *inactivity_timeout* | protocol { tcp | udp } response-timeout *response_timeout* | scanner-policy { block inactivity-timeout *inactivity_timeout* | log-only } }

default firewall port-scan { connection-attempt-success- percentage { non-scanner | scanner } | inactivity-timeout | protocol { tcp | udp } response-timeout | scanner-policy }

---

default

Configures the default port-scan detection settings.

---

connection-attempt-success-percentage { non-scanner | scanner } *percentage*

Specifies the connection attempt success percentage:

- **non-scanner**: Specifies the connection attempt success percentage for a non-scanner.

  percentage must be an integer from 60 through 99.

  Default: 70%

- **scanner**: Specifies the connection attempt success percentage for a scanner.

  percentage must be an integer from 1 through 40.

  Default: 30%

---

inactivity-timeout *inactivity_timeout*

Specifies the port scan inactivity timeout period, in seconds.
inactivity_timeout must be an integer from 60 through 1800.
Default: 300 seconds

---

protocol { tcp | udp } response-timeout *response_timeout*

Specifies transport protocol and response-timeout period:

- **tcp**: Specifies response timeout for TCP.

  response_timeout must be an integer from 3 through 30.

- **udp**: Specifies response timeout for UDP.

  response_timeout must be an integer from 3 through 60.

Default: 3 seconds

scanner-policy { block inactivity-timeout *inactivity_timeout* **| log-only }**

Specifies how to treat packets from a source address that has been detected as a scanner:

- **block inactivity-timeout** *inactivity_timeout*: Specifies blocking any subsequent traffic from the scanner. If the scanner is found to be inactive for the inactivity-timeout period, then the scanner is no longer blocked, and traffic is allowed.

  inactivity_timeout specifies the scanner inactivity timeout period, in seconds, and must be an integer from 1 through 4294967295.

- **log-only**: Specifies logging scanner information without blocking scanner traffic.

Default: **log-only**

Usage

Use this command to configure the Stateful Firewall Port Scan Detection algorithm enabled by the **firewall dos-protection port-scan** CLI command.
This protection tracks all uplink source addresses, and the packets they initiate towards all subscribers that have this protection enabled.

Example

The following command configures the Stateful Firewall Port Scan inactivity timeout setting to *900* seconds:

firewall port-scan inactivity-timeout *900*

firewall ruledef

This command enables creating/configuring/deleting firewall ruledefs.

Important: This command is only available in StarOS 8.1, and is customer-specific. This command must be used to configure the Rulebase-based Stateful Firewall and NAT features.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

`firewall ruledef` *`firewall_ruledef_name`* **`[ -noconfirm ]`**

`no firewall ruledef` *`firewall_ruledef_name`*

`no`

Deletes the specified firewall ruledef, if previously configured, from the active charging service.

`firewall_ruledef_name`

Specifies name of the firewall ruledef.
`firewall_ruledef_name` must be a string of 1 through 63 characters in length, and can contain punctuation characters.
If the named firewall ruledef does not exist, it is created, and the CLI mode changes to the Firewall Ruledef Configuration Mode wherein the ruledef can be configured.
If the named firewall ruledef already exists, the CLI mode changes to the Firewall Ruledef Configuration Mode for that ruledef.

`-noconfirm`

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete a firewall ruledef. A firewall ruledef contains different conditions to permit, drop, or reject a packet/connection/traffic based on one or more parameters. The ruledef name must be unique with in the service. Host pool, port map, IMSI pool, and firewall, routing, and charging ruledefs must have unique names.

Important: A firewall ruledef can be referenced by multiple firewall rulebases.

Important: The firewall ruledefs are different from the ACS ruledefs.

Also see the *Firewall Ruledef Configuration Mode Commands* chapter.

Example

The following command creates a firewall ruledef named *fw_ruledef1*, and enters the Firewall Ruledef Configuration Mode:

```
firewall ruledef fw_ruledef1
```

firewall tcp-syn-flood-intercept

This command enables and configures the TCP intercept parameters to prevent TCP-SYN flooding attacks by intercepting and validating TCP connection requests for DoS protection mechanism configured with the **dos-protection** command.

Important: In StarOS 8.1 and later releases, for Rulebase-based Stateful Firewall this command is available in the ACS Rulebase Configuration Mode, and for Policy-based Stateful Firewall in the Firewall-and-NAT Policy Configuration Mode. In StarOS 8.3, this command is available in the ACS Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall tcp-syn-flood-intercept { max-attempts max_attempts | mode { none | { intercept | watch } [ aggressive ] } | retransmit-timeout retransmit_timeout | watch-timeout intercept_watch_timeout }

default firewall tcp-syn-flood-intercept { max-attempts | mode | retransmit-timeout | watch-timeout }
```

default

Configures the default setting for TCP intercept parameters for SYN Flood DoS protection.

max-attempts *max_attempts*

Specifies the maximum number of attempts for sending proxy SYN to the target. This keyword works in conjunction with the **retransmit-timeout** keyword.
max_attempts specifies the maximum number of attempts for sending proxy SYN to the target after the timeout duration, and must be an integer from 1 through 5.
Default: 5

mode { none | { intercept | watch } [aggressive]

Specifies the TCP SYN flood intercept mode:

- **intercept**: Configures TCP SYN flood intercept feature in Intercept mode.
- **none**: Disables TCP SYN Flood Intercept feature.
- **watch**: Configures TCP SYN Flood Intercept feature in watch mode. The Stateful Firewall passively watches to see if TCP connections become established within a configurable interval. If connections are not established within the timeout period, the Stateful Firewall clears the half-open connections by sending RST to TCP client and server. The default watch-timeout for connection establishment is 30 seconds.
- **aggressive**: Configures TCP SYN flood Intercept or Watch feature for aggressive behavior. Each new connection request causes the oldest incomplete connection to be deleted. When operating in watch mode, the watch timeout is reduced by half. If the watch-timeout is 30 seconds, under

aggressive conditions it becomes 15 seconds. When operating in intercept mode, the retransmit timeout is reduced by half (i.e. if the timeout is 60 seconds, it is reduced to 30 seconds). Thus, the amount of time waiting for connections to be established is reduced by half (i.e. it is reduced to 150 seconds from 300 seconds under aggressive conditions).

Default: **none**

retransmit-timeout *retransmit_timeout*

Specifies the SYN-Proxy retransmit timeout in seconds. System waits for this period before sending proxy SYN to the target. This keyword works in conjunction with **max-attempts** keyword.
retransmit_timeout specifies the duration in seconds the system waits before sending proxy SYN, and must be an integer from 15 through 60.
Default: 60

watch-timeout *intercept_watch_timeout*

Specifies the TCP intercept watch timeout period, in seconds.
intercept_watch_timeout must be an integer from 5 through 30.
Default: 30

Usage

This TCP intercept functionality provides protection against TCP SYN Flooding attacks.
The system captures TCP SYN requests and responds with TCP SYN-ACKs. If a connection initiator completes the handshake with a TCP ACK, the TCP connection request is considered as valid by system and system forwards the initial TCP SYN to the valid target which triggers the target to send a TCP SYN-ACK. Now system intercepts with TCP SYN-ACK and sends the TCP ACK to complete the TCP handshake. Any TCP packet received before the handshake completion will be discarded.

Example

The following command sets the maximum number of attempts for sending proxy SYN to the target to *5*:

```
firewall tcp-syn-flood-intercept max-attempts 5
```

firewall track-list

This command configures the maximum number of server IPs to be tracked that are involved in any kind of DOS attacks.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall track-list attacking-servers *no_of_servers*

{ default | no } firewall track-list attacking-servers

default

Configures the default setting.
Default: 10

no

Important: This variant is only available in StarOS 8.3 and later releases.

Disables the configuration.

attacking-servers *no_of_servers*

Specifies to track the attacking servers.
no_of_servers specifies the number of servers to track, and must be an integer from 1 through 100.

Usage

Use this command to configure the maximum number of server IPs to be tracked that are involved in any kind of DOS attacks.

Example

The following command configures the maximum number of server IPs to be tracked that are involved in any kind of DOS attacks to *20*:

firewall track-list attacking-servers *20*

fw-and-nat policy

This command enables creating/configuring/deleting a Firewall-and-NAT policy.

Important: This command is only available in StarOS 8.1 and StarOS 9.0 and later releases. This command must be used to configure the Policy-based Stateful Firewall and NAT features.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

fw-and-nat policy *policy_name* **[-noconfirm]**

no fw-and-nat policy *policy_name*

no

Deletes the specified Firewall-and-NAT policy, if previously configured, from the active charging service.

Important: When a Firewall-and-NAT policy is deleted, for all subscribers using the policy, Stateful Firewall and NAT processing is disabled, also ACS sessions for the subscribers are dropped. In case of session recovery, the calls are recovered but with Stateful Firewall and NAT disabled.

policy_name

Specifies name of the Firewall-and-NAT policy.
policy_name must be an alpha and/or numeric string of 1 through 63 characters in length.
If the named Firewall-and-NAT policy does not exist, it is created and the CLI mode changes to the Firewall-and-NAT Policy Configuration Mode, wherein the policy can be configured.
If the named Firewall-and-NAT policy already exists, the CLI mode changes to the Firewall-and-NAT Policy Configuration Mode for that policy.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete a Firewall-and-NAT policy.
Also see the *Firewall-and-NAT Policy Configuration Mode Commands* chapter.

Example

The following command creates a Firewall-and-NAT policy named *test321*, and changes to the Firewall-and-NAT Policy Configuration Mode:

fw-and-nat policy *test321*

group-of-objects

This command enables creating/configuring/deleting a group-of-objects.

Important: This command is only available in StarOS 10.2 and later releases.

Important: A maximum of 16 object groups can be configured in the active charging service. And a maximum of 128 objects can be configured within each object group.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

group-of-objects *group_name* **[type string [-noconfirm]]**

no group-of-objects *group_name*

no

Deletes the specified group-of-objects, if previously configured, from the active charging service.

group_name

Specifies name of the group-of-objects.
group_name must be an alpha and/or numeric string of 1 through 63 characters in length.
If the named group-of-objects does not exist, it is created, and the CLI mode changes to the ACS Group-of-Objects Configuration Mode wherein the group can be configured.
If the named group-of-objects already exists, the CLI mode changes to the ACS Group-of-Objects Configuration Mode for that group.

type

Specifies the data type for the group-of-objects.

Important: "string" is the only data type supported in this release.

string

Specifies the data type as string.
When creating a group, specifying the data type is mandatory.
When modifying an existing group, specifying the data type is optional.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete a group-of-objects.
Also see the *ACS Group-of-Objects Configuration Mode Commands* chapter.

Example

The following command creates a group-of-objects named *test4* with the data type string, and enters the ACS Group-of-Objects Configuration Mode:

```
group-of-objects test4 type string
```

group-of-prefixed-urls

This command enables creating/configuring/deleting a group-of-prefixed-URLs.

Important: This command is customer specific. For more information, please contact your local sales representative.

Important: A maximum of 64 group-of-prefixed-URL groups can be configured in the active charging service.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

group-of-prefixed-urls *group_name* **[-noconfirm]**

no group-of-prefixed-urls *group_name*

no

Deletes the specified group-of-prefixed-urls, if previously configured, from the active charging service.

group_name

Specifies name of the group-of-prefixed-urls.
group_name must be an alpha and/or numeric string of 1 through 63 characters in length.
If the named group-of-prefixed-urls does not exist, it is created, and the CLI mode changes to the ACS Group-of-Prefixed-URLs Configuration Mode wherein the group can be configured.
If the named group-of-prefixed-urls already exists, the CLI mode changes to the ACS Group-of-Prefixed-URLs Configuration Mode for that group.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete a group-of-prefixed-URLs.
Also see the *ACS Group-of-Prefixed-URLs Configuration Mode Commands* chapter.

Example

The following command creates group-of-prefixed-urls named *test5*, and enters the ACS Group-of-Prefixed-URLs Configuration Mode:

group-of-prefixed-urls *test5*

group-of-ruledefs

This command enables creating/configuring/deleting a group-of-ruledefs.

Important: A maximum of 64 groups-of-ruledefs can be configured in the active charging service.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

group-of-ruledefs *ruledefs_group_name* **[-noconfirm]**

no group-of-ruledefs *ruledefs_group_name*

no

Deletes the specified group-of-ruledefs, if previously configured, from the active charging service.

ruledefs_group_name

Specifies name of the group-of-ruledefs.
ruledefs_group_name must be unique within the active charging service, and must be a string of 1 through 63 characters in length. Up 64 groups may be configured.
If the named group-of-ruledefs does not exist, it is created, and the CLI mode changes to the ACS Group-of-Ruledefs Configuration Mode wherein the group can be configured.
If the named group-of-ruledefs already exists, the CLI mode changes to the ACS Group-of-Ruledefs Configuration Mode for that group.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete a group-of-ruledefs.
A group-of-ruledefs is a collection of rule definitions to use in access policy creation. The group-of-ruledefs name must be unique within the service.
Also see the *ACS Group-of-Ruledefs Configuration Mode Commands* chapter.

Example

The following command creates a group-of-ruledefs named *group1*, and enters the ACS Group-of-Ruledefs Configuration Mode:

group-of-ruledefs *group1*

host-pool

This command enables creating/configuring/deleting an ACS host pool.

Product

All

Privilege

Security Administrator, Administrator

Syntax

host-pool *host_pool_name* **[-noconfirm]**

no host-pool *host_pool_name*

no

Deletes the specified host pool, if previously configured, from the active charging service.

host_pool_name

Specifies name of the host pool.
host_pool_name must be a string of 1 through 63 characters in length, and can contain punctuation characters.
If the named host pool does not exist, it is created, and the CLI mode changes to the ACS Host Pool Configuration Mode wherein the host pool can be configured.
If the named host pool already exists, the CLI mode changes to the ACS Host Pool Configuration Mode for that host pool.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete ACS host pools.
A host pool is a collection of hosts and IP addresses to use in access policy creation. The host pool name must be unique with in the service. Host pool, port map, IMSI pool, and firewall, routing, and charging ruledefs must have unique names. A maximum of the 256 host pools can be created.

Important: Host pools configured in other ruledefs cannot be deleted.

Also see the *ACS Host Pool Configuration Mode Commands* chapter.

Example

The following command creates a host pool named *hostpool1*, and enters the ACS Host Pool Configuration Mode:

host-pool *hostpool1*

idle-timeout

This command configures the maximum duration a flow can remain idle, in seconds, after which the system automatically terminates the flow.

Product

ACS, NAT, FW

Privilege

Security Administrator, Administrator

Syntax

idle-timeout { icmp | tcp | udp } *idle_timeout*

{ default | no } idle-timeout { icmp | tcp | udp }

default

Configures the default idle-timeout setting for the specified flow.
Default: **icmp**, **tcp**, **udp**: 300 seconds

no

Disables the idle-timeout configuration for the specified flow.

icmp | tcp | udp

Configures/disables the idle-timeout setting for the specified flow.

idle_timeout

Specifies the timeout duration, in seconds, and must be an integer from 0 through 86400.
A value of 0 disables the idle-timeout setting.

Usage

Use this command to configure the maximum duration a flow can remain idle, in seconds, after which the system automatically terminates the flow.
Setting the value to 0 will cause the idle-timeout setting to be disabled.
For flows other than TCP, UDP, and ICMP timeout will always be 300 seconds. (Unless configured in the charging-action). Charging action's flow idle-timeout will have precedence over ACS idle-timeout. If charging action's flow idle-timeout is default, then flows will have the value configured in the active charging service.

Example

The following command configures the maximum duration a TCP flow can remain idle to *3000* seconds, after which the system automatically terminates the flow:

idle-timeout tcp *3000*

imsi-pool

This command enables creating/configuring/deleting an ACS IMSI pool.

Product

All

Privilege

Security Administrator, Administrator

Syntax

imsi-pool *imsi_pool_name* **[-noconfirm]**

no imsi-pool *imsi_pool_name*

no

Deletes the specified IMSI pool, if previously configured, from the active charging service.

imsi_pool_name

Specifies name of the IMSI pool.
imsi_pool_name must be a string of 1 through 63 characters in length, and can contain punctuation characters.
If the named IMSI pool does not exist, it is created, and the CLI mode changes to the ACS IMSI Pool Configuration Mode wherein the IMSI pool can be configured.
If the named IMSI pool already exists, the CLI mode changes to the ACS IMSI Pool Configuration Mode for that IMSI pool.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete pools of International Mobile Subscriber Identifier (IMSI) numbers having group of single or range of IMSI numbers to use in access policy creation. The IMSI pool name must be unique with in the service. Host pool, port map, IMSI pool, and firewall, routing, and charging ruledefs must have unique names. A maximum of 256 IMSI pools can be created.

Important: IMSI pools configured in other ruledefs cannot be deleted.

Also see the *ACS IMSI Pool Configuration Mode Commands* chapter.

Example

The following command creates an IMSI pool named *imsipool1*, and enters the ACS IMSI Pool Configuration Mode:

imsi-pool *imsipool1*

ip max-fragments

This command limits the maximum number of IP fragments per fragment chain.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip max-fragments *max_fragments*

default ip max-fragments

default ip max-fragments

Configures the default maximum number of IP fragments limit.
Default: 45

max_fragments

Specifies the maximum number of IP fragments per fragment chain.
max_fragments must be an integer from 1 through 300.

Usage

Use this command to limit the maximum number of IP fragments.

Example

The following command limits the maximum number of IP fragments to *100*:

ip max-fragments *100*

label

This command defines a text string label to specific content ID for UDRs/EDRs/eG-CDRs in the active charging service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

label content-id *content_id* **text** *string*

no label content-id *content_id*

no

Deletes the specified label, if previously configured, from the active charging service.

content-id *content_id*

Specifies the content ID to add a text string label for a description.
content_id must be an integer from 0 through 4,294,967,295.

text *string*

This keyword provides option to add descriptive text with each content Id for definition or user specific requirement.
string must be an alpha and/or numeric string of 1 through 64 characters in length.

Usage

Use this command to create a label string to attach to a specific content ID configured in the ACS Charging Action Configuration Mode.
A maximum of 2048 labels can be configured in the active charging service.

Example

The following command creates a label string *test_charge1* for content-id *1378*:

label content-id *1378* **text** *test_charge1*

nat allocation-failure

Configures action to take when NAT IP/Port allocation fails.

Important: This command is only available in StarOS 8.3 and later releases.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

```
nat allocation-failure send-icmp-dest-unreachable

{ default | no } nat allocation-failure
```

default

Configures the default setting.
Default: Packets are dropped silently

no

Disables the NAT Allocation Failure configuration.
When set, packets are dropped silently.

send-icmp-dest-unreachable

Specifies sending ICMP Destination Unreachable message when NAT IP/Port allocation fails.

Usage

Use this command to configure the action to take when NAT IP/port allocation fails—to send or not to send an "ICMP destination unreachable message" when a NAT IP/port cannot be assigned to a flow in data-path.

Example

The following command configures sending ICMP Destination Unreachable message when NAT IP/Port allocation fails:

```
nat allocation-failure send-icmp-dest-unreachable
```

nat allocation-in-progress

Configures action to take on packets when NAT IP/NPU allocation is in progress.

Important: This command is only available in StarOS 8.3 and later releases.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

```
nat allocation-in-progress { buffer | drop }

default nat allocation-in-progress
```

default

Configures the default setting.

buffer | drop

Specifies the action to take on packets when NAT IP/NPU allocation is in progress:

- **buffer**: Specifies to buffer packets.
- **drop**: Specifies to drop packets.

Default: **buffer**

Usage

In On-demand NAT IP allocation (wherein NAT IP address is allocated to the subscriber when a packet is being sent), if no free NAT IP address is available, a NAT-IP Alloc Request is sent to the VPNMgr to get NAT-IP. During that time packets are dropped. This command enables buffering the packets received when IP Alloc Request is sent to VPNMgr.

Example

The following command specifies to buffer packets when NAT IP/NPU allocation is in progress:

```
nat allocation-in-progress buffer
```

nat tcp-2msl-timeout

This command configures TCP 2msl timeout configuration for NAT.

Important: This command is only available in StarOS 8.3 and later releases.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

nat tcp-2msl-timeout *timeout*

default nat tcp-2msl-timeout

default

Configures the default setting.

timeout

Specifies the TCP 2msl timeout in seconds, and must be an integer from 30 through 240.
Default: 60 seconds

Usage

Use this command to configure the TCP 2msl timeout configuration for NAT.

Example

The following command configures the TCP 2msl timeout for NAT to *120* seconds:

nat tcp-2msl-timeout *120*

p2p-detection protocol

This command configures the detection of specific peer-to-peer (P2P) protocols.

Product

P2P

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] p2p-detection protocol [ all | applejuice | ares | bittorrent | ddlink |
directconnect | edonkey | fasttrack | feidian | filetopia | fring | gadugadu |
gnutella | gtalk | halflife2 | hamachivpn | icecast | imesh | irc | iskoot |
jabber | kontiki | manolito | meebo | msn | mute | oovoo | orb | oscar | pando |
popo | pplive | ppstream | qq | qqlive | shoutcast | skinny | skype | slingbox |
sopcast | soulseek | steam | thunder | truphone | tvants | tvuplayer | uusee |
vpnx | vtun | winmx | winny | wofwarcraft | xbox | yahoo | zattoo + ]
```

all

Configures the system to detect all of the P2P protocols. Specifying **all** is the same as configuring each protocol individually.

applejuice

Configures the system to detect applejuice protocols.

ares

Configures the system to detect ares protocols.

bittorrent

Configures the system to detect bittorrent protocols.

ddlink

Configures the system to detect ddlink protocols.

directconnect

Configures the system to detect directconnect protocols.

edonkey

Configures the system to detect edonkey protocols.

fasttrack

Configures the system to detect fasttrack protocols.

feidian

Configures the system to detect feidian protocols.

filetopia

Configures the system to detect filetopia protocols.

fring

Configures the system to detect fring protocols.

gadugadu

Configures the system to detect gadugadu protocols.

gnutella

Configures the system to detect gnutella protocols.

gtalk

Configures the system to detect gtalk protocols.

halflife2

Configures the system to detect halflife2 protocols.

hamachivpn

Configures the system to detect hamachivpn protocols.

icecast

Configures the system to detect icecast protocols.

imesh

Configures the system to detect imesh protocols.

irc

Configures the system to detect irc protocols.

iskoot

Configures the system to detect iskoot protocols.

jabber

Configures the system to detect jabber protocols.

kontiki

Configures the system to detect kontiki protocols.

manolito

Configures the system to detect manolito protocols.

meebo

Configures the system to detect meebo protocols.

msn

Configures the system to detect msn protocols.

mute

Configures the system to detect mute protocols.

oovoo

Configures the system to detect oovoo protocols.

orb

Configures the system to detect orb protocols.

oscar

Configures the system to detect oscar protocols.

pando

Configures the system to detect pando protocols.

popo

Configures the system to detect popo protocols.

pplive

Configures the system to detect pplive protocols.

ppstream

Configures the system to detect ppstream protocols.

qq

Configures the system to detect qq protocols.

qqlive

Configures the system to detect qqlive protocols.

shoutcast

Configures the system to detect shoutcast protocols.

skinny

Configures the system to detect skinny protocols.

skype

Configures the system to detect skype protocols.

slingbox

Configures the system to detect slingbox protocols.

sopcast

Configures the system to detect sopcast protocols.

soulseek

Configures the system to detect soulseek protocols.

steam

Configures the system to detect steam protocols.

thunder

Configures the system to detect thunder protocols.

truphone

Configures the system to detect truphone protocols.

tvants

Configures the system to detect tvants protocols.

tvuplayer

Configures the system to detect tvuplayer protocols.

uusee

Configures the system to detect uusee protocols.

vpnx

Configures the system to detect vpnx protocols.

vtun

Configures the system to detect vtun protocols.

winmx

Configures the system to detect winmx protocols.

winny

Configures the system to detect winny protocols.

wofwarcraft

Configures the system to detect wofwarcraft protocols.

xbox

Configures the system to detect xbox protocols.

yahoo

Configures the system to detect yahoo protocols.

zattoo

Configures the system to detect zatoo protocols.

+

More than one of the above keywords can be entered within a single command.

Usage

Use this command to configure the detection of specific P2P protocols. Multiple commands can be specified in the command.

Example

The following command enables detection of all P2P protocols:

```
p2p-detection protocol all
```

p2p-dynamic-rules

This command enables/disables the P2P Dynamic Signature Updates feature, and loads the P2P signature file from the default or specified location into memory, optionally signatures for specific protocol(s) can be specified to be loaded.

Important: This release supports dynamic updates of signatures (detection logic) only for the following protocols: Bittorrent, DirectConnect, eDonkey, Gnutella, Skype, and Yahoo.

Product

P2P

Privilege

Security Administrator, Administrator

Syntax

```
p2p-dynamic-rules { file location [ force ] | protocol [ all | bittorrent |
directconnect | edonkey | gnutella | skype | yahoo + ] }

default p2p-dynamic-rules file

no p2p-dynamic-rules { file | protocol [ all | bittorrent | directconnect |
edonkey | gnutella | skype | yahoo + ] }
```

default

Enables the P2P Dynamic Signature Updates feature, and if available, loads the P2P signature file from the default location: /usr/lib/p2p-rules.xml.

no

Disables the P2P Dynamic Signature Updates feature, also any/specified signature(s) already loaded in the memory is unloaded.
If there are any active sessions using the file, it changes the file status to inactive. And, when the sessions are cleared, the file is removed from the memory.

file *location*

Specifies that the P2P signature file at the specified location (other than the default location) be loaded into memory and applied.
location specifies the file's location, and must be one of the following:

```
[file:]{/flash | /pcmcia1 | /hd-raid}[/directory]/<filename>
```

force

Specifies to force load the specified file into memory and apply it, even if it is obsolete.
By default, when a signature file is loaded from a specified location **file** *location*, while loading, it is compared with the file at the default location. The newer file of the two files is loaded into memory. To override this behavior, use the **force** keyword.

protocol [all | bittorrent | directconnect | edonkey | gnutella | skype | yahoo +]

Specifies the protocols for which signatures must be enabled for processing.
+ indicates that more than one of the keywords can be specified in the same command. Not applicable if the **all** option is selected first.

Usage

Use this command to enable/disable the P2P Dynamic Signature Updates feature, and load the P2P signature file from the default or specified location. Optionally the specific protocol(s) for which the signatures must be loaded can be specified.

Example

The following command enables the P2P Dynamic Signature Updates feature, and loads the signature file present in the default location:

```
default p2p-dynamic-rules file
```

packet-filter

This command enables creating/configuring/deleting ACS packet filters.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

packet-filter *packet_filter_name* **[-noconfirm]**

no packet-filter *packet_filter_name*

no

Deletes the specified packet filter, if previously configured, from the active charging service.

packet_filter_name

Specifies name of the packet filter.
packet_filter_name must be a string of 1 through 63 characters in length.
If the named packet filter does not exist, it is created, and the CLI mode changes to the ACS Packet Filter Configuration Mode wherein the packet filter can be configured.
If the named packet filter already exists, the CLI mode changes to the ACS Packet Filter Configuration Mode for that packet filter.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete an ACS packet filter.
Also see the *ACS Packet Filter Configuration Mode Commands* chapter.

Example

The following command creates a packet filter named *filter3*, and enters the ACS Packet Filter Configuration Mode:

packet-filter *filter3*

passive-mode

This command configures the active charging service to operate in passive mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] passive-mode
```

no

Disables the passive mode configuration.

default

Configures the default setting.
Default: Disabled

Usage

Use this command to put the active charging service in/out of passive mode operation. Configures whether the active charging service passively monitors copies of packets.

Example

The following command puts the active charging service into passive mode operation:

```
passive-mode
```

policy-control burst-size

This command configures the burst size for bandwidth limiting per dynamic-rule or per bearer.

Product

All

Privilege

Security Administrator, Administrator

Syntax

policy-control burst-size { auto-readjust [duration *duration* **] | bytes** *bytes* **}**

{ default | no } policy-control burst-size

default | no

Configures the default setting.
Default: 65535 bytes

auto-readjust

Configures the burst size equal to <seconds> of traffic.
Default: 10 seconds

duration *duration*

Specifies the seconds of traffic configured for burst size.
duration must be an integer from 1 through 20.

bytes *bytes*

Configures the burst size in bytes.
bytes must be an integer from 1 through 4000000000.

Usage

Use this command to configure the burst size for bandwidth limiting per dynamic-rule or per bearer.

Example

The following command configures the burst size for bandwidth limiting per dynamic-rule or per bearer equal to 10 seconds of traffic:

```
policy-control burst-size auto-readjust
```

policy-control charging-rule-base-name

This command configures interpretation of Charging-Rule-Base-Name AVP from PCRF either as active-charging rulebase or ACS group-of-ruledefs.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
policy-control charging-rule-base-name { active-charging-group-of-ruledefs |
active-charging-rulebase [ ignore-when-removed ] }

default policy-control charging-rule-base-name
```

default

Configures the default setting.
Default: **active-charging-group-of-ruledefs**

active-charging-group-of-ruledefs

Specifies interpreting Charging-Rule-Base-Name as active-charging group-of-ruledefs.

active-charging-rulebase [ignore-when-removed]

Specifies interpreting Charging-Rule-Base-Name as active-charging rulebase.
When Charging-Rule-Base-Name AVP is interpreted as active-charging rulebase, if PCRF requests the removal of a Charging-Rule-Base-Name, which is the same as the rulebase used for that PDP context, the PDP context is terminated. This is because after removal of the rulebase, the PDP context will have no rulebase. This is the default behavior.
When the **ignore-when-removed** option is configured, PCRF request for removal of Charging-Rule-Base-Name is ignored and no action is taken.
For each call, this interpretation is decided at call setup, and will not be changed during the life of that call. Change will only apply to new calls coming up after the change.

Usage

Use this command to configure interpretation of Charging-Rule-Base-Name AVP from PCRF either as active charging group-of-ruledefs or as active-charging rulebase.

Example

The following command configures interpreting of Charging-Rule-Base-Name AVP as active-charging rulebase:

```
policy-control charging-rule-base-name active-charging-rulebase
```

port-map

This command enables creating/configuring/deleting a port map.

Product

All

Privilege

Security Administrator, Administrator

Syntax

port-map *port_map_name* **[-noconfirm]**

no port-map *port_map_name*

no

Deletes the specified port map, if previously configured, from the active charging service.

port_map_name

Specifies name of the port map.
port_map_name must be an alpha and/or numeric string of 1 through 63 characters in length, and can contain punctuation characters.
If the named port map does not exist, it is created, and the CLI mode changes to the ACS Port Map Configuration Mode wherein the port map can be configured.
If the named port map already exists, the CLI mode changes to the ACS Port Map Configuration Mode for that port map.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete an ACS port map.
The port map name must be unique with in the service. Host pool, port map, IMSI pool, and firewall, routing, and charging ruledefs must have unique names. A maximum of the 256 port maps can be created.

Important: Port maps in use in other ruledefs cannot be deleted.

Also see the *ACS Port Map Configuration Mode Commands* chapter.

Example

The following command creates a port map named *portmap1*, and enters the ACS Port Map Configuration Mode:

port-map *portmap1*

redirect user-agent

This command specifies the user agent for conditional redirection of traffic flows.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] redirect user-agent *user_agent_name*

no

Deletes the specified user agent, if previously configured, from the active charging service.

user_agent_name

Specifies name of the user agent to be used for redirecting traffic flow.
user_agent_name must be an alpha and/or numeric string of 1 through 32 characters in length.
A maximum of 16 user-agents can be configured in the active charging service.

Usage

Use this command to redirect the traffic flow with conditions based on configured user-agent name. This user agent is used with **flow action** command in the ACS Charging Action Configuration Mode.

Example

The following command specifies the redirect user agent *user_rule1* for conditional redirection of traffic flow:

redirect user-agent *user_rule1*

rulebase

This command enables creating/configuring/deleting an ACS rulebase.

Important: A maximum of 512 rulebases can be configured in the active charging service.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

rulebase *rulebase_name* **[-noconfirm]**

no rulebase *rulebase_name*

no

Deletes the specified rulebase, if previously configured, from the active charging service.

rulebase_name

Specifies name of the rulebase.
rulebase_name must be an alpha and/or numeric string of 1 through 63 characters in length, and can contain punctuation characters.
If the named rulebase does not exist, it is created, and the CLI mode changes to the ACS Rulebase Configuration Mode wherein the rulebase can be configured.
If the named rulebase already exists, the CLI mode changes to the ACS Rulebase Configuration Mode for that rulebase.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete an ACS rulebase. A rulebase is a collection of protocol rules to match a flow and associated actions to be taken for matching flow. The *rulebase_name* must be unique in the active charging service.
The default rulebase is used when a subscriber/APN is not configured with a specific rulebase to use.
Also see the *ACS Rulebase Configuration Mode Commands* chapter.

Example

The following command creates a rulebase named *test1*, and enters the ACS Rulebase Configuration Mode:

rulebase *test1*

ruledef

This command enables creating/configuring/deleting an ACS rule definition.

Important: A maximum of 2048 ruledefs can be configured in the active charging service.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

ruledef *ruledef_name* **[-noconfirm]**

no ruledef *ruledef_name*

no

Deletes the specified ruledef, if previously configured, from the active charging service.

ruledef_name

Specifies name of the ruledef.
ruledef_name must be an alpha and/or numeric string of 1 through 63 characters in length, and can contain punctuation characters.
ruledef_name must be unique with in the service. Host pool, port map, IMSI pool, and firewall, routing, and charging ruledefs must have unique names.
If the named ruledef does not exist, it is created, and the CLI mode changes to the ACS Ruledef Configuration Mode wherein the ruledef can be configured.
If the named ruledef already exists, the CLI mode changes to the ACS Ruledef Configuration Mode for that ruledef.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete an ACS ruledef.
A ruledef represents a set of matching conditions across multiple L3 – L7 protocol based on protocol fields and state information. Each ruledef can be used across multiple rulebases within the active charging service.
Also see the *ACS Ruledef Configuration Mode Commands* chapter.

Example

The following command creates an ACS ruledef named *test1*, and enters the ACS Ruledef Configuration Mode:

ruledef *test1*

system-limit

This command configures the system-wide Layer 4 flow limit.

Important: This command is customer specific. For more information, please contact your local sales or service representative.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

system-limit l4-flows *limit*

{ default | no } system-limit l4-flows

default

Configures the default setting.
Default: **no system-limit l4-flows**

no

Disables the limit checking configuration.

limit

Specifies the Layer 4 flows limit, and must be an integer from 1 through 2147483647.

Usage

Use this command to configure the system-wide limit for Layer 4 flows.
The System-wide L4 Flow Limiting feature provides the capability to limit the number of TCP and UDP flow over the system. This limiting can be applied to all subscribers attaching to the system and to all APNs. This feature is compatible with the existing per-subscriber limiting (configured using the flow limit-for-flow-type charging action). Both limiting can be active in the same time.
System-wide flow limiting is implemented by comparing the “Effective Flows” periodically (~ every 10 seconds) against the configurable “System-wide Flow Limit”. Where “Effective Flows” is the number of active data sessions, each identified by 5 tuple key. If the “Effective Flows” exceeds the “System-wide Flow Limit”, the Resource Manager indicates it to the ACS service. Once ACS is aware of the “System-wide Flow Limit” being reached, no more data sessions are setup. The packets are discarded. While processing a successive flow-usage update from ACS service a change in behavior is indicated to ACS service to start accepting data sessions. As this relies on periodic reporting there is an inherent delay in the detection of “exceeding/returning once exceeded” to the flow limit.

Example

The following command sets the system limit for L4 flows to *100*:

system-limit l4-flows *100*

timedef

This command enables creating/configuring/deleting a Time Definition (timedef).

Important: This command is only available in StarOS 8.1 and in StarOS 9.0 and later releases.

Important: A maximum of 10 timedefs can be configured in the active charging service.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

timedef *timedef_name* **[-noconfirm]**

no timedef *timedef_name*

no

Deletes the specified timedef, if previously configured, from the active charging service.

timedef_name

Specifies name of the timedef.
timedef_name must be an alpha and/or numeric string of 1 through 63 characters in length.
If the named timedef does not exist, it is created, and the CLI mode changes to the ACS Timedef Configuration Mode wherein timeslots for the timedef can be configured.
If the named timedef already exists, the CLI mode changes to the ACS Timedef Configuration Mode for that timedef.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete ACS timedefs for the Time-of-Day Activation/Deactivation of Rules feature. Timedefs enable activation/deactivation of ruledefs/groups-of-ruledefs such that they are available for rule matching only when they are active.
Also see the *ACS Timedef Configuration Mode Commands* chapter.

Example

The following command creates a timedef named *test1*, and enters the ACS Timedef Configuration Mode:

timedef *test1*

udr-format

This command creates/configures/deletes an UDR format specification.

Product

All

Privilege

Security Administrator, Administrator

Syntax

udr-format *udr_format_name* **[-noconfirm]**

no udr-format *udr_format_name*

no

Deletes the specified UDR format, if previously configured, from the active charging service.

udr_format_name

Specifies name of UDR format.
udr_format_name must be an alpha and/or numeric string of 1 through 63 characters in length.
If the named UDR format does not exist, it is created, and the CLI mode changes to the UDR Format Configuration Mode wherein the UDR format can be configured.
If the named UDR format already exists, the CLI mode changes to the UDR Format Configuration Mode for that UDR format.
Up to 256 UDR and/or EDR formats can be configured in the active charging service.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete an UDR format in the active charging service.
Also see the *UDR Format Configuration Mode Commands* chapter.

Example

The following command creates an UDR format named *udr_fromat1*:

udr-format *udr_format1*

url-blacklisting match-method

This command sets the match method to look up URLs in the URL Blacklisting database.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

```
url-blacklisting match-method { exact | generic }

default url-blacklisting match-method
```

default

Default: **exact**
Configures the default match method.

exact

Specifies the exact-match method, wherein URL Blacklisting is performed only on exact match with URLs present in the URL Blacklisting database.

generic

Specifies the generic-match method, wherein URL Blacklisting is performed on generic match with URLs present in the URL Blacklisting database.

Usage

Use this command to set the match method to look up URLs in the URL Blacklisting database.

Example

The following command sets the exact-match method to look up URLs in the URL Blacklisting database:

```
url-blacklisting match-method exact
```

xheader-format

This command enables creating/configuring/deleting an extension-header (x-header) format specification for the active charging service.

Important: This is a customer-specific command. For more information, please contact your local sales representative.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

xheader-format *xheader_format_name* **[-noconfirm]**

no xheader-format *xheader_format_name*

no

Deletes the specified x-header format, if previously configured, from the active charging service.

xheader_format_name

Specifies name of the x-header format.
xheader_format_name must be an alpha and/or numeric string of 1 through 63 characters in length.
If the named x-header format does not exist, it is created, and the CLI mode changes to the ACS X-header Format Configuration Mode wherein the x-header format can be configured.
If the named x-header format already exists, the CLI mode changes to the ACS X-header Format Configuration Mode for that x-header format.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete an x-header format specification in the active charging service. An x-header may be specified in a charging action to be inserted into HTTP GET and POST request packets. See **xheader-insert** CLI command in the *ACS Charging Action Configuration Mode Commands* chapter. Also see the *ACS X-header Format Configuration Mode Commands* chapter.

Example

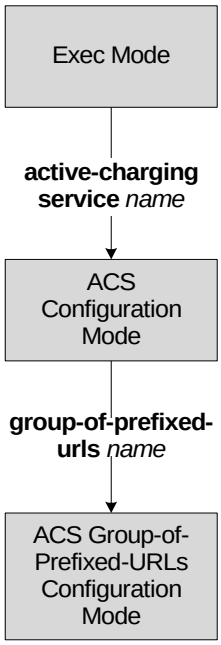
The following command creates an x-header format named *test*, and enters the ACS X-header Format Configuration Mode:

xheader-format *test*

Chapter 8
ACS Group-of-Prefixed-URLs Configuration Mode Commands

The ACS Group-of-Prefixed-URLs Configuration Mode is used to create and configure groups of prefixed URLs.

Important: This configuration mode is customer specific. For more information, please contact your local service representative.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

This command returns the CLI prompt to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec mode.

exit

This command exits the ACS Group-of-Prefixed-URLs Configuration Mode and returns to the ACS Configuration Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the ACS Configuration Mode.

prefixed-url

This command enables adding/removing URLs from the group.

Important: A maximum of 10 URLs can be added per group.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] prefixed-url` *`url`*

`no`

Removes the specified URL from the group.

`url`

Specifies the URL.
`url` must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to add/remove URLs to be filtered from the group.

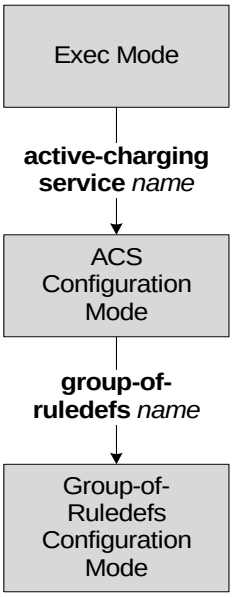
Example

The following command adds the URL *`http://abc.net`* to the current group:

`prefixed-url` *`http://abc.net`*

Chapter 9
ACS Group-of-Ruledefs Configuration Mode Commands

The ACS Group-of-Ruledefs Configuration Mode is used to configure groups of ruledefs.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

add-ruledef

This command enables to add/remove ruledefs from a group-of-ruledefs.

Important: A maximum of 128 ruledefs can be added to a group-of-ruledefs.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

add-ruledef priority *ruledef_priority* **ruledef** *ruledef_name*

no add-ruledef priority *ruledef_priority*

no

Specifies that the ruledef associated with the specified priority number is to be removed from the current group-of-ruledefs.

priority *ruledef_priority*

Specifies priority of the ruledef in the current group-of-ruledefs.
ruledef_priority must be unique in the group-of-ruledefs, and must be an integer from 1 through 10000.

ruledef *ruledef_name*

Specifies name of the ruledef to add to the current group-of-ruledefs.
ruledef_name must be the name of an ACS ruledef, and must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to add/remove ruledefs from a group-of-ruledefs.
A group-of-ruledefs can contain optimizable ruledefs. Whether a group is optimized or not is decided on whether all the ruledefs in the group-of-ruledefs can be optimized, and if the group is included in a rulebase that has optimization turned on, then the group will be optimized.
When a new ruledef is added, it is checked if it is included in any group-of-ruledefs, and whether it needs to be optimized, etc.

Example

The following command adds the ruledef *ruledef23* to the current group-of-ruledefs, and assigns it a priority of *3*:

add-ruledef priority *3* **ruledef** *ruledef23*

end

This command returns the CLI prompt to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec Mode.

exit

This command exits the ACS Group-of-Ruledefs Configuration Mode and returns the CLI prompt to the ACS Configuration Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the ACS Configuration Mode.

group-of-ruledefs-application

This command specifies the purpose of setting up a group-of-ruledefs as either for charging or for post processing.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
group-of-ruledefs-application { charging | post-processing }

no group-of-ruledefs-application
```

no

Removes the group-of-ruledefs-application configuration from the current group-of-ruledefs.

charging

Specifies that the current group-of-ruledefs is for charging purpose.

post-processing

Specifies that the current group-of-ruledefs is for post-processing purpose.

Usage

Use this command to specify the purpose of setting up a group-of-ruledefs as either for charging or for post processing. If not configured, by default the rule-application type will be charging.

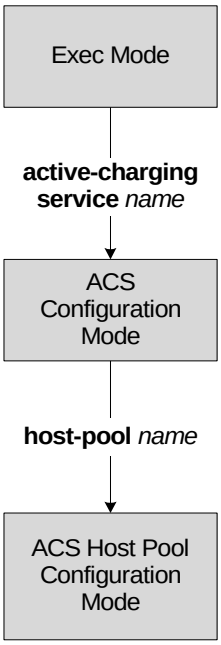
Example

The following command configures the current group-of-ruledefs as for post-processing purpose:

```
group-of-ruledefs-application post-processing
```

Chapter 10
ACS Host Pool Configuration Mode Commands

The ACS Host Pool Configuration Mode is used to define pool of host addresses and names within the ACS Configuration Mode. The Host Pool Configuration facilitates to create rules to handle the packets coming from or going to a group of hosts within an access policy.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

This command exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec mode.

exit

This command exits the current configuration mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

ip

This command specifies an individual or a range of host IP address(es) to add to the host pool.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip { *ip_address* **|** *ip_address/maskbit* **|** **range** *start_ip* **to** *end_ip* **}**

no

Removes the specified IP address(es) that were configured previously from this host pool.

ip_address

Specifies an individual host IP address to add to this host pool.
ip_address is the IP address in dotted decimal notation for IPv4 and in colon notation for IPv6.

ip_address/maskbit

Specifies an individual host IP address with subnet mask bit to add to this host pool.
ip_address/maskbit is the IP address in dotted decimal notation for IPv4, and in colon notation for IPv6 with subnet mask bit. The *maskbit* is a numeric value which is the number of bits in the subnet mask.

range *start_ip* **to** *end_ip*

Specifies a range of host IP addresses to add to this host pool.
start_ip is the start IP address of the range in dotted decimal notation for IPv4 and in colon notation for IPv6, and must be less than *end_ip*.
end_ip is the end IP address of range in dotted decimal notation for IPv4 and in colon notation for IPv6, and must be greater than *start_ip*.

Usage

Use this command to add an individual or range of IP addresses to the host pool. Up to 10 sets of IP addresses can be configured in each host pool.

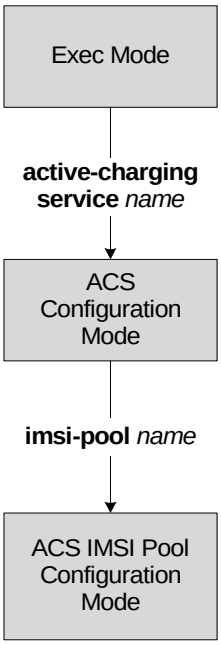
Example

The following command adds all IP addresses from *1.2.3.4* through *1.4.5.6* in IPv4 notation to the host pool:

ip range *1.2.3.4* **to** *1.4.5.6*

Chapter 11
ACS IMSI Pool Configuration Mode Commands

The ACS IMSI Pool Configuration Mode is used to define pool of subscriber's International Mobile Station Identifier numbers within the ACS Configuration Mode. IMSI pool configuration facilitates creation of rules to handle the packets coming from or going to a group of subscriber of IMSI numbers within an access policy.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

This command exits the current configuration mode and returns to the Executive mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Executive mode.

exit

This command exits the current configuration mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

imsi

This command specifies an individual or a range of subscriber IMSI numbers to add to the IMSI pool.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imsi { *imsi_num* | range *start_imsi* to *end_imsi* }

no

Removes the specified subscriber IMSI number(s) that were configured previously from this IMSI pool.

imsi_num

Specifies an individual subscriber IMSI number to add to this IMSI pool.
imsi_num is the IMSI number, and must be a sequence of hexadecimal digits between 1 and 15.

range *start_imsi* **to** *end_imsi*

Specifies a range of subscriber IMSI numbers to add to this IMSI pool.
start_imsi must be a sequence of hexadecimal numbers between 1 and 15 digits. This is the start IMSI number of subscriber IMSI range and must be less than *end_imsi*.
end_imsi must be a sequence of hexadecimal numbers between 1 and 15 digits. This is the end IMSI number of subscriber IMSI range and must be greater than *start_imsi*.

Usage

Use this command to specify the individual or range of subscriber IMSI numbers in an IMSI pool. Up to 10 sets of IMSI numbers can be configured in each IMSI pool.

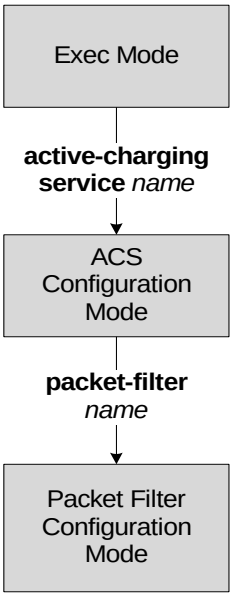
Example

The following command adds the specified range of IMSI numbers to the IMSI pool:

imsi range *<start_imsi>* **to** *<end_imsi>*

Chapter 12
ACS Packet Filter Configuration Mode Commands

The ACS Packet Filter Configuration Mode is used to create and configure ACS packet filters.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

direction

This command configures the direction in which the filter has to be applied.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
direction { bi-directional | downlink | uplink }

default direction
```

default

Applies the default configuration.
Default: **bi-directional**

bi-directional

Specifies that the filter is to be applied in both uplink and downlink directions.

downlink

Specifies that the filter is to be applied only in the downlink direction.

uplink

Specifies that the filter is to be applied only in the uplink direction.

Usage

Use this command to configure the direction in which the filter has to be applied.

Example

The following command configures the filter in the downlink direction:

```
direction downlink
```

end

This command returns the CLI prompt to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec mode.

exit

This command exits the ACS Packet Filter Configuration mode and returns the CLI prompt to the ACS Configuration Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the ACS Configuration Mode.

ip local-port

This command configures the IP 5-tuple local port parameter for the packet filter.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

ip local-port { = *port_number* | range *start_port_number* to *end_port_number* }

no ip local-port

no

Removes the local-port configuration, if previously configured.

= *port_number*

Specifies the port number of the transport protocol.
port_number must be the port number, and must be an integer from 1 through 65535.

range *start_port_number* **to** *end_port_number*

range specifies a range of port numbers.
start_port_number and *end_port_number* must be integers from 1 through 65535.
end_port_number must be greater than *start_port_number*.

Usage

Use this command to configure a specific or range of IP local port parameter for a packet filter.

Example

The following command configures the IP local port as *456*:

ip local-port *= 456*

ip protocol

This command configures the IP protocol parameter for the packet filter.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

In StarOS 8.x releases:

ip protocol { = *protocol_number* **| range** *start_protocol_number* **to** *end_protocol_number* **}**

no ip protocol

In StarOS 9.0 and later releases:

ip protocol = *protocol_number*

no ip protocol

no

Removes the IP protocol configuration, if previously configured.

= *protocol_number*

Specifies the transport protocol field in the IP header.
protocol_number must be the numerical value of the protocol, and must be an integer from 1 through 255.

range *start_protocol_number* **to** *end_protocol_number*

Important: In StarOS 9.0 and later releases this keyword is obsolete.

range specifies a range of protocol assignment numbers.
start_protocol_number and *end_protocol_number* must be integers from 1 through 255.
end_protocol_number must be greater than *start_protocol_number*.

Usage

Use this command to configure the protocol parameter for a packet filter.

Example

The following command configures the protocol assignment number *300*:

ip protocol *= 300*

ip remote-address

This command configures the IP remote address parameter for the packet filter.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

In StarOS 8.x releases:

ip remote-address { = { *ip_address* | *ip_address/mask* } | range { *ip_address* | *ip_address/mask* } to { *ip_address* | *ip_address/mask* } }

no ip remote-address

In StarOS 9.0 and later releases:

ip remote-address = { *ip_address* | *ip_address/mask* }

no ip remote-address

no

Removes the remote address configuration, if previously configured.

= { *ip_address* | *ip_address/mask* }

ip_address specifies the IP address in IPv4 dotted decimal or IPv6 colon separated notation format.
ip_address/mask specifies the IP address in IPv4 dotted decimal or IPv6 colon separated notation format, and the number of subnet bits representing the subnet mask in shorthand.

range { *start_ip_address* | *start_ip_address/mask* } to { *end_ip_address* | *end_ip_address/mask* }

Important: In StarOS 9.0 and later releases this keyword is obsolete.

range specifies a range of IP addresses.
start_ip_address and *end_ip_address* specify, for the range, the starting and ending IP address in IPv4 dotted decimal or IPv6 colon separated notation format. *end_ip_address* must be greater than *start_ip_address*.
start_ip_address/mask and *end_ip_address/mask* specify, for the range, the starting and ending IP address in IPv4 dotted decimal or IPv6 colon separated notation format, and the number of subnet bits representing the subnet mask in shorthand. *end_ip_address/mask* must be greater than *start_ip_address/mask*.

Usage

Use this command to configure the remote IP address parameter for a packet filter.

Example

The following command configures the IP remote address as *1.2.3.4/24*:

```
ip remote-address = 1.2.3.4/24
```

ip remote-port

This command configures the IP remote port parameter for the packet filter.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

ip remote-port { = *port_number* | range *start_port_number* to *end_port_number* }

no ip remote-port

no

Removes the remote port configuration, if previously configured.

= *port_number*

Specifies port number of the transport protocol.
port_number must be the port number, and must be an integer from 1 through 65535.

range *start_port_number* to *end_port_number*

Specifies a range of port numbers.
start_port_number and *end_port_number* must be integers from 1 through 65535.
end_port_number must be greater than *start_port_number*.

Usage

Use this command to configure a specific or range of IP remote port settings for a packet filter.

Example

The following command configures the IP remote port as *789*:

ip remote-port = *789*

priority

This command configures the packet filter's priority.

Important: This command is deprecated in certain 9.0 release and in 10.0 and later releases. The precedence values of packet filters (those from Dynamic Rules, and those from Predefined Rules) are assigned by the PCEF based on an internal process.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

priority *priority*

no priority

no

Removes the priority configuration, if previously configured.

priority

Specifies this packet filter's priority, and must be an integer from 0 through 255.

Usage

Use this command to configure the packet filter's priority. The priority must be configured for the packet filter to be used in a TFT. Packets are compared against packet filters in a prioritized fashion, with 0 being the highest priority. Without this setting, this filter will not be used.

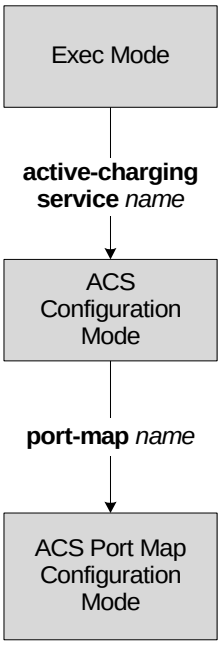
Example

The following command configures the packet filter's priority as *3*:

priority *3*

Chapter 13
ACS Port Map Configuration Mode Commands

The ACS Port Map Configuration Mode is used to define application-port map in the ACS Configuration Mode. The application-port map facilitates to associate a range of port to specific application/protocol within a rule definition (ruledef).



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

This command exits the current configuration mode and returns to the Executive mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Executive mode.

exit

This command exits the current configuration mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

port

This command specifies a range of ports for application or protocol in ACS Port Map Configuration Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] port { *port_num* | range *start_port* to *end_port* }

no

Removes the specified port(s) / range of ports that were configured previously from this port map.

port_num

Specifies the port number to add to the port map.
port_num must be an integer from 1 through 65535.

range *start_port* **to** *end_port*

Specifies the range of ports for an application/protocol to add to this port map.
start_port must be an integer from 1 through 65535, and must be lesser than *end_port*.
end_port must be an integer from 1 through 65535, and must be greater than *start_port*.

Usage

Use this command to specify mapping between application and range of ports. Up to 10 sets of ports can be configured in each port map.

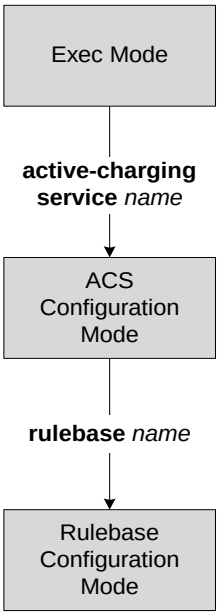
Example

The following command adds all ports from *3112* through *5000* to the port map:

port range *3112* **to** *5000*

Chapter 14
ACS Rulebase Configuration Mode Commands

The ACS Rulebase Configuration Mode is used to create and manage ACS rulebases.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

action priority

This command configures the action priority for a ruledef / group-of-ruledefs in the rulebase.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

no action priority *action_priority*

no

Removes the previously configured action priority from this rulebase.

priority *action_priority*

Specifies a priority for the specified ruledef / group-of-ruledefs in this rulebase.
The priority controls the ordering of the instance of the CLI command. Lower numbered priorities are examined first. Up to 2048 instances may be configured, totaled among all rulebases.
action_priority must be an integer from 1 through 65535.

dynamic-only

Enables matching of dynamic rules with static rules for this action priority on a flow.
The dynamic-only option causes the configuration to be defined, but not enabled. If enabled, the action associated with this option will not be matched against a flow until it is enabled from a dynamic charging interface like Gx. Gx can disable or enable this action entry in the rulebase using Gx messages.
Default: Disabled

static-and-dynamic

The static-and-dynamic option causes the configuration to be defined and enabled, and allows a dynamic protocol (such as, the Gx-interface) to disable or re-enable the configuration.
Default: Enabled

Important: When R7 Gx is enabled, “static-and-dynamic” rules behave exactly like “dynamic-only” rules. I.e. they must be activated explicitly by the PCRF. When Gx is not enabled, “static-and-dynamic” rules behave exactly like static rules.

timedef *timedef_name*

Important: This keyword is only available in StarOS 8.1 and StarOS 9.0 and later releases.

Associates the specified time definition with the ruledef/group-of-ruledefs. Timedefs enable activation/deactivation of ruledefs/groups-of-ruledefs such that they are available for rule matching only when they are active.

timedef_name must be the name of a timedef, and must be an alpha and/or numeric string of 1 through 63 characters in length.
A timedef can be used with several ruledefs/group-of-ruledefs. When a packet is received, and a ruledef/group-of-ruledefs is eligible for rule matching, if a timedef is associated with the ruledef/group-of-ruledefs, before rule matching, the packet-arrival time is compared with the timeslots configured in the timedef. If the packet arrived in any of the timeslots configured in the associated timedef, rule matching is undertaken, else the next ruledef/group-of-ruledefs is considered.

Important: The time considered for timedef matching is the system's local time.

ruledef *ruledef_name*

Assigns the specified ruledef to this rulebase.
ruledef_name must be the name of an existing ruledef, and must be an alpha and/or numeric string of 1 through 63 characters in length.
If the specified ruledef does not exist, there will be no ruledef triggers for this action priority within this rulebase.

Important: If the ruledef specified here is deleted or is not configured, the system accepts it without applying any ruledef under current rulebase for this action priority.

group-of-ruledefs *ruledefs_group_name*

Assigns the specified group-of-ruledefs to this rulebase.
ruledefs_group_name must be the name of an existing group-of-ruledefs, and must be an alpha and/or numeric string of 1 through 63 characters in length.
When a group-of-ruledefs is specified, if any of the ruledefs within the group matches, the specified charging-action is performed, any more of the action instances are not processed.

Important: If the group-of-ruledefs specified here is deleted or is not configured, the system accepts it without applying any ruledefs under current rulebase for this action priority.

charging-action *charging_action_name*

Specifies the charging action.
charging_action_name must be the name of an existing charging action, and must be an alpha and/or numeric string of 1 through 63 characters in length.
If the specified charging action does not exist, there will be no charging action triggers for this action priority within this rulebase.

Important: If the charging action specified here is deleted or not configured, the system accepts it without applying any charging action under current rulebase for this action priority.

monitoring-key *monitoring_key*

Associates the specified monitoring-key with ruledefs for usage monitoring.
monitoring_key must be an integer from 1 through 4000000000.

description *description*

Adds specified text to the rule and action.
description must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to configure action priorities for ruledefs / group-of-ruledefs in a rulebase.
This CLI command can be entered multiple times to specify multiple ruledefs and charging actions. The ruledefs are examined in priority order, until a match is found and the corresponding charging action is applied.

Example

The following command assigns a rule and action with the action priority of *23*, a ruledef named *test*, and a charging action named *test1* to the current rulebase:

```
action priority 23 ruledef test charging-action test1
```

bandwidth default-policy

This command configures the default bandwidth policy for the current rulebase.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

bandwidth default-policy *policy*

no bandwidth default-policy

no

Removes previously configured default bandwidth policy.

policy

Specifies the default bandwidth policy to be configured for the current rulebase.
policy must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to configure the default bandwidth policy for the current rulebase. This bandwidth policy will be used for subscribers using this rulebase for whom in the APN/Subscriber Configuration Mode the **default active-charging bandwidth-policy** command is configured, or no bandwidth policy is configured.

Example

The following command configures a bandwidth policy named *standard* for the rulebase:

bandwidth default-policy *standard*

billing-records

This command configures the type of billing to be performed for subscriber sessions.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

billing-records { egcdr | radius | rf | udr udr-format *udr_format_name* **} +**

no billing-records

no

Deletes the current billing-records configuration.

egcdr

Generates an enhanced G-CDR (eG-CDR) and/or UDR with specified format on the occurrence of an interim trigger condition at the end of a subscriber session, or an SGSN-to-SGSN handoff.

radius

Generates postpaid RADIUS accounting records at the start and end of a subscriber session, and on the occurrence of an interim trigger condition. RADIUS accounting records are generated for each content ID.

Important: In the GGSN, if in the APN configuration the "accounting-mode" is set to "none", the system continues to send ACS-generated RADIUS accounting messages. In the PDSN, if in the subscriber default configuration the "accounting-mode" is set to "none", the system does not send any RADIUS accounting messages (including ACS accounting messages).

rf

Enables Rf accounting.

udr udr-format *udr_format_name*

Generates UDRs with specified format on the occurrence of an interim trigger condition, at the end of a subscriber session or a handoff.
udr_format_name must be the name of an existing UDR format, and must be a string of 1 through 63 characters in length.

+

Indicates that more than one of the keywords can be entered in a single command.

Usage

Use this command to generate enhanced G-CDRs (eG-CDRs), RADIUS CDRs and/or UDRs for billing records. The format of eG-CDRs for the default GTPP group is controlled by the **inspector** command in the Context Configuration Mode.
If, in the APN configuration, the "accounting-mode" is set as default (GTPP), and in the rulebase configuration "billing-records egcdr" is configured, both G-CDRs and eG-CDRs are generated if configured.
If, in the APN, the accounting-mode is set to "none" G-CDRs will not be generated.

Example
The following command sets the billing record to UDR with UDR format named *udr_format1*:

billing-records udr udr-format *udr_format1*

cca diameter requested-service-unit

This command configures Diameter specific AVPs in Requested-Service-Unit group AVP with DCCA Credit Control Requests (CCRs).

Product

All

Privilege

Security Administrator, Administrator

Syntax

cca diameter requested-service-unit sub-avp { time cc-time *duration* **| units cc-service-specific-units** *charging_unit* **| volume { cc-input-octets** *bytes* **| cc-output-octets** *bytes* **| cc-total-octets** *bytes* **} + }**

no cca diameter requested-service-unit sub-avp

no

Disables the Diameter AVP configuration for DCCA CCRs.

time cc-time *duration*

Specifies requested service unit for charging time duration in seconds in included sub-AVP. *duration* specifies charging time in seconds and must be an integer from 1 through 4,294,967,295.

units cc-service-specific-units *charging_unit*

Specifies requested service unit by service specific units in bytes/packets in included sub-AVP. *charging_unit* specifies service-specific charging unit and must be an integer from 1 through 4,000,000,000.

volume { cc-input-octets *bytes* **| cc-output-octets** *bytes* **| cc-total-octets** *bytes* **} +**

Specifies requested service unit for charging octets by input, output and total volume in included sub-AVP.

- **cc-input-octets**: Specifies input charging octets.
- **cc-output-octets**: Specifies output charging octets.
- **cc-total-octets**: Specifies total charging octets.
- *bytes*: Specifies volume in bytes, and must be an integer from 1 through 4,000,000,000.

+: Indicates that more than one of the above keywords can be entered within a single command.

Usage

Use this command to include sub-AVPs based on time, volume, and service specific unit in Requested-Service-Unit group AVP with CCRs through Gy interface.

Example

The following command sets the time based sub-AVP with charging duration of 45 seconds in Requested-Service-Unit group AVP on DCCA CCRs:

```
cca diameter requested-service-unit sub-avp time cc-time 45
```

cca quota

This command is used to set various time and threshold-based quotas in the prepaid credit control service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

holding-time *holding_time*

Specifies the value for the Quota Holding Time (QHT). QHT is used with both time-based and volume-based quotas.
holding_time must be an integer from 1 through 4000000000.
After *holding_time* seconds has passed without user traffic, the quota is reported back and the charging stops until new traffic starts.

content-id *content_id*

Specifies the content ID (Rating group AVP) to use for the Quota holding time for this rulebase.
content_id is the content ID specified for credit control service in ACS, and must be an integer from 0 through 4,294,967,295.

retry-time *retry_time* **[max-retries** *retries* **]**

Specifies the retry time in seconds for the quota request.
retry_time must be an integer from 0 through 86400. To disable this assign 0.
Default: 60
This defines the maximum frequency at which the CC application tries to obtain quota for a subscriber passing traffic for a category with no/exhausted quota.
For a subscriber not passing traffic, the CC application will not try to obtain quota (except once at session start time, if so configured). i.e. the quota request from the no quota state is sent in response to user packets only, never based on a timer.
When subscriber hits a charging action that is a flow redirect, operator can optionally specify that this redirection shall clear the retry-time timer.
This allows the immediately following chargeable user traffic to trip a quota request, even if it would otherwise have been subject to the retry time limit. Such configuration allows quite large value for retry-time in quota charging or top up scenario.
max-retries *retries* option configures the maximum number of retries allowed for blacklisted categories. This option has default value of maximum retries of 65535 retries.
retries must be an integer from 1 through 65535. To disable this assign 0.

Usage

Use this command to set the prepaid credit control quotas.
cca quota retry time allows operator to set the amount of time that the ACS waits before it retries the prepaid server for a content id for which quota was exausted earlier.

When server sends the quota holding time (QHT) it has highest priority to use that QHT irrespective of the value configured in rulebase or Credit Control Application Configuration Mode. QHT configured here has second priority for the content ID (rating group) configured here.
In case of QHT is not available from server and rulebase configuration mode, the QHT values configured at Credit Control Application Configuration Mode is used.

Example
The following command sets the prepaid credit control request retry time to *30* seconds:

```
cca quota retry-time 30
```

The following command sets the system to use the QHT from Credit Control Application mode:

```
no cca quota holding-time content-id content_id
```

The following command sets the system to ignore the QHT from Credit Control Application mode:

```
default cca quota holding-time content-id content_id
```

The following command sets the prepaid credit control request retry time to *60* seconds and maximum numbers of retries to *65535*:

```
default cca quota retry-time max-retries
```

cca quota time-duration algorithm

This command is used to define the algorithm used to compute time duration for prepaid credit control application quotas in the rulebase service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
cca quota time-duration algorithm { consumed-time seconds [ plus-idle ] |
continuous-time-periods seconds | parking-meter seconds } [ content-id
content_id ]

default cca quota time-duration algorithm

no cca quota time-duration algorithm { consumed-time | continuous-time-periods |
parking-meter } [ content-id content_id ]
```

no

Removes the previously configured quota time-duration algorithm.

default

Configures the default setting.

consumed-time *seconds*

Specifies the Quota Consumption Time (QCT) in seconds. QCT is used with active time-based quotas and to determine chargeable time envelopes for the purposes of consuming time quota.
Time envelope is the basis for reporting active usage. For each time envelope, the quota consumption includes the last QCT (duration between first packet and last packet + QCT).
seconds must be an integer from 1 through 4,294,967,295.
Default: 0 (disabled)

plus-idle

Specifies the idle time for QCT.
When used along with **consumed-time** it indicates the active usage + idle time, when no traffic flow occurs.

continuous-time-periods *seconds*

Specifies the charging quota continuous period in seconds.
The Continuous Time Periods (CTP) mechanism constructs a time-envelopes out of consecutive base time intervals in which traffic has occurred up to and including a base time interval which contains no traffic. As with Quota-Consumption-Time envelopes, the end of an envelope can only be determined “retrospectively”. Again, as with Quota-Consumption-Time, the envelope for CTP includes the last base time interval, i.e. the one which contained no traffic.
seconds must be an integer from 1 through 4294967295.

Default: 0 (disabled)

parking-meter *seconds*

Specifies the Parking Meter (PM) period, in seconds, for particular rating group.
This mechanisms utilizes time quota, but instead of consuming linearly—once a decision to consume has been taken—the granted quota is consumed discretely in "chunks" of the base time interval at the start of each base time interval. Traffic is then allowed to flow for the period of the consumed quota.
The time interval seconds defines the length of the Parking Meter. A time-envelope corresponds to exactly one PM (and thus to one base time interval).
seconds must be an integer from 1 through 4294967295.
Default: 0 (disabled)

content-id *content_id*

Specifies the content ID (Rating group AVP) to use for the CCA Quota time duration algorithm selection in this rulebase.
content_id is the content ID specified for credit control service in ACS, and must be an integer from 1 through 65535.

session-time

Specifies the session period in seconds. This is the default setting.

Usage

Use this command to set the various time charging algorithms/schemes for prepaid credit control charging. If operator chooses **parking-meter** *seconds* style charging, then time is billed in *seconds* chunks.

Example

The following command sets time duration to *400* seconds for prepaid credit control time duration algorithm:

```
cca quota time-duration algorithm consumed-time 400
```

cca radius accounting

This command specifies the accounting interval duration for RADIUS prepaid service parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] cca radius accounting interval *interval*

no

Removes previously configured RADIUS accounting interval in the rulebase.

interval *interval*

Default: 0 (Disabled)
Specifies the time interval, in seconds, between accounting actions.
interval must be an integer from 0 through 3600.

Usage

Use this command to specify the RADIUS accounting interval between accounting of a prepaid subscriber. The same parameters are applicable for RADIUS server group.

Example

The following command defines RADIUS accounting interval of *20* seconds for RADIUS prepaid service in the rulebase:

cca radius accounting interval *20*

cca radius charging

This command specifies the charging context where RADIUS parameters are configured.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] cca radius charging context *vpn_context* **[group** *group_name* **]**

no

Removes the previously configured RADIUS charging context in the rulebase.

context *vpn_context*

Specifies the charging context where RADIUS prepaid charging are configured.
vpn_context must be an alpha and/or numeric string of 1 through 63 characters in length.

group *group_name*

Specifies the RADIUS server group name configured for RADIUS prepaid charging parameters.
group_name must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to specify the RADIUS charging context where RADIUS prepaid charging parameters are configured. The same parameters are applicable for RADIUS server group.

Example

The following command defines RADIUS charging context *prepaid_rad1* for RADIUS prepaid charging in the rulebase:

cca radius charging context *prepaid_rad1*

cca radius user-password

This command specifies the RADIUS prepaid service subscriber's user password parameters in the rulebase.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] cca radius user-password [encrypted] password *password*

no

Removes the previously configured RADIUS prepaid service user password in the rulebase.

[encrypted] password *password*

Specifies the password to use for the user being given privileges for prepaid services within the current rulebase. The **encrypted** keyword specifies that the password uses encryption.
password specifies the password. Without encryption *password* must be an alpha and/or numeric string of 1 through 63 characters in length. With encryption *password* must be alpha and/or numeric string of 1 through 127 characters in length.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

Usage

Use this command to specify the RADIUS user password for prepaid services within the current rulebase.

Example

The following command defines the user password *user_123* without encryption for a prepaid service subscriber with RADIUS charging in the rulebase.

```
cca radius user-password password user_123
```

charging-rule-optimization

This command enables charging rule-optimization and configures the level for rule matching in the rulebase.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
charging-rule-optimization { high | low | medium }

default charging-rule-optimization
```

default

Sets the default charging rule search and matching optimization level.
Default: **low**

high

Enables the highest efficient rule-searching organization with high memory utilization.

low

Enables minimally efficient rule-searching organization with minimal memory utilization.

medium

Enables moderately efficient rule-searching organization with medium memory utilization.

Usage

Use this command to specify the amount of internal optimization that is done for improved performance when evaluating each instance of the **action** CLI command.

Example

The following command specifies the highest optimization level for rule search and matching in the rulebase:

```
charging-rule-optimization high
```

constituent-policies

This command configures the bandwidth, CBB, and Firewall/Firewall-and-NAT constituent policies. The combination of the values of all three policies will uniquely identify the associated rulebase.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
constituent-policies { bandwidth-policy bandwidth_policy | cbb-policy cbb_policy
| firewall-policy fw_policy | fw-and-nat-policy fw_nat_policy_name } +

no constituent-policies
```

no

Removes the previous configuration.

bandwidth-policy *bandwidth_policy*

Specifies the Bandwidth policy.
bandwidth_policy must be a string of 1 through 63 characters in length.

cbb-policy *cbb_policy*

Specifies the CBB policy.
cbb_policy must be a string of 1 through 63 characters in length.

firewall-policy *fw_policy*

Important: This keyword is customer-specific.

Specifies the Firewall policy.
fw_policy must be a string of 1 through 63 characters in length.

fw-and-nat-policy *fw_nat_policy_name*

Important: This keyword is customer specific, and is only available in StarOS 8.1.

Specifies the Firewall-and-NAT policy.
fw_nat_policy_name must be a string of 1 through 63 characters in length.

Usage

Use this command to configure the bandwidth, CBB, and Firewall/Firewall-and-NAT constituent policies that will identify the rulebase. The combination of the values of all three policies will uniquely identify the rulebase associated.

Example

The following command configures the constituent bandwidth policy named *test123*:

```
constituent-policies bandwidth-policy test123
```

content-filtering category policy-id

This command configures the Content Filtering Category Policy Identifier for Policy-based Content Filtering support in the rulebase.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

content-filtering category policy-id *cf_policy_id*

no content-filtering category policy-id [*cf_policy_id* **]**

no

Removes the specified Content Filtering Category Policy configuration from the rulebase.
In StarOS 8.1 and later, optionally the policy ID can be specified. If the specified policy ID is invalid, or is not configured in the rulebase, an error message is displayed. If no policy ID is specified, whatever policy is configured, if any, is removed from the rulebase.

category policy-id *cf_policy_id*

Configures the specified Content Filtering Category Policy in the current rulebase.
cf_policy_id must be the ID of an existing Content Filtering Category Policy, and must be an integer from 1 through 4294967295.

Important: In case the specified Content Filtering Category Policy does not exist, all packets will be passed regardless of the categories/actions determined for such packets.

Important: The category policy ID configured using the **category policy-id** *cf_policy_id* command in the APN/Subscriber Configuration Mode prevails over this configuration.

Usage

Use this command to configure the Content Filtering Category Policy ID for Policy-based Content Filtering support in the rulebase.
The Content Filtering Category Policy is created/deleted in the ACS Configuration Mode, and is configured in the Content Filtering Policy Configuration Mode.

Example

The following command configures the policy ID *101* in the rulebase:

content-filtering category policy-id *101*

content-filtering flow-any-error

This command configures allowing/discarding of Content Filtering packets in case of ACS error scenarios.

Product

ACS, CF

Privilege

Security Administrator, Administrator

Syntax

```
content-filtering flow-any-error { deny | permit }

default content-filtering flow-any-error
```

default

Configures the default setting.
Default: **permit**

deny

Configures flow-any-error configuration as deny.
All the denied packets will be accounted by **discarded-flow-content-id** configuration in the Content Filtering Policy Configuration Mode. I.e. this very content ID will be used to generate UDRs for the denied packets in case of content filtering.

permit

Configures flow-any-error configuration as permit.

Usage

Use this command to allow/discard content filtering packets in case of ACS error scenarios.

Example

The following command allows content filtering packets in case of ACS error:

```
content-filtering flow-any-error permit
```

content-filtering mode

This command enables the specified Content Filtering mode within the rulebase.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

content-filtering mode { category { static-only | static-and-dynamic } | server-group *cf_server_group* **}**

no content-filtering mode

no

Removes/disables a previously configured content filtering mode in this rulebase.
It implies that content filtering in not to be performed for this rulebase.
This is the default mode.

category { static-and-dynamic | static-only }

This keyword specifies the category-based content filtering mode.

- **static-only**: Configures Content Filtering mode as Static only. Compares all URLs against internal database to determine the category or categories of the requested content.

  Using category-based content filtering support requires configuration of the **require active-charging content-filtering category** CLI command in the Global Configuration Mode.

- **static-and-dynamic**: Configures Content Filtering mode as Static-and-Dynamic, wherein first static rating of the URL is performed, and only if the static rating fails to find a match dynamic rating of the content that the server returns is performed.

Important: Before enabling static-and-dynamic rating in the rulebase, it must be enabled at the global level as the resources required for dynamic rating are allocated at the global level. To enable static-and-dynamic rating at the global level, in the Global Configuration Mode, use the **require active-charging content-filtering category static-and-dynamic** CLI command.

server-group *cf_server_group*

Enables and configures the CFSG mode within the rulebase to manage an external content filtering server with an ICAP client system.
cf_server_group must be the name of a CFSG, and must be unique, and must be an alpha and/or numeric string of 1 through 63 characters in length.
If configured, ACS attempts to establish TCP connections to every server in the named group.

Usage

Use this command to enable and apply the content filtering mode in the rulebase to manage a content filtering server with an ICAP client system.

Example

The following command enables the content filtering mode for external content filtering server group *CF_Server1* in the rulebase:

```
content-filtering mode server-group CF_Server1
```

The following command enables the category based static and dynamic content filtering mode for in the rulebase:

```
content-filtering mode category static-and-dynamic
```

dynamic-rule

This command configures the order of comparing the dynamic rules to static rules for the flow.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
dynamic-rule order { always-first | first-if-tied }

no dynamic-rule order
```

no

Removes the previously configured dynamic rule comparing order for this rulebase.

order { always-first | first-if-tied }

This command configures the way in which rules are selected for matching from dynamic rules list (per subscriber) and static rules list (from rulebase).

- **always-first**: If this option is configured, all the dynamic rules are matched against the flow prior to any static rule.
- **first-if-tied**: If this option is configured, rules are matched against the flow based on their priority with condition that dynamic rules match before a static rule of the same priority.

Usage

Use this command to configure the way in which rules are selected up for matching from dynamic rules list (per subscriber) and static rules list (from rulebase).

Example

The following command configures to match all dynamic rules against the flow prior to any static rule:

```
dynamic-rule order always-first
```

edr suppress-zero-byte-records

This command disables/enables the creation of EDRs when there is no data for the flows.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] edr suppress-zero-byte-records
```

no

Disables the suppression of zero-byte EDRs.

default

Configures the default setting.
Default: **no edr suppress-zero-byte-records**

Usage

Use this command to disable/enable the creation of EDRs that are empty. The situation where there is a zero-byte EDR would typically be possible when two successive EDRs are generated for a flow. This CLI command suppresses the second such EDR for the flow.

Example

The following command disables the creation of zero-byte EDRs:

```
edr suppress-zero-byte-records
```

edr transaction-complete

This command configures the generation of an EDR on the completion of a transaction.

Important: This command is only available in StarOS 8.1 and StarOS 9.0 and later.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

edr transaction-complete http edr-format *edr_format*

{ default | no } edr transaction-complete

default

Configures the default setting.
Default: **no edr transaction-complete**

no

Disables the generation of EDR on transaction completion.

http

Specifies EDR generation on transaction completion for HTTP protocol.

edr-format *edr_format*

Specifies the EDR format name.
edr_format must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to configure the generation of an EDR on the completion of a transaction. In this release EDR generation is supported only for HTTP protocol.

Example

The following command configures the generation of EDRs on the completion of transactions for HTTP protocol specifying the EDR format as *test123*:

edr transaction-complete http edr-format *test123*

edr voip-call-end

This command enables generating Event Data Record (EDR) on the completion of voice calls.

Product

ACS, P2P

Privilege

Security Administrator, Administrator

Syntax

edr voip-call-end edr-format *edr_format_name*

{ default | no } edr voip-call-end

default

Configures the default setting.
Default: **no edr voip-call-end**

no

Specifies to disable EDR generation on the completion of a voice call.

edr-format *edr_format_name*

Specifies EDR format name.
edr_format_name must be an existing EDR format's name, and must be a string of 1 through 63 characters in length.

Usage

Use this command to enable generating EDR on the completion of voice calls. This facilitates P2P voice duration reporting.

Example

The following command specifies generating EDR on completion of voice calls using the EDR format *test13*:

edr voip-call-end edr-format *test13*

egcdr inactivity-meter

DescriptionThis command is obsolete. It is included in the CLI for backward compatibility with older configuration files. When executed performs no function. Use **`egcdr threshold interval`** *`interval`* **`[ regardless-of-other-triggers ]`** command for this functionality.

egcdr service-data-flow

This command assigns volume or interval threshold values to the interim Service Data Flow Containers in Flow Based Charging (FBC).

Product

GGSN, ACS

Privilege

Security Administrator, Administrator

Syntax

egcdr service-data-flow threshold { interval *interval* **| volume { downlink | total | uplink }** *bytes* **}**

{ no | default } egcdr service-data-flow threshold { interval | volume }

no

Removes the previously configured eG-CDR service data flow threshold for FBC.

default

Disables the eG-CDR service data flow threshold settings for FBC.

interval *interval*

Specifies the time interval (in seconds) for closing the eG-CDR if the minimum time duration thresholds for service data flow containers satisfied in flow based charging. By default this option is disabled.
interval must be an integer from 60 through 40000000.

volume

Specifies the uplink/downlink volume octet counts for the generation of the interim eG-CDRs to service data flow container in FBC.

- **downlink** *bytes*: Specifies the limit for the number of downlink octets after which the eG-CDR is closed.

  bytes must be an integer from 10000 through 400000000.

  Default: 400000000

- **total** *bytes*: Specifies the limit for the total number of octets (uplink+downlink) after which the eG-CDR is closed.

  bytes must be an integer from 10000 through 400000000.

  Default: Disabled

- **uplink** *bytes*: Specifies the limit for the number of uplink octets after which the eG-CDR is closed.

  bytes must be an integer from 10000 through 400000000.

  Default: 400000000

Usage

Use this command to specify an eG-CDR threshold to generate it and write it to eG-CDR in service data flow container during flow based charging (FBC).

Example

The following command sets an eG-CDR threshold interval of *6000* seconds:

```
egcdr service-data-flow threshold interval 6000
```

egcdr tariff

This command sets the eG-CDR tariff time information to close and open new eG-CDR.

Product

GGSN, ACS

Privilege

Security Administrator, Administrator

Syntax

[no] egcdr tariff minute *minute* **hour** *hour*

no

Removes the previously configured eG-CDR tariff.

minute *minute*

Specifies the minute in a specified hour.
minute must be an integer from 0 through 59.

hour *hour*

Specifies the hour of the day.
hour must be an integer from 0 through 23.

Usage

Use this command to specify an eG-CDR tariff time. Up to 4 different time-of-day may be configured. When any tariff time reached the current eG-CDR will be closed and a new eG-CDR will be opened.

Example

The following command defines an eG-CDR tariff for the 23rd minute of the 22nd hour of the day:

egcdr tariff minute *23* **hour** *22*

egcdr threshold

This command sets the eG-CDR volume or interval values to generate the interim eG-CDRs and write them to eG-CDR file.

Product

GGSN, ACS

Privilege

Security Administrator, Administrator

Syntax

egcdr threshold { interval *interval* **[regardless-of-other-triggers] | volume { downlink | total | uplink }** *bytes* **}**

{ no | default } egcdr threshold { interval | volume }

---

no

Removes previously configured eG-CDR threshold.

---

default

Disables the eG-CDR threshold settings.

---

interval *interval* **[regardless-of-other-triggers]**

Specifies the time interval (in seconds) for closing the eG-CDR if the minimum time duration thresholds are satisfied. By default this option is disabled.
interval must be an integer from 60 through 40000000.
regardless-of-other-triggers: This option enables the eG-CDR generation at the fixed time interval irrespective of any other eG-CDR triggers that may have happened in between.

---

volume

Specifies the uplink/downlink volume octet counts for the generation of the interim eG-CDRs.

- **downlink** *bytes*: Specifies the limit for the number of downlink octets after which the eG-CDR is closed.

  bytes must be an integer from 100,000 through 4,000,000,000.

  Default: 4,000,000,000

- **total** *bytes*: Specifies the limit for the total number of octets (uplink+downlink) after which the eG-CDR is closed.

  bytes must be an integer from 100,000 through 4,000,000,000.

  Default: Disabled

- **uplink** *bytes*: Specifies the limit for the number of uplink octets after which the eG-CDR is closed.

  bytes must be an integer from 100,000 through 4,000,000,000.

  Default: 4,000,000,000

Usage

Use this command to specify an eG-CDR threshold to generate it and write it to eG-CDR file.

Example

The following command defines an eG-CDR threshold interval of *600* seconds:

```
egcdr threshold interval 600
```

egcdr time-duration algorithm

This command is used to define the algorithm used to compute the duration for time utilization in eG-CDR for specific rulebase.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
egcdr time-duration algorithm { consumed-time consumed_time [ plus-idle ] |
continuous-time-periods ctp_seconds | parking-meter seconds }

{ default | no } egcdr time-duration algorithm
```

no

Removes the previously configured eG-CDR time-duration algorithm.

default

Sets default time duration value to time duration algorithm for eG-CDR generation.

consumed-time *consumed_time* **[plus-idle]**

Default: 0 (disabled)
Specifies the actual consumption time in seconds. This is used to determine the actual used chargeable time envelopes for the purposes of consuming time quota.
Time envelope is the basis for reporting active usage. For each time envelope, the time consumption includes the time duration between arrival of last packet and first packet only.
consumed_time must be an integer from 1 through 4,294,967,295.
plus-idle: Specifies the idle time between arrival of two packets to include in time usage record in eG-CDR.
When used along with **consumed-time** it indicates the active usage + idle time, when no traffic flow occurs.

continuous-time-periods *ctp_time*

Specifies the continuous time period to compute the usage record in eG-CDR.
ctp_time sets the audition, in seconds, to start a counter on arrival of first packet and there after include only that period in charging in which one or more packets arrived. The period where no packets arrived or traffic detected no usage will be computed.
ctp_time must be an integer from 1 through 4294967295.

parking-meter *seconds*

Specifies the parking meter (PM) period, in seconds.
Parking meter is the method with which the usage time is set in the content-id containers in eG-CDRs. When a parking meter value is set, the user is charged for time in increments of the value set. For example; if the parking meter value is set to 300 seconds (5 minutes) and the subscriber only uses one minute, the charge is for 5 minutes.

seconds must be an integer from 1 through 4294967295.

Usage

Use this command to set the various time charging algorithms/schemes for time usage in eG-CDR.
For example, packets arrive at times T1, T2, T3 and T4. Then the typical time usage might be computed to be T4 – T1. However, if say there is an idle period between times T2 and T3, then system will compute the time usage to be (T2 – T1) + (T4 – T3).
consumed-time in above scenario calculates the time duration as (T2 – T1) + (T4 – T3) where **consumed-time** with **plus-idle** calculates the time duration as (T2-T1)+I + (T4 – T3)+I or (T4-T1).

Example

The following command sets consumed time duration to *400* seconds:

```
egcdr time-duration algorithm consumed-time 400
```

end

Returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec mode.

exit

Exits the ACS Rulebase Configuration Mode and returns to the ACS Configuration Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to change to the ACS Configuration Mode.

extract-host-from-uri

If the host field is not present in HTTP/WSP header, this command will extract host from URI, and store it in the host field.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
extract-host-from-uri { http | wsp + )
{ default | no } extract-host-from-uri
```

default

Configures the default setting.
Default: **no extract-host-from-uri**

no

Removes the previous extract-host-from-uri configuration for all protocols.

http | wsp

Specifies protocol(s) for extract-host-from-uri configuration.

+

Indicates that more than one of the previous keywords can be entered within a single command.

Usage

If the host field is not present in HTTP/WSP header, this command will extract host from URI, and store it in the host field to enable “http host” and “wsp host” rule matches using the stored value.

Important: Applying the **extract-host-from-uri** command a second time will overwrite the previous configuration. For example, if you apply the command **extract-host-from-uri http wsp http**, and then apply the command **extract-host-from-uri http wsp**, extraction of host from URI will happen only for WSP analyzer.

Example

The following command configures extraction of host from URI for both HTTP and WSP protocols:

```
extract-host-from-uri http wsp
```

firewall dos-protection

This command configures protection for subscribers from Denial-of-Service (DoS) attacks.

Important: In StarOS 8.0, this command is available in the ACS Configuration Mode. In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] firewall dos-protection { all | flooding { icmp | tcp-syn | udp } | ftp-bounce | ip-unaligned-timestamp | mime-flood | port-scan | tcp-window-containment | source-router | teardrop | winnuke }

default firewall dos-protection
```

no

Disables protection for subscribers from all or specified DoS attack(s).

default

Disables protection from all DOS attacks.

all

Enables protection against all DoS attacks supported by the Stateful Firewall service.

flooding { icmp | tcp-syn | udp }

Enables protection against specified flooding attacks:

- **icmp**: Enables protection against ICMP Flood attacks
- **tcp-syn**: Enables protection against TCP Syn Flood attacks
- **udp**: Enables protection against UDP Flood attacks

ftp-bounce

Enables protection against FTP Bounce attacks.
In an FTP Bounce attack, an attacker is able to use the PORT command to request access to ports indirectly through a user system as an agent for the request. This technique is used to port scan hosts discreetly, and to access specific ports that the attacker cannot access through a direct connection.

ip-unaligned-timestamp

Enables protection against IP Unaligned Timestamp attacks.

In an IP Unaligned Timestamp attack, certain operating systems crash if they receive a frame with the IP timestamp option that is not aligned on a 32-bit boundary.

mime-flood

Enables protection against HTTP Multiple Internet Mail Extension (MIME) Header Flooding attacks.
In a MIME Flood attack an attacker sends huge amount of MIME headers which consumes a lot of memory and CPU usage.

port-scan

Enables protection against Port Scan attacks.

tcp-window-containment

Enables protection against TCP Sequence Number Out-of-Range attacks.
In a Sequence Number Out-of-Range attack the attacker sends packets with out-of-range sequence numbers forcing the system to wait for missing sequence packets.

source-router

Enables protection against IP Source Route IP Option attacks.
Source routing is an IP option mainly used by network administrators to check connectivity. When an IP packet leaves a system, its path through various networks to its destination is controlled by the routers and their current configuration. Source routing provides a means to override the control of the routers. Strict source routing specifies the path through all the routers to the destination. The same path in reverse is used to return responses. Loose source routing allows the attacker to spoof both an address and sets the loose source routing option to force the response to return to the attacker's network.

teardrop

Enables protection against Teardrop attacks.
In a Teardrop attack, overlapping IP fragments are exploited causing the TCP/IP fragmentation re-assembly to improperly handle overlapping IP fragments.

winnuke

Enables protection against WIN-NUKE attacks.
This is a type of Nuke denial-of-service attack against networks consisting of fragmented or otherwise invalid ICMP packets sent to the target, achieved by using a modified ping utility to repeatedly send this corrupt data, thus slowing down the affected computer until it comes to a complete stop.
The WinNuke exploits the vulnerability in the NetBIOS handler and a string of out-of-band data sent to TCP port 139 of the victim machine causing it to lock up and display a Blue Screen of Death.

Usage

Use this command to enable firewall protection from different types of DoS attacks. This command can be used multiple times for different DoS attacks.

Important: The DoS attacks are detected only in the downlink direction.

Example

The following command enables protection from all supported DoS attacks in the In-line Firewall Service:

```
firewall dos-protection all
```

firewall flooding

This command configures Stateful Firewall protection from Packet Flooding attacks.

Important: In StarOS 8.0, this command is available in the ACS Configuration Mode. In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall flooding { { protocol { icmp | tcp-syn | udp } packet limit packets } |
{ sampling-interval interval } }

default firewall flooding { { protocol { icmp | tcp-syn | udp } packet limit } |
{ sampling-interval } }
```

default

Configures the default setting for the specified keyword.

protocol { icmp | tcp-syn | udp }

Specifies the transport protocol:

- **icmp**: Configuration for ICMP protocol.
- **tcp-syn**: Configuration for TCP-SYN packet limit.
- **udp**: Configuration for UDP protocol.

packet limit *packets*

Specifies the maximum number of specified packets a subscriber can receive during a sampling interval.
packets must be an integer from 1 through 4294967295.
Default: 1000 packets per sampling interval for all protocols.

sampling-interval *interval*

Specifies the flooding sampling interval, in seconds.
interval must be an integer from 1 through 60.
Default: 1 second

Usage

Use this command to configure the maximum number of ICMP, TCP-SYN, / UDP packets allowed to prevent the packet flooding attacks to the host.

Example

The following command ensures a subscriber will not receive more that 1000 ICMP packets per sampling interval:

```
firewall flooding protocol icmp packet limit 1000
```

The following command ensures a subscriber will not receive more than 1000 UDP packets per sampling interval on different 5-tuples. That is, if an attacker is sending lot of UDP packets on different ports or using different spoofed IPs, those packets will be limited to 1000 packets per sampling interval. This way only "suspected" malicious packets are limited and not "legitimate" packets:

```
firewall flooding protocol udp packet limit 1000
```

The following command ensures a subscriber will not receive more than 1000 TCP-Syn packets per sampling interval:

```
firewall flooding protocol tcp-syn packet limit 1000
```

The following command specifies a flooding sampling interval of 1 second:

```
firewall flooding sampling-interval 1
```

firewall icmp-destination-unreachable-message-threshold

This command configures a threshold on the number of ICMP error messages sent by the subscriber for a particular data flow.

Important: In StarOS 8.0, this command is available in the ACS Configuration Mode. In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall icmp-destination-unreachable-message-threshold *messages* **then-block-server**

{ default | no } firewall icmp-destination-unreachable-message -threshold

default

Configures the default setting.
Default: No limit

no

Removes the previous configuration.

messages

Specifies the threshold on the number of ICMP error messages sent by the subscriber for a particular data flow.
messages must be an integer from 1 through 100.

Usage

Use this command to configure a threshold on the number of ICMP error messages sent by the subscriber for a particular data flow. After the threshold is reached, it is assumed that the server is not reacting properly to the error messages, and further downlink traffic to the subscriber on the unwanted flow is blocked.
Some servers that run QChat ignore the ICMP error messages (Destination Port Unreachable and Host Unreachable) from the mobiles. So the mobiles continue to receive unwanted UDP traffic from the QChat servers, and their batteries get exhausted quickly.

Example

The following command configures a threshold of 10 ICMP error messages:

firewall icmp-destination-unreachable-message-threshold *10* **then-block-server**

firewall max-ip-packet-size

This command configures the maximum IP packet size (after IP reassembly) allowed over firewall.

Important: In StarOS 8.0, this command is available in the ACS Configuration Mode. In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall max-ip-packet-size *packet_size* **protocol { icmp | non-icmp }**

default firewall max-ip-packet-size protocol { icmp | non-icmp }

default

Configures the default maximum IP packet size configuration.
Default: 65535 bytes (for both ICMP and non-ICMP)

packet_size

Specifies the maximum packet size.
packet_size must be an integer from 30000 through 65535.

protocol { icmp | non-icmp }

Specifies the transport protocol:

- **icmp**: Configuration for ICMP protocol.
- **non-icmp**: Configuration for protocols other than ICMP.

Usage

Use this command to configure the maximum IP packet size allowed for ICMP and non-ICMP packets to prevent packet flooding attacks to the host. Packets exceeding the configured size will be dropped for “Jolt Attack” and “Ping-Of-Death Attack”.

Example

The following command allows a maximum packet size of *60000* for ICMP protocol:

firewall max-ip-packet-size *60000* **protocol icmp**

firewall mime-flood

This command configures firewall protection from MIME Flood attacks.

Important: In StarOS 8.0, this command is available in the ACS Configuration Mode. In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall mime-flood { http-headers-limit *max_limit* **| max-http-header-field-size** *max_size* **}**

default firewall mime-flood { http-headers-limit | max-http-header-field-size }

default

Configures the default setting.

http-headers-limit *max_limit*

Specifies the maximum number of headers allowed in an HTTP packet. If the number of HTTP headers in a page received is more than the specified limit, the request will be denied.
max_limit must be an integer from 1 through 256.
Default: 16

max-http-header-field-size *max_size*

Specifies the maximum header field size allowed in the HTTP header, in bytes. If the size of HTTP header in the received page is more than the specified number of bytes, the request will be denied.
max_size must be an integer from 1 through 8192.
Default: 4096 bytes

Usage

Use this command to configure the maximum number of headers allowed in an HTTP packet, and the maximum header field size allowed in the HTTP header to prevent MIME flooding attacks.

Example

The following command sets the maximum number of headers allowed in an HTTP packet to *100*:

firewall mime-flood http-headers-limit *100*

The following command sets the maximum header field size allowed in the HTTP header to *1000* bytes:

firewall mime-flood max-http-header-field-size *1000*

firewall no-ruledef-matches

This command configures the default action for packets when no Firewall Ruledef matches.

Important: In StarOS 8.0, this command is available in the ACS Configuration Mode. In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, use the **access-rule no-ruledef-matches** command available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

firewall no-ruledef-matches { downlink | uplink } action { deny [charging-action *charging_action_name* **] | permit [bypass-nat | nat-realm** *nat_realm_name* **] }**

default firewall no-ruledef-matches { downlink | uplink } action

default

Configures the default action for packets with no Firewall ruledef match.

downlink | uplink

Specifies the packet type:

- **downlink**: Downlink packets with no Firewall ruledef match.

  Default: **deny**

- **uplink**: Uplink packets with no Firewall ruledef match.

  Default: **permit**

action { deny [charging-action *charging_action_name* **] | permit [bypass-nat | nat-realm** *nat_realm_name* **] }**

Specifies the default action for packets with no Firewall ruledef match.
permit [bypass-nat | nat-realm *nat_realm_name* **]**: Permit packets.

Important: The **bypass-nat** keyword is only available in StarOS 8.3 and later releases.

Optionally specify:

- **bypass-nat**: Specifies to bypass Network Address Translation (NAT).
- **nat-realm** *nat_realm_name*: Specifies a NAT realm to be used for performing NAT on subscriber packets.

  nat_realm_name must be an alpha and/or numeric string of 1 through 31 characters in length.

Important: If neither **bypass-nat** or **nat-realm** are configured, NAT is performed if the **nat policy nat-required** CLI command is configured with the **default-nat-realm** option.

deny [charging-action *charging_action_name* **]**: Denies specified packets. Optionally, a charging action can be specified.
charging_action_name must be the name of a charging action, and must be a string of 1 through 63 characters in length.

Usage

Use this command to configure the default action to be taken on packets with no Firewall ruledef matches. If, for deny action, the optional charging action is configured, the action taken depends on what is configured in the charging action. For the firewall rule, the "flow action", "billing action", and "content ID" of the charging action will be used to take action. If flow exists, flow statistics are updated.
Allowing/dropping of packets is determined in the following sequence:

- Check is done to see if the packet matches any pinholes. If yes, no rule matching is done and the packet is allowed.
- Firewall ruledef matching is done. If a rule matches, the packet is allowed or dropped as per the **firewall priority** configuration.
- If no firewall ruledef matches, the packet is allowed or dropped as per the **no-ruledef-matches** configuration.

For a packet dropped due to firewall ruledef match or no match (first packet of a flow), the charging action applied is the one configured in the **firewall priority** or the **firewall no-ruledef-matches** command respectively.
In StarOS 8.1, in the case of Policy-based Firewall, the charging action applied is the one configured in the **access-rule priority** or the **access-rule no-ruledef-matches** command respectively.
For action on packets dropped due to any error condition after data session is created, the charging action must be configured in the **flow any-error charging-action** command.

Example

The following command sets Stateful Firewall to permit downlink packets with no ruledef matches:

```
firewall no-ruledef-matches downlink action permit
```

firewall policy

This command enables/disables Stateful Firewall support for all subscribers using this rulebase.

Important: In StarOS 8.0, this command is available in the APN/Subscriber Configuration Mode. In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall policy firewall-required

{ default | no } firewall policy
```

default

Configures the default firewall support setting for all subscribers using this rulebase.
Default: Disabled

no

Disables firewall support for all subscribers using this rulebase.

firewall-required

Enables firewall support for all subscribers using this rulebase.

Usage

Use this command to enable/disable firewall support for all subscribers using this rulebase.

Example

The following command enables Stateful Firewall support:

```
firewall policy firewall-required
```

The following command disables Stateful Firewall support:

```
no firewall policy
```

firewall priority

This command adds and specifies the priority and type of a firewall ruledef in the rulebase, and allows to configure a single or range of ports to be allowed on the server for auxiliary/data connections.

Important: In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, use the **access-rule priority** command available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

firewall priority *priority* **[dynamic-only | static-and-dynamic] firewall-ruledef** *firewall_ruledef_name* **{ { deny [charging-action** *charging_action_name* **] } | { permit [nat-realm** *nat_realm_name* **| [trigger open-port {** *aux_port_number* **| range** *start_port_number* **to** *end_port_number* **} direction { both | reverse | same }]] } }**

no firewall priority *priority*

no

Removes the specified firewall ruledef priority configuration from the rulebase.

priority

Specifies the firewall ruledef's priority in the rulebase.
priority must be unique, and must be an integer from 1 through 65535.

[dynamic-only | static-and-dynamic] firewall-ruledef *firewall_ruledef_name*

Specifies the firewall ruledef to add to the rulebase. Optionally, the firewall ruledef type can be specified.

- **dynamic-only**: Firewall Dynamic Ruledef—Predefined ruledef that can be enabled/disabled by the policy server, and is disabled by default.
- **static-and-dynamic**: Firewall Static and Dynamic Ruledef—Predefined ruledef that can be disabled/enabled by the policy server, and is enabled by default.
- *firewall_ruledef_name* must be the name of a predefined firewall ruledef, and must be a string of 1 through 63 characters in length.

deny [charging-action *charging_action_name* **]**

Denies packets if the rule is matched. An optional charging action can be specified. If a packet matches the deny rule, action is taken as configured in the charging action. For firewall ruledefs, only the terminate-flow action is applicable, if configured in the specified charging action.
charging_action_name must be a string of 1 through 63 characters in length.

permit [nat-realm *nat_realm_name* **| [bypass-nat] [trigger open-port {** *aux_port_number* **| range** *start_port_number* **to** *end_port_number* **}]]**

Permits packets.

- **nat-realm** *nat_realm_name*: Specifies the NAT realm to be used for performing NAT on subscriber packets matching the firewall ruledef.

  If the NAT realm is not specified, then NAT will be bypassed. That is, NAT will not be applied on subscriber packets that are matching a firewall ruledef with no NAT realm name configured.

  nat_realm_name specifies the NAT realm name, and must be a string of 1 through 31 characters in length.

- **bypass-nat**: Specifies that packets bypass NAT.

  Important: If the **nat-realm** is not configured, NAT is performed if the **nat policy nat-required** CLI command is configured with the **default-nat-realm** option.

- **trigger open-port {** *aux_port_number* **| range** *start_port_number* **to** *end_port_number* **}**: Permits packets if the rule is matched, and allows the creation of data flows for firewall. Optionally a port trigger can be specified to be used for this rule to limit the range of auxiliary data connections (a single or range of port numbers) for protocols having control and data connections (like FTP). The trigger port will be the destination port of an association which matches a rule.
  - *aux_port_number*: Specifies the number of auxiliary ports to open for traffic, and must be an integer from 1 through 65535.
  - **range** *start_port_number* **to** *end_port_number*: Specifies the range of ports to open for subscriber traffic.
    - *start_port_number* must be an integer from 1 through 65535. This is the start of the port range and must be less than *end_port_number*.
    - *end_port_number* must be an integer from 1 through 65535. This is the end of the port range and must be greater than *start_port_number*.

direction { both | reverse | same }

Specifies the direction from which the auxiliary connection is initiated. This direction can be same as the direction of control connection, or the reverse of the control connection direction, or in both directions.

- **both**: Provides the trigger to open port for traffic in either direction of the control connection.
- **reverse**: Provides the trigger to open port for traffic in the reverse direction of the control connection (from where the connection is initiated).
- **same**: Provides the trigger to open port for traffic in the same direction of the control connection (from where the connection is initiated).

Usage

Use this command to add firewall ruledefs to the rulebase and configure the priority, type, and port triggers. Port trigger configuration is optional. Port trigger can be configured only if a rule action is permit.
The rulebase specifies the firewall rules to be applied on the calls. The ruledefs within a rulebase have priorities, based on which priority matching is done. Once a rule is matched and the rule action is permit, if

the trigger is configured, the appropriate check is made. The trigger port will be the destination port of an association which matches the rule.
Multiple triggers can be defined for the same port number to permit multiple auxiliary ports for subscriber traffic.
Once a rule is matched and if the rule action is deny, the action taken depends on what is configured in the specified charging action. If the flow exists, flow statistics are updated and action is taken as configured in the charging action:

- If the billing action is configured as EDR enabled, EDR is generated.
- If the content ID is configured, UDR information is updated.
- If the flow action is configured as "terminate-flow", the flow is terminated instead of just discarding the packet.

If the billing action, content ID, and flow action are not configured, no action is taken on the dropped packets.

Important: For firewall ruledefs, only the terminate-flow action is applicable if configured in the specified charging action.

For a packet dropped due to firewall ruledef match or no match (first packet of a flow), the charging action applied is the one configured in the **firewall priority** or the **firewall no-ruledef-matches** command respectively.
In StarOS 8.1, in the case of Policy-based Firewall, the charging action applied is the one configured in the **access-rule priority** or the **access-rule no-ruledef-matches** command respectively.
For action on packets dropped due to any error condition after data session is created, the charging action must be configured in the **flow any-error charging-action** command.
The GGSN can dynamically activate/deactivate dynamic firewall ruledefs for a subscriber based on the rule name received from a policy server. At rule match, if a rule in the rulebase is a dynamic rule, and if the rule is enabled for the particular subscriber, rule matching is done for the rule. If the rule is disabled for the particular subscriber, rule matching is not done for the rule.

Example
The following command assigns a priority of *10* to the firewall ruledef *fw_rule1*, adds it to the rulebase, and permits port trigger to be used for the rule to open ports in the range of *100* to *200* in either direction of the control connection:

```
firewall priority 10 firewall-ruledef fw_rule1 permit trigger open-port
range 100 to 200 direction both
```

The following command configures the firewall ruledef *fw_rule2* as a dynamic ruledef:

```
firewall priority 7 dynamic-only firewall-ruledef fw_rule2 deny
```

firewall tcp-first-packet-non-syn

This command configures the action to take on TCP flow starting with a non-syn packet.

Important: In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall tcp-first-packet-non-syn { drop | reset }

default firewall tcp-first-packet-non-syn
```

`default`

Configures the default setting.
Default: **`drop`**

`drop | reset`

Specifies the action to take on TCP flow starting with a non-syn packet.

- **`drop`**: Drops the packet or session
- **`reset`**: Sends reset

Usage

Use this command to configure action to take on TCP flow starting with a non-syn packet.

Example

The following command configures action to take on TCP flow starting with a non-syn packet to drop:

```
firewall tcp-first-packet-non-syn drop
```

firewall tcp-idle-timeout-action

This command configures action to take on TCP idle timeout expiry.

Important: In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall tcp-idle-timeout-action { drop | reset }

default firewall tcp-idle-timeout-action
```

default

Configures the default setting.
Default: **reset**

drop | reset

Specifies the action to take on TCP timeout expiry:

- **drop**: Drops the packet or session
- **reset**: Sends reset

Usage

Use this command to configure action to take on TCP idle timeout expiry.

Example

The following command configures action to take on TCP idle timeout expiry to drop:

```
firewall tcp-idle-timeout-action drop
```

firewall tcp-reset-message-threshold

This command configures a threshold on the number of TCP reset messages sent by the subscriber for a particular data flow. After this threshold is reached, further downlink traffic to the subscriber on the unwanted flow is blocked.

Important: This command is only available in StarOS 8.3 and later. In StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall tcp-reset-message-threshold messages then-block-server

{ default | no } firewall tcp-reset-message-threshold
```

default

Configures the default setting.
Default: **no firewall tcp-reset-message-threshold**

no

Removes the previous configuration.

messages

Specifies the threshold on the number of TCP reset messages sent by the subscriber for a particular data flow. *messages* must be an integer from 1 through 100.

Usage

Use this command to configure a threshold on the number of TCP reset messages sent by the subscriber for a particular data flow. After the threshold is reached, assuming the server is not reacting properly to the reset messages further downlink traffic to the subscriber on the unwanted flow is blocked. This configuration enables QCHAT noise suppression for TCP.

Example

The following command sets the threshold on the number of TCP reset messages to *10*:

```
firewall tcp-reset-message-threshold 10 then-block-server
```

firewall tcp-syn-flood-intercept

This command enables and configures the TCP intercept parameters to prevent TCP SYN flooding attacks by intercepting and validating TCP connection requests for DoS protection mechanism configured with the **dos-protection** command.

Important: In StarOS 8.0, this command is available in the ACS Configuration Mode. In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall tcp-syn-flood-intercept { mode { none | watch [aggressive] } | watch-timeout *intercept_watch_timeout* **}**

default firewall tcp-syn-flood-intercept { mode | watch-timeout }

default

Sets the default values of TCP intercept parameters for SYN Flood DoS protection.

mode { none | watch [aggressive] }

Specifies the TCP SYN flood intercept mode:

- **none**: Disables TCP SYN flood intercept feature.
- **watch**: Configures TCP SYN flood intercept feature in watch mode. The firewall passively watches to see if TCP connections become established within a configurable interval. If connections are not established within the timeout period, the firewall clears the half-open connections by sending RST to TCP client and server. The default watch-timeout for connection establishment is 30 seconds.
- **aggressive**: Configures TCP SYN flood Intercept or Watch feature for aggressive behavior. Each new connection request causes the oldest incomplete connection to be deleted. When operating in watch mode, the watch timeout is reduced by half. If the watch-timeout is 30 seconds, under aggressive conditions it becomes 15 seconds. When operating in intercept mode, the retransmit timeout is reduced by half (i.e. if the timeout is 60 seconds, it is reduced to 30 seconds). Thus the amount of time waiting for connections to be established is reduced by half (i.e. it is reduced to 150 seconds from 300 seconds under aggressive conditions).

Default: **none**

watch-timeout *intercept_watch_timeout*

Specifies the TCP intercept watch timeout, in seconds.
intercept_watch_timeout must be an integer from 5 through 30.
Default: 30

Usage

This TCP intercept functionality provides protection against TCP SYN Flooding attacks.
The system captures TCP SYN requests and responds with TCP SYN-ACKs. If a connection initiator completes the handshake with a TCP ACK, the TCP connection request is considered as valid by system and system forwards the initial TCP SYN to the valid target which triggers the target to send a TCP SYN-ACK. Now system intercepts with TCP SYN-ACK and sends the TCP ACK to complete the TCP handshake. Any TCP packet received before the handshake completion will be discarded.

Example

The following command sets the TCP intercept watch timeout setting to *5* seconds:

```
firewall tcp-syn-flood-intercept watch-timeout 5
```

flow any-error

This command specifies the charging action to be used for packets dropped by Stateful Firewall due to any error conditions.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

flow any-error charging-action *charging_action_name*

default flow any-error

default

Configures the default action for packets dropped by Stateful Firewall due to any errors.
Default: Update the flow statistics if flow is available

charging-action *charging_action_name*

Specifies the charging action based on which accounting action is taken on packets dropped by Stateful Firewall due to any errors.

Important: The charging action specified here should preferably not be used for action on packets dropped due to firewall ruledef match or no-match (in the **firewall priority** and **firewall no-ruledef-matches** commands) and the content ID within the charging action must be unique so that dropped counts will not interfere with other content IDs.

charging_action_name must be the name of a charging action, and must be a string of 1 through 63 characters in length.

Usage

Use this command to configure the charging action for packets dropped by Stateful Firewall due to any error conditions, such as, a packet being inappropriate based on the state of the protocol of the packet's session, or DoS protection causing the packet to be discarded, and so on.
For a packet dropped due to firewall ruledef match or no match (first packet of a flow), the charging action applied is the one configured in the **firewall priority** or the **firewall no-ruledef-matches** command respectively.
In StarOS 8.1, in the case of Policy-based Firewall, the charging action applied is the one configured in the **access-rule priority** or the **access-rule no-ruledef-matches** command respectively.
For a packet dropped due to any error condition after data session is created, the charging action used is the one configured in the **flow any-error charging-action** command.
If the charging action applied on a packet is the one specified in the **flow any-error charging-action** command, flow statistics are updated and action is taken as configured in the charging action:

- If the billing action is configured as EDR enabled, EDR is generated.
- If the content ID is configured, UDR information is updated.

- If the flow action is configured as “terminate-flow”, the flow is terminated instead of just discarding the packet.

If the billing action, content ID, and flow action are not configured, no action is taken on the dropped packets.

Example

The following command specifies the charging action *test2* for accounting action on packets dropped/discarded by Stateful Firewall due to any error:

```
flow any-error charging-action test2
```

flow control-handshaking

This command specifies how to charge for the control traffic associated with an application.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
flow control-handshaking { charge-to-application { [ all-packets ] [ initial-packets ] [ mid-session-packets ] [ tear-down-packets ] } | charge-separate-from-application }

default flow control-handshaking

no flow control-handshaking [ charge-to-application ]
```

`no flow control-handshaking [ charge-to-application ]`

Removes the previous flow control-handshaking configuration. The control packets will use whatever content-id is determined by the normal use of the action CLI commands.
In this command, the optional keyword **`charge-to-application`** is deprecated and has no effect.

`default flow control-handshaking`

Configures the default setting.
Default: **`no flow control-handshaking`**

`charge-to-application`

This keyword configures the charging action to include the flow control packets either during initial handshaking only or specified control packets during session for charging.

`all-packets`

Specifies that the initial setup packets will wait until the application has been determined before assigning the content-id, and all mid-session ACK packets, as well as, the final tear-down packets will use that content-id.

`initial-packets`

Specifies that only the initial setup packets will wait for content-id assignment.

`mid-session-packets`

Specifies that the ACK packets after the initial setup will use the application's or content-id assignment.

`tear-down-packets`

Specifies that the final tear-down packets (TCP or WAP) will use the application's or content-id assignment.

charge-separate-from-application

This keyword configures the charging action to separate the charging of the initial control packets or all subsequent control packets from regular charging.

Usage

Use this command to configure how to charge for the control traffic associated with an application ruledef. Applications like HTTP use TCP to set up and tear down connections before the HTTP application starts. This CLI command controls whether the packets that set up and tear down the connections should use the same content ID as the application's flow.
In normal mode 3-way handshake TCP packets (SYN, SYN-ACK, and ACK) and closing or intermittent packets (FIN, RST, etc.) directed and charged based on configured matched rules. This command makes the system to wait for the start and stop of layer 7 packet flow and content ID and charge the initial, intermittent, and closing TCP packets as configured to the same matching rules and content ID as of the flow.
This CLI command also affects applications that do not use TCP but use other methods for control packets, e.g., WAP where WTP/UDP may be used to set up and tear down connection-oriented WSP.

Example

Following command enables the charging for initial TCP handshaking control packets and wait for content-id of data traffic flow:

```
flow control-handshaking charge-to-application initial-packets
```

The following command enables charging all mid-session ACKs as well as tear-down packets to application:

```
flow control-handshaking charge-to-application mid-session-packets tear-down-packets
```

flow end-condition

This command sets the end condition of the session flows related to a user session and triggers the EDR generation.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
flow end-condition { { content-filtering | normal-end-signaling | timeout + } |
{ { hagr | handoff | session-end } [ flow-overflow ] + } [ url-blacklisting ] }
edr edr_format

no flow end-condition
```

no

Removes the previously configured end condition of the EDR flow related to a user session.

content-filtering

Specifies to create an EDR with format named *edr_format* when category-based content filtering application action leads to a flow end. Possible Content-filtering actions redirect-url, terminate-flow, content-insert.

hagr

Specifies to create an EDR with format named *edr_format* when flow ended due to session handoff according to Interchassis Session Recovery support.

handoff

Specifies to create an EDR with format named *edr_format* when flow ended due to hand-off. Whenever a handoff occurs, ACS closes the EDRs for all current flows using the EDR format *edr_format*, and begin new statistics collection for the flows for the EDRs that will be generated when the flows actually end.

normal-end-signaling

Specifies the flow end condition as normal when a flow end is signaled normally like detecting FIN and ACK for a TCP flow, or a WSP-DISCONNECT terminating a connection-oriented WSP flow over UDP) and create an EDR for the flow using the EDR format *edr_format*.

session-end

Specify to create an EDR when a subscriber session ends. By this option ACS creates an EDR with format named *edr_format* for every flow that has had any activity since last EDR was created for the flow on session end.

timeout

Specify to create an EDT with format named *edr_format* when a flow ends or deleted due to a timeout condition.

flow-overflow

Important: This keyword is only available in StarOS 8.3 and later. And, is only applicable when used with the **hagr**, **handoff**, and **session-end** keywords.

Specifies generation of flow-overflow EDR for conditions that affect the call line. If any of the specified end-conditions that affect subscriber information stored at ACS (i.e. call line) is configured the "flow-overflow" EDR is generated.

url-blacklisting

Specifies to create an EDR with format named *edr_format* when URL Blacklisting application action leads to a flow end.

+

More than one of the keywords can be entered within a single command.

edr *edr_format*

Specifies the EDR format name to record EDR in specified flow end condition.
edr_format is a pre-configured format, and must be a unique alpha and/or numeric string 1 through 63 characters in length.

Usage

Use this command to enable or disable the capturing of EDRs based on flow end condition.

Example

The following command defines the end condition as handoff for flow and creates an EDR with as per format named *EDR_format1*:

flow end-condition handoff edr-format *EDR_format1*

flow limit-across-applications

This command limits the total number of simultaneous flows per Subscriber/APN sent to a rulebase regardless of the flow type, or limit flows based on the protocol type under the Session Control feature.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

flow limit-across-applications { *limit* | non-tcp *limit* | tcp *limit* }

no flow limit-across-applications [non-tcp | tcp]

no

Removes the previously configured flow limit configuration.

limit

Specifies the maximum number of flows across all applications for the rulebase.
limit must be an integer from 1 through 4000000000.
Default: No limits

non-tcp *limit*

Specifies the maximum limit of non-TCP type flows.
limit must be an integer from 1 through 4000000000.
Default: No limits

tcp *limit*

Specifies the maximum limit of TCP flows.
limit must be an integer from 1 through 4000000000.
Default: No limits

Usage

Use this command to limit the total number of flows allowed for a rulebase regardless of flow type, or limit flows based on the protocol—non-TCP (connection-less) or TCP (connection-oriented).
If a subscriber attempts to exceed these limits system discards the packets of new flow. This limit processing of this command has following aspects for UDP, TCP, ICMP and some of the exempted flows:

- UDP/ICMP: System waits for the flow timeout before updating the counter and removing it from the count of number of flows.
- TCP: After a TCP flow ends, system waits for a short period of time to accommodate the retransmission of any missed packet from one end. TCP flows those are ended, but are still in wait period for timeout are exempted for this limit processing.
- Exempted flows: System exempts all the other flows specified with the **flow limit-for-flow-type** command in the ACS Charging Action Configuration Mode set to **no**.

Example

The following command defines the maximum number of *200000* flows for the rulebase:

```
flow limit-across-applications 200000
```

fw-and-nat default-policy

This command configures the default Firewall-and-NAT policy for a rulebase.

Important: This command is only available in StarOS 8.1 and StarOS 9.0 and later. This command must be used to configure the Policy-based Firewall-and-NAT feature.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

fw-and-nat default-policy *fw_nat_policy_name*

no fw-and-nat default-policy

no

Removes the previously configured Firewall-and-NAT policy configured for the current rulebase.

fw_nat_policy_name

Specifies the Firewall-and-NAT policy name.
fw_nat_policy_name must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to configure the default Firewall-and-NAT policy for an ACS rulebase.
This policy is used for a subscriber only if:

- In the APN/subscriber Configuration Modes, the **default fw-and-nat policy** command is configured.
- Or, a policy to use is not received from the AAA/OCS.

For more information, see the *Personal Stateful Firewall Administration Guide*.

Example

The following command configures a Firewall-and-NAT policy named *standard* to the rulebase:

fw-and-nat default-policy *standard*

ip reassembly-timeout

This command configures how long to hold onto IP fragments for reassembly, while waiting for the complete packet to arrive.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

ip reassembly-timeout *timeout_duration*

default ip reassembly-timeout

default

Configures the default IP Reassembly Timeout setting.
Default: 5000 milliseconds

timeout_duration

Specifies the timeout period to hold fragmented packets before reassembly.
timeout_duration is the duration, in milliseconds, and must be an integer from 100 through 30000.

Usage

Use this command to configure duration for timeout timer to hold IP fragmented packets before reassembly is needed.
IP fragmented packet are retained, until either all fragmented packets have been received or the configured timeout has expired for the oldest fragment. If all fragments have been received, a temporary complete packet is reconstructed for analysis. Then all fragments are forwarded in order from first to last. If all fragments are not received, the fragments will be forwarded without being passed through the protocol analyzers, except for the IP analyzer.

Example

The following command sets the timeout timer to *15000* milliseconds:

ip reassembly-timeout *15000*

ip reset-tos

This command enables the system to reset the IP Type of Service (ToS) value to zero.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] ip tos-reset
```

default

Configures the default setting.
Default: Do not reset the ToS to zero

no

Removes the previous configuration.

Usage

Use this command to reset the ToS field of any packet after it reaches ACS, or to broaden the range of values that are used in the ToS field in the IP header of any packet.

nat binding-record

Configures the NAT Binding Record (NBR) generation setting.

Important: This command is only available in StarOS 8.3. In StarOS 9.0 this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

nat binding-record edr-format *edr_format* **[port-chunk-allocation] [port-chunk-release] +**

{ default | no } nat binding-record

default

Configures the default setting.
Default: **port-chunk-release**

no

Deletes the previous NBR configuration.

edr-format *edr_format*

Specifies the EDR format name.
edr_format must be an alpha and/or numeric string of 1 through 63 characters in length.

port-chunk-allocation

Specifies generating NBR when a port chunk is allocated.

port-chunk-release

Specifies generating NBR when a port chunk is released.

+

Indicates that more than one of the previous keywords can be entered within a single command.

Usage

Use this command to configure the NBR generation.

Example

The following command configures an EDR format named *test123* and specifies generating NBR when a port chunk is allocated, and when a port chunk is released:

```
nat binding-record edr-format test123 port-chunk-allocation port-chunk-release
```

nat policy

This command enables/disables Network Address Translation (NAT) processing for all subscribers using this rulebase.

Important: In StarOS 8.1 and StarOS 9.0 and later, for Policy-based Firewall-and-NAT, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Important: Before enabling NAT processing for a subscriber, Firewall must be enabled for the subscriber. See the firewall policy CLI command.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

nat policy nat-required [default-nat-realm *nat_realm_name* **]**

{ default | no } nat policy

default

Configures the default NAT processing setting for all subscribers using this rulebase.
Default: Disabled

no

Disables NAT processing for all subscribers using this rulebase.

nat-required

Enables NAT processing for all subscribers using this rulebase.

default-nat-realm *nat_realm_name*

Important: This keyword is only available in StarOS 8.3 and later.

Specifies the default NAT realm to be used if one is not already configured.
nat_realm_name must be an alpha and/or numeric string of 1 through 31 characters in length.

Important: Including the default NAT realm, a maximum of three NAT realms are supported.

Usage

Use this command to enable/disable NAT processing for all subscribers using this rulebase.

Once NAT is enabled for a subscriber, the NAT IP address to be used is chosen from the NAT realms defined in the rule priority lines within the rulebase. See the firewall priority CLI command.
NAT enable/disable status in the rulebase can be changed any time, however the changed NAT status will not be applied for active calls using the rulebase. The new NAT status is only applied to new calls.

Example
The following command enables NAT processing:

```
nat policy nat-required
```

The following command disables NAT processing:

```
no nat policy
```

nat suppress-aaa-update

This command suppresses the sending of NAT bind updates (NBU) to the AAA server when PPP disconnect happens.

Important: This command is customer-specific. For more information please contact your local service representative. In StarOS 9.0, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

```
nat suppress-aaa-update call-termination

default nat suppress-aaa-update
```

default

Configures the default setting.
Default: No suppression of AAA updates

Usage

Use this command to suppress the sending of NAT Bind Updates (NBU) to the AAA server when PPP disconnect happens, as these NBUs would be cleared at the AAA after receiving the accounting-stop. This enables to minimize the number of messages between the chassis and AAA server. When not configured, NAT bind updates are sent to the AAA server whenever a port chunk is allocated, de-allocated, or the call is cleared (PPP disconnect).

Example

The following command suppresses the sending of NBU to the AAA server when PPP disconnect happens:

```
nat suppress-aaa-update call-termination
```

p2p dynamic-flow-detection

This command enables the P2P analyzer to detect P2P applications configured for ACS.

Product

P2P

Privilege

Security Administrator, Administrator

Syntax

```
p2p dynamic-flow-detection

{ default | no } p2p dynamic-flow-detection
```

default

Configures the default setting.
Default: **no p2p dynamic-flow-detection**

no

Disables detecting P2P applications with the P2P analyzer.

Usage

Use this command to set up dynamic-flow detection. This allows the P2P analyzer to detect the P2P applications configured for the ACS.

post-processing priority

This command configures the post-processing priority and action to be taken on the specified ruledef in the rulebase.

Important: This command is only available in StarOS 8.3 and later.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

post-processing priority *priority* **{ group-of-ruledefs** *ruledefs_group_name* **| ruledef** *ruledef_name* **} charging-action** *charging_action_name* **[description** *description* **]**

no post-processing priority *priority*

priority *priority*

Specifies priority for the ruledef/group-of-ruledefs in the rulebase.
priority must be an integer from 1 through 65535, and must be unique.

group-of-ruledefs *ruledefs_group_name*

Assigns the specified group-of-ruledefs to the rulebase.
ruledefs_group_name must be the name of a group-of-ruledefs, and must be an alpha and/or numeric string of 1 through 63 characters in length.

Important: The group-of-ruledefs specified must be configured for post-processing. See the **group-of-ruledefs-application** CLI command in the ACS Group-of-Ruledefs Configuration Mode.

ruledef *ruledef_name*

Assign the specified ruledef to the rulebase.
ruledef_name must be an alpha and/or numeric string of 1 through 63 characters in length.

Important: The ruledef specified must be configured for post-processing. See the **rule-application** CLI command in the ACS Ruledef Configuration Mode.

charging-action *charging_action_name*

Specifies the charging action.
charging_action_name must be an alpha and/or numeric string of 1 through 63 characters in length.

description *description*

Specifies optional description for this configuration.

description must be an alpha and/or numeric string of 1 through 31 characters in length.

Usage

Use this command to configure the post-processing priority and action to be taken on a ruledef in the rulebase.

Example

The following command configures the ruledef named *test_ruledef* with a priority of *10*, and the charging action named *test_ca* for post processing:

```
post-processing priority 10 ruledef test_ruledef charging-action test_ca
```

post-processing dynamic

This command configures specified ruledefs/group-of-ruledefs as dynamic post-processing ruledefs/group-of-ruledefs enabling to differentiate between normal post-processing rules from pre-configured ones. By default this configuration is disabled.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

post-processing dynamic { group-of-ruledefs *ruledefs_group_name* **| ruledef** *ruledef_name* **} charging-action** *charging_action_name* **[description** *description* **]**

no post-processing dynamic { group-of-ruledefs *ruledefs_group_name* **| ruledef** *ruledef_name* **}**

no

Removes the specified post-processing dynamic configuration.

group-of-ruledefs *ruledefs_group_name*

Assigns the specified group-of-ruledefs to the current rulebase.
ruledefs_group_name must be an alpha and/or numeric string of 1 through 63 characters in length.

ruledef *ruledef_name*

Assigns the specified ruledef to the current rulebase.
ruledef_name must be an alpha and/or numeric string of 1 through 63 characters in length.

charging-action *charging_action_name*

Specifies the charging action.
charging_action_name must be an alpha and/or numeric string of 1 through 63 characters in length.

description *description*

Specifies optional description for this configuration.
description must be an alpha and/or numeric string of 1 through 31 characters in length.

Usage

Use this command to configure specific ruledefs/group-of-ruledefs as dynamic post-processing ruledefs/group-of-ruledefs enabling to differentiate between normal post-processing rules from the pre-configured ones. This makes possible enabling/disabling ruledefs/groups-of-ruledefs entry from external server.

Example

The following command specifies the ruledef named *test_rule* as a dynamic post-processing ruledef configured with the charging action *ca13* and a description of *testing*:

```
post-processing dynamic ruledef test_rule charging-action ca13
description testing
```

qos-renegotiate timeout

This command configures the timeout setting for the Quality of Service (QoS) Renegotiation feature.

Important: This command is controlled by the dynamic-qos-renegotiation license.

Product

All

Privilege

Security Administrator, Administrator

Syntax

qos-renegotiate timeout *timeout*

no qos-renegotiate timeout

no

Disables timeout setting if previously configured.

timeout *timeout*

Specifies the timeout period for QoS Renegotiation feature in this rulebase.
timeout must be the timeout period, in seconds, and must be an integer from 0 through 4294967295.
If set to 0, timeout is disabled.

Usage

Use this command to configure timeout setting for the QoS Renegotiation feature.

Example

The following command sets the QoS renegotiate timeout period to 1000 seconds:

qos-renegotiate timeout *1000*

radius threshold

This command sets the interval and volume thresholds to generate the interim RADIUS CDRs and write them to CDR file for ACS postpaid billing.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius threshold { interval *interval* **| volume total** *volume* **}**

{ no | default } radius threshold { interval | volume total }

no

Removes the previously RADIUS threshold configuration.

default

Configures the default settings.

interval *interval*

Specifies the time interval (in seconds) for generating RADIUS interim accounting requests. This option is disabled by default.
interval must be an integer from 60 through 40000000.
Default: Disabled

volume total *volume*

Default: Disabled
Specifies the limit for the total number of octets (uplink+downlink) after which a stop-start pair will be sent to RADIUS.
volume must be an integer from 100,000 through 4,000,000,000.

Usage

Use this command to specify a time interval threshold to generate interim RADIUS CDRs and write it to RADIUS CDR file for postpaid billing.

Example

The following command defines a time threshold interval of *600* seconds for RADIUS CDRs:

radius threshold interval *600*

route priority

This command controls routing of packets to protocol analyzers.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
route priority route_priority ruledef ruledef_name analyzer { dns | file-
transfer | ftp-control | ftp-data | http | imap | mms | p2p | pop3 | rtcp | rtp
| rtsp | sdp | secure-http | sip | smtp | wsp-connection-less | wsp-connection-
oriented } [ description description ]

no route priority route_priority
```

no

Removes the specified route configuration from the current rulebase.

priority *route_priority*

Specifies the route priority for the ruledef in the current rulebase.
route_priority must be an integer from 1 through 65535.
Lower numbered priorities are examined first. Up to 1024 instances can be configured across all rulebases.

ruledef *ruledef_name*

Specifies the ruledef to evaluate packets to determine analyzer.
ruledef_name specifies the name of an existing ruledef configured for the route application using the **rule-application** command in the ACS Ruledef Configuration Mode.

analyzer

Specifies the analyzer for the ruledef, and must be one of the following:

- **dns**: Route to DNS protocol analyzer.
- **file-transfer**: Route to file analyzer.
- **ftp-control**: Route to FTP control protocol analyzer.
- **ftp-data**: Route to FTP data protocol analyzer.
- **http**: Route to HTTP protocol analyzer.
- **imap**: Route to IMAP protocol analyzer.
- **mms**: Route to MMS protocol analyzer.
- **p2p**: Route to the P2P protocol analyzer.
- **pop3**: Route to POP3 protocol analyzer.
- **rtcp**: Route to RTCP protocol analyzer.
- **rtp**: Route to RTP protocol analyzer.

- **rtsp**: Route to RTSP protocol analyzer.
- **sdp**: Route to SDP protocol analyzer.
- **secure-http**: Route to secure HTTP protocol analyzer.
- **sip**: Route to SIP protocol analyzer.
- **smtp**: Route to SMTP protocol analyzer.
- **wsp-connection-less**: Route to WSP connection-less protocol analyzer.
- **wsp-connection-oriented**: Route to WSP connection-oriented protocol analyzer.

Important: To route packets to the P2P analyzer, the ruledef should have rules to match all IP packets. Otherwise, the analyzer may not detect all P2P traffic.

Important: Use the **show active-charging analyzer statistics** command in the Exec Mode to see the list of supported analyzers.

description *description*

Enables to add a description to the rule and action for later reference in saved configuration file. *description* must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Instances of this CLI command control which packets are routed to which protocol analyzers. Packets sent to ACS are always passed through the IP protocol analyzer. This CLI command controls which higher layer analyzers are also invoked.

Analyzer	Common ways to route to the analyzer
ip	All IPv4 packets are automatically routed here.
icmp	All IPv4 packets with IP protocol = ICMP (1) are automatically routed here.
tcp	All IPv4 packets with IP protocol = TCP (6) are automatically routed here.
udp	All IPv4 packets with IP protocol = UDP (17) are automatically routed here.
dns	UDP destination port or source port is DNS (53).
http	TCP destination port or source port is HTTP (80).
secure-http	TCP destination port or source port is HTTPS (443). Note that HTTP may use the CONNECT method (see RFC 2817), in which case, the subscriber will be upgraded with transport layer security, but the traffic to/from the chassis will still be HTTP and be passed through the http rather than the secure-http analyzer (assuming that routing to the http analyzer has been configured).
wsp	UDP destination port or source port is connection-less WSP (9200) or connection-oriented WSP (9201).
wtp	Packets are automatically routed here, if you specified “wsp-connection-oriented” as described above.
wap2	TCP destination port or source port of the carrier-specific port number for WAP-2 (e.g. one carrier uses 8799); or, send all HTTP traffic to the **wap2** analyzer if the carrier does not use a special port number.
ftp	TCP destination port or source port is FTP control (21) or FTP data (20); or, ftp analyzer (for FTP control packets) dynamically detected an FTP data flow over TCP (tcp dynamic-flow = ftp-data).

Analyzer	Common ways to route to the analyzer
file-transfer	FTP and the command name is **retr** or **stor**; or, HTTP and the request method is **get** or **post**.
mms	WSP content type is application/vnd.wap.**mms**-message; or, WSP uri contains "**mms**"; or, HTTP content type is application/vnd.wap.mms-message; or, HTTP uri contains "**mms**".
sip	UDP destination port or source port is SIP (5060).
sdp	RTSP or SIP content type is application/sdp
smtp	TCP destination port or source port is SMTP (25).
imap	TCP destination port or source port is IMAP (143).
pop3	TCP destination port or source port is POP3 (110).
rtp and **rtcp**	RTSP has embedded RTP/RTCP payloads (you need to enable RTP dynamic flow detection to catch those flows); or, RTSP or SDP (for SDP within SIP) creates an RTP/RTCP flow over UDP (in addition to enabling the aforementioned dynamic flow detection, you must make sure that UDP packets are routed to the UDP analyzer) or, RTP/RTCP uses predefined UDP port numbers (e.g. default UDP port numbers of 5004/5005).
rtsp	TCP destination port or source port is RTSP (554).
p2p	Use the **p2p dynamic-flow-detection** CLI command to enable detection of the different P2P applications specified by the **p2p application** CLI command; that will cause every TCP or UDP packet to be automatically routed here

Example

The following command assigns a route and rule action with the route priority of 23, a ruledef named *test*, and an analyzer *test_analyzer* with description as *route_test1* to the current rulebase:

```
route priority 23 ruledef test analizer test_analyzer description
route_test1
```

rtp dynamic-flow-detection

This command enables the RTSP and SDP analyzers to detect the start/stop of RTP and RTCP flows.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] rtp dynamic-flow-detection
```

no

Disables the previous RTP dynamic flow detection configuration.

default

Configures the default RTP dynamic flow detection configuration.
Default: **no rtp dynamic-flow-detection**

Usage

Use this command to enable the RTSP and SDP analyzer to detect the start/stop of RTP and RTCP flows. This command is used in conjunction with the **route priority** command.

Example

The following command enables RTP dynamic flow detection:

```
rtp dynamic-flow- detection
```

ruledef-parsing

This command configures whether to consider/ignore the port number embedded in the application header (for example, the ":80" in www.starentnetworks.com:80) when comparing the ruledef expressions to the packet contents.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ruledef-parsing ignore-port-numbers-embedded-in-application-headers
analyzers { http rtsp sip wsp }

default ruledef-parsing
```

no

Disables the previous configuration.

default

Configures the default setting.
Default: **no ruledef-parsing ignore-port-numbers-embedded-in-application-headers analyzers { http rstp sip wsp }**—not ignoring port numbers that are embedded in application headers

ignore-port-numbers-embedded-in-application-headers analyzers { http rtsp sip wsp }

Specifies to ignore the port numbers present in application header.
Specifies analyzers for which port number must be ignored.

Usage

Use this command to make the HTTP, RTSP, SIP, and WSP analyzer ignore port numbers embedded in application headers.

Example

The following command makes the HTTP analyzer in the current rulebase ignore port numbers embedded in application headers:

```
ruledef-parsing ignore-port-numbers-embedded-in-application-headers
analyzers http
```

tcp 2msl-timeout

This command configures how long to retain the TCP flow after the FIN has been acknowledged.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

tcp 2msl-timeout *seconds*

{ default | no } tcp 2msl-timeout

default

Configures the default setting.
Default: 2 seconds

no

Disables the timeout and sets the system to delete the flow immediately upon seeing the FIN be acknowledged.

seconds

The period of time, in seconds, to keep the TCP flow.
seconds must be an integer from 1 through 20.

Usage

Use this command to configures how long to retain the TCP flow after the FIN has been acknowledged. Acknowledgment to the FIN is not guaranteed to be received by the destination, then the FIN could be resent and re-acknowledged. In this scenario, it is desirable to still have the flow, so that the re-sends do not create a new flow.

Example

The following command sets the timeout to 4 seconds:

tcp 2msl-timeout *4*

tcp check-window-size

This command enables/disables TCP window-size check.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] tcp check-window-size
```

default

Configures the default setting.
Default: enabled, i.e. packets after the erroneous packet (with size > receiver's window size) will hit tcp-error ruledef.

no

Disables the window-size check, and will continue with normal L7 parsing.

Usage

Use this command to enable/disable TCP window-size check for packets out of TCP window.

Example

The following command enables TCP window-size check:

```
tcp check-window-size
```

tcp mss

This command configures the TCP Maximum Segment Size (MSS) in TCP SYN packets.

Important: This command is only available in StarOS 8.1 and later releases.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
tcp mss tcp_mss { add-if-not-present | limit-if-present } +
{ default | no } tcp mss
```

default

Removes the previously configured setting.

no

Removes the previously configured setting.

tcp_mss

Specifies the TCP MSS value.
tcp_mss must be an integer from 496 through 65535.

add-if-not-present

Adds the TCP MSS if not present in the packet.

limit-if-present

Limits the TCP MSS if present in the packet.

Usage

Using this command, TCP MSS can be limited if already present in the TCP SYN packets. If there are no errors detected in IP header/TCP mandatory header and there are no mem allocation failures, TCP optional header is parsed. If TCP MSS is present in the optional header and its value is greater than the configured MSS value, the value present in the TCP packet is replaced with the configured one.
If the TCP optional header is not present in the SYN packet and there are no errors in already present TCP header, the TCP MSS value configured will be inserted while sending the current packet out.

Example

The following command limits the TCP maximum segment size to *3000*, and if not present adds it to the packets:

```
tcp mss 3000 limit-if-present add-if-not-present
```

tcp out-of-order-timeout

Description This command has been deprecated, and is replaced by the tcp packets-out-of-order command.

tcp packets-out-of-order

This command configures processing of TCP packets that are out of order, while waiting for the earlier packet(s) to arrive.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

tcp packets-out-of-order { timeout *duration_ms* **| transmit [after-reordering | immediately] }**

default tcp packets-out-of-order { timeout | transmit }

timeout *duration_ms*

Specifies the timeout period for re-assembly of TCP out-of-order packets. *duration_ms* is the timeout period in milliseconds, and must be an integer from 100 through 30000.
Default: 5000 milliseconds

transmit [after-reordering | immediately]

Configures the TCP out-of-order segment behavior after buffering a copy.

- **after-reordering**: Sends the TCP out-of-order segment after all packets are received and successfully reordered. If reordering is not successful due to a timeout, the received packets are forwarded without being passed through the protocol analyzers. If memory allocation fails or the received packet is partial retransmitted data, the packet will be forwarded immediately without being passed through the protocol analyzers, except for the IP analyzer.
- **immediately**: Sends the TCP out-of-order segment immediately after buffering a copy. The packets are transmitted as they are received without any in-line services or charging action processing, but also a copy of each packet is held onto. When the missing packet is received, complete deep packet inspection of all the packets and all relevant in-line services is done, and then the last packet is forwarded.

Default: **immediately**

Usage

This command configures how to process TCP packets that are out of order, while waiting for the earlier packet(s) to arrive.

Example

The following command sets the timeout timer to *10000* milliseconds:

tcp packets-out-of-order timeout *10000*

tcp proxy-mode

This command enables/disables TCP Proxy mode for all subscribers using this ACS rulebase.

Important: This is a restricted command. Dynamic TCP Proxy mode is not supported in this release.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
tcp proxy-mode { dynamic { all | content-filtering | dcca | ip-readdressing |
nexthop-readdressing | xheader-insert + } | static }

default tcp proxy-mode

no tcp proxy-mode [ dynamic { content-filtering | dcca | ip-readdressing |
nexthop-readdressing | xheader-insert + } ]
```

default

Configures the default setting.
Default: Disabled

no

Disables TCP Proxy mode.
Optionally, TCP Proxy can be disabled for specific conditions that were previously enabled.

dynamic { all | content-filtering | dcca | ip-readdressing | nexthop-readdressing | xheader-insert + }

Important: In this release, TCP Proxy functions only in Static mode. Dynamic TCP Proxy mode is not supported, hence the dynamic keyword and options must not be configured.

Enables TCP proxy for subscriber-initiated TCP flows under the specified condition(s).
Optionally, TCP Proxy can be enabled only for specific conditions.

all

Specifies that TCP connection be split if all/any supported ACS features are enabled, and TCP Proxy mode is enabled.

content-filtering

Specifies that TCP connection be split if Content Filtering/ICAP is enabled.

dcca

Specifies that TCP connection be split if DCCA is enabled.

ip-readdressing

Specifies that TCP connection be split if IP Readdressing feature is enabled.

nexthop-readdressing

Specifies that TCP connection be split if Nexthop Readdressing feature is enabled.

xheader-insert

Specifies that TCP connection be split if x-Header Insertion feature is enabled.

static

Enables TCP proxy for every subscriber-initiated TCP flow.

Usage

Use this command to enable/disable TCP Proxy mode for all subscribers using this ACS rulebase. Optionally, TCP Proxy can be enabled/disabled for specific ACS features. Note that enabling/disabling the TCP Proxy feature for any of the optional ACS features, does not affect that feature.
Note that the last command overwrites any previous configuration. For example, when the following commands are applied in sequence:

```
tcp proxy-mode dynamic nexthop-readdressing
tcp proxy-mode dynamic xheader-insert
```

The nexthop configuration is overwritten by the x-header configuration.

Example

The following command enables TCP proxy for subscriber-initiated TCP flows whenever next-hop-forwarding-address is configured in the charging action:

```
tcp proxy-mode dynamic nexthop-readdressing
```

timestamp rounding

This command enables the configuration of timestamp rounding in an EDR or eG-CDR.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
timestamp rounding { edr | egcdr } { ceiling | floor | round-off }

{ no | default } timestamp rounding { edr | egcdr }
```

no | default

Default: **round-off**
Configures the default timestamp rounding configuration.

edr

Perform the timestamp rounding for EDRs.

egcdr

Perform the timestamp rounding for eG-CDRs.

ceiling

If the fractional part of the seconds is greater than 0, then this keyword adds 1 to the number of seconds and discard the fraction.

floor

This keyword always discards the fractional part of the second.

round-off

This keyword sets the fractional part of the seconds to nearest integer value. If fractional value is greater than or equal to 0.5, it adds 1 to the number of seconds and discards the fractional part of second.

Usage

Use this command to configure the timestamp rounding setting.
The specified rounding will be performed before system attempts any calculation. For example using round-off, if the start time is 1.4, and the end time is 1.6, then the calculated duration will be 1 (i.e., 2 – 1 = 1).
This command may be repeated for each type of EDR or eG-CDR.

Example

The following command sets the EDR timestamp to nearest integer value second; i.e. 34:12.23 to 34:12.00:

```
timestamp rounding edr round-off
```

transport-layer-checksum

This command enables/disables checksum verification for TCP and UDP packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] transport-layer-checksum verify-during-packet-inspection [ tcp | udp ]

default transport-layer-checksum
```

no

Disables the checksum calculation for the specified packet type.

default

Configures the default setting.
Default: **transport-layer-checksum verify-during-packet-inspection**—to perform the checksum verification calculation on all TCP and UDP packets.

tcp | udp

Specifies that either TCP or UDP packets should be verified or not verified.
If neither of these keywords is specified the command applies to both TCP and UDP packets.

Usage

Use this command to disable or enable performing checksum verification calculations on TCP or UDP packets.
If the checksum is not verified, the packets will go through the TCP/UDP analyzers (and deeper analyzers, if so configured with the **route** CLI command) regardless of the value of the TCP/UDP checksum.
If the checksum is verified, only packets with good checksums will go through the TCP/UDP analyzers (and deeper analyzers, if so configured).

Example

The following command disables checksum verification calculations on all TCP and UDP packets:

```
no transport-layer-checksum verify-during-packet-inspection
```

udr threshold

This command defines and enables the threshold limit to generate User Detail Records (UDRs) that provide Comma Separated Value (CSV) records written periodically in a fixed schema designed to reflect a total billable quantity.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
udr threshold { interval interval | volume { downlink bytes [ uplink bytes ] |
total bytes | downlink bytes [ uplink bytes ] } }

default udr threshold { interval | volume }

no udr threshold { interval | volume { downlink [ uplink ] | total | uplink [
downlink ] } }
```

no

Removes the previous configuration.

default

Configures the default setting.
Default: **no udr threshold interval**; **no udr threshold volume**—disables the UDR threshold settings.

interval *interval*

Default: 0 (Disabled)
Specifies the time interval in seconds for closing the UDR if the minimum time duration thresholds are satisfied. This option is disabled by default.
interval must be an integer from 60 through 40000000.

volume

Specifies the uplink/downlink volume octet counts for the generation of the interim UDRs.

- **downlink** *bytes*: Specifies the limit for the number of downlink octets after which the UDR is closed.

  bytes must be an integer from 100,000 through 4,000,000,000.

  Default: 4,000,000,000

- **total** *bytes*: Specifies the limit for the total number of octets (uplink+downlink) after which the UDR is closed. *bytes* must be an integer from 100,000 through 4,000,000,000. By default, this configuration is disabled.

- **uplink** *bytes*: Specifies the limit for the number of uplink octets after which the UDR is closed. *bytes* must be an integer from 100,000 through 4,000,000,000.

  Default: 4,000,000,000

UDR records are generated whenever either threshold is reached.

Usage

Use this command to enable the thresholds for generation of UDRs.

Example

The following command specifies that UDR records should be generated every 10 minutes (*600* seconds):

```
udr threshold interval 600
```

udr trigger

Use this command to assign first packet trigger to interim UDRs—for generating UDR for first packet hit per rating group/content ID.

Important: This command is only available in StarOS 8.3 and later.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] udr trigger first-hit-content-id

default udr trigger
```

no

Disables assigning first packet trigger to interim UDRs.

default

Configures the default setting.
Default: Disabled

first-hit-content-id

Specifies interim UDR generation on first packet hit per rating group/content ID.

Usage

This command enables generating UDR for first packet hit per rating group/content ID. Generation of UDR will be triggered when this CLI command is present in the rulebase.

Example

The following command assigns first packet trigger to interim UDRs, for generating UDR for first packet hit per rating group/content ID:

```
udr trigger first-hit-content-id
```

url-blacklisting action

This command enables/disables URL Blacklisting functionality for the rulebase, and configures the action to be taken when a URL matches one in the URL Blacklist.

Product

ACS, CF

Privilege

Security Administrator, Administrator

Syntax

url-blacklisting action { discard | redirect-url *url* **| terminate-flow | www-reply-code-and-terminate-flow** *reply_code* **}**

{ default | no } url-blacklisting action

{ default | no } url-blacklisting action

Disables the URL Blacklisting feature for this rulebase.

discard

Configures URL Blacklisting discard action.

redirect-url *url*

Configures URL Blacklisting redirect-url action.
url specifies the redirect URL/URI.
url must be a fully qualified URL/URI, and must be a string of 1 through 1023 characters in length.

terminate-flow

Configures URL Blacklisting terminate-flow action.

www-reply-code-and-terminate-flow *reply_code*

Configures URL Blacklisting terminate-flow action with reply code.
reply_code specifies the reply code, and must be an integer from 100 through 599.

Usage

Use this command to enable/disable URL Blacklisting functionality, and configure the EDRs to be generated on Blacklisting match and the action to be taken.

Example

The following command enables URL Blacklisting functionality, and configures the terminate-flow action with reply code 300:

url-blacklisting action www-reply-code-and-terminate-flow *300*

The following command disables URL Blacklisting feature in the rulebase:

```
no url-blacklisting action
```

url-preprocessing

This command enables/disables a group-of-prefixed-urls for preprocessing.

Important: This command is customer specific. For more information, please contact your local service representative.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] url-preprocessing bypass group-of-prefixed-urls` *`group_name`*

`no`

Removes configuration for the specified group-of-prefixed-urls.

`group_name`

Specifies the group-of-prefixed-urls name.
`group_name` must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to enable/disable a group-of-prefixed-urls. Multiple groups can be enabled.

Example

The following command enables looking for prefixed URLs of the group-of-prefixed-urls named *`test5`*:

`url-preprocessing bypass group-of-prefixed-urls` *`test5`*

wtp out-of-order-timeout

Description This command has been deprecated, and is replaced by the wtp packets-out-of-order command.

wtp packets-out-of-order

This command configures how to process WTP packets that are out of order, while waiting for the earlier packet(s) to arrive.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
wtp packets-out-of-order { out-of-order-timeout timeout | transmit [ after-reordering | immediately ] }

default wtp packets-out-of-order { out-of-order-timeout | transmit }
```

default

Configures the default setting.

out-of-order-timeout *timeout*

Specifies the maximum duration for which WTP out-of-order packets are retained, in milliseconds, before reassembly is needed.
timeout is the timeout duration in milliseconds, and must be an integer from 100 through 30000.
Default: 5000 milliseconds

transmit [after-reordering | immediately]

Specifies the WTP out-of-order segment behavior after buffering a copy:

- **after-reordering**: Send WTP out-of-order segment after it becomes ordered
- **immediately**: Send WTP out-of-order segment immediately after buffering a copy

Default: **immediately**

Usage

Use this command to configure TCP out-of-order segment options.
If out-of-order-timeout is specified, out-of-order packets are retained, until either all packets have been received or the configured timeout has expired for the oldest packet. If all packets have been received, a temporary complete packet is reconstructed for analysis. Then all packets are forwarded in order from first to last. If all packets are not received, the packets will be forwarded without being passed through the protocol analyzers, except for the IP analyzer.
If **after-reordering** transmitting is specified, the packets are held onto and reordered. After successfully reordering the packets, they are processed in the proper order. If reordering is not successful due to timeout (wtp out-of-order-timeout), the received packets are forwarded without being passed through the protocol analyzers.
If **immediately** is specified, the packets are transmitted as they are received without any in-line services or Charging Action processing, however a copy of each packet is retained. When the missing packet is received, complete deep packet inspection of all the packets and all relevant in-line services is undertaken, and then the last packet is forward (unless otherwise configured by the in-line services or Charging Action).

Example

The following command sets the timeout timer to *10000* milliseconds:

```
wtp out-of-order-timeout 10000
```

xheader-encryption

This command configures X-Header Encryption feature parameters.

Important: This command is license dependent. For more information, please contact your local sales representative.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

xheader-encryption { certificate-name *certificate_name* **| re-encryption period** *period* **}**

default xheader-encryption re-encryption period

no xheader-encryption { certificate-name | re-encryption }

default

Configures the default setting.
Default: No re-encryption

no

Removes the previously configured setting for the specified parameter.

certificate-name *certificate_name*

Specifies name of the encryption certificate to be used for X-Header Encryption feature.
certificate_name must be the name of a certificate, and must be an alpha and/or numeric string of 1 through 63 characters in length.

re-encryption *period*

Specifies how often to re-generate the encryption keys.
period specifies the re-encryption time period in minutes, and must be an integer from 1 through 10000.

Usage

Use this command to configure the X-Header Encryption feature's certificate and re-encryption parameters.

Example

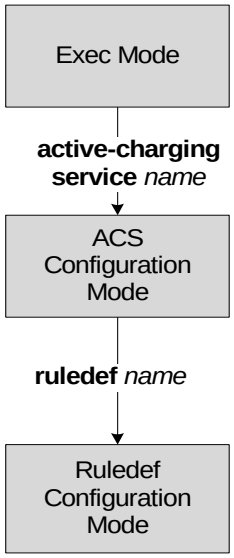
The following command configures the X-Header Encryption feature to use the certificate named *testcert*:

xheader-encryption certificate-name *testcert*

Chapter 15
ACS Ruledef Configuration Mode Commands

The ACS Ruledef Configuration Mode is used to create and manage ACS rule definitions.

Important: Up to 10 rule matches can be configured in one ruledef.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

bearer 3gpp apn

This command defines a rule definition to analyze and charge user traffic based on APN of the bearer flow.

Important: This command is only available in StarOS 8.1 and later releases.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

`[ no ] bearer 3gpp apn [ case-sensitive ]` *`operator value`*

`no`

Removes the specified rule definition.

`[ case-sensitive ]`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`value`

The name of the matching APN in bearer flow.
`value` must be an alpha and/or numeric string of 1 through 62 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on APN of the bearer flow.

Example

The following command creates a rule definition to analyze user traffic for an APN named *apn12*:

```
bearer 3gpp apn = apn12
```

bearer 3gpp imsi

This command defines a rule definition to analyze and charge user traffic based on the International Mobile Station Identification number (IMSI) in bearer flow.

Important: This command is only available in StarOS 8.1 and later releases.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] bearer 3gpp imsi { operator imsi | { !range | range } imsi-pool imsi_pool
}
```

no

Removes the specified rule definition.

operator

Specifies how to logically match the IMSI.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

imsi

Specifies the mobile station identifier.

{ !range | range } imsi-pool *imsi_pool*

!range | range: Specifies the range criteria:

- **!range**: Not in the range of
- **range**: In the range of

imsi-pool *imsi_pool*: Specifies the IMSI pool name. *imsi_pool* must be a string of 1 through 63 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on IMSI.

Example

The following command creates a rule definition to analyze user traffic for the IMSI number *9198838330912*:

```
bearer 3gpp imsi = 9198838330912
```

bearer 3gpp rat-type

This command defines a rule definition to analyze and charge user traffic based on the Radio Access Technology (RAT) in bearer flow.

Important: This command is only available in StarOS 8.1 and later releases.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] bearer 3gpp rat-type operator rat_type
```

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

rat_type

The RAT type associated with the bearer flow.

- **geran**: GSM EDGE Radio Access Network type
- **utran**: UMTS Terrestrial Radio Access Network type
- **wlan**: Wireless LAN type

Usage

Use this command to specify a rule definition to analyze user traffic based on RAT type.

Example

The following command creates a rule definition for analyzing user traffic for the WLAN RAT type **wlan**:

```
bearer 3gpp rat-type = wlan
```

bearer 3gpp sgsn-address

This command defines a rule definition to analyze and charge user traffic based on SGSN address associated in 3gpp bearer flow.

Important: This command is only available in StarOS 8.1 and later releases.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] bearer 3gpp sgsn-address *operator address*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

address

Specifies IP address of the SGSN node.
address must be an SGSN IP address expressed in standard IPv4 or IPv6 dotted decimal notation.

Usage

Use this command to specify a rule definition to analyze user traffic based on IP address of SGSN node. This command replaces the **bearer sgsn-address** command.

Example

The following command creates a rule definition for analyzing user traffic for an SGSN node with IP address of *19.88.3.8*:

bearer 3gpp sgsn-address = *19.88.3.8*

bearer 3gpp2 bsid

This command defines a rule definition to analyze and charge user traffic based on the 3GPP2 service Base Station Identifier (BSID) for bearer.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] bearer 3gpp2 bsid [case-sensitive] use-group-of-objects *operator string*

---

no

Removes the specified rule definition.

---

case-sensitive

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

---

use-group-of-objects

Specifies using a group-of-objects as a qualifier to match this rule.

---

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

---

string

If the **use-group-of-objects** keyword is not included in the command, *string* specifies name of the matching 3GPP2 service Base Station ID (BSID) in bearer flow.
If the **use-group-of-objects** keyword is included in the command, *string* must be the name of the group-of-objects to use. In this case, it is checked if the rule is satisfied for either one or none of the objects in the group-of-objects depending upon the operator used. For example, if the *operator* used is **contains**, the expression would be true if any of the objects in the specified object group is contained in the BSID. If the *operator* is **!contains**, then the expression would be true if none of the objects in the object group is contained in the BSID.

string must be an alpha and/or numeric string of 1 through 16 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on 3GPP2 service Base Station Identifier (BSID).

Example

The following command creates a rule definition to analyze user traffic for a 3GPP2 BSID named *bs001_xyz*:

```
bearer 3gpp2 bsid = bs001_xyz
```

bearer 3gpp2 service-option

This command defines a rule definition to analyze and charge user traffic based on the 3GPP2 service with service options for bearer.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] bearer 3gpp2 service-option *operator option_code*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

option_code

The code of the matching 3GPP2 service option in bearer flow.
option_code must be an integer from 0 through 1000.

Usage

Use this command to specify a rule definition to analyze user traffic based on 3GPP2 service's service option code.

Example

The following command creates a rule definition for analyzing user traffic for a 3GPP2 service's service option as = *1034*:

bearer 3gpp2 service-option = *1034*

bearer apn

This command defines a rule definition to analyze and charge user traffic based on APN bearer.

Important: In StarOS 8.1 and later, this command is deprecated and is replaced by the bearer 3gpp apn command.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

`[ no ] bearer apn [ case-sensitive ]` *`operator value`*

`no`

Removes the specified rule definition.

`[ case-sensitive ]`

Default: Disabled
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`value`

The name of the matching APN in bearer flow.
`value` must be an alpha and/or numeric string of 1 through 62 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on APN name.

Example

The following command creates a rule definition for analyzing user traffic for an APN name *apn12*:

```
bearer apn = apn12
```

bearer imsi

This command defines a rule definition to analyze and charge user traffic based on International Mobile Station Identification number (IMSI) in bearer flow.

Important: In StarOS 8.1 and later, this command is deprecated and is replaced by the bearer 3gpp imsi command.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] bearer imsi { `*`operator imsi`***` | { !range | range } imsi-pool `***`imsi_pool`***` }`**

`no`

Removes the specified rule definition.

`operator`

Specifies how to logically match the IMSI.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`=`**: Equals

`msid`

Specifies the Mobile Station Identifier.

`{ !range | range } imsi-pool `*`imsi_pool`*

`!range | range`: Specifies the range criteria:

- **`!range`**: Not in the range of
- **`range`**: In the range of

`imsi-pool` ***`imsi_pool`***: Specifies the IMSI pool name. ***`imsi_pool`*** must be a string of 1 through 63 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on IMSI number of mobile station.

Example

The following command creates a rule definition to analyze user traffic for an IMSI number ***`9198838330912`***:

`bearer imsi =` ***`9198838330912`***

bearer rat-type

This command defines a rule definition to analyze and charge user traffic based on the Radio Access Technology (RAT) in bearer flow.

Important: In StarOS 8.1 and later, this command is deprecated and is replaced by the bearer 3gpp rat-type command.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] bearer rat-type *operator rat_type*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

rat_type

The RAT type associated with the bearer flow.

- **geran**: GSM EDGE Radio Access Network type
- **utran**: UMTS Terrestrial Radio Access Network type
- **wlan**: Wireless LAN type

Usage

Use this command to specify a rule definition to analyze user traffic based on RAT type.

Example

The following command creates a rule definition for analyzing user traffic for the WLAN RAT type **wlan**:

```
bearer rat-type = wlan
```

bearer sgsn-address

This command defines a rule definition to analyze and charge user traffic based on SGSN address associated in bearer flow.

Important: In StarOS 8.1 and later, this command is deprecated and is replaced by the bearer 3gpp sgsn-address command.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] bearer sgsn-address` *`operator address`*

`no`

Removes the specified rule definition.

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`=`**: Equals

`address`

The IP address of SGSN node.
`address` must be an SGSN IP address expressed in standard IPv4 or IPv6 notation.

Usage

Use this command to specify a rule definition to analyze user traffic based on IP address of SGSN node.

Example

The following command creates a rule definition for analyzing user traffic for an SGSN node with IP address of *`19.88.3.8`*:

`bearer sgsn-address =` *`19.88.3.8`*

bearer traffic-group

This command defines a rule definition to analyze and charge user traffic based on the traffic group number associated to the bearer flow.

Important: This functionality is only available if the license for Content Access Control (P/N: 699-00-0011) has been purchased and installed.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] bearer traffic-group` *`operator group_num`*

`no`

Removes the specified rule definition.

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`<=`**: Lesser than or equals
- **`=`**: Equals
- **`>=`**: Greater than or equals

`group_num`

Specifies the traffic group number.
`group_num` must be an integer from 1 through 255.

Usage

Use this command to specify a rule definition to analyze user traffic based on the traffic group value. See the **`fa-ha-spi`** command in the *HA Service Configuration Mode Commands* chapter for more information.

Example

The following command creates a rule definition for all traffic groups assigned a value greater or equal to *`23`*:

`bearer traffic-group >=` *`23`*

cca quota-state

This command specifies the quota state of a subscriber for prepaid credit control service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] cca quota-state operator { limit-reached | lower-bandwidth }
```

no

Disables the configured credit control quota state for this rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

limit-reached

This state matches an affirmative end-of-quota indication for this rule definition from the prepay server.

lower-bandwidth

This state matches the lower-bandwidth quota state of a rating group.

Usage

This command supports URL redirection cases and creates a rule for subscriber prepaid quota state as exhausted or not exhausted.
If a subscriber has exhausted the quota but has not exhausted the qualified period, a different charging-action can applied based on the cca quota-state CLI.

Example

The following command creates a rule for subscriber to send end-of-quota indication when credit control prepay quota limit reached:

```
cca quota-state = limit-reached
```

cca redirect-indicator

This command configures the value of the redirect-indicator state of the credit control application.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] cca redirect-indicator` *`operator indicator`*

`no`

Disables the configured credit control redirect indicator for specified rule definition.

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`<=`**: Lesser than or equals
- **`=`**: Equals
- **`>=`**: Greater than or equals

`indicator`

Specifies the redirect indicator for AVP used for redirection of URL in RADIUS dictionary used for prepaid service.
`indicator` must be an integer from 0 through 4294967295.

Important: For the RADIUS server configured with different values to return for this AVP the ACS requires rule definitions to match the different values for system to associate with Charging Actions that have different redirect URLs configured.

Usage

This command is used to configure an AVP to be used from a dictionary that defines the AVP for the redirect-indicator.
For example, a RADIUS dictionary specifies the 3gpp2-release-indicator to be used for redirect indicator when RADIUS is used as the credit control application. In this case, the value for 3gpp2-release-indicator that is returned by the RADIUS prepaid server for a quota request for a given content-id is retained by system and associated with the flow.

Example

Following command specifies redirect indicator as *`1234`* for URL redirect AVP:

cca redirect-indicator = *1234*

copy-packet-to-log

This command prints every packet that hits this rule to a log statement.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] copy-packet-to-log
```

no

Disables the feature.

Usage

Use this command to print every packet that hits this rule to a log statement.

dns answer-name

This command defines a rule definition to analyze and charge user traffic based on the DNS answer-name.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] dns answer-name [ case-sensitive ]` *`operator value`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`value`

The value of the specified field.
`value` must be an alpha and/or numeric string of 1 through 255 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on answer name.

Example

The following command creates a rule definition for analyzing user traffic for a answer name of *`test`*:

dns answer-name = *test*

dns any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for DNS packets.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] dns any-match *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify an any match rule definition for analyzing user traffic for charging purposes.

Example

The following command defines an any match rule definition for analyzing DNS user traffic:

```
dns any-match = TRUE
```

dns previous-state

This command defines a rule definition to analyze and charge user traffic matching the previous state expressions for DNS packets.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] dns previous-state *operator dns_state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

dns_state

dns_state must be one of the following:

- **dns-timeout**
- **init**
- **req-sent**
- **resp-error**
- **resp-success**

Usage

Use this command to specify a rule definition to analyze user traffic based on the DNS previous state.

Example

The following command creates a rule definition for analyzing user traffic using a previous state of **req-sent**:

```
dns previous-state = req-sent
```

dns query-name

This command defines a rule definition to analyze and charge user traffic based on the DNS query-name.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] dns query-name [ case-sensitive ]` *`operator value`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`value`

The value of the specified field.
`value` must be an alpha and/or numeric string of 1 through 255 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on the DNS query name.

Example

The following command creates a rule definition for analyzing user traffic using a query name of *`test`*:

dns query-name = *test*

dns return-code

This command defines a rule definition to analyze and charge user traffic based on the DNS return-code.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] dns return-code *operator dns_response*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

dns_response

dns_response must be one of the following:

- **format-error**
- **name-error**
- **no-error**
- **not-implemented**
- **refused**
- **server-failure**

Usage

Use this command to specify a rule definition to analyze user traffic based on a DNS return code.

Example

The following command creates a rule definition for analyzing user traffic using a DNS response of *refused*:

```
dns return-code = refused
```

dns state

This command defines a rule definition to analyze and charge user traffic based on the DNS state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] dns state *operator dns_state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

dns_state

dns_state must be one of the following:

- **dns-timeout**
- **init**
- **req-sent**
- **resp-error**
- **resp-success**

Usage

Use this command to specify a rule definition to analyze user traffic based on a DNS state.

Example

The following command creates a rule definition for analyzing user traffic using a DNS state of **req-sent**:

```
dns state = req-sent
```

dns tid

This command defines a rule definition to analyze and charge user traffic based on the DNS Transaction Identifier (TID).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] dns tid *operator tid_value*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

tid_value

Specifies the DNS transaction identifier for this rule definition.
tid_value must be an integer from 1 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on the DNS TID.

Example

The following command creates a rule definition for analyzing user traffic using a DNS TID value of *test*:

dns tid = *test*

email

This command defines a rule definition to analyze and charge user traffic based on the conditions based on e-mail parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] email { cc | content { class | type } | from | size | subject | to } [ case-sensitive ]` *`operator value`*

`no`

Removes the specified rule definition.

`cc`

Specifies to match on the information in the CC field of e-mail message.

`content { class | type }`

Specifies to match on the information in the “content-type” or “content-class” field of e-mail message.

`from`

Specifies to match on the information in the “from” field of e-mail message.

`subject`

Specifies to match on the information in the “subject” field of e-mail message.

`to`

Specifies to match on the information in the “to” field of e-mail message.

`size`

Specifies to match with the total size of e-mail message in bytes.

`case-sensitive`

Default: Disabled
This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.

`operator`

Specifies how to logically match the information in the analyzed field of e-mail message.
`operator` must be one of the following except for **`size`**:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain

- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

operator must be one of the following for **size**:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

value

The value of the specified field. *value* must be an alpha and/or numeric string (allows punctuation characters) as follows:

- **cc**: A string of 1 through 512 characters in length
- **content**: A string of 1 through 128 characters in length
- **from**: A string of 1 through 64 characters in length
- **size**: A range of bytes from 1 through 4000000000 bytes
- **subject**: A string of 1 through 128 characters in length
- **to**: A string of 1 through 512 characters in length

Usage

Use this command to specify a rule definition to analyze user traffic based on different fields and parameters of e-mail message.

Example

The following command creates an e-mail rule definition for analyzing user traffic for the occurrence of triangular in the 'cc' field of e-mail message:

```
email cc contains triangular@xyz.com
```

end

This command returns the CLI prompt to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec Mode.

exit

This command exits the ACS Ruledef Configuration Mode and returns to the ACS Configuration Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the ACS Configuration Mode.

file-transfer any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for file transfer.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] file-transfer any-match *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the file transfer any match status.

Example

The following command creates a file transfer rule definition for analyzing user traffic using a file transfer any match status of *FASLE*:

```
file-transfer any-match = FALSE
```

file-transfer chunk-number

This command defines a rule definition to analyze and charge user traffic based on number of chunks in a file transfer.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] file-transfer chunk-number *operator value*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

value

Specifies the number of chunks for this rule definition.
value must be an integer from 1 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on the number of chunks in a file transfer.

Example

The following command creates a file transfer rule definition for analyzing user traffic using *150* number of chunks:

file-transfer chunk-number = *150*

file-transfer current-chunk-length

This command defines a rule definition to analyze and charge user traffic based on length of current chunk in a file transfer.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] file-transfer current-chunk-length *operator value*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

value

Specifies the length in bytes of current chunk for this rule definition.
value must be an integer from 1 through 40000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on the length of current chunk in a file transfer.

Example

The following command creates a file transfer rule definition for analyzing user traffic using current length of chunk as *1500000* bytes:

file-transfer current-chunk-length = *1500000*

file-transfer declared-chunk-length

This command defines a rule definition to analyze and charge user traffic based on declared length of chunk in a file transfer.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] file-transfer declared-chunk-length *operator value*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

value

Specifies the declared length, in bytes, of chunk for this rule definition.
value must be an integer from 1 through 40000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on the declared length of chunk in a file transfer.

Example

The following command creates a file transfer rule definition for analyzing user traffic using declared length of chunk as *2500000* bytes:

file-transfer declared-chunk-length = *2500000*

file-transfer declared-file-size

This command defines a rule definition to analyze and charge user traffic based on declared size of file in a file transfer.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] file-transfer declared-file-size *operator size*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

size

Specifies the declared size of file, in bytes, for this rule definition.
size must be an integer from 1 through 40000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on the declared size of file in a file transfer.

Example

The following command creates a file transfer rule definition for analyzing user traffic using declared size of file as *2500000* bytes:

file-transfer declared-file-size = *2500000*

file-transfer filename

This command defines a rule definition to analyze and charge user traffic based on declared name of the file in a file transfer.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] file-transfer filename [ case-sensitive ]` *`operator size`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`string`

Specifies the string for this rule definition.
`string` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on the declared name of file in a file transfer.

Example

The following command creates a file transfer rule definition for analyzing user traffic using declared name of file as *star1*:

file-transfer filename contains *star1*

file-transfer previous-state

This command defines a rule definition to analyze and charge user traffic based on the previous state of file transfer.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] file-transfer previous-state *operator previous_state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

previous_state

previous_state must be one of the following:

- **init**: Specifies previous state as initialization.
- **request-sent**: Specifies previous state as request sent.
- **transfer-error**: Specifies previous state as transfer error.
- **transfer-ok**: Specifies previous state as transfer ok.

Usage

Use this command to specify a rule definition to analyze user traffic based on a previous state of file transfer.

Example

The following command creates a file transfer rule definition for analyzing user traffic using a previous file transfer state of *init*:

```
file-transfer previous-state = init
```

file-transfer state

This command defines a rule definition to analyze and charge user traffic based on the current state of file transfer Finite State Machine (FSM).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] file-transfer state *operator state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

state

state must be one of the following

- **init**: Specifies current state as initialization.
- **request-sent**: Specifies current state as request sent.
- **transfer-error**: Specifies current state as transfer error.
- **transfer-ok**: Specifies current state as transfer ok.

Usage

Use this command to specify a rule definition to analyze user traffic based on state of file transfer.
Following table describes the details of file transfer FSM states with event:

Event	init	request-sent	transfer-ok	transfer-err
FTP “RETR” command or HTTP “GET” request received with chunk encoding	request-sent	Discarded	Discarded	Discarded
HTTP 2xx response received	transfer-ok	Discarded	Discarded	Discarded
HTTP 4xx or HTTP 5xx response received	transfer-error	Discarded	Discarded	Discarded
FTP reply received with reply status as file transfer complete/successful	Discarded	transfer-ok	Discarded	Discarded
FTP reply received with reply status as file transfer unsuccessful	Discarded	transfer-error	Discarded	Discarded

Example

The following command creates a file transfer rule definition for analyzing user traffic using a file transfer state of *init*:

```
file-transfer state = init
```

file-transfer transferred-file-size

This command defines a rule definition to analyze and charge user traffic based on transferred size of file in a file transfer.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] file-transfer transferred-file-size *operator size*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

size

Specifies the transferred size of file, in bytes, for this rule definition.
size must be an integer from 1 through 4000000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on the transferred size of file in a file transfer.

Example

The following command creates a file transfer rule definition for analyzing user traffic using transferred size of file as *2500*:

file-transfer transferred-file-size = *2500*

ftp any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for FTP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ftp any-match *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the FTP any match status.

Example

The following command creates an FTP rule definition for analyzing user traffic using an FTP any match status of *FALSE*:

```
ftp any-match = FALSE
```

ftp client-ip-address

This command defines a rule definition to analyze and charge user traffic based on FTP client IP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ftp client-ip-address *operator ip_address*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

ip_address

ip_address must be the client's IP address expressed in IPv4 dotted decimal or IPv6 colon notation.

Usage

Use this command to specify a rule definition to analyze user traffic based on an FTP client IP.

Example

The following command creates an FTP rule definition for analyzing user traffic using a client IP of *1.1.1.1*:

ftp client-ip = *1.1.1.1*

ftp client-port

This command defines a rule definition to analyze and charge user traffic based on FTP client port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ftp client-port *operator port*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

port

Specifies the port number for this rule definition.
port must be an integer from 1 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on an FTP client port.

Example

The following command creates an FTP rule definition for analyzing user traffic using ftp client port *10*:

ftp client-port = *10*

ftp command args

This command defines a rule definition to analyze and charge user traffic based on FTP command argument.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] ftp command args [ case-sensitive ]` *`operator argument`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`argument`

Specifies the argument for this rule definition.
`argument` must be a string of 1 through 127 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on an FTP command argument.

Example

The following command creates an FTP rule definition for analyzing user traffic using an FTP command argument of *`test`*:

ftp command args = *test*

ftp command id

This command defines a rule definition to analyze and charge user traffic based on FTP command ID.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ftp command id *operator command_id*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

command_id

Specifies the command identifier for this rule definition.
In StarOS 9.0 and later, *command_id* must be an integer from 0 through 18.
In StarOS 8.3 and earlier, *command_id* must be an integer from 0 through 15.

Usage

Use this command to specify a rule definition to analyze user traffic based on an FTP command ID.

Example

The following command creates an FTP rule definition for analyzing user traffic using an FTP command ID of *10*:

ftp command id = *10*

ftp command name

This command defines a rule definition to analyze and charge user traffic based on FTP command name.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ftp command name *operator command_name*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

command_name

Specifies the command name for this rule definition.
command_name must be one of the following:

- **abor**: Abort command
- **cwd**: Current working directory command
- **eprt**: eprt command
- **epsv**: epsv command
- **list**: List command
- **mode**: Transfer mode command
- **pass**: Password command
- **pasv**: Passive command
- **port**: Port command
- **quit**: Quit command
- **rest**: Restore command
- **retr**: Retry command
- **stor**: Store command
- **stru**: File structure command
- **syst**: System command
- **type**: Type command
- **user**: User command

Usage

Use this command to specify a rule definition to analyze user traffic based on an FTP command name.

Example

The following command creates an FTP rule definition for analyzing user traffic using the FTP command name of *list*:

```
ftp command name = list
```

ftp connection-type

This command defines a rule definition to analyze and charge user traffic based on FTP connection type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ftp connection-type *operator connection_type*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

connection_type

Specifies the connection type for this rule definition.
connection_type must be one of the following:

- **0**: Unknown
- **1**: Control connection
- **2**: Data connection

Usage

Use this command to specify a rule definition to analyze user traffic based on an FTP connection type.

Example

The following command creates an FTP rule definition for analyzing user traffic using an FTP connection type of *1*:

```
ftp connection-type = 1
```

ftp data-any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for FTP data packets.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ftp data-any-match *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the any match status for FTP data packets.

Example

The following command creates a rule definition for analyzing user traffic using data-any-match status for FTP data packet set as **FALSE**:

```
ftp data-any-match = FALSE
```

ftp filename

This command defines a rule definition to analyze and charge user traffic based on FTP file name.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] ftp filename [ case-sensitive ]` *`operator string`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`string`

Specifies the string for this rule definition. *`string`* must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an FTP filename.

Example

The following command creates an FTP rule definition for analyzing user traffic using an FTP filename of *`test`*:

`ftp filename =` *`test`*

ftp pdu-length

This command defines a rule definition to analyze and charge user traffic based on FTP Protocol Data Unit (PDU) length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ftp pdu-length *operator pdu_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

pdu_length

Specifies the FTP PDU length, in bytes, for this rule definition.
pdu_length must be an integer from 0 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on FTP PDU length (header + payload) in bytes.

Example

The following command creates an FTP rule definition for analyzing user traffic using an FTP pdu length of *9647* bytes:

ftp pdu-length = *9647*

ftp pdu-type

This command defines a rule definition to analyze and charge user traffic based on FTP Protocol Data Unit (PDU) type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ftp pdu-type *operator pdu_type*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

pdu_type

Specifies the PDU type for this rule definition.
pdu_type must be one of the following:

- **0**: Unknown
- **1**: Command
- **2**: Reply

Usage

Use this command to specify a rule definition to analyze user traffic based on an FTP PDU type.

Example

The following command creates an FTP rule definition for analyzing user traffic using an FTP PDU type of *0*:

ftp pdu-type = *0*

ftp previous-state

This command defines a rule definition to analyze and charge user traffic based on the previous state of FTP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ftp previous-state *operator previous_state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

previous_state

Specifies the previous state.
previous_state must be one of the following:

- **command-sent**
- **init**
- **response-error**
- **response-ok**

Usage

Use this command to specify a rule definition to analyze user traffic based on a previous state.

Example

The following command creates an FTP rule definition for analyzing user traffic using a previous FTP state of *init*:

```
ftp previous-state = init
```

ftp reply code

This command defines a rule definition to analyze and charge user traffic based on the FTP reply code.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] ftp reply code` *`operator code`*

`no`

Removes the specified rule definition.

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`<=`**: Lesser than or equals
- **`=`**: Equals
- **`>=`**: Greater than or equals

`code`

Specifies the code for this rule definition.
`code` must be an integer from 100 through 599.

Usage

Use this command to specify a rule definition to analyze user traffic based on an FTP reply.

Example

The following command creates an FTP rule definition for analyzing user traffic using an FTP reply code of *`199`*:

`ftp reply code =` *`199`*

ftp server-ip-address

This command defines a rule definition to analyze and charge user traffic based on the FTP server IP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ftp server-ip-address *operator ip_address*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

ip_address

Specifies the server address for this rule definition.
ip_address must be expressed in IPv4 decimal notation or IPv6 colon notation.

Usage

Use this command to specify a rule definition to analyze user traffic based on an FTP server IP address.

Example

The following command creates an FTP rule definition for analyzing user traffic using an FTP server IP of *1.1.1.1*:

ftp server-ip-address = *1.1.1.1*

ftp server-port

This command defines a rule definition to analyze and charge user traffic based on the FTP server port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ftp server-port *operator port*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

port

Specifies the FTP server port.
port must be an integer from 1 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on an FTP server port.

Example

The following command creates an FTP rule definition for analyzing user traffic using ftp server port *25*:

ftp server-port = *25*

ftp session-length

This command defines a rule definition to analyze and charge user traffic based on the FTP session-length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ftp session-length *operator session_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

session_length

Specifies the FTP session length for this rule definition.
session_length must be an integer from 1 through 4000000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on the FTP session's total length.

Example

The following command creates a rule definition for analyzing user traffic using an FTP session length of *40000*:

ftp session-length = *40000*

ftp state

This command defines a rule definition to analyze and charge user traffic based on the FTP state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] ftp state` *`operator`* **`{ close | command-sent | init | response-error | response-ok }`**

`no`

Removes the specified rule definition.

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`=`**: Equals

`close`

Analyzes FTP transmissions that are in a closed state.

`command-sent`

Analyzes FTP transmissions that are in a command sent state.

`init`

Analyzes FTP transmissions that are in the initialized state.

`response-error`

Analyzes FTP transmissions that are in the response error state.

`response-ok`

Analyzes FTP transmissions that are in the response ok state.

Usage

Use this command to specify a rule definition to analyze user traffic based on the current FTP session state.

Example

The following command creates an FTP rule definition for analyzing user traffic using a current FTP state of **`close`**:

```
ftp state = close
```

ftp url

This command defines a rule definition to analyze and charge user traffic based on the FTP URL.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] ftp url [ case-sensitive ]` *`operator string`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`string`

A unique name that you specify for the FTP URL.
`string` must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on FTP file location/path for transfer.

Example

The following command creates an FTP rule definition for analyzing user traffic using an FTP URL string of *`ftp://rfc.ietf.org/rfc/rfc1738.txt`*:

ftp url = *ftp://rfc.ietf.org/rfc/rfc1738.txt*

ftp user

This command defines a rule definition to analyze and charge user traffic based on the FTP user.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ftp user [case-sensitive] *operator ftp_user*

no

Removes the specified rule definition.

case-sensitive

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

ftp_user

A unique name that you specify for the FTP user. *ftp_user* must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on the FTP user.

Example

The following command creates an FTP rule definition for analyzing user traffic using an FTP user of *user1*:

ftp user = *user1*

http any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for HTTP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http any-match *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the HTTP any match status.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP any match status of *FALSE*:

```
http any-match = FALSE
```

http content disposition

This command defines a rule definition to analyze and charge user traffic based on the optional “content disposition” field of HTTP entity header.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] http content disposition [ case-sensitive ]` *`operator content_disposition`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`content_disposition`

This field offers a mechanism for the sender to transmit presentational information to the recipient, allowing each component of a message to be tagged with an indication of its desired presentation semantics.
`content_disposition` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an HTTP content type. This feature is to support RFC 2616 for HTTP and RFC 1806 for Content Disposition.

Example

The following command creates an HTTP rule definition for analyzing user traffic using content-disposition field in an HTTP entity header as *successful*:

```
http content disposition = successful
```

http content length

This command defines a rule definition to analyze and charge user traffic based on HTTP content length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http content length *operator content_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

content_length

Specifies the HTTP body length, in bytes, for this rule definition.
content_length must be an integer from 1 through 4000000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on an HTTP content length.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP body length of *10000*:

http content length = *10000*

http content type

This command defines a rule definition to analyze and charge user traffic on the basis of content-type field in HTTP entity header.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] http content type [ case-sensitive ]` *`operator content_type`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`content_type`

A unique content type that you specify for the HTTP rule definition.
`content_type` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on content-type field in HTTP entity header.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP content type of *abc100*:

```
http content type = abc100
```

http error

This command defines a rule definition to analyze user traffic for invalid HTTP packets and other errors while parsing HTTP packets.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http error *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define a rule definition to analyze user traffic for invalid HTTP packets and any other errors while parsing HTTP packets. For example, FSM error, invalid header field values, ACS memory and buffer limit, packet related errors.
ACS supports pipelining of up to 32 HTTP requests on the same TCP connection. Pipeline overflow requests are not analyzed. Such overflow requests are treated as http-error. The billing system, based on this information, decides to charge or not charge, or refund the subscriber accordingly.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP error status of *TRUE*:

```
http error = TRUE
```

http first-request-packet

This command defines a rule definition to analyze and charge user traffic based on the HTTP first-request-packet.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http first-request-packet *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the HTTP first request packet.

Example

The following command creates an HTTP rule definition for analyzing user traffic testing for the first-request-packet equals *TRUE*:

```
http first-request-packet = TRUE
```

http header-length

This command defines a rule definition to analyze and charge user traffic based on HTTP header length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http header-length *operator header_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

header_length

Specifies the HTTP header length, in bytes, for this rule definition.
header_length must be an integer from 0 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on HTTP header length.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP header length of *10000*:

http header-length = *10000*

http host

This command defines a rule definition to analyze and charge user traffic based on HTTP host.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] http host [ case-sensitive ]` *`operator host_name`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`host_name`

A unique name that you specify for the HTTP host.
`host_name` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an HTTP host name.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP host of *`host1`*:

http host = *host1*

http payload-length

This command defines a rule definition to analyze and charge user traffic based on HTTP payload length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http payload-length *operator payload_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

payload_length

Specifies the HTTP payload (content) length, in bytes, for this rule definition.
payload_length must be an integer from 1 through 4000000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on an HTTP payload length.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP payload length of *10000* bytes:

http payload-length = *10000*

http pdu-length

This command defines a rule definition to analyze and charge user traffic based on HTTP Protocol Data Unit (PDU) length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http pdu-length *operator pdu_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

pdu_length

Specifies the HTTP PDU length, in bytes, for this rule definition.
pdu_length must be an integer from 0 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on an HTTP PDU length (header + payload) in bytes.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP PDU length of *10000* bytes:

http pdu-length = *10000*

http previous-state

This command defines a rule definition to analyze and charge user traffic based on HTTP previous state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http previous-state *operator previous_state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

previous_state

Specifies the HTTP previous state for this rule definition.
previous_state must be one of the following:

- **init**: Initialized state
- **response-error**: Response error state
- **response-ok**: Response ok state
- **waiting-for-response**: Waiting for response state

Usage

Use this command to specify a rule definition to analyze user traffic based on an HTTP previous state.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP previous state of *response-ok*:

```
http previous-state = response-ok
```

http referer

This command defines a rule definition to analyze and charge user traffic based on HTTP referer link.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] http referer [ case-sensitive ]` *`operator referer_name`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`referer_name`

A unique name that you specify for the HTTP referer.
`referer_name` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an HTTP referer name. This feature provides the ability to operator to ACS collect or track all URLs visited during a particular subscriber session. These URLs would include the entire string of visited URLs including all referral links. This information output is used in an EDR format to use for reporting or billing functions.
For example, if subscriber begins a web session on his phone and click on the “Sports” link from his home deck and then choose ESPN and from ESPN move to an advertiser link, operator can capture all URLs for

that entire session. and during this period ACS collects the URLs for a particular subscriber session an be limited to time duration or number of URLs visited.
ACS supports EDRs for this and EDRs generated contains HTTP URL and the HTTP referer fields along with other fields.

Example
The following command creates an HTTP rule definition for analyzing user traffic using an HTTP referer to *cricket.espn.com*:

```
http referer = cricket.espn.com
```

http reply code

This command defines a rule definition to analyze and charge user traffic based on HTTP reply.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http reply code *operator reply_code*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

reply_code

Specifies the HTTP response for this rule definition.
reply_code must be an integer from 100 through 599.

Usage

Use this command to specify a rule definition to analyze user traffic based on an HTTP reply code.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP reply code of *356*:

http reply code = *356*

http request method

This command defines a rule definition to analyze and charge user traffic based on HTTP request method.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http request method *operator request*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

request

Specifies the HTTP request for this rule definition.
request must be one of the following requests:

- **connect**
- **delete**
- **get**
- **head**
- **options**
- **post**
- **put**
- **trace**

Usage

Use this command to specify a rule definition to analyze user traffic based on HTTP request method.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP request method of *connect*:

http request method = *connect*

http session-length

This command defines a rule definition to analyze and charge user traffic based on HTTP session length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http session-length *operator session_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

session_length

Specifies the HTTP total session length for this rule definition.
session_length must be an integer from 1 through 4000000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on the total HTTP session length.

Example

The following command creates an HTTP rule definition for analyzing user traffic using a total HTTP session length of *200000*:

http session-length = *200000*

http state

This command defines a rule definition to analyze and charge user traffic based on HTTP state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http state *operator state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

state

Specifies the HTTP state for this rule definition.
state must be one of the following:

- **close**: Closed state
- **response-error**: Response error state
- **response-ok**: Response ok state
- **waiting-for-response**: Waiting for response state

Usage

Use this command to specify a rule definition to analyze user traffic based on an HTTP state.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP state of *init*:

```
http state = init
```

http transaction-length

This command defines a rule definition to analyze and charge user traffic based on HTTP transaction length (combined length of one HTTP GET Request message and associated one or more response message).

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] http transaction-length {` *`operator trans_length`* **`|`** **`{ { range | !range }`** *`range_from`* **`to`** *`range_to`* **`} }`**

`no`

Removes the specified rule definition.

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`<=`**: Lesser than or equals
- **`=`**: Equals
- **`>=`**: Greater than or equals

`trans_length`

Specifies the HTTP transaction length, in bytes, for this rule definition.
`trans_length` must be an integer from 1 through 4000000000.

`{ range | !range }` *`range_from`* **`to`** *`range_to`*

Enables or disables the range criteria for length of transaction.

- **`range`**: Enables the range criteria for HTTP transaction length.
- **`!range`**: Disables the range criteria for HTTP transaction length.
- *`range_from`*: Specifies the start of range, in bytes, for HTTP transaction length.
- *`range_to`*: Specifies the end of range, in bytes, for HTTP transaction length.

Usage

Use this command to specify a rule definition to analyze user traffic based on HTTP transaction length (one HTTP GET Request message + one or more associated response message(s)) in bytes.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP transaction length of *10200* bytes:

```
http transaction-length = 10200
```

http transfer-encoding

This command defines a rule definition to analyze and charge user traffic based on HTTP encoding.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] http transfer-encoding [ case-sensitive ]` *`operator string`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`string`

A unique name that you specify for HTTP transfer encoding.
`string` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an HTTP transfer encoding string.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP transfer encoding string of *user1*:

http transfer-encoding = *user1*

http uri

This command defines a rule definition to analyze and charge user traffic based on HTTP uniform resource identifier (URI).

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] http uri [ case-sensitive ]` *`operator string`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`string`

A unique name that you specify for the HTTP URI.
`string` must be an alpha and/or numeric string of 1 through 127 characters in length. *`string`* allows punctuation characters and it does not include the “host” portion.

Usage

Use this command to specify a rule definition to analyze user traffic based on an HTTP URI.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP URI string of *http://www.somehost.com*:

http uri = *http://www.somehost.com*

http url

This command defines a rule definition to analyze and charge user traffic based on HTTP URL.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http url [case-sensitive] *operator string*

---

no

Removes the specified rule definition.

---

case-sensitive

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

---

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

---

string

A unique name that you specify for the HTTP URL.
string must be an alpha and/or numeric string of 1 through 127 characters in length. *string* allows punctuation characters and includes “host + URI” for HTTP PDUs.
For example, in case of the URL “http://www.google.fr/”, the host is “http://www.google.fr”, and the URI is “/”:

```
Hypertext Transfer Protocol
 GET / HTTP/1.1\r\n
 Request Method: GET
 Request URI: /
```

```
 Request Version: HTTP/1.1

 Accept: */*\r\n

 Accept-Language: fr\r\n

 Accept-Encoding: gzip, deflate\r\n

 User-Agent: Mozilla/4.0 (compatible; MSIE 6.0; Windows NT 5.1;
SV1)\r\n

 Host: www.google.fr\r\n

 Connection: Keep-Alive\r\n

 \r\n
```

Usage

Use this command to specify a rule definition to analyze user traffic based on an HTTP URL.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP URL string of *http://rfc.ietf.org/rfc/rfc1738.txt*:

http url = *http://rfc.ietf.org/rfc/rfc1738.txt*

http user-agent

This command defines a rule definition to analyze and charge user traffic based on the user agent information in "user-agent" field of HTTP header.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] http user-agent [ case-sensitive ]` *`operator string`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`string`

This matches the HTTP user agent information in HTTP header.
`string` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on the HTTP "user-agent" field.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP user agent as *xyz.123*:

http user-agent = *xyz.123*

http version

This command defines a rule definition to analyze and charge user traffic based on HTTP version information in header.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http version [case-sensitive] *operator string*

no

Removes the specified rule definition.

case-sensitive

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

string

This matches the HTTP version information in HTTP header.
string must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on the HTTP version.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an HTTP version of *http4.2*:

http version = *http4.2*

http x-header

This command configures and matches rules based on extension-headers (x-headers). All x-header fields must begin with "x-."

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] http x-header *name* **[case-sensitive]** *operator string*

no

Removes the specified rule definition.

name

A unique value that you specify to use for the x-header.
name must be an alpha and/or numeric string of 1 through 31 characters in length.

case-sensitive

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

string

This matches the HTTP x-header information in HTTP header.
string must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to configure and match rules based on extension-headers (x-headers). This allows additional header fields to be defined without changing the protocol. The extension-header can be any header fields which are not specified in RFC.

Example

The following command creates a rule definition for analyzing user traffic containing extension-header of *test_field* and value of *test_string*:

```
http x-header test_field = test_string
```

icmp any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for ICMP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] icmp any-match *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the icmp analyzed state.

Example

The following command creates an ICMP rule definition for analyzing user traffic using an ICMP any match state of *FALSE*:

```
icmp any-match = FALSE
```

icmp code

This command defines a rule definition to analyze and charge user traffic based on the ICMP code.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] icmp code *operator code*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

code

Specifies the ICMP code is for this rule definition.
code must be an integer from 0 through 255.

Usage

Use this command to specify a rule definition to analyze user traffic based on the ICMP code.

Example

The following command creates an ICMP rule definition for analyzing user traffic using an ICMP code as *23*:

icmp code = *23*

icmp type

This command defines a rule definition to analyze and charge user traffic based on the ICMP type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] icmp type operator type
```

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

type

Specifies the ICMP type for this rule definition.
type must be an integer from 0 through 255. For example, 0 for ECHO Reply, 3 for Destination Unreachable, and 5 for Redirect.

Usage

Use this command to specify a rule definition to analyze user traffic based on the ICMP type.

Example

The following command creates an ICMP rule definition for analyzing user traffic using an ICMP type as *123*:

```
icmp type = 123
```

icmpv6 any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for Internet Control Message Protocol Version 6 (ICMPv6).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] icmpv6 any-match *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the ICMPv6 analyzed state.

Example

The following command creates an ICMPv6 rule definition for analyzing user traffic using an ICMPv6 any match state of *FALSE*:

```
icmpv6 any-match = FALSE
```

icmpv6 code

This command defines a rule definition to analyze and charge user traffic based on the ICMPv6 code.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] icmpv6 code *operator code*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

code

Specifies the ICMPv6 code is for this rule definition.
code must be an integer from 0 through 255.

Usage

Use this command to specify a rule definition to analyze user traffic based on the ICMPv6 code.

Example

The following command creates an ICMPv6 rule definition for analyzing user traffic using an ICMPv6 code as *23*:

icmpv6 code = *23*

icmpv6 type

This command defines a rule definition to analyze and charge user traffic based on the ICMPv6 type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] icmpv6 type *operator type*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

type

Specifies the ICMPv6 type for this rule definition.
type must be an integer from 0 through 255. For example, 0 for ECHO Reply, 3 for Destination Unreachable, and 5 for Redirect.

Usage

Use this command to specify a rule definition to analyze user traffic based on the ICMPv6 type.

Example

The following command creates an ICMPv6 rule definition for analyzing user traffic using an ICMPv6 type as *123*:

icmpv6 type = *123*

if-protocol

This command allows different content IDs with certain protocols to be associated with the same.

Product

All

Privilege

Security Administrator, Administrator

Syntax

if-protocol [http | wsp-connection-less | wsp-connection-oriented] content-id *content_id*

no if-protocol [http | wsp-connection-less | wsp-connection-oriented]

no

Removes the specified rule definition.

http

Specifies HTTP protocol for the rule definition.

wsp-connection-less

This routes the packets to WSP connection less protocol.

wsp-connection-oriented

This routes the packets to WSP connection oriented protocol.

content-id *content_id*

Specifies content ID used to give to the rule definition.
content_id must be an integer from 1 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on if-protocol.

Example

The following command creates an if-protocol rule definition for analyzing user traffic using http and a content ID of *23*:

if-protocol http content-id *23*

imap any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for IMAP message packets.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imap any-match *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the any-match analyzed state.

Example

The following command creates IMAP rule definition for analyzing user traffic using an IMAP any match state of *FALSE*:

```
imap any-match = FALSE
```

imap cc

This command defines a rule definition to analyze and charge user traffic based on the recipient address in the Carbon Copy (cc) field of e-mail in the IMAP message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] imap cc [ case-sensitive ]` *`operator cc_address`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`cc_address`

Specifies the string for this rule definition.
`cc_address` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on the recipient address in the “cc” field of e-mail in the IMAP message of analyzed state.

Example

The following command creates IMAP rule definition for analyzing user traffic using recipient address *triangular@xyz.com* in the “cc” field of e-mail in the IMAP message:

imap cc contains *triangular@xyz.com*

imap command

This command defines a rule definition to analyze and charge user traffic based on the embedded IMAP commands in the IMAP message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imap command *operator commands*

---

no

Removes the specified rule definition.

---

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

---

commands

Specifies the command for this rule definition.
commands must be one of the following:

- **append**
- **authenticate**
- **capability**
- **check**
- **close**
- **copy**
- **create**
- **delete**
- **examine**
- **expunge**
- **fetch**
- **list**
- **login**
- **logout**
- **lsub**
- **noop**

- **rename**
- **search**
- **select**
- **starttls**
- **status**
- **store**
- **subscribe**
- **uid-copy**
- **uid-fetch**
- **uid-search**
- **uid-store**
- **unsubscribe**

Usage

Use this command to specify a rule definition to analyze user traffic based on the embedded command in the IMAP message of analyzed state.

Example

The following command creates IMAP rule definition for analyzing user traffic using presence of *close* command in the IMAP message:

imap command = *close*

imap content class

This command defines a rule definition to analyze and charge user traffic based on the “content-class” field of e-mail in the IMAP message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] imap content class [ case-sensitive ]` *`operator content_class`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`content_class`

Specifies the string for this rule definition.
`content_class` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on the “content-class” field of e-mail in the IMAP message of analyzed state.

Example

The following command creates IMAP rule definition for analyzing user traffic using content class as *javax.mail.internet.MimeMultipart* in the “content-class” field of e-mail in the IMAP message:

imap content class contains *javax.mail.internet.MimeMultipart*

imap content type

This command defines a rule definition to analyze and charge user traffic based on the “content-type” field of e-mail in the IMAP message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] imap content type [ case-sensitive ]` *`operator content_type`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`content_type`

Specifies the string for this rule definition.
`content_type` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on the “content-type” field of e-mail in the IMAP message of analyzed state.

Example

The following command creates IMAP rule definition for analyzing user traffic using content type *TEXT/plain; charset=iso-8859-1* in the ‘content-type’ field of e-mail in the IMAP message:

```
imap content type contains TEXT/plain; charset=iso-8859-1
```

imap date

This command defines a rule definition to analyze and charge user traffic based on the “date” field of e-mail in the IMAP message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imap date [case-sensitive] *operator date*

no

Removes the specified rule definition.

case-sensitive

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

date

Specifies the string for this rule definition.
date must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on the “date” field of e-mail in the IMAP message of analyzed state.

Example

The following command creates IMAP rule definition for analyzing user traffic using date *Fri, 21 Nov 1997 11:00:00 -0600* in the “date” field of e-mail in the IMAP message:

imap date contains *Fri, 21 Nov 1997 11:00:00 -0600*

imap final-reply

This command defines a rule definition to analyze and charge user traffic based on the “final-reply” value of the last IMAP final-reply message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imap final-reply *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the ‘final-reply’ condition value for the last IMAP final-reply message to match the information in the analyzed field.
condition must be one of the following:

- **bad**: Final reply is invalid or bad.
- **no**: There is no final reply.
- **ok**: Final reply is valid.

Usage

Use this command to specify a rule definition to analyze user traffic based on using the final-reply value of the last IMAP final-reply message of analyzed state.

Example

The following command creates IMAP rule definition for analyzing user traffic using the final-reply condition value as *bad* for the last IMAP final-reply message:

imap final-reply = *bad*

imap from

This command defines a rule definition to analyze and charge user traffic based on the “from” field of e-mail in the IMAP message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] imap from [ case-sensitive ]` *`operator from_string`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`from_string`

Specifies the string for this rule definition.
`from_string` must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on the “from” field of e-mail in the IMAP message of analyzed state.

Example

The following command creates IMAP rule definition for analyzing user traffic using occurrence of triangular in the “from” field of e-mail in the IMAP message;

imap from contains *triangular*

imap mail-size

This command defines a rule definition to analyze and charge user traffic based on the size of e-mail in retrieved by IMAP from server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imap mail-size *operator mail_size*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

mail_size

Specifies the total size of mail in bytes retrieved by IMAP from server for this rule definition.
mail_size must be an integer from 0 through 4000000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on the size of e-mail in the IMAP message of analyzed state. This rule uses size of the given mail retrieved by IMAP from server.

Example

The following command creates IMAP rule definition for analyzing user traffic using size of e-mail as less than or equal to *23400* bytes in the IMAP message:

imap mail-size *<= 23400*

imap mailbox-size

This command defines a rule definition to analyze and charge user traffic based on the number of e-mail messages in a mailbox of an IMAP e-mail user.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imap mailbox-size *operator mail_qty*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

mail_qty

Specifies the total number of e-mail messages in a mailbox of the IMAP user for this rule definition.
mail_qty must be an integer from 0 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on the size of mailbox of an IMAP message user of analyzed state. This rule uses number of e-mails messages contained in a mailbox.

Example

The following command creates IMAP rule definition for analyzing user traffic using number of e-mail messages in a mailbox to less than or equal to *1024*:

imap mailbox-size *<= 1024*

imap message-type

This command defines a rule definition to analyze and charge user traffic based on the type of message in IMAP packet header.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imap message-type *operator type*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the message-type condition/value for the IMAP e-mail message to match the information in the analyzed field.
condition must be one of the following:

- **command-continuation-reply**: Message with command-continuation-reply type.
- **final-reply**: Message is of final reply type.
- **request**: There is of request type.
- **untagged-reply**: Message of reply type, but without any tag.

Usage

Use this command to specify a rule definition to analyze user traffic based on using the type of message in "message-type" filed of the last IMAP message of analyzed state.

Example

The following command creates IMAP rule definition for analyzing user traffic using the message type as *request* for the IMAP message:

imap message-type = *request*

imap previous-state

This command defines a rule definition to analyze and charge user traffic based on the previous state of IMAP message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imap previous-state *operator state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

state

Specifies the previous state of the IMAP message to match the information in the analyzed field.
state must be one of the following:

- **init**: Message in initialization state.
- **request-sent**: Message in request-sent state.

Usage

Use this command to specify a rule definition to analyze user traffic based on using the previous state of the IMAP message of analyzed state.

Example

The following command creates IMAP rule definition for analyzing user traffic using the previous state as *init* of the IMAP message which was in initialization state:

imap previous-state = *init*

imap session-length

This command defines a rule definition to analyze and charge user traffic based on the IMAP session length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imap session-length *operator session_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

session_length

Specifies the total length of IMAP session, in bytes, for this rule definition.
session_length must be an integer from 1 through 4000000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on the length of IMAP session of the analyzed state.
The session length is calculated by adding together the IP payloads (i.e., starting after the IP header) of all relevant IMAP session packets.

Example

The following command creates IMAP rule definition for analyzing user traffic using session length as less than or equal to *4000* bytes for the IMAP session:

imap session-length *<= 4000*

imap session-previous-state

This command defines a rule definition to analyze and charge user traffic based on the previous state of IMAP session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imap session-previous-state *operator state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

state

Specifies the previous state of the IMAP session to match the information in the analyzed field.
state must be one of the following:

- **authenticated**: Session authenticated
- **connected**: Session connected
- **init**: Session initialized
- **mailbox-selected**: Mailbox selected

Usage

Use this command to specify a rule definition to analyze user traffic based on using the previous state of the IMAP session of analyzed state.

Example

The following command creates IMAP rule definition for analyzing user traffic using the previous state as *init* of the IMAP session which was initialized:

imap session-previous-state = *init*

imap session-state

This command defines a rule definition to analyze and charge user traffic based on the current state of IMAP session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imap session-state *operator state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

state

Specifies the current state of the IMAP session to match the information in the analyzed field.
state must be one of the following:

- **authenticated**: Session authenticating.
- **connected**: Session connecting.
- **logout**: Session logged out.
- **mailbox-selected**: Mailbox selecting.

Usage

Use this command to specify a rule definition to analyze user traffic based on using the current state of the IMAP session of analyzed state.

Example

The following command creates IMAP rule definition for analyzing user traffic using the current state as *connected* of the IMAP session which is in connecting state:

imap session-state = *connected*

imap state

This command defines a rule definition to analyze and charge user traffic based on the current state of IMAP request message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imap state *operator state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

state

Specifies the current state of the IMAP request message to match the information in the analyzed field.
state must be one of the following:

- **request-sent**: Request message sent
- **response-fail**: Request response failed
- **response-ok**: Request response is good

Usage

Use this command to specify a rule definition to analyze user traffic based on using the current state of the IMAP request message of analyzed state.

Example

The following command creates IMAP rule definition for analyzing user traffic using the current state as *response-fail* of the IMAP request message when request response is failed:

```
imap state = response-fail
```

imap subject

This command defines a rule definition to analyze and charge user traffic based on the ‘subject’ field of e-mail in the IMAP message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] imap subject [ case-sensitive ]` *`operator subject`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`subject`

Specifies the string for this rule definition.
`subject` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on the “subject” field of e-mail in the IMAP message of analyzed state.

Example

The following command creates IMAP rule definition for analyzing user traffic using occurrence of *My test* in the "subject" field of e-mail in the IMAP message:

```
imap subject contains My test
```

imap to

This command defines a rule definition to analyze and charge user traffic based on the ‘to’ field of e-mail in the IMAP message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imap to [case-sensitive] *operator subject*

no

Removes the specified rule definition.

case-sensitive

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

to

Specifies the string for this rule definition.
to must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on the “to” field of e-mail in the IMAP message of analyzed state.

Example

The following command creates IMAP rule definition for analyzing user traffic using occurrence of *xyz.com* in the "to" field of e-mail in the IMAP message:

```
imap to contains xyz.com
```

ip any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for IP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip any-match *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the IP analyzed state.

Example

The following command creates IP rule definition for analyzing user traffic using an IP any match state of *FALSE*:

```
ip any-match = FALSE
```

ip downlink

This command defines a rule definition to analyze and charge user traffic matching the direction of IP packet to downlink (to subscriber).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip downlink *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the IP packet direction as downlink.

Example

The following command creates IP rule definition for analyzing user traffic using an IP packet direction to downlink (to subscriber):

```
ip downlink = TRUE
```

ip dst-address

This command defines a rule definition to analyze and charge user traffic based on IP destination address.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] ip dst-address { `*`operator`*** **`{ `***`ip_address`*** **| `***`ip_address/mask`*** **} | { !range | range } host-pool `***`host_pool`*** **}`**

---

no

Removes the specified rule definition.

`operator` **`{ `***`ip_address`*** **| `***`ip_address/mask`***`}`**

`operator`: Specifies how to logically match the IP destination address.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`<=`**: Lesser than or equals
- **`=`**: Equals
- **`>=`**: Greater than or equals

`ip_address`: Specifies IP address of the destination node for outgoing traffic in IPv4 or IPv6 standard notation. ***`ip_address`*** must be an IPv4 address in dotted decimal notation, or an IPv6 address in colon notation.
`ip_address/mask`: Specifies IP address of the destination node for outgoing traffic in IPv4 or IPv6 standard notation with subnet mask bit. ***`ip_address/mask`*** must be an IPv4 address in dotted decimal notation, or an IPv6 address in colon notation with subnet mask bit. The mask bit is a numeric value which is the number of bits in the subnet mask.

`{ !range | range } host-pool `*`host_pool`*** **`}`**

`!range | range`: Specifies the range criteria:

- **`!range`**: Not in the range of
- **`range`**: In the range of

`host-pool` ***`host_pool`***: Specifies the host pool name. ***`host_pool`*** must be a string of 1 through 63 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on IP destination address.

Example

The following command creates IP rule definition for analyzing user traffic using an IP destination address of *1.1.1.1*:

```
ip dst-address = 1.1.1.1
```

ip error

This command defines a rule definition to analyze user traffic for invalid IP packets and other errors while parsing IP packets.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip error *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define a rule definition to analyze user traffic for invalid IP packets and any other errors while parsing IP packets.

Example

The following command creates an IP rule definition for analyzing user traffic using an IP error status of *TRUE*:

```
ip error = TRUE
```

ip protocol

This command defines a rule definition to analyze and charge user traffic based on the protocol being transported by IP packets.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip protocol *operator* **{** *protocol_assignment* **|** *protocol* **}**

no

Removes the specified rule definition.

operator

Specifies how to logically match the IP protocol.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals—available only in StarOS 8.1 and later
- **=**: Equals
- **>=**: Greater than or equals—available only in StarOS 8.1 and later releases

protocol_assignment

Specifies the protocol by assignment number.
protocol_assignment must be an integer from 0 through 255.
For example, 1 for ICMP, 6 for TCP, and 17 for UDP.

protocol

Specifies the protocol by name. *protocol* must be one of the following:

- **ah**
- **esp**
- **gre**
- **icmp**
- **icmpv6**
- **tcp**
- **udp**

Usage

Use this command to specify a rule definition to analyze user traffic based on the IP protocol.

Example

The following command creates IP rule definition for analyzing user traffic using a protocol assignment of *1*:

```
ip protocol = 1
```

ip server-ip-address

This command defines a rule definition to analyze and charge user traffic matching the IP address of the destination, i.e. from the subscriber, of the connection.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip server-ip-address { *operator* { *ip_address* | *ip_address/mask* } | { !range | range } host-pool *host_pool* }

---

no

Removes the specified rule definition.

---

operator{ *ip_address* | *ip_address/mask* }

operator: Specifies how to logically match the server IP address. *operator* must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

ip_address: Specifies the server IP address in IPv4 or IPv6 standard notation. For uplink packets (from subscriber) this field matches the destination IP address in the IP header, and for downlink packets (to the subscriber) it matches the source IP address in IP header. *ip_address* must be an IPv4 address in dotted decimal notation, or an IPv6 address in colon notation.
ip_address/mask: Specifies the server IP address in IPv4 or IPv6 standard notation with subnet mask bit. For uplink packets (from subscriber) this field matches the destination IP address in the IP header, and for downlink packets (to the subscriber) it matches the source IP address in IP header. *ip_address/mask* must be an IPv4 address in dotted decimal notation, or an IPv6 address in colon notation with subnet mask bit. The mask bit is a numeric value which is the number of bits in the subnet mask.

{ !range | range } host-pool *host_pool*

!range | range: Specifies the range criteria:

- **!range**: Not in the range of
- **range**: In the range of

host-pool *host_pool*: Specifies the host pool name. *host_pool* must be a string of 1 through 63 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on the server IP address.

Example

The following command creates an IP rule definition for analyzing user traffic using an IP server address of *1.10.1.1*:

```
ip server-ip-address = 1.10.1.1
```

ip src-address

This command defines a rule definition to analyze and charge user traffic based on IP source address.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip src-address { *operator* { *ip_address* | *ip_address/mask* } | { !range | range } host-pool *host_pool* }

no

Removes the specified rule definition.

operator **{** *ip_address* **|** *ip_address/mask* **}**

operator: Specifies how to logically match the IP source address.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

ip_address: Specifies IP address of the source node for incoming traffic in IPv4 or IPv6 standard notation. *ip_address* must be an IPv4 address in dotted decimal notation, or an IPv6 address in colon notation.
ip_address/mask: Specifies IP address of the source node for incoming traffic in IPv4 or IPv6 standard notation with subnet mask bit. *ip_address/mask* must be an IPv4 address in dotted decimal notation, or an IPv6 address in colon notation with subnet mask bit. The mask bit is a numeric value which is the number of bits in the subnet mask.

{ !range | range } host-pool *host_pool*

!range | range: Specifies the range criteria:

- **!range**: Not in the range of
- **range**: In the range of

host-pool *host_pool*: Specifies the host pool name. *host_pool* must be a string of 1 through 63 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on IP source address.

Example

The following command creates an IP rule definition for analyzing user traffic using an IP source address of *1.1.1.1*:

ip src-address = *1.1.1.1*

ip subscriber-ip-address

This command defines a rule definition to analyze and charge user traffic matching the IP address of the subscriber (either source address or destination address).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip subscriber-ip-address { *operator* { *ip_address* | *ip_address/mask* } | { !range | range } host-pool *host_pool* }

---

no

Removes the specified rule definition.

---

operator **{** *ip_address* **|** *ip_address/mask* **}**

operator: Specifies how to logically match the subscriber IP address.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

ip_address: Specifies the subscriber IP address. Depending on the direction of packet this IP address will be either the IP source address or the IP destination address. *ip_address* must be an IPv4 address in dotted decimal notation, or an IPv6 address in colon notation.
ip_address/mask: Specifies the subscriber IP address with subnet mask bit. Depending on the direction of packet this IP address will either be the IP source address or the IP destination address.
ip_address/mask must be an IPv4 address in dotted decimal notation, or an IPv6 address in colon notation with subnet mask bit. The mask bit is a numeric value which is the number of bits in the subnet mask.

{ !range | range } host-pool *host_pool*

!range | range: Specifies the range criteria:

- **!range**: Not in the range of
- **range**: In the range of

host-pool *host_pool*: Specifies the host pool name. *host_pool* must be a string of 1 through 63 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on the subscriber IP address.

Example

The following command creates an IP rule definition for analyzing user traffic using an IP address of *161.10.1.1* for subscriber:

```
ip subscriber-ip-address = 161.10.1.1
```

ip total-length

This command defines a rule definition to analyze and charge user traffic based on IP total length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip total-length *operator total_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

total_length

Specifies the total length of the IP packet including payload that is for this rule definition.
total_length must be an integer from 0 through 4096.

Usage

Use this command to specify a rule definition to analyze user traffic based on the IP total length.

Example

The following command creates an IP rule definition for analyzing user traffic using an IP total length of *2000* bytes:

ip total-length = *2000*

ip uplink

This command defines a rule definition to analyze and charge user traffic matching the direction of IP packet to uplink (from subscriber).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip uplink *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the IP packet direction as uplink.

Example

The following command creates IP rule definition for analyzing user traffic using an IP packet direction to uplink (from subscriber):

```
ip uplink = TRUE
```

ip version

This command defines a rule definition to analyze and charge user traffic based on the IP version.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip version *operator ip_version*

no

Removes the specified rule definition.

operator

Specifies how to logically match information in the analyzed field.
operator must be **=** (equals).

ip_version

Specifies the IP version. *ip_version* must be one of the following:

- **ipv4**
- **ipv6**

Usage

Use this command to define a rule definition to analyze and charge user traffic based on the IP version.

Example

The following command creates an IP rule definition to analyze user traffic for the IP version IPv6:

ip version = *ipv6*

mms any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for MMS.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] mms any-match *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the MMS any match status.

Example

The following command creates an MMS rule definition for analyzing user traffic using an MMS any match status of *FALSE*:

```
mms any-match = FALSE
```

mms bcc

This command defines a rule definition to analyze and charge user traffic based on MMS Blind Carbon Copy (BCC).

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] mms bcc [ case-sensitive ]` *`operator string`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`string`

Specifies the string for this rule definition.
`string` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an MMS BCC value.

Example

The following command creates an MMS rule definition for analyzing user traffic containing an MMS BCC value of *`test1`*:

mms bcc contains *test1*

mms cc

This command defines a rule definition to analyze and charge user traffic based on the Carbon Copy (cc) field of MMS message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] mms cc [case-sensitive] *operator string*

no

Removes the specified rule definition.

case-sensitive

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

string

Specifies the string for this rule definition.
string must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an MMS cc value.

Example

The following command creates an MMS rule definition for analyzing user traffic containing an MMS CC value of *test1*:

```
mms cc contains test1
```

mms content location

This command defines a rule definition to analyze and charge user traffic based on MMS content location.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] mms content location [ case-sensitive ]` *`operator string`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`string`

Specifies the string for this rule definition.
`string` must be an alpha and/or numeric string of 1 through 127 characters in length., and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an MMS content location value.

Example

The following command creates an MMS rule definition for analyzing user traffic containing an MMS content location value of *test1*:

```
mms content location contains test1
```

mms content type

This command defines a rule definition to analyze and charge user traffic based on MMS content type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] mms content type [ case-sensitive ]` *`operator string`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`string`

Specifies the string for this rule definition.
`string` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an MMS “content-type” field value.

Example

The following command creates an MMS rule definition for analyzing user traffic containing an MMS content type as *`image`*:

mms content type contains *image*

mms downlink

This command defines the rule definition to analyze and charge user traffic based on MMS message downlink condition.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] mms downlink *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Indicates the downlink (from the Mobile Node direction) status.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on an MMS downlink status.

Example

The following command creates an MMS rule definition for analyzing user traffic with an MMS downlink value to *TRUE*:

```
mms downlink = TRUE
```

mms from

This command defines the rule definition to analyze and charge user traffic based on the from field in MMS message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] mms from [case-sensitive] *operator string*

no

Removes the specified rule definition.

case-sensitive

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

string

Specifies the string for this rule definition.
string must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on the “from” field of an MMS message.

Example

The following command creates an MMS rule definition for analyzing user traffic containing *test1* in the “from” field of MMS message:

```
mms from contains test1
```

mms message-id

This command defines a rule definition to analyze and charge user traffic based on the "message-id" of an MMS message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] mms message-id [ case-sensitive ]` *`operator string`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`string`

Specifies the string for this rule definition.
`string` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an MMS message ID value.

Example

The following command creates an MMS rule definition for analyzing user traffic containing an MMS message ID of *test1*:

```
mms message-id contains test1
```

mms pdu-type

This command defines a rule definition to analyze and charge user traffic based on the MMS Protocol Data Unit (PDU) type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] mms pdu-type *operator pdu_type*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

pdu_type

Specifies the MMS PDU type used for this rule definition.
pdu_type must be one of the following:

- **mms-pdu-type-m-acknowledge-ind**
- **mms-pdu-type-m-delivery-ind**
- **mms-pdu-type-m-http-get**
- **mms-pdu-type-m-notification-ind**
- **mms-pdu-type-m-notify-rsp-ind**
- **mms-pdu-type-m-retrieve-conf**
- **mms-pdu-type-m-send-conf**
- **mms-pdu-type-m-send-request**
- **mms-pdu-type-m-wsp-get**
- **mms-pdu-type-response**

Usage

Use this command to specify a rule definition to analyze user traffic based on type of an MMS PDU.

Example

The following command creates an MMS rule definition for analyzing user traffic for **mms-pdu-type-m-http-get** of MMS PDU:

```
mms pdu-type = mms-pdu-type-m-http-get
```

mms previous-state

This command defines a rule definition to analyze and charge user traffic based on MMS previous state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] mms previous-state *operator previous_state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

previous_state

Analyzes the previous state of the MMS transmissions.
previous_state must be one of the following:

- **delayed-ack-pending**
- **delayed-m-notify-rsp-sent**
- **delayed-retrieval-pending**
- **immediate-retrieval-pending**
- **init**
- **m-send-conf-rcvd**
- **m-send-req-sent**
- **notification-ind-rcvd**
- **notify-rsp-sent**
- **retrieval-pending**
- **retrieve-conf-received**
- **send-success**

Usage

Use this command to specify a rule definition to analyze user traffic based on an MMS previous state.

Example

The following command creates an MMS rule definition for analyzing user traffic using an MMS previous state of **retrieval-pending**:

```
mms previous-state = retrieval-pending
```

mms response status

This command defines a rule definition to analyze and charge user traffic based on MMS response status code.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] mms response status *operator status_code*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

status_code

Specifies the code for this rule definition.
status_code must be an integer from 128 through 136.

Usage

Use this command to specify a rule definition to analyze user traffic based on an MMS response status.

Example

The following command creates an FTP rule definition for analyzing user traffic using an MMS response status code of *129*:

mms response status != *129*

mms state

This command defines a rule definition to analyze and charge user traffic based on the current state of MMS message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] mms state *operator mms_state*

---

no

Removes the specified rule definition.

---

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

---

mms_state

Analyzes the state of the MMS transmissions.
mms_state must be one of the following:

- **delayed-ack-pending**
- **delayed-m-notify-rsp-sent**
- **delayed-retrieval-pending**
- **delivery-failed**
- **delivery-success**
- **immediate-retrieval-pending**
- **m-send-conf-rcvd**
- **m-send-req-sent**
- **notification-ind-rcvd**
- **notify-rsp-sent**
- **retrieval-failed**
- **retrieval-pending**
- **retrieval-success**
- **retrieve-conf-received**
- **send-success**

Usage

Use this command to specify a rule definition to analyze user traffic based on current state of MMS message.

Example

The following command creates an MMS rule definition for analyzing user traffic using current state of MMS message as **retrieval-failed**:

```
mms state = retrieval-failed
```

mms status

This command defines a rule definition to analyze and charge user traffic based on MMS status.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] mms status *operator status*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

status

Specifies the status for this rule definition.
status must be an integer from 128 through 132.

Usage

Use this command to specify a rule definition to analyze user traffic based on an MMS status.

Example

The following command creates an MMS rule definition for analyzing user traffic using an MMS status of *130*:

mms status = *130*

mms subject

This command defines a rule definition to analyze and charge user traffic using “subject” field of MMS message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] mms subject [ case-sensitive ]` *`operator string`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`string`

Specifies the string for this rule definition.
`string` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on “subject” field of an MMS message.

Example

The following command creates an MMS rule definition for analyzing user traffic for occurrence of *test1* in "subject" field of MMS message:

```
mms subject contains test1
```

mms tid

This command defines a rule definition to analyze and charge user traffic based on MMS Transaction Identifier (TID).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] mms tid [case-sensitive] *operator tid_value*

no

Removes the specified rule definition.

case-sensitive

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

tid_value

The value of the specified field.
tid_value must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an MMS TID.

Example

The following command creates a rule definition for analyzing user traffic using an MMS TID value of *test*:

mms tid = *test*

mms to

This command defines a rule definition to analyze and charge user traffic using “to” field of MMS message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] mms to [case-sensitive] *operator to_value*

no

Removes the specified rule definition.

case-sensitive

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

to_value

The value of the specified field.
to_value must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an MMS to rule definition.

Example

The following command creates a rule definition for analyzing user traffic using an MMS to value of *test*:

mms to = *test*

mms uplink

This command defines a rule definition to analyze and charge user traffic based on MMS uplink.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] mms uplink *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Indicates the uplink (from the Mobile Node direction) status.

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the MMS uplink.

Example

The following command creates a rule definition for analyzing user traffic using an MMS uplink value of *TRUE*:

```
mms uplink = TRUE
```

mms version

This command defines a rule definition to analyze and charge user traffic based on MMS version.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] mms version operator version
```

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

version

Specifies the version for this rule definition.
version must be an integer from 1 through 65535.

Important: MMS protocol analyzer supports decoding of MMS version 1.0 only.

Usage

Use this command to specify a rule definition to analyze user traffic based on the MMS version.

Example

The following command creates a rule definition for analyzing user traffic using an MMS version of *1.0*:

```
mms version = 1.0
```

multi-line-or all-lines

Defines whether to apply the OR operator to all lines in a rule definition.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] multi-line-or all-lines
```

no

Removes the previous configuration.

Usage

If multi-line-or is enabled for a rule definition, the logical OR operator to all the rule-lines in the rule definition is applied to decide if the rule definition matches or not. If multi-line-or is not configured, the logical AND operator is applied.

p2p any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for Peer to Peer (P2P).

Product

ACS

Privilege

Administrator, Config-administrator

Syntax

`[ no ] p2p any-match` *`operator condition`*

`no`

Removes the specified rule definition.

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`=`**: Equals

`condition`

Specifies the condition for this rule definition.
`condition` must be one of the following:

- **`TRUE`**: The rule matches any P2P traffic.
- **`FALSE`**: The rule does not match any P2P traffic.

Usage

Use this command to specify a rule definition to analyze user traffic based on the P2P any match status.

Example

The following command creates a rule definition for analyzing user traffic using an P2P any match status of **`TRUE`**:

```
p2p any-match = TRUE
```

p2p protocol

This command configures the system to detect specific P2P protocols for charging purposes. This command is not used for detection purposes.

Product

ACS

Privilege

Administrator, Config-administrator

Syntax

[no] p2p protocol *operator protocol*

---

no

Removes the specified rule definition.

---

operator

Specifies how to logically match the information in the analyzed field.
operator must be **=** (equals).

---

protocol

Specifies the protocol for charging purposes.
protocol must be one of the following:

- **applejuice**
- **ares**
- **bittorrent**
- **ddlink**
- **directconnect**
- **edonkey**
- **fasttrack**
- **feidian**
- **filetopia**
- **fring**
- **gadugadu**
- **gnutella**
- **gtalk**
- **halflife2**
- **hamachivpn**
- **icecast**
- **imesh**
- **irc**

- iskoot
- jabber
- kontiki
- manolito
- meebo
- msn
- mute
- oovoo
- orb
- oscar
- pando
- popo
- pplive
- ppstream
- qq
- qqlive
- shoutcast
- skinny
- skype
- slingbox
- sopcast
- soulseek
- steam
- thunder
- truphone
- tvants
- tvuplayer
- uusee
- vpnx
- vtun
- winmx
- winny
- wofwarcraft
- xbox
- yahoo
- zattoo

Usage

Use this command to configure detection of protocols for charging purposes. For detection purposes use the **p2p-detection protocol** in the ACS Configuration Mode.

Example

The following command configures the system to detect orb protocol for charging purposes:

```
p2p protocol = orb
```

p2p traffic-type

This command defines a rule definition to analyze and charge user traffic based on the type of traffic, such as voice or non-voice.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] p2p traffic-type *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **voice**

Usage

Use this command to configure the system to detect voice or non-voice P2P traffic. When the detection of a protocol is enabled then the detection of sub-type is enabled by default.

Example

The following command configures the system to detect voice traffic:

```
p2p traffic-type = voice
```

pop3 any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for POP3.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 any-match *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the POP3 any match status.

Example

The following command creates an POP3 rule definition for analyzing user traffic using a POP3 any match status of *FALSE*:

```
pop3 any-match = FALSE
```

pop3 command args

This command defines a rule definition to analyze and charge user traffic based on the POP3 command arguments.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] pop3 command args [ case-sensitive ]` *`operator argument`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`argument`

A unique value that you specify to use for the command argument.
`argument` must be an alpha and/or numeric string of 1 through 40 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on a POP3 command argument.

Example

The following command defines a rule definition for analyzing POP3 user traffic using a command argument of *`test`*:

pop3 command args = *test*

pop3 command id

This command defines a rule definition to analyze and charge user traffic based on the POP3 command ID.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 command id *operator command_id*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

command_id

A unique value that you specify to use for the command argument.
command_id must be an integer from 1 through 12.

Usage

Use this command to specify a rule definition to analyze user traffic based on a POP3 command ID.

Example

The following command defines a rule definition for analyzing POP3 user traffic using a command ID of *8*:

pop3 command id = *8*

pop3 command name

This command defines a rule definition to analyze and charge user traffic based on the POP3 command name.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 command name *operator command_name*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

command_name

command_name must be one of the following:

- **apop**
- **dele**
- **list**
- **noop**
- **pass**
- **quit**
- **retr**
- **reset**
- **stat**
- **top**
- **uidl**
- **user**

Usage

Use this command to specify a rule definition to analyze user traffic based on a POP3 command name.

Example

The following command defines a rule definition for analyzing POP3 user traffic using a command name of *list*:

```
pop3 command name = list
```

pop3 mail-size

This command defines a rule definition to analyze and charge user traffic based on the POP3 mail size.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 mail-size { *operator mail_size* **| { { range | !range }** *range_from* **to** *range_to* **} }**

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

{ range | !range } *range_from* **to** *range_to*

Enables or disables the range criteria.

- **range**: Enables the range criteria.
- **!range**: Disables the range criteria.
- *range_from*: Specifies the start of range, and must be an integer from 1 through 4000000000.
- *range_to*: Specifies the end range. *range_to* must be an integer from 1 through 4000000000, and must be greater than *range_from*.

mail_size

Specifies the mail size for this rule definition.
mail_size must be an integer from 1 through 4000000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on POP3 mail size.

Example

The following command defines a rule definition for analyzing POP3 user traffic using a mail size of *40000*:

pop3 mail-size = *40000*

pop3 pdu-length

This command defines a rule definition to analyze and charge user traffic based on the POP3 Protocol Data Unit (PDU) length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 pdu-length { *operator pdu_length* **|** **{ { range | !range }** *range_from* **to** *range_to* **} }**

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

{ range | !range } *range_from* **to** *range_to*

Enables or disables the range criteria.

- **range**: Enables the range criteria.
- **!range**: Disables the range criteria.
- *range_from*: Specifies the start of range, and must be an integer from 0 through 65535.
- *range_to*: Specifies the end range. *range_to* must be an integer from 0 through 65535, and must be greater than *range_from*.

pdu_length

Specifies the POP3 PDU length for this rule definition.
pdu_length must be an integer from 0 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on a POP3 PDU length (header + payload) in bytes.

Example

The following command defines a rule definition for analyzing POP3 user traffic using a PDU length of *1000* bytes:

```
pop3 pdu-length = 1000
```

pop3 pdu-type

This command defines a rule definition to analyze and charge user traffic based on the POP3 PDU type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] pop3 pdu-type` *`operator condition`*

`no`

Removes the specified rule definition.

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`=`**: Equals

`condition`

Specifies the packet type for this rule definition.
`condition` must be one of the following:

- **`command-packet`**
- **`data-packet`**
- **`relay-packet`**

Usage

Use this command to specify a rule definition to analyze user traffic based on a POP3 PDU type.

Example

The following command defines a rule definition for analyzing POP3 user traffic using a PDU type of **`relay-packet`**:

```
pop3 pdu-type = relay-packet
```

pop3 previous-state

This command defines a rule definition to analyze and charge user traffic based on the POP3 previous state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 previous-state *operator previous-state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

previous_state

Specifies the previous state for this rule definition.
previous_state must be one of the following:

- **connected**: Connected state
- **data transaction**: Data transaction state
- **init**: Initialized state
- **reply-error**: Reply error state
- **reply-ok**: Response ok state
- **waiting-for-reply**: Waiting for reply state

Usage

Use this command to specify a rule definition to analyze user traffic based on a POP3 previous state.

Example

The following command creates a POP3 rule definition for analyzing user traffic using a POP3 previous state of *connected*:

```
pop3 previous-state = connected
```

pop3 reply args

This command defines a rule definition to analyze and charge user traffic based on the POP3 reply arguments.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] pop3 reply args [ case-sensitive ]` *`operator argument`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`argument`

A unique value that you specify to use for the reply argument.
`argument` must be an alpha and/or numeric string of 1 through 512 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on a POP3 reply argument rule definition.

Example

The following command defines a rule definition for analyzing POP3 user traffic using a reply argument of *`test`*:

pop3 reply args = *test*

pop3 reply id

This command defines a rule definition to analyze and charge user traffic based on the POP3 reply ID.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 reply id *operator reply_id*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

reply_id

Specifies the reply ID for this rule definition.
reply_id must be one of the following:

- **0**: Unknown reply
- **1**: +OK reply
- **2**: -ERR reply

Usage

Use this command to specify a rule definition to analyze user traffic based on a POP3 reply ID.

Example

The following command defines a rule definition for analyzing POP3 user traffic using a reply ID of *2*:

pop3 reply id = *2*

pop3 reply status

This command defines a rule definition to analyze and charge user traffic based on the POP3 reply status.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 reply status *operator reply_status*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

reply_status

Specifies the reply ID for this rule definition.
reply_status must be one of the following:

- **+OK**: Reply OK
- **-ERR**: Reply error

Usage

Use this command to specify a rule definition to analyze user traffic based on a POP3 reply status.

Example

The following command defines a rule definition for analyzing POP3 user traffic using a reply status of *+OK*:

pop3 reply status = *+ok*

pop3 session-length

This command defines a rule definition to analyze and charge user traffic based on the POP3 session-length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 session-length { *operator session_length* **|** **{ range | !range }** *range_from* **to** *range_to* **}**

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

session_length

Specifies the session length used for this rule definition.
session_length must be an integer from 1 through 4000000000.

{ range | !range } *range_from* **to** *range_to*

Enables or disables the range criteria for PoP3 session length.

- **range**: Enables the range criteria for Pop3 session length.
- **!range**: Disables the range criteria for PoP3 session length.
- *range_from*: Specifies the start of range of PoP3 session length, and must be an integer from 1 through 4000000000 but less than or equal to *range_to*.
- *range_to*: Specifies the end of range of PoP3 session length, and must be an integer from 1 through 4000000000 but greater than or equal to *range_from*.

Usage

Use this command to specify a rule definition to analyze user traffic based on the POP3 session length.

Example

The following command creates a POP3 rule definition for analyzing user traffic using a POP3 session length of *40000*:

```
pop3 session-length = 40000
```

pop3 state

This command defines a rule definition to analyze and charge user traffic based on the POP3 state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 state *operator state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

state

Specifies the POP3 state for this rule definition.
state must be one of the following:

- **close**
- **connected**
- **data-transaction**
- **reply-error**
- **reply-ok**
- **waiting-for-reply**

Usage

Use this command to specify a rule definition to analyze user traffic based on a POP3 state.

Example

The following command creates a POP3 rule definition for analyzing user traffic using a POP3 state of *close*:

pop3 state = *close*

pop3 user-name

This command defines a rule definition to analyze and charge user traffic based on the POP3 user name.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] pop3 user-name [ case-sensitive ]` *`operator user_name`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`user_name`

A unique value that you specify to use for the user name.
`user_name` must be an alpha and/or numeric string of 1 through 64 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on a POP3 username rule definition.

Example

The following command defines a rule definition for analyzing POP3 user traffic using the user name *`test`*:

pop3 user-name = *test*

rtcp any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for RTCP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtcp any-match *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **TRUE**: The rule matches any RTCP traffic
- **FALSE**: The rule does not match any RTCP traffic

Usage

Use this command to specify a rule definition to analyze user traffic based on the RTCP any match status.

Example

The following command creates a rule definition for analyzing user traffic using an RTCP any match status of *TRUE*:

```
rtcp any-match = TRUE
```

rtcp jitter

This command defines a rule definition to analyze and charge user traffic based upon the amount of jitter in the RTCP protocol.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtcp jitter *operator value*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

value

This value represents the amount of jitter to test against.
value must be an integer from 0 through 4294967295.

Usage

Use this command to set a rule based on the jitter in the RTCP protocol.

Example

The following command test for jitter greater than or equal to 12954:

rtcp jitter >= *12954*

rtcp parent-proto

This command defines a rule definition to analyze and charge user traffic based on the parent protocol of the RTCP flow.

Important: This command is only available in StarOS 8.1 and StarOS 9.0 and later.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtcp parent-proto *operator parent_protocol*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

parent_protocol

Specifies the RTCP parent protocol for this rule definition.
parent_protocol must be one of the following:

- **rtsp**: Real Time Streaming Protocol
- **sip**: Session Initiation Protocol

Usage

Use this command to specify a rule definition to analyze and charge user traffic based on the parent protocol of the RTCP flow.

Example

The following command creates an RTCP rule definition to analyze user traffic based on the parent protocol of the RTCP flow being SIP:

```
rtcp parent-proto = sip
```

rtcp pdu-length

This command defines a rule definition to analyze and charge user traffic based upon the Real-time Transport Protocol (RTCP) Protocol Data Unit (PDU) length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtcp pdu-length *operator pdu_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

pdu_length

Specifies the RTCP length, in bytes, for this rule definition.
In StarOS 8.1 and later, *pdu_length* must be an integer from 1 through 65535. In StarOS 8.0, *pdu_length* must be an integer from 1 through 2000.

Usage

Use this command to specify a rule definition to analyze user traffic based on an RTCP PDU length (header + payload) in bytes.

Example

The following command creates a rule definition for analyzing user traffic using an RTCP PDU length of *10000* bytes:

rtcp pdu-length = *10000*

rtcp rtsp-id

This command defines a rule definition to definition to analyze and charge user traffic using a RTSP ID associated with Real-time Transport Control Protocol (RTCP).

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] rtp rtsp-id [ case-sensitive ]` *`operator string`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`string`

Specifies the string for this rule definition.
`string` must be an alpha and/or numeric string of 1 through 32 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on an MMS message ID value.

Example

The following command creates an RTCP rule definition for analyzing user traffic containing an RTSP message ID of *`test1`*:

rtcp rtsp-id contains *test1*

rtcp session-length

This command defines a rule definition to analyze and charge user traffic based on the Real-time Transport Protocol (RTCP) session length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtcp session-length *operator session_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

session_length

Specifies the RTCP total session length for this rule definition.
In StarOS 8.1 and later releases, *session_length* must be an integer from 1 through 4000000000. In StarOS 8.0, *session_length* must be an integer from 1 through 40000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on the RTCP total session length.

Example

The following command creates an RTCP rule definition for analyzing user traffic using a total RTCP session length of *200000*:

rtcp session-length = *200000*

rtcp uri

This command defines a rule definition to definition to analyze and charge user traffic using uniform resource identifier (URI) associated with Real-time Transport Control Protocol (RTCP).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtcp uri [case-sensitive] *operator string*

no

Removes the specified rule definition.

case-sensitive

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

string

Specifies the string for this rule definition.
string must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on an RTCP URI.

Example

The following command creates an RTP rule definition for analyzing user traffic using an RTCP URI string of *rtsp://www.example.org*:

rtcp uri = *rtsp://www.example.org*

rtp any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for RTP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtp any-match *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the RTP any match status.

Example

The following command creates an MMS rule definition for analyzing user traffic using an RTP any match status of *TRUE*:

```
rtp any-match = TRUE
```

rtp parent-proto

This command defines a rule definition to analyze and charge user traffic based on the parent protocol of the RTP flow.

Important: This command is only available in StarOS 8.1 and in StarOS 9.0 and later releases.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] rtp parent-proto` *`operator parent_protocol`*

`no`

Removes the specified rule definition.

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`=`**: Equals

`parent_protocol`

Specifies the RTP parent protocol for this rule definition.
`parent_protocol` must be one of the following:

- **`rtsp`**: Real Time Streaming Protocol
- **`sip`**: Session Initiation Protocol

Usage

Use this command to specify a rule definition to analyze and charge user traffic based on the parent protocol of the RTP flow.

Example

The following command creates an RTP rule definition to analyze user traffic based on the parent protocol of the RTP flow being SIP:

```
rtp parent-proto = sip
```

rtp pdu-length

This command defines a rule definition to analyze and charge user traffic based on the RTP Protocol Data Unit (PDU) length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtp pdu-length *operator pdu_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

pdu_length

Specifies the RTP PDU length, in bytes, for this rule definition.
In StarOS 8.1 and later releases, *pdu_length* must be an integer from 1 through 65535. In StarOS 8.0, *pdu_length* must be an integer from 1 through 2000.

Usage

Use this command to specify a rule definition to analyze user traffic based on an RTP PDU length (header + payload) in bytes.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an RTP PDU length of *1000* bytes:

rtp pdu-length = *1000*

rtp rtsp-id

This command defines a rule definition to analyze and charge user traffic based on the RTSP ID associated with RTP flow.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] rtp rtsp-id [ case-sensitive ]` *`operator string`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`string`

Specifies the string for this rule definition.
`string` must be an alpha and/or numeric string of 1 through 32 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on an MMS message ID value.

Example

The following command creates an RTP rule definition for analyzing user traffic containing an RTSP message ID of *`test1`*:

rtp rtsp-id contains *test1*

rtp session-length

This command defines a rule definition to analyze and charge user traffic based on RTP session length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtp session-length *operator session_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

session_length

Specifies the RTP total session length for this rule definition.
In StarOS 8.1 and later releases, *session_length* must be an integer from 1 through 4000000000. In StarOS 8.0, *session_length* must be an integer from 1 through 40000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on the RTP total session length.

Example

The following command creates an RTP rule definition for analyzing user traffic using a total RTP session length of *200000*:

rtp session-length = *200000*

rtp uri

This command defines a rule definition to analyze and charge user traffic based on the uniform resource identifier (URI) associated with RTP flow.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtp uri [case-sensitive] *operator string*

no

Removes the specified rule definition.

case-sensitive

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

string

A unique name that you specify for the RTP URI.
string must be an alpha and/or numeric string of 1 through 127 characters in length. *string* allows punctuation characters and it does not include the “host” portion.

Usage

Use this command to specify a rule definition to analyze user traffic based on an RTP URI.

Example

The following command creates an RTP rule definition for analyzing user traffic using an RTP URI string of *rtsp://www.example.org*:

```
rtp uri = rtsp://www.example.org
```

rtsp any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for RTSP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp any-match *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the RTSP any match status.

Example

The following command creates an RTSP rule definition for analyzing user traffic using an RTSP any match status of *FALSE*:

```
rtsp any-match = FALSE
```

rtsp content length

This command defines a rule definition to analyze and charge user traffic based on RTSP content length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp content length *operator content_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

content_length

Specifies the RTSP body length, in bytes, for this rule definition.
content_length must be an integer from 0 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on an RTSP content length.

Example

The following command creates an RTSP rule definition for analyzing user traffic using an RTSP body length of *10000*:

rtsp content length = *10000*

rtsp content type

This command defines a rule definition to analyze and charge user traffic based on RTSP content type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] rtsp content type [ case-sensitive ]` *`operator content_type`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`content_type`

A unique name that you specify for the RTSP content type.
`content_type` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an RTSP content type.

Example

The following command creates an RTSP rule definition for analyzing user traffic using an RTSP content type of *`abc100`*:

rtsp content type = *abc100*

rtsp date

This command defines a rule definition to analyze and charge user traffic matching the ‘date’ field in the RTSP message type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp date [case-sensitive] *operator date_string*

no

Removes the specified rule definition.

case-sensitive

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

date_string

A unique name that you specify for the date in RTSP header.
content_type must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic matching date string in RTSP header.

Example

The following command creates an RTSP rule definition for analyzing user traffic using a match for date string of *12_04_2006* in RTSP message header:

```
rtsp date = 12_04_2006
```

rtsp previous-state

This command defines a rule definition to analyze and charge user traffic based on RTSP previous state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp previous-state *operator previous_state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

previous_state

Specifies the RTSP previous state for this rule definition.
previous_state must be one of the following:

- **init**
- **open**
- **play**
- **ready**
- **record**

Usage

Use this command to specify a rule definition to analyze user traffic based on an RTSP previous state.

Example

The following command creates an RTSP rule definition for analyzing user traffic using an RTSP previous state of *ready*:

```
rtsp previous-state = ready
```

rtsp reply code

This command defines a rule definition to analyze and charge user traffic based on RTSP reply.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp reply code *operator code*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

code

Specifies the RTSP response for this rule definition.
code must be an integer from 100 through 599.

Usage

Use this command to specify a rule definition to analyze user traffic based on an RTSP return code.

Example

The following command creates an RTSP rule definition for analyzing user traffic using an RTSP return code of *356*:

rtsp reply code = *356*

rtsp request method

This command defines a rule definition to analyze and charge user traffic based on RTSP method.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp request method *operator method*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

method

Specifies the RTSP method for this rule definition.
method must be one of the following requests:

- **announce**
- **describe**
- **get-parameter**
- **options**
- **pause**
- **play**
- **record**
- **redirect**
- **set-parameter**
- **setup**
- **teardown**

Usage

Use this command to specify a rule definition to analyze user traffic based on an RTSP method.

Example

The following command creates an RTSP rule definition for analyzing user traffic using an RTSP method of *announce*:

```
rtsp request method = announce
```

rtsp request packet

This command defines a rule definition to analyze and charge user traffic based on RTSP request packet.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp request packet *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **TRUE**: Is request
- **FALSE**: Is response

Usage

Use this command to specify a rule definition to analyze user traffic based on an RTSP request packet.

Example

The following command creates an RTSP rule definition for analyzing user traffic using an RTSP response packet:

```
rtsp request packet != FALSE
```

rtsp rtp-seq

This command defines a rule definition to analyze and charge user traffic based on sequence “seq” field in the RTP-Info header of the RTSP message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp rtp-seq *operator string*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

string

A unique name that you specify to match with the ‘seq’ field in RTP-Info header of the RTSP message.
string must be an alpha and/or numeric string of 0 through 65535 characters in Normal Play Time (NPT) time format.

Usage

Use this command to specify a rule definition to analyze user traffic matching the sequence ’seq’ field in the RTP-Info header of the RTSP response for a PLAY request.

Example

The following command creates an RTSP rule definition for analyzing user traffic using an RTP-seq of *2348*:

rtsp rtp-seq = *2348*

rtsp rtp-time

This command defines a rule definition to analyze and charge user traffic based on ‘time’ field in the RTP-Info header of the RTSP message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp rtp-time *operator string*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

string

A unique name that you specify to match with the ‘time’ field in RTP-Info header of the RTSP message.
string must be an alpha and/or numeric string of 1 through 2147483647 characters in Normal Play Time (NPT) time format.

Usage

Use this command to specify a rule definition to analyze user traffic matching the ‘time’ field in the RTP-Info header of the RTSP response for a PLAY request.

Example

The following command creates an RTSP rule definition for analyzing user traffic using an RTP-Time-stamp of *19970123T153600Z*:

rtsp rtp-time = *19970123T153600Z*

rtsp rtp-uri

This command defines a rule definition to analyze and charge user traffic based on the uniform resource identifier (URI) field in the RTP-Info header of the RTSP message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] rtsp rtp-uri [ case-sensitive ]` *`operator string`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`string`

A unique name that you specify to match with the URI in RTP-Info header of the RTSP message.
`string` must be an alpha and/or numeric string of 1 through 127 characters in length. *`string`* allows punctuation characters and it does not include the “host” portion.

Usage

Use this command to specify a rule definition to analyze user traffic matching the “URI” field in the RTP-Info header of the RTSP response for a PLAY request.

Example

The following command creates an RTSP rule definition for analyzing user traffic using an RTP-URI string of *rtsp://www.foo.com* in RTP-info header of RTSP packet:

rtsp rtp-uri = *rtsp://www.foo.com*

rtsp session-id

This command defines a rule definition to analyze and charge user traffic based on the RTSP session ID.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] rtsp session-id [ case-sensitive ]` *`operator session_id`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`session_id`

An unique session ID for the RTSP user.
`session_id` must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on an RTSP session ID.

Example

The following command creates an RTSP rule definition for analyzing user traffic using an RTSP session ID of *`0123abc100`*:

rtsp session-id = *0123abc100*

rtsp session-length

This command defines a rule definition to analyze and charge user traffic based on the RTSP session length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp session-length *operator session_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

session_length

Specifies the RTSP session length, in bytes, for this rule definition.
session_length must be an integer from 1 through 40000000.

Usage

Use this command to specify a rule definition to analyze, compare, or match the total length of RTSP session. The session-length is calculated by adding together the IP payloads (i.e., starting after the IP header) of all relevant packets.

Example

The following command creates an RTSP rule definition for analyzing user traffic using an RTSP session length of *3000* bytes:

rtsp session-length = *3000*

rtsp state

This command defines a rule definition to analyze and charge user traffic based on RTSP state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp state *operator state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

state

Specifies the RTSP state for this rule definition.
state must be one of the following:

- **end**
- **init**
- **open**
- **play**
- **ready**
- **record**

Usage

Use this command to specify a rule definition to analyze user traffic based on an RTSP state.

Example

The following command creates an RTSP rule definition for analyzing user traffic using an RTSP in state of *init*:

```
rtsp state = init
```

rtsp uri

This command defines a rule definition to analyze and charge user traffic based on the uniform resource identifier (URI) in RTSP message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp uri [case-sensitive] *operator string*

no

Removes the specified rule definition.

case-sensitive

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

string

A unique name that you specify to match with the URI in RTSP header.
string must be an alpha and/or numeric string of 1 through 127 characters in length. *string* allows punctuation characters and it does not include the “host” portion.

Usage

Use this command to specify a rule definition to analyze user traffic based on a URI in RTSP header.

Example

The following command creates an RTSP rule definition for analyzing user traffic using an RTSP URI string of *rtsp://www.example.com:554/twister/audiotrack*:

rtsp uri = *rtsp://www.example.com:554/twister/audiotrack*

rtsp uri sub-part

This command defines a rule definition to analyze and charge user traffic by parsing sub-parts of the URI in an RTSP request message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] rtsp uri sub-part { { absolute-path | host | query } [ case-sensitive ]
operator string | port { port_operator port_value | { range | !range }
range_from to range_to } }
```

no

Removes the specified rule definition.

absolute-path

Specifies the absolute path matching criteria to RTSP URI in an RTSP request message.

host

Specifies the host name matching criteria to RTSP URI in an RTSP request message.

query

Specifies the query string matching criteria to RTSP URI in an RTSP request message.

case-sensitive

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

string

A unique absolute path/host name or query string that you specify to match with the URI in RTSP header. *string* must be an alpha and/or numeric string of 1 through 127 characters in length. *string* allows punctuation characters and it does not include the "host" portion.

port

Specifies the port related matching for RTSP URI in an RTSP request message.

port_operator

Specifies how to logically match the information in the analyzed field. *operator* must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

port_value

Specifies the RTSP port number used for matching with port rule in RTSP flow. *port_value* must be an integer from 0 through 65535.

{ range | !range } *range_from* **to** *range_to* **}**

Enables or disables the range criteria for RTSP flow ports.

- **range**: Enables the range criteria for RTSP flow ports.
- **!range**: Disables the range criteria for RTSP flow ports.
- *range_from*: Specifies the start of range of RTSP flow ports and value must be an integer from 0 through 65535 but less than or equal to *range_to*.
- *range_to*: Specifies the end of range of RTSP flow ports and value must be an integer from 0 through 65535 but more than or equal to *range_from*.

Usage

Use this command to specify a rule definition to analyze user traffic based on a URI sub parts like host, absolute path, port, and query in RTSP request message.

Example

The following command creates an RTSP URI sub part rule definition to analyze user traffic using an RTSP URI port number between *1023* and *1068*:

```
rtsp uri sub-part port range 1023 to 1068
```

rtsp user-agent

This command defines a rule definition to analyze and charge user traffic matching 'user-agent' field in RTSP header.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp user-agent [case-sensitive] *operator user_agent*

no

Removes the specified rule definition.

case-sensitive

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

user_agent

Specifies the user agent in RTSP header for this rule definition.
user_agent must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage

Use this command to specify a rule definition to analyze user agent field in RTSP header.

Example

The following command creates a rule definition for analyzing user traffic using content as *test* in "user-agent" field of RTSP header:

rtsp user-agent = *test*

rule-application

This command specifies the application rule for the rule definition.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
rule-application { charging | post-processing | routing }

no rule-application
```

no

Removes the previous rule application configuration.

routing

Specifies that this rule definition only be used for routing purposes.
Up to 256 rule definitions can be defined for routing in an Active Charging Service.
Default: Disabled

post-processing

Important: The **post-processing** keyword is only available in StarOS 8.3 and later releases.

Specifies that this rule definition only be used for post-processing purposes. This enables processing of packets even if the rule matching for them has been disabled.

charging

Specifies that this rule definition only be used for charging purposes.
Up to 2048 rule definitions can be defined for charging application in an Active Charging Service.
Default: Enabled

Usage

Use this command to assign a rule application to a rule definition.
If, when configuring a ruledef, the rule-application is not specified, by default the system configures the ruledef as a charging ruledef.

Example

The following command assigns a rule application of **charging** to the current rule definition:

```
rule-application charging
```

sdp any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for SDP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] sdp any-match *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the SDP any match status.

Example

The following command defines an any match rule definition for analyzing SDP user traffic as *TRUE*:

```
sdp any-match = TRUE
```

sdp connection-ip-address

This command defines a rule definition to analyze and charge user traffic based on SDP connection IP address.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] sdp connection-ip-address *operator ip_address*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

ip_address

The connection IP address expressed in IPv4 dotted decimal notation.

Usage

Use this command to specify a rule definition to analyze user traffic based on the SDP connection-ip-address.

Example

The following command defines a rule definition for analyzing SDP user traffic using an SDP connection-ip-address of *1.1.1.1*:

sdp connection-ip-address = *1.1.1.1*

sdp media-audio-port

This command defines a rule definition to analyze and charge user traffic based on SDP media-audio-port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] sdp media-audio-port *operator port*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

port

Specifies the port number for this rule definition.
port must be an integer from 0 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on an SDP media-audio-port.

Example

The following command creates an SDP rule definition for analyzing user traffic using SDP media audio port *10*:

sdp media-audio-port = *10*

sdp media-video-port

This command defines a rule definition to analyze and charge user traffic based on SDP media-video-port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] sdp media-video-port *operator port*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

port

Specifies the port number for this rule definition.
port must be an integer from 0 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on an SDP media-video-port.

Example

The following command creates an SDP rule definition for analyzing user traffic using SDP media video port *10*:

sdp media-video-port = *10*

sdp uplink

This command defines a rule definition to analyze and charge user traffic based on SDP uplink.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] sdp uplink *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**: Is not uplink
- **TRUE**: Is uplink

Usage

Use this command to specify a rule definition to analyze user traffic based on whether the SDP traffic is uplink or not uplink.

Example

The following command defines a rule definition for analyzing SDP user traffic using an SDP uplink status is not equal to *FALSE*:

```
sdp uplink != FALSE
```

secure-http any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for Secure HTTP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] secure-http any-match *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the HTTP any match status.

Example

The following command creates an HTTPS rule definition for analyzing user traffic using an HTTPS any match status of *FALSE*:

```
secure-http any-match = FALSE
```

secure-http uplink

This command defines a rule definition to analyze and charge user traffic based on Secure-HTTP uplink.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] secure-http uplink *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**: Is not uplink
- **TRUE**: Is uplink

Usage

Use this command to specify a rule definition to analyze user traffic based on whether the HTTPS traffic is uplink or not uplink.

Example

The following command defines a rule definition for analyzing HTTPS user traffic using an HTTPS uplink status is not equal to *FALSE*:

```
secure-http uplink != FALSE
```

sip any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for SIP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] sip any-match *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the SIP any match status.

Example

The following command defines an any match rule definition for analyzing SIP user traffic:

```
sip any-match = TRUE
```

sip call-id

This command defines a rule definition to analyze and charge user traffic based on the SIP call ID.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] sip call-id [ case-sensitive ]` *`operator call-id`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`call-id`

`call-id` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a SIP call ID rule definition to analyze user traffic based on a SIP call ID.

Example

The following command creates a rule definition for analyzing user traffic using a SIP call ID of *`test`*:

`sip call-id =` *`test`*

sip content length

This command defines a rule definition to analyze and charge user traffic based on the SIP content length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] sip content length *operator content_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field. *operator* must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

content_length

Specifies the SIP content length for this rule definition.
content_length must be an integer from 0 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on a SIP content length.

Example

The following command creates a SIP rule definition for analyzing user traffic using a SIP content length of *10000*:

sip content length = *10000*

sip content type

This command defines a rule definition to analyze and charge user traffic based on the SIP content type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] sip content type [ case-sensitive ]` *`operator string`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`string`

Specifies content type is used in this rule definition.
`string` must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on a SIP content type.

Example

The following command creates a SIP rule definition for analyzing user traffic using a SIP content type as *`download_string`*:

sip content type = *download_string*

sip from

This command defines a rule definition to analyze and charge user traffic based on the SIP from.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] sip from [ case-sensitive ]` *`operator string`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field. *`operator`* must be one of the following:
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`string`

Specifies the string for this rule definition. *`string`* must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on a SIP from value.

Example

The following command creates a SIP rule definition for analyzing user traffic containing a SIP from value of *`test1`*:

sip from contains *test1*

sip previous-state

This command defines a rule definition to analyze and charge user traffic based on the SIP previous state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] sip previous-state *operator previous_state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field. *operator* must be one of the following:

- **!=**: Does not equal
- **=**: Equals

previous_state

Specifies the SIP previous state for this rule definition.
previous_state must be one of the following:

- **init**
- **provisional-response**
- **request-sent**
- **response-fail**
- **response-ok**

Usage

Use this command to specify a rule definition to analyze user traffic based on a SIP previous state.

Example

The following command creates a SIP rule definition for analyzing user traffic using a SIP previous state of *request-sent*:

sip previous-state = *request-sent*

sip reply code

This command defines a rule definition to analyze and charge user traffic based on the SIP reply code.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] sip reply code *operator return_code*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field. *operator* must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

return_code

Specifies the SIP return code for this rule definition.
return_code must be an integer from 100 through 699.

Usage

Use this command to specify a rule definition to analyze user traffic based on a SIP reply code.

Example

The following command creates a SIP rule definition for analyzing user traffic using a SIP reply code of *150*:

sip reply code = *150*

sip request method

This command defines a rule definition to analyze and charge user traffic based on the SIP request method.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] sip request method *operator method*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

method

Specifies the SIP method for this rule definition.
method must be one of the following:

- **ack**
- **bye**
- **cancel**
- **invite**
- **options**
- **register**

Usage

Use this command to specify a rule definition to analyze user traffic based on SIP method.

Example

The following command defines a rule definition for analyzing SIP user traffic using SIP request method *bye*:

sip request method = *bye*

sip request packet

This command defines a rule definition to analyze and charge user traffic based on the SIP request packet.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] sip request packet` *`operator condition`*

`no`

Removes the specified rule definition.

`operator`

Specifies how to logically match the information in the analyzed field. *`operator`* must be one of the following:

- **`=`**: Equals
- **`!=`**: Does not equal

`condition`

The type of SIP packet is-request.
`condition` must be one of the following:

- **`FALSE`**: Is a response
- **`TRUE`**: Is a request

Usage

Use this command to specify a rule definition to analyze user traffic based on the SIP request packet.

Example

The following command defines a rule definition for analyzing SIP user traffic using a SIP request packet is equals to request:

```
sip request packet = TRUE
```

sip state

This command defines a rule definition to analyze and charge user traffic based on the SIP state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] sip state *operator state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

state

Specifies the sip state for this rule definition.
state must be one of the following:

- **ack-received**
- **provisional-response**
- **request-sent**
- **response-fail**
- **response-ok**

Usage

Use this command to specify a rule definition to analyze user traffic based on a SIP state.

Example

The following command creates a SIP rule definition for analyzing user traffic using a SIP state of *request-sent*:

sip state = *request-sent*

sip to

This command defines a rule definition to analyze and charge user traffic based on the “to” field of SIP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] sip to [case-sensitive] *operator sip_to_field*

no

Removes the specified rule definition.

case-sensitive

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

sip_to_field

Specifies the SIP to value for this rule definition.
sip_to_field must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on a SIP to value.

Example

The following command creates a SIP rule definition for analyzing user traffic containing a SIP to value of *test1*:

sip to contains *test1*

sip uri

This command defines a rule definition to analyze and charge user traffic based on the SIP URI.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] sip uri [ sub-part { headers | host | parameters | port | userinfo } ] [ case-sensitive ]` *`operator string`*

`no`

Removes the specified rule definition.

`sub-part { headers | host | parameters | port | userinfo }`

This is an optional keyword that defines what sub-part of a SIP URI to check.

- **`headers`**: Apply the rule to SIP URI header field.
- **`host`**: Apply the rule the SIP URI host field.
- **`parameters`**: Apply the rule to the SIP URI parameters field.
- **`port`**: Apply the rule to the SIP URI port field.
- **`userinfo`**: Apply the rule to the SIP URI userinfo field.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

The string for sub-part keyword **`port`** must be an integer and requires different operators. Use the following operators with the **`port`** keyword:

- **`!=`**: Does not equal

- **<=**: Is less than
- **=**: Equals
- **>=**: Is greater than

string

A unique name that you specify for a SIP URI.
string must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.
The string for sub-part keyword **port** must be an integer from 0 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on a SIP URI.

Example

The following command creates a SIP rule definition for analyzing user traffic using a SIP URI string:

sip uri = *sip:192.168.1.51:5060***sip uri =** *sip:nnnnn@host:5060;user=phone*

smtp any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for SMTP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] smtp any-match *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify an any match rule definition on analyzing user traffic based on the SMTP analyzed status.

Example

The following command defines an any match rule definition for analyzing SMTP user traffic:

```
smtp any-match = TRUE
```

smtp command arguments

This command defines a rule definition to analyze and charge user traffic based on the SMTP command arguments.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] smtp command arguments [ case-sensitive ]` *`operator argument`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`argument`

A unique value that you specify to use for the command argument.
`argument` must be an alpha and/or numeric string of 1 through 63 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an SMTP command argument.

Example

The following command defines a rule definition for analyzing SMTP user traffic using a command argument of *`test`*:

smtp command arguments = *test*

smtp command id

This command defines a rule definition to analyze and charge user traffic based on the SMTP command ID.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] smtp command id *operator command_id*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

command_id

A unique value that you specify to use for the command argument.
command_id must be an integer from 0 through 10.

Usage

Use this command to specify a rule definition to analyze user traffic based on an SMTP command ID.

Example

The following command defines a rule definition for analyzing POP3 user traffic using a command ID of *8*:

smtp command id = *8*

smtp command name

This command defines a rule definition to analyze and charge user traffic based on the SMTP command name.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] smtp command name *operator command_name*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

command_name

command_name must be one of the following:

- **bdat**
- **data**
- **ehlo**
- **expn**
- **helo**
- **mail-from**
- **noop**
- **quit**
- **rcpt-to**
- **rset**
- **vrfy**

Usage

Use this command to specify a rule definition to analyze user traffic based on an SMTP command name.

Example

The following command defines a rule definition for analyzing SMTP user traffic using a command name of *data*:

```
smtp command name = data
```

smtp mail-size

This command defines a rule definition to analyze and charge user traffic based on the SMTP mail size.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] smtp mail-size { *operator mail_size* | { { range | !range } *range_from* to *range_to* } }

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

mail_size

Specifies the mail size, in bytes, for this rule definition.
mail_size must be an integer from 1 through 40000000.

{ range | !range } *range_from* **to** *range_to*

Enables or disables the range criteria.

- **range**: Enables the range criteria.
- **!range**: Disables the range criteria.
- *range_from*: Specifies the start of range, and must be an integer from 1 through 40000000.
- *range_to*: Specifies the end range. *range_to* must be an integer from 1 through 40000000, and must be greater than *range_from*.

Usage

Use this command to specify a rule definition to analyze user traffic based on SMTP mail size.

Example

The following command defines a rule definition for analyzing SMTP user traffic using a mail size of *40000*:

```
smtp mail-size = 40000
```

smtp pdu-length

This command defines a rule definition to analyze and charge user traffic based on the SMTP protocol data unit (PDU) length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] smtp pdu-length { *operator pdu_length* | { { range | !range } *range_from* to *range_to* } }

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

pdu_length

Specifies the SMTP PDU length, in bytes, for this rule definition.
pdu_length must be an integer from 1 through 65535.

{ range | !range } *range_from* **to** *range_to*

Enables or disables the range criteria.

- **range**: Enables the range criteria.
- **!range**: Disables the range criteria.
- *range_from*: Specifies the start of range, and must be an integer from 1 through 65535.
- *range_to*: Specifies the end range. *range_to* must be an integer from 1 through 65535, and must be greater than *range_from*.

Usage

Use this command to specify a rule definition to analyze user traffic based on an SMTP packet length.

Example

The following command defines a rule definition for analyzing SMTP user traffic using a PDU length of *1600* bytes:

smtp pdu-length = *1600*

smtp previous-state

This command defines a rule definition to analyze and charge user traffic based on the SMTP previous state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] smtp previous-state *operator pre_state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

pre_state

Specifies the previous state for this rule definition.
pre_state must be one of the following:

- **close**: Closed state
- **init**: Initialized state
- **response-error**: Reply error state
- **response-ok**: Response ok state
- **waiting-for-response**: Waiting for response state

Usage

Use this command to specify a rule definition to analyze user traffic based on an SMTP previous state.

Example

The following command creates an SMTP rule definition for analyzing user traffic using an SMTP previous state of *close*:

smtp previous-state = *close*

smtp recipient

This command defines a rule definition to analyze and charge user traffic based on the SMTP recipient.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] smtp recipient [ case-sensitive ]` *`operator argument`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`argument`

A unique value that you specify to use for the response argument.
`argument` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on a recipient rule definition.

Example

The following command defines a rule definition for analyzing SMTP user traffic using a recipient of *`test`*:

smtp recipient = *test*

smtp reply arguments

This command defines a rule definition to analyze and charge user traffic based on the SMTP reply argument.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] smtp reply arguments [ case-sensitive ]` *`operator argument`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`argument`

Specifies the string for this rule definition.
`argument` must be an alpha and/or numeric string of 1 through 63 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on an SMTP reply argument.

Example

The following command creates an SMTP reply argument rule definition for analyzing user traffic using a reply argument of *`test`*:

smtp reply arguments = *test*

smtp reply id

This command defines a rule definition to analyze and charge user traffic based on the SMTP reply ID.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] smtp reply id *operator reply_id*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

reply_id

Specifies the reply ID for this rule definition.
reply_id must be one of the following:

- **0**: +NO reply
- **1**: +OK reply
- **2**: -ERR reply

Usage

Use this command to specify a rule definition to analyze user traffic based on an SMTP reply ID.

Example

The following command defines a rule definition for analyzing SMTP user traffic using a reply ID of *2*:

```
smtp reply id = 2
```

smtp reply status

This command defines a rule definition to analyze and charge user traffic based on the SMTP reply status.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] smtp reply status *operator reply_status*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

reply_status

Specifies the response ID for this rule definition.
reply_status must be one of the following:

- **+OK**: Response OK
- **-ERR**: Response error

Usage

Use this command to specify a rule definition to analyze user traffic based on an SMTP reply status.

Example

The following command defines a rule definition for analyzing SMTP user traffic using a reply status of *+OK*:

smtp reply status = *+OK*

smtp sender

This command defines a rule definition to analyze and charge user traffic based on the SMTP sender.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] smtp sender [case-sensitive] *operator sender*

no

Removes the specified rule definition.

case-sensitive

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

sender

Specifies the session length used for this rule definition.
sender must be an alpha/or numeric string of 1 through 127 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on the SMTP session length.

Example

The following command creates an SMTP rule definition for analyzing user traffic using an SMTP sender of *test*:

smtp sender = *test*

smtp session-length

This command defines a rule definition to analyze and charge user traffic based on the SMTP session-length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] smtp session-length { *operator sess_length* | { range | !range } *range_from* to *range_to* }

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

sess_length

Specifies the session length for this rule definition.
sess_length must be an integer from 1 through 40000000.

{ range | !range } *range_from* **to** *range_to*

Enables or disables the range criteria.

- **range**: Enables the range criteria.
- **!range**: Disables the range criteria.
- *range_from*: Specifies the start of range, and must be an integer from 1 through 40000000.
- *range_to*: Specifies the end range. *range_to* must be an integer from 1 through 40000000, and must be greater than *range_from*.

Usage

Use this command to specify a rule definition to analyze user traffic based on the SMTP session length.

Example

The following command creates an SMTP rule definition for analyzing user traffic using an SMTP session length of *4000000*:

smtp session-length = *4000000*

smtp state

This command defines a rule definition to analyze and charge user traffic using SMTP state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] smtp state *operator state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

state

Specifies the SMTP state for this rule definition.
state must be one of the following:

- **close**: Closed state
- **init**: Initialized state
- **response-error**: Response of error state
- **response-ok**: Response of ok state
- **waiting-for-response**: Waiting for response state

Usage

Use this command to specify a rule definition to analyze user traffic based on SMTP state.

Example

The following command creates an SMTP rule definition for analyzing user traffic using an SMTP state of *close*:

```
smtp state = close
```

tcp analyzed out-of-order

This command specifies counting/charging of all TCP out-of-order packets that are received and buffered at ACSMgr/SessMgr due to non receipt of earlier packet(s) in sequence.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp analyzed out-of-order *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**: Not analyzed
- **TRUE**: Analyzed

Usage

This command is used to set the status flag to 'analyzed' or 'not analyzed' for all TCP packets received at the ACSMgr/SessMgr prior to their earlier packets.
When a packet reaches ACSMgr/SessMgr prior to earlier packet(s), particular packet with subsequent packets are buffered at ACSMgr/SessMgr as TCP out-of-order packets and ACSMgr/SessMgr waits for missing packet(s) till time-out duration expires. If the packet(s) with the missing sequence number(s) arrives with in time-out duration, all buffered packets with correct sequence will be presented to upper layers (HTTP etc.) for analysis; otherwise buffered TCP out-of-order packets will be sent to charging with analysis done flag at TCP/IP layer only.
If this command is enabled the TCP out-of-order packets marked and sent to TCP analyzer as analyzed for charging action otherwise discarded.

Example

The following command sets to analyze TCP out-of-order packets:

```
tcp analyzed out-of-order = TRUE
```

tcp analyzed out-of-order

tcp any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for TCP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp any-match *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**: Not analyzed
- **TRUE**: Analyzed

Usage

Use this command to specify a rule definition to analyze user traffic based on the tcp any match status.

Example

The following command defines an any match rule definition for analyzing TCP user traffic:

```
tcp any-match = TRUE
```

tcp connection-initiator

This command defines a rule definition to analyze and charge user traffic based on the TCP connection initiator.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] tcp connection-initiator operator subscriber
```

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

subscriber

Specifies that the connection is being initiated by the subscriber.

Usage

Use this command to specify a rule definition to analyze user traffic based on the TCP connection initiator and to allow the operator to differentiate between connection initiated by subscriber or the subscriber is acting as a Transaction Control Server (TCS) server.

Example

The following command creates TCP rule definition for analyzing user traffic using an TCP connection initiator as subscriber:

```
tcp connection-initiator = subscriber
```

tcp downlink

This command defines a rule definition to analyze and charge user traffic matching the direction of TCP packets to downlink (to subscriber).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp downlink *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the TCP packet direction as downlink.

Example

The following command creates TCP rule definition for analyzing user traffic using an TCP packet direction to downlink (to subscriber):

```
tcp downlink = TRUE
```

tcp dst-port

This command defines a rule definition to analyze and charge user traffic based on destination TCP port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp dst-port { *operator port_number* **|** **{ !range | range } {** *start_range* **to** *end_range* **|** **port-map** *port_map* **} }**

no

Removes the specified rule definition.

operator

Specifies how to logically match the port number.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

port_number

Specifies the port number to match.
port_number must be an integer from 1 through 65535.

range | !range

Specifies the range criteria:

- **!range**: Not in the range
- **range**: In the range

start_range **to** *end_range*

Specifies the starting and ending port numbers for the range of destination TCP ports.

- *start_range* must be an integer from 1 through 65535.
- *end_range* must be an integer from 1 through 65535, and must be greater than *start_range*.

port-map *port_map*

Specifies the port map for the port range.
port_map must be a string of 1 through 63 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on destination TCP port.

Example

The following command creates a TCP rule definition for analyzing user traffic matching destination port for TCP as *10*:

```
tcp dst-port = 10
```

tcp duplicate

This command defines a rule definition to analyze and charge user traffic using duplicate TCP packet.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] tcp duplicate` *`operator condition`*

`no`

Removes the specified rule definition.

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`=`**: Equals

`condition`

Specifies the condition for this rule definition.
`condition` must be one of the following:

- **`FALSE`**: Not duplicated/retransmitted
- **`TRUE`**: Duplicated/retransmitted

Usage

Use this command to specify a duplicate rule definition for analyzing user traffic.

Example

The following command defines a duplicate rule definition with a value of *`TRUE`*:

```
tcp duplicate = TRUE
```

tcp either-port

This command defines a rule definition to analyze and charge user traffic using either (destination or source) TCP port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp either-port { *operator port_number* **|** **{ !range | range } {** *start_range* **to** *end_range* **|** **port-map** *port_map* **} }**

---

no

Removes the specified rule definition.

---

operator

Specifies how to logically match the port number.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

---

port_number

Specifies the port number to match.
port_number must be an integer from 1 through 65535.

---

range | !range

Specifies the range criteria:

- **!range**: Not in the range
- **range**: In the range

---

start_range **to** *end_range*

Specifies the starting and ending port numbers for the port range.

- *start_range* must be an integer from 1 through 65535.
- *end_range* must be an integer from 1 through 65535, and must be greater than *start_range*.

---

port-map *port_map*

Specifies the port-map for the port range.
port_map must be a string of 1 through 63 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on either TCP port.

Example

The following command creates a TCP rule definition for analyzing user traffic matching destination or source port for TCP as *10*:

```
tcp either-port = 10
```

tcp error

This command defines a rule definition to identify any erroneous TCP packets.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp error *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to identify any erroneous TCP packets.

Example

The following command creates a TCP rule definition for identifying an erroneous TCP packet:

```
tcp error = TRUE
```

tcp flag

This command defines a rule definition to analyze and charge user traffic based on the TCP flag.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] tcp flag operator value
```

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!contains**: Does not contain
- **contains**: Contains
- **!=**: Does not equal
- **=**: Equals

value

The value of the specified field.
value must be one of the following:

- **ack**: TCP FLAG ACK
- **fin**: TCP FLAG FIN
- **push**: TCP FLAG PUSH
- **reset**: TCP FLAG RESET
- **syn**: TCP FLAG SYN

Usage

Use this command to specify a flag rule definition for analyzing user traffic.

Example

The following command defines a flag rule definition with a value of *reset*:

```
tcp flag = reset
```

tcp initial-handshake-lost

This command defines a rule definition to identify a TCP flow where the initial handshake was not seen.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp initial-handshake-lost *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to identify a TCP flow where the initial handshake was not seen.

Example

The following command creates a TCP rule definition for identifying a TCP flow where the initial handshake was not seen:

```
tcp initial-handshake-lost = TRUE
```

tcp payload

This command defines a rule definition to analyze and charge user traffic based on Hex/ASCII string content in payload protocol-signature field of TCP payload.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp payload starts-with { hex-signature *hex_string* **| string-signature** *string* **}**

no

Removes the specified rule definition.

hex-signature *hex_string*

Specifies hexadecimal protocol signature in payload field.
hex_string must be a dash-delimited list of hex data of size smaller than 32.

string-signature *string*

Specifies protocol signature in payload field.
string must be a string of 1 through 32 characters in length.

Usage

Use this command to define a rule definition to analyze user traffic based on a match for Hex/ASCII string content in payload protocol-signature field.

Example

The following command creates a TCP rule definition to identify user traffic using TCP protocol signature as *tcp1*:

tcp payload starts-with string-signature *tcp1*

tcp payload-length

This command defines a rule definition to analyze and charge user traffic based on the TCP payload length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp payload-length *operator payload_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

payload_length

Specifies the tcp payload length for this rule definition.
payload_length must be an integer from 0 through 40000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on a TCP payload length.

Example

The following command creates a TCP rule definition for analyzing user traffic using a TCP payload length of *10000*:

tcp payload-length = *10000*

tcp previous-state

This command defines a rule definition to analyze and charge user traffic using previous state of TCP packet.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp previous-state *operator previous_state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

previous_state

Specifies the TCP previous state for this rule definition.
previous_state must be one of the following:

- **close**
- **close-wait**
- **closing**
- **established**
- **fin-wait1**
- **fin-wait2**
- **last-ack**
- **listen**
- **syn-received**
- **syn-sent**
- **time-wait**

Usage

Use this command to specify a rule definition to analyze user traffic based on a TCP previous state.

Example

The following command creates a TCP rule definition for analyzing user traffic using a TCP previous state of time-wait:

```
tcp previous-state = time-wait
```

tcp session-length

This command defines a rule definition to analyze and charge user traffic using TCP session length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

sess_length

Specifies the TCP session length, in bytes, for this rule definition.
sess_length must be an integer from 0 through 4000000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on the TCP session length.

Example

The following command creates a TCP rule definition for analyzing user traffic using a TCP session length of *2000* bytes:

```
tcp session-length = 2000
```

tcp src-port

This command defines a rule definition to analyze and charge user traffic based on source TCP port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp src-port { *operator port_number* **|** **{ !range | range } {** *start_range* **to** *end_range* **|** **port-map** *port_map* **} }**

---

no

Removes the specified rule definition.

---

operator

Specifies how to logically match the port number.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

---

port_number

Specifies the port number to match.
port_number must be an integer from 1 through 65535.

---

range | !range

Specifies the range criteria:

- **!range**: Not in the range
- **range**: In the range

---

start_range **to** *end_range*

Specifies the starting and ending port numbers for the port range.

- *start_range* must be an integer from 1 through 65535.
- *end_range* must be an integer from 1 through 65535, and must be greater than *start_range*.

---

port-map *port_map*

Specifies the port map for the port range.
port_map must be a string of 1 through 63 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on source TCP port.

Example

The following command creates a TCP rule definition for analyzing user traffic matching source port for TCP as *10*:

```
tcp src-port = 10
```

tcp state

This command defines a rule definition to analyze and charge user traffic using current state of TCP packet.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp state *operator state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

state

Specifies the TCP state for this rule definition.
state must be one of the following:

- **close**
- **close-wait**
- **closing**
- **established**
- **fin-wait1**
- **fin-wait2**
- **last-ack**
- **listen**
- **syn-received**
- **syn-sent**
- **time-wait**

Usage

Use this command to specify a rule definition to analyze user traffic based on a TCP state.

Example

The following command creates a TCP rule definition for analyzing user traffic using a TCP state of *close*:

```
tcp state = close
```

tcp uplink

This command defines a rule definition to analyze and charge user traffic matching the direction of TCP packets to uplink (from subscriber).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp uplink *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the TCP packet direction as uplink.

Example

The following command creates TCP rule definition for analyzing user traffic using an TCP packet direction to uplink (from subscriber):

```
tcp uplink = TRUE
```

udp any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for UDP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] udp any-match *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the UDP analyzed status.

Example

The following command defines an any match rule definition for analyzing UDP user traffic:

```
udp any-match = TRUE
```

udp downlink

This command defines a rule definition to analyze and charge user traffic based on the UDP downlink.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] udp downlink` *`operator condition`*

`no`

Removes the specified rule definition.

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`=`**: Equals

`condition`

Specifies the condition for this rule definition.
`condition` must be one of the following:

- **`FALSE`**
- **`TRUE`**

Usage

Use this command to specify a rule definition to analyze user traffic based on a UDP downlink condition.

Example

The following command creates a UDP rule definition for analyzing user traffic using UDP downlink condition *`TRUE`*:

```
udp downlink = TRUE
```

udp dst-port

This command defines a rule definition to analyze and charge user traffic based on destination UDP port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] udp dst-port { *operator port_number* **| { !range | range } {** *start_range* **to** *end_range* **| port-map** *port_map* **} }**

no

Removes the specified rule definition.

operator

Specifies how to logically match the port number.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

port_number

Specifies the port number to match.
port_number must be an integer from 1 through 65535.

!range | range

Specifies the range criteria.

- **!range**: Not in the range
- **range**: In the range

start_range **to** *end_range*

Specifies the starting and ending port numbers for the port range.

- *start_range* must be an integer from 1 through 65535.
- *end_range* must be an integer from 1 through 65535, and must be greater than *start_range*.

port-map *port_map*

Specifies the port map for the port range.
port_map must be a string of 1 through 63 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on destination UDP port.

Example

The following command creates a UDP rule definition for analyzing user traffic matching destination port for UDP as *10*:

```
udp dst-port = 10
```

udp either-port

This command defines a rule definition to analyze and charge user traffic using either (destination or source) UDP port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] udp either-port { *operator port_number* **|** **{ !range | range } {** *start_range* **to** *end_range* **|** **port-map** *port_map* **} }**

no

Removes the specified rule definition.

operator

Specifies how to logically match the port number.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

port_number

Specifies the port number to match.
port_number must be an integer from 1 through 65535.

!range | range

Specifies the range criteria.

- **!range**: Not in the range
- **range**: In the range

start_range **to** *end_range*

Specifies the starting and ending port numbers for the port range.
start_range must be an integer from 1 through 65535.
end_range must be an integer from 1 through 65535, and must be greater than *start_range*.

port-map *port_map*

Specifies the port map for the port range.
port_map must be a string of 1 through 63 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on either UDP port.

Example

The following command creates a UDP rule definition for analyzing user traffic matching destination or source port for UDP as *10*:

```
udp either-port = 10
```

udp payload

This command defines rule to analyze and charge user traffic based on the match for Hex/ASCII string content in payload protocol-signature field in UDP payload.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] udp payload starts-with { hex-signature *hex_string* **| string-signature** *string* **}**

no

Removes the specified rule definition.

hex-signature *hex_string*

Specifies hexadecimal protocol signature in payload field.
hex_string must be a dash-delimited list of hex data of size smaller than 32.

string-signature *string*

Specifies protocol signature in payload field.
string must be a string of 1 through 32 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on a match for Hex/ASCII string content in payload protocol-signature field.

Example

The following command creates a UDP rule definition for analyzing user traffic using a UDP protocol signature as *udp1*:

udp payload starts-with string-signature *udp1*

udp src-port

This command defines a rule definition to analyze and charge user traffic based on source UDP port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] udp src-port { *operator port_number* **| { !range | range } {** *start_range* **to** *end_range* **| port-map** *port_map* **} }**

---

no

Removes the specified rule definition.

---

operator

Specifies how to logically match the port number.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

---

port_number

Specifies the port number to match.
port_number must be an integer from 1 through 65535.

!range | range

Specifies the range criteria.

- **!range**: Not in the range
- **range**: In the range

---

start_range **to** *end_range*

Specifies the starting and ending port numbers for the port range.
start_range must be an integer from 1 through 65535.
end_range must be an integer from 1 through 65535, and must be greater than *start_range*.

---

port-map *port_map*

Specifies the port map for the port range.
port_map must be a string of 1 through 63 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on source UDP port.

Example

The following command creates a UDP rule definition for analyzing user traffic matching source port for UDP as *10*:

```
udp src-port = 10
```

udp uplink

This command defines a rule definition to analyze and charge user traffic based on the UDP uplink.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] udp uplink` *`operator condition`*

`no`

Removes the specified rule definition.

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`=`**: Equals

`condition`

Specifies the condition for this rule definition.
`condition` must be one of the following:

- **`FALSE`**
- **`TRUE`**

Usage

Use this command to specify a rule definition to analyze user traffic based on a UDP uplink condition.

Example

The following command creates a UDP rule definition for analyzing user traffic using UDP uplink condition *`TRUE`*:

```
udp uplink = TRUE
```

wsp any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for WSP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wsp any-match *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify an any match WSP rule definition on analyzing user traffic.

Example

The following command defines an any match rule definition for analyzing WSP user traffic:

```
wsp any-match = TRUE
```

wsp content type

This command defines a rule definition to analyze and charge user traffic based on the WSP content type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] wsp content type [ case-sensitive ]` *`operator content_type`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`content_type`

`content_type` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on a WSP content type.

Example

The following command creates a SIP rule definition for analyzing user traffic using a WSP content of *`test`*:

`wsp content type =` *`test`*

wsp downlink

This command defines a rule definition to analyze and charge user traffic using WSP downlink.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wsp downlink *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Indicates the downlink (from the Mobile Node direction) status.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on a WSP downlink condition.

Example

The following command defines a rule definition for analyzing WSP user traffic based on the WSP downlink condition of *TRUE*:

```
wsp downlink = TRUE
```

wsp first-request-packet

This command defines a rule definition to analyze and charge user traffic based on the WSP first-request-packet.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wsp first-request-packet *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the WSP first request packet.

Example

The following command creates an WSP rule definition for analyzing user traffic testing for the first-request-packet equals *TRUE*:

```
wsp first-request-packet = TRUE
```

wsp host

This command defines a rule definition to analyze and charge user traffic using WSP host.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wsp host [case-sensitive] *operator host_name*

no

Removes the specified rule definition.

case-sensitive

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

host_name

A unique name that you specify for the WSP host.
host_name must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on a WSP host name.

Example

The following command creates a WSP rule definition for analyzing user traffic containing a WSP host of *host1*:

wsp host contains *host1*

wsp pdu-length

This command defines a rule definition to analyze and charge user traffic based on the WSP Protocol Data Unit (PDU) length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

pdu_length

Specifies the WSP PDU length, in bytes, for this rule definition.
pdu_length must be an integer from 1 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on a WSP PDU length (header + payload) in bytes.

Example

The following command creates a WSP rule definition for analyzing user traffic using an WSP PDU length of *10000* bytes:

```
wsp pdu-length = 10000
```

wsp pdu-type

This command defines a rule definition to analyze and charge user traffic using WSP Protocol Data Unit (PDU) type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wsp pdu-type *operator pdu_type*

---

no

Removes the specified rule definition.

---

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

---

pdu_type

Specifies the WSP PDU type used for this rule definition.
pdu_type must be one of the following:

- **confirmed push**
- **connect-reply**
- **connect-request**
- **data-fragment**
- **delete**
- **disconnect**
- **get**
- **head**
- **options**
- **post**
- **push**
- **put**
- **redirect**
- **reply**
- **resume**
- **suspend**
- **trace**

Usage

Use this command to specify a rule definition to analyze user traffic based on a WSP PDU type value.

Example

The following command creates a WSP rule definition for analyzing user traffic containing a WSP PDU type resume:

```
wsp pdu-type resume
```

wsp previous-state

This command defines a rule definition to analyze and charge user traffic using WSP previous state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wsp previous-state *operator previous_state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

previous_state

Specifies the previous state for this rule definition.
previous_state must be one of the following:

- **init**
- **response-error**
- **response-ok**
- **waiting-for-response**

Usage

Use this command to specify a rule definition to analyze user traffic based on a WSP previous state.

Example

The following command creates a WSP rule definition for analyzing user traffic using a WSP previous state of *response-ok*:

wsp previous-state = *response-ok*

wsp reply code

This command defines a rule definition to analyze and charge user traffic based on the WSP reply code.

Product

All

Privilege

Security Administrator, Administrator

Syntax

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field. *operator* must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

return_code

Specifies the WSP return code for this rule definition.
return_code must be an integer from 0 through 101.

Usage

Use this command to specify a rule definition to analyze user traffic based on a WSP reply code.

Example

The following command creates a WSP rule definition for analyzing user traffic using a WSP reply code of *50*:

```
wsp reply code = 50
```

wsp session-length

This command defines a rule definition to analyze and charge user traffic using WSP session length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: less than equals
- **=**: Equals
- **>=**: greater than equals

sess_length

Specifies the WSP session length, in bytes, for this rule definition.
sess_length must be an integer from 1 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on the WSP session length.

Example

The following command creates a WSP rule definition for analyzing user traffic using a WSP session length of *2000* bytes:

```
wsp session-length = 2000
```

wsp session-management

This command defines a rule definition to analyze and charge user traffic based on WSP session management information.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wsp session-management { previous-state | state } *operator state*

---

no

Removes the specified rule definition.

---

previous-state

Specifies WSP previous state information.

---

state

Specifies WSP current state information.

---

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

---

state

Specifies the WSP state.
For **previous-state**, *state* must be one of the following:

- **connected**
- **connecting**
- **init**
- **resuming**
- **suspended**

For **state**, *state* must be one of the following:

- **close**
- **connected**
- **connecting**
- **init**
- **resuming**

- **suspended**

Usage

Use this command to specify a rule definition to analyze user traffic based on WSP session management information.

Example

The following command creates a WSP rule definition for analyzing user traffic based on WSP session-management current state of *connecting*:

```
wsp session-management state = connecting
```

wsp state

This command defines a rule definition to analyze and charge user traffic using WSP state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wsp state *operator state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

state

Specifies the WSP state for this rule definition.
state must be one of the following:

- **close**
- **response-error**
- **response-ok**
- **waiting-for-response**

Usage

Use this command to specify a rule definition to analyze user traffic based on a WSP state.

Example

The following command creates a WSP rule definition for analyzing user traffic using a WSP state of *connecting*:

wsp state = *connecting*

wsp tid

This command defines a rule definition to analyze and charge user traffic using WSP Transaction Identifier (TID).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wsp tid *operator tid_value*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

tid_value

Specifies the transaction identifier for this rule definition.
tid_value must be an integer from 0 through 255.

Usage

Use this command to specify a rule definition to analyze user traffic based on a WSP TID.

Example

The following command creates a rule definition for analyzing user traffic using a WSP TID value of *22*:

wsp tid = *22*

wsp total-length

This command defines a rule definition to analyze and charge user traffic using WSP total packet length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wsp total-length *operator total_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: less than equals
- **=**: Equals
- **>=**: greater than equals

total_length

Specifies the total length of the WSP packet including payload for this rule definition.
total_length must be an integer from 1 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on the WSP total length.

Example

The following command creates a WSP rule definition for analyzing user traffic using an WSP total length of *2000* bytes:

wsp total-length = *2000*

wsp transfer-encoding

This command defines a rule definition to analyze and charge user traffic using WSP transfer-encoding.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] wsp transfer-encoding [ case-sensitive ]` *`operator string`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`string`

`string` must be of 1 through 127 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on WSP transfer-encoding.

Example

The following command creates a WSP rule definition for analyzing user traffic containing a WSP transfer encoding that contains the number 7:

```
wsp transfer-encoding contains 7
```

wsp uplink

This command defines a rule definition to analyze and charge user traffic using WSP uplink.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wsp uplink *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Indicates the uplink (to the Mobile Node direction) status.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the WSP uplink status.

Example

The following command creates a rule definition for analyzing user traffic using a WSP uplink value of *TRUE*:

```
wsp uplink = TRUE
```

wsp url

This command defines a rule definition to analyze and charge user traffic using WSP URL.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wsp url [case-sensitive] *operator url*

no

Removes the specified rule definition.

case-sensitive

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

operator

Specifies how to logically match the information in the analyzed field. *operator* must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

url

url must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on the WSP URL.

Example

The following command creates a rule definition for analyzing user traffic using a WSP URL of *wsp://wiki.tcl.tk*:

wsp url = *wsp://wiki.tcl.tk*

wsp user-agent

This command defines a rule definition to analyze and charge user traffic using WSP user agent.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] wsp user-agent [ case sensitive ]` *`operator user_agent`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`user_agent`

Specifies the WSP user agent for this rule definition.
`user_agent` must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on the WSP user agent.

Example

The following command creates a rule definition for analyzing user traffic containing a WSP user agent of *`test`*:

`wsp user-agent contains` *`test`*

wsp x-header

This command defines a rule definition to analyze and charge user traffic based on WSP extension-headers (x-headers).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wsp x-header *name* **[case-sensitive]** *operator string*

no

Removes the specified rule definition.

name

A unique value that you specify to use for the x-header.
name must be an alpha and/or numeric string of 1 through 31 characters in length.

case-sensitive

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

string

Specifies the value of the extension header.
string must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage

Use this CLI to configure any x-header field in WSP and parse it. The extension-header mechanism allows additional header fields to be defined without changing the protocol. The extension-header can be any header fields that are not specified in RFC/standard.

Example

The following command creates a rule definition for analyzing user traffic containing WSP extension-header of *test_field* and value of *test_string*:

```
wsp x-header test_field = test_string
```

wtp any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for WTP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wtp any-match *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the WTP any match status.

Example

The following command defines an any match rule definition for analyzing WTP user traffic:

```
wtp any-match = TRUE
```

wtp downlink

This command defines a rule definition to analyze and charge user traffic using WTP downlink.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wtp downlink *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Indicates the downlink (from the Mobile Node direction) status.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on a WTP downlink condition.

Example

The following command defines a rule definition for analyzing WTP user traffic based on the WTP downlink condition of *TRUE*:

```
wtp downlink = TRUE
```

wtp gtr

This command defines a rule definition to analyze and charge user traffic based on the WTP Group Transmission Flag (GTR).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wtp gtr *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on a WTP GTR condition.

Example

The following command defines a rule definition for analyzing WTP user traffic based on the WTP GTR condition of *TRUE*:

```
wtp gtr = TRUE
```

wtp pdu-length

This command defines a rule definition to analyze and charge user traffic using WTP Protocol Data Unit (PDU) length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wtp pdu-type *operator pdu_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

pdu_length

Specifies the WTP PDU length, in bytes, for this rule definition.
pdu_length must be an integer from 1 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on WTP PDU length (header + payload) in bytes.

Example

The following command creates a WTP rule definition for analyzing user traffic using an WTP PDU length of *9647* bytes:

ftp pdu-length = *9647*

wtp pdu-type

This command defines a rule definition to analyze and charge user traffic based on the WTP Protocol data Unit (PDU) type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wtp pdu-type *operator pdu_type*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

pdu_type

Specifies the WTP PDU type used for this rule definition.
pdu_type must be one of the following:

- **abort**
- **ack**
- **invoke**
- **negative-ack**
- **result**
- **segment-invoke**
- **segment-result**

Usage

Use this command to specify a rule definition to analyze user traffic based on a WTP PDU type value.

Example

The following command creates a WTP rule definition for analyzing user traffic containing a WTP PDU type **result**:

```
wtp pdu-type result
```

wtp previous-state

This command defines a rule definition to analyze and charge user traffic using WTP previous state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wtp previous-state *operator previous_state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

previous_state

Specifies the WTP previous state for this rule definition. *previous_state* must be one of the following:

- **ack-sent**
- **init**
- **invoke-sent**
- **rcvd**
- **result-rcvd**

Usage

Use this command to specify a rule definition to analyze user traffic based on a WTP previous state.

Example

The following command creates a WTP rule definition for analyzing user traffic using a WTP previous state of *ack_sent*:

```
wtp previous-state = ack-sent
```

wtp rid

This command defines a rule definition to analyze and charge user traffic based on the WTP Re-transmission Indicator (RID) flag.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wtp rid *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on a WTP RID.

Example

The following command creates a rule definition for analyzing user traffic containing a WTP RID condition of *TRUE*:

```
wtp rid = TRUE
```

wtp state

This command defines a rule definition to analyze and charge user traffic using WTP state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wtp state *operator state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

state

Specifies the WTP state for this rule definition.
state must be one of the following:

- **ack-sent**
- **close**
- **init**
- **invoke-sent**
- **rcvd**
- **result-rcvd**

Usage

Use this command to specify a rule definition to analyze user traffic based on a WTP state.

Example

The following command creates a WTP rule definition for analyzing user traffic using a WTP state of *close*:

```
wtp state = close
```

wtp tid

This command defines a rule definition to analyze and charge user traffic based on the WTP Transaction Identifier (TID).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wtp tid *operator tid_value*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

tid_value

Specifies the transaction identifier for this rule definition.
tid_value must be an integer from 0 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on a WTP TID.

Example

The following command creates a rule definition for analyzing user traffic containing a WTP TID value of *22*:

wtp tid = *22*

wtp transaction class

This command defines a rule definition to analyze and charge user traffic based on the WTP Transaction Class (TCL) state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wtp transaction class *operator transaction_class*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field. **operator** must be one of the following:

- **!=**: Does not equal
- **=**: Equals

transaction_class

Specifies the WTP TCL for this rule definition.
transaction_class must be an integer from 0 through 2.

Usage

Use this command to specify a rule definition to analyze user traffic based on a WTP transaction class.

Example

The following command creates a WTP rule definition for analyzing user traffic using a WTP transaction class of *2*:

wtp transaction class = *2*

wtp ttr

This command defines a rule definition to analyze and charge user traffic based on the WTP Trailer Transmission flag (TTR).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wtp ttr *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on a WTP TTR condition.

Example

The following command defines a rule definition for analyzing WTP user traffic based on the WTP TTR condition of *TRUE*:

```
wtp ttr = TRUE
```

wtp uplink

This command defines a rule definition to analyze and charge user traffic using WTP uplink.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] wtp uplink *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Indicates the uplink (to the Mobile Node direction) status.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the WTP uplink status.

Example

The following command creates a rule definition for analyzing user traffic using a WTP uplink value of *TRUE*:

```
wtp uplink = TRUE
```

www any-match

This command defines a rule definition to analyze and charge user traffic based on any match (catch-all) expression for WWW.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] www any-match *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the WWW any match status.

Example

The following command defines an any match rule definition for analyzing WWW user traffic:

```
www any-match = TRUE
```

www content type

This command defines a rule definition to analyze and charge user traffic based on the WWW content type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] www content type [case-sensitive] *operator content_type*

no

Removes the specified rule definition.

case-sensitive

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

operator

Specifies how to logically match the information in the analyzed field. **operator** must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

content_type

content_type must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on a WWW content type.

Example

The following command creates a SIP rule definition for analyzing user traffic using a WWW content of *test*:

```
www content type = test
```

www downlink

This command defines a rule definition to analyze and charge user traffic based on the WWW downlink conditions.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] www downlink *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Indicates the downlink (from the Mobile Node direction) status.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on a WWW downlink condition.

Example

The following command defines a rule definition for analyzing WWW user traffic based on the WWW downlink condition of *TRUE*:

```
www downlink = TRUE
```

www first-request-packet

This command defines a rule definition to analyze and charge user traffic based on the Wide Web (WWW) first-request-packet.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] www first-request-packet *operator condition*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition for this rule definition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule definition to analyze user traffic based on the WWW first request packet.

Example

The following command creates an WW rule definition for analyzing user traffic testing for the first-request-packet equals *TRUE*:

```
www first-request-packet = TRUE
```

www header-length

This command defines a rule definition to analyze and charge user traffic based on the WWW packet header length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] www header-length *operator header_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

header_length

Specifies the WWW packet header length, in bytes, for this rule definition.
header_length must be an integer from 0 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on a WWW packet header length.

Example

The following command creates an HTTP rule definition for analyzing user traffic using an WWW packet header length of *10000*:

www header-length = *10000*

www host

This command defines a rule definition to analyze and charge user traffic based on the WWW host.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] www host [case-sensitive] *operator host_name*

no

Removes the specified rule definition.

case-sensitive

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

host_name

A unique name that you specify for the WWW host.
host_name must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on a WWW host name.

Example

The following command creates a WWW rule definition for analyzing user traffic using a WWW host of *host1*:

www host = *host1*

www payload-length

This command defines a rule definition to analyze and charge user traffic based on the WWW payload length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] www payload-length *operator payload_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

payload_length

Specifies the WWW payload length for this rule definition.
payload_length must be an integer from 1 through 4000000000.

Usage

Use this command to specify a rule definition to analyze user traffic based on a WWW payload length.

Example

The following command creates a WWW rule definition for analyzing user traffic using a WWW payload length of *10000*:

www payload-length = *10000*

www pdu-length

This command defines a rule definition to analyze and charge user traffic based on the WWW Protocol Data Unit (PDU) length.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] www pdu-length *operator pdu_length*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

pdu_length

Specifies the WWW PDU length, in bytes, for this rule definition.
pdu_length must be an integer from 0 through 65535.

Usage

Use this command to specify a rule definition to analyze user traffic based on WWW PDU length (header + payload) in bytes.

Example

The following command creates an FTP rule definition for analyzing user traffic using a WWW PDU length of *9767* bytes:

www pdu-length = *9767*

www previous-state

This command defines a rule definition to analyze and charge user traffic based on the previous state of WWW.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] www previous-state *operator previous_state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

previous_state

Specifies the WWW previous state for this rule definition.
previous_state must be one of the following:

- **init**
- **response-error**
- **response-ok**
- **waiting-for-response**

Usage

Use this command to specify a rule definition to analyze user traffic based on a WWW previous state.

Example

The following command creates a WWW rule definition for analyzing user traffic using a WWW previous state of *init*:

```
www previous-state = init
```

www reply code

This command defines a rule definition to analyze and charge user traffic based on the WWW reply code arguments.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] www reply code *operator response_code*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

response_code

A unique value that you specify to use for the response.
response_code must be an integer from 100 through 599.

Usage

Use this command to specify a rule definition to analyze WWW user traffic based on a reply code rule definition.

Example

The following command defines a rule definition for analyzing WWW user traffic using a reply code of *110*:

www reply code = *110*

www state

This command defines a rule definition to analyze and charge user traffic based on the current state of WWW.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] www state *operator state*

no

Removes the specified rule definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

state

Specifies the WWW state for this rule definition.
state must be one of the following:

- **close**
- **response-error**
- **response-ok**
- **waiting-for-response**

Usage

Use this command to specify a rule definition to analyze user traffic based on a WWW state.

Example

The following command creates a WWW rule definition for analyzing user traffic using a WWW state of *close*:

```
www state = close
```

www transfer-encoding

This command defines a rule definition to analyze and charge user traffic based on the WWW transfer encoding.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] www transfer-encoding [ case-sensitive ]` *`operator string`*

`no`

Removes the specified rule definition.

`case-sensitive`

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

`operator`

Specifies how to logically match the information in the analyzed field.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`string`

A unique name that you specify for WWW transfer encoding.
`string` must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters.

Usage

Use this command to specify a rule definition to analyze user traffic based on a WWW transfer encoding string.

Example

The following command creates an HTTP rule definition for analyzing user traffic using a WWW transfer encoding string of *user1*:

www transfer-encoding = *user1*

www url

This command defines a rule definition to analyze and charge user traffic based on the WWW URL.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] www url [case-sensitive] *operator url*

no

Removes the specified rule definition.

case-sensitive

This keyword makes the rule case sensitive. By default, rule definitions are not case sensitive.
Default: Disabled

operator

Specifies how to logically match the information in the analyzed field. **operator** must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

url

url must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage

Use this command to specify a rule definition to analyze user traffic based on the WWW URL.

Example

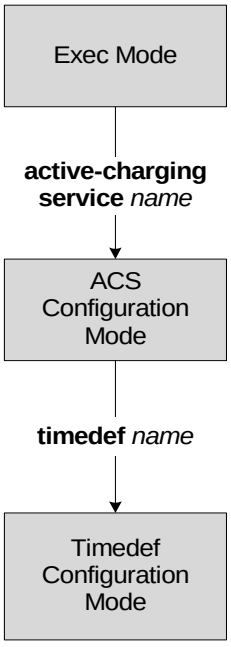
The following command creates a rule definition for analyzing user traffic using the WWW URL *www.abc.com*:

www url = *www.abc.com*

Chapter 16
ACS Timedef Configuration Mode Commands

The ACS Timedef Configuration Mode enables configuring the Time-of-Day Activation/Deactivation feature.

Important: This configuration mode is only available in StarOS 8.1 and in StarOS 9.0 and later releases.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

This command returns the CLI prompt to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec mode.

exit

This command exits the ACS Timedef Configuration Mode and returns the CLI prompt to the ACS Configuration Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the ACS Configuration Mode.

start

This command configures timeslots in the current timedef.

Important: This command is only available in StarOS 8.1 and in StarOS 9.0 and later releases.

Important: A maximum of 24 timeslots can be specified within a timedef.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] start day { friday | monday | saturday | sunday | thursday | tuesday | wednesday } time` *`hh mm ss`* **`end day { friday | monday | saturday | sunday | thursday | tuesday | wednesday } time`** *`hh mm ss`*

`[ no ] start time` *`hh mm ss`* **`end time`** *`hh mm ss`*

`no`

Removes the specified timeslot.

`start day { friday | monday | saturday | sunday | thursday | tuesday | wednesday } time` *`hh mm ss`* **`end day { friday | monday | saturday | sunday | thursday | tuesday | wednesday } time`** *`hh mm ss`*

Specifies a timeslot with a start day and time, and an end day and time.

- **`start day`**: Specifies the start day and start time.
- **`end day`**: Specifies the end day and end time.
- **`time`** *`hh mm ss`*: Specifies the start/end time:
  - *`hh`*: Specifies the start/end hour, and must be an integer from 0 through 23.
  - *`mm`*: Specifies the start/end minute, and must be an integer from 0 through 59.
  - *`ss`*: Specifies the start/end second, and must be an integer from 0 through 59.

`start time` *`hh mm ss`* **`end time`** *`hh mm ss`*

Specifies a timeslot with a start time and an end time to be applicable for all days of the week.
In specifying the start/end time:

- *`hh`*: Specifies the start/end hour, and must be an integer from 0 through 23.
- *`mm`*: Specifies the start/end minute, and must be an integer from 0 through 59.
- *`ss`*: Specifies the start/end second, and must be an integer from 0 through 59.

Usage

Use this command to create timeslots in a timedef during which rules have to be active. Timedefs enable activation/deactivation of ruledefs/groups-of-ruledefs such that they are available for rule matching only when they are active.
When a packet is received, and a ruledef/group-of-ruledefs is eligible for rule matching, if a timedef is associated with the ruledef/group-of-ruledefs, before rule matching, the packet-arrival time is compared with the timeslots configured in the timedef. If the packet arrived in any of the timeslots configured in the associated timedef, rule matching is undertaken, else the next ruledef/group-of-ruledefs is considered.

Important: The time considered for timedef matching is the system's local time.

This release does not support configuring a timeslot for a specific date.
If, in a timeslot, only the time is specified, that timeslot will be applicable for all days.
If for a timeslot, "start time" > "end time", that rule will span the midnight. I.e. that rule is considered to be active from the current day till the next day.
If for a timeslot, "start day" > "end day", that rule will span over the current week till the end day in the next week.
In the following cases a rule will be active all the time:

- A timedef is not configured in an action priority
- A timedef is configured in an action priority, but the named timedef is not defined
- A timedef is defined but with no timeslots

Example

The following example specifies a timeslot that starts on *Tuesday* at *09:00:00* and ends on *Friday* at *21:30:00*:

```
start day tuesday time 9 0 0 end day friday time 21 30 0
```

The following example specifies a timeslot that starts at *15:00:00* and ends at *17:00:00* on all days of the week:

```
start time 15 0 0 end time 17 0 0
```

The following example specifies a timeslot that starts on *Friday* at *22:00:00* and ends on *Tuesday* at *08:00:00*. This timeslot spans the complete week until the end day, i.e. up to *Tuesday*.

```
start day friday time 22 0 0 end day tuesday time 8 0 0
```

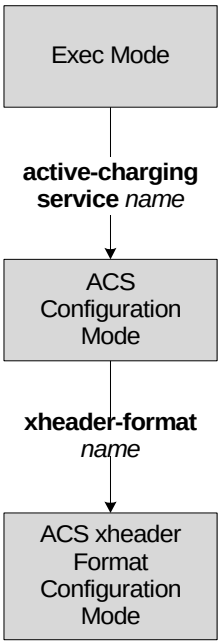
The following example specifies a timeslot that starts at *16:00:00* and ends at *09:00:00* on all days of the week. Also, as start time > end time, this timeslot spans the midnight too. I.e., from *16:00:00* to *23:59:59* and from *00:00:00* to *09:00:00*.

```
start time 16 0 0 end time 9 0 0
```

Chapter 17
ACS x-header Format Configuration Mode Commands

The ACS x-header Format Configuration Mode is used to create and configure extension-header (x-header) formats.

Important: This feature is license dependent. Please contact your local sales representative for more information.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

This command returns the CLI prompt to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec mode.

exit

This command exits the ACS x-header Format Configuration Mode and returns the CLI prompt to the ACS Configuration Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to change to the ACS Configuration Mode.

insert

This command configures the x-header fields to be inserted in HTTP GET and POST request packets.

Important: This command is license dependent. Please contact your local sales representative for more information.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

In StarOS 8.0:

insert *xheader_field_name* **{ string-constant** *xheader_field_value* **| variable { bearer { 3gpp charging-id | ggsn-address | imsi | radius-calling-station-id | sgsn-address | sn-rulebase | subscriber-ip-address } | http { host | url } }**

no insert *xheader_field_name*

In StarOS 8.1, StarOS 9.0 and later releases:

insert *xheader_field_name* **{ string-constant** *xheader_field_value* **| variable { bearer { 3gpp { apn | charging-characteristics | charging-id | imei | imsi | rat-type | sgsn-address } | acr | customer-id | ggsn-address | mdn | radius-calling-station-id | session-id | sn-rulebase | subscriber-ip-address | username } | http { host | url } }**

no insert *xheader_field_name*

no

Removes the specified x-header field configuration.

xheader_field_name

Specifies the x-header field name to be inserted in the packets.
xheader_field_name must be an alpha and/or numeric string of 1 through 31 characters in length.
Up to 10 fields can be inserted in each x-header format.

string-constant *xheader_field_value*

Specifies constant string value for x-header field to be inserted in the packets.
xheader_field_value must be the x-header field value, and must be an alpha and/or numeric string of 1 through 63 characters in length.

variable

Specifies name of the x-header field whose value must be inserted in the packets.

bearer { 3gpp { apn | charging-characteristics | charging-id | imei | imsi | rat-type | sgsn-address } | acr | customer-id | ggsn-address | mdn | radius-calling-station-id | session-id | sn-rulebase | subscriber-ip-address | username }

Specifies value of x-header field to be inserted:

- **3gpp**: 3GPP service
  - **apn**: APN of the bearer flow. This field is deprecated from under **bearer apn** and has been added within **bearer 3gpp apn**
  - **charging-characteristics**: Charging characteristics of the bearer flow
  - **charging-id**: Charging ID of the bearer flow
  - **imei**: IMEI or IMEISV (depending on the case) associated with the bearer flow
  - **imsi**: Specific Mobile Station Identification number.
  - **rat-type**: This field is deprecated from under **bearer rat-type** and has been added within **bearer 3gpp rat-type**
  - **sgsn-address**: SGSN associated with the bearer flow
- **acr**: Anonymous Customer Reference. Only MSISDN part of this is encrypted, if encrypt flag is set.
- **customer-id**: Customer ID of the bearer
- **ggsn-address**: GGSN IP address field
- **imsi**: This field is deprecated from within **bearer imsi** and has been moved within **bearer 3gpp imsi**
- **radius-calling-station-id**: Calling Station ID of the mobile handling the flow
- **session-id**: Accounting session ID of the bearer flow
- **sn-rulebase**: Name of the ACS rulebase
- **sgsn-address**: This field is deprecated from under **bearer sgsn-address** and has been moved within **bearer 3gpp sgsn-address**
- **subscriber-ip-address**: Subscriber IP address
- **username**: User name of the bearer flow

encrypt: Specifies encryption of x-header field configuration. This option must only be configured in the case of x-header encryption feature.

http { host | url }

Specifies value of the x-header field to be inserted:

- **host**: Host
- **url**: Uniform Resource Locator

Usage

Use this command to configure the x-header fields to be inserted in HTTP GET and POST request packets. The x-headers would be inserted at the end of HTTP header. This CLI command may be used up to 10 times. There is no control over the order of the fields that are to be inserted. Any of the indicated ruledef variables may be inserted using the variable option, or a static string may be inserted using the string-constant option. Operators may insert x-headers in some HTTP packets, for which some rules will be configured. The charging-action associated with these rules will contain the list of x-headers to be inserted in the packets.

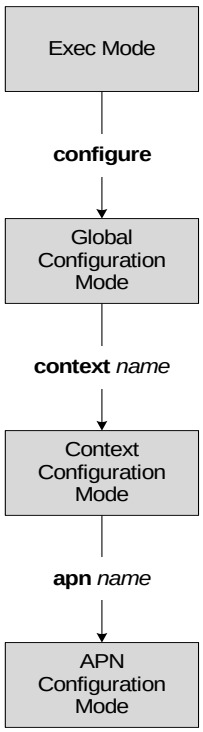
Example

The following command configures an x-header field named *test12* with a constant string value of *testing* to be inserted in HTTP GET and POST request packets:

```
insert test12 string-constant testing
```

Chapter 18
APN Configuration Mode Commands

The Access Point Name (APN) Configuration Mode is used to create and configure APN profiles within the current system context of a UMTS/LTE service.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

aaa group

This command configures a AAA server group for the APN for AAA functionality.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

[no] aaa group *group_name*

default aaa group

no

Disables the specified AAA group for the specific APN.

default

Sets / restores default AAA group specified at the context level or in APN template.

group_name

The AAA group to configure for the APN.
group_name must be a string of 1 through 63 characters in length.

Usage

Instead of having a single list of servers per context, this feature configures multiple server groups within a context and applies individual server group for APNs in that context. Each server group consists of a list of AAA servers for each AAA function (accounting, authentication, charging, etc.).

Example

The following command applies the AAA server group *star1* to an APN within the specific context:

aaa group *star1*

The following command disables the AAA group for the specific APN:

no aaa group *group_name*

access-link

Configures IP fragmentation processing over the Access-link (PPP, GTP etc).

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

access-link ip-fragmentation { **normal** | **df-ignore** | **df-fragment-and-icmp-notify** }

df-ignore

Default: Disabled
Ignore the DF bit setting. Fragment and forward the packet over the access link.

df-fragment-and-icmp-notify

Default: Disabled
Partially ignore the DF bit. Fragment and forward the packet, but also return an ICMP error message to the source of the packet. The number of ICMP errors sent like this is rate-limited to 1 ICMP error packet per second per session.

normal

Default: Enabled
Normal processing. Drop the packet and send an ICMP unreachable message to the source of packet. This is the default behavior.

Usage

If the IP packet to be forwarded is larger than the access-link MTU and if the DF (Don't Fragment) bit is set for the packet, then the fragmentation behavior configured by this command is applied. Use this command to fragment packets even if they are larger than the access-link MTU.
Note that regardless of whether or not fragmentation is performed because of one of the above reasons, fragmentation may also occur for other reasons.
Payloads are encapsulated within IP/UDP/GTP before being sent to the SGSN. If that encapsulation causes the packet to exceed 1500 bytes, the inner IP payload is fragmented (even if it's not considered too-large by the above tests) into two payloads (if the DF bit is not set). If the DF bit is set (and access-link ip-fragmentation normal is configured), the system performs IP fragmentation of the entire packet (i.e., IP fragmentation in the outer IP header) rather than fragmenting the inner IP payload. Either way, the result is two packets, but in one case the MS would have to perform IP reassembly while in the other case the SGSN would have to perform reassembly.

Example

Set fragmentation so that the DF bit is ignored and the packet is forwarded anyway by entering the following command:

```
access-link ip-fragmentation df-ignore
```

accounting-mode

This command configures the protocol to be used for PDP context accounting by this APN.

Product

GGSN, ECS, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
accounting-mode { gtpp | none | radius-diameter [ no-interims ] [ no-early-pdus
] }

default accounting-mode
```

default

Restores the command to its default setting.

gtpp

Configures the APN to use GPRS Tunneling Protocol Prime for accounting purposes. If used, accounting will begin as soon as the PDP context is established. This is the default setting.
Default: Enabled

Important: The system's GTPP parameters must be configured prior to using this protocol for accounting. Refer to the **gtpp** commands in the Context Configuration Mode Commands chapter of this reference.

none

Disables accounting for PDP contexts using this APN.
When accounting mode is set to none, it indicates to the GTP stack at session manager to not generate the regular GTPP accounting triggers.
Default: Disabled.

radius-diameter

Configures the APN to use RADIUS/Diameter protocol for accounting purposes.
Default: Disabled

Important: The system's RADIUS/Diameter accounting parameters must be configured prior to using either of the protocols for accounting. Refer to the **radius**/**diameter** commands in the Context Configuration Mode Commands and the AAA Server Group Configuration Mode Commands chapters of this reference.

no-early-pdus

Configures the GGSN to discard user traffic once the buffer is full until the RADIUS server has returned a response to the GGSN's accounting START request per 3GPP standards.

no-interims

Disables the generation of RADIUS interims per APN. If **no-interims** is specified, then it won't send any RADIUS INTERIM-UPDATEs for this APN, regardless of what is configured in the context that is used for RADIUS accounting.

Usage

This command specifies which protocol, if any, will be used to provide accounting for PDP contexts accessing the APN profile.

When the GTPP protocol is used, accounting messages are sent to the charging gateways (CGs) over the Ga interface. The Ga interface and GTPP functionality are typically configured within the system's source context. As specified by the standards, a CDR is not generated when a session starts - CDRs are generated according to the interim triggers (configured using the **cc** command in the GGSN service configuration mode) and a CDR is generated when the session ends. For interim accounting, STOP/START pairs are sent based on configured triggers.

GTPP version 2 is always used. However, if version 2 is not supported by the CGF, the system reverts to using GTPP version 1. All subsequent CDRs are always fully-qualified partial CDRs. All CDR fields are R4.

If the **radius-diameter** option is used, either the RADIUS or the Diameter protocol is used as configured in the Context Configuration mode or the AAA Server Group Configuration mode.

If the RADIUS protocol is used, accounting messages can be sent over a AAA interface or the Gi to the RADIUS server. The AAA or Gi interface(s) and RADIUS functionality are typically configured with the system's destination context along with the APN. RADIUS accounting begins immediately after an IP address is allocated for the MS. Interim accounting can be configured using the **radius accounting interim interval**. The **radius accounting interim interval** command sends INTERIM-UPDATE messages at specific intervals.

Keywords to this command can be used in combination to each other, depending on configuration requirements.

Important: If the accounting type in the APN is set to 'none' then G-CDRs will not be generated. If accounting type is left as default "GTPP" and "billing-records" are configured in the ACS Rulebase Configuration Mode, then both G-CDRs and eG-CDRs would be generated.

Example

The following command configures the APN to use the RADIUS/Diameter protocol for accounting:

```
accounting-mode radius-diameter

accounting-mode radius-diameter no-interims no-early-pdus

accounting-mode radius-diameter no-early-pdus no-interims
```

active-charging bandwidth-policy

This command configures the bandwidth policy to be used for subscribers who use this APN.

Product

GGSN, ECS

Privilege

Security Administrator, Administrator

Syntax

active-charging bandwidth-policy *bandwidth_policy_name*

{ default | no } active-charging bandwidth-policy

default

Configures the default setting.
Default: The default bandwidth policy configured in the rulebase is used for subscribers who use this APN.

no

Disables bandwidth control for the APN.

bandwidth_policy_name

Specifies the bandwidth policy name.
bandwidth_policy_name must be an alpha and/or numeric string from 1 through 63 characters in length.

Usage

Use this command to configure bandwidth policy to be used for subscribers who use this APN.

Example

The following command configures a bandwidth policy named *standard* for the APN:

active-charging bandwidth-policy *standard*

active-charging rulebase

This command specifies the name of the ACS rulebase to be used for subscribers who use this APN.

Product

GGSN, ECS, P-GW

Privilege

Security Administrator, Administrator

Syntax

active-charging rulebase *rulebase_name*

no active-charging rulebase

no

Removes the rulebase previously configured for this APN.

rulebase_name

Specifies name of the ACS rulebase.
rulebase_name must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to specify the ACS rulebase to be used for subscribers who use the APN.

Example

The following command specifies the ACS rulebase named *rule1* for the APN:

active-charging rulebase *rule1*

apn-ambr

Configures the Aggregated Maximum Bit Rate (AMBR) for all PDNs using this APN.

Product

P-GW

Privilege

Administrator

Syntax

apn-ambr rate-limit direction { downlink | uplink } [burst-size { auto-readjust duration *seconds* **|** *bytes* **} | violate-action { drop | lower-ip-precedence | shape [transmit-when-buffer-full] | transmit }]**

[default | no] apn-ambr rate-limit direction { downlink | uplink }

default

Returns the selected command to it's default setting of no APN-AMBR.

no

Disables the selected command.

rate-limit direction { downlink | uplink }

Specifies that the rate limit is to be applied to either the downlink traffic or the uplink traffic.
downlink: Applies the AMBR parameters to the downlink direction.
uplink: Applies the AMBR parameters to the uplink direction.

burst-size { auto-readjust duration *seconds* **|** *bytes***}**

This parameter is used by policing and shaping algorithms to permit short bursts of traffic in order to not exceed the allowed data rates. It is the maximum size of the token bucket.
auto-readjust duration *seconds*: A duration, in seconds, used in this burst size calculation: burst size = peak data rate/8 * auto-readjust duration
seconds must be an integer value from 1 to 30. Default is 1 second
bytes: Specifies the burst size in bytes allowed by this APN for the associated PDNs. *bytes* must be an integer value from 1 to 4294967295 (1 byte to 4 GB).

violate-action { drop | lower-ip-precedence | shape [transmit-when-buffer-full] | transmit }

The action that the P-GW will take when the data rate of the bearer context exceeds the AMBR.
drop: Violating packets are dropped.
lower-ip-precedence: The DSCP value is set to zero ("best effort") for the violating packets.
shape [transmit-when-buffer-full]: Place all violating packets into a buffer and, optionally, packets are transmitted when the buffer is full.
transmit: Violating packets are transmitted. This is the default setting.

Usage

Use this command to enforce the AMBR for the APN on bearers that do not have a Guaranteed Bit Rate (GBR).

Example

The following command sets the downlink burst rate to use an auto-readjust duration of 2 seconds and lowers the IP precedence of violating packets:

```
apn-ambr rate-limit direction downlink burst-size auto-readjust duration
2 violate-action lower-ip-precedence
```

associte accounting-policy

Associates the APN with specific pre-configured policies configured in the same context.

Product

P-GW

Privilege

Administrator

Syntax

[no] associate accounting-policy *name*

no

Removes the selected association from this APN.

accounting-policy*name*

Associates the P-GW APN with an accounting policy configured in the same context. *name* must be an existing accounting policy and be from 1 to 63 alpha and/or numeric characters.
Accounting policies are configured through the policy accounting command in the Context Configuration Mode.

Usage

Use this command to associate the P-GW APN with an accounting policy configured in this context.

Example

The following command associates this P-GW APN with an accounting policy called *acct1*:

associate accounting-policy *acct1*

authentication

Configures the APN's authentication parameters.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

authentication { [msid-auth | imsi-auth [username-strip-apn] [password-use-pco] | msisdn-auth [username-strip-apn] [password-use-pco]] | [allow-noauth] [chap *preference* **] [mschap** *preference* **] [pap** *preference* **] }**

default authentication

default

Sets the default authentication type for this APN. By default **allow-noauth** is the type for authentication for an APN.

msid-auth

Obsolete. Use **imsi-auth**.

imsi-auth

Default: Disabled.
Configures the APN to attempt to authenticate the subscriber based on their International Mobile Subscriber Identification (IMSI) number.

msisdn-auth

Default: Disabled.
Configures the APN to attempt to authenticate the subscriber based on their Mobile Station International Integrated Services Digital Network (MSISDN) number as described in table in *Usage* section of this command.

username-strip-apn

Default: Disabled.
This keyword if enabled , eaither with **msisdn-auth** or **imsi-auth** strips the APN name from the user name *msisdn@apn* or *imsi@apn*received from AAA and make the user name as *msisdn* or *imsi* respectively.

password-use-pco

Default: Disabled.
This keyword, if enabled, uses the password received through Protocol Configuration Options (PCO) from AAA for authentication.

allow-noauth

Default: Enabled
Configures the APN to not perform authentication for PDP contexts as described in table in *Usage* section.

chap *preference*

Default: Disabled
Configures the APN to attempt to use the Challenge Handshake Authentication Protocol (CHAP) to authenticate the subscriber as described in table in *Usage* section of this command.
A *preference* must be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on. preference must be an integer from 1 through 1000. The lower the integer, the higher the preference.

mschap *preference*

Default: Disabled
Configures the APN to attempt to use the Microsoft Challenge Handshake Authentication Protocol (MSCHAP) to authenticate the subscriber as described in table in *Usage* section of this command.
A *preference* can be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on. preference must be an integer from 1 through 1000. The lower the integer, the higher the preference.

pap *preference*

Default: Disabled
Configures the APN to attempt to use the Password Authentication Protocol (PAP) to authenticate the subscriber as described in table in *Usage* section of this command.
A *preference* must be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on. preference must be an integer from 1 through 1000. The lower the integer, the higher the preference.

Usage

Use this command to specify how the APN profile should handle PDP context authentication and what protocols to use (if any). The ability to configure this option is provided to accommodate the fact that not every MS will implement the same authentication protocols.
The authentication process varies depending on whether the PDP context is of type IP or PPP. Table given in this section describes these differences.
For IP PDP contexts, the authentication protocol and values will be passed from the SGSN as Protocol Configuration Options (PCOs) within the create PDP context PDU to the GGSN. The GGSN requires that the authentication protocol is specified by this command (with no regard to priority) and will use this information to authenticate the subscriber.

Table 6. Authentication Process Variances Between PDP Context Type

Authentication Mechanism	IP PDP Context Behavior	PPP PDP Context Behavior

Authentication Mechanism	IP PDP Context Behavior	PPP PDP Context Behavior
allow-noauth	Allows the session even if the PCOs do not match any of the configured algorithms. If the there was no match and the **aaa constructed-nai authentication** parameter is enabled in the authentication context, the system attempts to determine a subscriber profile (via PAP with no password) using the subscriber's MSISDN as the username.	Allows the session with no authentication algorithm selected. If the **aaa constructed-nai authentication** parameter is enabled in the authentication context, the system attempts to determine a subscriber profile (via PAP with no password) using the subscriber's MSISDN as the username.
chap	If also specified in the PCOs, this protocol will be used to authenticate the subscriber.	Attempts this protocol according to its configured priority. If accepted by the remote end of the PPP connection, this protocol will be used to provide authentication.
mschap	If also specified in the PCOs, this protocol will be used to authenticate the subscriber.	Attempts this protocol according to its configured priority. If accepted by the remote end of the PPP connection, this protocol will be used to provide authentication.
pap	If also specified in the PCOs, this protocol will be used to authenticate the subscriber. If this protocol is used is specified and the **allow-noauth** parameter is disabled, the system will attempt to use the APN's default username/password specified by the **outbound** command for authentication via PAP.	Attempts this protocol according to its configured priority. If accepted by the remote end of the PPP connection, this protocol will be used to provide authentication.
msid-auth	Obsolete. Use **imsi-auth**.	Obsolete. Use **imsi-auth**.
imsi-auth	Values in the PCOs are ignored. The subscriber's IMSI is used as the username for PAP authentication. No password is used.	The subscriber's IMSI is used as the username for PAP authentication. No password is used.
msisdn-auth	Values in the PCOs are ignored. The subscriber's MSISDN is used as the username for PAP authentication. No password is used.	Option not available.

Example

The following command would configure the system to attempt subscriber authentication first using MSCHAP, then CHAP, and finally PAP. Since the allow-noauth command was also issued, if all attempts to authenticate the subscriber using these protocols fail, then the subscriber would be still be allowed access.

```
authentication mschap 1 chap 2 pap 3 allow-noauth
```

To enable **imsi-auth** or **msisdn-auth**, the following command instances must be issued:

```
authentication imsi-authauthentication msisdn-auth
```

bearer-control-mode

This command enables/disables the bearer control mode for network controlled QoS (NCQoS) through this APN. It also controls the sending of IE in GTP messages.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
bearer-control-mode [ ms-only | mixed | none ]

default bearer-control-mode
```

default

Sets the bearer control mode to default mode of "none".

ms-only

Default: Disabled.
This keyword sets the bearer control mode to "MS-only" mode. In this mode bearer will be controlled by User Equipment (UE) side.

mixed

Default: Disabled.
This keyword sets the bearer control mode to "Mixed" mode. In this mode bearer will be controlled by User Equipment (UE) and network side (from GGSN) as well.
To enable network controlled QoS this option must be enabled.

none

Default: Enabled.
This keyword sets the bearer control mode to "none" mode.
With BCM mode as none, system will not send any BCM mode information, BCM IE and BCM information in protocol configuration option (PCO) IE, in GTPC messages sent by GGSN.
This command is useful in networks where AGWs/firewalls do not support unknown optional IEs in GTP message.

Usage

Use this command to enable the QoS through bearer control. This can be done either through MS side or from GGSN and MS both. To enable network requested QoS user need to enable "Mixed" mode for beaer control.
With this keyword operator can control sending of BCM information in GTPC messages from GGSN.
With MS-Only or Mixed options in this mode system sends BCM information element in every Create PDP Context Response & Unknown PDP Context Request and Response message.
It is possible in some networks that AGWs/Firewall drops/rejects GTPC message if there is an Unknown optional IE. To resolve this none option is used so operator can control sending of BCM IE and BCM information in PCO IE in GTPC messages from GGSN.

Example

The following command enables the bearer control from network and MS side for NCQoS.

```
bearer-control-mode mixed
```

cc-home

Configures the home subscriber charging characteristics (CC) used by the GGSN when those from the SGSN will not be accepted.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

cc-home behavior *bits* **profile** *index*

behavior *bits*

Specifies the behavior bit for the home subscriber charging characteristic.
bits can be configured to any unique bit from 001H to FFFH (0001 to 1111 1111 1111 bin) where the least-significant bit corresponds to B1 and the most-significant bit corresponds to B12.

profile *index*

Default: 8
Specifies the profile index for the home subscriber charging characteristic.
index can be configured to any integer value between 0 and 15.

Important: 3GPP standards suggest that profile index values of 1, 2, 4, and 8 be used for hot billing, flat rate billing, prepaid billing and normal billing, respectively. A single charging characteristics profile can contain multiple behavior settings.

Usage

When the GGSN is configured to reject the charging characteristics sent by the SGSN for "home" subscribers, it uses the profile index specified by this command to determine the appropriate CCs to use. Multiple behavior bits can be configured for a single profile index by "Or"ing the bit strings together and convert the result to hexadecimal.
The properties of the actual CC profile index are configured as part of the GGSN service using the cc profile command. Refer to the GGSN Service Configuration Mode chapter of this reference for additional information on this command.

Example

The following command configures a behavior bit of 2 (0000 0000 0010) and a profile index of 10 for home subscribers charging characteristics:

```
cc-home behavior 2 profile 10
```

The following command configures the behavior bits 3 (0000 0000 0100) and 5 (0000 0001 0000 bin) and a profile index of 14 for home subscriber charging characteristics:

```
cc-home behavior 14 profile 14
```

cc-roaming

Configures the roaming subscriber charging characteristics (CC) used by the GGSN when those from the SGSN will not be accepted.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

cc-roaming behavior *bits* **profile** *index*

behavior *bits*

Specifies the behavior bit for the roaming subscriber charging characteristic.
bits can be configured to any unique bit from 001H to FFFH (0001 to 1111 1111 1111 bin) where the least-significant bit corresponds to B1 and the most-significant bit corresponds to B12.

profile *index*

Default: 8
Specifies the profile index for the roaming subscriber charging characteristic.
index can be configured to any integer value between 0 and 15.

Important: 3GPP standards suggest that profile index values of 1, 2, 4, and 8 be used for hot billing, flat rate billing, prepaid billing and normal billing, respectively. A single charging characteristics profile can contain multiple behavior settings.

Usage

When the GGSN is configured to reject the charging characteristics sent by the SGSN for "roaming" subscribers, it uses the profile index specified by this command to determine the appropriate CCs to use.
Multiple behavior bits can be configured for a single profile index by "Or"ing the bit strings together and convert the result to hexadecimal.
The properties of the actual CC profile index are configured as part of the GGSN service using the cc profile command. Refer to the GGSN Service Configuration Mode chapter of this reference for additional information on this command.

Example

The following command configures a behavior bit 10 (0010 0000 0000) and a profile index of 10 for roaming subscriber charging characteristics:

```
cc-roaming behavior 200 profile 10
```

The following command configures the behavior bits 9 (0001 0000 0000) and 6 (0000 0010 0000) and a profile index of 14 for roaming subscriber charging characteristics:

```
cc-roaming behavior 120 profile 14
```

cc-sgsn

Specifies the GGSN's source for charging characteristics (CC) - those configured locally or those received from the SGSN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
cc-sgsn { radius-returned | home-subscriber-use-GGSN | roaming-subscriber-use-
GGSN | visiting-subscriber-use-GGSN } +

cc-sgsn { use-GGSN behavior bits profile index[ 0...15 ]  [ radius-returned ] }

no cc-sgsn { { radius-returned | home-subscriber-use-GGSN | roaming-subscriber-
use-GGSN | visiting-subscriber-use-GGSN } + | [ use-GGSN ] [ radius-returned ] }
```

no

Causes the GGSN to accept CCs from the SGSN(s) when the **no cc-sgsn** command is entered with all applicable keywords. Otherwise, **no cc-sgsn** can be used to turn off one or more of the GGSN sources of CC.
Before entering **no cc-sgsn**, it is helpful to determine which CC sources have been configured. This can be done with either **show configuration** or **show apn name** in Exec Command Mode.

home-subscriber-use-GGSN

Configures the GGSN to use the locally defined charging characteristics for home subscribers, as configured with the APN Configuration Mode **cc-home** command.

roaming-subscriber-use-GGSN

Configures the GGSN to use the locally defined charging characteristics for roaming subscribers, as configured with the APN Configuration Mode **cc-roaming** command.

visiting-subscriber-use-GGSN

Configures the GGSN to use the locally defined charging characteristics for visiting subscribers, as configured with the APN Configuration Mode **cc-visiting** command.

radius-returned

Configures the GGSN to accept charging characteristics returned from the RADIUS server for all subscribers for the APN.

use-GGSN [behavior *bits* **] profile** *index[0...15]*

Configures the GGSN to accept charging characteristics for all subscribers in the APN.

bits specifies the behavior bit for the charging characteristic. This variable can be configured to any unique bit from 001H to FFFH (0001 to 1111 1111 1111 bin) where the least-significant bit corresponds to B1 and the most-significant bit corresponds to B12.
index indicates which profile defined with **cc profile**, in GGSN Service Configuration mode, GGSN uses as a source for CCs. The index can be configured to any integer value from 0 to 15.
use-GGSN keyword can be entered alone or in conjunction with the **radius-returned** keyword. When entered, this keyword, overrides previous configuration using any of the home, roaming, and/or visiting keywords.

+

More than one of the above keywords can be entered within a single command.

Usage

This command specifies whether or not CCs received from the SGSN will be accepted. If they are not accepted, the GGSN will use those that have been configured locally.
The GGSN's behavior can be configured for the following subscriber types:

- **Home:** Subscribers belonging to the same Public Land Mobile Network (PLMN) as the one on which the GGSN is located.
- **Roaming:** Subscribers that are serviced by a an SGSN belonging to a different PLMN than the one on which the GGSN is located.
- **Visiting:** Subscribers belonging to a different PLMN than the one on which the GGSN is located.
- Any subscriber in the APN.

Example

The following command instructs the GGSN to accept CCs for any subscriber in the APN based on local profile configurations of CCs.

```
cc-sgsn use-GGSN profile x
```

Assuming the CC source as defined with the previous command, the following command instructs the GGSN to accept CCs supplied by the SGSN(s) and disables the acceptance of CCs supplied by the GGSN for any subscriber within the APN:

```
no cc-sgsn use-GGSN
```

The following command instructs the GGSN to accept CCs for any subscriber in the APN based on CC information returned from the RADIUS server. This command can be issued after the previous command to expand the possible sources.

```
cc-sgsn radius-returned
```

The following command disables the acceptance of CCs supplied by the GGSN for visiting and roaming subscribers:

```
no cc-sgsn roaming-subscriber-use-GGSN visiting-subscriber-use-GGSN
```

cc-visiting

Configures the visiting subscriber charging characteristics (CC) used by the GGSN when those from the SGSN will not be accepted.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

cc-visiting behavior *bits* **profile** *index*

behavior *bits*

Specifies the behavior bit for the visiting subscriber charging characteristic.
bits can be configured to any unique bit from 001H to FFFH (0001 to 1111 1111 1111 bin) where the least-significant bit corresponds to B1 and the most-significant bit corresponds to B12.

profile *index*

Default: 8
Specifies the profile index for the visiting subscriber charging characteristic.
index can be configured to any integer value between 0 and 15.

Important: 3GPP standards suggest that profile index values of 1, 2, 4, and 8 be used for hot billing, flat rate billing, prepaid billing and normal billing, respectively. A single charging characteristics profile can contain multiple behavior settings.

Usage

When the GGSN is configured to reject the charging characteristics sent by the SGSN for "visiting" subscribers, it uses the profile index specified by this command to determine the appropriate CCs to use. Multiple behavior bits can be configured for a single profile index by "Or"ing the bit strings together and convert the result to hexadecimal.
The properties of the actual CC profile index are configured as part of the GGSN service using the cc profile command. Refer to the GGSN Service Configuration Mode chapter of this reference for additional information on this command.

Example

The following command configures a behavior bit 7 (0000 0100 0000) and a profile index of 10 for visiting subscriber charging characteristics:

```
cc-visiting behavior 40 profile 10
```

The following command configures the behavior bits 1 (0000 0000 0001) and 12 (1000 0000 0000) and a profile index of 14 for visiting subscriber charging characteristics:

```
cc-visiting behavior 801 profile 14
```

content-filtering category

This command enables/disables the specified pre-configured Category Policy Identifier for Category-based Content Filtering support.

Product

All

Privilege

Security Administrator, Administrator

Syntax

content-filtering category policy-id *cf_policy_id*

no content-filtering category policy-id

no

Disables the previously configured category policy identifier for Content Filtering support to the APN. This is the default setting.

category policy-id *cf_policy_id*

This command applies the specified content filtering category policy ID, configured in the ACS Configuration Mode, to this APN.
cf_policy_id must be a category policy ID, and must be an integer from 1 through 4,294,967,295.
In case the specified category policy ID is not configured in the ACS Configuration Mode, all packets will be passed regardless of the categories determined for such packets.

Important: Category Policy ID configured through this mode overrides the Category Policy ID configured through **content-filtering category policy-id** command in the ACS Rulebase Configuration Mode.

Usage

Use this command to enter the Content Filtering Policy Configuration Mode and to enable or disable the Content Filtering Category Policy ID for an APN.

Important: If Content Filtering Category Policy ID is not specified here the similar command in the ACS Rulebase Configuration Mode determines the policy.

Up to 64 different policy IDs can be defined.

Example

The following command enters the Content Filtering Policy Configuration Mode and enables the Category Policy ID *101* for Content Filtering support:

content-filtering category policy-id *101*

credit-control-group

This command configures the Credit Control Group to be used for subscribers who use this APN.

Product

GGSN, ECS, P-GW

Privilege

Security Administrator, Administrator

Syntax

credit-control-group *cc_group_name*

no credit-control-group

no

Removes the previously configured Credit Control Group from the APN configuration.

cc_group_name

Specifies the Credit Control Group name.
cc_group_name must be a alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to configure the Credit Control Group for this APN.
Creating different credit control groups enables applying different credit control configurations (DCCA dictionary, failure-handling, session-failover, Diameter endpoint selection, etc.) to different subscribers on the same system.
Without credit control groups, only one credit control configuration is possible on a system. All the subscribers in the system will have to use the same configuration.

Example

The following command configures a Credit Control Group named *testgroup12* to the current APN:

credit-control-group *testgroup12*

data-tunneling ignore df-bit

Controls the handling of the DF (Don't Fragment) bit present in the user IPv4/IPv6 packet for tunneling used for the Mobile IP data path.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
data-tunneling ignore df-bit

no data-tunneling ignore df-bit
```

no

Disables this option. The DF bit in the tunneled IP packet header is not ignored during tunneling. This is the default setting.

Usage

Use this command to configure a user so that during Mobile IP tunneling the DF bit is ignored and packets are fragmented.
If this feature is enabled, and fragmentation is required for the tunneled user IPv4/IPv6 packet, then the DF bit is ignored and the packet is fragmented. Also the DF bit is not copied to the outer header.
In the GGSN, this command also affects the other L3 tunneling options, IP-in-IP and GRE, but does not affect L2TP tunneling.

Example

To enable fragmentation of a subscribers packets over a MIP tunnel even when the DF bit is present, enter the following command:

```
data-tunneling ignore df-bit
```

data-tunnel mtu

Configures the Maximum Transmission Unit (MTU) for data sent on the IPv6 tunnel between the P-GW and the mobile node.

Product

P-GW

Privilege

Administrator

Syntax

data-tunnel mtu *bytes*

default data-tunnel mtu

default

Returns the command to the default value of 1500.

mtu *bytes*

Default: 1500
Specifies the MTU for the IPv6 tunnel between the P-GW and the mobile node. *bytes* must be an integer between 1280 and 2000.

Usage

Use this command to set the MTU for data traffic on the IPv6 tunnel between the P-GW and the mobile node.

Example

The following command sets the MTU for IPv6 data traffic to *1400* bytes:

data-tunnel mtu *1400*

dcca origin endpoint

This command is obsolete. To configure the Diameter Credit Control Origin Endpoint, in the Credit Control Configuration Mode, use the **diameter origin endpoint** command.

dcca peer-select

Specifies the Diameter credit control primary and secondary host for credit control.

Product

GGSN, ECS, P-GW

Privilege

Security Administrator, Administrator

Syntax

dcca peer-select peer *host_name* **[realm** *realm_name* **] [secondary-peer** *host_name* **[realm** *realm_name* **]]**

no dcca peer-select

no

Removes the previously configured Diameter credit control peer selection.

peer *host_name*

A unique name that you specify for the peer.
peer_name must be an alpha and/or numeric string of from 1 through 127 characters. *peer_name* allows punctuation marks.

secondary-peer *host_name*

Specifies a back-up host that is used for fail-over processing. When the route-table does not find an AVAILABLE route the secondary host performs a fail-over processing.

realm *realm_name*

The *realm_name* must be an alpha and/or numeric string of from 1 to 127 characters. The realm may typically be a company or service name. *realm_name* allows punctuation marks.

Usage

Use this command to select a Diameter credit control peer and realm.

WARNING: This configuration completely overrides all instances of **diameter peer-select** that have been configured within the Credit Control Configuration Mode for an Active Charging Service.

Example

The following command selects a Diameter credit control peer named test and a realm of *companyx*:

dcca peer-select test realm *companyx*

default

Sets/restores the default value assigned for the specified parameter.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
default { access-link ip-fragmentation | accounting-mode | authentication | cc-
home | cc-roaming | cc-sgsn | cc-visiting | data-tunneling ignore df-bit | dhcp
lease-expiration-policy | idle-timeout-activity | ip { address { allocation-
method } | header-compression | multicast discard | qos-dscp | source-violation
} | l3-to-l2-tunnel | loadbalance-tunnel-peers | long-duration-action | max-
contexts | mobile ip { home-agent | mn-aaa-removal-indication | required |
reverse-tunnel } | pdp-type | ppp { data-compression { mode | protocols } |
keepalive | min-compression-size | mtu } | proxy-mip {required | null-username
static-homeaddr} | selection-mode | sgsn payload-compression| timeout [ absolute
| idle | long-duration | qos-renegotiate ] | tunnel load-balance }
```

`access-link ip-fragmentation`

Restores the APN access-link parameter to its default setting of normal.

`accounting-mode`

Restores the APN accounting-mode parameter to its default setting of gtpp.

`authentication`

Restores the APN authentication parameter to its default setting of allow-noauth.

`cc-home`

Restores the cc-home parameter to its default setting of the following:

- **behavior bits:** 0x00
- **profile index:** 8

`cc-roaming`

Restores the cc-roaming parameter to its default setting of the following:

- **behavior bits:** 0x00
- **profile index:** 8

`cc-sgsn`

Restores the cc-sgsn parameter to its default setting of the following:

- **home-subscriber-use-GGSN :** Disabled
- **roaming-subscriber-use-GGSN :** Disabled

- **visiting-subscriber-use-GGSN :** Disabled

cc-visiting

Restores the cc-visiting parameter to its default setting of the following:

- **behavior bits:** 0x00
- **profile index:** 8

data-tunneling ignore df-bit

Restores the data-tunneling parameter to its default setting of disabled.

dhcp lease-expiration-policy

Restores the dhcp lease-expiration-policy parameter to its default setting of auto-renew.

idle-timeout-activity

Sets or restores the session idle-timeout default so it is reset with both uplink and downlink packets.

ip { address { allocation-method } | header-compression | multicast discard | qos-dscp | source-violation }

Restores the APN ip parameters to the following default settings:

- **address allocation-method:** local and allow-user-specified enabled
- **header-compression:** Disabled
- **multicast discard:** configures the default multicast settings which is to discard PDUs
- **qos-dscp:** conversational ef streaming af11 interactive af21 background be
- **source-violation:** check enabled, drop-limit 10

l3-to-l2-tunnel

Restores the layer 3-to-layer 2 tunnel address policy parameter to its default setting of validation with no allocation.

loadbalance-tunnel-peers

Restores the loadbalance-tunnel-peers parameter to its default setting of random.

long-duration-action

Restores the long-duration-action parameter to its default setting of detection.

max-contexts

Restores the max-contexts parameter to its default settings of:

- **primary:** 1000000
- **total:** 1000000

mobile ip { home-agent | mn-aaa-removal-indication | required | reverse-tunnel }

Restores the APN mobile-ip parameters to the following default settings:

- **home-agent :** No HA address defined

- **mn-aaa-removal-indication :** Disabled
- **required :** Disabled
- **reverse-tunnel :** Enabled

`npu qos traffic priority`

Restores the APN NPU QoS parameter to its default setting of Derive from packet DSCP.

`pdp-type`

Restores the APN pdp-type parameter to its default setting of ipv4.

`ppp { data-compression { mode | protocols } | keepalive | min-compression-size | mtu }`

Restores the APN ppp parameters to the following default settings:

- **data-compression mode:** normal
- **data-compression protocols:** stac, mppc, deflate
- **keepalive:** 0
- **min-compression-size:** 128
- **mtu:** 1500

`proxy-mip {required | null-username static-homeaddr}`

Restores the APN proxy-mip required parameter to its default setting of Disabled.

- **`required:`** Configures handling of RRQ to enable the acceptance without NAI extension in this APN. Default: Disabled.
- **`null-username static-homeaddr:`** Configures handling of RRQ to enable the acceptance without NAI extension in this APN. Default: Disabled.

`qos-renegotiate`

This keyword is obsolete.

`selection-mode`

Restores the APN selection-mode parameter to its default setting of subscribed.

`sgsn payload-compression`

Configures payload compression by SGSN for this APN.

`timeout [ absolute | idle | long-duration | qos-renegotiate]`

Restores the APN timeout parameters to the following default settings:

- **absolute :** 0
- **idle :** 0
- **load-balance :** 0
- **qos-renegotiate** : 180 - This keyword is obsolete.

This is the timeout value for the dampening timer during the dynamic QoS renegotiation.

Usage

After system parameters have been modified, this command is used to set/restore specific parameters to their default values.

Example

The following command restores the ppp min-compression-size parameter to its default setting of 128:

```
default ppp min-compression-size
```

dhcp context-name

Configures the name of the context on the system in which Dynamic Host Control Protocol (DHCP) functionality is configured.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

dhcp context-name *name*

no dhcp context-name *name*

no

Removes a previously configured context name.

name

The name of a context configured on the system in which one or more DHCP services are configured. It can be from 1 to 79 alpha and/or numeric characters in length and is case sensitive.

Usage

If the APN is to support dynamic address assignment via DHCP (either the proxy or relay mode), this parameter must be configured to point the APN to the name of a pre-configured context on the chassis in which one or more DHCP services are configured.
The command can be used to identify a single DHCP service instance within the specified context to use to facilitate the address assignment.

Example

The following command configures the APN to look for DHCP services in a context called *dhcp-ctx:*

dhcp context-name *dhcp-ctx*

dhcp lease-expiration-policy

Configures the system's handling of PDP contexts whose DHCP assigned IP lease has expired.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
dhcp lease-expiration-policy { auto-renew | disconnect }
```

auto-renew

Default: Enabled
Configures the system to automatically renew an IP address' lease when it is about to expire for PDP contexts facilitated by the APN.

disconnect

Default: Disabled
Configures the system to automatically release the PDP context when the lease for the IP address associated with that context expires.

Usage

Use this command to specify the action the system is to take when leases for IP addresses for PDP contexts that it are currently facilitated by the current APN are about to expire.

Example

The following command causes the system to release PDP contexts associated with the current APN when the lease for their DHCP-assigned IP address expires:

```
dhcp lease-expiration-policy disconnect
```

dhcp service-name

Configures the name of a specific DHCP service to use when dynamically assigning IP addresses to PDP contexts using the the Dynamic Host Control Protocol.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

dhcp service-name *svc_name*

no dhcp service-name *svc_name*

no

Removes a previously configured DHCP service name.

svc_name

Configures the name of the DHCP service instance that is to be used by the current APN for the dynamic assignment of IP addresses to PDP contexts.
The name can be from 1 to 63 alpha and/or numeric characters in length and it case sensitive.

Usage

Use this command to specify a pre-configured DHCP service instance that is to be used by the APN for IP address assignment when the Dynamic Host Control Protocol is used.
The name of the context in which the desired DHCP service is configured must be specified by the parameter.

Example

The following command instructs the APN to use a DHCP service called *dhcp1*:

dhcp service-name *dhcp1*

dns

Configures the Domain Name Service (DNS) servers that will be used by the APN for PPP.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

dns { primary | secondary } { *address* }

no dns { primary | secondary } [*dns_address*]

no

Deletes a previously configured DNS server.

primary

Configures the primary DNS server for the APN.

secondary

Configures the secondary DNS server for the APN. Only one secondary DNS server can be configured.

address

Default: primary = 0.0.0.0, secondary = 0.0.0.0
Configures the IP address of the DNS server. *address* must be expressed in dotted decimal notation.

dns_address

Specifies the IP address of the DNS server to remove. *dns_address* must be expressed in dotted decimal notation.

Usage

DNS servers are configured on a per-APN profile basis. This allows each APN profile to use specific servers in processing PDP contexts.
The configured DNS IP addresses are relayed to the subscriber within IPCP if the PDP type is PPP, or as PCOs (Protocol Configuration Options) if the PDP type is IP.
The DNS can be specified at the APN level in APN configuration as well as at the Context level in Context configuration mode with **ip name-servers** command, or it can be received from AAA server.
When DNS is requested in PCO configuration, the following preference will be followed for DNS value:
1. DNS Values received from LNS have the first preference.
2. DNS values received from RADIUS Server has the second preference.
3. DNS values locally configured with APN has the third preference.
4. DNS values configured at context level with **ip name-servers** command has the last preference.

Important: The same preference would be applicable for the NBNS servers to be negotiated via ICPC with the LNS.

Example

The following commands configure a primary DNS server address of 192.168.100.3 and a secondary DNS server address of 192.168.100.4:

```
dns primary 192.168.100.3
dns secondary 192.168.100.4
```

ehrpd-access

Configures the P-GW to exclude IPv6 traffic from being delivered to UEs, accessing PDNs from the eHRPD network, that do not have IPv6 capabilities.

Product

P-GW

Privilege

Administrator

Syntax

```
[ default | no ] ehrpd-access drop-ipv6-traffic
```

`[ default | no ]`

Resets this command to its default setting of disabled.

Usage

Use this command to exclude IPv6 traffic from being delivered to UEs on the eHRPD network that do not have IPv6 capabilities.

end

Exits the APN configuration mode and returns to the Administrator-Exec mode prompt.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax `end`

Usage

Change the mode back to the Administrator-Exec mode.

exit

Exits the APN configuration mode and returns to the context configuration mode.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax`exit`

Usage

Returns to the context configuration mode.

firewall policy

This command enables/disables Stateful Firewall support for the APN.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
firewall policy firewall-required

{ default | no } firewall policy
```

no

Disables Stateful Firewall support for this APN.

default

Configures the default setting for Stateful Firewall support.
Default: Disabled

firewall-required

Enables Stateful Firewall support for this APN.

Usage

Use this command to enable or disable Stateful Firewall support for this APN.

Important: This command is only available in StarOS 8.0. In StarOS 8.1 and later, this configuration is available in the ACS Rulebase Configuration Mode.

Important: Unless Stateful Firewall support for this APN is enabled using this command, firewall processing for this APN is disabled.

Important: If firewall is enabled, and the rulebase has no firewall configuration, Stateful Firewall will cause all packets to be discarded.

Example

The following command enables Stateful Firewall support for an APN:

```
firewall policy firewall-required
```

The following command disables Stateful Firewall support for an APN:

```
no firewall policy
```

fw-and-nat policy

This command configures the Firewall-and-NAT policy to be used for subscribers who use this APN.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

fw-and-nat policy *fw_nat_policy*

{ default | no } fw-and-nat policy

default

Configures the default setting.
Default: The default Firewall-and-NAT policy configured in the rulebase is used for subscribers who use this APN.

no

Disables Firewall and NAT for the APN.

fw_nat_policy

Specifies the Firewall-and-NAT policy for the APN.
fw_nat_policy must be an alpha and/or numeric string of 1 through 63 characters in length. Note that this policy will override the **default Firewall-and-NAT policy** configured in the ACS rulebase.

Usage

Use this command to configure the Firewall-and-NAT policy for the APN. Note that the policy configured in the subscriber mode will override the default policy configured in the ACS rulebase. If a policy is not configured in the subscriber mode, the default policy configured in the ACS rulebase will be used.

Important: This command is customer-specific and is only available in StarOS 8.1.

Important: This command must be used to configure the Policy-based Firewall-and-NAT feature.

Example

The following command configures a Firewall-and-NAT policy named *standard* for the APN:

fw-and-nat policy *standard*

gsm-qos negotiate

Enables negotiation of QoS attribute Reliability Class based on the configuration provided for Service Data Unit (SDU) Error Ratio and Residual Bit Error Ratio (BER) attributes in the APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

gsm-qos negotiate sdu-error-ratio *sdu-error-ratio-code* **[residual-ber** *residual-ber-code* **]**

[no] gsm-qos negotiate sdu-error-ratio [*sdu-error-ratio-code* **[residual-ber** *residual-ber-code* **]]**

no

Disables the configuration for negotiation of QoS attribute reliability class.

sdu-error-ratio *sdu-error-ratio-code*

Enables the negotiation of QoS attribute reliability class based on Service Data Unit (SDU) Error Ratio attributes.
sdu-error-ratio-code corresponds to distinct SDU Error ratio values in integer between the range of 1 to 7.

residual-ber *residual-ber-code*

Enables the optional configuration of negotiation of QoS attribute reliability class based on Residual Bit Error Ratio (BER) attributes.
residual-ber-code corresponds to distinct Residual Bit Error Ratio values in integer between the range of 1 to 9.

Usage

This command configures the QoS attribute Reliability Class to be negotiated based on the configuration provided for SDU Error Ratio and Residual BER attributes. The derived Reliability Class and the configured values for SDU Error Ratio and Residual BER are sent back in CPC and UPC response.
The mapping for *sdu-error-ratio-code* is as follows:

Code	Value
1	10-2
2	7*10-3
3	10-3
4	10-4
5	10-5

Code	Value
6	10-6
7	10-1

Residual BER needs to be specified when SDU Error Ratio is set to codes 1, 2, 3 or 7 (Or, SDU Error Ratio is intended to be set to a value greater than 5*10-4), for determining the Reliability Class QoS attribute. Otherwise, the Residual BER value received in the Create PDP context request QoS (or UPC request) would be used. The mapping for *residual-ber-code* is as follows:

Code	Value
1	5*10-2
2	10-2
3	5*10-3
4	4*10-3
5	10-3
6	10-4
7	10-5
8	10-6
9	6*10-8

Example

The following commands configures the negotiation of QoS attribute Reliability Class based on Service Data Unit (SDU) Error Ratio *3* attributes in the APN:

```
gsm-qos negotiate sdu-error-ratio 3
```

gtpp group

This command enables a configured GTPP server group to an APN for CGF accounting functionality.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

gtpp group *group_name* **[accounting-context** *ac_context_name* **]**

[no | default] gtpp group *group_name*

no

Disables the applied GTPP group for specific APN.

default

Sets / Restores default GTPP server group specified at the context level or in APN template.

group_name

Specifies the name of server group that is used for authentication/accounting for specific APN.
group_name must be a string of size 1 to 63 character. It must be the same as configured earlier within the same context of APN.

accounting-context *ac_context_name*

Specifies the name of an accounting context on the system that processes accounting for PDP contexts handled by this GGSN service for accounting to specific APN.
ac_context_name specifies the name of the context to be used for accounting. The name must be between 1 and 79 alpha and/or numeric characters and is case sensitive.
Note that if accounting context is not specified here, it uses the GGSN service context or the context configured by the **accounting context** CLI command in GGSN Service Configuration Mode.

Usage

This feature provides the GTPP server configurables under GTPP group node. Instead of having a single list of servers per context, this feature configures multiple server groups within a context and applies individual GTPP server group for subscriber in that context. Each server group consists of a list of CGF accounting servers.
In case no GTPP group is applied for the said APN or default APN template, then the default GTPP server group available at context level is applicable for accounting of specific APN.

Example

The following command applies a previously configured GTPP server group named *star1* to an APN within the specific context:

gtpp group *star1*

The following command disables the applied GTPP server group for the specific APN:

no gtpp group *star1*

gtpp secondary-group

This command enables/associates a preconfigured secondary GTPP server group to an APN for CGF accounting functionality. By default it is disabled.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

gtpp secondary-group *group_name* **[accounting-context** *actt_ctxt_name* **]**

[no | default] gtpp secondary-group *group_name*

no

Disables the configured/associated GTPP secondary group for specific APN.

default

Default: Enabled
Restores the default mode for secondary GTPP group for APN template.

group_name

Specifies the name of secondary GTPP server group that is used as an alternate for primary GTPP group associated with specific APN for storage of GTPP messages.
group_name must be a string of size 1 to 63 character. It must be the same as configured earlier within the same context of APN.

accounting-context *actt_ctxt_name*

Specifies the name of an accounting context on the system that processes accounting for PDP contexts handled by this GGSN service for accounting to specific APN.
ac_context_name specifies the name of the context to be used for accounting. The name must be between 1 and 79 alpha and/or numeric characters and is case sensitive.
Note that if accounting context is not specified here, it uses the GGSN service context or the context configured by the **accounting context** CLI command in GGSN Service Configuration Mode .

Usage

Use this feature to provide the secondary GTPP server group support for an APN.
When the secondary GTPP group is configured with this command, the GTPP messages will be duplicated to the secondary servers also.
This secondary group configuration is ignored, if configured *group_name* is same as the primary group. It will also be ignored, if the configured GTPP group *group_name* and/or accounting context *ac_context_name* is invalid. In such a case, the call will be established successfully unlike the primary group configuration where the call drops.
In the absence of the configured *ac_context_name* context; by default the GGSN service context is chosen.

The secondary group messages are the low priority ones, and thus they are preferred to be purged when there is no room for the new messages.
For more information on GTPP group, refer **gtpp group** command in this guide.

Example
The following command applies a previously configured GTPP server group named *star2* to as secondary GTPP group to an APN within the specific context:

```
gtpp secondary-group star2
```

The following command disables the applied secondary GTPP server group for the specific APN:

```
no gtpp secondary-group star2
```

idle-timeout-activity

Configures a session idle-timeout to be reset with uplink packets only, or with both uplink and downlink packets.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] idle-timeout-activity ignore-downlink

default idle-timeout-activity
```

no

This is the default setting. When set, the downlink traffic is also considered to be an idle timeout activity.

default

Sets or restores the command to the default setting.

ignore-downlink

Sets the system to ignore the downlink traffic to consider as activity for idle-timeout.

Usage

If **idle-timeout-activity ignore-downlink** is configured, the downlink traffic will not be used to reset the idle-timeout. Only uplink packets will be able to reset the idle-timeout.
By default, **ignore-downlink** is negated by the **no** command so downlink traffic is also used to reset the idle-timeout.

Example

The following command causes both uplink and downlink traffic to reset a session idle-timeout:

```
default idle-timeout-activity
```

The following command causes the session idle-timeout to be reset with only uplink packets:

```
idle-timeout-activity ignore-downlink
```

ims-auth-service

It applies an IMS authorization service to a subscriber through APN for Gx interface support and functionality.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

[no | default] ims-auth-service *auth_svc_name*

no

Disables the applied IMS authorization service for specific APN.

default

Sets / Restores default state of IMS authorization service, disabled or as specified at the context level or in APN template.

auth_svc_name

Specifies the name of IMS authorization service name that is used for Gx interface authentication for specific APN.
auth_svc_name must be a string of size 1 to 63 character preconfigured with in the same context of this APN.

Usage

This feature provides the IMS authorization service configuration for Gx interface in IMS service node.

Example

Following command applies a previously configured IMS authorization service named *gx_interface1* to an APN within the specific context:

ims-auth-service *gx_interface1*

Following command disables the applied IMS authorization service *gx_interface1* for the specific APN:

no ims-auth-service *gx_interface1*

ip access-group

Configures IPv4/IPv6 access group for the current APN profile.

Product

GGSN, ECS, P-GW

Privilege

Security Administrator, Administrator

Syntax

[no] ip access-group *acl_group_name* **[in | out]**

no

Removes a previously configured IPv4/IPv6 access group association.

acl_group_name

Specifies the name of the IPv4/IPv6 access group. *acl_group_name* is a configured ACL group and must be an alpha and/or numeric string of 1 to 79 characters.

in | out

Default: both (in and out)
Specifies the access-group as either inbound or outbound by the keywords **in** and **out**, respectively.

Usage

Use this command to apply a Single IPv4/IPv6 access control list to multiple subscribers via this APN for inbound or outbound IPv4/IPv6 traffic.
If no traffic direction specified the selected access control list will be applied to both direction of traffic.

Example

The following command associates the *sampleipv4Group* access group with the current APN profile for both inbound and outbound access.

ip access-group *sampleipv4Group*

The following removes the outbound access group flag for *sampleipv4Group*.

no ip access-group *sampleipv4Group* **out**

ip address alloc-method

Configures the method by which this APN will obtain IP addresses for PDP contexts.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
ip address allocation-method { dhcp-proxy [ prefer-dhcp-options ] | dhcp-relay |
local | no-dynamic } [ allow-user-specified ]
```

dhcp-proxy

Default: Disabled
Configures the APN to assign an IP address received from a DHCP server.

Important: If this option is used, the system's DHCP parameters must be configured.

dhcp-relay

Default: Disabled
Configures the APN to forward DHCP packets received from the MS to a DHCP server.

Important: If this option is used, the system's DHCP parameters must be configured.

local

Default: Enabled
Configures the APN to allocate IP addresses from a pool configured in the destination context on the system.

Important: If this option is used, the name of the IP address pool from which to allocate addresses must be configured using the **ip address pool-name** command. If no pool name is specified, the system will attempt to allocate an address from any public pool configured in the destination context.

no-dynamic

Default: Disabled
Disables the dynamic assignment of IP addresses to PDP contexts using this APN.
If a PDP context needing an IP address is received by an APN with this option enabled, it will be rejected with a cause code of 220 (Unknown PDP address or PDP type).

prefer-dhcp-options

Default: Disabled

This keyword, when specified with **dhcp-proxy** for IP address allocation configuration, GGSN will prefer DHCP supplied parameters over values provided by AAA server or by local configuration. This keyword controls following parameters:

- primary and secondary Domain Name Server (DNS) address
- primary and secondary NetBIOS Name Server (NBNS) address

These values will be sent out in PCO IE of GTP Create PDP Response Message whenever MS Requests for them in Create PDP Request Message.

Important: This keyword is available only with dhcp-proxy ip allocation method as this functionality is implemented only for GGSN acting as DHCP proxy.

By default, this functionality is disabled. Hence, DNS and NBNS values, if received from DHCP server will not be considered by the GGSN.

allow-user-specified

Default: Enabled
Enables support for PDP contexts requesting the use of specific (static) addresses.

Important: If this option is not enabled, PDP contexts requesting the use of a static address will be rejected with a cause code of 220 (Unknown PDP address or PDP type).

Usage

Use this command to configure the method by which the APN profile will assign IP addresses to PDP contexts.
When the PDP context is being established and the APN name is determined, the system will examine the APN's configuration profile. Part of that procedure is determining how to handle IP address allocation. Figure in Example section displays the process used by the system to determine how the address should be allocated.

Example

The following command configures the APN to dynamically assign an address from a DHCP server and reject PDP sessions with static IP addresses:

```
ip address alloc-method dhcp-proxy
```

The following command configures the APN to reject sessions requesting dynamically assigned addresses and only allow those with static addresses:

```
ip address alloc-method no-dynamic allow-user-specified
```

The following figure provides the IP address allocation process:

Figure 4. IP Address Allocation Process

ip address pool

Configures the name of a a private IP address pool configured on the system from which to assign an address for a PDP context.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

ip address pool name *pool_name*

no ip address pool name *pool_name*

no

Removes a previously configured pool name.

name *pool_name*

Specifies the name of the private pool configured on the system from which an IP address will be assigned. The name can be from 1 to 31 alpha and/or numeric characters and is case sensitive.

Usage

If the **ip address alloc-method** command is configured to allow the assignment of IP addresses from a local pool configured on the system, this command instructs the system as to which pool should be used.
The pool specified by this command must be a private pool configured in the destination context on the system. Please refer to the ip pool command in the context configuration mode for information on configuring IP address pools.
Multiple APNs can use the same IP address pool if required. In addition, this command could be issued multiple times to allow a single APN to use different address pools.

Example

The following command configures the system to use a pool named private_pool1 for address allocation:

ip address pool *private_pool1*

ip context-name

Configures the name of the destination context to use for subscribers accessing this APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

ip context-name *name*

no ip context-name *name*

no

Removes a previously configured context name.

name

Specifies the name of the context through which subscriber data traffic will be routed. *name* must be from 1 to 79 alpha and/or numeric characters.

Usage

Use this command to specify the name of a destination context configured on the system through which to route all subscriber data traffic. This context will be used for subscribers accessing this APN. If no name is specified, the system will use the context in which the APN is configured as the destination context.
When the APN is used to support Mobile IP functionality, this command is used to indicate the context in which the FA service is configured. If no name is specified, the context in which the GGSN service facilitating the subscriber PDP context is used.

Example

The following command configures the system to route subscriber traffic for the APN through a context called isp1:

ip context-name *isp1*

ip header-compression

Configures IP packet header compression parameters for this APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
ip header-compression vj

no ip header-compression
```

no

Disables Van-Jacobson header compression.

vj

Default: Enabled
Enables Van-Jacobson header compression for IP packets.

Usage

IP header compression reduces packet header overhead resulting in more efficient utilization of available bandwidth.

Example

The following command disables packet header compression for the APN:

```
no ip header-compression
```

ip hide-service-address

This command is configured on a per-APN basis. It renders the IP address of the GGSN unreachable from MS's using this APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] ip hide-service-address
```

no

Allows the mobile station to reach the GGSN's IP address using this APN.

default

Does not allow the mobile station to reach the GGSN's IP address using this APN.

Usage

This hides the GGSN's IP address from the mobile station for security purposes.

Example

The following command allows the GGSN's IP address to be viewed by the mobile station:

```
no ip hide-service-address
```

ip local-address

Configures the local-side IP address of the subscriber's point-to-point connection.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

ip local-address *ip_address*

no ip local-address

no

Removes a previously configured IP local-address.

ip_address

Specifies an IP address configured in a destination context on the system through which a packet data network can be accessed.
ip_address must be expressed in dotted-decimal notation.

Usage

This parameter specifies the IP address on the system that the MS uses as the remote-end of the PPP connection. If no local address is configured, the system uses an unnumbered scheme for local-side addresses.

Example

The following command configures a local address of 192.168.1.23 for the MS:

ip local-address *192.168.1.23*

ip multicast discard

Configures the IP multicast discard packet behavior.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ip multicast discard
```

no

Removes a previously configured IP multicast discard.

Usage

This command specifies if IP multicast discard is enabled or disabled.

Example

The following command enables IP multicast discard for an APN:

```
ip multicast discard
```

ip qos-dscp

Configures the quality of service (QOS) differentiated service code point (DSCP) used when sending data packets over the Gi interface.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
ip qos-dscp { { allocation-retention-priority | background | conversational |
interactive traffic_priority | streaming } { dscp}} +

no ip qos-dscp { allocation-retention-priority | background | conversational |
interactive | streaming } +
```

no

Restores the QoS parameter to its default setting.

allocation-retention-priority

Specifies the DSCP for interactive class if the allocation priority is present in the QOS profile.
allocation-retention-priority can be the integers 1, 2, or 3.
DSCP values use the following matrix to map based on traffic handling priority and Alloc/Retention priority if the allocation priority is present in the QOS profile.
Following table shows the DSCP value matrix for *allocation-retention-priority*.

Table 7. Default DSCP Value Matrix

Allocation Priority	1	2	3
Traffic Handling Priority			
1	ef	ef	ef
2	af21	af21	af21
3	af21	af21	af21

Important: If you only configure DCSP marking for interactive traffic classes without specifying ARP, it may not properly take effect. The CLI allows this scenario for backward compatibility however, it is recommended that you configure all three values.

background

Specifies the QOS for traffic patterns in which the data transfer is not time-critical (for example email exchange). This traffic pattern should be the lowest QOS.

conversational

Specifies the QOS for traffic patterns in which there is an constant flow of packets in each direction, upstream and downstream. This traffic pattern should be the highest QOS.

interactive *traffic_priority*

Specifies the QOS for traffic patterns in which there is an intermittent flow of packets in each direction, upstream and downstream. This traffic pattern should be a higher QOS than the background pattern, but not as high as that for the streaming pattern.
traffic_priority is the 3GPP traffic handling priority and can be the integers 1,2 or 3.

streaming

Specifies the QOS for traffic patterns in which there is a constant flow of data in one direction, either upstream or downstream. This traffic pattern should be a higher QOS than the interactive pattern, but not as high as that for the conversational pattern.

dscp

Specifies the DSCP for the specified traffic pattern. *dscp* can be configured to any one of the following:

• **af11:** Assured Forwarding 11 per-hop-behavior (PHB)	• **af33:** Assured Forwarding 33 PHB
• **af12:** Assured Forwarding 12 PHB	• **af41:** Assured Forwarding 41 PHB
• **af13:** Assured Forwarding 13 PHB	• **af42:** Assured Forwarding 42 PHB
• **af21:** Assured Forwarding 21 PHB	• **af43:** Assured Forwarding 43 PHB
• **af22:** Assured Forwarding 22 PHB	• **be:** Best effort forwarding PHB
• **af23:** Assured Forwarding 23 PHB	• **ef:** Expedited forwarding PHB
• **af31:** Assured Forwarding 31 PHB	• **pt:** Pass through (ToS of user packet is not modified)
• **af32:** Assured Forwarding 32 PHB	

Default:

- background : be
- interactive
- Traffic Priority 1: ef
- Traffic Priority 1: af21
- Traffic Priority 1: af21
- streaming : af11
- conversational : ef

+

More than one of the above keywords can be entered within a single command.

Usage

DSCP levels can be assigned to specific traffic patterns in order to ensure that data packets are delivered according to the precedence with which they're tagged. The diffserv markings are applied to the IP header of every subscriber data packet transmitted over the Gi interface(s).

The four traffic patterns have the following order of precedence: background (lowest), interactive, streaming, and conversational (highest). Data packets falling under the category of each of the traffic patterns are tagged with a DSCP that further indicate their precedence as shown in following tables respectively:

Table 8. Class structure for assured forwarding (af) levels

Drop Precedence	Class			
	Class 1	Class 2	Class 3	Class 4
Low	af11	af21	af31	af41
Medium	af12	af22	af32	af41
High	af13	af23	af33	af43

Precedence (low to high)	DSCP
1	Best Effort (be)
2	Class 1
3	Class 2
4	Class 3
5	Class 4
6	Express Forwarding (ef)

The DSCP level can be configured for multiple traffic patterns within a single instance of this command.

Example

The following command configures the DSCP level for the streaming traffic pattern to be **ef**:

```
ip qos streaming ef
```

The following command configures the DSCP levels for the conversational, streaming, interactive and background traffic patterns to be ef, ef, af22, and af41, respectively:

```
ip qos-dscp conversational ef streaming ef interactive af22 background
af41
```

ip source-violation

Enables/disables packet source validation for the current APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
ip source-violation { ignore | check [ drop-limit limit ] } [ exclude-from-
accounting ]
```

ignore

Default: Disabled
Disables source address checking for the APN.

check [drop-limit *limit*]

Default: Enabled, limit = 10
Enables the checking of source addresses received from subscribers for violations.
A **drop-limit** can be configured to set a limit on the number of invalid packets that can be received from a subscriber prior to their session being deleted. *limit* can be configured to any integer value between 0 and 1000000. A value of 0 indicates that all invalid packets will be discarded but the session will never be deleted by the system.

exclude-from-accounting

Default: Disabled
Excludes the packets identified with IP source violation from the stats generated for accounting records on a basis of configurables.

Usage

Source validation is useful if packet spoofing is suspected or for verifying packet routing and labeling within the network.
Source validation requires the source address of received packets to match the IP address assigned to the subscriber (either statically or dynamically) during the session.

Example

The following command enables source address validation for the APN and configures a drop-limit of 15:

```
ip source-violation check drop-limit 15
```

ip user-datagram-tos copy data-tunnel

This command controls copying of IP TOS octet value from user IPv4/IPv6 datagrams to IP header of GTP data tunnel header.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] ip user-datagram-tos copy data-tunnel
```

no

Removes the preconfigured parameter for this command.

default

Sets the default behavior of this command. By default this function is disabled.

Usage

This command needs to copy TOS byte from inner IP header to the outer IP header for RP connection. This functionality will enable SGSN to detect special TOS marking in the outer IP header of GTP tunnel packets and to identify certain packets as control messages.

Example

The following command will copy TOS octet in the IP header of datagram to IP header of GTP tunnel encapsulation:

```
ip user-datagram-tos copy data-tunnel
```

ipv6 access-group

This command configures IPv6 access group for the current APN profile which applies a Single ACL to Multiple Subscribers via APN for ipv6 traffic.

Product

GGSN, ECS, P-GW

Privilege

Security Administrator, Administrator

Syntax

`[ no ] ipv6 access-group` *`group_name`* **`[ in | out ]`**

`no`

Removes a previously configured IPv6 ACL applied to a particular APN for IPv6 traffic. As per your requirement at least one of the two **`{in | out}`** must be selected for which the ACL will be removed.

`group_name`

Specifies the name of the IPv6 access group. *`group_name`* must be an alpha and/or numeric string of 1 to 79 characters.

`[ in | out ]`

Default: both (in and out)
Specifies the access-group as either inbound or outbound by the keywords **`in`** and **`out`**, respectively.
If neither of any specified with the base command the specific IPv6 access control list will be applied to both the traffic (downlink and uplink).

Usage

Use this command to apply a single IPv6 access control list to multiple subscribers via an APN for inbound or outbound IPv6 traffic.
If no traffic direction specified the selected access control list will be applied to both direction of traffic.

Example

The following command associates the *`sampleipv6Group`* access group with the current APN profile for both inbound and outbound access:

`ipv6 access-group` *`sampleipv6Group`*

The following removes the outbound access group flag for *`sampleipv6Group`*:

`no ipv6 access-group` *`sampleipv6Group`* **`out`**

ipv6 address prefix-pool

Configures the IPv6 address prefix pool name to the subscriber session. User can configure up to a maximum of 4 pools per subscriber.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

ipv6 address prefix-pool *value*

value

Default: None
The value may be a string size of 1 to 31 characters.

Usage

Names the IPv6 address prefix pool.

Example

The following command will Configures the IPv6 address prefix pool name ap1_ipv6 to the subscriber session:

ipv6 address prefix-pool *ap1_ip6*

ipv6 dns

Configures the IPv6 Domain Name Service (DNS) servers.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

`[ no ] ipv6 dns { primary | secondary } { ipv6_dns_address }`

`no`

Deletes a previously configured DNS server.

`primary`

Configures the primary DNS server for the APN.

`secondary`

Configures the secondary DNS server for the APN. Only one secondary DNS server can be configured.

`ipv6_dns_address`

Configures the IP address of the DNS server.

Usage

DNS servers are configured on a per-APN profile basis. This allows each APN profile to use specific servers in processing PDP contexts.
The DNS can be specified at the APN level in APN configuration as well as at the Context level in Context configuration mode with **`ip name-servers`** command, or it can be received from AAA server.
When DNS is requested in PCO configuration, the following preference will be followed for DNS value:
1. DNS Values received from LNS have the first preference
2. DNS values received from RADIUS Server has the second preference
3. DNS values locally configured with APN has the third preference
4. DNS values configured at context level with **`ip name-servers`** command has the last preference.

Important: The same preference would be applicable for the NBNS servers to be negotiated via ICPC with the LNS.

Example

The following command provides an example of setting the primary DNS server:

`ipv6 dns primary` *`1:1:1:1:1:1:1:1`*

ipv6 egress-address-filtering

Egress address filtering filters out packets not meant for the mobile interface ID. The GGSN records the source interface ID of all the packets received from the Mobile. When packets sent to the Mobile are received, the destination interface ID is compared against the list of recorded interface IDs and with the local interface-ID assigned to the Mobile during IPv6CP. If no match is found, the packet is dropped.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ipv6 egress-address-filtering
```

no

Disables IPv6 egress address filtering.

ipv6 egress-address-filtering

Enables IPv6 egress address filtering.

Usage

Used to filter packets that arrive from the internet to a particular site.

Example

The following command provides an example disabling egress address filtering:

```
no ipv6 egress-address-filtering
```

ipv6 initial-router-advt

Creates an IPv6 initial router advertisement interval for the current APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

ipv6 initial-router-advt { interval | num-advts } { *value* }

default ipv6 initial-router-advt { interval | num-advts }

default

Resets interval or num-advts to their default setting.

interval value

Default: 3000ms
The time interval the initial IPv6 router advertisement is sent to the mobile node in milliseconds.
value is an integer between 100 and 16000 milliseconds.

num-advts value

Default: 3
The number of initial IPv6 router advertisements sent to the mobile node.
value is an integer between 1 to 16.

Usage

This command is used to set the advertisement interval and the number of advertisements. Using a smaller advertisement interval increases the likelihood of router being discovered more quickly when it first becomes available.

Example

The following command specifies the initial ipv6 router interval to be 2000ms:

ipv6 initial-router-advt interval *2000*

l3-to-l2-tunnel address policy

Configures the address allocation/validation policy, when subscriber L3 (IPv4/IPv6) sessions are tunneled using a L2 tunneling protocol, such as L2TP.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
l3-to-l2-tunnel address-policy { alloc-only | alloc-validate | no-alloc-validate
}
```

alloc-only

Default: Disabled
Specifies that the system locally allocates and validates subscriber addresses.

alloc-validate

Default: Disabled
Specifies that the system allocates addresses for cases in which IP addresses are dynamically assigned. The system does not validate the address specified by the subscriber.

no-alloc-validate

Default: Enabled
Specifies that the system does not allocate or validate subscriber addresses locally for such sessions, it passes the address between remote tunnel terminator to the Mobile Node.

Usage

This command can be useful for such tunnels are MIP HA sessions tunneled from the system using a L2TP tunnels or GGSN PDP contexts of type IP tunneled using L2TP to a remote LNS.

Example

The following command configures the system to locally allocate and validate subscriber addresses:

```
l3-to-l2-tunnel address-policy alloc-only
```

loadbalance-tunnel-peers

Configures how tunnel-peers are selected for this APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
load-balancing { balanced | prioritized | random }
```

balanced

Default: Disabled
Tunnel-peer selection is made without regard to prioritization, but in a sequential order that balances the load across the total number of peer nodes available.

prioritized

Default: Disabled
Tunnel-peer selection is made based on the priority configured for the peer.

random

Default: Enabled
Tunnel-peer selection is random in order.

Usage

Use this command to configure the load-balancing algorithm that defines how the tunnel-peers are selected by the APN when multiple peers are configured in the APN.

Example

The following command sets the APN to connect to tunnel-peers in a sequential order:

```
load-balancing balanced
```

long-duration-action detection

This command sets the detection of a session that exceeds the long duration timer and sends notification.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
long-duration-action detection
```

`detection`

Default: Enabled
Detects long duration sessions and sends SNMP TRAP and CORBA notification. This is the default behavior.

Usage

Use this command to detect a session exceeds the limit set by the long duration timer.
Refer to the **`timeout idle`** and **`timeout long-duration`** command for information on setting the long duration timer.

Example

Use the following command to enable detecting the session that exceeds the long duration timer:

```
long-duration-action detection
```

long-duration-action disconnection

This command specifies what action is taken when the long duration timer expires.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
long-duration-action disconnection [ suppress-notification ] [ dormant-only ] +
```

disconnection

Default: Disabled
Detects a long duration session and disconnects the session after sending SNMP TRAP and CORBA notification.

suppress-notifiaction

Default: Disabled
Suppress the SNMP TRAP and CORBA notification after detecting and disconnecting a long duration session.

dormant only

Default: Disabled
Disconnects the dormant sessions after long duration timer and inactivity time with idle time-out duration expires. It sends the SNMP TRAP and CORBA notification after disconnecting a long duration session.

Usage

Use this command to determine what action is taken when a session exceeds the limit set by the long duration timer.
Refer to the **timeout idle** and **timeout long-duration** command for information on setting the long duration timer.

Example

Use the following command to enable disconnecting sessions that exceed the long duration timer:

```
long-duration-action disconnection
```

Use the following command to disconnect the session that exceed the long duration timer without sending SNMP TRAP and CORBA notification:

```
long-duration-action disconnection suppress-notification
```

Use the following command to disconnect the session that exceed the long duration timer and also inactivity timer for idle time-out duration and send SNMP TRAP and CORBA notification:

long-duration-action disconnection dormant-only

Use the following command to disconnect the session that exceed the long duration timer and also inactivity timer for idle time-out duration without sending any SNMP TRAP and CORBA notification. If the session is idle and the session-idle-time >= inactivity time the session gets disconnected. Even if session is idle when the long-duration timed-out and session-idle time < inactivity time the timer value is reset to idle-timeout time.

long-duration-action disconnection dormant-only suppress-notification

max-contexts

Configures the maximum number of PDP contexts (primary and secondary) that can be facilitated by the APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

max-contexts {[per-subscriber secondary *secondary_ctx* **] [primary** *number* **total** *total_number* **]**

[default] max-contexts

per-subscriber secondary *secondary_ctx*

This keyword specifies the maximum number of secondary PDP contexts that can be facilitated by the APN per primary context (per-subscriber). Subscribers can have primary PDP and secondary PDP contexts- the secondary contexts share the same IP address as the primary.
secondary_ctx can be configured to any integer value from 0 to 10.
Default: 10

primary *number*

This keyword specifies the maximum number of primary PDP contexts that can be facilitated by the APN. Subscribers can have primary PDP and secondary PDP contexts- the secondary contexts can be configured using **per-subscriber secondary** keyword.
number can be configured to any integer value from 1 to 4000000.
Default: 4000000

total *total_number*

Specifies the maximum total number of PDP contexts (primary and secondary) that can be facilitated by the APN.
total_number can be configured to any integer value from 1 to 4000000.
Default: 4000000

Usage

This parameter can be used to configure a “soft” limit on the number of PDP contexts supported by a single APN.
Soft limits are based on measurements gathered at regular short intervals (several times per minute) as opposed to measurements taken in real-time. Therefore the sampled measurement may not match the actual number of PDP contexts currently being processed. Every PDP context request received is compared against the result of the last sample. If the sample is less than the soft limit configured, the request will be processed. If it is more, the request will be rejected.

Example

The following command specifies that the maximum number of primary PDP contexts the APN can facilitate is 500,000 while the maximum total number is 750,000:

max-contexts primary *500000* **total** *750000*

mbms bmsc-profile

It applies a configured Broadcast-Multicast Service Center (BM-SC) profile to subscribers through APN for Multimedia Broadcast Multicast Service (MBMS) support and functionality.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

mbms bmsc-profile name *bmsc_profile_name*

no mbms bmsc-profile

no

Deletes a previously associated BM-SC profile with this APN.

bmsc_profile_name

Specifies a name for the BM-SC profile already configured in BMSC configuration mode.
bmsc_profile_name can be from 1 to 62 alpha and/or numeric characters and is not case sensitive. It may also contain dots (.) and/or dashes (-).

Usage

Use this command to associate a configured BM-SC profile to use for MBMS contexts with this APN for MBMS feature support.
For more information on BM-SC profile configuration, refer BMSC Profile Configuration Mode.
This command also configures the specific BM-SC profile to use for Internet group Management Protocol (IGMP) JOIN requests received from PDP contexts with this APN.

Example

Following command applies a previously configured BM-SC profile named *bm_sc_1* to an APN within the specific context.

mbms bmsc-profile name *bm_sc_1*

mbms bearer timeout

Configures the session timeout values for the MBMS bearer contexts with this MBMS APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

mbms bearer timeout { absolute | idle } *time*

[no | default] mbms bearer timeout { absolute | idle }

no

Returns the timeout parameter to its default setting. If neither the absolute or idle keywords are used in conjunction with this keyword, both timeout options will be returned to their default settings.

default

Set the default value for the followed option for MBMS bearer context timeout.

absolute

Default: Disabled
Configures the absolute maximum time an MBMS bearer context may exist in any state (active or idle).

idle

Default: Disabled
Configures the maximum amount of time an MBMS bearer context may be idle.

time

Default: 0
Measured in seconds, the time can be configured to any integer value between 0 and 4294967295.
A time of 0 disables timeouts for this APN.

Usage

Use this command to limit the amount of time that an MBMS bearer context session can remain connected.

Example

The following commands enables an absolute time timeout of *60000* seconds for MBMS bearer context:

mbms bearer timeout absolute *60000*

mbms ue timeout

Configures the session timeout values for the MBMS user equipment (UE) contexts with this MBMS APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

mbms ue timeout { absolute | idle } *time*

[no | default] mbms ue timeout { absolute | idle }

no

Returns the timeout parameter to its default setting. If neither the absolute or idle keywords are used in conjunction with this keyword, both timeout options will be returned to their default settings.

default

Set the default value for the followed option for MBMS UE context timeout.

absolute

Default: Disabled
Configures the absolute maximum time an MBMS UE context may exist in any state (active or idle).

idle

Default: Disabled
Configures the maximum amount of time an MBMS UE context may be idle.

time

Default: 0
Measured in seconds, the time can be configured to any integer value between 0 and 4294967295.
A time of 0 disables timeouts for this APN.

Usage

Use this command to limit the amount of time that an MBMS UE context session can remain connected.

Example

The following commands enables an absolute time timeout of *60000* seconds for MBMS UE context:

mbms bearer timeout absolute *60000*

mediation-device

Enables the use of a mediation device and specifies the system context to use for communicating with the device.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

mediation-device [context-name *context-name* **] [delay-GTP-response] [no-early-pdus] [no interims] +**

[no | default] mediation-device

+

Indicates that more than one of the options can be specified with a single execution of the command.

no

Deletes the mediation-device configuration.

default

Changes the mediation device to no context-name configured and restores the mediation device's default properties.

context-name *context-name*

Default: The subscribers destination context.
Configures the mediation VPN context for this APN.
context-name can be from 1 to 79 alpha and/or numeric characters and is case sensitive.
If not specified, the mediation context is same as the destination context of the subscriber.

delay-GTP-response

Default: Disabled
When enabled, delays the CPC response until an Accounting Start response is received from the mediation device.

no-early-pdus

Default: Disabled
Specifies that the system delays PDUs from the MS until a response to the GGSN's accounting start request is received from the mediation device. The PDUs are queued if possible, or discarded
If "no-early-PDUs" is enabled, the chassis shall not send uplink/downlink data from/to a MS till it receives the Acct-Rsp Start for the same--from the mediation device. On receiving the Acct-Rsp, pending PDUs are sent out. The chassis shall buffer up to 4 PDUs per call, before it flushes all the PDUs for that call. It is disabled by default.

no-interims

Default: Disabled
Disables sending of interims to the mediation device.

Usage

This command is used to enable mediation device support for the APN. Mediation devices can be either deep-packet inspection servers or transaction control servers.
Keywords to this command can be used in combination to each other, depending on configuration requirements.

Example

The following command enables mediation device support for the APN and uses the protocol configuration located in an system context called *ggsn1*:

```
mediation-device context-name ggsn1

mediation-device context-name ggsn1 no-interims no-early-pdus

mediation-device no-early-pdus no-interims

mediation-device no-interims no-early-pdus
```

The following command enables mediation device support for the APN and uses the protocol configuration located in the subscribers destination context:

```
mediation-device
```

mobile-ip home-agent

Configures the IP address of the home agent (HA) used by the current APN to facilitate subscriber Mobile IP sessions.

Product

GGSN, FA, P-GW

Privilege

Security Administrator, Administrator

Syntax

[no] mobile-ip home-agent *ip_address*

no

Removes a previously configured HA address.

ip_address

The IP address of the HA expressed in dotted-decimal notation.

Usage

If the APN is configured to support Mobile IP for all PDP contexts it is facilitating, this command specifies the IP address of the HA that is to be used.

Example

The following command configures an HA IP address of 192.168.1.15:

mobile-ip home-agent *192.168.1.15*

mobile-ip mn-aaa-removal-indication

Configures the system to remove various information elements when relaying Registration Request messages to the HA.

Product

GGSN, FA, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] mobile-ip mn-aaa-removal-indication
```

no

Disables this functionality. This is the default setting.

Usage

When this functionality is enabled, the MN-FA challenge and MN-AAA authentication extensions are removed when relaying a Registration Request (RRQ) to the HA.

Example

The following command enables the system to remove information elements from RRQs relayed to the HA:

```
mobile-ip mn-aaa-removal-indication
```

mobile-ip mh-ha-hash-algorithm

Designates the encryption algorithm to use.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
mobile-ip mn-ha-hash-algorithm { hmac-md5 | md5 | rfc2002-md5 }
```

hmac-md5 | md5 | rfc-2002-md5

Default: hmac-md5
The encryption algorithms that may be used.

Usage

Provides security by encrypting the data.

Example

The following command sets encryption for md5:

```
mobile-ip mn-ha-hash-algorithm md5
```

mobile-ip mh-ha-shared-key

Configures the subscriber MN-HA shared key.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

mobile-ip mn-ha-shared-key *key*

no mobile-ip mn-ha-shared-key

no

Disables this functionality. This is the default setting.

key

The key must be entered as either a string or a hexadecimal number beginning with “0x”.

Usage

Configures a shared key for the APN.

Example

The following command configures a shared key of *sfd23408imi9yn*:

mobile-ip mn-ha-shared-key *sfd23408imi9yn*

mobile-ip mh-ha-spi

Configures the SPI number.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

mobile-ip mn-ha-spi *spi_number*

no mobile-ip mn-ha-spi

no

Disables this functionality. This is the default setting.

spi_number

The number must be an integer between 256 and 4294967295.

Usage

Configures an SPI number for the APN.

Example

The following command configures an SPI number of 428856:

```
mobile-ip mn-ha-spi 428856
```

mobile-ip required

Enables support for Mobile IP functionality for all PDP contexts facilitated by the current APN.

Product

GGSN, FA, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] mobile-ip required
```

no

Disables this functionality. This is the default setting.

Usage

Mobile IP functionality for IP PDP contexts is only supported at the APN-level. This command enables/disables Mobile IP support for the APN.
When Mobile IP is performed, the system authenticates the subscriber and the Mobile IP FA.
If this option is enabled, the system deletes all PDP contexts attempting to access the APN for which a Mobile IP session can not be established.

Example

The following command enables Mobile IP support for the current APN:

```
mobile-ip required
```

mobile-ip reverse-tunnel

Configures the system to support reverse-tunneling for Mobile IP sessions facilitated by the current APN.

Product

GGSN, FA, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] mobile-ip reverse-tunnel
```

no

Disables this functionality. The default is enabled.

Usage

Use this command to enable support for Mobile IP reverse tunneling for the APN. Reverse tunneling is enabled by default.

Example

The following command enables reverse-tunneling for the APN:

```
mobile-ip reverse-tunnel
```

nai-construction

Configures the NAI construction parameters on a per-APN basis only rather than by per-aaa-group when constructed NAI authentication is enabled.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
nai-construction { imsi | msisdn } [ override-null-username ] [ encrypted
password string | use-shared-secret-password | password string ]

[ default | no ] nai-construction
```

default

Enables default method for NAI construction using International Mobile Subscriber Identity (IMSI) for authentication for a user. GGSN constructs NAI using IMSI when no user-name is received.

no

Disables the NAI construction at the APN level.

imsi

Default: Enabled.
Enables NAI construction using IMSI for authentication for a user. GGSN constructs NAI using IMSI when no user-name is received. This is the default setting.

msisdn

Enables NAI construction using Mobile Station International ISDN Number (MSISDN) for authentication for a user. GGSN constructs NAI using MSISDN when no user-name is received.

override-null-username

Enables NAI construction using IMSI/MSISDN for authentication for a user or when empty user name is received.

encrypted password

Specifies an encrypted password is to be used for this NAI-constructed user. string is a string from 0 - 63 characters.

password

Configures the authentication user-password for this NAI-constructed user. password is a string from 0 - 63 characters.

use-shared-secret-password

Specifies use of the RADIUS authentication shared secret password for this NAI-constructed user.

Usage

NAI-construction defines the behavior for construction at the APN level. If defined for a particular APN, this CLI both works independently and overwrites the behavior of aaa constructed-nai defined at the context level for calls involving this APN.
Note that NAI construction using IMSI or MSISDN, where ether no user name is received or a blank user name is received for authentication, is applicable only when NAI constructed authentication is enabled using **aaa nai-construction authentication** command in context configuration mode.

Example

The following command enables NAI-construction using IMSI as the authentication type with an encrypted password:

nai-construction imsi encrypted password *string*

nexthop-forwarding-address

Configures the next hop forwarding address for the APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

nexthop-forwarding-address *ip_address*

no nexthop-forwarding-address

no

Disables this function. This is the default setting.

ip_address

Configures the IP address of the nexthop forwarding address.

Usage

Use this command to configure the next hop forwarding address for the APN.

Example

The following command configures the next hop forwarding address to 1.1.1.1 using IPv4:

nexthop-forwarding-address *1.1.1.1*

nbns

Configures and Enables use of NetBios Name Service for the APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

[no] nbns { primary | secondary } *IP_address*

no

Removes/disables use of a previously configured NetBios Name Service.

primary

Designates primary NBNS server. Must be followed with IPv4 address in dotted-decimal notation.

secondary

Designates secondary/failover NBNS server. Must be followed with IPv4 address in dotted-decimal notation.

IP_address

Specifies the IPv4/IPv6 address expressed in standard notation.

Usage

This command specifies NBNS parameters. The NBNS option is present for both pdp type IP and pdp type PPP for GGSN.
The system can be configured to use NetBios Name Service for the APN.

Example

The following command configures the APN's NetBios Name Service to primary IP 192.168.1.15.

nbns primary *192.168.1.15*

npu qos

Configures an NPU QoS priority queue for packets facilitated by the APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator\

Syntax

```
[ no ] npu qos traffic priority { best-effort | bronze | derive-from-packet-dscp
| gold | silver }
```

no

Removes a previously configured priority queue.

best-effort

Assigns the best-effort queue priority. This is the lowest priority.

bronze

Assigns the bronze queue priority. This is the third-highest priority.

derive-from-packet-dscp

Default: Enabled
Specifies that the priority is to be determined from the DSCP field in the packet's TOS octet.

gold

Assigns the gold queue priority. This is the highest priority.

silver

Assigns the silver queue priority. This is the second-highest priority.

Usage

This command is used in conjunction with the Network Processing Unit (NPU) Quality of Service (QoS) functionality.
The system can be configured to determine the priority of a subscriber packet either based on the configuration of theAPN, or from the differentiated service (DS) field in the packet's TOS octet (representing the differentiated service code point (DSCP) value).
Refer to the GGSN System Administration and Configuration Guide for additional information on NPU QoS functionality.

Example

The following command configures the APN’s priority queue to be gold:

```
npu qos traffic priority gold
```

outbound

Configures the APN host username and password.

Syntax

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

outbound { [encrypted] password *pwd* **| username** *name***}**

no outbound password

no

Removes previously configured outbound information for the APN.

encrypted

The **encrypted** keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

password *pwd*

Specifies the password to use for session authentication.
pwd must be from 1 to 63 alpha and/or numeric characters and is case sensitive.

username *name*

Specifies the username to use for session authentication.
name must be from 1 to 63 alpha and/or numeric characters and is case sensitive.

Usage

This command can be used to provide a username and password for authentication when the subscriber doesn't supply one in accordance with 3GPP standards. In addition, it can be used to create a PPP session when using L2TP to tunnel IP PDP contexts.
If only a username is specified using this command, the password is determined based on the setting of the **aaa constructed-nai** command in the Context Configuration mode. That command is also used to determine the password if an outbound username and password are configured for the APN when the imsi-auth keyword is specified for the **authentication** command in this mode.

Example

The following commands configures an APN username of *isp1* and a password of *secRet123*.4.

outbound username *isp1*

outbound password *secRet123.4*

pdp-type

Configures the type of PDP contexts that are supported by this APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
pdp-type { ipv4 [ ipv6 ] | ipv6 [ ipv4 ] | ppp }
```

ipv4 [ipv6]

Default: Enabled
Enables support for IPv4 PDP contexts. Also enables support for IPv6 if the IPv6 optional keyword is entered in this command.

Important: Entering both IPv4 and IPv6 in either order enables support for both.

ipv6 [ipv4]

Default: Disabled
Enables support for IPv6 PDP contexts. Also enables support for IPv4 if the IPv6 optional keyword is entered in this command.

Important: Entering both IPv4 and IPv6 in either order enables support for both.

ppp

Default: Disabled
Enables support for PPP PDP contexts.

Usage

IP PDP context types are those in which the MS is communicating with a PDN such as the Internet or an intranet using IP. PPP PDP contexts are those in which PPP or PPP Network Control Protocol (NCP) frames from the MS are either terminated at, or forwarded by the GGSN.
If a session specifies a PDP type that is not supported by the APN, the system rejects the session with a cause code of 220 (DCH, Unknown PDP address or PDP type).

Example

The following command configures the APN to support PPP context types:

```
pdp-type ppp
```

ppp

Configures the Point-to-Point Protocol (PPP) options for the current APN.

Syntax

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

ppp { data-compression { protocols *protocols* **| mode** *modes* **} | keepalive** *seconds* **| min-compression-size** *min_octets* **| mtu** *max_octets* **}**

no ppp { data-compression protocols | keepalive *seconds* **| mtu }**

no

Resets the option specified to its default setting.

data-compression { mode *modes* **| protocols** *protocols***}**

Default: all protocols enabled
Configures the data compression or the compression protocol to use for the APN.
mode *modes*: Sets the compression mode to one of the following:

- **normal:** Packets are compressed using the packet history for automatic adjustment and for best compression.
- **stateless:** Each packet is compressed individually.

protocols *protocols*: Sets the compression protocol to one of the following:

- **deflate:** DEFLATE algorithm
- **mppc:** Microsoft Point-to-Point Compression
- **stac:** STAC LZS algorithm

keepalive *seconds*

Default: 30
Specifies the frequency of sending the Link Control Protocol (LCP) keep alive messages. *seconds* must be either 0 or in the range from 5 to 14400.
The special value 0 disables the keep alive messages entirely.

min-compression-size *min_octets*

Default: 128
Specifies the smallest packet to which compression may be applied. *min_octets* must be a value in the range from 0 to 2000.

mtu *max_octets*

Default: 1500
Specifies the maximum transmission unit (MTU) for packets accessing the APN. *max_octets* must be a value in the range from 100 to 2000.

Important: The MTU refers to the PPP payload which excludes the 2 PPP octets. Therefore, an MTU of 1500 corresponds to the 3GPP standard MTU of 1502 for GTP packets with PPP payloads.

Usage

Adjust packet sizes and compression to improve bandwidth utilization. Each network may have unique characteristics such that determining the best packet size and compression options may require system monitoring over an extended period of time.

Example

The following command configures the ppp data-compression mode for the APN to be stateless:

```
ppp data-compression mode stateless
```

The following command configures an MTU of 500 for the APN:

```
ppp mtu 500
```

proxy-mip

Configures support for Proxy Mobile IP functionality for the APN.

Product

GGSN, FA, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] proxy-mip { required | null-username static-homeaddr }
```

no

Disables this functionality. This is the default setting.

required

Default: Disabled.
Enables proxy-mip for all subscribers using this APN.

null-username

Default: Disabled.
Configures handling of RRQ to enable the acceptance without NAI extension in this APN.

Usage

This command requires that Proxy Mobile IP functionality be performed for all PDP contexts facilitated by the APN.
When Proxy Mobile IP is performed, the system performs subscriber authentication but not Mobile IP FA authentication. It can be configured to handling of RRQ without NAI extension in an APN.
More information about Proxy Mobile IP support for the GGSN can be found in the System Overview Guide.

Example

The following command causes the system to support Proxy Mobile IP for all PDP contexts facilitated by the APN:

```
proxy-mip required
```

The following command will enables the accepting of RRQ without NAI extensions in this APN.

```
proxy-mip null-username static-homeaddr
```

qos negotiate-limit

This command configure the QoS profile to provide the peak and committed data rate limits that the GGSN assigns to the APN, and sends to the SGSNs in response to GTP create/update PDP context requests for traffic shaping and policing functionality.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
qos negotiate-limit direction { downlink | uplink } [ class { background |
conversational | interactive traffic_priority | streaming } ] [ peak-data-rate
bps [ committed-data-rate bps ] | committed-data-rate [ peak-data-rate bps ] ]

no qos negotiate-limit direction { downlink | uplink } [ class { background |
conversational | interactive traffic_priority | streaming } ]
```

no

Disables the QoS Profile for the APN.

Important: When no Qos Profile is configured, the system's default behavior is to use the information provided by the SGSN.

downlink

Apply the specified limits and actions to the downlink (to-Gn direction).

uplink

Apply the specified limits and actions to the uplink (to-Gi direction).

class { background | conversational | interactive *traffic_priority* **| streaming }**

Apply the specified limits and actions to PDP contexts of the specified UMTS traffic class. The following classes are supported:

- **background :** Specifies the QOS for traffic patterns in which the data transfer is not time-critical (for example email exchange). This traffic pattern should be the lowest QOS.
- **conversational :** Specifies the QOS for traffic patterns in which there is an constant flow of packets in each direction, upstream and downstream. This traffic pattern should be the highest QOS.
- **interactive** *traffic_priority :* Specifies the QOS for traffic patterns in which there is an intermittent flow of packets in each direction, upstream and downstream. This traffic pattern should be a higher QOS than the background pattern, but not as high as that for the streaming pattern. *traffic_priority* is the 3GPP traffic handling priority and can be the integers 1,2 or 3.

- **streaming :** Specifies the QOS for traffic patterns in which there is a constant flow of data in one direction, either upstream or downstream. This traffic pattern should be a higher QOS than the interactive pattern, but not as high as that for the conversational pattern.

Important: If this keyword is omitted, the same values are used for all classes.

committed-data-rate *bps*

Default: See Usage section for this command
The committed data rate (guaranteed-data-rate) in bps (bits per second).
bps must be an integer from 1 through 16000000 for the downlink direction or 1 through 8640000 for the uplink direction. The value must also correspond to one of the permitted values identified in table given in this chapter. Note that if a non-permitted value is entered for this parameter, then the system rounds the value to the nearest lower supported value, except in the case where value is less than 1,000 bps. In this case, the system rounds the value to 1,000 bps. In addition, if the configured committed rate is lower than the value configured for the peak-data-rate, then the system uses the configured peak rate for this parameter.

Important: System measurements for this value exclude the GTP and outer packet headers. In addition, some traffic classes have both a committed rate and a peak rate, while other traffic classes have just a peak rate. If a committed rate is not applicable (i.e., the traffic class is **background** or **interactive**), then an error occurs if this option is configured. If the committed-rate is applicable (i.e., the traffic class is **conversational** or **streaming**), the values supplied by the SGSN are used if this option is not configured.

peak-data-rate *bps*

Default: See Usage section for this command
Specifies the peak data-rate for the subscriber, in bps (bits per second).
bps must be an integer from 1 through 16000000 for the downlink direction or 1 through 8640000 for the uplink direction. The value must also correspond to one of the permitted values identified in table given in this chapter. Note that if a non-permitted value is entered for this parameter, then the system rounds the value to the nearest lower supported value, except in the case where value is less than 1,000 bps. In this case, the system rounds the value to 1,000 bps.

Usage

This command configures the APN's quality of service (QoS) profile. This feature enables configuring and enforcing bandwidth limitations on individualPDP contexts of a particular traffic class. Traffic classes are defined in 3GPP TS 23.107 and are negotiated during PDP context activation. Bandwidth enforcement is configured and enforced independently on the downlink and the uplink directions.
The profile information is sent to the SGSN(s) in response to GTP Create/Update PDP Context Request messages. If the QoS profile requested by the SGSN is lower than the configured QoS profile configured, the profile requested by the SGSN is used. If the QoS profile requested by the SGSN is higher, the configured rates are used.
Note that the values for the uplink/downlink committed-data-rate and peak-data-rate parameters are exchanged in the GTP messages between the GGSN and the SGSN. Therefore, the values used may be lower than the configured values. When negotiating the rate with the SGSN(s), the system convert this to a value that is permitted by GTP as shown in table given in this chapter.

Table 9. Permitted Values for Committed and Peak Data Rates in GTP Messages

Value (bps)	Increment Granularity (bps)
From 1000 to 63,000	1,000 (e.g 1000, 2000, 3000, ... 63000)
From 64,000 to 568,000	8,000 (e.g. 64000, 72000, 80000, ... 568000)
From 57,6000 to 8,640,000	64,000 (e.g. 576000, 640000, 704000, ... 86400000)
From 8,700,000 to 16,000,000	100,000 bps (e.g. 8700000, 8800000, 8900000, ... 16000000)

The command can be entered multiple times to specify different combinations of direction and class. If this command is not configured at all, the GGSN does not perform traffic policing or QoS negotiation with the SGSN (i.e. it accepts all of the SGSN-provided values for the PDP context.

Important: This command should be used in conjunction with the **max-contexts** command to limit the maximum possible bandwidth consumption by the APN.

Additional information on the QoS traffic shaping functionality is located in the *System Enhanced Feature Configuration Guid*e.
Default Values:
The following table displays the default values for each of the traffic classes:

Table 10.

Class: Conversational	
Downlink Traffic: Disabled Peak Data Rate (in bps): 16000000 Committed Data Rate(in bps): 16000000 Burst Size (in bytes): 65535 Exceed Action: lower-ip-precedence Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate(in bps): 8640000 Committed Data Rate(in bps): 8640000 Burst Size(in bytes): 65535 Exceed Action: lower-ip-precedence Violate Action: drop
Class: Streaming	
Downlink Traffic: Disabled Peak Data Rate(in bps): 16000000 Committed Data Rate(in bps): 16000000 Burst Size(in bytes): 65535 Exceed Action: lower-ip-precedence Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate(in bps): 8640000 Committed Data Rate(in bps): 8640000 Burst Size(in bytes): 65535 Exceed Action: lower-ip-precedence Violate Action: drop
Class: Interactive, Traffic Handling Priority: 1	
Downlink Traffic: Disabled Peak Data Rate(in bps): 16000000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate(in bps): 8640000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop
Class: Interactive, Traffic Handling Priority: 2	

Downlink Traffic: Disabled Peak Data Rate(in bps): 16000000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate(in bps): 8640000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop
Class: Interactive, Traffic Handling Priority: 3	
Downlink Traffic: Disabled Peak Data Rate(in bps): 16000000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate(in bps): 8640000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop
Class: Background	
Downlink Traffic: Disabled Peak Data Rate(in bps): 16000000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate(in bps): 8640000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop

Important: If a “Subscribed” traffic class is received, the system changes the class to “Background” and sets the following parameters: The uplink and downlink guaranteed data rates are set to 0. If the received uplink or downlink data rates are 0 and traffic policing is disabled, the default of 64 kbps is used. When enabled, the APN configured values are used. If the configured value for downlink max data rate is larger than can fit in an R4 QoS profile, the default of 64 kbps is used. If either the received uplink or downlink max data rates is non-zero, traffic policing is employed if enabled for the “Background” class. The received values are used for responses when traffic policing is disabled.

Example

The following command sets an uplink peak data rate of 128000 bps for QoS negotiation limit:

```
qos negotiate-limit direction uplink peak-data-rate 128000
```

qos rate-limit

Configure the action on subscriber traffic flow that violates or exceeds the peak/committed data rate under traffic policing/shaping functionality.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
qos rate-limit { downlink | uplink } [ class { background | conversational |
interactive traffic_priority | streaming } ] [ burst-size { bytes | auto-
readjust [ duration dur ] } ] [ exceed-action { drop | lower-ip-precedence |
transmit } [ violate-action { drop | lower-ip-precedence | shape [ transmit-
when-buffer-full ] | transmit } ] ] | [ violate-action { drop | lower-ip-
precedence | shape [ transmit-when-buffer-full ] | transmit } [ exceed-action {
drop | lower-ip-precedence | transmit } ] ] +

no qos rate-limit direction { downlink | uplink } [ class { background |
conversational | interactive traffic_priority | streaming } ]
```

no

Disables the QoS data rate limit configuration for the APN.

Important: When no Qos Profile is configured, the system's default behavior is to use the information provided by the SGSN.

downlink

Apply the specified limits and actions to the downlink (the Gn direction).

uplink

Apply the specified limits and actions to the uplink (the Gi direction).

class { background | conversational | interactive *traffic_priority* **| streaming }**

Apply the specified limits and actions to PDP contexts of the specified UMTS traffic class. The following classes are supported:

- **background :** Specifies the QOS for traffic patterns in which the data transfer is not time-critical (for example email exchange). This traffic pattern should be the lowest QOS.
- **conversational :** Specifies the QOS for traffic patterns in which there is an constant flow of packets in each direction, upstream and downstream. This traffic pattern should be the highest QOS.
- **interactive** *traffic_priority :* Specifies the QOS for traffic patterns in which there is an intermittent flow of packets in each direction, upstream and downstream. This traffic pattern should be a higher QOS than the background pattern, but not as high as that for the streaming pattern. *traffic_priority* is the 3GPP traffic handling priority and can be the integers 1,2 or 3.

- **streaming :** Specifies the QOS for traffic patterns in which there is a constant flow of data in one direction, either upstream or downstream. This traffic pattern should be a higher QOS than the interactive pattern, but not as high as that for the conversational pattern.

Important: If this keyword is omitted, the same values are used for all classes.

burst-size { *bytes* | auto-readjust [duration *dur*] }

Default: See Usage section for this command
The burst size allowed, in bytes for peak data rate and committed data rate.
bytes must be an integer from 1 through 6000000.

Important: It is recommended that the minimum value of this parameter be configured to the greater of the following two values: 1) 3 times greater than packet MTU for the subscriber connection, OR 2) 3 seconds worth of token accumulation within the "bucket" for the configured peak-data-rate. In addition, if the committed-data-rate parameter is specified, the burst-size is applied to both the committed and peak rates.

auto-readjust [duration *dur* **]** keyword provides the option to calcualte the Burst size dynamically while configuring rate-limit. Whenever this keyword is enabled to calculate burst size GGSN QoS negotiated rate to be enforced for this calculation.
Every time there is a change in the rates (due to update QoS), the burst sizes will be updated accordingly. This keyword also provides two different burst sizes. One burst size for peak rate and another for committed rate.
By default this keyword is disabled.
duration *dur* describes the duration of burst in seconds. If duration is not specified this keyword will use 1 second as default value. *dur* must be an integer between 1 through 30.

exceed-action { drop | lower-ip-precedence | transmit }

Default: See Usage section for this command
The action to take on the packets that exceed the committed-data-rate but do not violate the peak-data-rate. The following actions are supported:

- **drop**: Drop the packet
- **lower-ip-precedence**: Transmit the packet after lowering the ip-precedence
- **transmit**: Transmit the packet

violate-action { drop | lower-ip-precedence | shape [transmit-when-buffer-full] | transmit }

Default: See Usage section for this command
The action to take on the packets that exceed both the committed-data-rate and the peak-data-rate. The following actions are supported:
drop: Drop the packet
lower-ip-precedence: Transmit the packet after lowering the IP precedence
shape [transmit-when-buffer-full]: Enables the traffic shaping and provides the buffering of user packets when subscriber traffic violates the allowed peak/committed data rate. The **[transmit-when-buffer-full]** keyword allows the packet to be transimitted when buffer memory is full.
transmit: Transmit the packet

+

More than one of the above keywords can be entered within a single command.

Usage

This command configures the APN's quality of service (QoS) data rate shaping through traffic policing/shaping. This command enables the actions on subscriber flow exceeding or violating peak/committed data rate allowed. The shaping function also provides an enhanced function to buffer the exceeded user packets in a buffer memory and sends them to the subscriber when subscriber traffic goes below the committed or peak data rate limit.

Important: The user packet buffer function in traffic shaping is not applicable for real-time traffic.

Important: If the exceed/violate action is set to "lower-ip-precedence", this command may override the configuration of the **`ip qos-dscp`** command in the GGSN service configuration mode for packets from the GGSN to the SGSN. In addition, the GGSN service **`ip qos-dscp`** command configuration can override the APN setting for packets from the GGSN to the Internet. Therefore, it is recommended that command not be used in conjunction with this action.

The command can be entered multiple times to specify different combinations of direction and class. If this command is not configured at all, the GGSN does not perform traffic policing or QoS negotiation with the SGSN (i.e. it accepts all of the SGSN-provided values for the PDP context.

Important: This command should be used in conjunction with the **`max-contexts`** command to limit the maximum possible bandwidth consumption by the APN.

Additional information on the QoS traffic shaping and policing functionality is located in the *System Enhanced Feature Configuration Guide*.
Default Values:
The following table displays the default values for each of the traffic classes:

Table 11.

Class: Conversational	
Downlink Traffic: Disabled Peak Data Rate (in bps): 16000000 Committed Data Rate(in bps): 16000000 Burst Size (in bytes): 65535 Exceed Action: lower-ip-precedence Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate(in bps): 8640000 Committed Data Rate(in bps): 8640000 Burst Size(in bytes): 65535 Exceed Action: lower-ip-precedence Violate Action: drop
Class: Streaming	

Downlink Traffic: Disabled Peak Data Rate(in bps): 16000000 Committed Data Rate(in bps): 16000000 Burst Size(in bytes): 65535 Exceed Action: lower-ip-precedence Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate(in bps): 8640000 Committed Data Rate(in bps): 8640000 Burst Size(in bytes): 65535 Exceed Action: lower-ip-precedence Violate Action: drop
Class: Interactive, Traffic Handling Priority: 1	
Downlink Traffic: Disabled Peak Data Rate(in bps): 16000000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate(in bps): 8640000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop
Class: Interactive, Traffic Handling Priority: 2	
Downlink Traffic: Disabled Peak Data Rate(in bps): 16000000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate(in bps): 8640000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop
Class: Interactive, Traffic Handling Priority: 3	
Downlink Traffic: Disabled Peak Data Rate(in bps): 16000000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate(in bps): 8640000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop
Class: Background	
Downlink Traffic: Disabled Peak Data Rate(in bps): 16000000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate(in bps): 8640000 Committed Data Rate(in bps): n/a Burst Size(in bytes): 65535 Exceed Action: n/a Violate Action: drop

Important: If a “Subscribed” traffic class is received, the system changes the class to “Background” and sets the following parameters: The uplink and downlink guaranteed data rates are set to 0. If the received uplink or downlink data rates are 0 and traffic policing is disabled, the default of 64 kbps is used. When enabled, the APN configured values are used. If the configured value for downlink max data rate is larger than can fit in an R4 QoS profile, the default of 64 kbps is used. If either the received uplink or downlink max data rates is non-zero, traffic policing is employed if enabled for the “Background” class. The received values are used for responses when traffic policing is disabled.

To calculate the burst size dynamically a new optional keyword **`auto-readjust [ duration`** *`dur`* **`]`** is provide with **`burst-size`** keyword. By default the burst size is fixed if defined in bytes with this command. In other words irrespective of the rate being enforced, burst-size fixed as given in the **`burst-size`** *`bytes`* parameter.

For the need of variable burst size depending on the rate being enforced this new keyword **auto-readjust [duration** *dur* **]** is provided. Use of this keyword enables the calculation of burst size as per token bucket algorithm calculation as T=B/R, where T is the time interval, B is the burst size and R is the Rate being enforced.
It also provides different burst size for Peak and Committed data rate-limiting.
If **auto-readjust** keyword is not used a fixed burst size must be defined which will be applicable for peak data rate and committed data rate irrespective of rate being enforced.
If **auto-readjust** keyword is provided without specifying the duration a default duration of 1 second will be taken for burst size calculation.

Example
The following command lowers the IP precedence when the committed-data-rate and the peak-data-rate are violated in uplink direction:

```
qos rate-limit direction uplink violate-action lower-ip-precedence
```

The following command buffers the excess user packets when the subscriber traffic violates the configured peak or committed data-rate bps in uplink direction. Once the peak/committed data rate for that subscriber goes below the configured limit it transmit them. It also transmits them if buffer memory is full:

```
qos rate-limit direction uplink violate-action shape transmit-when-buffer-full
```

qos-renegotiate

This keyword is obsolete.

qos traffic-police

This command is obsolete. This functionality is now supported through **`qos negotiate-limit`** and **`qos rate-limit`** commands.

radius

This command is obsolete.

radius group

This command is obsolete.

radius returned-framed-ip-address

This command sets the policy whether or not to reject a call when the RADIUS server supplies 255.255.255.255 as the framed IP address and the MS does not supply an address.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
radius returned-framed-ip-address 255.255.255.255-policy { accept-call-when-ms-ip-not-supplied | reject-call-when-ms-ip-not-supplied }

default radius returned-framed-ip-address 255.255.255.255-policy
```

default

Set the policy to its default of rejecting calls when the RADIUS server does not supply a framed IP address and the MS does not supply and address.

accept-call-when-ms-ip-not-supplied

Accept calls when the RADIUS server does not supply a framed IP address and the MS does not supply and address.

reject-call-when-ms-ip-not-supplied

Reject calls when the RADIUS server does not supply a framed IP address and the MS does not supply and address.

Usage

Use this command to set the behavior in the APN when the RADIUS server supplies 255.255.255.255 as the framed IP address and the MS does not supply an address.

Example

Use the following command to set the APN to reject calls when the RADIUS server does not supply a framed IP address and the MS does not supply and address:

```
radius returned-framed-ip-address 255.255.255.255-policy reject-call-when-ms-ip-not-supplied
```

radius returned-username

Product

This command configures the username that is returned in accounting messages. If the username is not available in the Protocol Configuration Options (PCO), then the radius returned username is preferred to the constructed username (imsi@apn, msisdn@apn, or outbound username).

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
radius returned-username { override-constructed-username | prefer-constructed-username }

default radius returned-username
```

override-constructed-username

If Radius Server returns a username in the Access-Accept message and username is not available in the Protocol Configuration Options (PCO) and then the new username from the radius server will be used.

prefer-constructed-username

If the username is not available in the PCO, constructed username (imsi@apn, msisdn@apn) will be used irrespective of the username for the Radius Server. This is the default.

default radius returned-username

The default value for the radius returned-username is prefer-constructed-username i.e. constructed username (imsi@apn, msisdn@apn) will be used.

Important: If the username is available in the PCO, then that username will be used irrespective of this CLI (radius returned-username).

Usage

Use this command to configure the username that is returned in accounting messages

Example

Following command sets the default value for the radius returned-username is prefer-constructed-username; i.e. constructed username (imsi@apn, msisdn@apn):

```
default radius returned-username
```

restriction-value

Configures the level of restriction to ensure controlled co-existence of the Primary PDP Contexts.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

restriction-value *value*

[default | no] restriction-value

value

A unique number identifying the type of network supported for primary PDP contexts facilitated by this APN. The following values are supported:

- *1*: Value used for WAP or MMS type of networks. This corresponds to APN type public-1.
- *2*: Value used for Internet or PSPDN type of networks. This corresponds to APN type public-2.
- *3*: Value used for corporate customers who use MMS. This corresponds to APN type private-1.
- *4*: Value used for corporate who do not use MMS. his corresponds to APN type private-2.

default | no

Default: no restriction-value
Entering either **default** or **no restriction-value** sets the internal value to zero (0) so that connection to any APN is allowed.

Usage

Restricts the ability to have connections to public access and certain private APNs as required by the APN configuration. Also allows co-existence of the Primary PDP Contexts in a controlled manner.
It does not restrict total number of Primary PDP Context for the user. It also configures a method for preventing hackers in the public domain from using the UE as a router.
Access is provided based on the following rules:

- If *value* = 1, then PDP contexts with restriction values of 0, 1, 2, and/or 3 are allowed
- If *value* = 2, then PDP contexts with restriction values of 0, 1 and/or 2 are allowed
- If *value* = 3, then PDP contexts with restriction values of 0 and/or 1 are allowed
- If *value* = 4, then PDP contexts with no restriction values are allowed
- If **default** or **no** syntax is entered, then no PDP contexts have restriction

In the event that a Maximum APN Restriction value is received from the SGSN as part of a PDP context Create (CPCR) or Update (UPCR) message, the GGSN allows the request based on the following matrix:

- If maximum = 0, then allow connection to any APN
- If maximum = 1, then allow APN Restriction values of 0, 1, 2, and/or 3
- If maximum = 2, then allow APN Restriction values of 0, 1 and/or 2

- If maximum = 3, the allow APN Restriction values of 0 and/or 1
- If maximum = 4, then always reject
- If maximum = anything else, then allow all APN Restriction values (1, 2, 3, and/or 4)

Refer to 3GPP 23.060 version 6.9.0 for more information.

Example

The following command sets the restriction value of the APN to *2*:

```
restriction-value 2
```

secondary ip pool

This command specifies a secondary IP pool to be used as backup pool for NAT.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

secondary ip pool *pool_name*

no secondary ip pool

no

Removes the previous secondary IP pool configuration.

pool_name

Specifies the secondary IP pool name.
pool_name must be an alpha and/or numeric string of 1 through 31 characters in length.

Usage

Use this command to configure a secondary IP pool for NAT subscribers, which is not overwritten by the RADIUS supplied list. The secondary pool configured will be appended to the RADIUS supplied IP pool list / APN provided IP pool list whichever is applicable during call setup.

Important: This command is license dependent, requiring the 600-00-7871 NAT Bypass license. Please contact your local sales representative for more information.

Example

The following command configures a secondary IP pool named *test123*:

secondary ip pool *test123*

selection-mode

Configures the level of verification that will be used to ensure a MS's subscription to use this APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
selection-mode { chosen-by-sgsn | sent-by-ms | subscribed } +
```

chosen-by-sgsn

Default: Disabled
The MS's subscription will not be verified and the APN will be provided by the SGSN.

sent-by-ms

Default: Disabled
The MS's subscription will not be verified and the APN will be provided by the MS.

subscribed

Default: Enabled
The MS's subscription will be verified by the SGSN.

+

More than one of the above keywords can be entered within a single command.

Usage

Use this command to specify the level of verification that will be used to ensure a MS's subscription to use this APN. This setting must mach the corresponding setting on the SGSN. If the two settings are not identical, the GGSN rejects the session with a cause code of 201 (D1H, User authentication failed).

Example

The following command specifies that the MS's subscription will not be verified and that the APN name will be supplied by the SGSN:

```
selection-mode chosen-by-sgsn
```

timeout

Configures the session timeout values for this APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

timeout { absolute | qos-renegotiate } *time*

[no | default] timeout [absolute | qos-renegotiate]

no

Returns the timeout parameter to its default setting. If neither the absolute or idle keywords are used in conjunction with this keyword, both timeout options will be returned to their default settings.

default

Set the default value for the followed option.

absolute

Configures the absolute maximum time a session may exist in any state (active or idle).

qos-renegotiate

This keyword is obsolete.

time

Default:

- absolute = 0 (Disabled)
- qos-renegotiation = 300

Measured in seconds, the time can be configured to any integer value between 0 and 4294967295.
A time of 0 disables timeouts for this APN.

Usage

Use this command to limit the amount of time that a subscriber session can remain connected or QoS renegotiation dampening timer.

Example

The following commands enables an absolute time timeout of *60000* seconds:

timeout absolute *60000*

timeout bearer-inactivity

This command configures the bearer inactivity timer and the threshold value of the traffic (uplink + downlink) through an APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

timeout bearer-inactivity *time* **volume-threshold total** *bytes*

[no | default] timeout bearer-inactivity

no

Removes the configured bearer inactivity timer values and traffic threshold limit.

default

Sets the bearer inactivity timer to disabled mode.

time

Specifies the timeout duration in second to check inactivity on the bearer.
time must be an integer value from 3600 through 2592000.

qos-renegotiate

Configures the dampening timeout value for the QoS renegotiation (in seconds).
In event of QoS upgrade specified timeout duration will be ignored and renegotiation will start immediately.

volume-threshold total *bytes*

The keyword sets the volume threshold in bytes to check the low activity on the bearer. This total volume is sum of the traffic in uplink and downlink direction
bytes must be an integer value from 1 through 4294967295.

Usage

Use this command to configures the bearer inactivity timer and the threshold value of the traffic (uplink + downlink) through an APN.

Example

The following commands enables the inactivity time on bearer with timeout duration of *7200* seconds and total traffic volume of *256000* bytes in uplink and downlink direction as threshold:

timeout bearer-inactivity *7200* **volume-threshold total** *256000*

timeout idle

Configures the idle timeout duration for long duration timer for subscriber session.

Product

All

Privilege

Security Administrator, Administrator

Syntax **timeout idle** *idle_dur*

no timeout idle

no

Indicates the timeout specified is to be returned to its default behavior. If no specific timeout is specified then all are set to their default behavior.

idle_dur

Default: 0
Designates the maximum duration of the session, in seconds, after the expiry of which the system considers the session as dormant or idle and invokes the long duration timer action.
idle_dur must be a value in the range from 0 through 4294967295.
The special value 0 disables the timeout specified.

Usage

Use this command to set the idle time duration for subscriber session to determine the dormant session.
Refer to the **long-duration-action detection** and **long-duration-action disconnection** command in this chapter for additional information.

Example

Following command sets the idle timeout duration to *450* seconds.

timeout idle *450*

timeout long-duration

Configures the long duration timeout and inactivity duration for subscriber session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

timeout long-duration *ldt_timeout* **[inactivity-time** *inact_timeout* **]**

no timeout long-duration

no

Indicates the timeout specified is to be returned to its default behavior. If no specific timeout is specified then all are set to their default behavior.

long-duration *ldt_timeout*

Default: 0
Designates the maximum duration of the session, in seconds, before the system automatically reports/terminates the session.
Specifies the maximum amount of time, in seconds, before the specified timeout action is activated.
ldt_timeout must be a value in the range from 0 through 4294967295.
The special value 0 disables the timeout specified.

inactivity-time *inact_timeout*

Specifies the maximum amount of time, in seconds, before the specified session is marked as dormant.
inact_timeout must be a value in the range from 0 through 4294967295.
The special value 0 disables the inactivity time specified.

Usage

Use this command to set the long duration timeout period and inactivity timer for subscriber session. Reduce the idle timeout to free session resources faster for use by new requests.
Refer to the **long-duration-action detection** and **long-duration-action disconnection** command in this chapter for additional information.

Example

Following command sets the long duration timeout duration to 300 seconds and inactivity timer for subscriber session to 45 seconds.

timeout long-duration *300* **inactivity-time** *45*

tunnel address-policy

This command specifies the address allocation / validation policy for all tunneled calls (IP-IP, IP-GRE) except L2TP calls. This means that GGSN IP address validation could be disabled for specified incoming calls.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
tunnel address-policy { alloc-only | alloc-validate | no-alloc-validate }

default tunnel address-policy
```

alloc-only

IP addresses are allocated locally and no validation is done.

alloc-validate

Default.
The VPN Manager allocates and validates all incoming IP addresses from a static pool of IP addresses.

no-alloc-validate

No IP address assignment or validation is done for calls coming in via L3 tunnels. Incoming static IP addresses are passed. This allows for the greatest flexibility.

default

Resets the tunnel address-policy to alloc-validate.

Usage

This command supports scalable solutions for Corporate APN deployment as many corporations handle their own IP address assignment. In some cases this is done to relieve the customer or the mobile operators from the necessity of reconfiguring the range of IP addresses for the IP pools at the GGSN.
For calls coming through L2TP tunnels, the command **l3-to-l2-tunnel address policy** as defined in the APN Configuration mode, will continue to be in effect.

Example

Use the following command to reset the IP address validation policy to validate against a static pool of address:

```
default tunnel address-policy
```

Use the following command to disable all IP address validation for calls coming through tunnels:

```
tunnel address-policy no-alloc-validate
```

tunnel gre

Configures Generic Routing Encapsulation (GRE) tunnel parameters between the GGSN and an external gateway for the APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

tunnel gre peer-address *peer_address* **local-address** *local_addr* **[preference** *num* **]**

no tunnel gre peer-address *peer_address*

no

Disables GRE tunneling for the APN.

peer-address *peer_address*

Specifies the IP address of the external gateway terminating the GRE tunnel.
peer_address must be expressed in dotted decimal notation.

local-address *local_addr*

Specifies the IP address of the interface in the destination context of the GGSN originating the GRE tunnel.
local_addr must be expressed in dotted decimal notation.

preference *num*

Default: 1
This option can be used to assign a preference to the tunnel.
preference can be configured to any integer value from 1 to 128.

Important: Only one GRE tunnel per APN is supported. Therefore, the preference should always be set to "1".

Usage

Subscriber IP payloads are encapsulated with IP/GRE headers and tunneled by the GGSN to an external gateway.

Example

The following command configures the system to encapsulate subscriber traffic using GRE and tunnel it from a local address of 192.168.1.100 to a gateway with an IP address of 192.168.1.225:

```
tunnel gre peer-address 192.168.1.225 local-address 192.168.1.100
preference 1
```

tunnel ipip

Configures IP-in-IP tunnelling parameters between the GGSN and an external gateway for the APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

tunnel ipip peer-address *peer_address* **local-address** *local_addr* **[preference** *num* **]**

no tunnel ipip

no

Disables IP-in-IP tunneling for the APN.

peer-address *peer_address*

Specifies the IP address of the external gateway terminating the IP-in-IP tunnel.
peer_address must be expressed in dotted decimal notation.

local-address *local_addr*

Specifies the IP address of the interface in the destination context of the GGSN originating the IP-in-IP tunnel.
local_addr must be expressed in dotted decimal notation.

preference *num*

Default: 1
If multiple tunnels will be configured, this option can be used to assign a preference to the tunnel.
preference can be configured to any integer value from 1 to 128.

Usage

Subscriber IP payloads are encapsulated with IP-in-IP headers and tunneled by the GGSN to an external gateway.

Example

The following command configures the system to encapsulate subscriber traffic using IP-in-IP and tunnel it from a local address of 192.168.1.100 to a gateway with an IP address of 192.168.1.225:

tunnel ipip peer-address *192.168.1.225*

local-address *192.168.1.100* **preference** *1*

tunnel ipsec

This command configures sessions for the current APN to use an IPSEC tunnel based on the IP pool corresponding to the subscribers assigned ip address.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] tunnel ipsec use-policy-matching-ip-pool
```

no

Disables the use of the IPSEC policy that matches the IP pool that the assigned IP address relates to.

Usage

Use this command to set the APN to use an IPSEC policy that is assigned to the IP pool that the subscribers assigned IP address relates to.

Example

The following command enables the use of the policy that matches the IP pool address:

```
tunnel ipsec use-policy-matching-ip-pool
```

tunnel l2tp

Configures Layer 2 Tunnelling Protocol (L2TP) parameters between the GGSN and an external gateway for the APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

tunnel l2tp [peer-address *lns-address* **[[encrypted] secret** *l2tp_secret* **] [preference** *num* **] [tunnel-context** *name* **] [local-address** *ip-address* **] [crypto-map** *map_name* **{ [encrypted] isakmp-secret** *crypto_secret* **}] [local-hostname** *hostname* **]**

no tunnel [peer-address *lns-address***]**

no

Disables L2TP, or secure L2TP tunneling for the APN if a specific peer-address is not specified, or, if a peer-address is specified, this keyword removes the peer-address configuration from the APN.

l2tp

Configures the APN to support L2TP tunnels to a peer LNS.

peer-address *lns-address*

Specifies the IP address of the LNS node that the LAC service connects to.
lns-address must be expressed in dotted decimal notation.

Important: A maximum of four LNS peers can be configured per APN.

encrypted

This keyword is intended only for use by the system while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the secret keyword is the encrypted version of the plain text secret. Only the encrypted secret is saved as part of the configuration file.

secret *l2tp_secret*

Specifies the shared secret (password) between the LAC service (configured on the system) and the LNS node.
l2tp_secret must be from 1 to 127 alpha and/or numeric characters and is case sensitive.

preference *num*

Default: 1
Specifies the preference of the tunnel if the LAC service communicates with multiple LNS nodes.
preference can be configured to any integer value from 1 to 128.

tunnel-context *name*

Specifies the name of the destination context on the system in which the LAC service(s) is configured.
name must be from 1 to 79 alpha and/or numeric characters and is case sensitive.

Important: If this option is not configured, the system will attempt to determine the name of the destination context from the **ip context-name** parameter configured for the APN.

local-address *ip-address*

Specifies the IP address of an interface that is bound to a LAC service. This is a mechanism to dictate which LAC service to use to facilitate the subscriber's L2TP session.
address is the IP address of the interface in dotted decimal notation.

Important: If the address configured does not exist or is not bound to a LAC service, the system will automatically choose a LAC service to use.

local-hostname *hostname*

This keyword configures LAC-Hostname to be used for the communication with the LNS peer for this APN. When Tunnel parameters are not received from the RADIUS Server, Tunnel parameters configured in APN are considered for the LNS peer selection. When APN Configuration is selected, local-hostname configured with "tunnel l2tp" command in the APN for the LNS peer will be used as a LAC Hostname.

Important: For this configuration to take effect **allow aaa-assigned-hostname** command, which is used to configure LAC-Hostname based on the "Tunnel-Client-Auth-ID" attribute received from the RADIUS Server, needs to be configured in the LAC Service Configuration mode.

hostname is name of the local host for the LNS peer and must be an alpha and/or numeric string of between 1 through 127 characters.
When Tunnel parameters are not received from the RADIUS Server, Tunnel parameters configured in APN will be considered for the LNS peer selection. When APN Configuration is selected, local hostname *hostname* configured with this command in the APN for the LNS peer will be used as a LAC Hostname.

crypto-map *map_name* **{ [encrypted] secret** *crypto_secret* **}**

Configures the IPSec crypto-map policy that is to be associated with this L2TP tunnel configuration for secure L2TP.
map_name is the name of a crypto-map policy configured on the system and must be from 1 to 127 alpha and/or numeric characters and is case sensitive.
encrypted is intended only for use by the system while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the secret keyword is the encrypted version of the plain text secret. Only the encrypted secret is saved as part of the configuration file.
secret specifies the secret associated with the crypto-map policy. *crypto_secret* can be from 0x to 255 bytes.

Usage

This command can be used to configure the GGSN to tunnel subscriber traffic to one or more peer LNSs using L2TP or L2TP with IPSec.

When using L2TP, the system functions as a L2TP access Concentrator (LAC) and tunnels traffic to a peer L2TP Network Server (LNS). LAC functionality is supported through the configuration of LAC Services defined in destination contexts configured on the system.
When using crypt-map policies, the system functions in the same fashion as with L2TP, with the exception that the encapsulated L2TP traffic is further encrypted using IPSec. IPSec functionality is supported through the definition of crypto maps configured in the same destination context as the LAC services.
A maximum of four LNS peers can be configured per APN. If no peer is specified, the system will use the LAC Service(s) configured in the same destination context as the APN.

Example
The following command configures L2TP support for the APN. It configures the APN to tunnel traffic to an LNS with an IP address of 192.168.1.50 through a LAC service bound to an interface with an IP address 192.168.1.201 configured in a destination context on the system called pdn1. The shared secret between the system and the LNS is 5496secRet. This will be the only LNS configured so the default preference of 1 will not be changed.

```
tunnel l2tp peer-address 192.168.1.50 secret 5496secRet tunnel-context
pdn1 local-address 192.168.1.201
```

virtual-apn

Configures references (or links) to alternative APNs to be used for PDP context processing based on properties of the context. This command also configures the APN properties against which the PDP contexts are compared. This command supports roaming and visiting subscriber also.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

virtual-apn { **gcdr apn-name-to-be-included** { *gn* | *virtual* } | **preference** *priority* **apn** *apn_name* { **domain** *domain_name* | **mcc** *mcc_number* **mnc** *mnc_number* | { | } | | { | } | { | | } } }

no virtual-apn preference *priority*

no

Removes a previously configured "virtual" APN.

gcdr apn-name-to-be-included { *gn* | *virtual* }

If *virtual* APN to be used is configured, the virtual APN name is sent in G-CDRs. Provides an option to either send the virtual APN name or the Gn APN name (that comes from the SGSN) in G-CDRs.
gn: the APN received in the Create PDP Context Request message from SGSN
virtual: the APN selected by the GGSN. This is the default.

preference *priority*

Specifies the order in which the referenced APNs are compared by the system.
priority specifies the order and can be configured to any integer value from 1 (highest priority) to 1000 (lowest priority).

apn *apn_name*

Specifies the name of an alternative APN configured on the system that is to be used for PDP contexts with matching properties.
apn_name is the name of the alternative APN and can be from 1 to 62 alpha and/or numeric characters and is not case sensitive. It may also contain dots (.) and/or dashes (-).

domain *domain_name*

Specifies the subscriber's domain name (realm).
domain_name must be a string of 1 through 79 characters in length, is case sensitive and can contain all special characters.

ggsn-service *svc-name*

Specifies the name of the GGSN service.
svc-name must be from 1 to 63 alpha and/or numeric characters and is case sensitive.

mcc *mcc_number*

Specifies the mobile country code (MCC) portion of the PLMN's identifier.
mcc_number is the PLMN MCC identifier and can be configured to any integer value between 100 and 999.

mnc *mnc_number*

Specifies the mobile network code (MNC) portion of the PLMN's identifier.
mnc_number is the PLMN MNC identifier and can be configured to any 2 or 3 digit integer value between 00 and 999.

sgsn-address {*ip_address | ip_address/mask***}**

Specifies SGSN address (or network) for this virtual APN.
ip_address is the IP address of the SGSN in dotted decimal notation.
ip_address/mask is the IP address of the SGSN in dotted decimal notation with network-host mask separation.

roaming-mode { home | visiting | roaming }

Supports separate PDP context processing for roaming, visiting, and home subscribers. It supports separate rule type along with domain, imsi, and sgsn-address types.

Usage

This command simplifies the configuration process for mobile operators allowing them to provide subscribers with access to a large number of packet data networks, characterized by APN templates, while only having to configure a small number of APNs on the HLR.
Each "virtual" APN is a reference, or a link, to an alternate APN configured on the system. Each reference is configured with a rule that subscriber PDP contexts are compared against and a priority that dictates the comparison order. The references works as follows:
1. A Create PDP Context Request message is received by the GGSN. The message specifies an APN configured in the HLR.
2. The GGSN determine whether its own matching APN configuration contains "virtual" APN references.
3. The system determines the priority of the references and compares the associated information pertaining to the PDP context against the configured rules.
4. If the rule matches, the parameters in the APN specified by the reference are applied to the PDP context. If not, the rules in the reference with the next highest priority are compared against the PDP context. This occurs until a match is found. If none of the references match, then the parameters within the current APN are applied to the PDP context.
The GGSN supports a maximum of 1023 Virtual APN mapping configurations in a system. A single Gn APN can be configured with up to 1000 mapping rules. Multiple Gn APNs are supported - each requiring Virtual APN mapping configurations. The limit imposed is that the total virtual apn mappings across all Gn APNs should not exceed 1023.
The functionality provided by this command can also be used to restrict access to particular APNs. To restrict access based on a particular rule (either domain name or mobile country code/mobile network code), the "virtual" APN reference should refer to an APN that not is configured on the system and contain the desired rule. All PDP contexts matching the configured rule would then be denied with a reason code of 219 (DBH), Missing or Unknown APN.

Example

The following commands configure two “virtual” APNs, priority 1 references the bigco APN with a domain rule of bigco.com, priority 2 references the bigtown APN with a mobile country code rule of 100 and a mobile network code rule of 50.

```
virtual-apn preference 1 apn bigco domain bigco.com

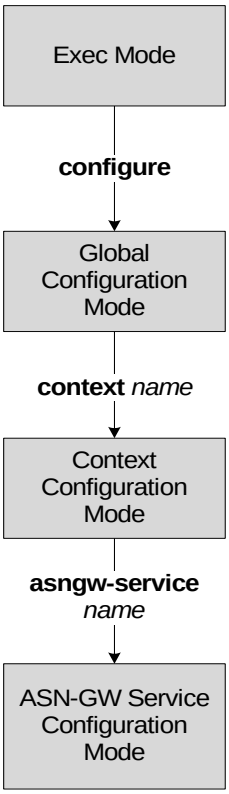
virtual-apn preference 2 apn bigtown mcc 100 mnc 50

virtual-apn preference 3 apn bigco.com sgsn-address 192.168.62.2

virtual-apn preference 4 apn bigco.co.kr sgsn-address 192.168.60.2/24
```

Chapter 19
ASN Gateway Service Configuration Mode Commands

Use the ASN GW Service Configuration Mode to create and manage ASN Gateway services within the current context.



active-relay

Use this command to enable the active relay of R4 and R6 messages in ASN GW, and to configure the timeout duration in seconds for the R4 or R6 messages (for example, Data Path messages).

Product

ASN GW

Privilege

Administrator

Syntax

active-relay timeout < *duration*>

[default] active-relay timeout

default

Sets the total timeout duration to 15 seconds to actively relayed R4 or R6 messages.

duration

Default: 15
Specifies the maximum allowable timeout duration for the ASN GW service to actively relay the R4 or R6 messages.
duration is measured in seconds. Configure as an integer from 5 through 65535.

Usage

Use this command to enable the active relay of R4 and R6 messages and also to configure the maximum timeout duration for the actively relayed R4 or R6 messages by ASN GW.
By default, the system is pre-configured for passive relay functionality for R4 and R6 messages.

Example

The following command configures the timeout duration of *20* seconds for actively relayed R4 or R6 messages:

active-relay timeout *20*

authentication

Use this command to configure the authentication type and parameters used for subscribers in this service.

Product

ASN GW

Privilege

Administrator

Syntax

```
authentication { single-eap |  none }

default authentication
```

default

Disables the authentication requirement for the ASN GW service.

single-eap

This keyword enables single Extensible Authentication Protocol (EAP) authentication for specific ASN GW service subscribers. Possible single-EAP authentication options are User-only, Device-only, or Device-User.

none

This is the default setting for authentication. Enter this keyword to disable all authentication types for a specific ASN GW service.

Usage

Use this command to configure authentication requirements for the ASN GW service.

Example

The following command sets the user authentication for ASN GW service with single EAP:

```
authentication single-eap
```

bind

Use this command to bind the ASN GW service to a logical IP interface and to configure the maximum number of subscribers supported within an ASN GW service.

Product

ASN GW

Privilege

Administrator

Syntax

bind address *ip_address* **[max-subscribers** *max_subs* **]**

no bind

no

Removes the binding of the service to a specified interface.

ip_address

Specifies the IP address of the interface to which the service is to be bound. Express *ip_address* in IPv4 dotted decimal or IPv6 colon-separated notation.

max-subscribers *max_subs*

Configures the maximum number of subscribers allowed to connect with this ASN Gateway within a specific ASN GW service.
max_subs must be an integer from 1 and 500000.
max_subs must be an integer from 1 and 1500000.

Usage

Use this command to associate the service with a specific logical IP address and provide the identity of the ASN Gateway. The identity is either the domain name of the ASN GW service or the IP address. This command also configures the maximum number of subscribers with this service.

Example

The following command binds the ASN GW service to a logical interface with an IP address of *1.2.3.4* with a limit of *250000* subscribers:

bind address *1.2.3.4* **max-subscribers** *250000*

bs-monitor

Use this command to enable or disable the ASN base station monitoring and related parameters in a WiMAX ASN.

Product

ASN GW

Privilege

Administrator

Syntax

bs-monitor [interval *duration* **| num-retry** *retries* **| timeout** *idle_time* **]**

[default | no] bs-monitor

default

Disables the configured BS monitoring parameters.

no

Removes the configured BS monitoring feature and parameters.

interval *duration*

Default: 60
Configures the interval duration in seconds between two ICMP ping messages sent to the ASN BS for BS monitoring.
duration specifies the amount of time in seconds between two ICMP ping messages sent to monitor an ASN BS. Specify an integer from 1 through 36000.

num-retry *retries*

Default: 5
Configures the number of retries before marking a specific ASN BS as unreachable.
retries specifies the number of times to send ICMP ping messages to an ASN BS before the ASN BS is declared unreachable. Enter an integer from 0 through 100.

timeout *idle_time*

Default: 3
Configures the timeout duration to wait for a response from ASN BS of ICMP ping message before retransmitting the ICMP ping packets.
idle_time must be an integer value in the range of 1 through 10.

Usage

Use this command to enable or disable base station monitoring and to configure the ASN BS monitoring parameters in a WiMAX ASN.

Important: Base Station Monitoring is a license-enabled feature.

Example

The following command configures the timeout duration of *5* seconds before sending an ICMP ping message if the ASN BS does not respond:

bs-monitor timeout *6*

end

This command exits the current mode and returns you to the Executive Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Executive mode.

exit

This command exits the current mode and returns you to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

gre

This command configures the GRE tunnel parameters for ASN GW gateway functionality within a specific ASN GW service.

Product

ASN GW

Privilege

Administrator

Syntax

gre mtu *mtu_size*

default gre mtu

default

Sets the MTU size for the GRE tunnel to the default value of 1500 bytes in a WiMAX network.

mtu *mtu_size*

Default: 1500 bytes
Configures the maximum transmission unit size in bytes for the GRE tunnel within a specific ASN GW service.
mtu_size must be an integer between 36 and 2000.

Usage

Use this command to support tunnel reassembly optimization with the MTU size for a GRE tunnel in a WiMAX network.

Example

The following command configures the maximum transmission unit (MTU) size to *1700* bytes for a GRE tunnel:

default gre mtu *1700*

handover

This command specifies the handover-related parameters between BS, ASN GW, and MS.

Product

ASN GW

Privilege

Administrator

Syntax

handover { anchor { dp-pre-reg-termination timeout *duration*| **dp-termination timeout** *duration* **} | max-dp-pre-registrations** *reg_num* **| non-anchor { dp-pre-reg-termination timeout** *duration* **| dp-termination timeout** *duration* **} }**

default handover { anchor { dp-pre-reg-termination timeout | dp-termination timeout } | max-dp-pre-registrations | non-anchor { dp-pre-reg-termination timeout | dp-termination timeout } }

default

Sets the default values for configured handover parameters.

anchor

Configures datapath pre-registration and/or termination parameters for an anchor gateway handover.

dp-pre-reg-termination timeout *duration*

Default: 5
Configures the maximum duration in seconds that a single MS can keep the pre-registration datapath with the previous BS after a completed handover to another BS.
duration is measured in seconds. Configure as any integer from 0 through 65535.

dp-termination timeout *duration*

Default: 0
Configures the maximum duration in seconds for which the datapath with the previous BS is maintained after a completed handover to another BS. The system maintains the old datapath for the specified period after the new datapath setup is completed, and then terminates it.
duration is measured in seconds. Configured as any integer from 0 through 65535.

max-dp-pre-registrations *reg_num*

Default: 1
Configures the maximum number of pre-registrations from multiple BSs that a single MS can keep at a time.
reg_num is the number of pre-registrations. Configure as any integer from 0 through 5.

non-anchor

Configures datapath pre-registration and/or termination parameters for a non-anchor gateway handover.

Usage

Use this command to configure the handover-related parameters between MS, BS, and ASN GW.
By default, the system is configured to terminate the previous sessions immediately. The number of pre-registrations from multiple BSs is set to 0 for an MS.

Example

The following command configures the maximum duration as *20* seconds. This is the amount of time for which the datapath with the previous BS is maintained after a completed handover to another BS:

```
dp-pre-reg-termination timeout 20
```

idle-mode

Use this command to configure the time in seconds that an ASN GW service waits to place a session in idle mode or reactivates an idle session after the specified time for exit timeout. This occurs if there is no activity for the amount of time you specified.

Product

ASN GW

Privilege

Administrator

Syntax

idle-mode { entry-timeout *duration* **| exit-timeout** *duration* **| timeout** *duration* **}**

default idle-mode { entry-timeout | exit-timeout | timeout }

default

Resets the idle mode durations to their respective default values.

no

Disables/removes the configured idle mode entry and/or exit timeout duration for a session.

entry-timeout *duration*

Default: 60
Specifies the maximum duration in seconds allowed for idle mode entry for a session.
duration is measured in seconds. Configure as an integer from 1 through 100000.

exit-timeout *duration*

Default: 60
Specifies the maximum duration in seconds allowed for session to reenter active mode after idle mode exit.
duration is measured in seconds. Configure as an integer from 1 through 100000.

timeout *duration*

Default: 4069
Specifies the maximum time (in seconds) allowed for a session to remain in idle mode. *duration* is an integer from 128 to 65535.

Usage

Use this command to configure the ASN GW service to send a session for idle mode or active mode after specified duration of time.

Example

The following command configures the idle mode entry timeout value to *50* seconds:

idle-mode entry-timeout *50*

max-retransmission

Use this command to specify the number of times the system can attempt retransmission of R6 control packets to communicate with an unresponsive BS.

Product

ASN GW

Privilege

Administrator

Syntax

max-retransmission *retry*

default max-retransmission

default

Sets the maximum number of retransmission counters to 3 for R6 control packets within a specific ASN GW service.

retry

Default: 3
Configures the maximum number of retransmission of R6 control packets to BS before marking it as failed. *retry* must be an integer between 1 and 10.

Usage

Use this command to configure number of retransmission of R6 control packets to BS before marking it as failed.

Example

The following command configures the system to attempt sending R6 control packets to the BS *2* times:

max-retransmission *2*

mobile-access-gateway

Use this command to associate MAG context and/or MAG service for an ASNGW service. This is available only when PMIPv6 is supported and the license is enabled. Default: no

Product

ASN GW

Privilege

Administrator

Syntax

mobile-access-gateway context < *context_name* >**[mag-service**< *service-name* > **]**

no mobile-access-gateway context

Usage

MAG service is responsible for PMIPv6 signaling. MAG service establishes and maintains a bi-directional tunnel for the subscriber traffic with LMA.
Use the **no mobile-access-gateway context** to delete a previously configured context.

Example

The following command instructs the ASN GW service to use the context named mag-service for MAG functionality:

mobile-access-gateway context *context-name***mag-service** *service-name*

mobile-ip

This command configures Mobile IP support with FA service(s) for specific ASN GW service and specifies the context in which the FA service is configured. Default: no

Product

ASN GW

Privilege

Administrator

Syntax

mobile-ip foreign-agent context *context_name*

no mobile-ip foreign-agent context

foreign-agent context *context_name*

Default: No FA context specified.
Specifies the name of the previously configured context that facilitates the FA service(s).
context_name must be between 1 and 79 alpha or numeric characters and is case sensitive.

Usage

You can configure FA services on the system in either the same or different contexts from those facilitating ASN GW services. When they are configured in separate contexts, this command, configured within an ASN GW service, instructs the ASN GW service to route traffic to the context facilitating the FA service.
Use the **no mobile-ip foreign-agent context** to delete a previously configured destination context.

Example

The following command instructs the ASN GW service to use the context named FA-destination for FA functionality:

mobile-ip foreign-agent context *fa-destination*

peer-asngw

Use this command to configure the addresses of trusted non-anchor ASN GWs or ASN PC/LR peers for which a specific ASN GW service can allow R4 control and data path registration.

Product

ASN GW

Privilege

Administrator

Syntax

[no] peer-asngw address *ip_address* < > | **mode** {*legacy* | *non-legacy* } | *simple-ip re-anchoring*]

no

Removes the configured non-anchor ASN GW or non-anchor ASN PC/LR peers from a specific ASN GW service's trusted peer list.

peer-asngw address

Specifies the IP address of the non-anchor ASN GW or non-anchor ASN PC/LR peers. The IP address is added as a trusted peer with the ASN GW service.
ip_address is the IP address of the non-anchor ASN GW or non-anchor ASN PC/LR peers expressed in IPv4 dotted decimal or IPv6 colon separated notation.

Usage

Use this command to create trusted non-anchor ASN GW or non-anchor ASN PC/LR peers with a specific ASN GW service to establish R4 control and data path registration. The ASN GW supports the 6-byte ASNGW ID in the souce ID TLV and destination ID TLV of all the messages. The 6-byte anchor gateway ID and authenticator ID are also supported.
On receipt of an R4 control or data path registration request message, the ASN GW service checks whether a non-anchor DPF/Authenticator ASN GW/ASN PC-LR address received in a request message, is in the trusted peer list configured with this command. If the Anchor DPF/Authenticator ASN GW/ASN PC-LR address is not configured in the non-anchor ASN GW or non-anchor ASN PC/LR peers' list, the ASN GW service sends a response for a request message with Failure Indication TLV and unspecified error code.
You can configure a maximum of 32 ASN GWs or ASN PC/LRs with this command.

Example

The following command adds the ASN GW with an IP address as a trusted peer within an ASN GW service, and a 6-byte ID for the peer ASN GW.

peer-asngw address *1.2.3.4* **id** *00-05-47-00-37-44*

policy

This command configures the policies for ASN Gateway behavior within a specific ASN GW service.

Product

ASN GW

Privilege

Administrator

Syntax

```
policy { ms-unexpected-network-reentry | msid-dhcp-chaddr-mismatch | non-anchor-mode } { allow | disallow }

default policy { ms-unexpected-network-reentry | msid-dhcp-chaddr-mismatch | non-anchor-mode }
```

default

Resets the policy parameters to their respective default values.

ms-unexpected-network-reentry

Default: allow
Configures the ASN Gateway to allow or disallow an MS re-entry from the same or a new BS, when an active call already exists for the same MS on the ASN Gateway.
This policy performs in the following manner:

- If the pre-attachment request of the new call comes from a different BS, re-entry is accepted regardless of the call state.
- If the pre-attachment request of the new call comes from the same BS, re-entry is accepted if the original call is in any state past the pre-attachment phase.
- Original call is dropped in favor of new call.

msid-dhcp-chaddr-mismatch

Default: disallow
Configures the ASN Gateway to allow or disallow an MS to connect if the MSID and DHCP address information is mismatched.

non-anchor-mode

Default: allow
Configures the ASN Gateway to allow or disallow the creation of non-anchor sessions based on the DP Registration Request from any base station.
When non-anchor mode is not allowed and a DP Registration Request is received, if there is no matching session for the MSID, the request is rejected and a DP Registration Response is sent with an error code: "**Admin Prohibited**".

allow

Sets the policies to allow the MS matching with specified policy for ASN Gateway.

disallow

Sets the policies to deny or disallow the MS matching the specified policy for ASN Gateway.

Usage

Use this command to configure the policies of the ASN Gateway to handle the MS connection within a specific ASN GW service.

Example

The following command enforces the policy to allow an MS re-entry from a new BS, when an active call exists for the same MS on the ASN Gateway via another BS.:

```
policy ms-unexpected-network-reentry allow
```

policy asngw-initiated-reauth

This command configures the policies for how the ASN Gateway initiates reauthorization triggers from an ASN GW service.

Product

ASN GW

Privilege

Administrator

Syntax

policy asngw-initiated-reauth { allow | disallow | max-cmac-key-count *max_count*| **pmk-grace-time** *grace_time* **}**

default policy asngw-initiated-reauth [max-cmac-key-count | pmk-grace-time]

default

Resets the policy to disallow ASN GW-initiated re-authorization and sets the default values for CMAC key count and PMK grace time within a specific ASN GW service.

max-cmac-key-count *max_count*

Default: 100
Configures the ASN Gateway to trigger the reauthorization on the basis of Cipher-based Message Authentication Code (CMAC) key counter. Once the CMAC counter crosses the configured value, the system initiates the reauthorization trigger.
max_count is the CMAC key counter and is an integer from 2 through 32768.

pmk-grace-time *grace_time*

Default: 60
Configures the ASN Gateway to trigger the reauthorization on the basis of the Pair-wise Master Key (PMK) key grace period. Once the configured PMK grace period is exhausted, the system initiates the reauthorization trigger.
grace_time is the grace period in seconds to wait for the Pair-wise Master Key (PMK) and is an integer from 10 through 65335.

allow

Default: disabled
Configures the ASN Gateway to trigger re-authentication based on two locally configured parameters: **pmk-grace-time** and **cmac-key-count**.

disallow

Default: enabled
Configures the ASN Gateway not trigger the re-authentication based on two locally configured parameters: **pmk-grace-time** and **cmac-key-count**.

Usage

Use this command to enable the ASN GW to initiate the reauthorization trigger on the basis of the configured policy.

Example

The following command enforces the reauthorization policy from the ASN GW:

```
policy asngw-initiated-reauth allow
```

policy overload

Configures the traffic overload policy that controls congestion in this service.

Product

ASN GW

Privilege

Administrator

Syntax

```
policy overload { drop | reject }

default policy overload
```

default

Sets the traffic overload policy action to reject in this service.

drop

Default: disabled
Specifies that the system is to drop incoming packets containing new session requests.

reject

Default: enabled
Specifies that the system processes new session request messages and responds with a reject message.

Usage

You can configure congestion policies at the service-level. When congestion control functionality is enabled at the service level, these policies dictate how services respond should the system detect that a congestion condition threshold has been crossed.

Example

The following command configures an overload policy of reject for this ASN GW service:

```
policy overload reject
```

ran-peer-map

Identifies a base station peer map for this service.

Product

ASN GW

Privilege

Administrator

Syntax

ran-peer-map *name*

no ran-peer-map

name

Specifies the name of the RAN Peer Map. Specify a *name* from 1 to 31 alpha and/or numeric characters. The name must be an existing peer map. Configure RAN Peer Maps in the Global Configuration Mode.

Usage

Use this command to configure a base station peer map that this service will use to map MAC addresses received in R6 protocol messages to IPv4 addresses.

Example

The following command configures the service to refer to a peer map named *ran12* when reconciling a base station MAC address to an IP address:

ran-peer-map *ran12*

retransmission-timeout

Use this command to configure the non-response time before the system re-attempts to send R6 control packets to the BS.

Product

ASN GW

Privilege

Administrator

Syntax

retransmission-timeout *duration*

[no | default] retransmission-timeout

default

Sets the timeout duration to 3 seconds before R6 control packets are retransmitted.

no

Disables or removes the configured timeout duration for the retransmission of R6 control packets.

duration

Default: 3
Specifies the the number of seconds for the ASN GW service to wait for a response from the BS before it (a) attempts to communicate with the BS again (if the system is configured to retry the BS), or (b) marks the BS as unreachable.
duration is measured in seconds and can be configured to any integer value between 1 and 1,000.

Usage

Use this command in conjunction with the **max-retransmission** command to configure the ASN GW services behavior when it does not receive a response from a particular BS.
Use the **no retransmission-timeout** command to delete a previously configured timeout value. If after deleting the lifetime setting you desire to return the lifetime parameter to its default setting, use the **default retransmission-timeout** command.
The chassis is shipped with the retransmission timeout set to 3 seconds.

Example

The following example configures a retransmission timeout value of 5 seconds:

```
retransmission-timeout 5
```

The following command deletes a previously configured retransmission-timeout setting:

```
no retransmission-timeout
```

secondary-ip-hosts

Use this command to enable or disable multiple host support behind WiMAX customer premises equipment (CPE).
Default: disabled

Product

ASN GW

Privilege

Administrator

Syntax

secondary-ip-hosts *max_hosts*

default multiple-ip-hosts

default

Sets the multiple host configuration in an ASN GW service to disabled (default mode).

max_hosts

Default: 0 (disabled)
Specifies the maximum number of hosts allowed to connect through one primary node connection behind a WiMAX CPE.
max_hosts must be an integer from 0 through 4, where 0, the default value, disables this feature.

Usage

Use this command to enable or disable multi-IP host support in an ASN GW service behind one WiMAX CPE through a primary airlink. If enabled, this command supports up to four hosts as an auxiliary connection. Accounting and UDR generation for such connections are based on the primary connection with the WiMAX CPE. To apply this facility to a subscriber, configure the **ip address secondary-pool** command in the **Subscriber Configuration** mode.

Example

The following command enables multiple host support and instructs the ASN GW service to allow *3* IP hosts as auxiliary connections behind one CPE:

```
secondary-ip-hosts 3
```

The following command disable the multiple host support and instructs the ASN GW service not to allow auxiliary connections behind one CPE:

```
default secondary-ip-host
```

secondary-ip-hosts

Use this command to enable or disable multiple host support behind WiMAX customer premises equipment (CPE).
Default: disabled

Product

ASN GW

Privilege

Administrator

Syntax

secondary-ip-hosts *max_hosts*

default multiple-ip-hosts

default

Sets the multiple host configuration in an ASN GW service to disabled (default mode).

max_hosts

Default: 0 (disabled)
Specifies the maximum number of hosts allowed to connect through one primary node connection behind a WiMAX CPE.
max_hosts must be an integer from 0 through 4, where 0, the default value, disables this feature.

Usage

Use this command to enable or disable multi-IP host support in an ASN GW service behind one WiMAX CPE through a primary airlink. If enabled, this command supports up to four hosts as an auxiliary connection. Accounting and UDR generation for such connections are based on the primary connection with the WiMAX CPE. To apply this facility to a subscriber, configure the **ip address secondary-pool** command in the **Subscriber Configuration** mode.

Example

The following command enables multiple host support and instructs the ASN GW service to allow *3* IP hosts as auxiliary connections behind one CPE:

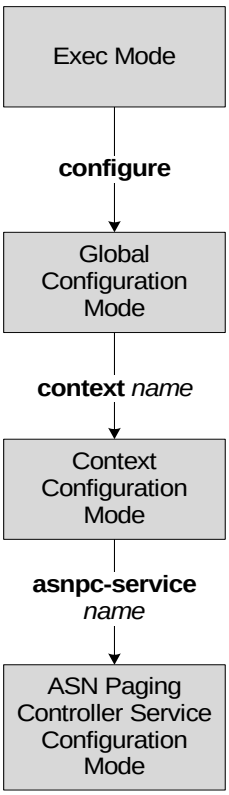
secondary-ip-hosts *3*

The following command disable the multiple host support and instructs the ASN GW service not to allow auxiliary connections behind one CPE:

default secondary-ip-host

Chapter 20
ASN Paging Controller Configuration Mode Commands

Use the ASN Paging Controller Configuration Mode to create and manage ASN paging and location register services for WiMAX subscribers within a context.



asnpc-id

Use this command to configure the identifier for an ASN paging controller for the subscribers in this service.

Product

ASN PC-LR

Privilege

Administrator

Syntax

asnpc-id *mac_address*

default asnpc-id

default

Sets the ASN paging controller identifier as the IP address of the system running the ASN paging controller and location registry service.

mac_address

Specifies the MAC address of the system running the ASN paging controller and location registry service. *mac_address* is the MAC address of paging controller in standard (IEEE 802) format, six groups of two hexadecimal digits separated by hyphens (-) or colons (:).

Usage

Use this command to configure the MAC address of the paging controller for the ASN paging controller service.

Example

The following command sets the MAC address of paging controller to *01:23:45:67:89:ab* in colon (:) separated format:

asnpc-id *01:23:45:67:89:ab*

bind

This command binds the ASN paging controller service to a logical IP interface and configures the maximum number of subscribers allowed within a service.

Product

ASN PC-LR

Privilege

Administrator

Syntax

bind address *ip_address* **[max-subscribers** *max_subs* **]**

no bind

no

Removes the binding of the service to a specified interface.

ip_address

Use to specify the IP address of the interface to which the service is to be bound.
Express *ip_address* in IPv4 dotted decimal or IPv6 colon separated notation.

max-subscribers *max_subs*

Configures the maximum number of subscribers allowed to connect with this ASN Gateway within a specific ASN paging controller service.
Express *max_subs* as an integer between 0 and 1000000 for an ST16 system.
Express *max_subs* as an integer between 0 and 3000000 for an ASR 5000 system.

Usage

Use this command to associate the service with a specific logical IP address and to provide the identity of the ASN paging controller as either the domain name of the ASN paging controller service or the IP address. This command also configures the maximum number of subscribers allowed with this service.

Example

The following command binds the ASN paging controller service to a logical interface with an IP address of *1.2.3.4* and a limit of *250000* subscribers:

bind address *1.2.3.4* **max-subscribers** *250000*

end

Enter this command to exit the current mode and return to the Executive Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Executive mode.

exit

Enter this command to exit the current mode and return to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the previous mode.

max-retransmission

Use this command to configure the maximum number of times the system attempts retransmission of R6 control packets to communicate with an unresponsive BS.

Product

ASN PC-LR

Privilege

Administrator

Syntax

max-retransmission *retry*

default max-retransmission

default

Sets the maximum number of retransmission counter to 3 for R6 control packets within a specific ASN paging controller service.

retry

Default: 3
Configures the maximum number of retransmission attempts of R6 control packets to the BS before marking it as unresponsive. Enter *retry* as an integer between 1 and 10.

Usage

Use this command to configure the number of retransmission attempts of R6 control packets to the BS before marking it as unresponsive.

Example

The following command configures the system to attempt *2* tries to send R6 control packets to BS:

max-retransmission *2*

paging-announce

Configures the number of seconds to wait before sending a paging announcement messages to the MS.

Product

ASN PC-LR

Privilege

Administrator

Syntax

paging-announce timeout *duration*

default paging-announce timeout

default

Sets the paging announcement timeout to 10 seconds.

duration

Default: 10
Specifies the maximum duration in seconds to wait for sending a paging announce to the MS.
Enter *duration* in seconds as an integer from 1 through 1,000.

Usage

Use this command to configure the number of seconds for the ASN paging controller services to wait before sending a paging announcement if there is no data communication.

Example

The following command configures the paging announce timeout value of *500* seconds:

paging-announce timeout *500*

paging-group

Use this command to create or remove the Paging-Group Identifier within a specific ASN paging controller service.

Product

ASN PC-LR

Privilege

Administrator

Syntax

paging-group id *paging_group_id* **[-noconfirm]**

no paging-group id *paging_group_id*

no

This command disables or removes the paging group identifier from a specific ASN paging controller service.

id *paging_group_id*

Use this command to configure the paging group identifier and other parameters within a specific ASN paging controller service.
This is a logical network identifier for the serving BS or other network entity that retains MS service and operational information or administers paging activity for the MS while it is in idle mode
paging_group_id must be an integer from 1 through 65535.

-noconfirm

The command executes without any additional prompt and confirmation from you.

WARNING: If you use this keyword option with **no paging-group id** *paging_group_id* command, the **paging group id** *paging_group_id* is deleted and disabled with all active or inactive configurations in a paging group. There are no prompts, warning, or confirmations.

Usage

Use this command to enter, enable, or disable the Paging Group Identifier Configuration mode functionality within a specific ASN paging controller service.

Important: Configure a maximum of 32 paging groups within a service.

Example

The following command configures the paging group identifier as *1234* for the ASN paging controller service:

paging-group id *1234*

peer-asngw

Use this command to configure the addresses of trusted anchor ASN GW peers. These are the peers with which a specified ASN Paging Controller and Location Registry service will allow R4 control and data path registration.

Product

ASN PC-LR

Privilege

Administrator

Syntax

[no] peer-asngw address *ip_address*[| **mode** [*legacy* | *non-legacy*]]

no

Removes the configured peer anchor ASN GW from a specific ASN PC/LR service's trusted peer list.

address *ip_address*

Specifies the IP address of the anchor ASN GW which is added as a trusted peer with the ASN PC/LR service.
ip_address is the IP address of an anchor ASN GW peer expressed in IPv4 dotted decimal or IPv6 colon-separated notation.

Usage

Use this command to create trusted peer anchor ASN GWs with a specific ASN PC/LR service to establish R4 control and data path registration.
On receipt of an idle mode entry request message, the ASN PC/LR service checks the anchor DPF/authenticator. If the Anchor DPF/Authenticator ASN GW address received in the idle mode entry request message is not there, (or not configured in the peer list), the ASN PC/LR service sends the idle mode entry response message with a Failure Indication TLV with an unspecified error code.
Configure a maximum of 32 ASN GWs with this command.

Example

The following command adds the anchor ASN GW with an IP address of *1.2.3.4* as a trusted peer within an ASN PC service.

peer-asngw address *1.2.3.4*

peer-asnpc

Use this command to configure the peer Anchor Paging Controller(s) in this ASN PC/LR service.

Product

ASN PC-LR

Privilege

Administrator

Syntax

[no] peer-asnpc id *mac_address* **ip-address** *ip_address*

no

Removes the configured peer ASN PC/LR MAC address and IP address as the trusted peer anchor ASN PC/LR.

id *mac_address*

Specifies the MAC address of the trusted peer system running the ASN paging controller and location registry service.
mac_address is the MAC address of the paging controller in standard (IEEE 802) format in six groups of two hexadecimal digits, separated by hyphens (-) or colons (:).

ip-address *ip_address*

Specifies the IP address of the trusted peer system running the ASN paging controller and location registry service.
ip_address is the IP address of the paging controller in the standard IPv4 format of dotted decimal notation.

Usage

Use this command to configure the trusted peer anchor paging controller for ASN paging controller service. This command provides the input for the internal mapping from PC ID to IP address that is needed to forward the Location Update request from an Anchor PC to the current Anchor PC during PC relocation.

Example

The following command sets the peer AS NPC id to *01:23:45:67:89:ab* in colon (:) separated format and the IP address of the paging controller to 1.1.1.1:

peer-asnpc id *01:23:45:67:89:ab* **ip-address** *1.1.1.1*

policy overload

Configures traffic overload policy to control congestion in this service.

Product

ASN PC-LR

Privilege

Administrator

Syntax

```
policy overload { drop | reject }

default policy overload
```

default

Sets the traffic overload policy action to reject in this service.

drop

Default: disabled
Specifies that the system is to drop incoming packets containing new session requests.

reject

Default: enabled
Specifies that the system processes new session request messages and responds with a reject message.

Usage

Configure congestion policies at the service-level. When congestion control functionality is enabled at the service level, these policies dictate how services respond should the system detect that a congestion condition threshold has been crossed.

Example

The following command configures an overload policy of reject for this ASN PC service:

```
policy overload reject
```

retransmission-timeout

Use this command to configure the amount of time that must pass before the system re-attempts to send R6 control packets to the BS.

Product

ASN PC-LR

Privilege

Administrator

Syntax

default

Sets the timeout duration to 3 seconds for retransmission of R6 control packets.

no

Disables or removes the configured timeout duration for retransmission of R6 control packets.

duration

Default: 3
Specifies the maximum time for the ASN paging controller service to wait for a response from the BS before it a) attempts to communicate with the BS again (if the system is configured to retry the BS), or b) marks the BS as unreachable.
Enter an integer between 1 and 1000 as the *duration* in seconds.

Usage

Use this command in conjunction with the **max-retransmission** command to configure the ASN paging controller services behavior when it does not receive a response from a particular BS.
Use the **no retransmission-timeout** command to delete a previously configured timeout value. If, after deleting the lifetime setting you desire to return the lifetime parameter to its default setting, use the **default retransmission-timeout** command.
The chassis is shipped from the factory with the retransmission timeout set to 3 seconds.

Example

The following command configures a retransmission timeout value of 5 seconds:

```
retransmission-timeout 5
```

The following command deletes a previously configured retransmission-timeout setting:

setup-timeout

Use this command to configure the amount of time for the ASN paging controller service to set up a connection with the BS before it marks the BS as unreachable.

Product

ASN PC-LR

Privilege

Administrator

Syntax

setup-timeout *duration*

default setup-timeout

default

Sets the timeout to 60 seconds to set up a connection with BS.

duration

Default: 60
Specifies the maximum allowable time for the ASN paging controller service to set up the R6 connection with BS before it marks the BS as unreachable.
duration is measured in seconds and can be configured to any integer value between 1 and 100000.

Usage

Use this command to configure the maximum setup timeout duration to setup an R6 connection with BS. This command supersedes the duration set through the **max-retransmission** and **retransmission-timeout** commands for R6 connection.
The chassis is shipped with the connection setup timeout duration to 60 seconds.

Example

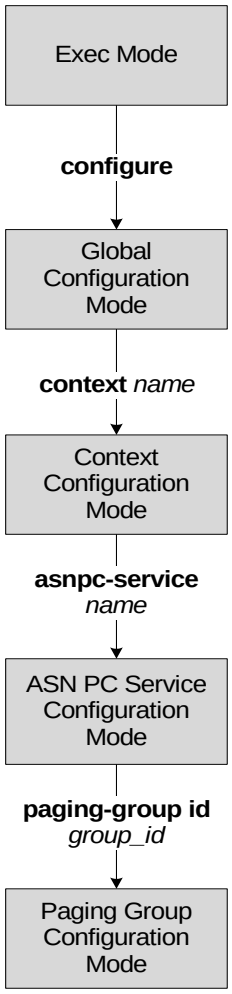
The following command configures an ASN paging controller service to mark a BS after waiting for *100* seconds before it marks it as unreachable:

setup-timeout *100*

Chapter 21
ASN Paging Group Configuration Mode Commands

Use the Paging Group Configuration Mode to create and manage Paging Agents for the paging and location register controller within the ASN PC-LR service.

Important: This functionality is still in development stage.



end

Use this command to exit the current mode and return to the Executive mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Executive mode.

exit

Use this command to exit the current mode and return to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

paging

Use to configure the paging parameters within the paging group for PC-LR functionality.

Product

ASN PC-LR

Privilege

Administrator

Syntax

paging { cycle *cycle_value* **| interval** *interval_value* **| node id** *mac_address* **address***ip_address* **| offset algorithm uniform start** *start_value* **increment** *inc_value* **count** *count_value* **}**

no paging { cycle | node id *mac_address* **| offset }**

no

Disables the configured paging parameters within this paging group.

cycle *cycle_value*

Specifies the cycle in which the paging message is transmitted within the paging group.
Enter an integer for *cycle_value* from 0 through 65535.

interval *interval_value*

Specifies the maximum duration in frames of Paging Listening Interval; used in calculation of Paging Listening Interval.
interval_value must be an integer from 1 through 5.

node id *mac_address* **address** *ip_address*

id *mac_address*: Configures the MAC address of the node in the paging group.
mac_address must be in one of the following formats:
nn:nn:nn:nn:nn:nn or nn-nn-nn-nn-nn-nn
address *ip_address*: Specifies the IP address of the node. Express *ip_address* in IPv4 or IPv6 dotted decimal notation.

Important: Configure up to 128 paging nodes per paging group.

offset algorithm uniform start *start_value* **increment** *inc_value* **count** *count_value*

start *start_value*: Specifies the starting value of the available offset.
For *start_value*, enter an integer from 0 through 65535.
increment *inc_value*: Specifies the distance between two offsets.
For *inc_value*, enter an integer from 0 through 65535.
count *count_value*: Specifies the number of offsets available.
For *count_value*, enter an integer from 0 through 65535.
Offsets are uniformly load balanced across the available range. For this configuration:

paging offset algorithm uniform start *10* **increment** *10* **count** *4*
the following occurs:
if MS1, MS2,...MS100, perform IM-Entry, then offset assigned: MS1=10, MS2=20, MS3=30, MS4=40, MS5=10, MS6=20, etc.

Usage

Use this command to define the paging behavior of a paging group. There must be only one instance of paging parameters per paging group.

Example

The following example configures the paging cycle for a paging group to *10*.

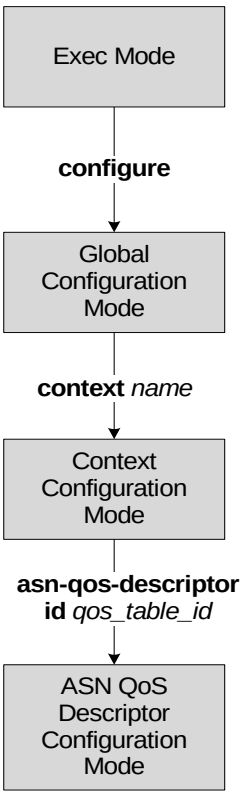
```
paging cycle 10
```

The following example configures a paging node in the group:

```
paging node id 00:05:47:00:37:44 address 12.345.76.789
```

Chapter 22
ASN QoS Descriptor Configuration Mode Commands

Use the ASN QoS Descriptor Configuration mode to create and manage the Quality of Service Descriptor table for ASN GW service subscribers.



end

Enter this command to exit the current mode and return to the Executive mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Executive mode.

exit

Use this command to exit the current mode and return to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the previous mode.

global-service-class-name

Use this command to configure the global service class name within a QoS descriptor table.

Product

ASN GW

Privilege

Administrator

Syntax

global-service-class-name *svc_class_name*

no global-service-class-name

no

Deletes the configured global service class name from this QoS descriptor table.

svc_class_name

Specifies the global service class name in QoS descriptor table.
svc_class_name must be an ASCII string of 6 characters in length.

Usage

Use this command to specify the global service class name (as per IEEE 802.16e standard) within a QoS descriptor table for an ASN GW service.
The global service class name is similar in function to the Service Class Name except that (1) it may not be modified by a BS, (2) it remains consistent among all BSs, and 3) it is based on a rules-based naming system and contains referential QoS parameter codes.

Example

The following command specifies the global service class name *g_svc1* in an ASN QoS descriptor table:

global-service-class-name *g_svc1*

schedule-type

Use this command to configure the type of data delivery service identifier/type for an ASN GW service.

Product

ASN GW

Privilege

Administrator

Syntax

schedule-type be [max-sustained-traffic-rate *max_sust_traffic_rate* **| traffic-priority** *priority_value* **] +**

schedule-type ert-vr min-reserved-traffic-rate *min_resd_traffic_rate* **max-latency** *dur_ms* **unsolicited-grant-interval** *dur_ms* **[max-sustained-traffic-rate** *max_sust_traffic_rate* **| max-traffic-burst** *burst_size* **| tolerated-jitter** *dur_ms* **| traffic-priority** *priority_value* **] +**

schedule-type nrt-vr min-reserved-traffic-rate *min_resd_traffic_rate* **[max-sustained-traffic-rate** *max_sust_traffic_rate* **| max-traffic-burst** *burst_size* **| traffic-priority** *priority_value* **] +**

schedule-type rt-vr min-reserved-traffic-rate *min_resd_traffic_rate* **max-latency** *dur_ms* **unsolicited-polling-interval** *dur_ms* **[max-sustained-traffic-rate** *max_sust_traffic_rate* **| max-traffic-burst** *burst_size* **| traffic-priority** *priority_value* **] +**

schedule-type ugs max-sustained-traffic-rate *max-latency* **max-latency** *dur_ms* **unsolicited-grant-interval** *dur_ms* **[sdu-size** *sdu_size* **| tolerated-jitter** *dur_ms* **| traffic-priority** *priority_value* **| min-reserved-traffic-rate** *min-latency* **] +**

default schedule-type

default

Configures the data delivery service type to Best Effort (BE) service for a specific ASN GW service.

be

Configures the data delivery service type to Best Effort (BE) service for a specific ASN GW service.

ert-vr

Configures the data delivery service type to Extended Real-Time Variable Rate (ERT-VR) service for a specific ASN GW service.

nrt-vr

Configures the data delivery service type to Non-Real-Time Variable Rate (NRT-VR) service for specific ASN GW service.

rt-vr

Configures the data delivery service type to Real-Time Variable Rate (RT-VR) service for a specific ASN GW service.

ugs

Configures the data delivery service type to Unsolicited Grant Service (UGS) for a specific ASN GW service.

max-sustained-traffic-rate *max_resd_traffic_rate*

Specifies the maximum sustained traffic rate in bits per second, reserved for a service flow.
For *dur_ms*, specify an integer between 0 and 65535. Maximum latency set to zero means no commitment is available for this service flow.

max-latency *dur_ms*

Specifies the maximum interval in milliseconds between the receipt of a packet to a BS or an SS on its network interface/Convergence Sublayer (CS), and the arrival of a packet to its RF interface or the peer device. This value represents a service commitment.
For *dur_ms*, specify an integer between 0 and 65535. Maximum latency set to zero means no commitment is available for this service flow.

min-reserved-traffic-rate *min_resd_traffic_rate*

Default: 0 (disabled)
Specifies the minimum traffic rates in bits per second, reserved for a service flow.
min_resd_traffic_rate must be an integer between 0 and 65535. A minimum reserved traffic rate set to zero means no minimum traffic rate reservation is required for this service flow.

max-sustained-traffic-rate *max_sust_traffic_rate*

Configures the maximum sustained traffic rate in bits per second for traffic schedule.
traffic_rate must be an integer between 1 and 65535.

max-traffic-burst *burst_size*

Default: 0 (disabled)
Specifies the maximum burst size in bits that must be maintained for the service.
For *burst_size*, specify an integer between 0 and 65535. A maximum traffic burst set to zero means no maximum traffic burst reservation is required for this service flow.

sdu-size *sdu_size*

Default: 49
Specifies the length of the Service Data Unit (SDU) in bytes for a fixed-length SDU service flow.
sdu_size must be an integer between 1 and 65535.

Important: Use this parameter only if packing is on and the service flow is carrying fixed-length SDUs.

tolerated-jitter *dur_ms*

Specifies the maximum delay variation (jitter) allowed for the connection.
dur_ms must be an integer between 1 and 65535.

traffic-priority *priority_value*

Default: 0 (disabled)
This optional keyword specifies the traffic priority.
priority_value must be an integer from 0 to 7.

unsolicited-grant-interval *dur_ms*

Specifies the nominal interval in millisecond between successive data grant opportunities for this service flow.
dur_ms must be an integer value between 1 and 65535.

unsolicited-polling-interval *dur_ms*

Specifies the maximum nominal interval in millisecond between successive polling grants opportunities for this service flow.
dur_ms must be an integer between 1 and 65535.

Usage

Use this command to configure type of data delivery service identifier within ASN GW service.

Important: Only one data delivery service type between **be**, **et-vr**, **rt-vr**, **nrt-vr**, or **ugs** is allowed within an ASN GW service.

Example

The following command configures the data delivery service type to Best Efforts (BE) service for an ASN GW service:

```
default schedule-type
```

service-class-name

Use this command to configure the Service Class Name name within a specific QoS descriptor table.

Product

ASN GW

Privilege

Administrator

Syntax

service-class-name *svc_class_name*

no service-class-name

no

Deletes the configured global service class name from this QoS descriptor table.

svc_class_name

Specifies the service class name in QoS descriptor table.
svc_class_name must be an ASCII string of from 2 through 128 characters.

Usage

A service class name is a group of QoS parameters defined at the BS that can be referenced by a service flow to apply certain QoS parameters. Use this command to specify a service class name (per IEEE 802.16 standard) within a specific QoS descriptor table for an ASN GW service

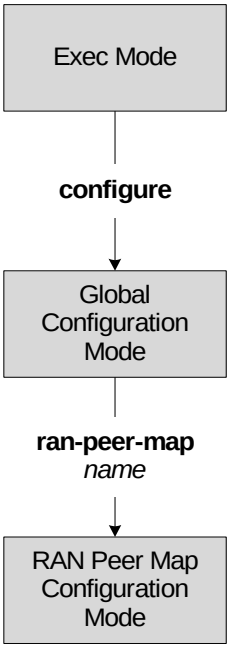
Example

The following command specifies the service class name *ASN_Serv_class1* in a ASN QoS descriptor table:

service-class-name *ASN_Serv_class1*

Chapter 23
ASN RAN Peer Map Configuration Mode Commands

Use the RAN Peer Map Configuration Mode to create and manage global mapping tables of base station peers.



end

Use this command to exit the current mode and return to the Executive Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Executive mode.

exit

Use this command to exit the current mode and return to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

ran-peer

Use this command to configure the MAC and IP addresses of the base station peers you are adding to this map.

Product

ASN GW

Privilege

Administrator

Syntax

[no] ran-peer id *mac_address* **address** *ip_address* **[mode{non-legacy | legacy}]**

no

Removes the base station peer entry from this map.

id *mac_address* **address** *ip_address*

id *mac_address*: Configures the MAC address of the base station peer in this map.
mac_address must be in one of the following formats:
nn:nn:nn:nn:nn:nn or nn-nn-nn-nn-nn-nn
address *ip_address*: Specifies the IP address of the base station peer. Express *ip_address* in IPv4 or IPv6 dotted decimal notation.
mode {non-legacy | legacy}: Default mode is non-legacy.

Usage

Use this command to add base station peers to this peer map.

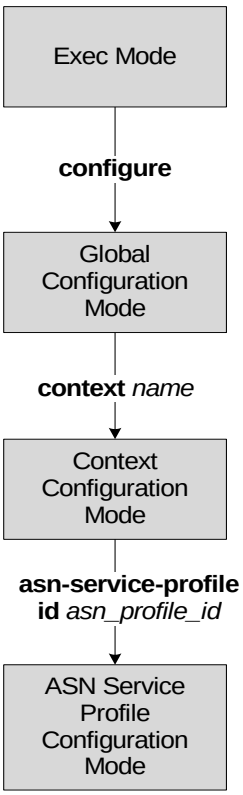
Example

The following command adds a base station peer to this map:

```
ran-peer id 00:05:47:00:37:44 address 12.345.76.789
```

Chapter 24
ASN Service Profile Configuration Mode Commands

Use the ASN Service Profile Configuration Mode to create and manage the service profiles table for the ASN GW service subscribers within the current context.



downlink-classifier

Use this command to specify which classifier to match for traffic flow in the downlink direction for subscribers in this service.

Product

ASN GW

Privilege

Administrator

Syntax

[no] downlink-classifier class-map *class_map_name*

no

Deletes the configured class map for this traffic flow in the ASN GW service.

class-map *class_map_name*

Specifies the configured Class-Map to this traffic flow.
class_map_name is the name of an existing Class-Map configured in the destination context.
Refer to the Class-Map Configuration Mode chapter of this reference for additional information on configuring the class maps.

Usage

Use this command to configure classifier for downlink traffic with a configured Class-Map for the ASN GW service subscribers.
You can configure a maximum of 4 class-maps in one ASN GW service profile.
Access Class-Map Configuration Mode through Context Configuration Mode.

Example

The following command applies the Class-Map *class_1* to this traffic:

downlink-classifier class-map *class_1*

downlink-qos-id

Use this command to specify the QoS table identifier to traffic flowing in the downlink direction for subscribers in this service.

Product

ASN GW

Privilege

Administrator

Syntax

downlink-qos-id *qos_table_id*

[no] downlink-qos-id

no

Deletes the configured class map for this traffic flow in the ASN GW service.

qos_table_id

Specifies the configured ASN QoS descriptor identifier to this traffic flow.
qos_table_id is the identifier of an existing ASN QoS descriptor table configured in the source context.
Refer to the ASN QoS Descriptor Configuration Mode chapter of this reference for additional information on configuring QoS descriptor table identifiers.

Usage

Use this command to apply a QoS identifier for downlink traffic with a configured ASN QoS descriptor table identifier for the ASN GW service subscribers.
Configure only one QoS identifier per ASN GW service profile.
Access ASN QoS Descriptor Configuration Mode through Context Configuration Mode.

Example

The following command applies the QoS table identifier *123* to this traffic:

downlink-qos-id *123*

end

Use this command to exit the current mode and return to the Executive Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Executive mode.

exit

Use this command to exit the current mode and return to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the previous mode.

uplink-classifier

Use this command to specify which classifier to match for traffic flow in the uplink direction for subscribers in this service.

Product

ASN GW

Privilege

Administrator

Syntax

[no] uplink-classifier class-map *class_map_name*

no

Deletes the configured class map for this traffic flow in the ASN GW service.

class-map *class_map_name*

Specifies the configured Class-Map to this traffic flow.
class_map_name is the name of an existing Class-Map configured in the destination context.
Refer to the Class-Map Configuration Mode chapter of this reference for additional information on configuring class maps.

Usage

Use this command to configure classifier for uplink traffic with a configured Class-Map for the ASN GW service subscribers.
Configure a maximum of 4 class-maps per ASN GW service profile.
Access Class-Map Configuration Mode through Context Configuration Mode.

Example

The following command applies the Class-Map *class_1* to this traffic:

uplink-classifier class-map *class_1*

uplink-qos-id

Use this command to specify the QoS table identifier to the traffic flow in the uplink direction for subscribers in this service.

Product

ASN GW

Privilege

Administrator

Syntax

uplink-qos-id *qos_table_id*

[no] uplink-qos-id

no

Deletes the configured class map for this traffic flow in the ASN GW service.

uplink_qos_id

Specifies the configured ASN QoS Descriptor Identifier to this traffic flow.
qos_table_id is the identifier of an existing ASN QoS Descriptor Table configured in the source context.
Refer to the ASN QoS Descriptor Configuration Mode chapter of this reference for additional information on configuring the QoS descriptor table identifier.

Usage

Use this command to apply a QoS identifier for uplink traffic with a configured ASN QoS Descriptor Table Identifier for the ASN GW service subscribers.
Configure only one QoS identifier per ASN GW service profile.
Access ASN QoS Descriptor Configuration Mode through Context Configuration Mode.

Example

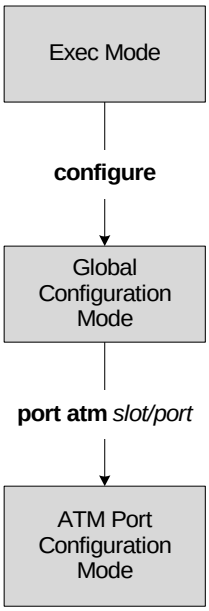
The following command applies the QoS table identifier *123* to this traffic:

uplink-qos-id *123*

Chapter 25
ATM Port Configuration Mode Commands

The Asynchronous Transfer Mode (ATM) port configuration mode provides the commands to create, configure, bind, and manage the ATM ports on line cards that support ATM, such as the ATM/POS OC-3 single-mode and multi-mode optical line cards.

Important: Before using these commands, card framing should be configured for either SDH or SONET with the framing command described in the *Card Configuration Mode* chapter.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

default

Restores the port's default speed and communication mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

default { preferred slot | threshold { *threshold_type* **} }**

preferred slot

Sets the port for non-revertive operation for port redundancy auto-recovery; requiring an administrative user to manually issue a port switch to command to return service to the original port.

threshold { *threshold_type***}**

Restores the system defaults for the selected threshold. The possible threshold types are:

- **high-activity:** High port activity threshold settings
- **monitoring:** Threshold monitoring configuration settings
- **rx-utilization:** Receive port utilization threshold settings
- **tx-utilization:** Transmit port utilization threshold settings

Usage

Restores port-level parameters to their default values.

Example

The following example restores the default non-revertive status to the ports on the card in the specified slot:

default preferred slot *22*

description

Defines descriptive text that provides useful information about the port.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

description *text*

no description

no

Erases the port's defined description from the configuration file.

text

text must be a string of 1 to 79 alphanumeric characters with no spaces or a string within double quotes that includes printable characters. The description is case-sensitive.

Usage

Set the description to provide helpful information, for example the port's primary function, services, end users. Define any information, the only limit is the number of characters.

Example

The following example sets a port description that will read in the configuration file:

description *samplePortDescriptiveText*

The following example sets a port description that will be easy to read because it retains the spaces between words:

description *"This is a sample description"*

end

Exits the ATM Port configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the ATM Port configuration mode and returns to the global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the Global configuration mode.

line-timing

This command enables the SPIO to recover transmit timing source via the line attached to the selected port. By default, line-timing is not enabled.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] line-timing
```

no

Disables line-timing as the source for the transmit clock.

Usage

The port must be enabled (**no shutdown**) to enable recovery of timing source via the line. As well, the card's slot number must be entered in the **recover line#** command in the BITS port configuration mode.

Example

Disable configured line-timing as the clock source for this port.

```
no line-timing
```

preferred slot

Identifies which card in a chassis should assume revertive (redundancy auto-recovery) functionality should the slot/port being configured go down. This command must be issued on a per port basis, allowing you to configure specific ports to be used on individual LCs or SPIO cards. For example, ports 1 through 4 could be configured as "preferred" on the LC in slot 17 while ports 5 through 8 are "preferred" on the LC in slot 33. In this scenario, both LCs would be in an Active operational state while still providing LC and port redundancy for the other.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

preferred slot *slot#*

[default | no] preferred slot

default

Default: non-revertive operation.
Sets the port for non-revertive operation for port redundancy auto-recovery; requiring an administrative user to manually issue a port switch to command to return service to the original port.

no

Disables revertive, or auto-recovery, operation for the port.

slot#

Identifies the physical slot in the chassis where the preferred line card is installed.

Usage

This command enables or disables revertive port redundancy. So after a port failover, when the original port is restored to service (i.e. link up) the system will return service to that port automatically.
Disabled, which is the default setting, causes non-revertive operation; requiring an administrative user to manually issue a port switch command to return service to the original port.

Example

The following commands sets revertive port redundancy for ports on the card in slot 17:

preferred slot *17*

pvc

This command creates a Permanent Virtual Connection (PVC), including the definition of the associated Virtual Path Identifiers (VPI) and Virtual Connection Identifiers (VCI) for the PVC. By defining a PVC, this command enters into PVC configuration mode. The ATM port supports a maximum of 256 PVC definitions.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] pvc vpi *vpi#* **vci** *vci#*

no

Deletes the PVC's entry from the configuration.

vpi *vpi#*

VPI identifies a unique path to a destination point in the ATM portion of the network. The VPI and the VCI combine to create the PVC between the MS and the destination point. *vpi#* must be an integer, 0 to 255.

vci *vci#*

VCI identifies a unique virtual circuit within the associated VPI. *vci#* must be an integer, 0 to 65535.

Usage

Creates a virtual circuit between two specific points that the carrier will use repeatedly.

Example

Define a PVC with VPI 2 and VCI 353.

```
pvc vpi 2 vci 353
```

shutdown

Terminates all processes supporting the port or blocks the shutting down of the port. Conversely, this command with the **no** keyword enables the port.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] shutdown
```

no

Enables the port's administrative state. When this command is omitted from the configuration, the card is shutdown (removed from service).

Usage

Shut down a port prior to re-cabling and/or other maintenance activities. This is the default state of each port upon installation and initial configuration.
This command with the **no** keyword is *required* to bring a port into active service.

Example

The following command enables the port for service:

```
no shutdown
```

The following command disables the port and takes it out of service:

```
shutdown
```

snmp trap link-status

Enables/disables the generation and sending of an SNMP (notification) trap when the port experiences a change of state (up or down).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] snmp trap link-status
```

no

Disables the sending of traps for link-status changes.

Usage

Enable the sending of link-status change traps for this port if there is a monitoring facility that can use the information or if there are troubleshooting activities in progress.

Example

Use the following command to send SNMP link-status traps for this port:

```
snmp trap link-status
```

Use the following command to disable the sending SNMP link-status traps for this port:

```
no snmp trap link-status
```

threshold high-activity

Configures the port's high and low activity thresholds.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

threshold high-activity *high_thresh* **[clear** *low_thresh* **]**

default threshold high-activity

default

Restores both port high-activity thresholds to the system default of 50 percent.

high_thresh

Default: 50
Sets the threshold for the highest percentage of port activity that must be met or exceeded, within the polling interval, to generate an alert or alarm.
high_thresh_% can be configured to any integer value between 0 and 100.

clear *low_thresh*

Default: 50
Sets the threshold for the lowest percentage level of port activity that must be met to generate and send a clear alarm. If port activity does not drop to or below this threshold then the alarm is maintained.
low_thresh_% can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

High port activity thresholds generate alerts or alarms based on the utilization percentage of each configured port during the specified polling interval. This threshold is configured on a per-port basis.
Alerts or alarms are triggered for high port activity based on the following rules:

- **Enter condition:** Actual percent utilization of a port > High Threshold
- **Clear condition:** Actual percent utilization of a port < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command in the *Global Configuration Mode Commands* chapter of this reference to configure the polling interval and the **threshold monitoring** command in this chapter to enable thresholding for this value.

Example

The following command configures a high port utilization threshold of 70 percent and a low threshold of 50 percent for a system using the Alarm thresholding model:

```
threshold high-activity 70 clear 50
```

threshold monitoring

Enables thresholding for port-level values.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] threshold monitoring
```

default

Restores the system default to disable threshold monitoring for port-level values.

no

Disables threshold monitoring for port-level values. This is the default setting.

Usage

Thresholding on the system is used to monitor the system for conditions that could potentially cause errors or outage. Typically, these conditions are temporary (i.e high-activity) and are quickly resolved. However, continuous or large numbers of these error conditions within a specific time interval may be indicative of larger, more severe issues. The purpose of thresholding is to help identify potentially severe conditions so that immediate action can be taken to minimize and/or avoid system downtime.

Thresholding reports conditions using one of the following mechanisms:

- **SNMP traps:** SNMP traps have been created that indicate the condition (high threshold crossing and/or clear) of each of the monitored values. Complete descriptions and other information pertaining to these traps is located in the starentMIB(8164).starentTraps(2) section of the SNMP MIB Reference.

The generation of specific traps can be enabled or disabled on the system allowing you to view only those traps that are most important to you.

- **Logs:** The system provides a facility called threshold for which active and event logs can be generated. As with other system facilities, logs are generated Log messages pertaining to the condition of a monitored value are generated with a severity level of WARNING.
- **Alarm System:** High threshold alarms generated within the specified polling interval are considered "outstanding" until a the condition no longer exists and/or a condition clear alarm is generated.

"Outstanding" alarms are reported to through the system's alarm subsystem and are viewable through the system's CLI.

The following table indicates the reporting mechanisms supported by each of the above models.

Table 12. Thresholding Reporting Mechanisms by Model

Model	SNMP Traps	Logs	Alarm System
Alert	X	X	

Model	SNMP Traps	Logs	Alarm System
Alarm	X	X	X

This command enables thresholding for port-level values. Refer to the sections covering **threshold high-activity**, **threshold rx-utilization,** and **threshold tx-utilization** commands in this chapter for information on configuring these values. In addition, refer to the **threshold poll** command in the *Global Configuration Mode Commands* chapter of this reference for information on configuring the polling interval over which these values are monitored.

threshold rx-utilization

Configures thresholds for receive-port utilization.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold rx-utilization *high_thresh* **[clear** *low_thresh* **]**

default threshold rx-utilization

default

Restores both rx-utilization thresholds to the system default of 80 percent.

high_thresh

Default: 80
The high threshold receive port utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
The percentage can be configured to any integer value between 0 and 100.

clear *low_thresh*

Allows the configuration of the low threshold.
Default: 80
The low threshold receive port utilization percentage that maintains a previously generated alarm condition. If the utilization percentage falls below the low threshold within the polling interval, a clear alarm will be generated.
The percentage can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Receive port utilization thresholds generate alerts or alarms based on the utilization percentage of each configured port in relation to data received during the specified polling interval. This threshold is configured on a per-port basis.

Important: Ports configured for half-duplex do not differentiate between data received and data transmitted. Therefore, to avoid redundant alarms, it is recommended that only the receive **or** transmit utilization threshold be configured.

Alerts or alarms are triggered for receive port utilization based on the following rules:

- **Enter condition:** Actual percent utilization of a port for received data > High Threshold

- **Clear condition:** Actual percent utilization of a port for received data < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command in the Global Configuration Mode Commands chapter of this reference to configure the polling interval and the **threshold monitoring** command in this chapter to enable thresholding for this value.

Example
The following command configures a receive port high utilization threshold percent of 70 and a low threshold of 50 for an system using the Alarm thresholding model:

```
threshold rx-utilization 70 clear 50
```

threshold tx-utilization

Configures thresholds for transmit port utilization.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold tx-utilization *high_thresh* **[clear** *low_thresh* **]**

default threshold tx-utilization

default

Restores the port tx-thresholds to their system defaults of 80 percent.

high_thresh

Default: 80
The high threshold transmit port utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
The percentage can be configured to any integer value between 0 and 100.

clear *low_thresh*

Allows the configuration of the low threshold.
Default: 80
The low threshold transmit port utilization percentage that maintains a previously generated alarm condition. If the utilization percentage falls below the low threshold within the polling interval, a clear alarm will be generated.
The percentage can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Transmit port utilization thresholds generate alerts or alarms based on the utilization percentage of each configured port in relation to data transmitted during the specified polling interval. This threshold is configured on a per-port basis.

Important: Ports configured for half-duplex do not differentiate between data received and data transmitted. Therefore, to avoid redundant alarms, it is recommended that only the receive **or** transmit utilization threshold be configured.

Alerts or alarms are triggered for transmit port utilization based on the following rules:

- **Enter condition:** Actual percent utilization of a port for transmit data > High Threshold

- **Clear condition:** Actual percent utilization of a port for transmit data < Low Threshold

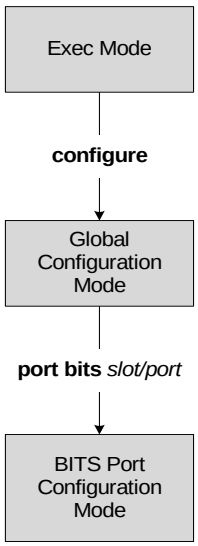
If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command in the Global Configuration Mode Commands chapter of this reference to configure the polling interval and the **threshold monitoring** command in this chapter to enable thresholding for this value.

Example
The following command configures a transmit port high utilization threshold percent of 70 and a low threshold of 50 for an system using the Alarm thresholding model:

```
threshold tx-utilization 70 clear 50
```

Chapter 26
BITS Port Configuration Mode Commands

The Building Integrated Timing Supply (BITS) port configuration mode provides the commands to configure the BITS ports on the SPIO and optionally to configure the transmit timing source.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

default

Restores the port's default speed and communication mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
default { mode | preferred slot }
```

mode

Default: none
Sets the default for the ports framing mode.

preferred slot

Default: non-revertive
Sets the port for non-revertive operation for port redundancy auto-recovery; requiring an administrative user to manually issue a port switch command to return service to the original port.

Usage

Restores port-level parameters to their default values.

Example

Use the following command to remove any setting for this port's framing mode:

```
default mode
```

description

Defines descriptive text that provides useful information about the port.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

description *text*

no description

no

Erases the port's description from the configuration file.

text

text must be a string of 1 to 79 alphanumeric characters with no spaces or a string within double quotes that includes printable characters. The description is case-sensitive.

Usage

Set the description to provide helpful information, for example the port's primary function, services, end users. Define any information, the only limit is the number of characters.

Example

Use the following command to set a sample port description in the configuration file:

description *samplePortDescriptiveText*

Use the following command to set a more readable description:

description *"This is a sample description"*

end

Exits the BITS port configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the BITS port configuration mode and returns to the Global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the Global configuration mode.

mode

Configures the framing mode for the port.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

mode { e1 | t1 } framing *type*

e1 | t1

e1 selects the SDH E1 framing mode.
t1 selects the SONET T1 framing mode.

framing *type*

basic: Selects the Frame Alignment Signal (FAS) used with E1.
crcmf: Selects the Multiframe with CRC (FAS+CRC) used with E1.
esf: Selects the extended superframe format used with T1.
sf: Selects the superframe format (D4) used with T1.

Usage

Set the ports framing mode parameters.

Example

Configure the port to support E1 with crcmf framing.

mode e1 framing *crcmf*

preferred slot

Identifies which card in a chassis should assume revertive (redundancy auto-recovery) functionality should the slot/port being configured go down. There are only two SPIO, one in slot 24 and the other in slot 25.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

preferred slot *slot#*

[default | no] preferred slot

default

Default: non-revertive operation.

no

Disables revertive, or auto-recovery, operation for the port.

slot#

Identifies the physical slot in the chassis where the SPIO is installed.

Usage

This command enables or disables revertive port redundancy. So after a port failover, when the original port is restored to service (i.e. link up) the system will return service to that port automatically.
Disabled, which is the default setting, causes non-revertive operation; requiring an administrative user to manually issue a **port switch** to command to return service to the original port.

Example

Use this command to set the ports on the card in slot 25 as “preferred” for port redundancy:

preferred slot *25*

recover

Configure line-timing so the SPIO recovers the transmit timing source from an external source via one of the line cards in the chassis. The recovered clock is then distributed for use to all line cards in the chassis.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

recover { line1 *slot#* **| line2** *slot #* **}**

no recover { line1 | line2 }

no

Deletes the identified line-timing source definition from the configuration.

line1 *slot#*

Sets first priority for line-timing clock recovered from the line card in the specified slot.
slot#: a number between 1 and 48.

line2 *slot#*

Sets second priority for line-timing clock recovered from the line card in the specified slot.
slot#: a number between 1 and 48. Can not be the same slot number entered for **line1**.

Usage

Define which line-timing source has priority.

Example

Configure the line card in slot 19 as the preferred source for line-timing.

```
recover line1 19
```

shutdown

Terminates all processes supporting the port or blocks the shutting down of the port. Conversely, this command with the **no** keyword enables the port and BITS -timing as a transmit timing source.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] shutdown
```

no

Enables the port's administrative state. When omitted the card is shutdown (removed from service).

Usage

Shut down a port prior to re-cabling and/or other maintenance activities.
This command with the **no** keyword is required to bring a port into service.

Example

Use the following command to enable the port for service:

```
no shutdown
```

snmp trap link-status

Enables/disables the generation and sending of an SNMP (notification) trap when the port experiences a change of state (up or down).

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] snmp trap link-status
```

no

Disables the sending of traps for link-status changes.

Usage

Enable the sending of link-status change traps if there is a monitoring facility that can use the information or if there are troubleshooting activities in progress.

Example

Use this command to enable sending of link-status SNMP traps:

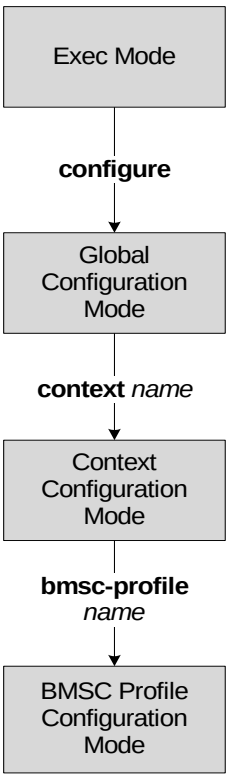
```
snmp trap link-status
```

Use this command to disable sending of link-status SNMP traps:

```
no snmp trap link-status
```

Chapter 27
BMSC Profile Configuration Mode Commands

The BMSC Profile Configuration Mode is used to configure Broadcast Multicast Service Center profiles for Multimedia Broadcast Multicast Service (MBMS) applications. The mode is accessed by entering the bmsc-profile command from the Context Configuration Mode.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Returns the CLI prompt to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

Example

```
end
```

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the previous or parent mode.

Example

exit

gmb diameter dictionary

Specifies the Diameter dictionary for the Gmb interface in BM-SC profile of MBMS user service.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
gmb diameter dictionary { custom1 | custom10 | custom2 | custom3 | custom4 |
custom5 | custom6 | custom7 | custom8 | custom9 | standard }

default gmb diameter dictionary
```

custom1 ... custom10

Custom-defined Diameter dictionary. Specific to customer requirement.

standard

Default: Enabled
Specifies the standard Gmb Diameter dictionary conforming to 3GPP TS 29.061 (Rel. 7).

default

Sets the Diameter dictionary to standard.

Usage

Use this command to select the Gmb Diameter dictionary in BM-SC profile of MBMS user service.

Example

The following command sets the Gmb Diameter dictionary to TS 29.061 (Rel. 7) specific:

```
gmb diameter dictionary standard
```

gmb diameter endpoint

Specifies the Diameter endpoint name for Gmb interface in BM-SC profile of MBMS user service.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gmb diameter endpoint *endpoint_name*

no gmb diameter endpoint

no

Removes the previously configured Diameter endpoint name for Gmb interface in BM-SC profile of MBMS user service.

endpoint_name

Specifies the Diameter endpoint name for Gmb interface. This must be present in all Diameter messages and is the endpoint that originates the Diameter message.
endpoint_name must be an alpha and/or numeric string of length between 1 to 63 characters.

Usage

Use this command to create a Gmb Diameter endpoint for BM-SC profile.

Example

The following command creates a Diameter endpoint named *test1* in BM-SC profile of MBMS user service:

gmb diameter endpoint *test1*

gmb diameter peer-select

Specifies the peer ids of BM-SC Diameter primary and secondary host in BM-SC profile for MBMS user service.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax **gmb diameter peer-select peer** *peer_name* **[realm** *realm_name* **] [secondary-peer** *sec_peer_name* **[realm** *sec_realm_name* **]]**
gmb diameter peer-select

no

Removes the previously configured BM-SC Diameter peer ids configured in BM-SC profile of MBMS user service.

peer *peer_name*

Specifies the primary diameter host id for BM-SC in this BM-SC profile for MBMS user service. This is a unique name that is specified for the primary peer.
peer_name must be an alpha and/or numeric string of from 1 through 127 characters and it allows punctuation marks.

realm *realm_name*

Specifies the realm or domain for Gmb diameter peer. The realm may typically be a company or service name.
realm_name must be an alpha and/or numeric string of from 1 to 127 characters and allows punctuation marks.

secondary-peer *sec_peer_name*

Specifies a back-up host that is used for fail-over processing. When the route-table does not find an AVAILABLE route the secondary host performs a fail-over processing.
sec_peer_name must be an alpha and/or numeric string of from 1 through 127 characters and it allows punctuation marks.

realm *sec_realm_name*

Specifies the realm or domain for Gmb diameter secondary host. The realm may typically be a company or service name.
sec_realm_name must be an alpha and/or numeric string of from 1 to 127 characters and allows punctuation marks.

Usage

Use this command to select a BM-SC Diameter peer and realm in this BM-SC profile for MBMS user service.

Example

The following command selects a Gmb Diameter peer named *test1* and a realm of *companyx*:

```
gmb diameter peer-select peer test1 realm companyx
```

gmb user-data

This command configures the parameters in this BM-SC profile for user data of MBMS user service.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gmb user-data { mode-preference { multicast | unicast } | unicast-self-address *self_ip_address* **}**

default gmb user-data mode-preference

no gmb user-data unicast-self-address

no

Removes the configured self address of GGSN for unicast in BM-SC profile for user data of MBMS user service.

defualt

Sets the user data mode to unicast in BM-SC profile for user data of MBMS user service.

mode-preference { multicast | unicast }

Default: unicast
Specifies the preferred mode of GGSN for receiving MBMS suer service data.
multicast: specifies the preferred mode as multicast for MBMS user service.

Important: Note that this **multicast** keyword is not supported in this release.

unicast: specifies the preferred mode as unicast for MBMS user service.

unicast-self-address *self_ip_address*

Specifies the GGSN's IP address for BM-SC to use as outer destination address for the IP-in-IP tunnel to send multicast data if configured preferred data mode is unicast.
self_ip_address must be the IPv4 address in dotted decimal notation.
This command must be configured if GGSN's user-data mode-preference is Unicast.

Usage

Use this command to configure user data mode and other parameters in BM-SC profile for user data of MBMS user service.
GGSN can receive multicast data from BM-SC in one of two modes - Multicast or Unicast. In Unicast mode, BM-SC tunnels the multicast data to the GGSN in an IP-in-IP tunnel instead of direct multicast. This

command with mode-preference keyword configures the GGSN's preferred mode for receiving multicast data.

Important: Both GGSN and BM-SC must support the Unicast mode of multicast data transfer. If any of GGSN or BM-SC doesn't support Multicast mode, BM-SC will transfer multicast data using Unicast mode only.

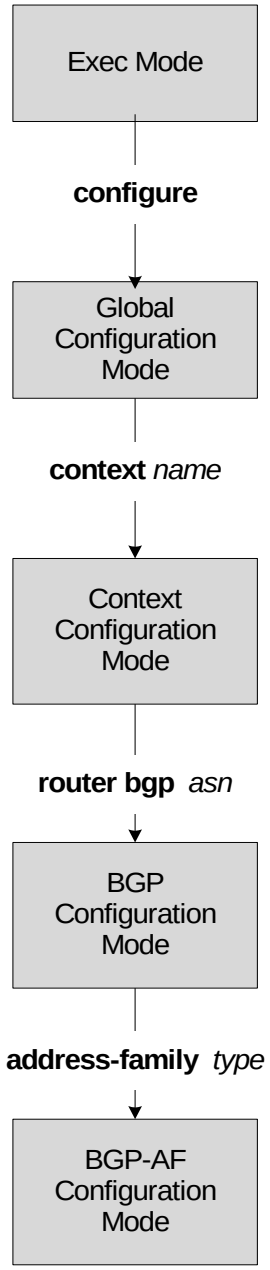
Use unicast-self-address keyword to configure GGSN's IP address which the BM-SC should use as the outer destination address for the IP-in-IP tunnel to send multicast data if the selected user data mode to receive multicast data is Unicast (i.e. either of GGSN or BM-SC doesn't support Multicast mode of data transfer).

Example
The following command sets the MBMS data transfer mode to unicast:

```
default gmb user-data mode-preference
```

Chapter 28
Border Gateway Protocol Address-Family Configuration Mode Commands

The Border Gateway Protocol (BGP) Address-Family Configuration Mode is used to configure properties for BGP-4 routing.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the global configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the context configuration mode.

neighbor

This command configures BGP routers that interconnect to non-broadcast networks. Note that a remote AS number must be specified for a neighbor before other parameters can be configured.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

[no] neighbor *ip_address* **{activate|advertisement-interval** *adv_time* **| default-originate [route-map** *map_name***] | distribute-list** *dist_list* **{in | out}| ebgp-multihop [max-hop** *number***] | filter-list** *filt_list* **{in | out}| max-prefix** *max_num* **[threshold** *thresh_percent***] [warning-only] | remote-as** *AS_num***| remove-private-AS | route-map** *map_name* **{in | out} | shutdown | timers {[connect-interval** *conn_time***] | [keepalive-interval** *keep_time* **Holdtime-interval** *hold_time***]}| update-source** *ip_address* **| weight** *value***}**

---

no

Delete the specified parameter from the router configuration.

---

activate

Enable the exchange of routes with this neighbor.

---

advertisement-interval *adv_time*

The minimum interval, in seconds, between sending BGP routing updates.
Default: 30
adv_time must be an integer from 0 through 600.

---

default-originate [route-map *map_name***]**

Originate default routes to this neighbor
route-map *map_name*: Specifies the route-map that contains the criteria to originate default routes.
map_name must be the name of an existing route-map in the current context.

---

distribute-list *dist_list* **{in | out}**

Filter updates to and from this neighbor based on a route access list.
Default: No filtering is performed.
dist_list: The name or number of an existing route-access-list.
in: Indicates that incoming advertised routes should be filtered.
out: Indicates that outgoing advertised routes should be filtered.

---

ebgp-multihop [max-hop *number***]**

Allow EBGP neighbors not on directly connected networks.
Default hop count: 255
max-hop *number*: The maximum number of hops allowed to reach a neighbor. *number* must be an integer from 1 through 255.

filter-list *filt_list* **{in | out}**

Establish BGP filters based on an AS path access list
filt_list: The name of an existing AS path access list.
in: Indicates that incoming advertised routes will be filtered.
out: Indicates that outgoing advertised routes will be filtered.

max-prefix *max_num* **[threshold** *thresh_percent***] [warning-only]**

The maximum number of prefixes accepted from this peer. When the maximum is exceeded the neighbor connection is reset.
Default: No maximum prefix limit.
max_num: Specifies the maximum number of prefixes permitted. This must be an integer from 1 through 4294967295.
threshold *thresh_percent*: A percentage value which specifies that when the BGP table is the specified percentage full from this peer warnings are sent to the neighbor. *thresh_percent* must be an integer from 1 through 100.
warning-only: This keyword specifies that only a warning message is sent when the limit is exceeded. The neighbor connection is not reset

remote-as *AS_num*

Specify the AS number of the BGP neighbor.
AS_num: The neighbor's autonomous system number. must be an integer from 1 through 65535.

remove-private-AS

Remove the private AS number from outbound updates.
Default: Do not remove the private AS number.

route-map *map_name* **{in | out}**

Apply a route map to the neighbor.
map_name: Specifies the route-map apply. *map_name* must be the name of an existing route-map in the current context.
in: Indicates that the route map applies to incoming advertisements.
out: Indicates that the route map applies to outgoing advertisements.

shutdown

Administratively shut down this neighbor. This disables exchanging routes or configuring parameters for this neighbor.

timers {[connect-interval *conn_time***] | [keepalive-interval** *keep_time* **Holdtime-interval** *hold_time***]}**

BGP timers for the specified neighbor.
connect-interval *conn_time*: Specifies the connect timer in seconds. *conn_time* must be an integer from 0 through 65535. The default is 60 seconds.
keepalive-interval *keep_time*: The frequency, in seconds, at which the current BGP router sends keepalive messages to its neighbor. *keep_time* must be an integer from 0 through 65535. The default is 30 seconds.
Holdtime-interval *hold_time*: The interval, in seconds, the router waits for a keepalive message before declaring a neighbor dead. *hold_time* must be an integer from 0 through 65535. The default is 90 seconds.

update-source *ip_address*

use this keyword to bind the specified IP address to the bgp socket that is used to communicate to the peer.
ip_address is an IPv4 address in dotted decimal notation.
In most cases you should set the update-source address to the address of the loopback interface in the current context. By doing this, the tcp connection does not go down until there is no route for the loopback address in the peering router.

weight *value*

This command sets the default weight for routes from this neighbor.
Default: 0
value: This must be an integer from 0 through 65535.

Usage

Use this command to set parameters for communication with a specified neighbor. The chassis supports a maximum of 64 peers per context.

Example

The following command specifies that the neighbor at the IP address 192.168.100.25 has an AS number of 2000:
```
neighbor 192.168.100.25 remote-as 2000
```
The following command allows BGP neighbors that are a maximum of 27 hops away:
```
neighbor 192.168.100.25 ebgp-multihop max-hop 27
```
The following command sets the minimum interval between sending routing updates to 3 minutes
```
neighbor 192.168.100.25 advertisement-interval 180
```
The following command sets the default weight for all routes from the specified neighbor to 100:
```
neighbor 192.168.100.25 weight 100
```

network

Specify a network to announce via BGP

Product

HA

Privilege

Security Administrator, Administrator

Syntax

network *ip_adrress/mask* **[route-map** *map_name* **]**
no network *ip_adrress/mask* [**route-map** *map_name*]

no

Delete the specified network from the configuration for the BGP router.

ip_adrress/mask

Specifies the IP address and netmask bits for the network to announce via BGP. *ip_address* is a network IP address (in dotted-decimal notation) and *mask* is the number of subnet bits, representing a subnet mask in shorthand. These must be entered in the dotted-decimal notation/subnet bits format (1.1.1.1/24).

route-map *map_name*

Filter routes through the specified route map before announcing the network. map_name specifies the name of the route-map to use and must be specified as a string of 1 through 79 alphanumeric characters.

Usage

Use this command to specify a network to announce via BGP.

Example

The following command announces the network 192.168.0.0 with a netmask of 16 via BGP:
network 192.168.0.0/16
The following command removes the network from the BGP router configuration:
no network 192.168.0.0/16

redistribute

This command redistributes routes into BGP. This means that any routes from another protocol are redistributed to BGP neighbors using the BGP protocol.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

redistribute { connected | ospf | rip | static } [route-map *map_name* **]**

no

Remove the specified redistribution parameters from the BGP router configuration.

connected

Specifies that connected routes will be redistributed.

ospf

Specifies that OSPF routes will be redistributed

rip

Specifies that RIP routes will be redistributed. (RIP is not supported at this time.)

static

Specifies that static routes will be redistributed.

route-map map_name

Filter routes through the specified route map before redistribution. map_name specifies the name of the route-map to use and must be specified as a string of 1 through 79 alphanumeric characters.

Usage

Use this command to specify what routes this BGP router should redistribute into BGP.

Example

The following command redistributes OSPF routes after filtering them through the route map named Map1:
redistribute ospf route-map *Map1*
The following command removes the redistribution of OSPF routes from the router's configuration:
no redistribute ospf route-map *Map1*

neighbor

This command configures BGP routers that interconnect to non-broadcast networks and enables the exchange of routing information with a peer router (neighbor). Note that a remote AS number must be specified for a neighbor before other parameters can be configured.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[no] neighbor ip_address {activate| remote-as AS_num | send-community {both |
extended | standard} }
```

no

Delete the specified parameter from the router configuration.

ip_address

Specifies the IP address of the peer router (neighbor).

activate

Enable the exchange of routing information with this neighbor.

remote-as *AS_num*

Specify the AS number of the BGP neighbor.
AS_num: The neighbor's autonomous system number. must be an integer from 1 through 65535.

send-community extended

This keyword sends the extended community attributes to a peer router (neighbor).

Usage

Use this command to enable the exchange of routing information with a peer router. The chassis supports a maximum of 64 peers per context.

Example

The following command specifies that the neighbor at the IP address 192.168.100.25 has an AS number of 2000:
neighbor *192.168.100.25* **remote-as** *2000*

redistribute

This command redistributes routes into BGP. This means that any routes from another protocol are redistributed to BGP neighbors using the BGP protocol.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] redistribute {connected | kernel}
```

no

Remove the specified redistribution parameters from the BGP router configuration.

connected

Specifies that connected routes will be redistributed.

kernel

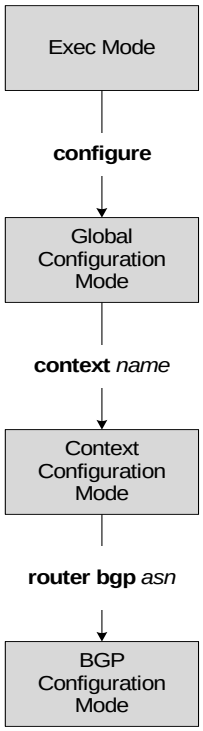
Specifies that kernel routes will be redistributed.

Usage

Use this command to specify what routes this BGP router should redistribute into BGP.

Chapter 29
Border Gateway Protocol Configuration Mode Commands

The Border Gateway Protocol (BGP) Configuration Mode is used to configure properties for BGP-4 routing.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

address-family ipv4

Configures the IPv4 Address Family information for the specified BGP AS number. Optionally it also enables the VRF routing information, if specified.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
address-family ipv4 [ vrf vrf_name]

[no] address-family ipv4 vrf vrf_name}
```

no

This keyword removes the configured IPv4 address family VRF mode for specific BGP AS number.

vrf *vrf_name*

This optional keyword enables the exchange of VRF routing informaiton. When this keyword is specified with this command then the address family mode changed to VRF address family mode for specific BGP AS number.

Important: The route distinguigher id must be configured for this VRF name through **route-distinguisher** command in BGP VRF Configuration mode, before using this keyword.

Usage

Use this command to configure the IPv4 BGP address family configuration parameters for BGP router and optionally enables the exchange of VRF routing information. This command is also used to switch the command mode to enter the *BGP Address Family Configuration Mode*.
Use of **address-family ipv4** command swithces the command mode to *BGP Address Family Configuraiton Mode* and prompt will be changed to the following:

```
[context_name>]host_name(config-bgp-af-v4)#
```

Use of **address-family ipv4 vrf** *vrf_name* command swithces the command mode to *BGP Address Family Configuraiton Mode* and prompt will be changed to the following:

```
[context_name>]host_name(config-bgp-af-vrf)#
```

Example

Use following command to enter the IPv4 BGP Address-Family configuration mode:

```
address-family ipv4
```

Use following command to enter the IPv4 VRF BGP Address-Family configuration mode for exchange of VRF routing information from VRF *route_vrf1*:

address-family ipv4 vrf*route_vrf1*

address-family ipv6

Configures the IPv6 Address Family information for the specified BGP AS number.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
address-family ipv6
```

Usage

Use this command to configure the IPv6 BGP address family configuration parameters for BGP router. This command is also used to switch the command mode to enter the *BGP Address Family Configuration Mode*. Use of **address-family ipv6** command swithces the command mode to *BGP Address Family Configuraiton Mode* and prompt will be changed to the following:

```
[context_name>]host_name(config-bgp-af-v6)#
```

Example

Use the following command to enter the IPv6 BGP Address-Family configuration mode:

```
address-family ipv6
```

address-family vpnv4

Configures the VPNv4 Address Family information for the specified BGP AS number.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
address-family vpnv4
```

Usage

Use this command to configure the VPNv4 address family configuration parameters for BGP router. This command is also used to switch the command mode to enter the *BGP Address Family Configuration Mode*. Use of **address-family vpnv4** command swithces the command mode to *BGP Address Family Configuraiton Mode* and prompt will be changed to the following:

```
[context_name>]host_name(config-bgp-af-vpnv4)#
```

Example

Use the following command to enter the BGP Address-Family configuration mode for VPNv4 address parameters:

```
address-family vpnv4
```

distance

Define the administrative distance for routes. The administrative distance is the default priority for a specific route or type route.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
distance { admin distance prefix prefix_addr [ route-access-list list_name ]
| bgp external ebgp_dist internal ibgp_dist local local_dist }
no distance { admin distance prefix prefix_addr [ route-access-list
list_name ] | bgp [ external ebgp_dist internal ibgp_dist local local_dist ]
}
```

no

Remove the specified administrative distance for the specific route.

admin *distance* **prefix** *prefix_addr* **[route-access-list** *list_name* **]**

This keyword sets the administrative distance to a specified value for routes with a specific IP prefix. If you also specify a route access list, the IP prefix must match the rules of that access list.
admin *distance*: The administrative distance that you want to apply to the IP prefix. *distance* must be an integer from 1 through 254.
prefix *prefix_addr*: The IP prefix of routes that should have the admin distance applied. *prefix_addr* must be an IPv4 address (in dotted-decimal notation) and the number of subnet bits, representing the subnet mask in shorthand (1.1.1.1/24).
route-access-list *list_name*: Define the name of a route access list that defines for which routes the administrative distance should be set.

bgp external *ebgp_dist* **internal** *ibgp_dist* **local** *local_dist*

This keyword sets the administrative distance for internal (IBGP), external (EBGP) and local routes.
external *ebgp_dist*: Set the administrative distance for EBGP routes. *ebgp_dist* must be an integer from 1 through 254.
internal *ibgp_dist*: Set the administrative distance for IBGP routes. *ibgp_dist* must be an integer from 1 through 254.
local *local_dist*: Set the administrative distance for local routes. *local_dist* must be an integer from 1 through 254.

Usage

Use this command to set the administrative distance for specific routes to values that you specify. These values are only applied to the current router.

Example

Use the following command to set the administrative distance to 100 for all routes that have an IP prefix of 192.168.0.0 with a netmask of 16 and are specified in a remote access list named racl1:
distance admin 100 prefix 192.168.0.0/16 route-access-list racl1

end

Exits the current configuration mode and returns to the Exec mode.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Return to the Exec mode.

enforce-first-as

Enforce the first Autonomous System (AS) for Exterior Border Gateway Protocol (EBGP) routes. As stated in RFC1930; “An AS is a connected group of one or more Internet Protocol prefixes run by one or more network operators which has a single and clearly defined routing policy.”

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
enforce-first-as
```

Usage

Use this command to enforce the use of the first AS for EBGP routes.

Example

Use the following command to enable this functionality:

```
enforce-first-as
```

exit

Exits the current configuration mode and returns to the global configuration mode.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the context configuration mode.

ip vrf

This command adds a preconfigured IP VRF context instance to the BGP ASN and configures the BGP attributes and related parameters to the VRF. This command also switches the command mode to BGP VRF Configuration mode.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[no] ip vrf vrf_name
```

no

Removes an associated IP VRF from specified BGP AS number and other configured parameters.

vrf_name

Specifies the IP VRF context configured in the Context configuration mode and to be associated with a BGP AS number.
vrf_name must be a string from 1 to 79 identifying an existing instance.

Usage

Use this command to associate the specified IP VRF context instance to the BGP AS number and configures the BGP attributes and related parameters to the VRF. This command also switches the command mode to BGP VRF Configuration mode.
This command swithces the command mode to *BGP IP VRF Configuraiton Mode* and prompt will be changed to the following:

```
[context_name>]host_name(config-bgp-vrf)#
```

Example

Use the following command associates the pre-defined VRF context instance *router_mpls* to this BGP AS number:
ip vrf *router_mpls*

neighbor

This command configures BGP routers that interconnect to non-broadcast networks. Note that a remote AS number must be specified for a neighbor before other parameters can be configured.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

[no] neighbor *ip_address* **{activate|advertisement-interval** *adv_time* **| default-originate [route-map** *map_name***] | distribute-list** *dist_list* **{in | out}| ebgp-multihop [max-hop** *number***] | filter-list** *filt_list* **{in | out}| max-prefix** *max_num* **[threshold** *thresh_percent***] [warning-only] | remote-as** *AS_num***| remove-private-AS | route-map** *map_name* **{in | out} | shutdown | timers {[connect-interval** *conn_time***] | [keepalive-interval** *keep_time* **Holdtime-interval** *hold_time***]}| update-source** *ip_address* **| weight** *value***}**

---

no

Delete the specified parameter from the router configuration.

---

activate

Enable the exchange of routes with this neighbor.

---

advertisement-interval *adv_time*

The minimum interval, in seconds, between sending BGP routing updates.
Default: 30
adv_time must be an integer from 0 through 600.

---

default-originate [route-map *map_name***]**

Originate default routes to this neighbor
route-map *map_name*: Specifies the route-map that contains the criteria to originate default routes.
map_name must be the name of an existing route-map in the current context.

---

distribute-list *dist_list* **{in | out}**

Filter updates to and from this neighbor based on a route access list.
Default: No filtering is performed.
dist_list: The name or number of an existing route-access-list.
in: Indicates that incoming advertised routes should be filtered.
out: Indicates that outgoing advertised routes should be filtered.

---

ebgp-multihop [max-hop *number***]**

Allow EBGP neighbors not on directly connected networks.
Default hop count: 255
max-hop *number*: The maximum number of hops allowed to reach a neighbor. *number* must be an integer from 1 through 255.

filter-list *filt_list* **{in | out}**

Establish BGP filters based on an AS path access list
filt_list: The name of an existing AS path access list.
in: Indicates that incoming advertised routes will be filtered.
out: Indicates that outgoing advertised routes will be filtered.

max-prefix *max_num* **[threshold** *thresh_percent***] [warning-only]**

The maximum number of prefixes accepted from this peer. When the maximum is exceeded the neighbor connection is reset.
Default: No maximum prefix limit.
max_num: Specifies the maximum number of prefixes permitted. This must be an integer from 1 through 4294967295.
threshold *thresh_percent*: A percentage value which specifies that when the BGP table is the specified percentage full from this peer warnings are sent to the neighbor. *thresh_percent* must be an integer from 1 through 100.
warning-only: This keyword specifies that only a warning message is sent when the limit is exceeded. The neighbor connection is not reset

remote-as *AS_num*

Specify the AS number of the BGP neighbor.
AS_num: The neighbor's autonomous system number. must be an integer from 1 through 65535.

remove-private-AS

Remove the private AS number from outbound updates.
Default: Do not remove the private AS number.

route-map *map_name* **{in | out}**

Apply a route map to the neighbor.
map_name: Specifies the route-map apply. *map_name* must be the name of an existing route-map in the current context.
in: Indicates that the route map applies to incoming advertisements.
out: Indicates that the route map applies to outgoing advertisements.

shutdown

Administratively shut down this neighbor. This disables exchanging routes or configuring parameters for this neighbor.

timers {[connect-interval *conn_time***] | [keepalive-interval** *keep_time* **Holdtime-interval** *hold_time***]}**

BGP timers for the specified neighbor.
connect-interval *conn_time*: Specifies the connect timer in seconds. *conn_time* must be an integer from 0 through 65535. The default is 60 seconds.
keepalive-interval *keep_time*: The frequency, in seconds, at which the current BGP router sends keepalive messages to its neighbor. *keep_time* must be an integer from 0 through 65535. The default is 30 seconds.
Holdtime-interval *hold_time*: The interval, in seconds, the router waits for a keepalive message before declaring a neighbor dead. *hold_time* must be an integer from 0 through 65535. The default is 90 seconds.

update-source *ip_address*

use this keyword to bind the specified IP address to the bgp socket that is used to communicate to the peer.
ip_address is an IPv4 address in dotted decimal notation.
In most cases you should set the update-source address to the address of the loopback interface in the current context. By doing this, the tcp connection does not go down until there is no route for the loopback address in the peering router.

weight *value*

This command sets the default weight for routes from this neighbor.
Default: 0
value: This must be an integer from 0 through 65535.

Usage

Use this command to set parameters for communication with a specified neighbor. The chassis supports a maximum of 64 peers per context.

Example

The following command specifies that the neighbor at the IP address 192.168.100.25 has an AS number of 2000:
```
neighbor 192.168.100.25 remote-as 2000
```
The following command allows BGP neighbors that are a maximum of 27 hops away:
```
neighbor 192.168.100.25 ebgp-multihop max-hop 27
```
The following command sets the minimum interval between sending routing updates to 3 minutes
```
neighbor 192.168.100.25 advertisement-interval 180
```
The following command sets the default weight for all routes from the specified neighbor to 100:
```
neighbor 192.168.100.25 weight 100
```

network

Specify a network to announce via BGP

Product

HA

Privilege

Security Administrator, Administrator

Syntax

network *ip_adrress/mask* **[route-map** *map_name* **]**
no network *ip_adrress/mask* [**route-map** *map_name*]

no

Delete the specified network from the configuration for the BGP router.

ip_adrress/mask

Specifies the IP address and netmask bits for the network to announce via BGP. *ip_address* is a network IP address (in dotted-decimal notation) and *mask* is the number of subnet bits, representing a subnet mask in shorthand. These must be entered in the dotted-decimal notation/subnet bits format (1.1.1.1/24).

route-map *map_name*

Filter routes through the specified route map before announcing the network. map_name specifies the name of the route-map to use and must be specified as a string of 1 through 79 alphanumeric characters.

Usage

Use this command to specify a network to announce via BGP.

Example

The following command announces the network 192.168.0.0 with a netmask of 16 via BGP:
network 192.168.0.0/16
The following command removes the network from the BGP router configuration:
no network 192.168.0.0/16

redistribute

This command redistributes routes into BGP. This means that any routes from another protocol are redistributed to BGP neighbors using the BGP protocol.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

redistribute { connected | ospf | rip | static } [route-map *map_name* **]**

no

Remove the specified redistribution parameters from the BGP router configuration.

connected

Specifies that connected routes will be redistributed.

ospf

Specifies that OSPF routes will be redistributed

rip

Specifies that RIP routes will be redistributed. (RIP is not supported at this time.)

static

Specifies that static routes will be redistributed.

route-map map_name

Filter routes through the specified route map before redistribution. map_name specifies the name of the route-map to use and must be specified as a string of 1 through 79 alphanumeric characters.

Usage

Use this command to specify what routes this BGP router should redistribute into BGP.

Example

The following command redistributes OSPF routes after filtering them through the route map named Map1:
redistribute ospf route-map *Map1*
The following command removes the redistribution of OSPF routes from the router's configuration:
no redistribute ospf route-map *Map1*

router-id

Override the configured router identifier (peers will reset).

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
router-id ip_address
no router-id [ ip_address ]
```

no

Remove the specified router ID from the router's configuration and use the default router ID.

ip_address

The IP address to use as the BGP router ID. *ip_address* must be an IPv4 address in dotted decimal notation (###.###.###.###).

Usage

Use this command to configure a specific router ID that overrides the default.

Example

The following command sets the router ID to 192.168.100.25:
router-id 192.168.100.25

scan-time

Configure background scanner interval. The background scanner scans routers for next hop validation.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

scan-time *time*
no scan-time

no

Remove the user specified scan time from the router's configuration. The scan time is reset to the default value.

time

Default: 60
The amount of time, in seconds, to wait between background scans to determine next-hop validity. *time* must be an integer from 5 through 60.

Usage

Use this command to set the background scanner interval for the BGP router.

Example

The following command sets the background scanner interval to 30 seconds:
scan-time 30

timers

This command configures BGP routing timers.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

timers bgp Keepalive-interval *interval* **Holdtime-interval** *time* **[Min-peer-holdtime-interval]** *time*
no timers bgp

---

no

Remove the user specified timer values from the router's configuration. The timer values are reset to the default values.

Keepalive-interval *interval*

Default: 30
The interval, in seconds, to wait between sending keepalive packets. Must be an integer from 0 through 65535.

Holdtime-interval *time*

Default: 90
The interval, in seconds, after which the neighbor is considered dead if keepalive messages are not received. Must be an integer from 0 through 65535.

Min-peer-holdtime-interval *time*

Default: 0
The interval, in seconds, that is the minimum acceptable hold time from a neighbor. Must be an integer from 0 through 65535. The default is 0 so that there is no restriction on the hold time received in an OPEN message from the peer.

Usage

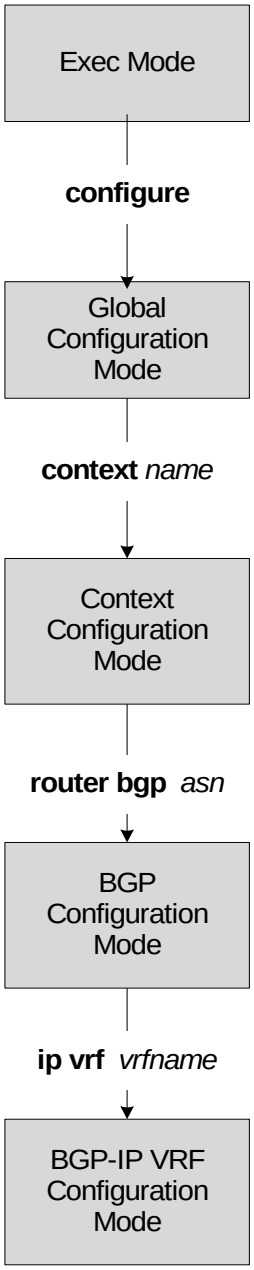
Use this command to configure the how long to wait between sending keepalive packets and how long to wait for a keepalive before considering a a neighbor dead.

Example

The following command sets the keepalive interval to 2 minutes and the holdtime interval to 3 minutes:
timers bgp Keepalive-interval *120* **Holdtime-interval** *180* **Min-peer-holdtime-interval** *0*

Chapter 30
Border Gateway Protocol IP VRF Configuration Mode Commands

The Border Gateway Protocol (BGP) IP VRF Configuration Mode is used to configure properties for BGP-4 routing.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the global configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the context configuration mode.

route-distinguisher

This command assigns a route distinguisher (RD) for the VRF. The route distinguisher value must be a unique value on the router for each VRF.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

route-distinguisher {*as_value* | *ip_address***}** *rd_value*

as_value

The *ASN value* is a 16-bit autonomous-system (AS) number from 0 through 65535.

ip_address **}**

ip_address is an 32 bit IP address in IPv4 dotted decimal notation.

rd_value **}**

rd_value is an unique route distinguisher identifier and must be an integer between 0 through 4294967295.

Usage

Use this command to assign a router distinguisher (RD) for the IP VRF. The combination of AS number/IP address and RD value must be unique for every VRF configured. The RD is added to the beginning of the pool addresses to change them into globally unique VPN-IPv4 prefixes.
If the RD is not configured for a VRF, user cannot enter into the BGP Address-Family mode for that VRF to configure the neighbors or other related BGP commands.
An RD assigined to a VRF cannot be changed untill the existing VRF is deleted or removed and reconfigured.

Example

The following command assigns a router distingusher *12345* to VRF with AS number *300*:

route-distingusher *300 12345*

The following command assigns a router distingusher *12345* to VRF with IP address *1.5.3.4*:

route-distingusher *1.5.3.4 12345*

route-target

This command adds a list of import and/or export route target extended communitites to the VRF.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

route-target {export} {*as_value* | *ip_address***}** *rt_value*

export

This keyword creates list of import route targets for the VRF with same parameters. The list contains AS number or IP address along with RT value.

as_value

The *ASN value* is a 16-bit autonomous-system (AS) number from 0 through 65535.

ip_address **}**

ip_address is an 32 bit IP address in IPv4 dotted decimal notation.

rt_value **}**

rt_value is an unique route target identifier and must be an integer between 0 through 4294967295.

Usage

Use this command to create the list of export and/or import route target extended communities for VRF. It specifies the a target VPN extened community.
A maximm of 5 route targets can be defined with this command up to release 9.0.

Important: This command must be executed for each route target extended communities.

Example

The following command creates an export list of route target extended community *12345* for VRF with AS number *300*:

```
route-target export  300 12345
```

The following command creates an export list of route target extended community *12345* for VRF with IP address *192.168.1.2*:

```
route-target export  192.168.1.2 12345
```

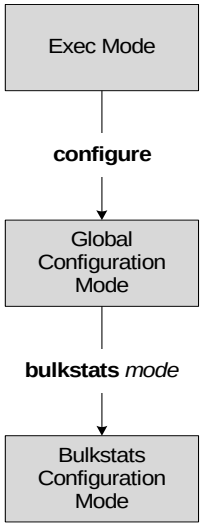
Chapter 31
Bulk Statistics File Configuration Mode Commands

This section describes a bulk statistic “file” under which to group the bulk statistic configuration. The Bulk Statistics File Configuration mode supports the configuration of “files” used for organizing bulk statistics schema, delivery options, and receiver information.

Because multiple “files” can be configured, this functionality provides greater flexibility in that it allows you to configure different schemas to go to different receivers. To configure a bulk statistics file, enter the following command:

Important: Use of bulk statistics “files” is optional. However system logically assigns “file 1” to the standard configuration. Therefore, if you wish to configure bulk statistics “files” at a later time, “file 1” can be used.

Caution: If the Web Element Manager application is used to collect and process (XML parsing, graphing, etc.) bulk statistics data, “file 1” is used by the Web Element Manager’s default bulk statistics collection information and schemas. To avoid errors in processing by the Web Element Manager, do not configure “file 1" via the CLI. However, it is possible to configure files 1 through 4 using the system’s CLI, regardless of whether or not the Web Element Manager is configured as a receiver. In this case, the bulk statistics data is written to the server but not processed by the Web Element Manager application.



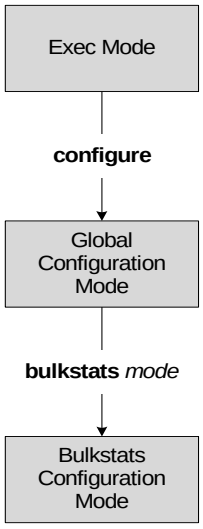
Important: The commands in this configuration mode are identical to the same commands in the “Bulk Statistics Configuration Mode Commands” chapter.

Chapter 32
Bulk Statistics Configuration Mode Commands

The Bulk Statistics Configuration Mode is used to manage the system statistics options for collection and delivery as well as for the format of data delivered to remote nodes.

Refer to the Common Syntax Options section in this chapter for information about formatting bulk statistics output.

Important: Unless otherwise indicated, all statistics are counters. For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295. For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.



Common Syntax Options

The following defines common syntax block options. These options appear in similar commands and are detailed here for easy reference.

Schema Format String Syntax

The schema format string is used to define the structure of generated bulk statistics data. The string may contain static text, dynamic content, and bulk statistic variables, or any combination.

Static text includes any ASCII characters that are of a fixed value. Static text may also include control characters by using escape character sequences.

Escape character shortcuts are supported are “\n” for new line and “\t” for tab.

Variables within the format string must be enclosed within “%”, for example “%var%”. The actual variables supported are command-dependent and are described in the *Statistics and Counters Reference*.

Common Statistics

For a list of the statistics that are common to all schema, refer to the *Statistics and Counters Reference*.

apn schema

This command configures APN bulk statistics schema.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

apn schema *schema_name* **format** *format_string*

no apn schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for APN bulk statistics collection. Multiple APN schemas can be created to further categorize APN-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple APN schemas, re-issue the **apn schema** command using a different schema name.

Example

The following command creates a schema called apn1stats1 that records the number of sessions currently facilitated by the APN:

apn schema *apn1stats1* **format** *"%sess-curr%"*

asngw schema

This command configures ASN-GW bulk statistics schema.

Product

ASN GW

Privilege

Security Administrator, Administrator

Syntax

asngw schema *schema_name* **format** *format_string*

no asngw schema *schema_name*

---

no

Removes the specified schema.

---

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

---

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for ASN-GW bulk statistics collection. Multiple ASN-GW service schemas can be created to further categorize ASN-GW service bulk statistics. All of the schemas are processed at each collection interval. To create multiple ASN-GW service schemas, re-issue the **asngw schema** command using a different schema name.

Example

To create an ASN-GW schema called *asngw_statistics* that specifies a schema format of:

- VPN context name: *vpnname*
- VPN Context Identifier: *vpnid*
- ASN-GW Service name: *servname*
- ASN-GW Service identifier: *servid*
- Peer IP address: *peeripaddr*

Use the following command:

```
asngw schema asngw_statistics format "VPN name: %vpnname%\nVPN ID:
%vpnid%\nASN-GW Service Name: %servname%\nASN-GW Service Identifier:
%servid%\nPeer IP Address: %peeripaddr%"
```

bcmcs schema

This command configures BCMCS bulk statistics schema.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

bcmcs schema *schema_name* **format** *format_string*

no bcmcs schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for BCMCS bulk statistics collection. Multiple BCMCS schemas can be created to further categorize BCMCS-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple BCMCS schemas, re-issue the **bcmcs schema** command using a different schema name.

Example

The following command creates a schema named *bcmcs1stats1* that records the number of sessions currently facilitated by BCMCS:

bcmcs schema *bcmcs1stats1* **format** *"%sess-curr%"*

card schema

This command configures card bulk statistics schema.

Product

All

Privilege

Security Administrator, Administrator

Syntax

card schema *schema_name* **format** *format_string*

no card schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for card bulk statistics collection. Multiple card schemas can be created to categorize card-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple card schemas, re-issue the **card schema** command using a different schema name.

Important: Not supported on all platforms

Example

The following command creates a schema called card1stats1 that records the number of processes for all installed cards:

```
card schema card1stats1 format "%slot%-%numproc%"
```

To create a card-level schema called cardresourcestats that specifies a schema format of:

```
Chassis slot number: slot
Available Memory: memtotal Memory Used (%): memused
```

Available CPU (%): cpuidle
Use the following command:

```
card schema cardresourcestats format "Chassis slot number:
%slot%\nAvailable Memory: %memtotal%\tMemory Used (%):
%memused%\nAvailable CPU (%): %cpuidle%"
```

context schema

This command configures Firewall bulk statistics schema.

Product

All

Privilege

Security Administrator, Administrator

Syntax

context schema *schema_name* **format** *format_string*

no context schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3600 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For the complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for Context bulk statistics collection. Multiple context schemas can be created to categorize context statistics. All of the schemas are processed at each collection interval. To create multiple context schemas, re-issue the context schema command using a different schema name.

Example

To create a context schema called *sfw_context_stats1* that specifies a schema format of:

- Total packets received by firewall: *sfw-total-rxpackets*
- Total packets sent by firewall: *sfw-total-txpackets*
- Total ICMP packets discarded by firewall: *fw-icmp-discardpackets*

Use the following command:

context schema *sfw_context_stats1* **format** "*Packets received Rx: %sfw-total-rxpackets%\nPackets Sent Tx:: %sfw-total-txpackets%\nICMP Packets discarded: %fw-icmp-discardpackets%*"

cscf schema

This command configures CSCF bulk statistics schema.

Product

SCM

Privilege

Security Administrator, Administrator

Syntax

cscf schema *schema_name* **format** *format_string*

no cscf schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for CSCF bulk statistics collection. Multiple CSCF-service schemas can be created to categorize CSCF-service bulk statistics. All of the schemas are processed at each collection interval. To create multiple CSCF-service schemas, re-issue the **cscf schema** command using a different schema name.

Example

To create a CSCF schema called *cscf_statistics* that specifies a schema format of:

- Call attempts received: *callattrx*
- Call attempts transmitted: *callatttx*
- Call successes received: *callsuccrx*
- Call successes transmitted: *callsucctx*
- Call failures received: *callfailrx*

- Call failures transmitted: *callfailtx*

Use the following command:

```
cscf schema cscf_statistics format "Call Attempts Rx: %callattrx%\nCall
Attempts Tx: %callatttx%\nCall Successes Rx: %callsuccrx%\nCall Successes
Tx: %callsucctx%\nCall Failures Rx: %callfailrx%\nCall Failures Tx:
%callfailtx%"
```

dcca schema

This command configures Diameter Credit Control Application (DCCA) bulk statistics schema. This command is available only in StarOS 9.0 and later releases.

Product

All

Privilege

Security Administrator, Administrator

Syntax

dcca schema *schema_name* **format** *format_string*

no dcca schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for DCCA bulk statistics collection.

default

Restores the system default for the option specified.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
default { limit | receiver mode | remotefile format | sample-interval |
transfer-interval }
```

limit

Restores the memory utilization limit system default: 1000 kilobytes.

receiver mode

Restores the behavior for sending files to the receivers to the default value.
Default: secondary-on-failure

remotefile format

Restores the format of remote bulkstats file names to the default value.
Default: "%date%-%time%"

sample-interval

Restores the system default for the local polling interval for statistic sampling.
Default: 15 minutes

transfer-interval

Restores the system default for the time between transfer of data files to receivers.
Default: 480 minutes

Usage

Restore the default values when troubleshooting the system. Setting values to the system defaults places them in well known states as starting points for monitoring for problems.

Example

```
default limit

default transfer-interval
```

dpca schema

This command configures Diameter Policy Control Application (DPCA) bulk statistics schema. This command is available only in StarOS 9.0 and later releases.

Product

All

Privilege

Security Administrator, Administrator

Syntax

dpca schema *schema_name* **format** *format_string*

no dpca schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for DPCA bulk statistics collection.

ecs schema

This command configures Enhanced Charging Service (ECS) bulk statistics schema.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ecs schema *schema_name* **format** *format_string*

no ecs schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for ECS bulk statistics collection. Multiple ECS schemas can be created to categorize ECS bulk statistics. All of the schemas are processed at each collection interval. To create multiple ECS schemas, re-issue the **ecs schema** command using a different schema name.

egtpc schema

Configures the enhanced GTP-C statistics schema for naming conventions of data files.

Product

P-GW, S-GW

Privilege

Administrator

Syntax

egtpc schema *schema_name* **format** *format_string*

no egtpc schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for enhanced GTP-C bulk statistics collection. Multiple eGTP-C service schemas can be created to categorize eGTP-C service bulk statistics. All of the schemas are processed at each collection interval. To create multiple eGTP-C service schemas, re-issue the **egtpc schema** command using a different schema name.

Example

For an eGTP-C-level schema called *egtpcservicestats* that specifies a schema format of:
Tunnel - Create Session Request Sent: tun-sent-cresess
Tunnel - Create Session Request Received: tun-recv-cresess
Use the following command:

```
egtpc schema egtpcservicestats format "Number of GTP Tunnel Requests
Sent: %tun-sent-cresess%\nNumber of GTP Tunnel Requests Received: %tun-
recv-cresess%\n"
```

end

Exits the bulk statistics configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the bulk statistics configuration mode and returns to the global configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the global configuration mode.

fa schema

This command configures Foreign Agent (FA) bulk statistics schema.

Product

All

Privilege

Security Administrator, Administrator

Syntax

fa schema *schema_name* **format** *format_string*

no fa schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for FA bulk statistics collection. Multiple FA service schemas can be created to categorize FA service bulk statistics. All of the schemas are processed at each collection interval. To create multiple FA service schemas, re-issue the **fa schema** command using a different schema name.

Example

To create a FA-level schema named *faservicestats* that separates the *date*, *time*, and *vpnname* by tabs, enter the following command:

```
fa schema faservicestats format %date%\t%time%\t%vpnname%
```

The schema format appears as follows:

```
date    time    vpnname
```

file

Enters the Bulk Statistics File Configuration mode which supports the configuration of “files” used for grouping bulk statistic configuration information.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] file` *number*

`no`

Removes a previously configured bulk statistic file.

number

Specifies the a number for the bulkstatistics file. This number is how the file is recognized by the system. *number* must be an integer value from 1 to 4.

Usage

Bulk statistics “files” are used to group bulk statistic schema, delivery options, and receiver configuration. Because multiple “files” can be configured, this functionality provides greater flexibility in that it allows you to configure different schemas to go to different receivers. A Maximum of 4 files can be assigned for bulk statistics collection.

Executing this command allows you to enter the Bulk Statistics File Configuration Mode. This mode supports all of the commands from the Bulk Statistics Configuration mode except **`limit, local-directory, sample-interval,`** and **`transfer-interval`** (these commands are configured globally for all “files”).

Important: Use of bulk statistics “files” is optional. If you do not wish to configure bulk statistic “files”, you can perform a standard configuration using the commands in the Bulk Statistic Configuration Mode. Note, however, that the system logically assigns “file 1” to the standard configuration. Therefore, if you wish to configure bulk statistics “files” at a later time, “file 1” will already be used.

Caution: If the Web Element Manager application is used to collect and process (XML parsing, graphing, etc.) bulk statistics data, “file 1” is used by the Web Element Manager’s default bulk statistics collection information and schemas. To avoid errors in processing by the Web Element Manager, do not configure "file 1" via the CLI. However, it is possible to configure files 1 through 4 using the system’s CLI, regardless of whether or not the Web Element Manager is configured as a receiver. In this case, the bulk statistics data is written to the server but not processed by the Web Element Manager application.

Example

The following command creates a bulk statistics file numbered 2 and enter the Bulk Statistics File Configuration Mode:

file *2*

footer

Configures the footer string placed in the end of the generated bulk statistics data files.

Product

All

Privilege

Security Administrator, Administrator

Syntax

footer format *format_string*

no footer format

no

Clears the footer format string which results in the default file footer being used in generated data files.

format *format_string*

Default: "" (an empty footer)
Specifies the footer format string for use in generated data files. *format_string* must be from 1 to 2047 alpha and/or numeric characters with no spaces or as a quoted string. The format string syntax is described in the Schema Format String Syntax section.
The following variables are supported:

Table 13. footer Command Format String Variables

Variable	Description	Data Type
date	The date that the collection file was created in YYYYMMDD format where YYYY represents the year, MM represents the month and DD represents the day.	String
host	The system hostname that created the file	String
ipaddr	The default management (local context) IP address in ###.###.###.### format. An empty string is inserted if no address is available.	String
sysuptime	The uptime (in seconds) of the system that created the file.	32-bit signed
time	The time that the collection file was created in HHMMSS format where HH represents the hours, MM represents the minutes, and SS represents the seconds.	String

Usage

Define a unique footer in data files which allows for easy identification of which system generated the data file or any other useful information. The use of the variables is suggested so as to allow for a uniform footer across all systems. The hostname variable should be used to identify the source of the data in the footer and all remaining items can be formatted consistently across all chassis.

Example

Following command can be used to define different header formats:

```
footer format northStreet

footer format "Created on: %date%-%time% by %host%"

no footer format
```

gather-on-standby

This command controls whether or not statistics are gathered when a system is in the standby state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] gather-on-standby
```

no

Do not gather bulk statistics when the system is in the standby state.

default

Reset this command to its default action of gathering bulk statistics when the system is in the standby state.

Usage

Use this command to configure a system to either gather or not gather statistics when the system is in the standby state. This is useful for HA or GGSN systems configured for Interchassis Session Recovery. See the System Administration Guide for more details on this feature.
If a chassis transitions to standby state and it has accumulated but not yet transferred bulk statistics data, the previously accumulated data is transferred at the first opportunity, but no additional statistics gathering takes place.

Example

The following command disables gathering statistics when the system is in the standby state:

```
no gather-on-standby
```

The following command enables the gathering of statistics when the system is in the standby state:

```
gather-on-standby
```

gprs schema

This command configures GPRS bulk statistics schema.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gprs schema*schema_name* **format** *format_string*

no gprs schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

gtpc schema

This command configures GPRS Tunneling Protocol-Control (GTPC) message statistics schema.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gtpc schema *gtpc_schema_name* **format** *gtpc_schema_format*

no gtpc schema*gtpc_schema_name*

no

Removes the specified schema.

gtpc_schema_name

Specifies the schema name.
gtpc_schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *gtpc_schema_format*

Specifies the schema format.
gtpc_schema_format must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for GTPC bulk statistics collection. Multiple GTPC schemas can be created to categorize GTPC bulk statistics. All of the schemas are processed at each collection interval. To create multiple GTPC schemas, re-issue the **gtpc schema** command using a different schema name.

Example

To create a GTPC-level schema named *gtpc_stats* that specifies a schema format of:

```
Context Name: vpnname
GGSN Service Name: servname
Total PDP Contexts Processed: setup-total
```

Use the following command:

```
gtpc schema gtpc_stats format "Context Name: %vpnname%\nGGSN Service
Name: %servname%\nTotal PDP Contexts Processed: %setup-total%\n"
```

gtpp schema

This command configures GPRS Tunneling Protocol-Prime (GTPP) statistics schema.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp schema *gtpp_schema_name* **format** *gtpp_schema_format*

no gtpp schema *gtpp_schema_name*

no

Removes the specified schema.

gtpp_schema_name

Specifies the schema name.
gtpp_schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *gtpp_schema_format*

Specifies the schema format.
gtpp_schema_format must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for GTPP bulk statistics collection. Multiple GTPP schemas can be created to categorize GTPP bulk statistics. All of the schemas are processed at each collection interval. To create multiple GTPP schemas, re-issue the **gtpp schema** command using a different schema name.

Example

To create a GTPP schema named *gtpp_statistics* that specifies a schema format of:
Time: time Total Redirection Requests Received: redir-rcvd
Use the following command:

```
gtpp schema gtpp_statistics format "Time: %time%\tTotal Redirection
Requests Received: %redir-rcvd%\n"
```

ha schema

This command configures Home Agent (HA) bulk statistics schema.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

ha schema *schema_name* **format** *format_string*

no ha schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for HA bulk statistics collection. Multiple HA service schemas can be created to categorize HA service bulk statistics. All of the schemas are processed at each collection interval. To create multiple HA service schemas, re-issue the **ha schema** command using a different schema name.

Example

For an HA schema named *haservicestats* that specifies a schema format of:
Number of HA authentication failures: reply-haauthfail
Number of Mobile Node authentication failures: reply-mnauthfail
Use the following command:

```
ha schema haservicestats format "Number of HA authentication failures:
%reply-haauthfail%\nNumber of Mobile Node authentication failures:
%reply-mnauthfail%\n"
```

header

Configures the header string placed in the beginning of the generated bulk statistics data files.

Product

All

Privilege

Security Administrator, Administrator

Syntax

header format *format_string*

no header format

no

Clears the header format string which results in the default file header being used in generated data files.

format *format_string*

Default: "" (an empty header)
Specifies the header format string for use in generated data files. *format_string* must be from 1 to 2047 alpha and/or numeric characters with no spaces or as a quoted string. The format string syntax is described in the Schema Format String Syntax section.
The following variables are supported:

Table 14. header Command Format String Variables

Variable	Description	Data Type
date	The UTC date that the collection file was created in YYYYMMDD format where YYYY represents the year, MM represents the month and DD represents the day.	String
date3	The UTC date that the collection file was created in YYMMDD format where YY represents the year, MM represents the month and DD represents the day.	String
host	The system hostname that created the file	String
ipaddr	The default management (local context) IP address in ###.###.###.### format. An empty string is inserted if no address is available.	String
sysuptime	The uptime (in seconds) of the system that created the file.	32-bit signed
time	The time that the collection file was created in HHMMSS format where HH represents the hours, MM represents the minutes, and SS represents the seconds.	String

Usage

Define a unique header in data files which allows for easy identification of which system generated the data file or any other useful information.

The use of the variables is suggested so as to allow for a uniform header across all systems. The hostname variable should be used to identify the source of the data in the header and all remaining items can be formatted consistently across all chassis.

Example

Following command can be used to define different header formats:

```
header format northStreet

header format "Created on: %date%-%time% by %host%"

no header format
```

ippool schema

This command configures IP pool bulk statistics schema.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ippool schema *schema_name* **format** *format_string*

no ippool schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for IP pool bulk statistics collection. Multiple IP pool schemas can be created to further IP pool bulk statistics. All of the schemas are processed at each collection interval. To create multiple IP pool schemas, re-issue the **ippool schema** command using a different schema name.

Example

To create an IP pool schema named *ippoolstats* that specifies a schema format of:
Number of IP addresses on hold: hold
Number of free IP addresses: free
Use the following command:

```
ippool schema ippoolstats  format"Number of IP addresses on hold:
%hold%\nNumber of free IP addresses: %free%\n"
```

ipsg schema

This command configures IP Services Gateway (IPSG) bulk statistics schema.

Product

IPSG

Privilege

Security Administrator, Administrator

Syntax

ipsg schema *schema_name* **format** *format_string*

no ipsg schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define the schemas used for IPSG bulk statistics collection. Multiple IPSG schemas can be created to categorize IPSG bulk statistics. All of the schemas are processed at each collection interval. To create multiple schemas, re-issue the **ipsg schema** command using a different schema name.

Example

To create an IPSG schema named *ipsgstats* that specifies a schema format of:
Context name: vpnname
Service name: servname
Total responses sent: total-rsp-sent
Use the following command:

```
ipsg schema ippoolstats format "Context name: %vpnname%\nService name:
%servname%\nTotal responses sent: %total-rsp-sent%\n"
```

lac schema

This command configures LAC bulk statistics schema.

Product

All

Privilege

Security Administrator, Administrator

Syntax

lac schema *schema_name* **format** *format_string*

no lac schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see TSchema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for LAC bulk statistics collection. Multiple LAC schemas can be created to categorize LAC bulk statistics. All of the schemas are processed at each collection interval. To create multiple schemas, re-issue the **lac schema** command using a different schema name.

Example

The following command creates a schema called lac1stats1 that records the number of active subscriber sessions and the number of sessions that failed or were disconnected due to the maximum tunnel limit being reached:

```
lac schema lac1stats1 format "%sess-curactive%-%sess-maxtunnel%"
```

To create a schema called *lacresourcestats* that specifies a schema format of:
Number of Successful Session Connections: sess-successful
Number of Session Attempts That Failed: sess-failed
Number of Sessions Currently Active: sess-curative
Use the following command:

lac schema *lacresourcestats* **format** *"Number of Successful Session Connections: %sess-successful%\nNumber of Session Attempts That Failed: %sess-failed%\nNumber of Sessions Currently Active: %sess-curative%"*

limit

Configures the maximum amount of system memory bulk statistics may utilize.

Product

All

Privilege

Security Administrator, Administrator

Syntax

limit *kilobytes*

kilobytes

Specifies the maximum amount of memory, in kilobytes, that may be used for bulk statistics. *kilobytes* must be a value in the range from 1 to 32000.

Usage

Adjust bulk statics memory usage when considering the sampling interval adjustments.
The system is shipped from the factory with the limit set to 1000.

Caution: Bulk statistics are stored in Random Access Memory (RAM) on the SPC/SMC. In the event of power loss or system failure, the statistics will be lost. If the maximum storage limit has been reached before the system's configured transfer-interval is reached, the oldest information stored in the collection will be overwritten.

Example

limit *2048*

lma schema

Configures the Local Mobility Anchor (LMA) statistics schema for naming conventions of data files.

Product

P-GW

Privilege

Administrator

Syntax

lma schema *schema_name* **format** *format_string*

no lma schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for LMA bulk statistics collection. Multiple LMA service schemas can be created to categorize LMA service bulk statistics. All of the schemas are processed at each collection interval. To create multiple LMA service schemas, re-issue the **lma schema** command using a different schema name.

Example

For an LMA-level schema called *lmaservicestats* that specifies a schema format of:
Binding Update Received: bindupd
Binding Update Received - Denied: bindupd-denied
Use the following command:

```
lma schema lmaservicestats format "Number of Binding Updates Received:
%bindupd%\nNumber of Binding Updates Received and Denied: %bindupd-
denied%\n"
```

local-directory

Sets the local directory for storing bulkstats collection files

Product

All

Privilege

Security Administrator, Administrator

Syntax

local-directory *pathname*

no local-directory

no

Delete the setting for local-directory.

pathname

The local path of the directory in which to store bulkstats collection files. This must be an alpha and/or numeric string of 1 to 127 characters. Pathnames are case sensitive.

Usage

Use this command to designate a directory on a local file system in which collection files with bulkstats information are stored. The directory specified must already exist. Use the Exec Mode command **mkdir** to create a directory.

Example

To specify that bulkstats collection files are stored in the local directory /flash/bulkstats, enter the following command:

```
local-directory /flash/bulkstats
```

mag schema

Configures the Mobile Access Gateway (MAG) statistics schema for naming conventions of data files.

Product

HSGW, S-GW

Privilege

Administrator

Syntax

mag schema *schema_name* **format** *format_string*

no mag schema *schema_name*

no

Removes the specified schema from MAG bulk statistics generation.

schema_name

Specifies the name to use to refer to the schema and associated format string.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for MAG bulk statistics collection. Multiple MAG service schemas can be created to categorize MAG service bulk statistics. All of the schemas are processed at each collection interval. To create multiple MAG service schemas, re-issue the **mag schema** command using a different schema name.

Example

For a MAG-level schema called *magservicestats* that specifies a schema format of:
Binding Update Sent: bindupd
Binding Acknowledgement Received: bindack
Use the following command:

```
mag schema magservicestats format "Number of Binding Updates Sent:
%bindupd%\nNumber of Binding Acknowledgements Received: %bindack%\n"
```

mipv6ha schema

This command configures MIPv6 HA bulk statistics schema.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

mipv6ha schema *schema_name* **format** *format_string*

no mipv6ha schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for MIPv6 HA bulk statistics collection. Multiple MIPv6 HA bulk statistics schemas can be created to categorize MIPv6 HA bulk statistics. All of the schemas are processed at each collection interval. To create multiple MIPv6 HA service schemas, re-issue the **mipv6ha schema** command using a different schema name.

Example

The following command creates a schema called *mipv6haservicestats* that records the number of authorization attempt failures due to access rejects from AAA:

mipv6ha schema *mipv6haservicestats* **format** *"%aaa-actauthfail%"*

nat-realm schema

This command creates and configures Network Address Translation (NAT) realm statistics schema.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

nat-realm schema *schema_name* **format** *format_string*

no nat-realm schema *schema_name*

schema_name

Specifies the NAT realm bulk statistics schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for NAT Realm bulk statistics collection. Multiple NAT realm schemas can be created to further categorize NAT realm level bulk statistics. All of the schemas are processed at each collection interval. To create multiple NAT Realm schemas, re-issue the **nat-realm schema** command using a different schema name.

Example

The following command creates a NAT realm schema with the VPN name, realm name, and flows information:

nat-realm schema *relam1* **format** *"%vpnname% %realmname% %nat-rlm-flows%"*

pdif schema

This command configures PDIF bulk statistics schema.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

pdif schema *schema_name* **format** *format_string*

no pdif schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3600 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for PDIF bulk statistics collection. Multiple PDIF schemas can be created to categorize PDIF bulk statistics. All of the schemas are processed at each collection interval. To create multiple schemas, re-issue the **pdif schema** command using a different schema name.

Example

The following command creates a schema called *pdifschema1* for the category current active ipv4 sessions:

pdif schema *pdifschema1* **format** *%sess-curactip4%*

port schema

This command configures port bulk statistics schema.

Product

All

Privilege

Security Administrator, Administrator

Syntax

port schema *schema_name* **format** *format_string*

no port schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for port bulk statistics collection. Multiple port schemas can be created to categorize port-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple port schemas, re-issue the **port schema** command using a different schema name.

Important: The *card* variable in the Port schema is not supported on all platforms

Example

To create a port-level schema named *portstats1* that separates the *card/port*, *bcast_inpackets*, and *bcast-outpackets* variables by hyphens ("-"), enter the following command:

```
port schema portstats1 format "%card%/%port% - %bcast_inpackets% -
%bcast_outpackets%"
```

ppp schema

This command configures point-to-point protocol bulk statistics schema.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ppp schema *schema_name* **format** *format_string*

no ppp schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for point-to-point protocol bulk statistics collection. Multiple PPP-service schemas can be created to categorize PPP-service bulk statistics. All of the schemas are processed at each collection interval. To create multiple PPP-service schemas, re-issue the **ppp schema** command using a different schema name.

Example

To create a ppp-level schema named *pppstats* that specifies a schema format of:

```
CHAP:
Auth. Attempts: auth-attempt-chapAuth. Successes: auth-success-chap
PAP:
Auth. Attempts: auth-attempt-papAuth. Successes: auth-success-pap
```

Use the following command:

ppp schema *pppstats* **format** *"CHAP:\nAuth. Attempts: %auth-attempt-chap%\tAuth. Successes: %auth-success-chap%\nPAP:\nAuth. Attempts: %auth-attempt-pap%\tAuth. Successes: %auth-success-pap%\n"*

radius schema

This command configures RADIUS bulk statistics schema.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

radius schema *schema_name* **format** *format_string*

no radius schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length and is case sensitive.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for RADIUS bulk statistics collection. Multiple RADIUS schemas can be created to categorize RADIUS bulk statistics. All of the schemas are processed at each collection interval. To create multiple RADIUS schemas, re-issue the **radius schema** command using a different schema name.

Example

To create a RADIUS schema named *radius_statistics* that specifies a schema format of:

- Server: ipaddr
- Authentication Requests Sent: auth-req-sent
- Accounting Requests Sent: acc-req-sent

Use the following command:

radius schema *radius_statistics* **format** *"Server: %ipaddr%\nAuthentication Requests Sent: %auth-req-sent%\nAccounting Requests Sent: %acc-req-sent%"*

receiver

Configures host system to receive bulkstats information through TFTP transfer.

Product

All

Privilege

Security Administrator, Administrator

Syntax

receiver { mode { redundant | secondary-on-failure } | *ip_address* { primary | secondary } [mechanism { { { ftp | sftp } login *user_name* [encrypted] password *pwd* } | tftp } }] }

no receiver*ip_address*

---

no

Removes the receiver specified from the list of receivers where data files are sent.

---

mode { redundant | secondary-on-failure }

Determines how bulkstats are delivered to the primary and secondary receivers.
Default: **secondary-on-failure**
redundant: Files are transferred to both the primary and secondary receivers. If either transfer isn't possible, the file is transferred when possible. The system continues to hold in memory as much data as possible until the data has been successfully transferred to both receivers. Data is only discarded if the in-memory data reaches the configured limit. Refer to the **limit** command.
secondary-on-failure: Files are transferred to the secondary receiver if the primary receiver fails. In-memory data is erased once the data is transferred to either the primary or secondary receiver. This is the default behavior.

---

ip_address

Specifies the IP address of the receiver of interest. *ip_address* must be specified using the standard IPv4 dotted decimal notation.

---

primary | secondary

Primary and secondary are used to indicate the order in which receivers are connected. The secondary is used when the primary is unreachable.
primary: indicates the receiver is the primary receiver of data.
secondary: indicates the receiver is the secondary receiver of data.

---

mechanism { { { ftp | sftp } login *user_name* **[encrypted] password** *pwd* **} | tftp } }**

Specifies the method by which data is transferred to the receiver.
ftp login *user_name* [**encrypted**] **password** *pwd*: the FTP protocol shall be used for data file transfer. *user_name* specifies the user to provide for remote system secure logins and must be an alpha and/or numeric string of 1 through 31 characters in length. The password to use for remote system

authentication is specified as *pwd* and must be from 1 to 31 alpha and/or numeric characters or 1 to 64 alpha and/or numeric characters if the **encrypted** keyword is also specified.
sftp login *user_name* [**encrypted**] **password** *pwd*: the SFTP protocol shall be used for data file transfer. *user_name* specifies the user to provide for remote system secure logins and must be an alpha and/or numeric string of 1 through 31 characters in length. The password to use for remote system authentication is specified as *pwd* and must be from 1 to 31 alpha and/or numeric characters or 1 to 64 alpha and/or numeric characters if the **encrypted** keyword is also specified.
tftp: the TFTP protocol is to be used to transfer files.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

Usage

Use TFTP methods to reduce transfer times if excessive system resources are being used across the network for transfer of data.
FTP transfer method allows for login which then provides system logging within the enabled FTP logs.
The initially connection is attempted to the primary. If the primary is unreachable for any reason the secondary is used. If the secondary is also unreachable the system retrys after a delay period where it again attempts to connect to the primary followed by the secondary as necessary.

Important: For redundant receivers, configuration changes to the receivers are applied to all existing and all subsequent data sets pending transfer. If no receiver is configured, bulk statistics will be collected and stored on the system until the maximum amount of memory is used; they will not be transferred to the receiver(s). When the storage limit has been reached the oldest information is overwritten. When a receiver is configured for the primary and secondary target, this command will use both receivers as default if no receiver is specified.

Example

```
receiver 1.2.3.4 primary mechanism tftp

receiver 1.2.3.5 secondary

no receiver 1.2.3.4
```

remotefile

Configures the naming convention with support for multiple file format to multiple receivers when storing the data files on the remote receiver/s.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
remotefile format format_string [ both-receivers | primary-receiver | secondary-receiver ]

no remotefile format
```

no

Resets the remote file naming convention to the system default.

format *format_string*

Default: "%date%-%time%"
Specifies the naming convention format to use. *format_string* must be from 1 to 127 alpha and/or numeric characters with no spaces or as a quoted string. The format string syntax is described in the Schema Format String Syntax section.

Important: The remote file naming format should only use static text and bulk statistic variables to avoid any possible file creation issues on the receivers.

The following variables are supported:

Table 15. remote file Command Naming Format Variables

Variable	Description	Data Type
date	The UTC date that the collection file was created in YYYYMMDD format where YYYY represents the year, MM represents the month and DD represents the day.	String
date3	The UTC date that the collection file was created in YYMMDD format where YY represents the year, MM represents the month and DD represents the day.	String
host	The system hostname that created the file	String
sysuptime	The uptime (in seconds) of the system that created the file.	32-bit signed
time	The time that the collection file was created in HHMMSS format where HH represents the hours, MM represents the minutes, and SS represents the seconds.	String

both-receivers | primary-receiver | secondary-receiver

Set the remote file creation target to both receivers, primary receiver or secondary receiver.
Default: Both receivers.

Usage

Set the remote file naming format to ensure consistent data file naming across a network or adjusting a single system's format for easy identification.
This command specify whether the format should be used in conjunction with both receivers, only the primary receiver, or only the secondary receiver.

Important: For redundant receivers, the filenames for the output data files are applied when the information is first gathered. If the name format is modified, the change takes effect for the next data set. The current data set name remains unchanged. even if has not yet been transferred.

Example

```
remotefile format simpleFormat

remotefile format "%host%-%date%-%time%"

remotefile format "%host%-%date%-%time%" both-receivers

remotefile format "%host%-%date%" primary-receiver

no remotefile format
```

rp schema

This command configures R-P bulk statistics schema.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

rp schema *schema_name* **format** *format_string*

no rp schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for R-P bulk statistics collection. Multiple PDSN service schemas can be created to categorize PDSN service bulk statistics. All of the schemas are processed at each collection interval. To create multiple PDSN service schemas, re-issue the **rp schema** command using a different schema name.

Example

To create an PDSN-level schema called pdsnservicestats that specifies a schema format of:

```
Date: date
Time: time
Number of Authentication Denials: deny-auth
```

Use the following command:

```
rp schema rpservicestats format "Date: %date%\nTime: %time%\nNumber of
Authentication Denials: %deny-auth%\n"
```

sample-interval

This command configures the time interval between collecting local statistics.

Product

All

Privilege

Security Administrator, Administrator

Syntax

sample-interval *minutes*

minutes

Specifies the frequency of polling for local statistics.
minutes must be an integer from 1 through 1440.

Usage

Adjust the sampling interval to tune the system response as shorter periods can cause undue system overhead whereas longer periods have less of a statistical importance when analyzing data.
The system is shipped from the factory with the sampling interval set to 15 minutes.

Example

sample-interval *120*

sccp schema

This command configures the statistics collection schema for the Signalling Connection Control Part function (SCCP).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
sccp schema schema_name format format_string
no sccp schema schema_name
```

no

Removes the specified SCCP schema from statistics collection.

schema_name

Specifies the name to use to refer to the schema and associated format string. *schema_name* must be from 1 to 31 alpha and/or numeric characters.

format *format_string*

Specifies the naming convention format to use. *format_string* must be from 1 to 3599 alpha and/or numeric characters with no spaces or as a quoted string. The format string syntax is described by Schema Format String Syntax .

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

schema

This command configures the system-level bulk statistics schema.

Product

All

Privilege

Security Administrator, Administrator

Syntax

schema *schema_name* **format** *format_string*

no schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name.
schema_name must be an alpha and/or numeric string of 1 through 31 characters in length.

format *format_string*

Specifies the schema format.
format_string must be an alpha and/or numeric string of 1 through 3599 characters in length, and cannot include spaces or must be a quoted string. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for system-level bulk statistics collection. Multiple schemas can be created to categorize system-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple system schemas, re-issue the **schema** command using a different schema name.

Example

The following command creates a schema called *systemstats1* that records the number of current Simple IP and the number of current Mobile IP sessions:

```
schema systemstats1 format "%sess-cursipconn% - %sess-curmipconn%"
```

To create a system-level schema called bulksysstats that specifies a schema format of:
Number of currently active sessions: sess-curactcall
Number of currently dormant sessions: sess-curdormcall
Use the following command:

schema *bulksysstats* **format** *"Number of currently active sessions: %sess-curactcall%\nNumber of currently dormant sessions: %sess-curdormcall%\n"*

sgsn schema

This command configures the statistics collection schema for the SGSN services.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sgsn schema *schema_name* **format** *format_string*

no sgsn schema *schema_name*

no

Removes the specified SGSN schema from statistics collection.

schema_name

Specifies the name to use to refer to the schema and associated format string. *schema_name* must be from 1 to 31 alpha and/or numeric characters.

format *format_string*

Specifies the naming convention format to use. *format_string* must be from 1 to 3599 alpha and/or numeric characters with no spaces or as a quoted string. The format string syntax is described by Schema Format String Syntax .

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

sgtp schema

This command configures the statistics collection schema for the SGSN's GTP-C and GTP-U activity.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sgtp schema *schema_name* **format** *format_string*

no sgtp schema *schema_name*

no

Removes the specified SGTP schema from statistics collection.

schema_name

Specifies the name to use to refer to the schema and associated format string. *schema_name* must be from 1 to 31 alpha and/or numeric characters.

format *format_string*

Specifies the naming convention format to use. *format_string* must be from 1 to 3599 alpha and/or numeric characters with no spaces or as a quoted string. The format string syntax is described by Schema Format String Syntax .

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

ss7link schema

This command configures the collection schema for the SS7 Link services statistics.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ss7link schema *schema_name* **format** *format_string*

no ss7link schema *schema_name*

no

Removes the specified SS7 Link schema from statistics collection.

schema_name

Specifies the name to use to refer to the schema and associated format string. *schema_name* must be from 1 to 31 alpha and/or numeric characters.

format *format_string*

Specifies the naming convention format to use. *format_string* must be from 1 to 3599 alpha and/or numeric characters with no spaces or as a quoted string. The format string syntax is described by Schema Format String Syntax .

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

ss7rd schema

This command configures the collection schema for the SS7 Routing Domain services statistics which include the statistics for Stream Control Transmission Protocol (SCTP) activities, the statistics for MTP3, and M3UA data activity.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ss7rd schema *schema_name* **format** *format_string*

no ss7rd schema *schema_name*

no

Removes the specified SS7 routing domain schema from statistics collection.

schema_name

Specifies the name to use to refer to the schema and associated format string. *schema_name* must be from 1 to 31 alpha and/or numeric characters.

format *format_string*

Specifies the naming convention format to use. *format_string* must be from 1 to 3599 alpha and/or numeric characters with no spaces or as a quoted string. The format string syntax is described by Schema Format String Syntax .

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

show variables

Displays the bulk statistics variable information.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
show variables [ [ apn | asngw | bcmcs | card | closedrp | common | context |
cscf | ecs | dcca | dpca | fa | gprs | gtpc | gtpp | ha | imsa | ippool | ipsg |
lac | nat-realm | pdg| pdif | port | ppp | radius | rp | sccp | sgsn | sgtp |
ss7rd | ss7link| system | vpn ] [ obsolete ] ]
```

```
show variables [ [ apn | asngw | bcmcs | card | closedrp | common |
context | cscf | ecs | dcca | dpca | fa | gprs | gtpc | gtpp | ha | imsa
| ippool | ipsg | lac | nat-realm | pdg| pdif | port | ppp | radius | rp
| sccp | sgsn | sgtp | ss7rd | ss7link| system | vpn ] [ obsolete ] ]
```

Displays only the variables for the specified schema.
If the **obsolete** keyword is used, obsolete (but still available) schema variables are displayed. An asterisk (*) is displayed next to schema variables that have been obsoleted.

Usage

Use this command to list supported bulk statistic variables. Variables can be listed for a specified schema. If no schema is specified, all supported variables are listed on a per-schema basis.

Example

The following command displays the bulkstat variables only for the card schema:

```
show variables card
```

transfer-interval

Configures the frequency of transfer of collected statistics to the receiver.

Product

All

Privilege

Security Administrator, Administrator

Syntax

transfer-interval *minutes*

minutes

Specifies the number of minutes between the transfer of collected statistics to the receivers. *minutes* must be an integer from 1 through 999999.

Usage

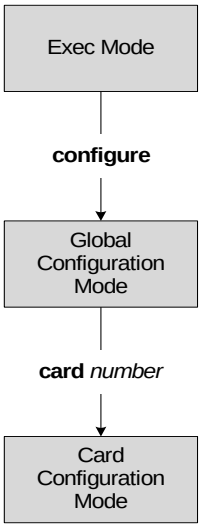
Modify the transfer interval based upon the number of sessions per second. As the number of session requests a second increases it may become necessary to increase the transfer interval to reduce the processing overhead frequency for statistics delivery. This is tempered by the impact reduced resolution of statical data has on usefulness of data when the interval gets larger than the least busy hours and most busy hours of the day.
The system is shipped from the factory with the transfer interval set to 480 minutes.

Example

transfer-interval *1440*

Chapter 33
Card Configuration Mode Commands

Use the Card Configuration Mode to create and manage the physical cards in the chassis.



aps

This command configures automatic protection switching (APS) features for SONET/SDH line cards: OLC2 or CLC2.

Important: This feature is not yet fully supported.

Product

SGSN

Privilege

Security Administrator, Administrator

1+1

Linear 1+1 Uni-directional APS type redundancy:

-

1:1

APS type Linear 1:1 Bi-directional.

non-revertive

revertive

-noconfirm

Instructs the system to execute the command without additional prompting for command confirmation.

end

Use this command to exit the card configuration mode and return to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the command mode back to the Exec mode.

exit

Use this command to exit card configuration mode, and return the CLI session to the previous mode, global configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the global configuration mode.

framing

Use this command to configure the type of framing to be used for the signaling generated on a specific line card.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
framing { ethernet | sdh [ ds1 | e1 ] | sonet [ ds1 | e1 ] | unspecified } [ -
noconfirm ]

default framing [ -noconfirm ]
```

default

Resets the framing generated by the card to the default for the particular card type.

ethernet

Configures the system to use Ethernet framing for this line card. This type of framing can only be used on an Ethernet card.
Default: Ethernet framing type is the default for an Ethernet line card.

Important: Using this keyword with an OLC/OLC2 or CLC/CLC2 would take the card offline.

sdh [ds1 | e1]

Configures the system to use SDH signal framing for either an OLC/OLC2 or CLC/CLC2 line card in an SGSN.

Important: Using this keyword with an Ethernet line card takes the line card offline.

In releases 8.1 and higher, you can also set the type of signaling path for a CLC2.
ds1 - configures the card to support a DS1/T1.
e1 - configures the card to support an E1. This is the default for SDH.

sonet [ds1 | e1]

Configures the system to use SONET signal framing for either an OLC/OLC2 or CLC/CLC2 line card in an SGSN.
Default: SONET is the default framing type for an OLC/OLC2 or CLC/CLC2 line card.

Important: Using this keyword with an Ethernet line card takes the line card offline.

In releases 8.1 and higher, you can also set the type of signaling path for a CLC2.
ds1 - configures the card to support a DS1/T. This is the default for SONET.

e1 - configures the card to support an E1.

unspecified

Configures the system to use the default framing type for the particular line card resident in the identified slot.

-noconfirm

Instructs the system to execute the command without additional prompting for command confirmation.

Usage

Use the **framing** command to identify the type of signal framing to be used by the line card in the identified slot.

Note that each type of line card uses a different type of signal framing. If you configure the wrong framing type for a line card, the line card is taken offline.

Important: This command is not supported on all platforms.

Example

Use the following command to configure SDH signal framing on a CLC2. If you do not include the path-type, the default of **e1** is automatically included in the card's framing configuration:

```
framing sdh
```

header-type

Use this command to define the size of the header frame for Frame Relay transmissions over a CLC or CLC2 channelized line card.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

header-type *header-size* [**-noconfirm**]

default header-type [-noconfirm]

default

Resets the configuration to the default header size of 2-bytes.

header-size

This sets the size, number of bytes, for the header frame.
header-size must be either 2-bytes or 4-bytes.

-noconfirm

Instructs the system to execute the command without additional prompting for command confirmation.

Usage

Use this command to set the size of the header frame for Frame Relay messages emanating from the line card. The size (2-bytes or 4-bytes) determines the amount of information that can be transmitted in that first information frame.

Important: Not supported on all platforms

Example

Set the header to the smallest size.

header-type *2-byte*

initial-e1-framing

Use this command to configure the type of framing mode that will initially be available at the time the line card boots.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
initial-e1-framing [ crc4 | standard ]

default initial-e1-framing
```

default

Returns the configuration to CRC4 as the default type.

crc4

Accepts the default CRC4, in the configuration, as the initial at-boot framing mode.

standard

Accepts the **standard** mode as the initialization framing mode.

Usage

For a CLC-type line card, the default E1 framing mode is CRC4. When a card reboots, all E1s are initialized with CRC4 framing mode and then switch to the configured framing mode. With this keyword, you have the option to choose the initialization framing mode.

Important: Only supported on CLC/CLC2

Example

```
initial-e1-framing standard
```

link-aggregation

Configures the link-aggregation system-priority for a Quad Gig-E line card (QGLC). This parameter is usually changed to match the feature requirements of the remote switch.

Product

WiMAX, PDSN, HA, FA, GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

link-aggregation { system-priority *priority* | **toggle-link } [-noconfirm]**

{ default | no } link-aggregation { system-priority | toggle-link } [-noconfirm]

default

Resets the configuration to the default.

link-aggregation system-priority *priority*

This command sets the system priority used by LACP to form the system ID.
priority is a hex value in the range of 0x0000 to 0xFFFF.
Default system priority value is 0x8000 (32768).

toggle-link

When enabled, port line down and port link up events are generated.
Default is disabled.

-noconfirm

Instructs the system to execute the command without additional prompting for command confirmation.

Usage

This value is combined with the Master port's MAC address to form the system ID. A system is a packet processing card and its associated QGLC(s) The highest system ID priority (the lowest number) handles dynamic changes.
For additional usage and configuration information for the link aggregation feature, go to Configuring Link Aggregation in the *Cisco ASR 5000 Series System Administration Guide.*

Important: Not supported on all platforms

Example

The following command configures the link aggregation system-priority to 10640:

link-aggregation system-priority *0x2990*

mode

Sets the application processor card's current administrative state to active or standby.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
mode { active [ pac | psc] | standby } [ -noconfirm ]
default mode [ -noconfirm ]
```

default

Returns the mode to the default value appropriate to the card type.
The default administrative mode for line cards affects a single card and its mated line card. The default state for line cards in the top shelf is active. The default for line cards in the bottom shelf is standby.
The default administrative state for the SPIO in slot 24 is active and the SPIO in slot 25 is standby.
The default administrative mode for packet processing cards is standby.

Important: This command results in a migration of processes if the default mode for a card is different than the current state of the card.

active [pac | psc]

Defines which card type is to be switched from standby to active state. If a card is present in the slot, the packet processing card is automatically selected depending upon the type of card. If no card is present in the slot, a packet processing card is assumed.
pac: Identifies a PAC
psc: Identifies a PSC or PSC2

standby

Sets the PAC, PSC, or PSC2 in the slot to standby mode.

Caution: Switching an active packet processing card to standby deletes all port configurations, including bindings, for the attached line cards.

-noconfirm

Instructs the system to execute the command without additional prompting for command confirmation.

Usage

Set the desired mode of mated cards. The card targeted for maintenance is placed in the standby state first. The setting of the mode determines which packet processing cards are to be active and which are to be the standby cards for redundancy. Use this command to configure the set of active and standby packet processing

cards. The application processor card's standby priority is then used in conjunction with the set of standby packet processing cards to determine the order in which the standby cards are used for redundancy support.

Important: Not supported on all platforms

Important: This command results in a migration of processes if the mode specified for the card is different than the current state of the card.

Example
The following commands set the state of a card to active and standby, respectively.

```
mode active

mode standby
```

redundancy

Configures the type of redundancy for a line card or SPIO.

Product

PDSN, FA, HA, GGSN, SSGN

Privilege

Security Administrator, Administrator

Syntax

```
redundancy { card-mode | mixed-mode | port-mode | pseudo-aps-mode } [-noconfirm
]
```

```
default redundancy [ -noconfirm ]
```

default

Restores redundancy to **port-mode** type redundancy.

card-mode

Specifies no port redundancy is used. This is used mostly for legacy products.

mixed-mode

Sets the OLC line card so that ATM cross-connects are not redundant and they are independent.

Important: This keyword is specific to OLC-type (ATM) line cards installed in an ST16 platform. If you attempt to use this keyword on line cards other than the OLC-type in an ST16, it could result in the line card being switched into an offline state.

port-mode

Enables port redundancy on line cards or on SPIO cards.
This is the default setting used by the system.

Important: Port-type redundancy does not affect line card failover/redundancy operations.

pseudo-aps-mode

Important: This feature is not yet fully supported.

With release 8.1 and higher, this keyword enables pseudo-APS type port redundancy on OLC2/CLC2 line cards.

-noconfirm

Instructs the system to execute the command without additional prompting for command confirmation.

Usage

Use this command to configure redundancy on a line card (LC) or a SPIO card. With **port-mode** enabled, if an external network device or cable failure occurs that causes a link down failure on the port, the redundant port is used.

Important: Not supported on all platforms

Important: You do not need to enter this command for each line card or SPIO card, as the system intuitively understands that if the command is entered for an active line card or SPIO card, the standby line card or SPIO card switches to operate in the same mode. For example, if you enter the **port-mode** command for an LC in slot 17, you automatically enabls a redundant line card in slot 33 for port redundant operation.

Example

The following command sets the redundancy mode to port redundancy.

redundancy *port-mode*

service-type

This command configures the type of service the CLC or CLC2 line card will support.

Important: Supported in software releases 8.1 and higher.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
service-type { frame-relay | mtp2 | pwe3-cesopsn | unspecified } [ -noconfirm ]
default service-type [ -noconfirm ]
```

default

Returns the card configuration to *unspecified*.

frame-relay

Configures the card to operate in Frame Relay service mode.

mtp2

Important: MTP2 functionality is not yet supported.

Enables MTP2 type service to support narrowband transmissions.

pwe3-cesopsn

Important: pwe3-cesopsn functionality has been replaced by **mtp2**.

unspecified

This is the default mode for a CLC or CLC2 linecard.

Important: You must configure the linecard to one of the available service types or the card will not function.

-noconfirm

Instructs the system to execute the command without additional prompting for command confirmation.

Usage

Use this command to configure the operational service mode for the channelized line card - CLC or CLC2. Once you select the service-type, refer to the Channelized Port configuration mode chapter to review the commands needed to configure the parameters for the port.

Example

```
service-type frame-relay
```

shutdown

Configures a card for active service or terminates all processes on the card.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] shutdown
```

no

no shutdown enables the card.
Enter only the **shutdown** keyword to shut the the card down.

Usage

Shut down a card to remove it from service or to enable a card to put it into service.

Important: Do not use this command to remove a card from service for maintenance. Use the command **card halt** to remove a card for service to avoid changing or deleting the active-mode configuration. See the Exec Mode chapter.

Important: Not supported on all platforms

Example

The following commands shutdown the card and switch a card to online, respectively.

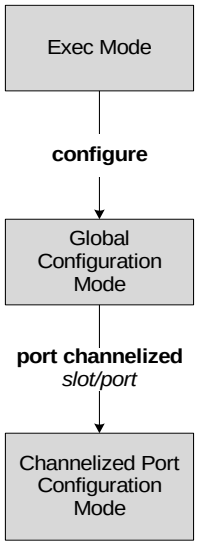
```
shutdown

no shutdown
```

Chapter 34
Channelized Port Configuration Mode Commands

The channelized port configuration mode provides the commands to create, configure, bind, and manage the Frame Relay service ports on the channelized line card.

Important: Before using these commands, card framing should be configured for either SDH or SONET with the framing command described in the Card Configuration Mode chapter.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

alarm-disable

Entering this command disables the alarm detection for designated sets of alarms.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

alarm-disable { all | ds1-e1 | none | sonet-sdh }

[no | default] alarm-disable

no

Deletes the disable configuration.

default

Returns the settings for disabling alarms to the system default.

all

Disables detection of all SONET/SDH and DS1/E1 alarms.

ds1-e1

Disables detection of the DS1/E1 alarms.

none

None of the alarm detection is disabled so that all DS1/E1 and SONET/SDH alarms are detected.

sonet-sdh

Disables detection of SONE/SDH alarms.

Usage

Configure selected alarm detection for the port.

Example

Enter the following command to enable DS1/E1 and SONET/SDH alarm detection.

alarm-disable none

alarm-soak-timer

This command sets the timer for the duration that a detected alarm will be soaked before the alarm is reported.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

alarm-soak-timer *seconds*

default alarm-soak-timer

default

Returns the timer settings to the system default.

seconds

Defines the number of seconds the system waits (soaks the alarm) before reporting the alarm.
seconds: any integer from 0 to 32767.

Usage

Configures the delay before reporting detected alarms.

Example

Configure a 20 second alarm report delay.

alarm-soak-timer *20*

clock-source

This command sets the source of the port's transmit clock.

Important: This command is only available for releases 8.1 or higher.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax `clock-source { internal-timing | loop-timing }default clock-source`

`default`

Using this command combination sets the port clock source to internal timing.

`internal-timing`

Sets the port clock to derive timing from the recovered receive clock.

`loop-timing`

Sets the port clock to transmit in sync with the system timing.

Usage

Use this command for either SONET or SDH channelized (Frame Relay) ports on the SGSN.

Example

The following command resets the transmit clock source to internal timing.

```
default clock-source
```

description

Defines descriptive text that provides useful information about the port.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

description *text*

no description

no

Erases the port's description from the configuration file.

text

text must be a string of 1 to 79 alphanumeric characters with no spaces or a string within double quotes that includes printable characters. The description is case-sensitive.

Usage

Set the description to provide helpful information, for example the port's primary function, services, end users. Define any information, the only limit is the number of characters.

Example

description *samplePortDescriptiveText*

description *"This is a sample description"*

dlci

Identifies a data link connection identifier (DLCI), a frame relay logical connection, and binds it with a specific channelized path configuration. Once the DLCI is bound to the path, the system enters DLCI configuration mode.

Important: The **path** command must be configured prior to attempting configuration with the **dlci** command.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

dlci path *path_id* **{ ds1 | e1 }** *connects* **{ dlci** *dlci_id* **| timeslots** *slot#* **dlci** *dlci_id* **}**

no dlci path path_id { ds1 | e1 } *connects*

no

Disables the configured DLCI.

path *path_id*

Identifies a specific path configuration, set with the **path** command in this configuration mode, that will be associated with a DLCI.
path_id must be an integer from 1 to 3.

ds1 *connects* **| e1** *connects*

Selects the framing speed for the connection.
DS1: Is associated with North American networks and would be the best choice to work with the SONET framing selected with the **card** configuration command.
connects: Defines the number of logical connections supported via the DS1. The selection must be an integer from 1 to 28.
E1: is associated with European networks and would be associated with the SDH framing selected with the **card** configuration command.
connects: Defines the number of logical connections supported via the E1. The selection must be an integer from 1 to 21.

dlci *dlci_id*

Identifies a specific Frame Relay PVC DLCI to associate with the path.
dlci_id: an integer from 16 to 991.

timeslot *slot#*

Identifies one of the timeslots within a timeslot group configured with the **path** command for the E1, DS1 or fractional E1 port. Identifying one slot in a group means that all the slots in that group will have the Frame Relay parameters configured in the same manner.

slot#: Must be an integer from 1 to 31.

Usage

Associating a routing path with a specific frame relay DLCI is a significant part of the process for defining the frame relay interface.

Example

Associate path 1 with DLCI 123.

```
dlci path 1 ds1 21 dlci  123
```

end

Exits the Channelized Port configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the Channelized Port configuration mode and returns to the Global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the Global Configuration mode.

frame-relay

Configures the parameters for the Frame Relay connections for E1, DS1 and fractional E1 ports created with the **path** command. Frame

Important: The **path** command must be configured prior to attempting configuration with the **frame-relay** command.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

frame-relay path *path_id* **{ ds1** *connects* **| e1** *connects* **} timeslot** *slot#* **[intf-type** *intf_type* **] [lmi_type** *lmi_type* **]**

path *path_id*

Identifies a specific path configuration, set with the **path** command in this configuration model.
path_id must be an integer from 1 to 3.

ds1 *connects* **| e1** *connects*

Selects the pipe splitting for the connection.
DS1: Is associated with North American networks and would be the best choice to work with the SONET framing selected with the **card** configuration command. DS1 splits the path into 28 logical connections.
connects: Defines the number of logical connections supported via the DS1. The selection must be an integer from 1 to 28.
E1: is associated with European networks and would be associated with the SDH framing selected with the **card** configuration command. E1 splits the path into 21 logical connections.
connects: Defines the number of logical connections supported via the E1. The selection must be an integer from 1 to 21.

timeslot *slot#*

Identifies one of the timeslots within a timeslot group configured with the **path** command for the E1, DS1 or fractional E1 port. Identifying one slot in a group means that all the slots in that group will have the Frame Relay parameters configured in the same manner.
slot#: Must be an integer from 1 to 31.

intf-type *intf_type*

Selecting the interface type specifies signaling parameters for the DLCI, options include:

- **dce**: Selects data circuit-terminating equipment -type signaling.
- **dte**: Selects data terminal equipment -type signaling.
- **nni**: Selects the network-to-network interface

Default: DTE for Release 8.0
Default: DCE for Release 8.1

frame-relay lmi_type *lmi_type*

Default: **none**.
Line management options include:

- **ansi** - ANSI ANNEXED LMI, may include option:
- **cisco** - Cisco/Gang Of Four LMI
- **none** - LMI Disabled
- **q933a** - Q.933A LMI

Any of the above LMI types can take one or more additional options

- **n391** *value* - Number of keep exchanges before requesting a full status message. Default is 6. *value* must be an integer from 1 to 255.
- **n392** *value* - Error Threshold value. Default is 2. *value* must be an integer from 1 to 10.
- **n393** *value* - Monitored events count value. Default is 2. *value* must be an integer from 1 to 10.
- **t391** *value* - Timer to send messages. Default is 10. *value* must be an integer from 5 to 30.
- **t392** *value* - Polling verification timer value. Default is 15. *value* must be an integer from 5 to 30.

Usage

Use this command to define LMI type and timers and to associate time group 2 with the Frame Relay connection.

Example

frame-relay path *1e1 3* **timeslot** *2*

hopath-sdsf

Configures the high-order path for SDSF bit error rate (BER) thresholds.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

hopath-sdsf *hopath_value*

hopath_value

- 0: Disabled
- 1 -1.E-03
- 2 - 1.E-04
- 3 - 1.E-05
- 4 - 1.E-06
- 5 - 1.E-07
- 6 - 1.E-08
- 7 - 1.E-09
- 8 - 1.E-10

Usage

Sets a standard option for the high-order path for SDSF.

Example

hopath-sdsf *1*

line-timing

This command enables the SPIO to recover transmit timing source via line attached to the selected port. By default, line-timing is not enabled.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] line-timing
```

no

Disables line-timing as the source for the transmit clock.

Usage

The port must be enabled (with the **no shutdown** command) to enable recovery of timing source via the line. As well, the card's slot number must be entered in the **recover line#** command of the BITS port configuration mode.

Example

Disable timing clock recovery on this port.

```
no line-timing
```

loopback

Configures the type of loopback mode used for diagnostic testing.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax `loopback { ds1-e1-diag | ds1-e1-line | none | sonet-sdh-diag | sonet-sdh-line }`

`ds1-e1-diag`

Enables a system generated diagnostic lookback signal at the DS1/E1 layer.

`ds1-e1-line`

Loops back a network diagnostic signal at the DS1/E1 layer.

`none`

Stops diagnostic loopback signalling.

`sonet-sdh-diag`

Enables a system generated diagnostic lookback signal at the SONET/SDH layer.

`sonet-sdh-line`

Loops back a network diagnostic signal at the SONET/SDH layer.

Usage

Setup diagnostic loopback signals for troubleshooting purposes.

Example

```
loopback ds1-e1-diag
```

lopath-sdsf

Configures the low-order path for SDSF bit error rate (BER) thresholds.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

lopath-sdsf *lopath_value*

lopath_value

- 0: Disabled
- 1 -1.E-03
- 10 - 1.E-12
- 2 - 1.E-04
- 3 - 1.E-05
- 4 - 1.E-06
- 5 - 1.E-07
- 6 - 1.E-08
- 7 - 1.E-09
- 8 - 1.E-10
- 9 - 1.E-11

Usage

Sets a standard option for the low-order path for SDSF.

Example

lopath-sdsf *1*

mtp2

Creates an MTP2 configuration instance for the port.

Important: The port DS1/E1 tributaries must be configured using the **path** command prior to creating a port MTP2 configuration.

Important: The MTP2 feature is not yet fully supported and so the command is not yet fully functional. Please ignore this keyword, at this time, while configuring the channelized port.

Product

SGSN

Privilege

Security Administrator, Administrator

path

This command configures the parameters that define the routing path for a DLCI. It must match with the DLCI configuration parameters. The values entered with these commands should be noted as they will be needed to configure the **frame-relay** and **dlci** commands also in this configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

path *path_id* **{ ds1** *connects* **| e1** *connects* **}** *frame-mapping multiplexing index# index#* **framing** *mode* **mapping-mode { bit-sync | byte-sync } [timeslots** *slot#* **[** *slot#* **] | frame-relay [intf-type** *intf_type* **[lmi_type** *lmi_type* **]]]**

no path *path_id* **{ ds1 | e1 }***connects*

no

Deletes the routing path entry from the configuration.

path *path_id*

Identifies a specific path configuration that will be associated with a DLCI. The *path_id* must be an integer from 1 to 3.

ds1 *connects* **| e1** *connects*

Selects the channelization for the connection.
DS1: (AKA: T1) Is associated with North American networks and would be the best choice to work with the SONET (can also work with SDH) framing selected with the **card** configuration command. DS1 splits the path into 28 logical connections.
connects: Defines the number of logical connections supported via the DS1. The selection must be an integer from 1 to 28.
E1: is associated with European networks and would be associated with the SDH (can also work with SONET) framing selected with the **card** configuration command. E1 splits the path into 21 logical connections.
connects: Defines the number of logical connections supported via the E1. The selection must be an integer from 1 to 21.

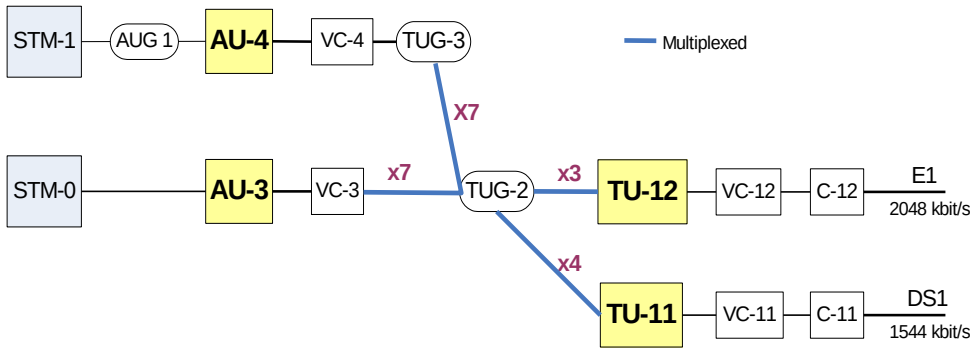
frame-mapping

Frame mapping sets the channelization according to the national standards that correlate with the framing/speed standards. This option selects the mapping of containers (C), virtual containers (VC), tributary units (TU), and tributary unit groups (TUG), that is appropriate for the channel characteristics:

- **tu11-au3**: Appropriate for DS1 in SDH. Maps as follows AU-3—VC-3— m# —TUG-2— m# —TU-12—VC-12—C-12
- **tu11-au4**: Appropriate for DS1 in SDH. Maps as follows AU-4—VC-4—TUG-3— m# —TUG-2— m# —TU-11—VC-11—C-11

- **tu12-au3**: Appropriate for E1 in SDH. Maps as follows AU-3—VC-3— m# —TUG-2— m# —TU-12—VC-12—C-12
- **tu12-au4**: Appropriate for E1 in SDH. Maps as follows AU-4—VC-4—TUG-3— m# —TUG-2— m# —TU-12—VC-12—C-12

Frame Mapping for E1 and DS1 to STM-n Interfaces



- **vt1.5**: Only appropriate for DS1 in SONET framing.
- **vt2**: Only appropriate for E1 in SONET framing.

---

multiplexing index# index#

index#: TUG-2 index - Must be an integer from 1 to 7 to identify a multiplex channel between TUG-2 and VC-3 (E1) or TUG-3 (DS1).
index#: TU index - Must be an integer from 1 to 4 (DS1) or 1 to 3 (E1) to identify a multiplex channel between TU-11 (DS1) and TUG-2 or between TU-12 (E1) and TUG-2.

---

framing *mode*

Defines the framing modes to be used for the channelization to E1 or T1 of the (optical) port.

- options for E1:
  - **cas:** standard mapping with CAS
  - **cas-crc4:** CRC4 mapping with CAS
  - **crc4:** CRC4 mapping
  - **standard:** mapping
- options for DS1:
  - **esf:** extended superframe mapping
  - **sf:** superframe mapping
  - option for either E1 or DS1:
  - **unframed**

---

mapping-mode

- **bit-sync**
- **byte-sync**

timeslots *timeslots*

Defines up to 8 timeslot groupings for multiple fractional DS1/E1 channels. Each slot is 2.048/32 Mbytes. Slots 0 and 16 are reserved for synchronization and alarms. Slots 1-15 and 17-31 are used for data. Timeslots must be unique -- a timeslot can not be used in more than one grouping.
timeslots: Must be an integer from 1 to 31. Timeslot groups are separated by spaces and can consist of a single slot and/or a range indicated with a hyphen. Example: 3,7-10 is a single fractional group. NOTE there is no space after the comma. Timeslots must be unique -- a timeslot can not be used in more than one grouping.

frame-relay

Enables definition of a Frame Relay connection with the **frame-relay** command.

Important: For release 8.1 and higher, this feature has been moved to the **frame-relay** command.

intf-type *intf_type*

Selecting the interface type specifies signaling parameters for the DLCI, options include:

- **dce**: Selects data circuit-terminating equipment -type signaling.
- **dte**: Selects data terminal equipment -type signaling.
- **nni**: Selects the network-to-network interface

Default: DTE for Release 8.0
Default: DCE for Release 8.1

Important: For release 8.1 and higher, this feature has been moved to the **frame-relay** command.

lmi_type *lmi_type*

Default: **none**.
Line management type options include:

- **ansi** - ANSI ANNEXED LMI, may include option:
- **cisco** - Cisco/Gang Of Four LMI
- **none** - LMI Disabled
- **q933a** - Q.933A LMI

Any of the above LMI types can take one or more additional options

- **n391** *value* - Number of keep exchanges before requesting a full status message. Default is 6. *value* must be an integer from 1 to 255.
- **n392** *value* - Error Threshold value. Default is 2. *value* must be an integer from 1 to 10.
- **n393** *value* - Monitored events count value. Default is 2. *value* must be an integer from 1 to 10.
- **t391** *value* - Timer to send messages. Default is 10. *value* must be an integer from 5 to 30.
- **t392** *value* - Polling verification timer value. Default is 15. *value* must be an integer from 5 to 30.

Important: For release 8.1 and higher, this feature has been moved to the **frame-relay** command.

Usage

Defines the signaling characteristics of a frame relay connection or timeslots for a fractional connection. Use this command to create E1 ports or fractional E1 ports. Fractional E1 ports are created with the timeslot definitions. The fractional E1 port can consist of one or more or all of the timeslots.

Example

In the first example, define timers for the q933a LMI-type.

```
path 1 e1 1 tu12-au4 1 1 framing crc4 mapping-mode bit-async frame-relay
intf-type dce lmi_type  q933a  n391 6 n392 2 n393 2 t391 10 t392 15
```

The next example defines 3 groups of fractional timeslots with group 1 having slots 1-5 and 8, group 2 having slot 22-25, and group 3 having slots 31.

```
path 1 e1 1 tu12-au3 1 1 framing cas  mapping-mode bit-async timeslots 1-
5,8 22-25 31
```

preferred slot

Identifies which card in a chassis should assume revertive (redundancy auto-recovery) functionality should the slot/port being configured go down. This command must be issued on a per port basis, allowing you to configure specific ports to be used on individual LCs or SPIO cards. For example, ports 1 through 4 could be configured as "preferred" on the LC in slot 17 while ports 5 through 8 are "preferred" on the LC in slot 33. In this scenario, both LCs would be in an Active operational state while still providing LC and port redundancy for the other.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

preferred slot *slot#*

no preferred slot

slot#

Identifies the physical slot in the chassis where the line card is installed.

no

Disables revertive, or auto-recovery, operation for the port.

Usage

This command enables or disables revertive port redundancy. So after a port failover, when the original port is restored to service (i.e. link up) the system will return service to that port automatically.
Disabled, which is the default setting, causes non-revertive operation; requiring an administrative user to manually issue a port switch to command to return service to the original port.

Example

preferred slot 17

pwe3-cesopsn

This command has been replaced by the **mtp2** command.

Product

SGSN

Privilege

Security Administrator, Administrator

shutdown

Terminates all processes supporting the port or blocks the shutting down of the port. Conversely, this command with the **no** keyword enables the port.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] shutdown
```

no

Enables the port's administrative state. When omitted the card is shutdown (removed from service).

Usage

Shut down a port prior to re-cabling and/or other maintenance activities.
This command with the **no** keyword is required to bring a port into service.

Example

Use the following command to disable a port:

```
shutdown
```

Use the following command to enable a port for service:

```
no shutdown
```

snmp trap link-status

Enables/disables the generation and sending of an SNMP (notification) trap when the port experiences a change of state (up or down).

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] snmp trap link-status
```

no

Disables the sending of traps for link-status changes.

Usage

Enable the sending of link-status change traps if there is a monitoring facility that can use the information or if there are troubleshooting activities in progress.

Example

```
snmp trap link-status
```

threshold high-activity

Configures the port's high and low activity thresholds.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

threshold high-activity *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 50
Sets the threshold for the highest percentage of port activity that must be met or exceeded, within the polling interval, to generate an alert or alarm.
high_thresh_% can be configured to any integer value between 0 and 100.

clear *low_thresh*

Default: 50
Sets the threshold for the lowest percentage level of port activity that must be met to generate and send a clear alarm. If port activity does not drop to or below this threshold then the alarm is maintained.
low_thresh_% can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

High port activity thresholds generate alerts or alarms based on the utilization percentage of each configured port during the specified polling interval. This threshold is configured on a per-port basis.
Alerts or alarms are triggered for high port activity based on the following rules:

- **Enter condition:** Actual percent utilization of a port > High Threshold
- **Clear condition:** Actual percent utilization of a port < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command in the Global Configuration Mode Commands chapter of this reference to configure the polling interval and the **threshold monitoring** command in this chapter to enable thresholding for this value.

Example

The following command configures a high port utilization threshold percent of 70 and a low threshold of 50 for an system using the Alarm thresholding model:

threshold high-activity *70* **clear** *50*

threshold monitoring

Enables thresholding for port-level values.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] threshold monitoring
```

no

Disables threshold monitoring for port-level values. This is the default setting.

Usage

Thresholding on the system is used to monitor the system for conditions that could potentially cause errors or outage. Typically, these conditions are temporary (i.e high-activity) and are quickly resolved. However, continuous or large numbers of these error conditions within a specific time interval may be indicative of larger, more severe issues. The purpose of thresholding is to help identify potentially severe conditions so that immediate action can be taken to minimize and/or avoid system downtime.

Thresholding reports conditions using one of the following mechanisms:

- **SNMP traps:** SNMP traps have been created that indicate the condition (high threshold crossing and/or clear) of each of the monitored values. Complete descriptions and other information pertaining to these traps is located in the starentMIB(8164).starentTraps(2) section of the SNMP MIB Reference.

The generation of specific traps can be enabled or disabled on the system allowing you to view only those traps that are most important to you.

- **Logs:** The system provides a facility called threshold for which active and event logs can be generated. As with other system facilities, logs are generated Log messages pertaining to the condition of a monitored value are generated with a severity level of WARNING.
- **Alarm System:** High threshold alarms generated within the specified polling interval are considered "outstanding" until a the condition no longer exists and/or a condition clear alarm is generated.

"Outstanding" alarms are reported to through the system's alarm subsystem and are viewable through the system's CLI.

The following table indicates the reporting mechanisms supported by each of the above models.

Table 16. Thresholding Reporting Mechanisms by Model

Model	SNMP Traps	Logs	Alarm System
Alert	X	X	
Alarm	X	X	X

This command enables thresholding for port-level values. Refer to the **threshold high-activity**,**threshold rx-utilization**, and **threshold tx-utilization** commands in this

chapter for information on configuring these values. In addition refer to the **threshold poll** command in the Global Configuration Mode Commands chapter of this reference for information on configuring the polling interval over which these values are monitored.

Example

Use the following command to terminate thresholding:

```
no threshold monitoring
```

threshold rx-utilization

Configures thresholds for receive-port utilization.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

threshold rx-utilization *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 80
The high threshold receive port utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
The percentage can be configured to any integer value between 0 and 100.

clear*low_thresh*

Default: 80
Allows the configuration of the low threshold.
The low threshold receive port utilization percentage that maintains a previously generated alarm condition. If the utilization percentage falls below the low threshold within the polling interval, a clear alarm will be generated.
The percentage can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Receive port utilization thresholds generate alerts or alarms based on the utilization percentage of each configured port in relation to data received during the specified polling interval. This threshold is configured on a per-port basis.

Important: Ports configured for half-duplex do not differentiate between data received and data transmitted. Therefore, to avoid redundant alarms, it is recommended that only the receive **or** transmit utilization threshold be configured.

Alerts or alarms are triggered for receive port utilization based on the following rules:

- **Enter condition:** Actual percent utilization of a port for received data ³ High Threshold
- **Clear condition:** Actual percent utilization of a port for received data < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command in the Global Configuration Mode Commands chapter of this reference to configure the polling interval and the **threshold monitoring** command in this chapter to enable thresholding for this value.

Example

The following command configures a receive port high utilization threshold percent of 70 and a low threshold of 50 for an system using the Alarm thresholding model:

```
threshold rx-utilization 70 clear 50
```

threshold tx-utilization

Configures thresholds for transmit port utilization.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

threshold tx-utilization *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 80
The high threshold transmit port utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
The percentage can be configured to any integer value between 0 and 100.

clear *low_thresh*

Default: 80
Allows the configuration of the low threshold.
The low threshold transmit port utilization percentage that maintains a previously generated alarm condition. If the utilization percentage falls below the low threshold within the polling interval, a clear alarm will be generated.
The percentage can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Transmit port utilization thresholds generate alerts or alarms based on the utilization percentage of each configured port in relation to data transmitted during the specified polling interval. This threshold is configured on a per-port basis.

Important: Ports configured for half-duplex do not differentiate between data received and data transmitted. Therefore, to avoid redundant alarms, it is recommended that only the receive **or** transmit utilization threshold be configured.

Alerts or alarms are triggered for transmit port utilization based on the following rules:

- **Enter condition:** Actual percent utilization of a port for transmit data ³ High Threshold
- **Clear condition:** Actual percent utilization of a port for transmit data < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command in the Global Configuration Mode Commands chapter of this reference to configure the polling interval and the **threshold monitoring** command in this chapter to enable thresholding for this value.

Example

The following command configures a transmit port high utilization threshold percent of 70 and a low threshold of 50 for an system using the Alarm thresholding model:

```
threshold tx-utilization 70 clear 50
```

toh-sdsf

Configures the line SDSF bit error rate (BER) thresholds.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

toh-sdsf *toh_value*

toh_value

- 0: Disabled
- 1 -1.E-04
- 2 - 1.E-05
- 3 - 1.E-06
- 4 - 1.E-07
- 5 - 1.E-08
- 6 - 1.E-09
- 7 - 1.E-10
- 8 - 1.E-11

Usage

Sets a standard option for the line SDSF BER.

Example

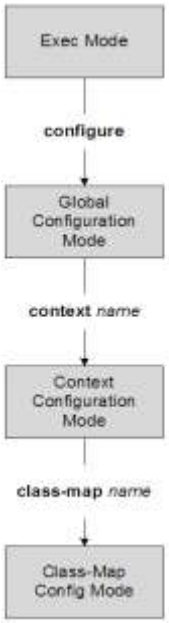
toh-sdsf *1*

vc-mapping

This command has been deprecated. Go to the **frame-mapping** keyword in the **path** command to configure this functionality.

Chapter 35
Class-Map Configuration Mode Commands

Class-Map is used to configure a packet classifier for flow-based Traffic Policing feature within destination context. It filters egress and/or ingress packets of a subscriber session based on rules configured in a subscriber context.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the context configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the context configuration mode and returns to the global configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the global configuration mode.

match any

This command allows all traffics in this class map.

Product

PDSN, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
match any
```

Usage

Sets the match rule to allow all traffic flow for specific class map.

Example

The following commands allows all packets going to a system with this class map.

```
match any
```

match dst-ip-address

This command specifies a traffic classification rule based on the destination IP address of packets.

Product

PDSN, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

match dst-ip-address*dst_ip_address subnet_mask*

dst_ip_address

Specifies the destination IP address of the packets.
dst_ip_address must be specified using the standard IPv4 dotted decimal notation.

subnet_mask

Specifies the IP address mask bits to determine the number of IP addresses in the pool. *ip_mask* must be specified using the standard IPv4 dotted decimal notation.
1 bits in the *ip_mask* indicate that bit position in the *ip_address* must also have a value of 1.
0 bits in the *ip_mask* indicate that bit position in the *ip_address* does not need to match, i.e., the bit can be either a 0 or a 1.
For example, if the IP address and mask are specified as 172.168.10.0 and 255.255.255.224, respectively, the pool will contain IP addresses in the range 172.168.10.0 through 172.168.10.31 for a total of 32 addresses.

Usage

Sets the match rule based on the destination IP address of packets for specific Class Map.

Example

The following commands specifies the rule for packets going to a system having an IP address 10.1.2.6.
match dst-ip-address *10.1.2.6*

match dst-port-range

This command specifies a traffic classification rule based on the range of destination ports of L4 packets.

Product

PDSN, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

match dst-port-range*initial_port_number* **[to***last_port_number* **]**

initial_port_number **[to** *last_port_number* **]**

Specifies the destination port or range of ports of L4 packets.
initial_port_number is the starting port number and must be an integer value in the range from 1 through 65535 but less than *last_port_number*, if specified.
last_port_number is the end port number and must be an integer value in the range from 1 through 65535 but more than *initial_port_number*.

Usage

Sets the match rule based on the destination port number or range of ports of L4 packets for specific Class Map.

Example

The following commands specifies the rule for packets having destination port number from 23 to 88.

```
match dst-port-range 23 to 88
```

match ip-tos

This command specifies a traffic classification rule based on the IP Type of Service value in ToS field of packet.

Product

PDSN, HA, ASN-GW

Privilege

Administrator

Syntax

match ip-tos { *service_value* **[ip-tos-mask** *mask_value* **] | tos-range** *low_value* **to** *high_value* **}**

service_value

Specifies the IP Type-of-Service value to match inside the ToS field of packets.
service_value must be an integer value in the range from 0 through 255.

ip-tos-mask *mask_value*

Specifies the IP Type-of-Service mask value to match inside the ToS field of packets.
mask_value must be an integer value in the range from 1 through 255.

tos-range *low_value* **to** *high_value*

Specifies a range that a ToS value in a received packet must fall within to be considered a match.
low_value and *high_value* must be an integer from 0 to 255.

Usage

Sets the match rule based on the IP ToS value in ToS field of packets for specific Class Map.

Example

The following commands specifies the IP ToS value of 3 is the value to match in a ToS field in received packets.

match ip-tos *3*

match ipsec-spi

This command specifies a traffic classification rule based on the IPSec Security Parameter Index (SPI) value in SPI field of packet.

Product

PDSN, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

match ipsec-spi *index_value*

index_value

Specifies the IPSec SPI value to match inside the SPI field of packets.
index_value must be an integer value in the range from 1 through 65535

Usage

Sets the match rule based on the IPSec SPI value in SPI field of packets for specific Class Map.

Example

The following commands specifies the IPsec SPI value to 1234 for SPI field in packets

match ipsec-spi *1234*

match packet-size

This command specifies a traffic classification rule based on the size of packet.

Product

PDSN, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

match packet-size [gt | lt] *size*

size

Specifies the packet length in bytes.
length must be an integer value in the range from 1 through 65535.

[gt | lt]

Applies operator to specify a range of packets having packet size greater than or less than the specified size *size*.

Usage

Sets the match rule based on the size of packets for specific Class Map. This command is only applicable for static policies; it is not available for dynamic policies.

Example

The following commands specifies the packet length to 1024 bytes.

match packet-size *1024*

match protocol

This command specifies a traffic classification rule based on the protocol used for session flow.

Product

PDSN, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
match protocol { gre | ip-in-ip | number | tcp | udp }
```

gre

Sets the match rule for session flow using Generic Routing Encapsulation (GRE) Protocol. It matches the protocol field to gre inside the packet.

ip-in-ip

Sets the match rule for session flow using IP-in-IP encapsulation protocol. It matches the protocol field to ip-in-ip inside the packet.

number

Sets the match rule for a session flow using Transmission Control Protocol (TCP). It matches the specified protocol field inside the packet.

tcp

Sets the match rule for a session flow using Transmission Control Protocol (TCP). It matches the protocol field to tcp inside the packet.

udp

Sets the match rule for a session flow having User Datagram Protocol (UDP). It matches the protocol field to udp inside the packet.

Usage

Sets the match rule based on the protocol of packet flow for a specific Class Map.

Example

The following commands specifies the rule for packet flow using IP-in-IP as protocol.

```
match protocol ip-in-ip
```

match src-ip-address

This command specifies a traffic classification rule based on the source IP address of packets.

Product

PDSN, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

match src-ip-address*src_ip_address subnet_mask*

src_ip_address

Specifies the source IP address of the packets.
ip_address must be specified using the standard IPv4 dotted decimal notation.

subnet_mask

Specifies the IP address mask bits to determine the number of IP addresses in the pool. *ip_mask* must be specified using the standard IPv4 dotted decimal notation.
1 bits in the *ip_mask* indicate that bit position in the *ip_address* must also have a value of 1.
0 bits in the *ip_mask* indicate that bit position in the *ip_address* does not need to match, i.e., the bit can be either a 0 or a 1.
For example, if the IP address and mask are specified as 172.168.10.0 and 255.255.255.224, respectively, the pool will contain IP addresses in the range 172.168.10.0 through 172.168.10.31 for a total of 32 addresses.

Usage

Sets the match rule based on the source IP address of packets for specific Class Map.

Example

The following commands specifies the rule for packets coming from a system having an IP address 10.1.2.3.

match src-ip-address *10.1.2.3*

match src-port-range

This command specifies a traffic classification rule based on the range of source ports of L4 packets.

Product

PDSN, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

match src-port-range*initial_port_number* **[to***last_port_number* **]**

initial_port_number **[to** *last_port_number* **]**

Specifies the source port or range of ports of the L4 packets.
initial_port_number is the starting port number and must be an integer value in the range from 1 through 65535 but less than *last_port_number*, if specified.
last_port_number is the end port number and must be an integer value in the range from 1 through 65535 but more than *initial_port_number*.

Usage

Sets the match rule based on source port number or range of ports of L4 packets for specific Class Map.

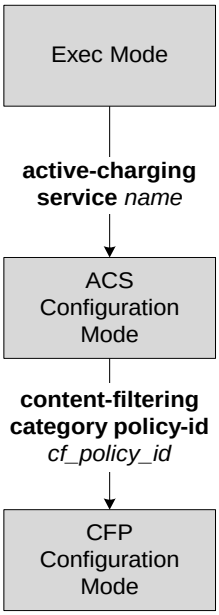
Example

The following commands specifies the rule for packets having source port number from 23 to 88.

```
match src-port-range 23 to 88
```

Chapter 36
Content Filtering Policy Configuration Mode Commands

In the Content Filtering Policy (CFP) Configuration Mode, you can configure analysis and action on matching results of Content Filtering (CF) analysis for Content Filtering Category Policy Identifier.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

analyze

This command specifies the action to take for the indicated result after content filtering analysis.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

analyze priority *priority* **{ all | category** *category* **| x-category** *string* **} action { allow | content-insert** *content_string* **| discard | redirect-url** *url* **| terminate-flow | www-reply-code-and-terminate-flow** *reply_code* **} [edr** *edr_format_name* **]**

no analyze priority *priority*

---

no

Removes the specified analyze priority configuration.

---

priority *priority*

Specifies the precedence of a category in the content filtering policy.
priority must be an integer from 1 through 65535, and must be unique in the content filtering policy.

---

all

Specifies the default action to take if the category returned after rating is not configured in the subscriber's content filtering policy. This has the lowest priority.

---

category *category*

Specifies the category.
category must be one of the following.

- ABOR
- ADULT
- ADVERT
- ANON
- ART
- AUTO
- BLACK
- BLOG
- BUSI
- CAR
- CHAT
- CMC

- CRIME
- CULT
- DRUG
- DYNAM
- EDU
- ENERGY
- ENT
- FIN
- FORUM
- GAMB
- GAME
- GLAM
- GOVERN
- HACK
- HATE
- HEALTH
- HOBBY
- HOSTS
- KIDS
- LEGAL
- LIFES
- MAIL
- MIL
- NEWS
- OCCULT
- PEER
- PERS
- POLTIC
- PORN
- PORTAL
- PROXY
- REF
- REL
- SCI
- SEARCH
- SHOP
- SPORT

- STREAM
- SUIC
- SXED
- TECH
- TRAV
- VIOL
- VOIP
- WEAP
- WHITE
- UNKNOW

Important: Content can simultaneously match multiple categories, therefore specific **priority** must be used for required evaluation precedence.

x-category *string*

This keyword can be used to configure runtime categories not present in the CLI.
string specifies the unclassified category to be rated, and must be an alpha and/or numeric string of 1 through 6 characters in length.
A maximum of 10 x-categories can be configured.

action { allow | content-insert *content_string* **| discard | redirect-url** *url* **| terminate-flow | www-reply-code-and-terminate-flow** *reply_code* **}**

Specifies the action to take for the indicated result of content filtering analysis.
allow: In the case of static content filtering, this option allows the request for content, and in dynamic content filtering allows the content itself.
content-insert *content_string*: Specifies the content string to be inserted in place of the message returned from prohibited/restricted site or content server.
In case of static content filtering, *content_string* is used to create a response to the subscriber's attempt to get content, and in dynamic content filtering, it is used to replace the content returned by a server.
content_string must be an alpha and/or numeric string of 1 through 1023 characters in length.
discard: In case of static content filtering, this option discards the packet(s) that requested, and in dynamic content filtering it discards the packet(s) that contain(s) the content.
redirect-url *url*: Specifies redirecting the subscriber to the specified URL.
url must be a string of 1 through 1023 characters in length, and in the *http://search.com/subtarg=#HTTP.URL#* format.
terminate-flow: Specifies terminating the TCP connection gracefully between the subscriber and server, and sends a TCP FIN to the subscriber and a TCP RST to the server.
www-reply-code-and-terminate-flow *reply_code*: Specifies terminating flow with the specified reply code. *reply_code* must be a reply code, and must be an integer from 100 through 599.

Important: Static-and-Dynamic Content Filtering is only supported in StarOS 9.0 and later releases.

edr *edr_format_name*

Specifies to generate separate EDRs for content filtering based on action and content category using EDR file format name *edr_format_name*.
edr_format_name is the name of a pre-defined EDR file format name in the EDR Format Configuration Mode, and must be an alpha and/or numeric string of 1 through 63 characters in length.

Important: EDRs generated through this keyword are different from charging EDRs generated for subscriber accounting and billing. For more information on generation of charging EDRs, refer to the *ACS Rulebase Configuration Mode Commands* chapter.

Usage

Use this command to specify the action and priorities for the indicated result of content filtering analysis. Up to 64 priorities and actions can be entered with this command.

Example

The following command sets priority *10* for category *ADULT* with action as **terminate-flow**:

```
analyze priority 10 category ADULT action terminate-flow
```

discarded-flow-content-id

This command is used in the configuration to account for packets discarded as a result of content filtering action.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

discarded-flow-content-id *content_id*

no discarded-flow-content-id

content_id

Specifies content ID for discarded flows.
content_id must be an integer from 1 through 65535.

Usage

Use this command in the configuration to account for packets discarded as a result of CF action.
A flow end-condition EDR would be generated as a charging EDR for content-filtered packets. No billing EDRs (even with flow-end) would be generated for a discarded packet as the flow will not end. Dual EDRs would exist for customers who want to use "flow end" to get EDRs for charging, plus CF-specific EDRs. The second EDR for charging comes from the **flow end-condition content-filtering** configuration in the Rulebase Configuration Mode.
The **discarded-flow-content-id** configuration can be used for accumulating stats for UDR generation in case CF discards the packets. These stats for UDR generation (based on the CF content ID) would also be accumulated in case of ACS error scenarios where the packets are discarded but the flow does not end.
If, in the Rulebase Configuration Mode, the **content-filtering flow-any-error** configuration is set to **deny**, then all the denied packets will be accounted for by the **discarded-flow-content-id** config. That is, the *content_id* will be used to generate UDRs for the denied packets in case of content filtering.

Example

Use the following command to set the accumulation of stats for UDR generation based on the CF content ID *1003*:

discarded-flow-content-id *1003*

failure-action

This command specifies the failure action when the content filtering analysis results are not available to analyze.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

failure-action { allow | content-insert *content_string* **| discard | redirect-url** *url* **| terminate-flow | www-reply-code-and-terminate-flow** *reply_code* **} [edr** *edr_format_name* **]**

default failure-action [edr *edr_format_name* **]**

default

Configures the default setting.
Default: **discard**

allow

In static content filtering, this option allows the request for content, and in dynamic content filtering allows the content itself.

Important: Static-and-Dynamic Content Filtering is only supported in StarOS 9.0 and later releases.

content-insertion *content_string*

Specifies the content string to be inserted in place of the message returned from the content server due to connection timeout or when no category policy ID is available for the content.
In case of static content filtering, the *content_string* is used to create a response to the subscriber's attempt to get content, and in dynamic content filtering it replaces the content returned by a server.
content_string must be an alpha and/or numeric string of 1 through 1023 characters in length.

Important: Static-and-Dynamic Content Filtering is only supported in StarOS 9.0 and later releases.

discard

In static content filtering, specifies discarding the packet(s) that requested, and in dynamic content filtering discards the packet(s) that contain the content.

Important: Static-and-Dynamic Content Filtering is only supported in StarOS 9.0 and later releases.

redirect-url *url*

Redirects the subscriber to the specified URL.
url must be a string of 1 through 1023 characters in length, and must be in the following format:

http://search.com/subtarg=#HTTP.URL#

terminate-flow

Terminates the TCP connection gracefully between the subscriber and external server and sends a TCP FIN to the subscriber and a TCP RST to the server.

www-reply-code-and-terminate-flow *reply_code*

Sets action as terminate-flow with specified reply code.
reply_code must be a reply code, and must be an integer from 100 through 599.

edr *edr_format_name*

Specifies name of the EDR format to be generated on the content filtering action using EDR file format name *edr_format_name*.
edr_format_name is the name of a pre-defined EDR file format name in the EDR Format Configuration Mode, and must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to set the failure action to take when no content filtering analysis result is available to analyze for **analyze priority** *priority* **category** *category_string* command.

Example

The following command sets the failure action as **discard**:

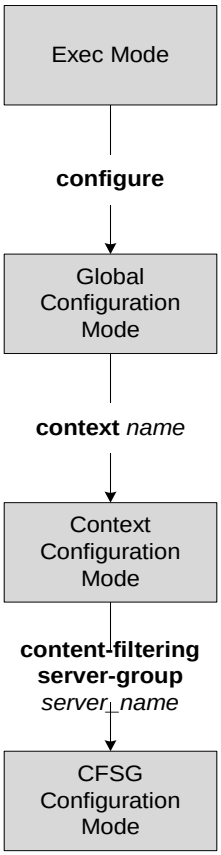
```
failure-action discard
```

timeout action

This command has been deprecated, and is replaced by the failure-action command.

Chapter 37
Content Filtering Server Group Configuration Mode Commands

Content Filtering Server Group (CFSG) Configuration Mode is accessed by entering the **`content-filtering server-group`** command in the Context Configuration Mode.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

connection retry-timeout

This command configures the TCP connection retry timer for Internet Content Adaptation Protocol (ICAP) server and client.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

connection retry-timeout *duration*

{ default | no } connection retry-timeout

default

Configures the default setting.
Default: 30 seconds

no

Removes the connection retry timeout configuration.

duration

The duration in seconds and must be an integer from 1 through 3600.

Usage

Use this command to configure the connection retry timer between ICAP server and client TCP connection, i.e. how long to wait before re-attempting to establish a TCP connection.

Example

The following command sets the ICAP client and server connection retry timer to 120 seconds:

connection retry-timeout *120*

deny-message

This command configures the text message that is returned to the subscriber in a deny response.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

deny-message *string*

{ default | no } deny-message

default

Configures the default setting.
Default: Disabled

no

Removes previously configured deny message setting.

string

Specifies a text message that is to be returned to the subscriber in a deny response.
string must be an alpha and/or numeric string of 1 through 511 characters in length.

Usage

Use this command to define a text message that is returned to the subscriber in a deny response.

Example

The following command sets the text message to *no_Authorization* in a deny message:

deny-message *no_Authorization*

dictionary

This command specifies the dictionary to use for requests to the server(s) in this CFSG.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

```
dictionary { custom1 | custom2 | standard }

{ default | no } dictionary
```

default

Sets the default dictionary.
Default: **default**

no

Removes the previously configured dictionary setting.

custom1

Custom-defined dictionary. It conforms to TS 32.015 v 3.6.0 for R99. It provides proprietary header fields for MSISDN and APN/subscriber. Please contact your local sales representative for additional information.

custom2

Custom-defined dictionary. Please contact your local sales representative for additional information.

standard

Default: Enabled
This dictionary is used to use an HTTP Get Request to specify the URL. It is conforming to TS 32.215 v 4.6.0 for R4 (and also R5 - extended QoS format).

Usage

Use this command to specify the standard and customized encoding mechanism used for elements included messages.

Example

The following command configures the system to use standard dictionary to encode messages:

```
default dictionary
```

end

Returns the CLI prompt to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

failure-action

This command specifies the actions to be taken when communication between ICAP endpoints within this CFSG fail.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

failure-action { allow | content-insertion *content_string* **| discard | redirect-url** *url* **| terminate-flow }**

{ default | no } failure-action

default

Configures the default setting.
Default: **terminate-flow**

no

Removes previously configured failure action.

allow

In case of static content filtering this option allows the request for content, and for dynamic content filtering it allows the content itself.

content-insertion *content_string*

Specifies the content string to be used for failure action.
In case of static content filtering, the specified text *content_string* is used to create a response to the subscriber's attempt to get content. In dynamic content filtering, the specified text *content_string* is used to replace the content returned by a server.
content_string must be an alpha and/or numeric string of 1 through 128 characters in length.

discard

In case of static content filtering this option discards the packet(s) requested, and for dynamic content filtering it discards the packet(s) that contain(s) the content.

redirect-url *url*

Redirects the subscriber to the specified URL.
url must be a string of 1 through 128 characters in length, and must be in the following format:
http://search.com/subtarg=#HTTP.URL#

terminate-flow

For TCP, gracefully terminates the connection between the subscriber and external server, and sends a TCP FIN to the subscriber and a TCP RST to the server.

For WAP-Connection Oriented, the WSP session is gracefully terminated by sending WTP Aborts for each of the outstanding requests, and WSP Disconnect to the client and the server. For WSP-Connectionless, only the current WSP request is rejected.

Usage

Use this command to set the actions on failure for server connection.

Example

The following command sets the failure action to terminate:

```
failure-action terminate-flow
```

icap server

This command adds an Internet Content Adaptation Protocol (ICAP) server configuration to the current Content Filtering Server Group.

Important: In StarOS 8.1 and later releases, a maximum of five ICAP servers can be configured per Content Filtering Server Group. In StarOS 8.0 and earlier releases, only one ICAP Server can be configured per Content Filtering Server Group.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

icap server *ip_address* **[port** *port_number* **] [max** *msgs* **] [priority** *priority* **]**

no icap server *ip_address* **[port** *port_number* **] [priority** *priority* **]**

no

Removes the specified ICAP server configuration from the current Content Filtering Server Group.

ip_address

Specifies the ICAP server's IP address.
ip_address must be a standard IPv4 address expressed in dotted decimal notation format, or an IPv6 address expressed in colon notation format.

port *port_number*

Default: 1344
Specifies the ICAP server's port number to use for communications.
port_number must be an integer from 1 through 65535.

max *msgs*

Specifies the maximum number of unanswered outstanding messages that may be allowed to the ICAP server.

Important: The maximum outstanding requests per ICAP connection is limited to one. Therefore the value configured using the **max** keyword will be ignored.

priority *priority*

Default: 1
Specifies priority of the ICAP server in the current Content Filtering Server Group. The priority is used in server selection to determine which standby server becomes active.

priority must be an integer from 1 through 65535, where 1 is the highest priority.

Important: The **priority** keyword is only available in StarOS 8.1 and later releases.

Usage

This command is used to add an ICAP server configuration to a Content Filtering Server Group with which the system is to communicate for content filtering communication.
In StarOS 8.0, the ICAP solution supports only one connection between ACS Manager and ICAP server.
In StarOS 8.1, multiple ICAP server connections are supported per manager. At any time only one connection is active with the other connections acting as standby. In case of a connection failure, based on its priority, a standby connection becomes active. Any pending ICAP requests are moved to the new active connection. If a standby connection is unavailable, failure action is taken on all pending ICAP requests. See the failure-action command.
In StarOS 8.1 and later releases, a maximum of five ICAP servers can be configured per Content Filtering Server Group with a priority associated with each server. Once configured, an ICAP server's priority cannot be changed. To change a server's priority, the server configuration must be removed, and added with the new priority.

Example

The following command sets the ICAP server IP address to *1.2.3.4* and port to *1024*:

```
icap server 1.2.3.4 port 1024
```

The following command specifies an ICAP server with IP address *5.6.7.8*, port number *1024*, and priority *3*:

```
icap server 5.6.7.8 port 1024 priority 3
```

origin address

This command specifies a bind address for the CFSG endpoint.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

origin address *ip_address*

no origin address

no

Disables/releases the binding address for the CFSG endpoint.

ip_address

Specifies the IP address to bind the CFSG endpoint.
ip_address can be an IPv4 address expressed in dotted decimal notation, or an IPv6 address expressed in colon notation.

Usage

Use this command to set the bind address for the CFSG endpoint.

Example

The following command sets the origin address of *1.1.1.1*:

origin address *1.1.1.1*

response-timeout

This command sets the response timeout for the ICAP connection between ICAP server and client.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

response-timeout *duration*

{ default | no } response-timeout

default

Configures the default setting.
Default: 30 seconds

no

Removes the response timeout configuration.

duration

The timeout duration in seconds, and must be an integer from 1 through 300.
Default: 30 seconds

Usage

Use this command to set the ICAP connection response timeout, after which connection will be marked as unsuccessful between ICAP endpoint.

Example

The following command sets the ICAP connection response timeout to *100* seconds:

response-timeout *100*

timeout action

This command has been deprecated, and is replaced by the failure-action command.

url-extraction

This command enables configuration of ICAP URL extraction behavior.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

```
url-extraction { after-parsing | raw }

default url-extraction
```

default

Configures the default setting.
Default: **after-parsing**

after-parsing

Specifies sending parsed URI and host name. Percent-encoded hex characters in URLs sent from the ACF client to the ICAP server will be converted to corresponding ASCII characters and sent.
For example, the URL:
http://www.google.co.uk/?this%20is%20a%20test
will be sent to the ICAP server as:
http://www.google.co.uk/?this is a test

raw

Specifies sending raw URI and host name. The URLs will contain percent-encoded hex characters as is.
For example, the URL:
http://www.google.co.uk/?this%20is%20a%20test
will be sent to the ICAP server as:
http://www.google.co.uk/?this%20is%20a%20test

Usage

Use this command to configure the ICAP URL extraction behavior. Percent-encoded hex characters—for example, space (%20) and the percent character (%25)—in URLs sent from the ACF client to the ICAP server can be sent either as percent-encoded hex characters or as their corresponding ASCII characters.

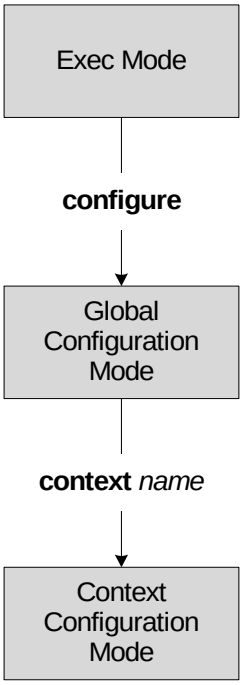
Example

The following command configures URLs sent from the ACF client to the ICAP server to contain the escape encoding as is:

```
url-extraction raw
```

Chapter 38
Context Configuration Mode Commands

The Context Configuration Mode is used to create and manage contexts in the system. Contexts facilitate management of subscribers and services in the system.



aaa accounting

This command enables/disables accounting for subscribers and context-level administrative users for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
aaa accounting { administrator radius-diameter | subscriber [ radius-diameter ]
}

default aaa accounting { administrator | subscriber }

no aaa accounting { administrator | subscriber } [ radius-diameter ]
```

default

Configures the default setting.
Default: RADIUS

no

Disables AAA accounting per the options specified.

administrator | subscriber

administrator: Enables/disables AAA accounting for context-level administrative users.
subscriber: Enables/disables AAA accounting for subscribers.

radius-diameter

Enables/disables RADIUS or Diameter accounting for administrator(s)/subscribers as specified.

Usage

Use this command to enable/disable accounting for subscribers and context-level administrative users for the current context.
To enable or disable accounting for individual local subscriber configurations refer to the **accounting-mode** command in the *Subscriber Configuration Mode Commands* chapter.

Important: The accounting parameters in the APN Configuration Mode take precedence over this command for subscriber sessions. Therefore, if accounting is disabled using this command but enabled within the APN configuration, accounting is performed for subscriber sessions.

Example

The following command disables AAA accounting for context-level administrative users:

```
no aaa accounting administrator
```

The following command enables AAA accounting for context-level administrative users:

```
aaa accounting administrator radius-diameter
```

aaa authentication

This command enables/disables authentication for subscribers and context-level administrative users for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] aaa authentication { administrator | subscriber } { local | none |
radius-diameter }

default aaa authentication { administrator | subscriber }
```

default

Configures the default setting.
administrator: local+RADIUS
subscriber: RADIUS

no

Disables AAA authentication for administrator(s)/subscribers as specified.
local: Disables local authentication for current context.
none: Disables NULL authentication for current context, which enables both local and RADIUS-based authentication.
radius-diameter: Disables RADIUS or Diameter-based authentication.

administrator | subscriber

administrator: Enables/disables authentication for administrative users.
subscriber: Enables/disables authentication for subscribers.

local | none | radius-diameter

Enables AAA authentication for administrator(s)/subscribers as specified.
local: Enables local authentication for the current context.
none: Disables authentication for the current context.
radius-diameter: Enables RADIUS or Diameter-based authentication.

Usage

Use this command to enable/disable AAA authentication during specific maintenance activities or during test periods. The authentication can then be enabled again for the entire context as needed.

Example

The following command disables RADIUS or Diameter-based authentication for subscribers for the current context:

```
no aaa authentication subscriber radius-diameter
```

The following command enables RADIUS or Diameter-based authentication for subscribers for the current context:

```
aaa authentication subscriber radius-diameter
```

aaa constructed-nai

Configures the password used during authentication for sessions using a Constructed Network Access Identifier (NAI) or an APN-specified user name.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

aaa constructed-nai authentication [[encrypted] password *user_password* **| use-shared-secret-password]**

no aaa constructed-nai authentication

no

Disables authentication based upon the constructed network access identifier.

[encrypted] password *user_password*

encrypted: Specifies that the password (*user_password*) is encrypted.
password *user_password*: Specifies an authentication password for the NAI-constructed user. *user_password* must be an alpha and/or numeric string of 0 through 63 characters in length.

use-shared-secret-password

Specifies using RADIUS shared secret as the password.
Default: No password

Usage

This command is used to configure passwords for user sessions that utilize a constructed NAI assigned via a PDSN service or a user name assigned via the APN configuration.
For simple IP sessions facilitated by PDSN services in which the **authentication allow-noauth** and **aaa constructed-nai** commands are configured, this command provides a password used for the duration of the session.
For PDP contexts using an APN in which the outbound user name is configured with no password, this command is used to provide the password. Additionally, this command is also used to provide a password for situations in which an outbound username and password are configured and the **authentication imsi-auth** command has been specified.
The encrypted keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.
If a password is configured with this keyword, then the specified password is used. Otherwise, an empty user-password attribute is sent.
Note that this configuration works in a different way for GGSN services. If a password is configured with this keyword for GGSN service, the specified password is used. Otherwise, if an outbound password is

configured, that password is used. If no outbound password is configured, the RADIUS server secret is used as the user-password string to compute the user-password RADIUS attribute.
The NAI-construction consists of the subscriber's MSID, a separator character, and a domain. The domain that is used is either the domain name supplied as part of the subscriber's user name or a domain alias.

Important: The domain alias can be set with the **nai-construction domain** command in the PDSN Service Configuration mode, or the **aaa default-domain subscriber** command in the Global Configuration mode for other core network services.

The domain alias is determined according to the following rules:

- If the domain alias is set by **nai-construction domain**, that value is always used and the **aaa default-domain subscriber** value is disregarded, if set. The NAI is of the form **<msid><symbol><nai-construction domain>**.
- If the domain alias is not set by **nai-construction domain**, and the domain alias is set by **aaa default-domain subscriber**, the **aaa default-domain subscriber** value is used. The NAI is of the form **<msid><symbol><aaa default-domain subscriber>**.
- If the domain alias is not set by **nai-construction domain** or **aaa default-domain subscriber**, the domain name alias is the name of the source context for the PDSN service. The NAI is of the form **<msid><symbol><source context of PDSN Service>**.

The special separator character can be one of the following six: @, -, %, \, -, /
The subscriber's MSID is constructed in one of the formats displayed in the following figure.

Mobile Country Code (3 digits)	Mobile Network Code (2 or 3 digits)	Mobile Subscriber Identification Number (10 digits max)

International Mobile Station Identity (IMSI)

Area Code (3 digits)	Office Code (3 digits)	Subscriber Number (4 digits)

Mobile Identification Number (MIN)

Mobile Country Code (3 digits)	Mobile Network Code (1 digit)	Subscriber Number (6 digits)

International Roaming MIN (IRM)

Example

```
aaa constructed-nai authentication
```

```
aaa constructed-nai authentication use-shared-secret-password
```

aaa filter-id rulebase mapping

This command configures the system to use value of the Filter-Id AVP as the ACS rulebase name.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] aaa filter-id rulebase mapping
```

no

Disables the mapping of Filter-Id AVP and ACS rulebase name.

default

Configures the default setting.
Default: Disabled

Usage

Use this command to enable the mapping of Filter-Id attribute's value returned during RADIUS authentication as the ACS rulebase name.
This feature provides the flexibility for operator to transact between multi-charging-service support for postpaid and prepaid subscribers through Access Control Lists (ACLs) entered in AAA profiles in RADIUS server to single-charging-service system based on rulebase configuration for postpaid and prepaid subscribers.
This feature internally maps the received ACL in to rulebase name and configures subscriber for postpaid or prepaid services accordingly.
When this feature is enabled and ACS rulebase attribute is not received from RADIUS or not configured in local default subscriber template system copies the filter-id attribute value to ACS rulebase attribute.
This copying happens only if the filter-id is configured and received from RADIUS server and ACS rulebase is not configured in ACS or not received from RADIUS.

Example

Following command enables the mapping value of the Filter-Id attribute to ACS rulebase name:

```
aaa filter-id rulebase mapping
```

aaa group

This command enables creating/configuring/deleting AAA server groups in the context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

aaa group *group_name* **[-noconfirm]**

no aaa group *group_name*

no

Deletes the specified AAA group.

group_name

Specifies the AAA group's name.
If the specified AAA group does not exist, it is created, and the prompt changes to the AAA Server Group Configuration Mode, wherein the AAA group can be configured.
If the specified AAA group already exists, the prompt changes to the AAA Server Group Configuration Mode, wherein the AAA group can be configured.
group_name must be a string of 1 through 63 characters in length.

-noconfirm

Specifies that the command must execute without any prompt and confirmation from the user.

Usage

Use this command to create/configure/delete AAA server groups within the context. Also, refer to the *AAA Server Group Configuration Mode Commands* chapter.

Example

The following command creates a AAA group named *test321*, and enters the AAA Group Configuration Mode:

aaa group *test321*

aaa nai-policy

This commands sets policies on how NAIs (Network Access Identifiers) are handled during the authentication process.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] aaa nai-policy reformat-alg-hex-0-9
```

default

Sets the NAI policy back to its default setting which is to remap hexadecimal digits in NAIs and accept calls with embedded 0x00 hexadecimal digits.

no

Disable remapping of hexadecimal digits in the NAI and reject calls that have a 0x00 hexadecimal digit embedded in the NAI.

reformat-alg-hex-0-9

Default: Enabled
This keyword controls remapping of NAIs that consist only of hex digits 0x00 through 0x09 or if a 0x00 hexadecimal digit is embedded in the NAI.
By default, the system remaps NAIs that consist solely of characters 0x00 through 0x09 to their ASCII equivalent. For example; 0x00 0x01 0x2 0x03 will get remapped to 123.
Also by default the system accepts an NAI containing one or more 0x00 characters within the NAI ignoring all characters after the first 0x00.
When this keyword is disabled NAIs are processed as follows:

- Remapping of hexadecimal digits 0x00 through 0x09 within the user-provided NAI is disabled.
- When the NAI has an embedded 0x00 character anywhere within it (including if there is an extra 0x00 character at the end) the call is rejected.

Usage

Use this command to disable or re-enable remapping of hexadecimal digits in the NAI.

Example

The following command disables the remapping of hexadecimal digits in the NAI:

```
no aaa nai-policy reformat-alg-hex-0-9
```

access-list undefined

Configures the behavior of access control for the current context when an undefined access control list is specified.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
access-list undefined { deny-all | permit-all }

no access-list undefined
```

no

Disables handling undefined access lists.

deny-all | permit-all

Specifies the handling of packets when an undefined ACL is specified.
deny-all: Specifies to drop all packets.
permit-all: Specifies to forward all packets.

Usage

Use this command to specify the default behavior when an ACL specified does not exist.
When the security policies require strict access control the **deny-all** handling should be configured.

Example

The following command sets the packet handling to ignore (drop) all packets when an undefined ACL is specified.

```
access-list undefined deny-all
```

administrator

This command configures a user with Security Administrator privileges in the current context.

Product

All

Privilege

Security Administrator

Syntax

administrator *user_name* **[encrypted] password** *password* **| [ecs] [expiry-date** *date_time* **] [ftp] [li-administration] [nocli] [noecs] [timeout-absolute** *timeout_absolute* **] [timeout-min-absolute** *timeout_min_absolute* **] [timeout-idle** *timeout_idle* **] [timeout-min-idle** *timeout_min_idle* **]**

no administrator *user_name*

no

Removes Security Administrator privileges for the specified user name.

user_name

Specifies the user name for which Security Administrator privileges must be enabled in the current context. *user_name* must be an alpha and/or numeric string of 1 through 32 characters in length.

[encrypted] password *password*

Specifies password for the user name. Optionally, the **encrypted** keyword can be used to specify the password uses encryption.
Without encryption *password* must be an alpha and/or numeric string of 1 through 63 characters in length.
With encryption *password* can be an alpha and/or numeric string of 1 through 127 characters in length.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

ecs

Permits the user to use ACS-specific configuration commands.
Default: Permitted

expiry-date *date_time*

Specifies the date and time that this login account expires.
Enter the date and time in the YYYY:MM:DD:HH:mm or YYYY:MM:DD:HH:mm:ss format. Where YYYY is the year, MM is the month, DD is the day of the month, HH is the hour, mm is minutes, and ss is seconds.

ftp

Permits the user to use FTP and SFTP .

Default: Not permitted

li-administration

Permits the user to execute Lawful Intercept commands.

Important: Users who have Lawful Intercept privileges are only given those privileges when connected to the system through a Secure Shell (SSH). If this user connects through a Telnet session or through the console port, Lawful Intercept privileges are not enabled.

nocli

Default: Permitted
Prevents the user from using the command line interface.

noecs

Prevents the user from accessing ACS-specific commands.

timeout-absolute *timeout_absolute*

Important: This keyword is obsolete. It has been left in place for backward compatibility. If used, a warning is issued and the value entered is rounded to the nearest whole minute.

Specifies the maximum time, in seconds, the Security Administrator may have a session active before the session is forcibly terminated. *timeout_absolute* must be an integer from 0 through 300000000.
The value 0 disables this timeout configuration.
Default: 0

timeout-min-absolute *timeout_min_absolute*

Specifies the maximum time, in minutes, the Security Administrator may have a session active before the session is forcibly terminated. *timeout_min_absolute* must be an integer from 0 through 525600.
The value 0 disables this timeout configuration.
Default: 0

timeout-idle *timeout_idle*

Important: This keyword is obsolete. It has been left in place for backward compatibility. If used a warning is issued and the value entered is rounded to the nearest whole minute.

Specifies the maximum time, in seconds, the Security Administrator may have a session active before the session is terminated. *timeout_idle* must be an integer from 0 through 300000000.
The value 0 disables the idle timeout configuration.
Default: 0

timeout-min-idle *timeout_min_idle*

Specifies the maximum time, in minutes, the Security Administrator may have a session active before the session is terminated. *timeout_min_idle* must be an integer from 0 through 525600.
The value 0 disables the idle timeout configuration.

Default: 0

Usage

Use this command to create new Security Administrators or modify existing user's settings.
Security Administrator users have read-write privileges and full access to all contexts and command modes.
Refer to the *Command Line Interface Overview* chapter for more information.

Important: A maximum of 128 administrative users and/or subscribers may be locally configured per context.

Example

The following command creates a Security Administrator account named *user1* with access to ACS configuration commands:

```
administrator user1 password secretPassword
```

The following removes the Security Administrator account named *user1*:

```
no administrator user1
```

apn

Creates/deletes Access Point Name (APN) templates and enters the APN Configuration Mode within the current context.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

apn *apn_name* **[-noconfirm]**

no apn *apn_name* **[-noconfirm]**

no

Deletes a previously configured APN template.

apn_name

Specifies a name for the APN template.
apn_name can be from 1 to 62 alpha and/or numeric characters and is not case sensitive. It may also contain dots (.) and/or dashes (-).

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

WARNING: If this keyword option is used with **no apn** *apn_name* command the APN named *apn_name* will be deleted with all active/inactive subscribers without prompting any warning or confirmation.

Usage

This command creates an APN within the system and causes the CLI to enter the APN Configuration Mode. The APN is a logical name for a packet data network and/or a service to which the system supports access. When a create PDP context request is received by the system, it examines the APN information element within the packet. The system determines if an APN with the identical name is configured. If so, the system uses the configuration parameters associated with that APN as a template for processing the request. If the names do not match, the request is rejected with a cause code of 219 (DBH, Missing or unknown APN). APN templates should be created/configured within destination contexts on the system. Up to 1000 APNs can be configured.

Example

The following command creates an APN template called isp1:

apn *isp1*

asn-qos-descriptor

Creates/deletes/manages the Quality of Service (QoS) descriptor table identifier for Access Service Node Gateway (ASN-GW) service and enters the ASN QoS Descriptor Table Identifier Configuration mode within the source context.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
asn-qos-descriptor id qos_table_id [ default ] dscp [ be | af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af 42 | af 43 | ef ] [ -noconfirm ]

no asn-qos-descriptor qos_table_id [ default ] dscp [ be | af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af 42 | af 43 | ef ] [ -noconfirm ]
```

no

Deletes a preciously configured ASN QoS descriptor table identifier.

qos_table_id

Specifies an unique identifier for ASN QoS descriptor table to create/configure.
qos_table_id must be an integer between 1 to 65535.

[default] dscp

Specifies DSCP marking for this QoS descriptor.

[be | af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af 42 | af 43 | ef]

The DSCP marking for this QoS descriptor. Deafault value is be (best effort).

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

WARNING: If this keyword option is used with **no asn-qos-descriptor id** *qos_table_id* command the ASN QoS descriptor table with identifier *qos_table_id* will be deleted with all active/inactive configurations without prompting any warning or confirmation.

Usage

Use this command to configure a QoS description table to manage QoS functionality for an ASN-GW service subscriber. This command creates and allows the configuration of QoS tables with in a context. This command is also used to remove previously configured ASN-GW services QoS descriptor table.
A maximum of 16 QoS Descriptor Tables can be configured per system.

Refer to the *ASN QoS Descriptor Configuration Mode Commands* chapter of this reference for additional information.

Example

The following command creates a QoS descriptor table with identifier *1234* for the ASN-GW service subscribers:

```
asn-qos-descriptor id 1234
```

asn-service-profile

Creates/deletes/manages the Service Profiles Identifier for Access Service Node Gateway (ASN-GW) service subscribers and enters the ASN Service Profile Configuration mode within the current context.

Product

ASN-GW

Privilege

Administrator

Syntax

asn-service-profile id *asn_profile_id* **direction { bi-directional | downlink | uplink } [-noconfirm]**

no asn-service-profile id *asn_profile_id* **[-noconfirm]**

no

Deletes a preciously configured ASN service profile identifier.

qos_table_id

Specifies an unique identifier for ASN QoS descriptor table to create/configure.
qos_table_id must be an integer between 1 to 65535.

direction { bi-directional | downlink | uplink }

Specifies the direction of data traffic to apply this service profile.
bi-directional: This keyword enables this service profile in both direction of uplink and downlink.
downlink: This keyword enables this service profile in downlink direction, towards the subscriber.
uplink: This keyword enables this service profile in uplink direction, towards the system.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

WARNING: If this keyword option is used with **no asn-service-profile id** *asn_profile_id* command the ASN service profile with identifier *asn_profile_id* will be deleted with all active/inactive configurations without prompting any warning or confirmation.

Usage

Use this command to configure a service profile to apply the ASN-GW service subscribers. This command creates and allows the configuration of service profiles with in a context. This command is also used to remove previously configured ASN-GW services profiles.
A maximum of 32 ASN Service Profiles can be configured per context.
Refer to the *ASN Service Profile Configuration Mode Commands* chapter of this reference for additional information.

Example

The following command creates an ASN Service Profile with identifier *1234* for the ASN-GW service subscribers:

```
asn-service-profile id 1234 direction uplink
```

asngw-service

Creates/deletes/manages an Access Service Node Gateway (ASN-GW) service and enters the ASN Gateway Service Configuration Mode within the current context.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

asngw-service *asngw_name* **[-noconfirm]**

no asn-service *asngw_name* **[-noconfirm]**

no

Deletes a previously configured ASN-GW service.

asngw_name

Specifies the name of the ASN-GW service to create/configure.
asngw_name must be from 1 to 63 alpha and/or numeric characters and is case sensitive.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

WARNING: If this keyword option is used with **no asn-service** *asngw_name* command the ASN-GW service named *asngw_name* will be deleted with all active/inactive subscribers without prompting any warning or confirmation.

Usage

Services are configured within a context and enable certain functionality. This command creates and allows the configuration of services enabling the system to function as an ASN Gateway in a WiMAX network. This command is also used to remove previously configured ASN-GW services.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (i.e. resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Refer to the *ASN Gateway Service Configuration Mode Commands* chapter of this reference for additional information.

Example

The following command creates an ASN-GW service name *asn-gw1*:

asngw-service *asn-gw1*

asnpc-service

This command Creates/deletes/manages an ASN Paging Controller service to manage the ASN paging controller service and enters the ASN Paging Controller Configuration mode within the current context.

Product

ASN GW

Privilege

Security Administrator, Administrator

Syntax

`[ no ] asnpc-service` *`asn_pc_svc_name`* **`[ -noconfirm ]`**

`no`

Deletes a preciously configured ASN paging controller service.

`asn_pc_svc_name`

Specifies the name of the ASN Paging Controller Service to create and enable.
`asn_pc_svc_name` must be from 1 to 63 alpha and/or numeric characters and is case sensitive.

`-noconfirm`

Indicates that the command is to execute without any additional prompt and confirmation from the user.

WARNING: If this keyword option is used with **`no asnpc-service`** *`asn_pc_svc_name`* command the ASN Paging Controller service named *`asn_pc_svc_name`* will be deleted and disabled with all active/inactive paging groups and paging agents configured in a context for ASN paging controller service without prompting any warning or confirmation.

Usage

Use this command to create and enable the ASN paging controller services in the system to provide functionality of an ASN Paging Controller service within a context. Additionally this command provides the access to the ASN Paging Controller Service Configuration mode and also used to remove previously configured ASN Paging Controller services.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (i.e. resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Refer to the *ASN Paging Controller Service Configuration Mode Commands* chapter of this reference for additional information.

Example

The following command creates an ASN paging controller service name *asnpc_1*:

asnpc-service *asnpc_1*

bmsc-profile

Creates/deletes Broadcast Multicast Service Center (BM-SC) profiles and enters the BMSC Profile Configuration Mode within the current context.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

bmsc-profile name *bmsc_profile_name* **[-noconfirm]**

no bmsc-profile name *bmsc_profile_name* **[-noconfirm]**

no

Deletes a previously configured BM-SC profile.

bmsc_profile_name

Specifies a name for the BM-SC profile.
bmsc_profile_name can be from 1 to 62 alpha and/or numeric characters and is not case sensitive. It may also contain dots (.) and/or dashes (-).

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

WARNING: If this keyword option is used with **no bmsc-profile name** *bmsc_profile_name* command the BM-SC profile named *bmsc_profile_name* will be deleted with all active/inactive subscribers without prompting any warning or confirmation.

Usage

This command creates a BM-SC profile within the context and take the user to enter the BMSC Profile Configuration Mode.
The BM-SC profile is a logical name for a Broadcast Multicast Service Center in Multimedia Broadcast and Multicast service.
BM-SC profile should be created/configured within contexts on the system. Up to 4 BM-SC profiles can be configured.

Example

The following command creates a BM-SC Profile called *mbms_sc_1*:

bmsc-profile name *mbms_sc_1*

busyout ip pool

This command makes addresses from an IP pool in the current context unavailable once they are free.

Product

PDSN, HA, GGSN, NAT

Privilege

Security Administrator, Administrator

Syntax

busyout ip pool { all | all-dynamic | all-static | name *pool_name* **} [address-range** *start_address end_address* **| lower-percentage** *percent* **| upper-percentage** *percent* **]**

no busyout ip pool { all | all-dynamic | all-static | name *pool_name* **} [address-range** *start_address end_address* **| lower-percentage** *percent* **| upper-percentage** *percent* **]**

no

Disable the busyout command specified.

all

This command applies to all IP pools in the current context.

all-dynamic

This command applies to all dynamic IP-pools in the current context.

all-static

This command applies to all static IP pools in the current context.

name *pool_name*

This is the name of an IP pool or IP pool group in the current context to which this command is applied. *pool_name* must be the name of an existing IP pool or IP pool group in the current context.

address-range *start_address end_address*

Busyout all addresses from *start_address* through *end_address*. *start_address*: The beginning IP address of the range of addresses to busyout. This IP address must exist in the pool specified and must be entered in IP v4 dotted decimal notation.
end_address: The ending IP address of the range of addresses to busyout. This IP address must exist in the pool specified and must be entered in IP v4 dotted decimal notation.

lower-percentage *percent*

Busyout the percentage of IP addresses specified, beginning at the lowest numbered IP address. This is a percentage of all of the IP addresses in the specified IP pool. *percent* must be an integer from 0 through 100.

upper-percentage *percent*

Busyout the percentage of IP addresses specified, beginning at the highest numbered IP address. This is a percentage of all of the IP addresses in the specified IP pool. *percent* must be an integer from 0 through 100.

Usage

Use this command to busyout IP addresses when resizing an IP pool.
Up to 32 instances of this command can be executed per context.
A single instance of this command can busy-out multiple IP address pools in the context through the use of the **all**, **all-static**, or **all-dynamic** keywords.

Example

Assume an IP pool named *Pool10* with addresses from *192.168.100.1* through *192.168.100.254*. To busy out the addresses from *192.168.100.50* through *192.169.100.100*, enter the following command:

```
busyout ip pool name Pool10 address-range 92.168.100.50 192.169.100.100
```

To restore the IP addresses from the previous example and make them accessible again, enter the following command:

```
no busyout ip pool name Pool10 address-range 92.168.100.50
192.169.100.100
```

class-map

This command deletes/creates and enters the Class-Map Configuration Mode within the current destination context to configure the match rules for packet classification to flow-based traffic policing for a subscriber session flow.

Product

PDSN, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

`[ no ] class-map name` *`class_name`* **`[ match-all | match-any ]`**

`no`

Deletes configured Class-Map within the context.

`class_name`

Specifies the name of Class-Map rule and can consist of from 1 to 15 alpha and/or numeric characters in length and is case sensitive.

`match-all`

Default: Enabled.
Enables AND logic for all matching parameters configured in specific Class-Map to classify traffic flow/packets. It indicates to match all classification rules in specific Class-Map to consider the specified Class-Map as a match.

`match-any`

Default: Disabled.
Enables OR logic for matching parameters configured in specific Class-Map to classify traffic flow/packets. It indicates to match any of the classification rule in specific Class-Map to consider the specified Class-Map as a match.

Usage

Use this command to enter in Class-Map Configuration Mode to set classification parameters or filters in traffic policy for a subscriber session flow.

Important: In this mode classification rules added sequentially with **match** command to form a Class-Map. To change and/or delete or re-add a particular rule entire Class-Map is required to delete.

Example

Following command configures classification map *`class_map1`* with option to match any condition in match rule.

```
class-map name class_map1 match-any
```

closedrp-rp handoff

This command enables session handoff between Closed-RP and RP connections. Default: Disabled

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
closedrp-rp handoff
```

```
[ default | no ] closedrp-rp handoff
```

default

Resets the command to its default setting of disabled.

no

Disables Closed-RP to RP session handoff.

Usage

Use this command to enable a PDSN service to handoff sessions between Closed-RP and RP connections.

Example

To enable Closed-RP to RP handoffs, use the following command:

```
closedrp-rp handoff
```

To disable Closed-RP to RP handoffs, use the following command:

```
no closedrp-rp handoff
```

config-administrator

Configures a context-level administrator account within the current context.

Product

All

Privilege

Security Administrator

Syntax

config-administrator *user_name* **[encrypted] password** *password* **[ecs] [expiry-date** *date_time* **] [ftp] [li-administration] [nocli] [noecs] [timeout-absolute** *abs_seconds* **] [timeout-min-absolute** *abs_minutes* **] [timeout-idle** *idle_seconds* **] [timeout-min-idle** *idle_minutes* **]**

no config-administrator *user_name*

no

Removes a previously configured context-level administrator account.

user_name

Specifies the name for the account. *user_name* must be from 1 to 32 alpha and/or numeric characters.

[encrypted] password *password*

Specifies the password to use for the user which is being given context-level administrator privileges within the current context. The encrypted keyword indicates the password specified uses encryption.
password must be from 1 to 63 alpha and/or numeric characters without encryption and must be from 1 to 127 alpha and/or numeric characters when encryption has been indicated.
The encrypted keyword is intended only for use by the system while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the password keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

ecs

Default: Enhanced Charging Service (ECS / ACS) specific configuration commands allowed.
Permits the user access to ACS-specific configuration commands.

expiry-date *date_time*

The date and time that this account expires. Enter the date and time in the format YYYY:MM:DD:HH:mm or YYYY:MM:DD:HH:mm:ss.
Where YYYY is the year, MM is the month, DD is the day of the month, HH is the hour, mm is minutes, and ss is seconds.

ftp

Default: FTP and SFTP are not allowed.
Indicates the user gains FTP and SFTP access with the administrator privileges.

li-administration

Permits this user to execute Lawful Intercept commands.

Important: Users who have Lawful Intercept privileges are only given those privileges when connected to the system through a Secure Shell (SSH). If this user connects through a Telnet session or through the console port, Lawful Intercept privileges are not enabled.

nocli

Default: CLI access allowed.
Indicates the user is not allowed to access the command line interface.

noecs

Prevents the specific user to access ACS-specific configuration commands.

timeout-absolute *abs_seconds*

Default: 0
This keyword is obsolete. It has been left in place for backward compatibility. If used a warning is issued and the value entered is rounded to the nearest whole minute.
Specifies the maximum amount of time, in seconds, the administrator may have a session active before the session is forcibly terminated. *abs_seconds* must be a value in the range from 0 through 300000000.
The special value 0 disables the absolute timeout.

timeout-min-absolute *abs_minutes*

Default: 0
Specifies the maximum amount of time, in minutes, the context-level administrator may have a session active before the session is forcibly terminated. *abs_minutes* must be a value in the range from 0 through 525600 (365 days).
The special value 0 disables the absolute timeout.

timeout-idle *idle_seconds*

Default: 0
This keyword is obsolete. It has been left in place for backward compatibility. If used a warning is issued and the value entered is rounded to the nearest whole minute.
Specifies the maximum amount of idle time, in seconds, the context-level administrator may have a session active before the session is terminated. *idle_seconds* must be a value in the range from 0 through 300000000.
The special value 0 disables the idle timeout.

timeout-min-idle *idle_minutes*

Default: 0
Specifies the maximum amount of idle time, in minutes, the context-level administrator may have a session active before the session is terminated. *idle_minutes* must be a value in the range from 0 through 525600 (365 days).
The special value 0 disables the idle timeout.

Usage

Create new context-level administrators or modify existing administrator's options, in particular, the timeout values.
Administrator users have read-write privileges and full access to all contexts and command modes (except for a few security functions). Refer to the *Command Line Interface Overview* chapter of this guide for more information.

Important: A maximum of 128 administrative users and/or subscribers may be locally configured per context.

Example
The following configures a context-level administration named *user1* with ACS parameter control:

```
config-administrator user1 password secretPassword ecs
```

The following command removes a context-level administrator named *user1*:

```
no config-administrator user1
```

content-filtering

This command enables creating/configuring/deleting Content Filtering Server Groups (CFSG).

Product

CF

Privilege

Security Administrator, Administrator

Syntax

content-filtering server-group *cf_server_group_name* **[-noconfirm]**

no content-filtering server-group *cf_server_group_name*

no

Removes the specified CFSG previously configured in this context.

cf_server_group

Specifies the CFSG name.
cf_server_group_name must be an alpha and/or numeric string of 1 through 63 characters in length.

-noconfirm

Specifies to create the CFSG without prompting for confirmation.

Usage

Use this command to create/configure/delete a CFSG.

Example

The following command creates a CFSG named *CF_Server1*:

content-filtering server-group *CF_Server1*

credit-control-service

This command enables creating/configuring/deleting credit-control services.

Product

All

Privilege

Security Administrator, Administrator

Syntax

credit-control-service *service_name* **[-noconfirm]**

no credit-control-service *service_name*

no

Deletes the specified credit-control service.

service_name

Specifies name of the credit-control service.
service_name must be an alpha and/or numeric string of 1 through 63 characters in length.
If the named credit-control service does not exist, it is created, and the CLI mode changes to the Credit Control Service Configuration Mode wherein the service can be configured.
If the named credit-control service already exists, the CLI mode changes to the Credit Control Service Configuration Mode wherein the service can be configured.

-noconfirm

Specifies that the command must execute without any additional prompt and confirmation from the user.

Usage

Use this command to create/configure/delete credit-control services.

Example

The following command creates a credit-control service named *test159*, and enters the Credit Control Service Configuration Mode:

credit-control-service *test159*

crypto group

Creates a crypto group and enters the Crypto Configuration Mode allowing the configuration of crypto group parameters.

Product

PDSN, PDIF, HA, GGSN, SCM

Privilege

Administrator, Config-Administrator

Syntax

crypto group *group_name*

no crypto group *group_name*

no

Deletes a previously configured crypto group.

group_name

The name of the crypto group and can consist of from 1 to 127 alpha and/or numeric characters in length and is case sensitive.

Important: A maximum of 32 crypto groups per context can be configured.

Usage

Use this command to enter the configuration mode allowing the configuration of crypto group parameters. Crypto (tunnel) groups are used to support the Redundant IPSec Tunnel Fail-over feature and consist of two configured ISAKMP crypto maps. Each crypto map defines the IPSec policy for a tunnel. In the crypto group, one tunnel serves as the primary, the other as the secondary (redundant).

Example

The following command configures a crypto group called *group1*:

crypto group *group1*

crypto ipsec transform-set

Configures transform-sets on the system and enters the Crypto Trans Configuration Mode.

Product

PDSN, PDIF, HA, GGSN, SCM

Privilege

Security Administrator, Administrator

Syntax

```
crypto ipsec transform-set transform_name [ ah { hmac { md5-96 | none | sha1-96
} { esp { hmac { { md5-96 | sha1-96 } { cipher { des-cbc | 3des-cbc | aes-cbc }
} | none } } } } ]

no crypto ipsec transform-set transform_name
```

no

Removes a previously configured transform set

transform_name

Configures the name by which the transform set will be recognized by the system.
transform_name must be from 1 to 127 alpha and/or numeric characters and is case sensitive.

ah hmac

Configures the Authentication Header (AH) hash message authentication codes (HMAC) parameter for the transform set to one of the following:

- **md5-96**: Message Digest 5 truncated to 96 bits
- **none**: Disables the use of the AH protocol for the transform set.
- **sha1-96**: Secure Hash Algorithm-1 truncated to 96 bits

esp hmac

Configures the Encapsulating Security Payload (ESP) hash message authentication codes (HMAC) parameter for the transform set to one of the following:

- **md5-96**: Message Digest 5 truncated to 96 bits
- **none**: Disables the use of the AH protocol for the transform set.
- **sha1-96**: Secure Hash Algorithm-1 truncated to 96 bits

cipher

If ESP is enabled, this option must be used to set the encapsulation cipher protocol to one of the following:

- **3des-cbc**: Triple Data Encryption Standard (3DES) in chain block (CBC) mode
- **aes-cbc**: Advanced Encryption Standard (AES) in CBC mode
- **des-cbc**: DES in CBC mode

Usage

Use this command to create a transform set on the system.

Transform Sets are used to define IPSec security associations (SAs). IPSec SAs specify the IPSec protocols to use to protect packets.

Transform sets are used during Phase 2 of IPSec establishment. In this phase, the system and a peer security gateway negotiate one or more transform sets (IPSec SAs) containing the rules for protecting packets. This negotiation ensures that both peers can properly protect and process the packets.

Important: The **ah** and subsequent keywords are required when the transform set is initially configured.

Example

Create a transform set that has the name *tset1*, no authentication header, an encapsulating security protocol header hash message authentication code of md5, and a bulk payload encryption algorithm of des-cbc with the following command:

```
crypto ipsec transform-set tset1 ah hmac none esp hmac md5 cipher des-cbc
```

crypto map

Configures the name of the policy and enters either the specified Crypto Map Configuration Mode.

Product

PDSN, HA, GGSN, SCM, P-GW, PDIF

Privilege

Security Administrator, Administrator

Syntax

crypto map *name* **[ikev2-ipv6 | ipsec-dynamic | ipsec-ikev1 | ipsec-manual]**

no crypto map *name*

no

Removes a previously configured crypto map.

name

The name by which the crypto map will be recognized by the system. *name* must be a string of from 1 through 127 alpha and/or numeric characters and is case sensitive.

ikev2-ipv6

Creates an IKEv2-IPv6 crypto map and enters the Crypto Map IKEv2-IPv6 Configuration Mode

ipsec-dynamic

Creates a dynamic crypto map and/or enters the Crypto Map Dynamic Configuration Mode.

ipsec-ikev1

Creates an IKEv1 crypto map and/or enters the Crypto Map IKEv1 Configuration Mode.

ipsec-manual

Creates a manual crypto map and/or enters the Crypto Map Manual Configuration Mode.

Usage

Crypto Maps define the policies that determine how IPSec is implemented for subscriber data packets. There are several types of crypto maps supported by the system. They are:

- **Manual crypto maps**: These are static tunnels that use pre-configured information (including security keys) for establishment. Because they rely on statically configured information, once created, the tunnels never expire; they exist until their configuration is deleted.

Important: Because manual crypto map configurations require the use of static security keys (associations), they are not as secure as crypto maps that rely on dynamically configured keys. Therefore, it is recommended that they only be configured and used for testing purposes.

- **IKEv1 crypto maps**: These tunnels are similar to manual crypto maps in that they require some statically configured information such as the IP address of a peer security gateway and that they are applied to specific system interfaces. However, IKEv1 crypto maps offer greater security because they rely on dynamically generated security associations through the use of the Internet Key Exchange (IKE) protocol.
- **IKEv2-IPv6 crypto maps**: Used to protect X3 data between a P-GW and a Lawful Intercept server.
- **Dynamic crypto maps:** These tunnels are used for protecting L2TP-encapsulated data between the system and an LNS/security gateway or Mobile IP data between an FA service configured on one system and an HA service configured on another.

Important: The crypto map type (dynamic, IKEv1, IKEv2-IPv6, or manual) is specified when the map is first created using this command.

Example

Create a dynamic crypto map named map1 and enter the Crypto Map Dynamic Configuration Mode by entering the following command:

```
crypto map map1 ipsec-dynamic
```

crypto node

Creates a crypto node.

Product

SCM

Privilege

Administrator, Config-Administrator

Syntax

crypto node *node_name* **map** *name*

no crypto node *node_name*

node_name

The name of the crypto node and can consist of from 1 to 127 alpha and/or numeric characters in length and is case sensitive.

map *name*

Assigns a previously configured crypto map policy to this crypto node. *name* must be a string of from 1 through 127 alpha and/or numeric characters and is case sensitive.

no

Deletes a previously configured crypto node.

Usage

Use this command to configure a crypto node and assign policies (crypto maps) to the node.

Example

The following command configures a crypto node called *node1* and assigns a policy named *map1* to it:

crypto node *node1* **map** *map1*

crypto template

Creates a new, or specifies an existing, crypto template and enters the Crypto Template Configuration Mode.

Product

PDIF, SCM

Privilege

Security Administrator, Administrator

Syntax

crypto template *name* **{ ikev2-pdif | ipsec-3gpp-cscf }**

no crypto template *name*

name **{ ikev2-pdif | ipsec-3gpp-cscf }**

Specifies the name of a new or existing crypto template. *name* must be from 1 to 127 alpha and/or numeric characters.
ikev2-pdif: Configure the Crypto Template to be used for configuring PDIF functionality.

Important: This keyword cannot be used with IPSec for the SCM.

ipsec-3gpp-cscf: Configure the Crypto Template to be used for configuring P-CSCF IPSec functionality.

Important: This keyword can only be used with IPSec for the SCM.

Usage

Use this command to create a new or enter an existing PDIF or P-CSCF crypto template.

Important: The CSCF crypto template should be configured in the same context in which the P-CSCF is configured.

Entering this command results in one of the following prompts:

```
[context_name]hostname(cfg-crypto-tmpl-ikev2-tunnel)#
```

```
[context_name]hostname(cfg-crypto-tmpl-ims-cscf-tunnel)#
```

Crypto Template Configuration Mode commands are defined in the *Crypto Template Configuration Mode Commands* and *CSCF Crypto Template Configuration Mode Commands* chapters.

Example

The following command configures a PDIF crypto template called *crypto1* and enters the Crypto Template Configuration Mode:

```
crypto template crypto1 ikev2-pdif
```

The following command configures a P-CSCF crypto template called *crypto2* and enters the CSCF Crypto Template Configuration Mode:

```
crypto template crypto2 ipsec-3gpp-cscf
```

cscf access-profile

Creates a new or enters an existing access profile used to set signaling compression for various network access types.

Product

SCM

Privilege

Administrator

Syntax

cscf access-profile { default | name *profile_name* **[-noconfirm] }**

no cscf access-profile name *profile_name*

default

Specifies that the system is to enter the Access Profile Configuration Mode for the default access profile.

name *profile_name*

Specifies a name for the access profile.
profile_name must be from 1 to 79 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no cscf access-profile name *profile_name*

Removes the CSCF access profile from the context.

Usage

Use this command to create an access profile for the CSCF service and cause the system to enter the Access Profile Configuration Mode where parameters are configured for the profile.
Entering this command results in the following prompt:

```
[context_name]hostname(config-cscf-access-profile)#
```

Access Profile Configuration Mode commands are defined in the *CSCF Access Profile Configuration Mode Commands* chapter.

Example

The following command creates a CSCF Access Profile named *profile2* and enters the Access Profile Configuration Mode:

cscf access-profile name *profile2*

cscf acl

Creates an Access Control List (ACL) and enters the ACL Configuration Mode.

Product

SCM

Privilege

Administrator

Syntax

cscf acl { default | name *list_name* **[-noconfirm] }**

no cscf acl name *list_name*

default

Specifies that the system is to enter the ACL Configuration Mode for the default ACL.

name *list_name*

Specifies a name for the ACL.
list_name must be from 1 to 47 alpha and/or numeric characters in length.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no cscf acl name *list_name*

Removes the CSCF ACL from the context.

Usage

Use this command to create an access control list for the CSCF service and cause the system to enter the ACL Configuration Mode where parameters are configured for the new list.
Entering this command results in the following prompt:

```
[context_name]hostname(config-cscf-acl)#
```

ACL Configuration Mode commands are defined in the *CSCF ACL Configuration Mode Commands* chapter.
Use this command when configuring the following SCM components: P-CSCF, S-CSCF, and SIP Proxy.

Example

The following command creates a CSCF access control list named *acl1* and enters the ACL Configuration Mode:

cscf acl name *acl1*

cscf ifc-filter-criteria

Creates Initial Filter Criteria (iFC) filter criteria for shared iFC functionality.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

cscf ifc-filter-criteria name *fc_name* **priority** *pri* **profile-part-indicator { registered | unregistered } app-server uri scheme { sip | sips }** *as* **as-default-handling { session-continue | session-terminate } [-noconfirm] | [service-info** *info* **] [trigger-point** *tp_name* **] [-noconfirm] | [trigger-point** *tp_name* **] [-noconfirm]**

no cscf ifc-filter-criteria name *fc_name*

name *fc_name*

Specifies a name for the iFC filter criteria.
fc_name must be from 1 to 39 alpha and/or numeric characters in length.

priority *pri*

Specifies the priority of the filter criteria, which is used to select a particular filter criteria from multiple ones present under an ISC template.
pri must be an integer from 0 through 1024.

profile-part-indicator { registered | unregistered }

Indicates whether the iFC is a part of the registered (**registered**) or unregistered (**unregistered**) user profile.

app-server uri scheme { sip | sips }

Determines the associated application server's uri scheme.
sip: sip uri
sips: sips uri

as

Specifies an address for the associated application server.
as must be from 1 to 127 alpha and/or numeric characters in length.

as-default-handling { session-continue | session-terminate }

Determines whether the dialog should be released (**session-terminate**) or not (**session-continue**) if the application server could not be reached or on application server error return.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

service-info *info*

Specifies optional service information to be sent to the application server.
info must be from 1 to 63 alpha and/or numeric characters in length.

trigger-point *tp_name*

Assigns an iFC trigger point to the filter criteria.
tp_name must be from 1 to 39 alpha and/or numeric characters in length.

no cscf ifc-filter-criteria name *fc_name*

Removes the specified CSCF iFC filter criteria from the context.

Usage

Use this command to create a filter criteria name and associate an application server address to it. You may also define a trigger point name to be executed in order to select the application server. If no trigger point is specified, then the application server is selected unconditionally.

Important: Filter criteria is associated with an ISC template in the ISC Template Configuration Mode.

Important: Filter criteria can be assigned to more than one ISC template.

Example

The following command creates an iFC filter criteria named *ifcfc1*, which has a priority of 2 and is part of the registered user profile. *ifcfc1* is assigned to a sip application server named *appserver*. The dialog will not be released if the application server can not be reached. *ifcfc1* is also assigned a trigger point named *tp2*:

```
cscf ifc-filter-criteria name ifcfc1 priority 2 profile-part-indicator
registered app-server uri scheme sip appserver as-default-handling
session-continue trigger-point tp2
```

cscf ifc-spt-condition

Creates an Initial Filter Criteria (iFC) Service Point Trigger (SPT) condition for shared iFC functionality.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

cscf ifc-spt-condition name *cond_name* **{ request-uri content** *uri_content* **| session-case { originating-registered | originating-unregistered | terminating-registered | terminating-unregistered } | session-description** *sdp* **[content** *sdp_data* **] | sip-header** *hdr* **[content** *hdr_data* **] | sip-method** *method* **} [-noconfirm] [condition-negated]**

no cscf ifc-spt-condition name *cond_name*

---

name *cond_name*

Specifies a name for the iFC SPT condition.
cond_name must be from 1 to 39 alpha and/or numeric characters in length.

---

request-uri content *uri_content*

Specifies request uri content.
uri_content must be from 1 to 127 alpha and/or numeric characters in length.

Important: Wildcard Extended Regular Expressions (ERE) are supported for this value. For example, "sip.user[0-9]@192\\.168\\.176\\.150"

---

session-case { originating-registered | originating-unregistered | terminating-registered | terminating-unregistered }

Determines the type of session:

- **originating-registered**: Session handling an originating end user.
- **originating-unregistered**: Session handling an unregistered originating end user.
- **terminating-registered**: Session handling a terminating registered end user.
- **terminating-unregistered**: Session handling a terminating unregistered end user.

---

session-description *sdp* **[content** *sdp_data* **]**

Specifies an SDP line type.
sdp must be from 1 to 15 alpha and/or numeric characters in length.
content specifies content on the SDP line.
sdp_data must be from 1 to 127 alpha and/or numeric characters in length.

---

sip-header *hdr* **[content** *hdr_data* **]**

Specifies a header type.

hdr must be from 1 to 127 alpha and/or numeric characters in length.
content specifies content on the header.
hdr_data must be from 1 to 127 alpha and/or numeric characters in length.

sip-method *method*

Specifies a sip method.
method must be from 1 to 127 alpha and/or numeric characters in length.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

condition-negated

Negates the specified condition.

no cscf ifc-spt-condition name *cond_name*

Removes the specified CSCF iFC SPT condition from the context.

Usage

Use this command to create individual SPT conditions that are later associated with an SPT group in the iFC SPT Group Configuration Mode.

Important: An iFC SPT group may be associated with multiple SPT conditions.

Example

The following command creates an iFC SPT condition named *cond2* which handles an originating end user:

```
cscf ifc-spt-condition name cond2 session-case originating-registered
```

The following command negates the condition created above:

```
cscf ifc-spt-condition name cond2 session-case originating-registered
condition-negated
```

cscf ifc-spt-group

Creates an Initial Filter Criteria (iFC) Service Point Trigger (SPT) group for shared iFC functionality.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

cscf ifc-spt-group name *group_name* **[[-noconfirm] | reg-type { de-registration | initial-registration | re-registration } [-noconfirm]]**

no cscf ifc-spt-group name *group_name*

name *group_name*

Specifies a name for the iFC SPT group.
group_name must be from 1 to 39 alpha and/or numeric characters in length.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

reg-type { de-registration| initial-registration | re-registration }

Defines whether the SPT condition matches to REGISTER messages that are related to:

- **de-registration**
- **initial-registration**
- **re-registration**

no cscf ifc-spt-group name *group_name*

Removes the specified CSCF iFC SPT group from the context.

Usage

Use this command to create an iFC SPT group name and bind different SPT conditions under it.

Important: An iFC SPT group may be associated with multiple SPT conditions.

The SPT group can also specify the registration type that defines whether the SPT condition matches to REGISTER messages that are related to initial registrations, re-registrations, or de-registrations.
Entering this command results in the following prompt:

```
[context_name]hostname(config-cscf-ifc-spt-group)#
```

iFC SPT Group Configuration Mode commands are defined in the *CSCF IFC SPT Group Configuration Mode Commands* chapter.

Example

The following command creates an iFC SPT group named *group2*:

```
cscf ifc-spt-group name group2
```

cscf ifc-trigger-point

Creates an Initial Filter Criteria (iFC) trigger point for shared iFC functionality.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

cscf ifc-trigger-point name *tp_name* **condition-type { cnf | dnf } [-noconfirm]**

no cscf ifc-trigger-point name *tp_name*

name *tp_name*

Specifies a name for the iFC trigger point.
tp_name must be from 1 to 39 alpha and/or numeric characters in length.

condition-type { cnf | dnf }

Defines the condition type of the iFC trigger point:
cnf: conjunctive normal form
dnf: disjunctive normal form

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no cscf ifc-trigger-point name *tp_name*

Removes the specified CSCF iFC trigger point from the context.

Usage

Use this command to create a trigger point name and bind different SPT groups under it.

Important: An iFC SPT group can be assigned to more than one iFC trigger point.

Entering this command results in the following prompt:

```
[context_name]hostname(config-cscf-ifc-trigger-point)#
```

IFC Trigger Point Configuration Mode commands are defined in the *CSCF IFC Trigger Point Configuration Mode Commands* chapter.

Example

The following command creates an iFC trigger point named *tp_2* with a cnf condition type:

```
cscf ifc-trigger-point name tp_2 condition-type cnf
```

cscf isc-template

Creates an IMS Service Control (ISC) template and enters the ISC Template Configuration Mode.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

[no] cscf isc-template name *template_name*

no

Removes the CSCF ISC template from the context.

name *template_name*

Specifies a name for the ISC template.
template_name must be from 1 to 39 alpha and/or numeric characters in length.

Usage

Use this command to create an ISC template for the CSCF service and cause the system to enter the ISC Template Configuration Mode where parameters are configured for the new template.
Entering this command results in the following prompt:

```
[context_name]hostname(config-cscf-isc-tmpl)#
```

ISC Template Configuration Mode commands are defined in the *CSCF ISC Template Configuration Mode Commands* chapter.
Use this command when configuring the following SCM component: S-CSCF.

Example

The following command creates an ISC template named *template1* and enters the ISC Template Configuration Mode:

```
cscf isc-template name template1
```

cscf last-route-profile

Creates a last route profile, which will be specified on peer server configuration to select the Last Routing Option (LRO) number while forwarding an emergency call packet to a particular peering server, and enters the Last Route Profile Criteria Configuration Mode.

Product

SCM

Privilege

Administrator

Syntax

cscf last-route-profile name *profile_name* **criteria { county-name | round-robin }**
[-noconfirm]no cscf last-route-profile name *profile_name*

name *profile_name*

Specifies the name of the last route profile.
profile_name must be from 1 to 79 alpha and/or numeric characters in length.

---

criteria { county-name | round-robin }

county-name: Profile specific to the county-name criteria.
Entering this command results in the following prompt:

```
[context_name]hostname(config-county-name-lro-profile)#
```

Last Route Profile Criteria Configuration Mode commands are defined in the *CSCF Last Route Profile Criteria Configuration Mode Commands* chapter.
round-robin: Profile specific to the round-robin criteria.
Entering this command results in the following prompt:

```
[context_name]hostname(config-round-robin-lro-profile)#
```

Last Route Profile Criteria Configuration Mode commands are defined in the *CSCF Last Route Profile Criteria Configuration Mode Commands* chapter.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

---

no cscf last-route-profile name *profile*

Removes the specified CSCF last route profile from the context.

Usage

Use this command to create a last route profile and enter the Last Route Profile Criteria Configuration Mode.

Important: Last route profiles are associated with peer servers in the CSCF Peer Server Monitoring Configuration Mode.

Use this command when configuring the following SCM components: S-CSCF and SIP Proxy.

Example

The following command creates a last route profile named *lro1* and enters the CSCF Last Route Profile Criteria Configuration Mode to specify county name criteria:

```
cscf last-route-profile name lro1 criteria county-name
```

The following command creates a last route profile named *lro2* and enters the CSCF Last Route Profile Criteria Configuration Mode to specify round robin criteria:

```
cscf last-route-profile name lro2 criteria round-robin
```

cscf peer-servers

Creates a peer server group type for next-hop session routing and enters the Peer Server Configuration Mode.

Product

SCM

Privilege

Administrator

Syntax

cscf peer-servers *server_name* **type { bgcf | ibcf | icscf | mgcf | mrfc | pcscf | scscf | sip-as } [-noconfirm]**

no cscf peer-servers *server_name*

server_name

Specifies the name of the peer server group.
server_name must be from 1 to 79 alpha and/or numeric characters in length.

type { bgcf | ibcf | icscf | mgcf | mrfc | pcscf | scscf | sip-as }

Specifies the type of peer server group to configure:

- **bgcf**: Borader Gateway Control Function
- **ibcf**: Interconnect Border Control Function
- **icscf**: Interrogating-Call/Session Control Function
- **mgcf**: Media Gateway Control Function
- **mrfc**: Media Resource Function Controller
- **pcscf**: Proxy-Call/Session Control Function
- **scscf**: Serving-Call/Session Control Function
- **sip-as**: Session Initiation Protocol-Application Server

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no cscf peer-servers *server_name*

Removes the specified CSCF peer server group from the context.

Usage

Use this command to create a specific peer server group and enter the Peer Server Configuration Mode where connectivity parameters can be entered.
Entering this command results in the following prompt:

```
[context_name]hostname(config-cscf-peer-servers)#
```

Peer Servers Configuration Mode commands are defined in the *CSCF Peer Servers Configuration Mode Commands* chapter.
Use this command when configuring the following SCM components: P-CSCF, S-CSCF, and SIP Proxy.

Example
The following command creates an I-CSCF server group type called *icscf_group1* and enters the Peer Server Configuration Mode:

```
cscf peer-servers icscf_group1 type icscf
```

cscf policy

Creates a policy group for specific AoR profiles and enters the Policy Configuration Mode.

Product

SCM

Privilege

Administrator

Syntax

cscf policy { default | name *policy_name* **[-noconfirm] }**

no cscf policy name *policy_name*

default

Specifies that the system is to enter the AoR Policy Rules Configuration Mode for the default policy. The default policy uses AoR policy rules.
Entering this command results in the following prompt:
[*context_name*]*hostname*(config-aor-policy)#
Default (AoR) Policy Configuration Mode commands are defined in the *CSCF AoR Policy Rules Configuration Mode Commands* chapter.

name *policy_name*

Specifies the name of the policy group.
policy_name must be from 1 to 79 alpha and/or numeric characters in length.
Entering this command results in the following prompt:
[*context_name*]*hostname*(config-cscf-policy)#
Policy Configuration Mode commands are defined in the *CSCF Policy Configuration Mode Commands* chapter.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no cscf policy name *policy_name*

Removes the specified CSCF policy group from the context.

Usage

Use this command to create a policy group and enter either the AoR Policy Rules Configuration Mode (**default**) or Policy Configuration Mode (**name** *policy_name*).
Use this command when configuring the following SCM components: P-CSCF, S-CSCF, and SIP Proxy.

Example

The following command creates a policy group named *group2* and enters the CSCF Policy Configuration Mode:

cscf policy name *group2*

cscf routes

Creates a route group for specifying routing information and enters the Routes Configuration Mode.

Product

SCM

Privilege

Administrator

Syntax

cscf routes { default | name *route_name* **[-noconfirm] }**

no cscf routes name *route_name*

default

Specifies that the system is to enter the Routes Configuration Mode for the default route group.

name *route_name*

Specifies the name of the route group.
route_name must be from 1 to 79 alpha and/or numeric characters in length.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no cscf routes name *route_name*

Removes the specified CSCF route group from the context.

Usage

Use this command to create a route group and enter the Routes Configuration Mode.
Entering this command results in the following prompt:

```
[context_name]hostname(config-cscf-route)#
```

Routes Configuration Mode commands are defined in the *CSCF Routes Configuration Mode Commands* chapter.
Use this command when configuring the following SCM components: P-CSCF, S-CSCF, SIP Proxy.

Example

The following command creates a route group named *route_group5* and enters the Route Group Configuration Mode:

cscf routes name *route_group5*

cscf service

Creates a CSCF service or specifies an existing CSCF service and enters the CSCF Service Configuration Mode for the current context.

Product

SCM

Privilege

Administrator

Syntax

cscf service *service_name* **[-noconfirm]**

no cscf service *service_name*

service_name

Specifies the name of the CSCF service. If *service_name* does not refer to an existing service, the new service is created if resources allow.
service_name must be from 1 to 63 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no cscf service *service_name*

Removes the specified CSCF service from the context.

Usage

Enter the CSCF Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:

```
[context_name]hostname(config-cscf-service)#
```

CSCF Service Configuration Mode commands are defined in the *CSCF Service Configuration Mode Commands* chapter.
Use this command when configuring the following SCM components: P-CSCF, S-CSCF, SIP Proxy.

Example

The following command enters the existing CSCF Service Configuration Mode (or creates it if it does not already exist) for the service named *cscf-service1*:

```
cscf service cscf-service1
```

The following command will remove *cscf-service1* from the system:

```
no cscf service cscf-service1
```

cscf session-template

Creates a session template and/or enters the Session Template Configuration Mode.

Product

SCM

Privilege

Administrator

Syntax

cscf session-template { default | name *template_name* **[-noconfirm] }**

no cscf session-template name *template_name*

default

Specifies that the system is to enter the Session Template Configuration Mode for the default session template.

name *template_name*

Specifies a name for the template.
template_name must be from 1 to 79 alpha and/or numeric characters in length.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no cscf session-template name *template_name*

Removes the specified CSCF session template from the context.

Usage

Use this command to create a new session template and enter the Session Template Configuration Mode or enter the mode for an existing template.
Entering this command results in the following prompt:

```
[context_name]hostname(config-cscf-session-template)#
```

Session Template Configuration Mode commands are defined in the *CSCF Session Template Configuration Mode Commands* chapter.
Use this command when configuring the following SCM components: P-CSCF, S-CSCF, SIP Proxy.

Example

The following command enters the Session Template Configuration Mode for a template named *sess_temp4*:

cscf session-template name *sess_temp4*

cscf translation

Creates/removes a translation list and/or enters the Translation Configuration Mode.

Product

SCM

Privilege

Administrator

Syntax

cscf translation { default | name *list_name* **[-noconfirm] }**

no cscf translation name *list_name*

default

Specifies that the system is to enter the Translation Configuration Mode for the default translation list.

name *list_name*

Specifies a name for the translation list.
list_name must be from 1 to 79 alpha and/or numeric characters in length.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no cscf translation name *list_name*

Removes the specified CSCF translation list from the context.

Usage

Use this command to create a new translation list and enter the Translation Configuration Mode or enter the mode for an existing list.
Translation lists are used to modify or replace a request-URI such as an E.164 number. For example, a translation list can be configured to append digits to the end of a number or replace a domain name with another.
Entering this command results in the following prompt:

```
[context_name]hostname(config-cscf-translation)#
```

Translation Configuration Mode commands are defined in the *CSCF Translation Configuration Mode Commands* chapter.
Use this command when configuring the following SCM components: P-CSCF, S-CSCF, SIP Proxy.

Example

The following command enters the Translation Configuration Mode for a translation list named *trans_list3*:

cscf translation name *trans_list3*

cscf urn-service-list

Creates/removes a URN service list and/or enters the URN List Configuration Mode.

Product

SCM

Privilege

Administrator

Syntax

cscf urn-service-list { default | name *list_name* **[-noconfirm] }**

no cscf urn-service-list name *list_name*

default

Specifies that the system is to enter the URN List Configuration Mode for the default URN service list.

name *list_name*

Specifies a name for the URN service list.
list_name must be from 1 to 79 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no cscf urn-service-list name *list_name*

Removes the specified CSCF URN service list from the context.

Usage

Use this command to create a URN service list name and enter the URN List Configuration Mode. URN lists contain URN to URI mappings used for emergency and location-based services. A URN service list is selected by a CSCF session template.
Entering this command results in the following prompt:

```
[context_name]hostname(config-cscf-service-urn)#
```

URN List Configuration Mode commands are defined in the *CSCF URN List Configuration Mode Commands* chapter.
Use this command when configuring the following SCM components: P-CSCF.

Example

The following command enters the URN List Configuration Mode for a URN list named *urn_list1*:

cscf urn-service-list name *urn_list1*

css server

This is a restricted command. In Release 9.0 and later, this command is obsoleted.

default aaa

Restores the system's accounting and authentication parameters to default settings for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
default aaa { accounting { administrator | subscriber } | authentication {
administrator | subscriber }
```

accounting { administrator | subscriber }

administrator: Restores the system default setting for RADIUS accounting for administrative user sessions.
subscriber: Restores the system default setting for RADIUS accounting for subscriber sessions.

authentication { administrator | subscriber }

subscriber: Restores the system default setting for RADIUS authentication for subscribers.
administrator: Restores the system default setting for RADIUS authentication for administrative users.

Usage

Use this command to restore the system's accounting and authentication options to the default settings for the current context.
The system is shipped from the factory with the administrative user and subscriber RADIUS accounting enabled.

Example

```
default aaa accounting subscriber
```

```
default aaa authentication default
```

default access-list

Restores the system default for packet handling when an undefined ACL is specified.

Product

PDSN, FA, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
default access-list undefined
```

undefined

Restores the system default for handling of packets when an undefined ACL is specified.

Usage

Restore the chassis to the system defaults.

Example

```
default access-list undefined
```

default gtpp

Restores gtpp parameter settings to their default values.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
default gtpp { attribute { diagnostics | duration-ms | local-record-sequence-number | plmn-id } | algorithm | deadtime | detect-dead-server { consecutive-failures } | duplicate-hold-time | echo-interval | egcdr final-record { include-content-ids only-with-traffic closing-cause same-in-all-partials } | egcdr losdv-max-containers | egcdr lotdv-max-containers | egcdr service-idle-timeout | max-cdrs | max-pdu-size | max-retries | redirection-allowed | timeout | trigger }
```

`attribute { diagnostics | duration-ms | local-record-sequence-number | plmn-id }`

Restores the gtpp attribute parameter to the following default settings:

- **`diagnostics`**: Disabled
- **`duration-ms`**: Disabled
- **`local-record-sequence-number`**: Disabled
- **`plmn-id`**: Enabled

`algorithm`

Restores the gtpp algorithm parameter to its default setting of first-server.

`deadtime`

Restores the gtpp deadtime parameter to its default setting of 120 seconds.

`detect-dead-server { consecutive-failures }`

Restores the gtpp detect-dead-server consecutive-failure parameter to its default setting of 5.

`duplicate-hold-time`

Restores the gtpp duplicate-hold-time parameter to its default setting of 60 minutes.

`echo-interval`

Restores the gtpp echo-interval parameter to its default setting of 60 seconds.

egcdr final-record { include-content-ids only-with-traffic closing-cause same-in-all-partials }

Restores the gtpp egcdr final record to the default settings to include content-ids with some data to report are included. Also sets the closing cause to the default of using the same closing cause for multiple final eGCDRs.

egcdr losdv-max-containers

Restores the gtpp egcdr maximum number of List of Service Data Volume (LoSDV) containers in one EGCDR to the default of 10.

egcdr lotdv-max-containers

Restores the gtpp egcdr maximum number of List of Traffic Data Volume (LoTDV) containers in one EGCDR to the default of 8.

egcdr service-idle-timeout

Restores the gtpp egcdr service-idle-timeout parameter to its default setting of 0.

max-cdrs

Restores the gtpp max-cdrs parameter to its default setting of 1 CDR per packet.

max-pdu-size

Restores the gtpp max-pdu-size parameter to its default setting of 4096 octets.

max-retries

Restores the gtpp max-retries parameter to its default setting of 4.

redirection-allowed

Restores the gtpp redirection-allowed parameter to its default setting of enabled.

timeout

Restores the gtpp timeout parameter to its default setting of 5.

trigger

Restores the gtpp triggers to their default settings.

Usage

After system parameters have been modified, this command is used to set/restore specific parameters to their default values.

Example

The following command restores the gtpp max-pdu-size to its default setting of 4096 octets:

```
default gtpp max-pdu-size
```

default mobile-ip

Sets the behavior of all HA services when a new call has a duplicate home address or IMSI.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
default mobile-ip { ha newcall { duplicate-home-address | duplicate-imsi-session
} | fa { multiple-dynamic-reg-per-nai | newcall duplicate-home-address } }
```

duplicate-home-address

Set HA or FA services to reject a new call that requests an IP address that is already assigned.

duplicate-imsi-session

Set HA services to accept new calls that have the same IMSI as a call that is already active.

multiple-dynamic-reg-per-nai

All FA services in the current context can not simultaneously setup multiple dynamic home address registrations that have the same NAI.

Usage

Use this command to reset the HA behavior for new calls.

Example

The following commands reset the HA and the FA to reject new calls that request a static IP address that is already in use from an IP pool in the same destination context:

```
default mobile-ip ha newcall duplicate-home-address

default mobile-ip fa newcall duplicate-home-address
```

default network-requested-pdp-context

Restores network-requested-pdp-context parameters to their default settings.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
default network-requested-pdp-context { hold-down-time | sgsn-cache-time }
```

hold-down-time

Restores the hold-down-time parameter to its default setting of 60 seconds.

sgsn-cache-time

Restores the sgsn-cache-time parameter to its default setting of 300 seconds.

Usage

After system parameters have been modified, this command is used to set/restore specific parameters to their default values.

Example

The following command restores the network-requested-pdp-context hold-down-time parameter to its default setting:

```
default network-requested-pdp-context hold-down-time
```

default ppp

Restores the point-to-point protocol option defaults.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
default ppp { acfc { receive | transmit } | auth-retry suppress-aaa-auth | echo-
max-retransmissions | echo-retransmit-timeout | first-lcp-retransmit-timeout |
lcp-authentication-reject retry alternate | lcp start-delay | lcp-terminate
connect-state | lcp-terminate mip-lifetime-expiry | lcp-terminate mip-revocation
| max-authentication-attempts | max-configuration-nak | max-retransmissions |
max-terminate | mru | negotiate default-value-options | peer-authentication |
pfc { receive | transmit } | reject-peer-authentication | retransmit-
timeout|renegotiation retain-ip-address }
```

acfc { receive | transmit }

receive: Set the ACFC receive setting to the default, allow. The local PPP side indicates that it can process ACFC compressed PPP packets and compressed packets are allowed.
transmit: Set the ACFC transmit setting to the default, ignore. If the peer requests ACFC, the request is accepted, but ACFC is not applied for transmitted PPP packets.

auth-retry suppress-aaa-auth

Restores the system default and allows authentication retries to the AAA server after authorization has already been performed.

chap fixed-challenge-length

Disables a specified fixed PPP CHAP challenge length and sets the system back to the default of a random PPP CHAP challenge length from 17 to 32 bytes.

echo-max-retransmissions

Restores the system default for the maximum number of retransmissions of LCP ECHO_REQ before a session is terminated in an always-on session.

echo-retransmit-timeout

Restores the system default for the timeout before trying LCP ECHO_REQ for an always-on session.

first-lcp-retransmit-timeout

Sets the number of milliseconds to wait before the first retransmit of a control packet. to the system default.

lcp-authentication-reject retry-alternate

Default: Disabled. No alternate authentication option will be retried.

The action that is taken if the authentication option is rejected during LCP negotiation and retry the allowed alternate authentication option

lcp start-delay

Sets the delay before Line Control Protocol (LCP) starts to its default of 0 (zero) milliseconds.

lcp-terminate connect-state

This option enables sending an LCP terminate message to the Mobile Node when a PPP session is disconnected if the PPP session was already in a connected state.
Note that if the no keyword is used with this option, the PDSN must still send LCP Terminate in the event of an LCP/PCP negotiation failure or PPP authentication failure, which happens during connecting state.

Important: This option is not supported in conjunction with the GGSN product.

lcp-terminate mip-lifetime-expiry

This option configures the PDSN to send a LCP Terminate Request when a MIP Session is terminated due to MIP Lifetime expiry (default).
Note that if the no keyword is used with this option, the PDSN does not send a LCP Terminate Request when a MIP session is terminated due to MIP Lifetime expiry.

lcp-terminate mip-revocation

This option configures the PDSN to send a LCP Terminate Request when a MIP Session is terminated due to a Revocation being received from the HA (default).
Note that if the no keyword is used with this option, the PDSN does not send a LCP Terminate Request when a MIP session is terminated due to a Revocation being received from the HA.

max-authentication-attempts

Restores the maximum PPP authentication retry attempts possible from the peer, when the authentication attempts fail to the default of 1.

max-configuration-nak

Restores the maximum number of consecutive configuration NAKs to be sent to the peer before disconnecting the PPP session to the default of 10

max-retransmissions

Restores the system default for the maximum number of times to retransmit control packets.

max-terminate

Restore the maximum number of PPP LCP Terminate Requests transmitted to the Mobile Node to the system default of 2.

mru

Resets the maximum packet size than can be received to the default of 1500.

negotiate default-value-options

Disables the inclusion of configuration options with default values in PPP configuration requests.

peer-authentication

Sets the peer authentication user name and password to its system default.

pfc { receive | transmit }

receive: Sets the Protocol Field Compression (PFC) receive setting to the default, allow. The peer is allowed to request PFC during LCP negotiation.
transmit: Sets the PFC transmit setting to the default, ignore. If the peer requests PFC, it is accepted but PFC is not applied for transmitted packets.

reject-peer-authentication

Rejection of peer requests for authentication is enabled.

renegotiation retain-ip-address

Retain the currently allocated IP address for the session during PPP renegotiation (Simple IP) between FA and Mobile node.

retransmit-timeout

Restores the number of milliseconds to wait before retransmitting packets.

Usage

Restore the PPP settings for the current context to the system defaults.

Example

```
default ppp echo-max-retransmissions
default ppp echo-retransmit-timeout
default ppp max-retransmissions
default ppp peer-authentication
default ppp retransmit-timeout
```

default radius

This command restores the context's RADIUS parameters to the system default settings.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
default radius { accounting { algorithm | deadtime | detect-dead-server
consecutive-failures | max-outstanding | max-pdu-size | max-retries | timeout }
| algorithm | attribute { nas-identifier } | deadtime | detect-dead-server
consecutive-failures | dictionary | keepalive | max-outstanding | max-retries |
max-transmissions | probe-interval | timeout }
```

`accounting { algorithm | apn-to-be-included | archive | deadtime | detect-dead-server consecutive-failures | keepalive | max-outstanding | max-pdu-size | max-retries | max-transmissions | rp trigger-policy | timeout }`

Restores the system default value for the RADIUS accounting option specified.
`algorithm`: Restores the accounting server selection algorithm to the system default.
`apn-to-be-included:` Configures the APN name to be included for radius accounting.
`archive`: Enables archiving of RADIUS accounting messages.
`deadtime`: Restores the default number of seconds before attempting to communicate with an accounting server marked as unreachable.
`detect-dead-server consecutive-failures`: Restores the default value for the number of consecutive failed attempts to reach an accounting server before it is marked as unreachable.
`radius accounting ha policy`: Resets the HA accounting policy to the system default: session-start-stop. Send Accounting Start when the Session is connected, Send Accounting Stop when the session is disconnected.
`keepalive`: Restores the default keepalive accounting related parameters values.
`max-outstanding`: Restores the system default for the maximum number of outstanding messages to queue for a given accounting server.
`max-pdu-size`: Restores the maximum size a packet data unit can be.
`max-retries`: Restores the maximum number of times a packet will be retransmitted to the system default.
`max-transmissions`: Disables the maximum transmissions limit.
`rp trigger-policy`: Restores the RADIUS accounting R-P policy to the default of Airlink Usage.
`timeout`: Restores the number of seconds to wait before retransmitting a PDU to the system default.

`algorithm`

Restores the RADIUS server selection algorithm to the system default.

`attribute { nas-identifier }`

`nas-identifier`: Restores the network access server Id to the system default.

deadtime

Restores the default number of seconds before attempting to communicate an RADIUS server marked as unreachable.

detect-dead-server

Restores consecutive failures to the default of 4 and disables response-timeout.

dictionary

Restores the context's dictionary to the system's default setting.

keepalive [calling-station-id *id* **|** **consecutive-response** *number* **|** **encrypted | interval** *seconds* **| password | retries** *number* **| timeout** *seconds* **| username** *name* **| valid-response access-accept [access-reject]]**

calling-station-id *id*: Restores the default calling-station-id to be used for the keepalive authentication.
consecutive-response *number*: Restores the default number of consecutive authentication responses after which the server is marked as reachable.
interval *seconds*: Restores the default time interval between the keepalive access requests.
password: Restores the default password to be used for the authentication.
retries *number*: Restores the default number of times the keepalive access request to be sent before marking the server as unreachable.
timeout *seconds*: Restores the default time interval between each keepalive access request retries.
username *name*: Restores the default username to be used for the authentication.
valid-response access-accept [*access-reject* **]**: Restores the default valid response for the authentication request.

max-outstanding

Restores the system default for the maximum number of outstanding messages to queue for a given RADIUS server.

max-retries

Restores the maximum number of times a packet will be retransmitted to the system default.

probe-interval

Sets the amount of time to wait before sending another probe authentication request to a RADIUS server to the default setting of 60 seconds.

timeout

Restores the number of seconds to wait before retransmitting a message to the system default.

Usage

Restores RADIUS parameters to the system default settings.

Example

```
default radius accounting deadtime

default radius accounting max-outstanding

default radius algorithm

default radius attribute nas-identifier
```

default radius authenticate null-username

Restores the system default setting for authenticating null or blank user names. The default behavior is to authenticate, send Access-Request messages to the AAA server, all user names including null user names.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
default radius authenticate null-username
```

Usage

Use this command to return to the default behavior of authenticating, sending Access-Request messages to the AAA server, all user names, including NULL user names.

Example

Enter the following command to return username authentication to the default behavior:

```
default radius authenticate null-username
```

default threshold

Restores context-level thresholds to their default settings.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
default threshold { available-ip-pool-group | ip-pool-free | ip-pool-hold | ip-pool-release | ip-pool-used | monitoring available-ip-pool-group }
```

available-ip-pool-group

Configures the context-level IP address pool group utilization thresholds to the default setting.

ip-pool-free

Default: 0
Restores to default the thresholds for the percentage of the IP pool addresses that are in the free state.

ip-pool-hold

Default: 0
Restores to default the thresholds for the percentage of the IP pool addresses that are in the hold state.

ip-pool-release

Default: 0
Restores to default the thresholds for the percentage of IP pool address that are in the release state.

ip-pool-used

Default: 0
Restores to default the thresholds for the percentage off the IP pool addresses that are used.

monitoring available-ip-pool-group

Restores the IP address pool threshold monitoring parameter to its default setting.

Usage

Use this command to restore IP address pool-related threshold parameters to their default settings.

Example

```
default threshold available-ip-pool-group
```

dhcp-service

Adds a Dynamic Host Control Protocol (DHCP) service instance to the current context and enters the configuration mode for that service.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

dhcp-service *service_name*

no dhcp-service *service_name*

no

Removes a previously configured DHCP service from the current context.

service_name

The name by which the DHCP service is to be recognized by the system. The name can be from 1 to 63 alpha and/or numeric characters in length and is case sensitive.

Usage

Use this command to add a DHCP service to a context configured on the system and enter the DHCP Service Configuration Mode. A DHCP service is a logical grouping of external DHCP servers.
The DHCP Configuration Mode provides parameters that dictate the system's communication with one or more of these DHCP servers.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (i.e. resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Refer to the *DHCP Service Configuration Mode* chapter of this reference for additional information.

Example

The following command creates a DHCP service called DHCP1 and enter the DHCP Service Configuration Mode:

dhcp-service *dhcp1*

diameter accounting

This command configures Diameter accounting related settings.

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter accounting { dictionary { aaa-custom1 | aaa-custom10 | aaa-custom2 | aaa-custom3 | aaa-custom4 | aaa-custom5 | aaa-custom6 | aaa-custom7 | aaa-custom8 | aaa-custom9 | nasreq | rf-plus } | endpoint *endpoint_name* **| hd-mode fall-back-to-local | hd-storage-policy** *hd_policy* **| max-retries** *tries* **| max-transmissions** *transmissions* **| request-timeout** *duration* **| server** *host_name* **priority** *priority* **}**

default diameter accounting { dictionary | hd-mode | max-retries | max-transmissions | request-timeout }

no diameter accounting { endpoint | hd-mode | hd-storage-policy | max-retries | max-transmissions | server *host_name* **}**

---

no diameter accounting { endpoint | hd-mode | hd-storage-policy | max-retries | max-transmissions | server *host_name* **}**

endpoint: Removes the currently configured accounting endpoint. The default accounting server configured in the default AAA group will be used.
hd-mode: Sends records to the Diameter server, if all Diameter servers are down or unreachable, then copies records to the local HDD and periodically retries the Diameter server.
hd-storage-policy: Disables use of the specified HD storage policy.
max-retries: Disables the retry attempts for Diameter accounting in this AAA group.
max-transmissions: Disables the maximum number of transmission attempts for Diameter accounting in this AAA group.
server *host_name*: Removes the Diameter host *host_name* from this AAA server group for Diameter accounting.

---

default diameter accounting { dictionary | hd-mode | max-retries | max-transmissions | request-timeout }

dictionary: Sets the context's dictionary to the default.
hd-mode: Sends records to the Diameter server, if all Diameter servers are down or unreachable, then copies records to the local HDD and periodically retries the Diameter server.
max-retries: Sets the retry attempts for Diameter accounting in this AAA group to default 0 (disable).
max-transmissions: Sets the maximum transmission attempts for Diameter accounting in this AAA group to default 0 (disable).
request-timeout: Sets the timeout duration, in seconds, for Diameter accounting requests in this AAA group to default (20).

dictionary { aaa-custom1 | aaa-custom10 | aaa-custom2 | aaa-custom3 | aaa-custom4 | aaa-custom5 | aaa-custom6 | aaa-custom7 | aaa-custom8 | aaa-custom9 | nasreq | rf-plus }

Specifies the Diameter accounting dictionary.
aaa-custom1 ... aaa-custom10: The custom dictionaries. Even though the CLI syntax supports several custom dictionaries, not necessarily all of them have been defined. If a custom dictionary that has not been implemented is selected, the default dictionary will be used.
nasreq: nasreq dictionary—the dictionary defined by RFC 4005.
rf-plus: RF Plus dictionary.

endpoint *endpoint_name*

Enables Diameter to be used for accounting, and specifies which Diameter endpoint to use.
endpoint_name must be a string of 1 through 63 characters in length.

hd-mode fall-back-to-local

Specifies that records be copied to the local HDD if the Diameter server is down or unreachable. CDF/CGF will pull the records through SFTP.

hd-storage-policy *hd_policy*

Specifies the HD Storage policy name.
hd_policy must be the name of a configured HD Storage policy, and must be a string of 1 through 63 alpha and/or numeric characters in length.
HD storage policies are configured through the Global Configuration Mode.
This and the **hd-mode** command are used to enable the storage of Rf Diameter Messages to HDD in case all Diameter Servers are down or unreachable.

max-retries *tries*

Specifies how many times a Diameter request should be retried with the same server, if the server fails to respond to a request.
tries specifies the maximum number of retry attempts. The value must be an integer from 1 through 1000.
Default: 0

max-transmissions *transmissions*

Specifies the maximum number of transmission attempts for a Diameter request. Use this in conjunction with the "**max-retries** *tries*" option to control how many servers will be attempted to communicate with.
transmissions specifies the maximum number of transmission attempts for a Diameter request. The value must be an integer from 1 through 1000.
Default: 0

request-timeout *duration*

Specifies how long the system will wait for a response from a Diameter server before re-transmitting the request.
duration specifies the number of seconds the system will wait for a response from a Diameter server before re-transmitting the request. The value must be an integer from 1 to 3600.
Default: 20

server *host_name* **priority** *priority*

Specifies the current context Diameter accounting server's host name and priority.

host_name specifies the Diameter host name, it must be a string of 1 through 63 characters in length.
priority specifies the relative priority of this Diameter host. The priority is used in server selection. The priority must be an integer from 1 through 1000.

Usage

Use this command to manage the Diameter accounting options according to the Diameter server used for the context.

Example

The following command configures the Diameter accounting dictionary as **aaa-custom4**:

```
diameter accounting dictionary aaa-custom4
```

The following command configures the Diameter endpoint named *aaaa_test*:

```
diameter accounting endpoint aaaa_test
```

diameter authentication

Use this command to configure Diameter authentication related settings.

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter authentication { dictionary { aaa-custom1 | aaa-custom10 | aaa-custom11 | aaa-custom12 | aaa-custom13 | aaa-custom14 | aaa-custom15 | aaa-custom16 | aaa-custom17 | aaa-custom18 | aaa-custom19 | aaa-custom2 | aaa-custom20 | aaa-custom3 | aaa-custom4 | aaa-custom5 | aaa-custom6 | aaa-custom7 | aaa-custom8 | aaa-custom9 | nasreq } | endpoint *endpoint_name* **| max-retries** *tries* **| max-transmissions** *transmissions* **| redirect-host-avp { just-primary | primary-then-secondary } | request-timeout** *duration* **| server** *host_name* **priority** *priority* **}**

default diameter authentication { dictionary | max-retries | max-transmissions | redirect-host-avp | request-timeout }

no diameter authentication { endpoint | max-retries | max-transmissions | server *host_name* **}**

---

no diameter authentication { endpoint | max-retries | max-transmissions | server *host_name* **}**

endpoint: Removes the authentication endpoint. The default server configured in default AAA group will be used.
max-retries: Disables the retry attempts for Diameter authentication in this AAA group.
max-transmissions: Disables the maximum transmission attempts for Diameter authentication in this AAA group.
server *host_name*: Removes the Diameter host *host_name* from this AAA server group for Diameter authentication.

---

default diameter authentication { dictionary | max-retries | max-transmissions | redirect-host-avp | request-timeout }

dictionary: Sets the context's dictionary to the default.
max-retries: Sets the retry attempts for Diameter authentication requests in this AAA group to default 0 (disable).
max-transmissions: Sets the configured maximum transmission attempts for Diameter authentication in this AAA group to default 0 (disable).
redirect-host-avp: Sets the redirect choice to default (just-primary).
request-timeout: Sets the timeout duration, in seconds, for Diameter authentication requests in this AAA group to default (20).

---

dictionary { aaa-custom1 | aaa-custom10 | aaa-custom11 | aaa-custom12 | aaa-custom13 | aaa-custom14 | aaa-custom15 | aaa-custom16 | aaa-custom17 | aaa-custom18 | aaa-custom19 | aaa-custom2 | aaa-custom20 | aaa-custom3

| aaa-custom4 | aaa-custom5 | aaa-custom6 | aaa-custom7 | aaa-custom8 | aaa-custom9 | nasreq }

Specifies the Diameter authentication dictionary.
aaa-custom1 ... aaa-custom20: The custom dictionaries. Even though the CLI syntax supports several custom dictionaries, not necessarily all of them have been defined. If a custom dictionary that has not been implemented is selected, the default dictionary will be used.

Important: **aaa-custom11** dictionary is only available in Release 8.1 and later. **aaa-custom12** to **aaa-custom20** dictionaries are only available in Release 9.0 and later releases.

nasreq: nasreq dictionary—the dictionary defined by RFC 4005.

endpoint *endpoint_name*

Enables Diameter to be used for authentication, and specifies which Diameter endpoint to use.
endpoint_name must be a string of 1 through 63 characters in length.

max-retries *tries*

Specifies how many times a Diameter authentication request should be retried with the same server, if the server fails to respond to a request.
tries specifies the maximum number of retry attempts, and must be an integer from 1 through 1000.
Default: 0

max-transmissions *transmissions*

Specifies the maximum number of transmission attempts for a Diameter authentication request. Use this in conjunction with the "**max-retries** *tries*" option to control how many servers will be attempted to communicate with.
transmissions specifies the maximum number of transmission attempts, and must be an integer from 1 through 1000.
Default: 0

diameter authentication redirect-host-avp { just-primary | primary-then-secondary }

Specifies whether to use just one returned AVP, or use the first returned AVP as selecting the primary host and the second returned AVP as selecting the secondary host.
just-primary: Redirect only to primary host.
primary-then-secondary: Redirect to primary host, if fails then redirect to the secondary host.
Default: **just-primary**

request-timeout *duration*

Specifies how long the system will wait for a response from a Diameter server before re-transmitting the request.
duration specifies the number of seconds the system will wait for a response from a Diameter server before re-transmitting the request, and must be an integer from 1 through 3600.
Default: 20 seconds

server *host_name* **priority** *priority*

Specifies the current context Diameter authentication server's host name and priority.

host_name specifies the Diameter host name, and must be a string of 1 through 63 characters in length.
priority specifies the relative priority of this Diameter host, and must be an integer from 1 through 1000. The priority is used in server selection.

Usage

Use this command to manage the Diameter authentication configurations according to the Diameter server used for the context.

Example

The following command configures the Diameter authentication dictionary *aaa-custom14*:

```
diameter authentication dictionary aaa-custom14
```

The following command configures the Diameter endpoint named *aaau1*:

```
diameter authentication endpoint aaau1
```

diameter authentication failure-handling

This command configures error handling for Diameter EAP requests.

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter authentication failure-handling { authorization-request | eap-request | eap-termination-request } { request-timeout action { continue | retry-and-terminate | terminate } | result-code *result_code* **{ [to** *end_result_code* **] action { continue | retry-and-terminate | terminate } } }**

no diameter authentication failure-handling { authorization-request | eap-request | eap-termination-request } result-code *result_code* **[to** *end_result_code* **]**

default diameter authentication failure-handling { authorization-request | eap-request | eap-termination-request } request-timeout action

no

Disables Diameter authentication failure handling.

default

Configures the default Diameter authentication failure handling setting.

authorization-request

Specifies that failure handling is to be performed on Diameter authorization request messages (AAR/AAA).

eap-request

Specifies configuring failure handling for EAP requests.

eap-termination-request

Specifies configuring failure handling for EAP termination requests.

request-timeout action { continue | retry-and-terminate | terminate }

Specifies the action to be taken for failures:

- **continue**: Continues the session
- **retry-and-terminate**: First retries, if it fails then terminates the session
- **terminate**: Terminates the session

result-code *result_code* **{ [to** *end_result_code* **] action { continue | retry-and-terminate | terminate } }**

result_code: Specifies the result code, must be an integer from 1 through 65535.
to *end_result_code*: Specifies the upper limit of a range of result codes. *end_result_code* must be greater than *result_code*.
action { continue | retry-and-terminate | terminate }: Specifies action to be taken for failures:

- **continue**: Continues the session
- **retry-and-terminate**: First retries, if it fails then terminates the session
- **terminate**: Terminates the session

Usage

Use this command to configure error handling for Diameter EAP, EAP-termination , and authorization requests. Specific actions (continue, retry-and-terminate, or terminate) can be associated with each possible result-code. Ranges of result codes can be defined with the same action, or actions can be specific on a per-result code basis.

Example

The following commands configure result codes 5001, 5002, 5004, and 5005 to use "action continue" and result code 5003 to use "action terminate”:

```
diameter authentication failure-handling eap-request result-code 5001 to 5005 action continue

diameter authentication failure-handling eap-request result-code 5003 action terminate
```

diameter dictionary

This command is deprecated and is replaced by the **diameter accounting dictionary** and **diameter authentication dictionary** commands. See **diameter accounting** and **diameter authentication** commands respectively.

diameter endpoint

This command enables creating/configuring/deleting a Diameter endpoint.

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter endpoint *endpoint_name* **[-noconfirm]**

no diameter endpoint *endpoint_name*

no

Removes the specified Diameter endpoint.

endpoint_name

Specifies name of the Diameter endpoint.
endpoint_name must be an alpha and/or numeric string of 1 through 63 characters in length.
If the named endpoint does not exist, it is created, and the CLI mode changes to the Diameter Endpoint Configuration Mode wherein the endpoint can be configured.
If the named endpoint already exists, the CLI mode changes to the Diameter Endpoint Configuration Mode wherein the endpoint can be reconfigured.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create/configure/delete a Diameter origin endpoint.

Example

The following command creates a Diameter origin endpoint named *test13*:

diameter endpoint *test13*

diameter sctp

Configures Diameter SCTP parameters for all Diameter endpoints within the context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter sctp { hearbeat-interval *interval* **| path max-retransmissions** *retransmissions* **}**

default diameter sctp { heartbeat-interval | path max-retransmissions }

default

Configures this command with the default settings.
heartbeat-interval: Sets the heartbeat interval to the default value.
path max-retransmissions: Sets the SCTP path maximum retransmissions to the default value.

hearbeat-interval *interval*

Specifies the time interval between heartbeat chunks sent to a destination transport address in seconds.
interval must be an integer from 1 through 255.
Default: 30 seconds

path max-retransmissions *retransmissions*

Specifies the maximum number of consecutive retransmissions over a destination transport address of a peer endpoint before it is marked as inactive.
retransmissions must be an integer from 1 through 10.
Default: 10

Usage

Use this command to configure Diameter SCTP parameters for all diameter endpoints within the context.

Example

The following command configures the heartbeat interval to *60* seconds:

diameter sctp hearbeat-interval *60*

The following command configures the maximum number of consecutive retransmissions to *6*, after which the endpoint is marked as inactive:

diameter sctp path max-retransmissions *6*

diameter origin

This command is deprecated and is replaced by the **diameter endpoint** command.

dns-client

Creates a DNS client and/or enters the DNS Client Configuration Mode.

Product

SCM, SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] dns-client *name* **[-noconfirm]**

no

Removes the specified DNS client from the context.

name

Specifies a name for the DNS client. *name* must be from 1 to 63 alpha and/or numeric characters in length.

Usage

Use this command to create a new DNS client and enter the DNS Client Configuration Mode or enter the mode for an existing client.
Entering this command results in the following prompt:

```
[context_name]hostname(config-dns-client)#
```

DNS Client Configuration Mode commands are defined in the *DNS Client Configuration Mode Commands* chapter.

Example

The following command enters the DNS Client Configuration Mode for a DNS client named *dns1*:

dns-client *dns1*

domain

Configures a domain alias for the current context.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

domain [*] *domain_name* **[default subscriber** *subs_temp_name* **]**

no domain [*] *domain_name*

no domain [*] *domain_name*

Indicates the domain specified is to be removed as an alias to the current context.

[*] *domain_name*

domain_name specifies the domain alias to create/remove from the current context. If the domain portion of a subscribers user name matches this value, the current context is used for that subscriber.
domain_name must be an alpha and/or numeric string of 1 through 79 characters in length. The domain name can contain all special characters, however note that the character * (wildcard character) is only allowed at the beginning of the domain name.
If the domain name is prefixed with * (wildcard character), and an exact match is not found for the domain portion of a subscriber's user name, subdomains of the domain name are matched. For example, if the domain portion of a subscriber's user name is abc.xyz.com and you use the domain command **domain** **xyz.com* it matches. But if you do not use the wildcard (**domain** *xyz.com*) it does not match.

Important: The domain alias specified must not conflict with the name of any existing context or domain names.

default subscriber *subs_temp_name*

Specifies the name of the subscriber template to apply to subscribers using this domain alias.
subs_temp_name must be an alpha and/or numeric string of 1 through 127 characters in length. If this keyword is not specified the default subscriber configuration in the current context is used.

Usage

Set a domain alias when a single context may be used to support multiple domains via aliasing.

Example

domain *sampleDomain.net*

no domain *sampleDomain.net*

eap-profile

Creates a new, or specifies an existing, Extensible Authentication Protocol (EAP) profile and enters the EAP Configuration Mode.

Product

ASN GW, PDIF

Privilege

Security Administrator, Administrator

Syntax

[no] eap-profile *name*

name

Specifies the name of a new or existing EAP profile. *name* must be from 1 to 256 alpha and/or numeric characters.

Usage

Use this command to create a new or enter an existing EAP profile.
Entering this command results in the following prompt:

```
[context_name]hostname(config-ctx-eap-profile)#
```

EAP Configuration Mode commands are defined in the *EAP Configuration Mode Commands* chapter.

Example

The following command configures an EAP profile called *eap1* and enters the EAP Configuration Mode:

eap-profile *eap1*

edr-module active-charging-service

This command creates the Event Data Record (EDR) module and enters the EDR Module Active Charging Service Configuration Mode.

Product

ACS, GGSN, HA, LNS, PDSN

Privilege

Security Administrator, Administrator

Syntax

```
edr-module active-charging-service
```

Usage

Use this command to create the EDR module for the context and configure the EDR module for active charging service records. You must be in a non-local context when specifying this command, and you must use the same context when specifying the UDR module command.

Example

```
edr-module active-charging-service
```

egtp-service

Creates an eGTP service or specifies an existing eGTP service and enters the eGTP Service Configuration Mode for the current context.

Product

MME, P-GW, S-GW

Privilege

Administrator

Syntax

egtp-service *service_name* **[-noconfirm]**

no egtp-service *service_name*

service_name

Specifies the name of the eGTP service. If *service_name* does not refer to an existing service, the new service is created if resources allow.
service_name must be from 1 to 63 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no egtp-service *service_name*

Removes the specified eGTP service from the context.

Usage

Enter the eGTP Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:

```
[context_name]hostname(config-egtp-service)#
```

eGTP Service Configuration Mode commands are defined in the *eGTP Service Configuration Mode Commands* chapter.
Use this command when configuring the following GTP SAE components: MME, P-GW, and S-GW.

Example

The following command enters the existing eGTP Service Configuration Mode (or creates it if it does not already exist) for the service named *egtp-service1*:

egtp-service *egtp-service1*

The following command will remove *egtp-service1* from the system:

no egtp-service *egtp-service1*

end

Exits the Context Configuration Mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec Mode.

exit

Exits the Context Configuration Mode and returns to the Global Configuration Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the Global Configuration Mode.

external-inline-server

This is a restricted command.

fa-service

Creates/deletes a foreign agent service or specifies an existing FA service for which to enter the FA Service Configuration Mode for the current context.

Product

PDSN, ASN-GW, FA

Privilege

Security Administrator, Administrator

Syntax

[no] fa-service *name*

no

Indicates the foreign agent service specified is to be removed.

name

Specifies the name of the FA service to configure. If *name* does not refer to an existing service, the new service is created if resources allow. *name* must be from 1 to 63 alpha and/or numeric characters.

Usage

Enter the FA Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (i.e. resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Example

The following command will enter the FA Service Configuration Mode creating the service *sampleService*, if necessary.

fa-service *sampleService*

The following command will remove *sampleService* as being a defined FA service.

no fa-service *sampleService*

firewall max-associations

This command is obsolete.

ggsn-service

Creates/deletes a Gateway GPRS Support Node (GGSN) service and enters the GGSN Service Configuration Mode within the current context.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

ggsn-service *name* **[-noconfirm]**

no ggsn-service *name*

no

Deletes a preciously configured GGSN service.

name

Specifies the name of the GGSN service to create/configure.
name must be from 1 to 63 alpha and/or numeric characters and is case sensitive.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Services are configured within a context and enable certain functionality. This command creates and allows the configuration of services enabling the system to function as a GGSN in a GPRS or UMTS network. This command is also used to remove previously configured GGSN services.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (i.e. resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Example

The following command creates a GGSN service name ggsn1:

ggsn-service *ggsn1*

gprs-service

This command creates a GPRS service instance and enters the GPRS Service Configuration Mode. This mode configures all of the parameters specific to the operation of an SGSN in a GPRS network.

Important: For details about the commands and parameters for this mode, check the *GPRS Service Configuration Mode* chapter.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gprs-service *srvc_name*

no gprs-service *srvc_name*

no

Remove the configuration for the specified IGPRS service from the configuration for the current context.

srvc_name

A unique string of 1 to 63 alphanumeric characters that identify the specific GPRS service.

Usage

Use this command to create or remove a GPRS service. Entering this command will move the system to the GPRS Service Configuration Mode and change the prompt to:

```
[context_name]hostname(config-gprs-service)#
```

Example

The following command creates an GPRS service named gprs1:

gprs-service *gprs1*

The following command removes the GPRS service named gprs1:

no gprs-service *gprs1*

gs-service

This command creates a Gs service instance and enters the Gs Service Configuration Mode. This mode configures the parameters specific to the Gs interface between the SGSN and the MSC/VLR.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gs-service *svc_name* **[-noconfirm]**

no gs-service *svc_name*

no

Remove the configured Gs service from the current context.

svc_name

A unique string of 1 to 63 alphanumeric characters that identify the specific Gs service.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create, edit, or remove a Gs service.
A maximum of 32 Gs service can be configured in one context/system. This limit is subject to maximum of 256 services (regardless of type) can be configured per system.

Important: For details about the commands and parameters for this mode, refer *Gs Service Configuration Mode* chapter.

Example

The following command creates an Gs service named '*gs1*':

gs-service *gs1*

The following command removes the Gs service named '*gs1*':

no gs-service *gs1*

gtpp algorithm

Configures GTPP routing algorithms for the current context.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp algorithm { first-server | round-robin | first-n *n* **}**

first-server

Default: Enabled
Specifies that accounting data is sent to the first available charging gateway function (CGF) based upon the relative priority of each configured CGF.

round-robin

Default: Disabled
Specifies that accounting data is transmitted in a circular queue fashion such that data is sent to the highest priority CGF first, then to the next available CGF of the highest priority, and so on. Ultimately, the queue returns to the CGF with the highest configured priority.

first-n *n*

Default: 1 (Disabled)
Specifies that the AGW must send accounting data to *n* (more than one) CGFs based on their priority. Response from any one of the *n* CGFs would suffice to proceed with the call. The full set of accounting data is sent to each of the *n* CGFs.
n is the number of CGFs to which accounting data will be sent, and must be an integer from 2 through 65535.

Usage

Use this command to control how G-CDR accounting data is routed among the configured CGFs.

Example

The following command configures the system to use the round-robin algorithm when transmitting G-CDR accounting data:

```
gtpp algorithm round-robin
```

gtpp attribute

This command allows the specification of the optional attributes to be present in the call detail records (CDRs) that the GPRS/UMTS access gateway generates. It also defines that how the information is presented in CDRs by encoding the attribute field values.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp attribute { cell-plmn-id | diagnostics | duration-ms | imei | local-record-sequence-number | msisdn | node-id-suffix *suffix* **| plmn-id [unknown-use** *uncode_value* **] | rat | record-extensions rat | sms { destination-number | recording-entity | service-centre }**

default gtpp attribute { cell-plmn-id | diagnostics | duration-ms | imei | local-record-sequence-number | msisdn | plmn-id | rat | record-extensions | sms { destination-number | recording-entity | service-centre }

no gtpp attribute { cell-plmn-id | diagnostics | duration-ms | imei | local-record-sequence-number | msisdn | node-id-suffix | plmn-id | rat | record-extensions rat | sms { destination-number | recording-entity | service-centre }

no

Removes the configured GTPP attributes from the CDRs.

default

Sets the default GTPP attributes in generated the CDRs. It also sets the default presentation of attribute values in generated CDRs.

cell-plmn-id

Default: Disabled
This keyword configures the SGSN to include the cell's PLMN identifier (MCC and MNC) in generated CDRs (M-CDRs and/or the S-CDRs).
This keyword is applicable for SGSN only.

diagnostics

Default: Disabled
Includes the Diagnostic field in the CDR that is created when PDP contexts are released. The field will contain one of the following values:

- **36**: if the SGSN sends us "delete PDP context request".
- **38**: if the GGSN sends "delete PDP context request" due to GTP-C/GTP-U echo timeout with SGSN.
- **40**: if the GGSN sends "delete PDP context request" due to receiving a RADIUS Disconnect-Request message.

- **26**: if the GGSN sends "delete PDP context request" for any other reason (e.g., the operator types "clear subscribers" on the GGSN).

duration-ms

Default: Disabled
Specifies that the information contained in the mandatory Duration field be reported in milliseconds instead of seconds (as the standards require).

imei

Default: Disabled
This keyword configures the SGSN to include the International Mobile Equipment Id in generated CDRs (M-CDRs and/or the S-CDRs).
This keyword is applicable for SGSN only.

local-record-sequence-number

Default: Disabled
Includes the Node ID field in the CDR that is created when PDP contexts are released. The field consists of a AAA Manager identifier automatically appended to the name of the GGSN or SGSN service.
The name of the GGSN/SGSN service may be truncated, because the maximum length of the Node ID field is 20 bytes. Since each AAA Manager generates CDRs independently, this allows the Local Record Sequence Number and Node ID fields to uniquely identify a CDR.

msisdn

Default: Disabled
This keyword configures the SGSN to include the Mobile Subscribers Integrated Services Digital Network identifier in generated CDRs (M-CDRs and/or the S-CDRs).
This keyword is applicable for SGSN only.

node-id-suffix *string*

Default: Disabled
Specifies the string suffix to use in the NodeID field of GTPP CDRs. Each Session Manager task generates a unique NodeID string per GTPP context.
string: This is the configured Node-ID-Suffix having any string between 1 to16 characters.

Important: The NodeID field is a printable string of the *ndddstring* format: *n*: The first digit is the SessMgr restart counter having a value between 0 and 7. *ddd*: The number of SessMgr instances. Uses the specified NodeID-suffix in all CDRs. The “Node-ID” field is consists of SessMgr Recovery counter (1 digit) *n* + AAA Manager identifier (3 digits) *ddd* + the configured Node-Id-suffix (1 to 16 characters) *string*.

Important: If the centralized LRSN feature is enabled, the “Node-ID” field consists of only the specified NodeID-suffix. Otherwise GTPP group name is used. For default GTPP groups, GTPP context-name (truncated to 16 characters) is used.

Important: SessMgr recovery counter gets updated in case of “session recovery not enabled” If session recovery is enabled, the counter never updates. The node-id is displayed in the G-CDR irrespective of gtpp dictionary. The G-CDR is not decoded in monitor protocol for custom1 / custom3 dictionaries.

plmn-id [unknown-use *uncode_value* **]**

Default: Enabled
Includes the SGSN PLMN Identifier value (the RAI) in generated CDR (M-CDRs and/or the S-CDRs), if it is provided by the SGSN in the GTP create PDP context request. It is omitted if the SGSN does not supply one.

Important: For the GGSN it provides radio access identifier as the SGSN PLMN Id and for SGSN it includes the PLMN-id of RNC.

unknown-use *uncode_value* encodes the specified value for "SGSN PLMN Identifier" in the CDR if SGSN PLMN-ID information is unavailable.
Must be followed by the *uncode_value* value to be encoded.
uncode_value must be an hexadecimal value between 0x0 and 0xFFFFFF.
This keyword is applicable for SGSN only.

rat

Default: Disabled
This keyword configures the SGSN to include the radio access technology attribute in generated CDRs (M-CDRs and/or the S-CDRs).
This keyword is applicable for SGSN only.

record-extensions rat

Default: Disabled
This keyword configures the SGSN to include the radio access technology attribute in record extension field of generated CDRs (M-CDRs and/or the S-CDRs).
This keyword is applicable for SGSN only.

sms { destination-number | recording-entity | service-centre }

Default: Disabled
This keyword configures the SGSN to include the SMS related attributes in generated S-SMO-CDRs or S-SMT-CDRs.
destination-number: This keyword includes the destination-number information of SMS in generated S-SMO-CDRs or S-SMT-CDRs.
Note: This is the destination number of the short message subscriber.
recording-entity: This keyword includes the recording entity information of SMS in generated S-SMO-CDRs or S-SMT-CDRs.
Note: The recording entity is the E.164 number of the SGSN.
service-centre: This keyword includes the service-centre information of SMS in generated S-SMO-CDRs or S-SMT-CDRs.
Note: This is the E.164 address of the SMS-service centre.
This keyword is applicable for SGSN only.

Usage

Use this command to configure the type of optional information fields to include in generated CDRs (M-CDRs, S-CDRs, S-SMO-CDR, S-SMT-CDR from SGSN and G-CDRs, eG-CDRs from GGSN) by the AGW (SGSN and/or GGSN). In addition, it controls how the information for some of the mandatory fields are reported.
Fields described as optional by the standards but not listed above will always be present in the CDRs, except for Record Extensions (which will never be present).

Important: This command can be repeated multiple times with different keywords to configure multiple GTPP attributes.

Example

The following command configures the system to present the time provided in the Duration field of the CDR is reported in milliseconds:

```
gtpp attribute duration-ms
```

gtpp charging-agent

Configures the IP address and port of the system interface within the current context used to communicate with the CGF.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp charging-agent address *ip_address* **[port** *port* **]**

no gtpp charging-agent

no

Removes a previously configured charging agent address.

address *ip_address*

Specifies the IP address of the interface configured within the current context that is used to transmit CDR records (G-CDR/eGCRD/M-CDR/S-CDR) to the CGF.
ip_address must be configured using dotted decimal notation.

port *port*

It is an optional parameter. It specifies the Charging Agent UDP port.
If *port* is not defined IP will take the default port number 49999.
port must be an integer from 1 through 65535.

Important: Configuring gtpp charging-agent on port 3386 may interfere with ggsn-service configured with the same ip address.

Default: 49999

Usage

This command establishes a Ga interface for the system. For GTPP accounting, one or more Ga interfaces must be specified for communication with the CGF. These interfaces must exist in the same context in which GTPP functionality is configured (refer to the **gtpp** commands in this chapter).
This command instructs the system as to what interface to use. The IP address supplied is also the address by which the GSN is known to the CGF. Therefore, the IP address used for the Ga interface could be identical to one bound to a GSN service (a Gn interface).
If no GSN service is configured in the same context as the Ga interface, the address configured by this command is used to receive unsolicited GTPP packets.

Example

The following command configures the system to use the interface with an IP address of *192.168.13.10* as the accounting interface with port *20000* to the CGF:

gtpp charging-agent address *192.168.13.10*

gtpp charging-agent address *192.168.13.10* **port** *20000*

gtpp data-request sequence-numbers

Configures the range of sequence numbers to be used in the GTPP data record transfer record (DRT). Use this command to set the start value for the sequence number.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp data-request sequence-numbers start { 0 | 1 }

default gtpp data-request sequence-numbers start
```

default

Default is 0 (zero).

start { 0 | 1 }

Specifies the value of the start sequence number for the GTPP Data Record Transfer Request. Default: 0

- **0**: Designates the start sequence number as 0.
- **1**: Designates the start sequence number as 1.

Usage

When the GGSN/SGSN is configured to send GTPP echo request packets, the SGSN always uses 0 as the sequence number in those packets. Re-using 0 as a sequence number in the DRT packets is allowed by the 3GPP standards; however, this CLI command ensures the possibility of inter-operating with CGFs that can not properly handle the re-use of sequence number 0 in the echo request packets.

Example

The following command sets the sequence to start at 1.

```
gtpp data-request sequence-numbers start 1
```

gtpp dead-server suppress-cdrs

This command enables/disables CDR archival when a dead server is detected.

Important: This command is customer specific. For more information please contact your local service representative.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] gtpp dead-server suppress-cdrs
```

default

Configures the default setting.
Default: Disabled

no

Disables CDR archival.

Usage

Use this command to enable/disable CDR archival when a dead server is detected. With this CLI, once a server is detected as down, requests are purged. Also the requests generated for the period when the server is down are purged.

gtpp deadtime

Configures the amount of time to wait before attempting to communicate with a CGF that was previously marked as unreachable.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp deadtime *time*

time

Default: 120
Specifies the amount of time that must elapse before the system attempts to communicate with a CGF that was previously unreachable.
time is measured in seconds and can be configured to any integer value from 1 to 65535.

Usage

If the system is unable to communicate with a configured CGF, after a pre-configured number of failures the system marks the CGF as being down.
This command specifies the amount of time that the system waits prior to attempting to communicate with the downed CGF.
Refer to the **gtpp detect-dead-server** and **gtpp max-retries** commands for additional information on the process the system uses to mark a CGF as down.

Example

The following command configures the system to wait *60* seconds before attempting to re-communicate with a CGF that was marked as down:

gtpp deadtime *60*

gtpp detect-dead-server

Configures the number of consecutive communication failures that could occur before the system marks a CGF as down.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp detect-dead-server consecutive-failures *max_number*

consecutive-failures *max_number*

Default: 0
Specifies the number of failures that could occur before marking a CGF as down.
max_number could be configured to any integer value from 0 to 1000.

Usage

This command works in conjunction with the **gtpp max-retries** parameter to set a limit to the number of communication failures that can occur with a configured CGF.
The gtpp max-retries parameter limits the number of attempts to communicate with a CGF. Once that limit is reached, the system treats it as a single failure. The gtpp detect-dead-server parameter limits the number of consecutive failures that can occur before the system marks the CGF as down and communicate with the CGF of next highest priority.
If all of the configured CGFs are down, the system ignores the detect-dead-server configuration and attempt to communicate with highest priority CGF again.
If the system receives a GTPP Node Alive Request, Echo Request, or Echo Response message from a CGF that was previously marked as down, the system immediately treats it as being active.
Refer to the **gtpp max-retries** command for additional information.

Example

The following command configures the system to allow *8* consecutive communication failures with a CGF before it marks it as down:

gtpp detect-dead-server consecutive-failures *8*

gtpp dictionary

This command designates specific dictionary used by GTPP for specific context.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp dictionary { custom1 | custom10 | custom11 | custom12 | custom13 | custom14
| custom15 | custom16 | custom17 | custom18 | custom19 | custom2 | custom20 |
custom21 | custom22 | custom23 | custom24 | custom25 | custom26 | custom27 |
custom28 | custom29 | custom3 | custom30 | custom4 | custom5 | custom6 | custom7
| custom8 | custom9 | standard }

default gtpp dictionary
```

default

Configures the default dictionary.

custom1

Custom-defined dictionary. It conforms to TS 32.015 v 3.6.0 for R99. It supports the encoding of IP addresses in text format for G-CDRs.

custom2

Custom-defined dictionary.

custom3

Custom-defined dictionary. It conforms to TS 32.015 v 3.6.0 for R99 except that it supports the encoding of IP addresses in Binary format for G-CDRs.

custom4

Custom-defined dictionary. It conforms to TS 32.015 v 3.6.0 for R99 except that:

- IP addresses are encoded in binary format
- the Data Record Format Version information element contains 0x1307 instead of 0x1308
- QoSRequested is not present in the LoTV containers
- QoSnegotiated is added only for the first container and the container after a QoS change

custom5

Custom-defined dictionary.

custom6

Custom-defined dictionary for eG-CDR encoding.

custom7 ... custom30

Custom-defined dictionaries. These dictionary have default behavior or “standard” dictionary.

standard

Default: Enabled
A dictionary conforming to TS 32.215 v 4.6.0 for R4 (and also R5 - extended QoS format).

Usage

Use this command to designate specific dictionary used by GTPP for specific context.

Example

The following command configures the system to use custom3 dictionary to encode IP address in Binary format in G-CDRs:

```
gtpp dictionary custom3
```

gtpp duplicate-hold-time

This command configures the number of minutes to hold onto CDRs that are possibly duplicates while waiting for the primary CGF to come back up.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp duplicate-hold-time *minutes*

minutes

Default: 60
When the primary CGF is down, the number of minutes to hold onto CDRs that may be duplicates. *minutes* must be an integer from 1 to 10080.

Usage

Use this command to configure how long to hold onto CDRs that are possibly duplicates while waiting for the primary CGF to come back up. If the GGSN determines that the primary CGF is down, CDRs that were sent to the primary CGF but not acknowledged are sent by the GSN to the secondary CGF as "possibly duplicates". When the primary CGF comes back up, the GSN uses GTPP to determine whether the possibly duplicate CDRs were received by the primary CGF. Then the secondary CGF is told whether to release or cancel those CDRs. This command configures how long the system should wait for the primary CGF to come back up. As soon as the configured time expires, the secondary CGF is told to release all of the possibly duplicate CDRs.

Example

Use the following command to set the amount of time to hold onto CDRs to 2 hours (120 minutes);

gtpp duplicate-hold-time *120*

gtpp echo-interval

Configures the frequency at which the system sends GTPP echo packets to configured CGFs.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp echo-interval *time*

no gtpp echo-interval

no

Disables the use of the echo protocol except for the scenarios described in the Usage section for this command.

time

Default: 60
Specifies the time interval for sending GTPP echo packets.
time is measured in seconds and can be configured to any integer value from 60 to 2147483647.

Usage

The GTPP echo protocol is used by the system to ensure that it can communicate with configured CGFs. The system initiates this protocol for each of the following scenarios:

- Upon system boot
- Upon the configuration of a new CGF server on the system using the **gtpp server** command as described in this chapter
- Upon the execution of the **gtpp test accounting** command as described in the *Exec Mode Commands* chapter of this reference
- Upon the execution of the **gtpp sequence-numbers private-extensions** command as described in this chapter

The echo-interval command is used in conjunction with the gtpp max-retries and gtpp timeout commands as described in this chapter.
In addition to receiving an echo response for this echo protocol, if we receive a GTPP Node Alive Request message or a GTPP Echo Request message from a presumed dead CGF server, we will immediately assume the server is active again.
The alive/dead status of the CGFs is used by the AAA Managers to affect the sending of CDRs to the CGFs. If all CGFs are dead, the AAA Managers will still send CDRs, (refer to the **gtpp deadtime** command), albeit at a slower rate than if a CGF were alive. Also, AAA Managers independently determine if CGFs are alive/dead.

Example

The following command configures an echo interval of 120 seconds:

```
gtpp echo-interval 120
```

gtpp egcdr

Configures the eG-CDR parameters and triggers.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp egcdr { final-record [ closing-cause [ same-in-all-partials | unique ] |
include-content-ids { all | only-with-traffic } [ closing-cause { same-in-all-
partials | unique } ] | losdv-max-containers number | lotdv-max-containers
number | service-data-flow threshold [ interval seconds | volume { downlink |
total | uplink } bytes ] | service-idle-timeout seconds }

default gtpp egcdr { final-record include-content-ids only-with-traffic closing-
cause same-in-all-partials | losdv-max-containers | lotdv-max-containers |
service-idle-timeout 0 }

no gtpp egcdr service-data-flow threshold { interval | volume { downlink [
uplink ] | total | uplink [ downlink ] } }
```

final-record [closing-cause [same-in-all-partials | unique] | include-content-ids [all | only-with-traffic]]

Enables configuration of the final eG-CDR.

- **closing-cause**: Configures closing cause for the final eG-CDR.
  - **same-in-all-partials**: Specifies that the same closing cause is to be included for multiple final eG-CDRs
  - **unique**: Specifies that the closing cause for final eG-CDRs is to be unique.
- **include-content-ids**: Controls which content-ids are being included inthe final eG-CDR.
  - **all**: Specifies that all content-ids be included in the final eG-CDR.
  - **only-with-traffic**: Specifies that only content-ids with traffic be included in the final eG-CDRs.

losdv-max-containers *number*

The maximum number of List of Service Data Volume (LoSDV) containers in one eG-CDR. number can be configured to any integer value from 1 to 255.
Default: 10

lotdv-max-containers *number*

The maximum number of List of Traffic Data Volume (LoTDV) containers in one eG-CDR. number can be configured to any integer value from 1 to 8.
Default: 8

service-data-flow threshold [interval *seconds* **| volume { downlink | total | uplink }** *bytes* **]**

Configures the thresholds for closing a service data flow container within an eG-CDR.

- **interval**: configures the time interval in seconds
- **volume**: can specify uplink or downlink or combined total (uplink + downlink) byte thresholds.

A service data flow container has statistics for an individual content-id. When the threshold is reached, the service data flow container is closed.
Default: disabled

service-idle-timeout *seconds*

Specifies a time period where if no data is reported for a service flow, then the service container is closed and added to eG-CDR (as part of LOSDV container list) with service condition change as ServiceIdleOut.
seconds can be configured to any integer value from 10 to 86,400.
Default: 0. This means there is no service-idle-timeout trigger.

Usage

Use this command to configure individual triggers for eG-CDR generation.

Example

Use the following command to set the maximum number of LoSDV containers to 7.

```
gtpp egcdr losdv-max-containers 7
```

gtpp error-response

This command configures the response when the system receives an error response after transmitting a DRT (data record transfer) request.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp error-response { discard-cdr | retry-request }

default gtpp error-response
```

default

Resets the system's configuration to the default value for error-response. Default is **retry-request**.

discard-cdr

Instructs the system to purge the request upon receipt of an error response and not to retry.

retry-request

Instructs the system to retry sending a DRT after receiving an error response. This is the default behavior.

Usage

This command configures the system's response to receiving an error message after sending a DRT request.

Example

```
gtpp error-response discard-cdr
```

gtpp group

It configures GTPP server group in a context for the charging gateway function (CGF) accounting server(s) that the system is to communicate with.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp group *group_name* **[-noconfirm]**

group_name

Specifies the name of GTPP server group that is used for charging and/or accounting in a specific context. *group_name* must be a string of size 1 to 63 character.
A maximum of 8 GTPP server groups (excluding system created default GTPP server group "default") can be configured with this command in a context.

no

Removes the previously configured GTPP group within a context.
When a GTPP group is removed accounting information is not generated for all calls using that group and all calls associated with that group are dropped. A warning message displays indicating the number of calls that will be dropped.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

This feature provides the charging gateway function (CGF) accounting server configurables for a group of servers. Instead of having a single list of CGF accounting servers per context, this feature configures multiple GTPP accounting server groups in a context and each server group is consist of list of CGF accounting servers.
In case no GTPP server group is configured in a context, a server group named "default" is available and all the CGF servers configured in a specific context for CGF accounting functionality will be part of this "default" server group.

Example

Following command configures a GTPP server group named *star1* for charging gateway function accounting functionality and this server group is available for all subscribers with in that context.

gtpp group *star1*

gtpp max-cdrs

Configures the maximum number of charging data records (CDRs) included per packet.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp max-cdrs *number_cdrs* **[wait-time** *time* **]**

number_cdrs

Default: 1
Specifies the maximum number of CDRs to be insert in a single packet.
number_cdrs: any integer value from 1 to 255.

wait-time *time*

Default: disabled
Specifies the number of seconds the system waits for CDRs to be inserted into the packet before sending it.
time: any integer from 1 to 300.

Important: If the **wait-time** expires, the packet is sent as this keyword over-rides *number_cdrs*.

Usage

CDRs are placed into a GTPP packet as the CDRs close. The system stops placing CDRs into a packet when either the maximum *number_cdrs* is met, or the **wait-time** expires, or the value for the **gtpp max-pdu-size** command is met.

Example

The following command configures the system to place a maximum of 10 CDRs in a single GTPP packet before transmitting the packet.

```
gtpp max-cdrs 10
```

gtpp max-pdu-size

Configures the maximum payload size of a single GTPP packet that could be sent by the system.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp max-pdu-size *pdu_size*

pdu_size

Default: 4096
Specifies the maximum payload size of the GTPP packet. The payload includes the CDR and the GTPP header.
pdu_size is measured in octets and can be configured to any integer value from 1024 to 65400.

Usage

The GTPP packet contains headers (layer 2, IP, UDP, and GTPP) followed by the CDR. Each CDR contains one or more volume containers. If a packet containing one CDR exceeds the configured maximum payload size, the system creates and send the packet containing the one CDR regardless.
The larger the packet data unit (PDU) size allowed, the more volume containers that can be fit into the CDR.
The system performs standard IP fragmentation for packets that exceed the system's maximum transmission unit (MTU).

Important: The maximum size of an IPv4 PDU (including the IPv4 and subsequent headers) is 65,535. However, a slightly smaller limit is imposed by this command because the system's max-pdu-size doesn't include the IPv4 and UDP headers, and because the system may need to encapsulate GTPP packets in a different/larger IP packet (for sending to a backup device).

Example

The following command configures a maximum PDU size of 2048 octets:

gtpp max-pdu-size *2048*

gtpp max-retries

Configures the maximum number of times the system attempts to communicate with an unresponsive CGF.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp max-retries *max_attempts*

max_attempts

Default: 4
Specifies the number of times the system attempts to communicate with a CGF that is not responding. *max_attempts* can be configured to any integer value from 1 to 15.

Usage

This command works in conjunction with the **gtpp detect-dead-server** and **gtpp timeout** parameters to set a limit to the number of communication failures that can occur with a configured CGF.
When the value specified by this parameter is met, a failure is logged. The gtpp detect-dead-server parameter specifies the number of consecutive failures that could occur before the server is marked as down.
In addition, the gtpp timeout command controls the amount of time between re-tries.
If the value for the max-retries is met, the system begins storing CDRs in Random Access Memory (RAM). The system allocates memory as a buffer, enough to store one million CDRs for a fully loaded chassis (a maximum of one outstanding CDR per PDP context). Archived CDRs are re-transmitted to the CGF until they are acknowledged or the system's memory buffer is exceeded.
Refer to the **gtpp detect-dead-server** and **gtpp timeout** commands for additional information.

Example

The following command configures the maximum number of re-tries to be *8*.

gtpp max-retries *8*

gtpp node-id

This command configures the GTPP Node ID for all CDRs.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp node-id *node_id*

no gtpp node-id

no

Removes the previous gtpp node ID configuration.

node_id

Specifies the node ID for all CDRs.
node_id must be a string of 1 through 16 characters in length.

Usage

Use this command to configure the GTPP Node ID for all CDRs.

Example

The following command configures the GTPP Node ID as *test123*:

gtpp node-id *test123*

gtpp redirection-allowed

Configures the system to allow/disallow the redirection of CDRs when the primary CGF is unavailable.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp redirection-allowed

no gtpp redirection-allowed
```

Usage

This command allows operators to better handle erratic network links, without having to remove the configuration of the backup server(s) via the **no gtpp server** command.
This functionality is enabled by default.
If the no gtpp redirection-allowed command is executed, the system only sends CDRs to the primary CGF. If that CGF goes down, we will buffer the CDRs in memory until the CGF comes back or until the system runs out of buffer memory. In addition, if the primary CGF announces its intent to go down (with a GTPP Redirection Request message), the system responds to that request with an error response.

gtpp redirection-disallowed

This command has been obsoleted and replaced with the **gtpp redirection-allowed** command.

gtpp server

Configures the charging gateway function (CGF) accounting server(s) that the system is to communicate with.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp server ip_address [ max msgs ] [ priority priority ] [ udp-port port ] [
node-alive { enable | disable } ] [ -noconfirm ]

no gtpp server ip_address
```

no

Deletes a previously configured CGF.

ip_address

Specifies the IP address of the CGF in dotted decimal notation for IPv4 or colon notation for IPv6.

max *msgs*

Default: 256
Specifies the maximum number of outstanding or unacknowledged GTPP packets (from any one AAA Manager task) allowed for this CGF before the system begins buffering the packets.
msgs can be configured to any integer value from 1 to 256.

priority *priority*

Default:1000
Specifies the relative priority of this CGF. When multiple CGFs are configured, the priority is used to determine which CGF server to send accounting data to.
priority can be configured to any integer value from 1 to 1000. When configuring two or more servers with the same priority you will be asked to confirm that you want to do this. If you use the **-noconfirm** option, you are not asked for confirmation and multiple servers could be assigned the same priority.

udp-port *port*

Default: 3386
Specifies the UDP port over which the GSN communicates with the CGF. *port* can be configured to any integer value between 1 and 65535.

node-alive { enable | disable }

Default: Disable.
This optional keyword allows operator to enable/disable GSN to send Node Alive Request to GTPP Server (i.e. CGF). This configuration can be done per GTPP Server basis.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to configure the CGF(s) that the system sends CDR accounting data to. Multiple CGFs can be configured using multiple instances of this command. Up to 12 CGFs can be configured per system context. Each configured CGF can be assigned a priority. The priority is used to determine which server to use for any given subscriber based on the routing algorithm that has been implemented. A CGF with a priority of "1" has the highest priority.

Important: The configuration of multiple CGFs with the same IP address but different port numbers is not supported.

Each CGF can also be configured with the maximum allowable number of unacknowledged GTPP packets. Since multiple AAA Manager tasks could be communicating with the same CGF, the maximum is based on any one AAA Manager instance. If the maximum is reached, the system buffers the packets Random Access Memory (RAM). The system allocates memory as a buffer, enough to store one million CDRs for a fully loaded chassis (a maximum of one outstanding CDR per PDP context).

Example

The following command configures a CGF with an IP address of *192.168.2.2* and a priority of *5*.

```
gtpp server 192.168.2.2 priority 5
```

The following command deletes a previously configured CGF with an IP address of *100.10.35.7*:

```
no gtpp server 100.10.35.7
```

gtpp source-port-validation

Toggles port checking for node alive/echo/redirection requests from the CGF.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp source-port-validation

[ no | default ] gtpp source-port-validation
```

no

Disables CGF port checking. Only the IP address will be used to verify CGF requests.

default

Restores this parameter to its default setting of enabled.

Usage

This command is for enabling or disabling port checking on node alive/echo/redirection requests from the CGF. If the CGF sends messages on a non-standard port, it may be necessary to disable port checking in order to receive CGF requests. On the default setting, both IP and port are checked.

Example

The following command disables port checking for CGF requests:

```
no gtpp source-port-validation
```

gtpp storage-server

Configures information for the GTPP back-up storage server.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp storage-server *ip-address* **port** *port-num*

no gtpp storage-server *ip-address* **port** *port-num*

no

Removes a previously configured back-up storage server.

ip-address

The IP address of the back-up storage server expressed in dotted decimal notation.

port *port-num*

Default: 3386
Specifies the UDP port number over which the GSN communicates with the back-up storage server.

Usage

This command configures the information for the server to which GTPP packets are to be backed-up to in the event that all CGFs are unreachable.
One backup storage server can be configured per system context.

Important: This command only takes affect if **gtpp single-source** in the Global Configuration Mode is also configured. Additionally, this command is customer specific. Please contact your local sales representative for additional information.

Example

The following command configures a back-up server with an IP address of *192.168.1.2*:

gtpp storage-server *192.168.1.2*

gtpp storage-server local file

Configures the parameters for GTPP files stored locally on the GTPP storage server. This command is available for ASR 5000 platform only.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp storage-server local file { compression { gzip | none } | format { custom1
| custom2 | custom3 | custom4 | custom5 | custom6 } | name prefix prefix |
purge-processed-files [ purge-interval purge_dur ] | rotation { cdr-count count
| time-interval time | volume mb size } }

default gtpp storage-server local file { compression | format | name prefix |
purge-processed-files | rotation { cdr-count | time-interval | volume } }

no gtpp storage-server local file rotation { purge-processed-files | rotation {
cdr-count | time-interval } }
```

no

Removes a previously configured parameters for local storage of CDR files on HDD on SMC card.

compression { gzip | none }

Configures the type of compression to be used on the files stored locally.
gzip: Enables Gzip file compression.
none: Disables Gzip file compression -this is the default value.

format { *custom-n* }

Configures the file format to be used to format files to be stored locally.
custom1: File format custom1—this is the default value.
custom2: File format custom2.
custom3: File format custom3.
custom4: File format custom4.
custom5: File format custom5.
custom6: File format custom6 with a block size of 8K for CDR files.

name prefix *prefix*

Defines the prefix to be used for the file name. By default the file name prefix would be 'GTPP-group-name + VPN-ID'.
prefix must be a string of 1 to 64 alphanumeric characters.

purge-processed-files [purge-interval *purge_dur* **]**

Default: Disabled.

Enables the GSN to periodically (every 4 minutes) delete locally processed (*.p) CDR files from the HDD on the SMC card.

Important: This option is available only when GTPP server storage mode is configured for local storage of CDRs with the **gtpp storage-server mode local** command.

Optional keyword **purge-interval** *purge_dur* provides an option for user to control the purge interval duration in minutes by setting *purge_dur*.
purge_dur must be and integer between 1 through 259200. Which has a default value of 60 minutes.

rotation { cdr-count *count* **| time-interval** *time* **| volume mb** *size* **}**

Specifies rotation related configuration for GTPP files stored locally.
cdr-count *count*: Configure the CDR count for the file rotation. Enter a value from 1000 to 65000. Default value 10000.
time-interval *time*: Configure the time interval for file rotation. Enter a value in seconds ranging from 30 to 86400. Default value is 3600 seconds (1 hour).
volume mb *size*: Configure the file volume, in MB, for file rotation. Enter a value ranging from 2 to 40. This trigger can not be disabled. Default value is 10MB.

Usage

This command configures the parameters for storage of GTPP packets as files on the local server—meaning the hard disk.

Example

The following command configures rotation for every 1.5 hours for locally stored files.

```
gtpp storage-server local file rotation time-interval 5400
```

gtpp storage-server max-retries

Configures the maximum number of times the system attempts to communicate with an unresponsive GTPP back-up storage server.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp storage-server max-retries *max_attempts*

max_attempts

Default: 2
Specifies the number of times the system attempts to communicate with a GTPP back-up storage server that is not responding.
max_attempts can be configured to any integer value from 1 to 15.

Usage

This command works in conjunction with the **gtpp storage-server timeout** parameters to set a limit to the number of communication failures that can occur with a configured GTPP back-up storage server.
The gtpp storage-server timeout command controls the amount of time between re-tries.
Refer to the gtpp storage-server timeout command for additional information.

Example

The following command configures the maximum number of re-tries to be *8*.

```
gtpp storage-server max-retries 8
```

gtpp storage-server mode

This command configures storage mode, local or remote, for CDRs. Local storage mode is available with ASR 5000 platforms only.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp storage-server mode { local | remote | streaming }

default gtpp storage-server mode
```

default

Returns the GTPP group configuration to the default 'remote' value for the GTPP storage server mode.

local

Default: Disabled
Specifies the use of the hard disk on the SMC for storing CDRs

remote

Specifies the use of an external server for storing CDRs. This is the default value.

streaming

Default: Disabled
This keyword allows the operator to configure "streaming" mode of operation for GTPP group. When this keyword is supplied the CDRs will be stored in following fashion:

- When GTPP link is active with CGF, CDRs are sent to a CGF via GTPP and local hard disk is NOT used as long as every record is acknowledged in time.
- If the GTPP connection is considered to be down, all streaming CDRs will be saved temporarily on the local hard disk and once the connection is restored, unacknowledged records will be retrieved from the hard disk and sent to the CGF.

Usage

This command configures whether the CDRs should be stored on the hard disk of the SMC or remotely, on an external server.

Example

The following command configures use of a hard disk for storing CDRs.

```
gtpp storage-server mode local
```

gtpp storage-server timeout

Configures the amount of time that must pass with no response before the system re-attempts to communicate with the GTPP back-up storage server.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp storage-server timeout *duration*

duration

Default: 30
Specifies the maximum amount of time the system waits for a response from the GTPP back-up storage server before assuming the packet is lost.
duration is measured in seconds and can be configured to any integer value from 30 to 120.

Usage

This command works in conjunction with the **gtpp storage-server max-retries** command to establish a limit on the number of times that communication with a GTPP back-up storage server is attempted before a failure is logged.
This parameter specifies the time between retries.

Example

The following command configures a retry timeout of *60* seconds:

gtpp storage-server timeout *60*

gtpp suppress-cdrs zero-volume-and-duration

This command suppresses the CDRs created by session having zero duration and/or zero volume. By default this mode is 'disabled'.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp suppress-cdrs zero-volume-and-duration { gcdrs [ egcdrs ] | egcdrs [ gcdrs ] }

default gtpp suppress-cdrs zero-volume-and-duration
```

default

Disables the CDR suppression mode.

gcdrs [egcdrs]

Specifies that this command will handle G-CDRs before eG-CDRs.

gcdrs [egcdrs]

Specifies that this command will handle eG-CDRs before G-CDRs.

Usage

Use this command to suppress the CDRs (G-CDRs and eG-CDRs) which were created due with zero-duration session and zero-volume session due to any reason. By default this command is disabled and system will not suppress any CDR.

Example

The following command configures the system to suppression the eG-CDRs created for a zero duration session or zero volume session:

```
gtpp suppress-cdrs zero-volume-and-duration egcdrs gcdrs
```

gtpp timeout

Configures the amount of time that must pass with no response before the system re-attempts to communicate with the CGF.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp timeout *time*

time

Default: 20
Specifies the maximum amount of time the system waits for a response from the CGF before assuming the packet is lost.
time is measured in seconds and can be configured to any integer value from 1 to 60.

Usage

This command works in conjunction with the **gtpp max-retries** command to establish a limit on the number of times that communication with a CGF is attempted before a failure is logged.
This parameter specifies the time between retries.

Example

The following command configures a retry timeout of *30* seconds:

gtpp timeout *30*

gtpp trigger

This command is left in place for backward compatibility. To disable and enable GTPP triggers you should use the **gtpp trigger** command in GTPP Server Group Configuration Mode.

gtpp transport-layer

This commands selects the transport layer protocol for Ga interface for communication between AGW (GSNs) and GTPP servers.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp transport-layer { tcp | udp }

default gtpp transport-layer
```

default

Resets the transport layer protocol to GTPP servers to the default UDP.

tcp

Default: Disabled
Enables the system to implement TCP as transport layer protocol for communication with GTPP server.

udp

Default: Enabled
Enables the system to implement UDP as transport layer protocol for communication with GTPP server.

Usage

Use this command to select the TCP or UDP as the transport layer protocol for Ga interface communication between GTPP servers and AGWs (GSNs).

Example

The following command enables TCP as the transport layer protocol for the GSN's Ga interface.

```
gtpp transport-layer tcp
```

gtpu-service

Creates a GTP-U service or specifies an existing GTP-U service and enters the GTP-U Service Configuration Mode for the current context.

Product

GGSN, P-GW, S-GW

Privilege

Administrator

Syntax

gtpu-service *service_name* **[-noconfirm]**

no gtpu-service *service_name*

service_name

Specifies the name of the GTP-U service. If *service_name* does not refer to an existing service, a new service is created if resources allow.
service_name must be from 1 to 63 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no gtpu-service *service_name*

Removes the specified GTP-U service from the context.

Usage

Enter the GTP-U Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:

```
[context_name]hostname(config-gtpu-service)#
```

GTP-U Service Configuration Mode commands are defined in the *GTP-U Service Configuration Mode Commands* chapter.

Example

The following command enters the existing GTP-U Service Configuration Mode (or creates it if it does not already exist) for the service named *gtpu-service1*:

```
gtpu-service gtpu-service1
```

The following command will remove *gtpu-service1* from the system:

```
no gtpu-service gtpu-service1
```

ha-service

Creates/deletes a home agent service or specifies an existing HA service for which to enter the Home Agent Service Configuration Mode for the current context.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

ha-service *name*

no ha-service *name*

no

Indicates the home agent service specified is to be removed.

name

Specifies the name of the HA service to configure. If *name* does not refer to an existing service, the new service is created if resources allow. *name* must be from 1 to 63 alpha and/or numeric characters.

Usage

Enter the HA Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (i.e. resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Example

The following command will enter the HA Service Configuration Mode creating the service *sampleService*, if necessary.

ha-service *sampleService*

The following command will remove *sampleService* as being a defined HA service.

no ha-service *sampleService*

hsgw-service

Creates an HSGW service or specifies an existing HSGW service and enters the HSGW Service Configuration Mode for the current context.

Product

HSGW

Privilege

Administrator

Syntax

hsgw-service *service_name* **[-noconfirm]**

no hsgw-service *service_name*

service_name

Specifies the name of the HSGW service. If *service_name* does not refer to an existing service, the new service is created if resources allow.
service_name must be from 1 to 63 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no hsgw-service *service_name*

Removes the specified HSGW service from the context.

Usage

Enter the HSGW Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:

```
[context_name]hostname(config-hsgw-service)#
```

HSGW Service Configuration Mode commands are defined in the *HSGW Service Configuration Mode Commands* chapter.
Use this command when configuring the following eHRPD components: HSGW.

Example

The following command enters the existing HSGW Service Configuration Mode (or creates it if it does not already exist) for the service named *hsgw-service1*:

hsgw-service *hsgw-service1*

The following command will remove *hsgw-service1* from the system:

no hsgw-service *hsgw-service1*

ikev1 disable-phase1-rekey

This command configures the rekeying of Phase1 SA when the Internet Security Association and Key Management Protocol (ISAKMP) lifetime expires in Internet Key Exchange (IKE) v1 protocol.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ikev1 disable-phase1-rekey
```

no

Disable this command which re-enables Phase 1 SAs when the ISAKMP lifetime expires.

Usage

Use this command to disable the rekeying of Phase 1 SAs when the ISAKMP lifetime expires in IKE v1 protocol.

Example

The following command disables rekeying of Phase1 SAs when the lifetime expires:

```
ikev1 disable-phase1-rekey
```

ikev1 keepalive dpd

This command configures the ISAKMP IPSec Dead Peer Detection (DPD) message parameters for IKE v1 protocol.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

[no] ikev1 keepalive dpd interval *interval* **timeout** *time* **num-retry** *retries*

no

Deletes previously configured IPSec DPD Protocol settings.

interval *interval*

The time interval at which IPSec DPD Protocol messages are sent.
interval is measured in seconds and can be configured to any integer value between 10 and 3600.

timeout *time*

The amount of time allowed for receiving a response from the peer security gateway prior to re-sending the message.
time is measured in seconds and can be configured to any integer value between 10 and 3600.

num-retry *retries*

The maximum number of times that the system should attempt to reach the peer security gateway prior to considering it unreachable.
retries can be configured to any integer value between 1 and 100.

Usage

Use this command to configure the ISAKMP dead peer detection parameters in IKE v1 protocol. Tunnels belonging to crypto groups are perpetually kept “up” through the use of the IPSec Dead Peer Detection (DPD) packets exchanged with the peer security gateway.

Important: The peer security gateway must support RFC 3706 in order for this functionality to function properly.

This functionality is for use with the Redundant IPSec Tunnel Fail-over feature and to prevent IPSec tunnel state mismatches between the FA and HA when used in conjunction with Mobile IP applications. Regardless of the application, DPD must be supported/configured on both security peers. If the system is configured with DPD but it is communicating with a peer that does not have DPD configured, IPSec tunnels still come up. However, the only indication that the remote peer does not support DPD exists in the output of the **show crypto isakmp security associations summary dpd** command.

Important: If DPD is enabled while IPSec tunnels are up, it will not take affect until all of the tunnels are cleared.

Example

The following command configures IPSec DPD Protocol parameters to have an interval of *15*, a timeout of *10*, to retry each attempt *5* times:

```
ikev1 keepalive dpd interval 15 timeout 10 num-retry 5
```

ikev1 policy

This command configures/creates an ISAKMP policy with the specified priority and enters ISAKMP Configuration Mode for IKE v1 protocol.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

[no] ikev1 policy *priority*

no

Removes a previously configured ISAKMP policy for IKE v1 protocol.

priority

Default: 0
This must be an integer from 0 through 100. ISAKMP policies for IKE v1 protocol with lower priority numbers take precedence over policies with higher priorities. “0” is the highest priority.

Usage

Use this command to create ISAKMP policies to regulate how IPSec key negotiation is performed for IKE v1 protocol.
Internet Security Association Key Management Protocol (ISAKMP) policies are used to define Internet Key Exchange (IKE) SAs. The IKE SAs dictate the shared security parameters (i.e. which encryption parameters to use, how to authenticate the remote peer, etc.) between the system and a peer security gateway.
During Phase 1 of IPSec establishment, the system and a peer security gateway negotiate IKE SAs. These SAs are used to protect subsequent communications between the peers including the IPSec SA negotiation process.
Multiple ISAKMP policies can be configured in the same context and are used in an order determined by their priority number.

Example

Use the following command to create an ISAKMP policy with the priority 1 and enter the ISAKMP Configuration Mode:

ikev1 policy *1*

ikev2-ikesa

Creates a new, or specifies an existing, IKEv2 security association transform set and enters the IKEv2 Security Association Configuration Mode.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

[no] ikev2-ikesa transform-set *name*

name

Specifies the name of a new or existing security association transform set. *name* must be from 1 to 127 alpha and/or numeric characters.

Usage

Use this command to create a new or enter an existing IKEv2 security association transform-set. A list of up to four separate transform-sets can be created.
Entering this command results in the following prompt:

```
[context_name]hostname(cfg-ctx-ikev2ikesa-tran-set)#
```

IKEv2 Security Association Configuration Mode commands are defined in the *IKEv2 Security Association Configuration Mode Commands* chapter.

Example

The following command configures an IKEv2 security association transform set called *ikesa3* and enters the IKEv2 Security Association Configuration Mode:

```
ikev2-ikesa transform-set  ikesa3
```

ims-auth-service

This command creates the specified IMS authorization service, and enters the IMS Authorization Service Configuration Mode within the current context for Gx/Ty interface support to a subscriber session for IMS authorization and flow-based charging procedures.

Product

PDSN, GGSN, HA

Privilege

Security Administrator, Administrator

Syntax

ims-auth-service *auth_svc_name* **[-noconfirm]**

{ no | default } ims-auth-service *auth_svc_name*

no

Deletes the specified IMS authorization service with in specific context.

default

Restores default state of IMS authorization service, disabled for specific context.

auth_svc_name

Specifies the unique name of IMS authorization service across the system to be configured for Gx/Ty interface authentication within specific context.
auth_svc_name must be a unique string of 1 through 63 characters in length.
A maximum of 16 authorization services can be configured globally in the system. There is also a system limit for the maximum number of total configured services.

-noconfirm

Specifies that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create/delete an IMS authorization service for Gx/Ty interface for a subscriber.

Example

The following command configures an IMS authorization service *ims_interface1* with in this context:

ims-auth-service *ims_interface1*

ims-sh-service

This command creates the specified IMS Sh service name to allow configuration of Sh service.

Product

PDIF, SCM

Privilege

Administrator

Syntax

ims-sh-service *name*

no ims-sh-service *name*

no

Removes a previously configured IMS-Sh-service.

name

Name of the IMS-Sh-service to be configured. *name* must be from 1 to 63 alpha and/or numeric characters.

Usage

The IMS-Sh-service is named in the pdif-service and/or cscf-service. Use this command to enter the IMS Sh Service Configuration Mode.
Entering this command results in the following prompt:
[*context_name*]*hostname*(config-ims-sh-service)#
IMS Sh Service Configuration Mode commands are defined in the *IMS Sh Service Configuration Mode Commands* chapter in this guide.

Example

The following example names a service to be configured:

ims-sh-service *ims-1*

inspector

Configures a context-level inspector account within the current context.

Product

All

Privilege

Security Administrator

Syntax

inspector *user_name* **[encrypted] password** *password* **[ecs | noecs] [expiry-date** *date_time* **] [li-administration] [noecs] [timeout-absolute** *abs_seconds* **] [timeout-min-absolute** *abs_minutes* **] [timeout-idle** *idle_seconds* **] [timeout-min-idle** *idle_minutes* **]**

no inspector *user_name*

no

Removes a previously configured inspector account.

user_name

Specifies a name for the context-level inspector account. *user_name* must be from 1 to 32 alpha and/or numeric characters.

[encrypted] password *password*

Specifies the password to use for the user which is being given context-level inspector privileges within the current context. The encrypted keyword indicates the password specified uses encryption.
password must be from 1 to 63 alpha and/or numeric characters without encryption and must be from 1 to 127 alpha and/or numeric characters when encryption has been indicated.
The encrypted keyword is intended only for use by the system while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the password keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

ecs | noecs

Default: **noecs**
ecs: Permits the specific user to access ACS-specific configuration commands.
noecs: Prevents the specific user to access ACS-specific configuration commands.

expiry-date *date_time*

The date and time that this account expires. Enter the date and time in the format YYYY:MM:DD:HH:mm or YYYY:MM:DD:HH:mm:ss.
Where YYYY is the year, MM is the month, DD is the day of the month, HH is the hour, mm is minutes, and ss is seconds.

li-administration

Permits this user to execute Lawful Intercept commands.

Important: Users who have Lawful Intercept privileges are only given those privileges when connected to the system through a Secure Shell (SSH). If this user connects through a Telnet session or through the console port, Lawful Intercept privileges are not enabled.

timeout-absolute *abs_seconds*

Default: 0
This keyword is obsolete. It has been left in place for backward compatibility. If used a warning is issued and the value entered is rounded to the nearest whole minute.
Specifies the maximum amount of time, in seconds, the context-level inspector may have a session active before the session is forcibly terminated. *abs_seconds* must be a value in the range from 0 through 300000000.
The special value 0 disables the absolute timeout.

timeout-min-absolute *abs_minutes*

Default: 0
Specifies the maximum amount of time, in minutes, the context-level inspector may have a session active before the session is forcibly terminated. *abs_minutes* must be a value in the range from 0 through 525600 (365 days).
The special value 0 disables the absolute timeout.

timeout-idle *idle_seconds*

Default: 0
This keyword is obsolete. It has been left in place for backward compatibility. If used a warning is issued and the value entered is rounded to the nearest whole minute.
Specifies the maximum amount of idle time, in seconds, the context-level inspector may have a session active before the session is terminated. *idle_seconds* must be a value in the range from 0 through 300000000.
The special value 0 disables the idle timeout.

timeout-min-idle *idle_minutes*

Default: 0
Specifies the maximum amount of idle time, in minutes, the context-level inspector may have a session active before the session is terminated. *idle_minutes* must be a value in the range from 0 through 525600 (365 days).
The special value 0 disables the idle timeout.

Usage

Create new context-level inspector or modify existing inspector's options, in particular, the timeout values. Inspector users have minimal read-only privileges. Refer to the *Command Line Interface Overview* chapter for more information.

Important: A maximum of 128 administrative users and/or subscribers may be locally configured per context.

Example

The following command creates a context-level inspector account named *user1*:

```
inspector user1 password secretPassword
```

The following command removes a context-level inspector account named *user1*:

```
no inspector user1
```

interface

Creates/deletes an interface or specifies an existing interface. By identifying an interface, the mode changes to configure this interface in the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

interface *name* **[broadcast | loopback | point-to-point | tunnel]**

no interface *name*

no

Indicates the interface specified is to be removed.

name

Specifies the name of the interface to configure. If *name* does not refer to an existing interface, the new interface is created if resources allow. *name* must be from 1 to 79 alpha and/or numeric characters.

broadcast

Default: Enabled
Creates an Ethernet broadcast (IP) interface and enters the Ethernet Configuration Mode.

Important: Refer to the *Ethernet interface Configuration Mode Command* chapter for more information.

loopback

Default: Disabled
Creates an internal IP address that can be reached by any interface configured in the current context. The interface must be configured for loopback when configuring Interchassis Session Recovery. A total of 256 loopback interfaces can be configured.

Important: Refer to the *Loopback Interface Configuration Mode Command* chapter for more information.

point-to-point

Creates a permanent virtual connection (PVC) in the current context and enters the PVC Configuration Mode. Currently, this type of interface is only used with an optical (ATM) line card.

Important: Refer to the *PVC Interface Configuration Mode Command* chapter for more information.

tunnel

Creates a tunnel interface to support the various tunnel interfaces. Currently only IPv6-over-IPv4 and GRE tunnel interface is supported.

Important: Refer to the *Tunnel Interface Configuration Mode Commands* chapter for more information.

Usage

Use this command to enter/create the interface configuration mode for an existing interface or for a newly defined interface. This command is also used to remove an existing interface when it longer is needed.

Important: If no keyword is specified, broadcast is assumed and the interface is Ethernet by default.

For IPv6-over-IPv4 or GRE tunneling user need to specify the interface type as **tunnel**.

Example

The following command enters the Ethernet Interface Configuration Mode creating the interface *sampleService*, if necessary.

```
interface sampleInterface
```

The following command removes *sampleService* as being a defined interface.

```
no interface sampleInterface
```

The following command enters the Tunnel Interface Configuration Mode creating the interface *GRE_tunnel1*, if necessary.

```
interface GRE_tunnel1 tunnel
```

ip access-group

Configures access group with Access Control List (ACL) for IP traffic for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip access-group *name* **[in | out] [** *priority_value* **]**

no ip access-group *name* **[in | out]**

no

Indicates the specified ACL rule is to be removed from the group.

name

Specifies the ACL rule to be added/removed from the group.
In Release 8.1 and later, *name* must be an alpha and/or numeric string of 1 through 47 characters in length.
In Release 8.0, *name* must be an alpha and/or numeric string of 1 through 79 characters in length.

Important: Up to 8 ACLs can be applied to a group provided that the number of rules configured within the ACL(s) does not exceed the 256 rule limit for the context.

in | out

The **in** and **out** keywords are deprecated and are only present for backward compatibility. The Context-level ACL are applied only to outgoing packets.

priority_value

Default: 0
Specifies the priority of the access group. 0 is the highest priority. If *priority_value* is not specified, the priority is set to 0. *priority_value* must be an integer from 0 through 4294967295.
If access groups in the list have the same priority, the last one entered is used first.

Usage

Use this command to add IP access lists (refer to the **ip access-list** command) configured with in the same context to an ACL group.
Refer to the *Access Control Lists* chapter of the *System Enhanced Feature Configuration Guide* for more information on ACLs.

Example

The following commands add *sampleGroup* to the context-level ACL with a priority of *0*.

ip access-group *sampleGroup 0*

ip access-list

This command enables creating/configuring/deleting an IP Access List in the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip access-list *name*

{ default | no } ip access-list *name*

default

Sets the context's default access control list to that specified by *name*.

no

Removes the specified access list.

name

Specifies the access list name.
In Release 8.0, *name* must be an alpha and/or numeric string of 1 through 79 characters in length.
In Release 8.1 and later, *name* must be an alpha and/or numeric string of 1 through 47 characters in length.
If the named access list does not exist, it is created, and the CLI mode changes to the ACL Configuration Mode, wherein the access list can be configured.
If the named access list already exists, the CLI mode changes to the ACL Configuration Mode, wherein the access list can be reconfigured.

Usage

Executing this command enters the ACL Configuration Mode in which rules and criteria are defined for the ACL.

Important: A maximum of 64 rules can be configured per ACL. The maximum number of ACLs that can be configured per context is limited by the amount of available memory in the VPN Manager software task; it is typically less then 200.

The no version of this command deletes the ACL.
Refer to the *Access Control Lists* chapter of the *System Enhanced Feature Configuration Guide* for more information on ACLs.

Example

The following command creates an access list named *sampleList*, and enters the ACL Configuration Mode:

ip access-list *sampleList*

ip arp

Configures the address resolution protocol options for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip arp *ip_address mac_address* **[vrf** *vrf_name* **]**

no ip arp *ip_address*

no

Indicates the ARP configuration data for the IP address specified is to be removed from the configuration.

ip_address

Specifies the IP address to configure the ARP options where *ip_address* must be specified using the standard IPv4 dotted decimal notation.

mac_address

Specifies the media-specific access control layer address for the IP address. *mac_address* must be specified as a an 6-byte hexadecimal number with each byte separated by a colon, e.g., 'AA:12:bb:34:f5:0E'.

vrf *vrf_name*

This keyword associates a Virtual Routing and Forwarding (VRF) context with this static ARP entry. *vrf_name* is name of a preconfigured virtual routing and forwarding (VRF) context configured in Context Configuration Mode through **ip vrf** command.

Usage

Manage the IP address mapping which is a logical/virtual identifier to the more lower layer addressing used for address resolution in ICMP messages.
For tunnel-based interface, network IP pool can have overlapping ip-addresses across VRFs. To manage it adding a preconfigured VRF context is required to associate with an static ARP entry. By default, the ARP is added in the given context. If the VRF name is specified, then the ARP is added to the VRF ARP table.

Example

The following commands set the IP and MAC address for the current context then remove it from the configuration.

ip arp *1.2.3.4 F1:E2:D4:C5:B6:A7*

no ip arp *1.2.3.4*

The following commands set the IP and MAC address for a VRF context *GRE_vrf1* in the configuration.

ip arp *1.2.3.4 F1:E2:D4:C5:B6:A7* **vrf** *GRE_vrf1*

ip as-path access-list

Defines BGP AS Path access lists.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

ip as-path access-list *list_name* **[{ deny | permit }** *reg_expr* **]**

no ip as-path access-list *list_name* **[{ deny | permit }** *reg_expr* **]**

no

Remove the specified regular expression from the AS path access list.

list_name

To add new rules to an existing list, enter the list name. *list_name* must be a string of alpha numeric characters from 1 through 79 characters.

{ deny | permit }

deny: Deny access to AS paths that match the regular expression.
permit: Allow access to AS paths that match the regular expression.

reg_expr

A regular expression to define the AS paths to match. *reg_expr* must be a string containing 1 through 254 alpha and/or numeric characters.

Important: The **?** (question mark) character is not supported in regular expressions for this command.

Usage

Use this command to define AS path access lists for the BGP router in the current context. The chassis supports a maximum of 64 access lists per context.

Example

The following command creates an AS access list named *ASlist1* and permits access to AS paths.

ip as-path access-list *ASlist1* **permit**

ip dns-proxy source-address

Enables the proxy DNS functionality and identifies this context as the destination context for all redirected DNS requests.

Important: This command must be entered in the destination context for the subscriber. If there are multiple destination contexts for different subscribers, the command must be entered in each context.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

`[ no ] ip dns-proxy source-address` *`ip_address`*

`no`

Removes the address in this context as a destination for redirected DNS packets.

`ip dns-proxy source-address` *`ip_address`*

Specifies an interface in this context used for redirected DNS packets. *`ip_address`* must be specified using the standard IPv4 dotted decimal notation.

Usage

Use this command to identify the interface in this context where redirected DNS packets are sent to the home DNS. The system uses this address as the source address of the DNS packets when forwarding the intercepted DNS request to the home DNS server. For a more detailed explanation of the proxy DNS intercept feature, see the **`proxy-dns intercept-list`** command.

Example

The following command identifies an interface with an address of *`1.23.456.456`* in a destination context where the system forwards all intercepted DNS requests:

`ip dns-proxy source-address` *`1.23.456.456`*

ip domain-lookup

Enables/disables domain name lookup via domain name servers for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
ip domain-lookup

no ip domain-lookup
```

no

Disables domain name lookup.

Usage

Domain name look up is necessary if the subscribers configured for the context are to be allowed to use logical host names for services which requires the host name resolution via DNS.

Example

```
ip domain-lookup

no ip domain-lookup
```

ip domain-name

Configures/removes the logical domain name for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip domain-name *name*

no ip domain-name *name*

no

Indicates the logical domain name for the current context is to be removed.

name

Specifies the logical domain name to use for domain name server address resolution. *name* must be from 1 to 1023 alpha and/or numeric characters formatted to be a valid IP domain name.

Usage

Set a logical domain name if the context is to be accessed by logical domain name in addition to direct IP address.

Example

ip domain-name *sampleName.org*

ip forward

This command configures an IP forwarding policy to forward outgoing pool packets whose flow lookup fails to the default-gateway.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ip forward outbound unused-pool-dest-address default-gateway
```

no

Disable forwarding to the default gateway.

Usage

Use this command to set an IP forwarding policy that forwards outgoing pool packets whose flow lookup fails to the default gateway.
By default, the behavior is to either send an ICMP Unreachable message or to discard the packet depending on the configuration of the IP pool.
Pool packets coming from the linecard whose flow lookup fails are discarded or ICMP unreachable is sent irrespective of whether this command is configured or not.

Example

To enable this functionality, enter the following command:

```
ip forward outbound unused-pool-dest-address default-gateway
```

To disable this functionality, enter the following command:

```
no ip forward outbound unused-pool-dest-address default-gateway
```

ip identification packet-size-threshold

Configures the packet size above which system will assign unique IP header identification.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

ip identification packet-size-threshold *size*

default ip identification packet-size-threshold

default

Restores default value of 576 bytes to IP packet size for fragmentation threshold.

size

Default: 576 bytes.
Specifies the size of IP packet in bytes above which system will assign unique IP header identification for system generated IP encapsulation headers. (such as MIP data tunnel).
size can be configured to any integer value from 0 to 2000.

Usage

This configuration is used to set the upper limit of the IP packet size. All packets above that size limit will be considered ‘fragmentable’, and an unique non-zero identifier will be assigned.

Example

The following commands set the IP packet size to 1024 bytes as threshold. above this limit system will assign unique IP header identification for system generated IP encapsulation headers:

ip identification packet-size-threshold *1024*

ip localhost

Configures or removes the static local host logical name to IP address mapping for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip localhost *name ip_address*

no ip localhost *name ip_address*

no

Specifies that the static mapping must be removed.

name

Specifies the logical host name for the local machine the current context resides on. *name* must be from 1 to 1023 alpha and/or numeric characters formatted to be a valid IP host name.

ip_address

Specifies the IP address for the static mapping. *ip_address* must be specified using the standard IPv4 dotted decimal notation.

Usage

Avoid excessive DNS lookups across the network by statically mapping the logical host name to the local host's context.

Example

ip localhost *localHostName 1.2.3.4*

no ip localhost *localHostName 1.2.3.4*

ip name-servers

Modifies the list of domain name servers the current context may use for logical host name resolution.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip name-servers *ip_address secondary_ip_address*

no ip name-servers *ip_address*

no

Indicates the name server specified is to be removed from the list of name servers for the current context.

ip_address

Specifies the IP address of a domain name server. *ip_address* must be specified using either standard IPv4 dotted decimal notation or standard IPv6 colon-separated notation.

secondary_ip_address

Specifies the IP address of a secondary domain name server. *secondary_ip_address* must be specified using either standard IPv4 dotted decimal notation or standard IPv6 colon-separated notation.

Usage

Manage the list of name servers the current context may use in resolving logical host names.
The DNS can be specified at the Context level in Context configuration as well as at the APN level in APN Configuration Mode with **dns** and **ipv6 dns** commands, or it can be received from AAA server.
When DNS is requested in PCO configuration, the following preference will be followed for DNS value:

1. DNS Values received from LNS have the first preference.
2. DNS values received from RADIUS Server has the second preference.
3. DNS values locally configured with APN with **dns** and **ipv6 dns** commands has the third preference.
4. DNS values configured at context level has the last preference.

Important: The same preference would be applicable for the NBNS servers to be negotiated via ICPC with the LNS.

Example

ip name-servers *1.2.3.4*

ip pool

This command enables to add/configure/delete IP address pools in the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip pool *pool_name* **{** *ip_address subnet_mask* **|** *ip_address_mask_combo* **| range** *start_ip_address end_ip_address* **} [address-hold-timer** *address_hold_timer* **] [advertise-if-used] [alert-threshold [group-available | pool-free | pool-hold | pool-release | pool-used]** *low_thresh* **[clear** *high_thresh* **]] [explicit-route-advertise] [group-name** *group_name* **] [include-nw-bcast] [napt-users-per-ip-address** *users_per_ip* **[alert-threshold { { pool-free | pool-hold | pool-release | pool-used }** *low_thresh* **[clear** *high_thresh* **] } +] [max-chunks-per-user** *max_chunks_per_user* **[nat-binding-timer** *nat_binding_timer* **] [nexthop-forwarding-address** *ip_address* **] [on-demand] [port-chunk-size** *port_chunk_size* **] [port-chunk-threshold** *port_chunk_threshold* **] [send-nat-binding-update] +] [nat** *priority* **] [nat-one-to-one [alert-threshold { { pool-free | pool-hold | pool-release | pool-used }** *low_thresh* **[clear** *high_thresh* **] } +] [nat-binding-timer** *nat_binding_timer* **] [nexthop-forwarding-address** *ip_address* **] [on-demand] [send-nat-binding-update] +] [nat-realm users-per-nat-ip-address** *users* **[on-demand [address-hold-timer** *address_hold_timer* **]]] [nexthop-forwarding-address** *ip_address* **[overlap vlanid** *vlan_id* **] [respond-icmp-echo** *ip_address* **]] [nw-reachability server** *server_name* **] [policy allow-static-allocation] [private** *priority* **] [public** *priority* **] [resource** *priority* **] [send-icmp-dest-unreachable] [srp-activate] [static] [suppress-switchover-arps] [tag { none | pdif-setup-addr }] [unicast-gratuitous-arp-address** *ip_address* **] [vrf** *vrf_name* **{ [mpls-label input** *in_label_value* **| output** *out_label_value1* **[** *out_label_value2* **] }] +**

no ip pool *pool_name* **[address-hold-timer] [advertise-if-used] [alert-threshold [[group-available] [pool-free] [pool-hold] [pool-release] [pool-used] +] [explicit-route-advertise] [group-name] [include-nw-bcast] [nexthop-forwarding-address [respond-icmp-echo]] [nw-reachability server] [policy allow-static-allocation] [send-icmp-dest-unreachable] [srp-activate] [suppress-switchover-arps] [tag { none | pdif-setup-addr }] [unicast-gratuitous-arp-address] + [send-nat-binding-update]**

no

Removes the specified IP address pool from the current context's configuration, or disables the specified option(s) for the specified IP pool.

no alert-threshold

This command without any optional keywords disables all alert thresholds.

name

Specifies the logical name of the IP address pool. *name* must be an alpha and/or numeric string of 1 through 31 characters in length.

Important: An error message displays if the **ip** *pool name* and the *group name* in the configuration are the same. An error message displays if the **ip** *pool name* or *group name* are already used in the context.

ip_address

Specifies the beginning IP address of the IP address pool. *ip_address* can either be an IPv4 address expressed in dotted decimal notation, or an IPv6 address expressed in colon notation.

subnet_mask

Specifies the IP address mask bits to determine the number of IP addresses in the pool. *ip_mask* must be specified using the standard IPv4 dotted decimal notation.
1 bits in the *ip_mask* indicate that bit position in the *ip_address* must also have a value of 1.
0 bits in the *ip_mask* indicate that bit position in the *ip_address* does not need to match, i.e., the bit can be either a 0 or a 1.
For example, if the IP address and mask are specified as *172.168.10.0* and *255.255.255.224*, respectively, the pool will contain IP addresses in the range *172.168.10.0* through *172.168.10.31* for a total of 32 addresses.

ip_address_mask_combo

Specifies a combined IP address subnet mask bits to indicate what IP addresses the route applies to. *ip_address_mask_combo* must be specified using the form 'IP Address/Mask Bits' where the IP address is specified using the standard IPv4 dotted decimal notation and the mask bits are a numeric value which is the number of bits in the subnet mask.

range *start_ip_address end_ip_address*

Specifies the IP addresses for the IP pool as a range of addresses.
start_ip_address specifies the beginning of the range of addresses for the IP pool.
end_ip_address specifies the end of the range of addresses for the IP pool.
The IP address range must be specified using the standard IPv4 dotted decimal notation.
For example, if *start_ip_address* is specified as *172.168.10.0* and *end_ip_address* is specified as *172.168.10.31* the IP pool will contain addresses in the range *172.168.10.0* through *172.168.10.31* for a total of 32 addresses.

private [*priority* **]**

Address pool may only be used by mobile stations which have requested an IP address from a specified pool. When private pools are part of an IP pool group, they are used in a priority order according to the precedence setting. *priority* must be a value in the range from 0 through 10 with 0 being the highest priority. The default value is 0.

public [*priority* **]**

Address pool is used in priority order for assigning IP addresses to mobile stations which have not requested a specific address pool. *priority* must be a value in the range from 0 through 10 with 0 being the highest priority. The default value is 0.

static

Address pool is used for statically assigned mobile stations. Statically assigned mobile stations are those with a fixed IP address at all times.

tag { none | pdif-setup-addr }

Default: **none**
none: default tag for all IP address pools
pdif-setup-addr: pool with this tag should only be used for PDIF calls.

address-hold-timer *seconds*

When this is enabled, and an active subscriber is disconnected, the IP address is held, or condsidered still in use, and is not returned to the free state until the address-hold-timer expires. This enables subscribers who reconnect within the length of time specified (in seconds) to obtain the same IP address from the IP pool. *seconds* is the time in seconds and must be an integer from 0 through 31556926.

alert-threshold { group-available | pool-free | pool-hold | pool-release | pool-used } *low_thresh* **[clear** *high_thresh* **]**

Default: All thresholds are disabled.
Configures IP address pool-level utilization thresholds. These thresholds take precedence over context-level IP pool thresholds.
group-available: Set an alert based on the available percentage of IP addresses for the entire IP pool group.
pool-free: Set an alert based on the percentage of IP addresses that are unassigned in this IP pool.
pool-hold: Set an alert based on the percentage of IP addresses from this IP pool that are on hold.
pool-release: Set an alert based on the percentage of IP addresses from this IP pool that are in the release state.
pool-used: This command sets an alert based on the percentage of IP addresses that have been assigned from this IP pool.

Important: Refer to the **threshold available-ip-pool-group** and **threshold monitoring** commands in this chapter for additional information on IP pool utilization thresholding.

low_thresh: The IP pool utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100.
clear *high_thresh* : The IP pool utilization percentage that maintains a previously generated alarm condition. If the utilization percentage rises above the high threshold within the polling interval, a clear alarm is generated. It may be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

group-name *group_name*

Assigns preconfigured one or more IP pools to the IP pool group *group_name*. *group_name* is case sensitive and must be a string of 1 to 31 characters. One or more IP pool groups are assigned to a context and one IP pool group consists one or more IP pool(s).

IP pool group name is used in place of an IP pool name. When specifying a desired pool group in a configuration the IP pool with the highest precedence is used first. When that IP pool's addresses are exhausted the pool with the next highest precedence is used.

include-nw-bcast

Includes the network and broadcast addresses as part of the pool.
To remove the include-nw-bcast option from the ip pool, use the **no ip pool test include-nw-bcast** command.

napt-users-per-ip-address *users_per_ip* **[alert-threshold { { pool-free | pool-hold | pool-release | pool-used }** *low_thresh* **[clear** *high_thresh* **] } +] [max-chunks-per-user** *max_chunks_per_user* **[nat-binding-timer** *nat_binding_timer* **] [nexthop-forwarding-address** *ip_address* **] [on-demand] [port-chunk-size** *port_chunk_size* **] [port-chunk-threshold** *port_chunk_threshold* **] [send-nat-binding-update] +**

Important: In UMTS deployments this keyword is available in Release 9.0 and later releases. In CDMA deployments this keyword is available in Release 8.3 and later releases.

Important: In UMTS deployments, on upgrading from Release 8.1 to Release 9.0, and in CDMA deployments, on upgrading from Release 8.1 to 8.3, all NAT realms configured in Release 8.1 using the **nat-realm** keyword must be reconfigured using either the **nat-one-to-one** (for one-to-one NAT realms) or the **napt-users-per-ip-address** (for many-to-one NAT realms) keywords.

Configures many-to-one NAT realms.

- *users_per_ip*: Specifies how many users can share a single NAT IP address. *users_per_ip* must be an integer from 2 through 2016.
- **alert-threshold**: Specifies alert threshold for the pool:

Important: Thresholds configured using the **alert-threshold** keyword are specific to the pool that they are configured in. Thresholds configured using the **threshold ip-pool-*** commands in the Context Configuration Mode apply to all IP pools in that context, and override the threshold configurations set within individual pools.

- **pool-free**: Percentage free alert threshold for this pool
- **pool-hold**: Percentage hold alert threshold for this pool
- **pool-release**: Percentage released alert threshold for this pool
- **pool-used**: Percentage used alert threshold for this pool
- *low_thresh*: The IP pool utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm. *low_thresh* must be an integer from 0 through 100.
- **clear** *high_thresh* : The IP pool utilization percentage that maintains a previously generated alarm condition. If the utilization percentage rises above the high threshold within the polling interval, a clear alarm is generated. *high_thresh* must be an integer from 0 through 100.

Important: The *high_thresh* value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

- **max-chunks-per-user** *max_chunks_per_user*: Specifies the maximum number of port chunks to be allocated per subscriber in the many-to-one NAT pool. *max_chunks_per_user* must be an integer from 1 through 2016. Default: 1
- **nat-binding-timer** *binding_timer*: Specifies NAT Binding Timer for the NAT pool. *timer* must be an integer from 0 through 31556926. If set to 0, is disabled. Default: 0
- **nexthop-forwarding-address** *address*: Specifies the nexthop forwarding address for this pool. *address* must be a standard IPv4 or IPv6 address. If configured for a NAT pool, packets that are NATed using that NAT pool will be routed based on the configured nexthop address.

Important: The **nexthop-forwarding-address** support for NAT IP pools is functional only in later releases of Release 9.0 and in Release 10.0 and later releases.

- **on-demand**: Specifies allocating IP when matching data traffic begins.
- **port-chunk-size** *size*: Specifies NAT port chunk size (number of NAT ports per chunk) for many-to-one NAT pool. *size* must be an integer from 32 through 32256.

Important: The **port-chunk-size** configuration is only available for many-to-one NAT pools.

- **port-chunk-threshold** *chunk_threshold*: Specifies NAT port chunk threshold in percentage of number of chunks for many-to-one NAT pool. *chunk_threshold* must be an integer from 1 through 100. Default: 100%

Important: The **port-chunk-threshold** configuration is only available for many-to-one NAT pools.

- **send-nat-binding-update**: Specifies sending NAT binding updates to AAA for this realm. Default: Disabled

Important: **send-nat-binding-update** is not supported for many-to-one realms.

The following IP pool configuration keywords can also be used in the many-to-one NAT pool configuration:

- : This keyword is available for NAT pool configuration only in Release 10.0 and later.

  Specifies the pool group name. The grouping enables to bind discontigous IP address blocks in individual NAT IP pools to a single pool group.

  NAT pool and NAT pool group names must be unique.

  group_name must be an alpha and/or numeric string of 1 through 31 characters in length, and is case sensitive .

- **srp-activate**

nat *priority*

Designates the IP address pool as a Network Address Translation (NAT) address pool.
priority specifies the priority of the NAT pool. 0 is the highest priority. If *priority* is not specified, the priority is set to 0.
Must be a value from 0 (default) to 10.

Important: This functionality is currently supported for use with systems configured as an A-BG or P-CSCF.

nat-one-to-one [alert-threshold { { pool-free | pool-hold | pool-release | pool-used } *low_thresh* [clear *high_thresh*] } +] [nat-binding-timer *nat_binding_timer*] [nexthop-forwarding-address *ip_address*] [on-demand] [send-nat-binding-update] +

Important: In UMTS deployments this keyword is available in Release 9.0 and later releases. In CDMA deployments this keyword is available in Release 8.3 and later releases.

Important: In UMTS deployments, on upgrading from Release 8.1 to Release 9.0, and in CDMA deployments, on upgrading from Release 8.1 to Release 8.3, all NAT realms configured in Release 8.1 using the **nat-realm** keyword must be reconfigured using either the **nat-one-to-one** (for one-to-one NAT realms) or the **napt-users-per-ip-address** (for many-to-one NAT realms) keywords.

Configures one-to-one NAT realm.

- **alert-threshold**: Specifies alert threshold for this pool:

Important: Thresholds configured using the **alert-threshold** keyword are specific to the pool that they are configured in. Thresholds configured using the **threshold ip-pool *** commands in the Context Configuration Mode apply to all IP pools in the context, and override the threshold configurations set within individual pools.

- **pool-free**: Percentage free alert threshold for this pool
- **pool-hold**: Percentage hold alert threshold for this pool
- **pool-release**: Percentage released alert threshold for this pool
- **pool-used**: Percentage used alert threshold for this pool
- *low_thresh*: The IP pool utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm. *low_thresh* must be an integer from 0 through 100.
- **clear** *high_thresh* : The IP pool utilization percentage that maintains a previously generated alarm condition. If the utilization percentage rises above the high threshold within the polling interval, a clear alarm is generated. *high_thresh* must be an integer from 0 through 100.

Important: The *high_thresh* value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

- **nat-binding-timer** *nat_binding_timer*: Specifies NAT Binding Timer for the NAT pool. *binding_timer* must be an integer from 0 through 31556926. If set to 0, is disabled.

Important: For many-to-one NAT pools, the default NAT Binding Timer value is 60 seconds. For one-to-one NAT pools, it is 0. I.e., by default, the feature is disabled—the IP addresses/ port-chunks once allocated will never be freed.

- **nexthop-forwarding-address** *ip_address*: Specifies the nexthop forwarding address for this pool. *address* must be a standard IPv4 or IPv6 address. If configured for a NAT pool, packets that are NATed using that NAT pool will be routed based on the configured nexthop address.

Important: The **nexthop-forwarding-address** support for NAT IP pools is functional only in later releases of Release 9.0 and in Release 10.0 and later releases.

- **on-demand**: Specifies allocating IP address when matching data traffic begins.
- **send-nat-binding-update**: Specifies sending NAT binding updates to AAA for this realm. Default: Disabled

Important: **send-nat-binding-update** is not supported for many-to-one realms.

The following IP pool configuration keywords can also be used in the one-to-one NAT pool configurations:

- **address-hold-timer** *address_hold_timer*
- : This keyword is available for NAT pool configuration only in StarOS 10.0 and later releases.

  Specifies the pool group name. The grouping enables to bind discontigous IP address blocks in individual NAT IP pools to a single pool group.

  NAT pool and NAT pool group names must be unique.

  group_name must be an alpha and/or numeric string of 1 through 31 characters in length, and is case sensitive .
- **srp-activate**

nat-realm users-per-nat-ip-address *users* **[on-demand [address-hold-timer** *address_hold_timer* **]]**

Important: The **nat-realm** keyword is only available in Release 8.1.

Important: In Release 8.1, the NAT On-demand feature is not supported.

Important: This functionality is currently supported for use with systems configured as an A-BG or P-CSCF.

Designates the IP address pool as a Network Address Translation (NAT) realm pool.
users-per-nat-ip-address *users*: Specifies the number of users sharing a single NAT IP address. *users* must be an integer from 1 through 5000.
on-demand: Specifies to allocate IP when matching data traffic begins.
address-hold-timer *address_hold_timer*: Specifies the address hold timer for this pool, in seconds. *address_hold_timer* must be an integer from 0 through 31556926. If set to 0, the address hold timer is disabled.

nexthop-forwarding-address *ip_address*

A subscriber that is assigned an IP address from this pool is forwarded to the next hop gateway with the specified IP address.

overlap vlanid *vlan_id*

When a nexthop forwarding address is configured, this keyword can be configured to enable over-lapping IP address pool support and associates the pool with the specified virtual LAN (VLAN).
For more information on configuring VLANs, refer to the *System Enhanced Feature Configuration Guide*.
vlan_id is the identification number of a VLAN assigned to a physical port and can be configured to any integer value from 1 to 4095.

Important: This functionality is currently supported for use with systems configured as an HA, or as a PDSN for Simple IP, or as a GGSN. This keyword can only be issued for pools of type private or static and must be associated with a different nexthop forwarding address and VLAN. A maximum of 256 over-lapping pools can be configured per context and a maximum of 256 over-lapping pools can be configured per HA or simple IP PDSN. For GGSNs, the total number of pools is limited by the number of VLANs defined but the maximum number per context is 256. Additional network considerations and configuration outside of the system may be required.

nw-reachability server *server_name*

Bind the name of a configured network reachability server to the IP pool and enable network reachability detection for the IP pool. This takes precedence over any network reachability server settings in a subscriber configuration.
server_name: Specifies the name of a network reachabile server that has been defined in the current context, and must be a string of 1 through 16 characters in length.

Important: Also see the following commands for more information: Refer to the **policy nw-reachability-fail** command in the HA Configuration Mode to configure the action that should be taken when network reachability fails. Refer to the **nw-reachability server** command in this chapter to configure network reachability servers. Refer to the **nw-reachability-server** command in the Subscriber Configuration Mode to bind a network reachability server to a specific subscriber.

respond-icmp-echo *ip_address*

Pings the first IP address from overlapping IP address pools.

Important: In order for this functionality to work, all of the pools should contain an initial IP address that can be pinged.

resource

Default: Disabled
Specifies this IP pool as a resource pool. The IP addresses in resource pools may have IP addresses that exist in other resource pools. IP addresses from a resource pool should not be used for IP connectivity within the system where the pool is defined. These IP addresses should be allocated for sessions which are L3 tunneled through the system (IP-in-IP or GRE). It is possible for resource pools in the same context to have overlapping addresses when the terminating network elements for the L3 tunnels are in different VPNs.
Also refer to the Subscriber Configuration Mode **l3-to-l2-tunnel address-policy** command.

send-icmp-dest-unreachable

Default: Disabled
When enabled, this generates an ICMP destination unreachable PDU when the system receives a PDU destined for an unused address within the pool.

explicit-route-advertise

Default: Enabled
When enabled, the show ip pool verbose output includes the total number of explicit host routes.

srp-activate

Activates the IP pool for Interchassis Session Redundancy.

suppress-switchover-arp

Default: Disabled
Suppress corresponding gratuitous ARP generation when a line card switchover occurs.

unicast-gratuitous-arp-address *ip_address*

Default: Perform broadcast gratuitous ARP.
Perform a unicast gratuitous ARP to the specified IP address rather than broadcast gratuitous ARP when gratuitous ARP generation is required.

vrf *vrf_name* **{ [mpls-label input** *in_label_value* **| output** *out_label_value1* **[** *out_label_value2* **] }**

This keyword associates a preconfigured Virtual Routing and Forwarding (VRF) context instance with this IP pool and configures the other MPLS label parameters like values of In and Out labels.

Important: This command must be used with next-hop paramters.

vrf_name is name of a preconfigured virtual routing and forwarding (VRF) context configured in Context Configuration Mode through **ip vrf** command.

- *in_label_value* is the MPLS label that identifies the inbound traffic destined for this pool.
- The *out_label_value1* and *out_label_value2* identify the MPLS labels to be added to the outgoing packets sent for subscriber from this pool. Where *out_label_value1* is the inner output label and *out_label_value2* is the outer output label.

MPLS label values must be an integer from 16 to 1048575.
By default, the pools configured are bound to the default VRF unless specified with a VRF name.

Important: You cannot have overlapping pool addresses using the same VRF. Also you cannot have two pools using different VRF's but the same in-label irrespective of whether the pools are overlapping or not. The pool must be private or static pool in-order to be associated with a certain VRF. If the VRF with such a name is not configured, then the pool configuration would return an error prompting to add the VRF before configuring a pool.

policy allow-static-allocation

Configures static address allocation policy for dynamic IP pool. This keyword enables a dynamic IP pool to accept a static address for allocation.

Important: In static allocation scenario, the pool group name is returned by AAA in the attribute **SN1-IP-Pool-Name**, and the IP address to use will be returned in the **Framed-IP-Address** attribute.

+

Indicates that more than one of the previous keywords can be entered within a single command.

Usage

Define one or more pools of IP addresses for the context to use in assigning IPs to mobile stations. This command is also useful in resizing existing IP pools to expand or contract the number of addresses allocated. If you resize an IP pool, the change is effective immediately.
When using the ip pool command to resize an IP pool, the type must be specified since by default the command assumes the type as public. In other words, the CLI syntax to resize an ip pool is the same syntax used to create the pool. See examples below.

```
ip pool pool1 100.1.1.0/24 static
```

Then the syntax to resize that pool would be

```
ip pool pool1 100.1.1.0/25 static
```

A pool which is deleted will be marked as such. No new IP addresses will be assigned from a deleted pool. Once all assigned IP addresses from a deleted pool have been released, the pool, and all associated resources, are freed.

Important: If an IP address pool is matched to a ISAKMP crypto map and is resized, removed, or added, the corresponding security association must be cleared in order for the change to take effect. Refer to the **clear crypto** command in the Exec mode for information on clearing security associations.

Over-lapping IP Pools - The system supports the configuration of over-lapping IP address pools within a particular context. Over-lapping pools are configured using either the resource or overlap keywords.
The **resource** keyword allows over-lapping addresses tunneled to different VPN end points.
The **overlap** keyword allows over-lapping addresses each associated with a specific virtual LAN (VLAN) configured for an egress port. It uses the VLAN ID and the nexthop address to determine how to forward subscriber traffic with addresses from the pool thus resolving any conflicts with overlapping addresses.
Note that if an overlapping IP Pool is bound to an IPSec Tunnel (refer to the **match ip pool** command in the *Crypto Group Configuration Mode* chapter), that tunnel carries the traffic ignoring the nexthop configuration. Therefore, the IPSec Tunnel takes precedence over the nexthop configuration. (Thus, one can configure the overlapping IP Pool with fake VLAN ID and nexthop and still be able to bind it to an IPSec Tunnel for successful operation.
The **overlap** keyword allows over-lapping addresses each associated with a specific VLAN can only be issued for pools of type private or static and must be associated with a different nexthop forwarding address and VLAN. A maximum of 128 over-lapping pools can be configured per context and a maximum of 256 over-lapping pools can be configured per system.

Important: Overlapping IP address functionality is currently supported for use with systems configured as an HA for Mobile IP, or as a PDSN for Simple IP, or as a GGSN. For deployments in which subscriber traffic is tunneled from the FA to the HA using IP-in-IP, a separate HA service must be configured for each over-lapping pool.

IP Pool Address Assignment Method - IP addresses can be dynamically assigned from a single pool or from a group of pools. The addresses are placed into a queue in each pool. An address is assigned from the head of the queue and, when released, returned to the end. This method is known as least recently used (LRU).

When a group of pools have the same priority, an algorithm is used to determine a probability for each pool based on the number of available addresses, then a pool is chosen based on the probability. This method, over time, allocates addresses evenly from the group of pools.

Important: Note that setting different priorities on each individual pool in a group can cause addresses in some pools to be used more frequently.

Important: In NAT IP pool configurations, the minimum number of public IP addresses that must be allocated to each NAT pool must be greater than or equal to the number of Session Managers (SessMgrs) available on the system. On the ASR 5000, it is >= 84 public IP addresses. This can be met by a range of 84 host addresses from a single Class C. The remaining space from the Class C can be used for other allocations.

Example

The following commands define a private IP address pool, a public IP address pool, and a static address pool, respectively.

```
ip pool samplePool1 1.2.3.0 255.255.255.0 private
ip pool samplePool2 1.3.0.0 255.255.0.0 public
ip pool samplePool3 1.4.5.0 255.255.255.0 static
```

The following command defines a private IP pool specified with a range of IP addresses. The pool has 101 addresses.

```
ip pool samplePool4 range 1.5.5.0 1.5.5.100 private
```

The following command sets the address hold timer on the pool to *60* minutes (*3600* seconds):

```
ip pool samplePool4 address-hold-timer 3600
```

The following command removes the IP address pool from the configuration:

```
no ip pool samplePool1
```

The following command creates a static IP pool:

```
ip pool pool1 100.1.1.0/24 static
```

The following command resizes the static IP pool created in the previous example:

```
ip pool pool1 100.1.1.0/25 static
```

ip prefix-list

Creates an IP prefix list for filtering routes.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

ip prefix-list name *list_name* **[seq** *seq_number* **] { deny | permit } { any |** *network_address*/*net_mask* **[ge** *ge_value* **] [le** *le_value* **]**

no ip prefix-list *list_name* **[seq** *seq_number* **] { deny | permit } { any |** *network_address*/*net_mask* **[ge** *ge_value* **] [le** *le_value* **]**

no

Delete the specified prefix-list entry.

name *list_name*

Specifies a name for the prefix list. *list_name* must be a string of 1 through 79 characters in length.

seq *seq_number*

Assign the specified sequence number to the prefix list entry. *seq_number* must be an integer from 1 through 4294967295.

deny

Specify prefixes to deny.

permit

Specify prefixes to permit.

any

Match any prefix.

network_address/*net_mask* **[ge** *ge_value* **] [le** *le_value* **]**

The prefix to match.
network_address/*net_mask* : the IP address and the length, in bits, of the network mask that defines the prefix. This must be an IP address entered in dotted decimal notation and a mask (192.168.0/24). When neither ge or le are specified an exact match is assumed.
ge *ge_value*: The minimum prefix length to match. This must be an integer from 0 through 32. If only the ge value is specified, the range is from the ge value to 32. The ge value must be greater than *net_mask* and less than the le value.
le *le_value*: The maximum prefix length to match. This must be an integer from 0 through 32. If only the le value is specified, the range is from the *net_mask* to the le value. The le value must be less than or equal to 32.

The following equation describes the conditions that ge and le values must satisfy :
net_mask **<** *ge_value* **<** *le_value* **<= 32**

Usage

Use this command to filter routes by their IP prefix.

Example

```
ip prefix-list name prelist10 seq 5 permit 192.168.100.0/8 ge 12 le 24
```

ip prefix-list sequence-number

This enables and disables the inclusion of IP prefix list sequence numbers in the configuration file. This is enabled by default.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
ip prefix-list sequence-number

no ip prefix-list sequence-number
```

no

Disable listing IP prefix list sequence numbers in the configuration file.

Usage

Use this command to enable and disable the inclusion of IP prefix list sequence numbers in the configuration file.

Example

To disable the inclusion of IP prefix list sequence numbers in the configuration file, enter the following command:

```
no ip prefix-list sequence-number
```

ip route

Adds/removes routing information from the current context's configuration.

Product

All

Privilege

Administrator

Syntax

[no] ip route { *ip_address***/***ip_mask* **|** *ip_address ip_mask* **} {** *gateway_ip_address* **| next-hop** *next_hop_ip_address* **| point-to-point | tunnel }***egress_intrfc_name* **[cost** *cost* **] [precedence** *precedence* **] [vrf** *vrf_name* **] +**

no

Indicates the route specified by this options is to be removed from the configuration.

*ip_address***/***ip_mask* **|** *ip_address ip_mask*

Specifies a destination IP address or group of addresses that will use this route.
*ip_address***/***ip_mask*: Specifies a combined IP address subnet mask bits to indicate what IP addresses to which the route applies. *ip_address***/***ip_mask* must be specified using the form 'IP Address/Mask Bits' where the IP address is specified using the standard IPv4 dotted decimal notation and the mask bits are a numeric value which is the number of bits in the subnet mask.
ip_address ip_mask: Specifies an IP address and the networking (subnet) mask pair which is used to identify the set of IP addresses to which the route applies. *ip_address* must be specified using the standard IPv4 dotted decimal notation. *ip_mask* must be specified using the standard IPv4 dotted decimal notation as network mask for subnets.
The mask as specified by *ip_mask* or resulting from *ip_address***/***ip_mask* is used to determine the network for packet routing.
0's in the resulting mask indicate the corresponding bit in the IP address is not significant in determining the network for packet routing.
1's in the resulting mask indicate the corresponding bit in the IP address is significant in determining the network.

gateway_ip_address **| next-hop** *next_hop_ip_address* **| point-to-point | tunnel**

Specifies which device or network to use when forwarding packets.
gateway_ip_address: Specifies the IP address of the network gateway to which to forward packets. The address must be entered in IPv4 dotted decimal notation (###.###.###.###).
next-hop *next_hop_ip_address*: The next-hop IP address to which to forward packets. The address must be entered in IPv4 dotted decimal notation (###.###.###.###).
point-to-point: Specifies that the egress port is an ATM point-to-point interface.
tunnel: This keyword sets the static route for this egress interfaceas tunnel type. i.e. IPv6-over-IPv4 or GRE.

egress_intrfc_name

Specifies the name of the egress (out-bound) interface name in the current context. *egress_intrfc_name* must be from 1 to 79 alpha and/or numeric characters.

cost *cost*

Default: 0
Specifies the relative cost of the route. *cost* must be a value in the range 0 through 255 where 255 is the most expensive.

precedence *precedence*

Default: 1
Specifies the selection order precedence for this routing information. *precedence* must be a value in the range from 1through 254 where 1 is the highest precedence.

vrf *vrf_name*

This keyword associates a Virtual Routing and Forwarding (VRF) context with this static route configuration. *vrf_name* is name of a preconfigured virtual routing and forwarding (VRF) context configured in Context Configuration Mode through **ip vrf** command.

Usage

Use this command to configure the IP route parameters. Precedence and cost options are used to tailor the route selections such that routes of the same precedence are grouped together then lowest cost is selected first. This results in route's being selected first by lower precedence then the cost is used if multiple route's are defined with the same precedence.

Important: A maximum of 1200 static routes may be configured per context.

Virtual Routing and Forwarding (VRF) context can be associated with static IP route for GRE tunneling support.

Example

The following command adds a route using the combined IP address and subnet mask form:

```
ip route 1.2.3.0/32 192.168.1.2 egressSample1 precedence 160
```

The following configures route options for a route specified using the distinct IP address and subnet mask form:

```
ip route 1.2.3.4 255.224.0.0 10.1.2.3 egressSample2 cost 43
```

The following deletes the two routes configured above:

```
no ip route 1.2.3.0/32 192.168.1.2 egressSample1 precedence 160
```

```
no ip route 1.2.3.4 255.224.0.0 10.1.2.3 egressSample2 cost 43
```

The following command adds a route using the combined IP address and subnet mask form and specifies the egress interface as tunnel type:

ip route *1.2.3.0/32* **tunnel** *egressSample1* **precedence** *160* **vrf** *GRE_vrf1*

ip routing maximum-paths

This command enables Equal Cost Multiple Path (ECMP) routing support and specifies the maximum number of ECMP paths that can be submitted by a routing protocol in the current context.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

ip routing maximum-paths [*max_no* **]**

[default | no] ip routing maximum-paths

default

Resets the command to its default setting of 4.

no

Disables ECMP for the current context.

max_no

Default: 4
The maximum number of ECMP paths that can be submitted by a routing protocol. *max_no* must be an integer from 1 through 10.

Usage

Use this command to enable ECMP for routing and set the maximum number of ECMP paths that can be submitted by a routing protocol.

Example

To enable ECMP and set the maximum number of paths that may be submitted by a routing protocol in the current context to *10*, enter the following command:

```
ip routing maximum-paths 10
```

To disable ECMP in the current context, enter the following command:

```
no ip routing maximum-paths
```

ip routing overlap-pool

Configures the routing behavior for overlap-pool addresses.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] ip routing overlap-pool
```

default

Resets the command to its default setting of disabled.

no

Disables the routing behavior for overlap-pool addresses for the current context.

Usage

Default: disabled
Use this command configuration to advertise overlap-pool addresses in dynamic routing protocols when overlap pools are configured using vlan-ids. If the “ip routing overlap-pool” is configured, then the overlap-addresses are added as interface addresses and advertised.

ip vrf

This command creats a Virtual Routing and Forwarding (VRF) context instance, assigns a VTF id, and configures the VRF parameters for BGP MPLS VPN and GRE tunnel interface configuration.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip vrf *vrf_name*

no ip vrf

---

no

Disables IP Virtual Routing and Forwarding (VRF) parameters.

---

vrf_name

Specifies the name of the virtual routing and forwarding interface.
vrf_name must be an alpha and/or neumeric string of 1 t o 79 characters.

Usage

Use this command to create a VRF context and assigns a VRF id to this instance. This command used when system works as a BGP router with MPLS VPN and binds a MPLS VPN to system or to facilitate GRE tunnelling. The addresses that assigned to this interface are visible in the VRF routing table.
This command swithces the command mode to *IP VRF Context Configuraiton Mode* and prompt will be changed to the following:

```
[context_name>]host_name(config-context-vrf)#
```

If required, this command creates IP VRF Context Configuration Mode instance.
While using this command user must take note of the following:

- A VRF context instance must be created and configured before referring, associating, or binding the same with any command or mode.
- If interface binding to a VRF context instance is changed or any IP address assigned to the interface is deleted a warning will be displayed.
- All interface bind with a VRF context instance will be deleted when that VRF is removed/deleted.
- An interface can be bound to only one VRF context instance.
- A maximum of 100 VRF context instances can be configured on a system.

Kindly refer *IP VRF Context Configuration Mode Commands* chapter for parameter configurations.

Example

Following command configures the virtual routing and forwarding context instance *GRE_vrf1* in a context:

ip vrf *GRE_vrf1*

ipms

Enables/disables/manages an intelligent packet monitoring system (IPMS) client service and enters the IPMS Client Configuration Mode within the current context.

Important: The IPMS is a license enabled external application support. Refer to the *IPMS Installation and Administration Guide* for more information on this product.

Product

IPMS

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ipms [ -noconfirm ]
```

no

Deletes a previously configured IPMs client service.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

WARNING: If this keyword option is used with **no ipms** command the IPMS client service will be deleted with all active/inactive IPMS sessions without prompting any warning or confirmation.

Usage

Use this command to enable/disable/manage the IPMS client service within a context and configure certain functionality. This command enables and allows the configuration of service enabling the system to function as an IPMS-enabled Access Gateway in a network. This command is also used to remove previously configured IPMS client service.
A maximum of 1 IPMS client can be configured per system.
Refer to the *IPMS Installation and Administration Guide* and *IPMS Configuration Mode* chapter of this reference for additional information.

Example

The following command creates an IPMS client service name within the context:

```
ipms
```

ipsec

Creates a new, or specifies an existing, IPSec transform set and enters the IPSec Transform Set Configuration Mode for the current context.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

`[ no ] ipsec transform-set` *`name`*

`name`

Specifies the name of a new or existing transform set. *`name`* must be from 1 to 127 alpha and/or numeric characters .

Usage

Use this command to create an new or enter an existing IPSec transform-set. Up to four transform-sets can be created.
Entering this command results in the following prompt:
[*`context_name`*]*`hostname`*(cfg-ctx-ipsec-tran-set)#
IPSec Transform Set Configuration Mode commands are defined in the *IPSec Transform Set Configuration Mode Commands* chapter.

Example

The following command configures an IPSec transform set called *`ipsec12`* and enters the IPSec Transform Set Configuration Mode:

`ipsec transfrom-set` *`ipsec12`*

ipsg-service

Creates an IP Services Gateway service, or specifies an existing IPSG service, in the current context and enters the IPSG RADIUS Snoop or IPSG RADIUS Server Configuration Mode.

Product

IPSG

Privilege

Security Administrator, Administrator

Syntax

ipsg-service *name* **[mode { radius-server | radius-snoop }] [-noconfirm]**

no ipsg-service *name* **[mode { radius-server | radius-snoop }]**

no

Removes the IPSG service from the system.

name

Specifies the name of the IPSG service to be configured. If *name* does not refer to an existing service, the new service is created if resources allow. *name* must be an alpha and/or numeric string of 1 through 63 characters in length.

mode { radius-server | radius-snoop }

Configures the IPSG to perform as either a RADIUS server or as a device to extract user information from RADIUS accounting request messages (snoop). If the optional keyword **mode** is not entered, the system defaults to **radius-server**.
radius-server: Creates an IP Services Gateway RADIUS Server service in the context and enters the IPSG RADIUS Server Configuration Mode.
radius-snoop: Creates an IP Services Gateway RADIUS Snoop service in the context and enters the IPSG RADIUS Snoop Configuration Mode.

-noconfirm

Indicates that the command is to execute without an additional prompt and confirmation from the user.

Usage

Enter the IPSG RADIUS Snoop or IPSG RADIUS Server Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of one IPSG service can be configured per context.
Entering this command results in the following prompt (RADIUS Server shown):
[*context_name-service_name*]*hostname*(config-radius-server)#
IPSG service commands are defined in the *IPSG RADIUS Snoop Configuration Mode Commands* chapter or the *IPSG RADIUS Server Configuration Mode Commands* chapters.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: A large number of services greatly increases the complexity of system management and may impact overall system performance (i.e., resulting from system handoffs). Do not configure a large number of services unless your application requires it. Contact your local service representative for more information.

Important: IP Services Gateway functionality is a license-controlled feature. A valid feature license must be installed prior to configuring an IPSG service. If you have not previously purchased this feature, contact your sales representative for more information.

For more information about the IP Services Gateway, refer to the *IP Services Gateway Administration Guide*.

Example

The following command configures an IPSG RADIUS Snoop service named *ipsg1* and enters the IPSG RADIUS Snoop Configuration Mode:

```
ipsg-service ipsg1 mode radius-snoop
```

ipv6 access-group

Configures the IPv6 Access group.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

ipv6 access-group *group name* **{** *priority_value* **}**

group_name

Specifies the name of the access group. group_name must be an alpha and/or numeric string of 1 to 79 characters.

priority_value

Default: 0
Specifies the priority of the access group. 0 is the highest priority. If *priority_value* is not specified the priority is set to 0. *priority_value* must be a value from 0 to 4294967295.
If access groups in the list have the same priority, the last one entered is used first.

Usage

Use this command to specify Ipv6 access group name and priority. Use a lower value to indicate a higher priority for the group.

Example

ipv6 access-group *group_1*

ipv6 access-list

Configures access list (or packet filter) name and enters the IPv6 ACL Configuration Mode.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

[no] ipv6 access-list *name*

no

Indicates the access list specified is to be removed from the configuration.

name

Specifies the access list for which to enter the IPv6 ACL Configuration Mode or the list to remove. *name* must be from 1 to 79 alpha and/or numeric characters.

Usage

Executing this command enters the IPv6 ACL Configuration Mode in which rules and criteria are defined for the ACL.

Example

ipv6 access-list *samplelist*

no ipv6 access-list *samplelist*

ipv6 dns-proxy

Configures the domain name server proxy for the context.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

ipv6 dns-proxy source-ipv4-address *ip_address*

no ipv6 dns-proxy source-ipv4-address *ip_address*

no

Removes the predefined IP address for local interface in the destination context.

source-ipv4-address

Enables the IPv6 proxy DNS functionality for a context. It makes PDSN to use this address as the source address of the IPv4 packets.
Default: no address is configured.

ip_address

Specifies the IPv4 address of one of the local interface in the destination context to configure the IPv6 DNS proxy where *ip_address* must be specified using the standard IPv4 dotted decimal notation.

Usage

The IPv6 DNS proxy source IPv4 address is used as the source IP address for the DNS proxy transaction.

Example

The following command provides an example of configuring a IPv6 DNS proxy of *192.168.23.1*:

ipv6 dns-proxy source-ipv4-address *192.168.23.1*

ipv6 neighbor

Add a static IPv6 neighbor entry into the neighbor discovery table.

Product

PDIF

Privilege

Administrator, Security Administrator

Syntax

[no] ipv6 neighbor *ipv6_address hardware_address*

no

Removes the specified address.

ipv6 neighbor *ipv6_address hardware_address*

ipv6_address is the IP address of node to be added to the table.
hardware_address is the associated 48-bit MAC address.

Usage

Add a static IPv6 neighbor entry into the neighbor discovery table.

Example

Add the ipv6 address *fe80::210:83ff:fef7:7a9d::/24* and associated 48 bit MAC address *0:10:83:f7:7a:9d* to the table.

ipv6 neighbor *fe80::210:83ff:fef7:7a9d::/24 0:10:83:f7:7a:9d*

ipv6 pool

Modifies the current context's IP address pools by adding, updating, or deleting a pool. Also use this command to resize an existing IP pool.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ipv6 pool *name* **{ 6to4 local-endpoint** *ipv4_address* **[default-relay-router** *router_address* **] | alert threshold | group-name** *name* **| policy { allow-static-allocation | dup-addr-detection} | prefix** *ip_address/len* **[6to4-tunnel local-endpoint** *ip_address* **| default-relay-router** *router_address* **] | range** *start_address end_address* **| suppress-switchover-arps } [private** *priority* **] [public** *priority* **] [shared** *priority* **] [static** *priority* **] [group-name** *name* **]**

no ipv6 pool *name*

---

no

Deletes the previously configured ipv6 pool.

---

name

Specifies the logical name of the IP address pool. *name* must be from 1 to 31 alpha and/or numeric characters.

6to4-tunnel local-endpoint *ip_address*

Specifies the IPv4 Address of the local interface to be used for 6to4 compatible pool address construction.

---

alert threshold { 6to4 local-endpoint *ipv4_address* **| alert threshold | group-available | group-name** *name* **| policy { allow-static-allocation | dup-addr-detection } | pool-free | pool-used | prefix | range** *start_address end_address* **}**

Default: All thresholds are disabled.
Configures IP address pool-level utilization thresholds. These thresholds take precedence over context-level IPv6 pool thresholds.

- **6to4**: Sets an alert based on the IPv6 Pool for 6to4 compatible address type.
- **alert-threshold**: Sets an alert based on the percentage free alert threshold for this group.
- **group-available**: Sets an alert based on the percentage free alert threshold for this group.
- **group-name**: Sets an alert based on the IPv6 Pool Group.
- **policy allow-static-allocation**: Sets an alert based on the address allocation policy.
- **pool-free**: Sets an alert based on the percentage free alert threshold for this pool.
- **pool-used**: Sets an alert based on the percentage used alert threshold for this pool.

- **prefix**: Sets an alert based on the IPv6 Pool address prefix.
- **range**: Sets an alert based on the IPv6 address pool range of addresses.
- **suppress-switchover-arps**: Sets an alert based on the Suppress Gratuitous ARPS when performing a line card switchover.

---

group name *name*

IPv6 Pool Group.
The following options are available:

- **6to4**: IPv6 Pool for 6to4 compatible address type
- **alert-threshold**: Percentage free alert threshold for this group
- **group-name**: IPv6 Pool Group
- **policy**: Configure an address allocation policy
- **prefix**: IPv6 Pool address prefix
- **range**: Configures IPv6 address pool to use a range of addresses
- **suppress-switchover-arps**: Suppress Gratuitous ARPS when performing a line card switchover

---

ipv4_address

Specifies the beginning IPv4 address of the IPv4 address pool. *ipv4_address* must be specified using the standard IPv4 dotted decimal notation.

---

default-relay-router *router address*

Specifies the default relay router for the tunnel.

---

policy allow-static-allocation

Allows a dynamic pool to accept a static address allocation.
The following options are available:

- **6to4**: IPv6 Pool for 6to4 compatible address type
- **alert-threshold**: Percentage free alert threshold for this group
- **group-name**: IPv6 Pool Group
- **policy**: Configure an address allocation policy
- **prefix**: IPv6 Pool address prefix
- **range**: Configures IPv6 address pool to use a range of addresses
- **suppress-switchover-arps**: Suppress Gratuitous ARPS when performing a line card switchover

---

policy dup-addr-detection

Default: Disabled.
This command is valid for IPv6 shared pools only (Sample syntax: **ipv6 pool** *name* **prefix** *ip_address/len* **shared policy dup-addr-detection**). When this policy is enabled, the IPv6 shared pool allows a prefix to be shared in different call sessions with different interface IDs for an IPv6 address. This allows the tracking of interface IDs per prefix and the detection of duplicated IDs.

With this policy disabled, the IPv6 shared pool will allow a prefix to be shared across different call sessions. The interface ID is not considered for any duplicate address detection.
The following options are available:

- **6to4**: IPv6 pool for 6to4 compatible address type
- **alert-threshold**: Percentage free alert threshold for this group
- **group-name**: IPv6 pool group
- **policy**: Configure an address allocation policy
- **prefix**: IPv6 pool address prefix
- **range**: Configures IPv6 address pool to use a range of addresses
- **suppress-switchover-arps**: Suppress gratuitous ARPS when performing a line card switchover

---

prefix *ip_address/len*

Specifies the beginning IPv6 address of the IPv6 address pool. *ip_address/len* must be specified using colon notation.

---

range *start_address end_address*

Configures IPv6 address pool to use a range of addresses.
start_address specifies the beginning of the range of addresses for the IPv6 pool.
end_address specifies the end of the range of addresses for the IPv6 pool.

---

suppress-switchover-arps

Suppresses Gratuitous ARPS when performing a line card switchover.
The following options are available:

- **6to4**: IPv6 Pool for 6to4 compatible address type
- **alert-threshold**: Percentage free alert threshold for this group
- **group-name**: IPv6 Pool Group
- **policy**: Configure an address allocation policy
- **prefix**: IPv6 Pool address prefix
- **range**: Configures IPv6 address pool to use a range of addresses
- **suppress-switchover-arps**: Suppress Gratuitous ARPS when performing a line card switchover

---

private *priority* | **public** *priority* | **shared** *priority* | **static** *priority*

Default: **public**
private *priority*: address pool may only be used by mobile stations which have requested an IP address from a specified pool. When private pools are part of an IP pool group, they are used in a priority order according to the precedence setting. *priority* must be a value in the range from 0 through 10 with 0 being the highest. The default is 0.
public *priority*: address pool is used in priority order for assigning IP addresses to mobile stations which have not requested a specific address pool. *priority* must be a value in the range from 0 through 10 with 0 being the highest and with a default of 0.
shared *priority*: address pool that may be used by more than one session at any time. *priority* must be a value in the range from 0 through 10 with 0 being the highest and with a default of 0.

static *priority*: address pool is used for statically assigned mobile stations. Statically assigned mobile stations are those with a fixed IP address at all times. *priority* must be a value in the range from 0 through 10 with 0 being the highest and with a default of 0.

group-name *name*

This keyword is used to group the IPv6 pools in to different groups. The subscribers/domain can be configured with the group-name instead of the prefix-pool names.
name is the name of the group by which the IPv6 pool is to be configured and must be a string having 1 to 79 alpha and/or numeric characters.

Usage

Use this command to modify the current context's IP address pools by adding, updating, or deleting a pool. Also use this command to resize an existing IP pool.

Example

Following command provides an example of adding IPv6 pool named *ip6Star*.

```
ipv6 pool ip6Star
```

ipv6 route

Configures a static IPv6 route to the next-hop router.

Product

All

Privilege

Administrator

Syntax

[no] ipv6 route *ipv6_address/prefix_length* **{ interface** *name* **| next-hop** *ipv6_address* **interface** *name* **} [cost** *cost* **] [precedence** *precedence* **]**

no

Removes the specified static route.

ipv6_address/prefix_length

Specifies a destination IPv6 address or group of addresses that will use this route. *ipv6_address/prefix_length* must be specified in IPv6 colon separated notation.

interface *name*

Specifies the name of the interface on this system associated with the specified route or next-hop address. *name* must be an existing interface name on the system and be from 1 to 79 alpha and/or numeric characters.

next-hop *ipv6_address*

The IPv6 address of the directly connected next hop device. *ipv6_address* must be specified in IPv6 colon separated notation.

cost *cost*

Default: 0
Defines the number of hops to the next gateway. *cost* must be an integer value from 0 to 255.

precedence *precedence*

Default: 1
Indicates the administrative preference of the route. A low precedence specifies that this route takes preference over the route with a higher precedence. *precedence* must be an integer value from 1 to 254.

Usage

Use this command to create a static route and send data traffic to a next-hop device.

Example

Use the following example to configure a static route with ipv6 prefix/length *2001:0db8:3c4d:0015:0000:0000:abcd:ef12/24* to the next hop interface *egress1*:

ipv6 route *2001:0db8:3c4d:0015:0000:0000:abcd:ef12/24* **interface** *egress1*

isakmp disable-phase1-rekey

This command is deprecated. Use **ikev1 disable-phase1-rekey** command to configure the parameters for Phase1 SA rekeying when ISAKMP lifetime expires for IKE v1 protocol.

isakmp keepalive

This command is deprecated. Use **ikev1 keepalive dpd** command to configure ISAKMP IPSec Dead Peer Detection (DPD) message parameters for IKE v1 protocol.

isakmp policy

This command is deprecated. Use **ikev1 policy** command to create/configure an ISAKMP policy with the specified priority for IKE v1 protocol.

iups-service

This command creates an Iu-PS service instance and enters the Iu-PS Service Configuration Mode. This mode defines the configuration and usage of Iu-PS interfaces between the SGSN and the RNCs in the UMTS radio access network (UTRAN) and defines both the control plane (GTP-C) and the data plane (GTP-U) between these nodes.

Important: For details about the commands and parameters for this mode, check the *IuPS Service Configuration Mode* chapter.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

iups-service *srvc_name*

no iups-service *srvc_name*

no

Remove the configuration for the specified Iu-PS service from the configuration for the current context.

srvc_name

A unique string of 1 to 63 alphanumeric characters that identify the specific IuPS service.

Usage

Use this command to create, edit, or remove an Iu-PS service. Add up to 8 definitions to be used with a single SGSN service so the SGSN can support multiple PLMNs.

Example

The following command creates an Iu-PS service named *iu-ps1*:

```
iups-service iu-ps1
```

The following command removes the Iu-PS service named *iu-ps1*:

```
no iups-service iu-ps1
```

l2tp peer-dead-time

Configures a delay for attempting to tunnel to a specific peer which is initially unreachable due to reasons such as a network issue or temporarily having reached its capacity.

Product

All

Privilege

Security Administrator, Administrator

Syntax

l2tp peer-dead-time *seconds*

default l2tp peer-dead-time

default

Rests the command to its default setting of 60.

peer-dead-time

seconds: Must be an integer value from 5 to 64,000.
Default: 60

Usage

The time to wait before trying to establish a tunnel to a known peer after the initial attempt was unsuccessful.

Example

The following example configures the delay in attempting to tunnel to a temporarily unreachable peer. The delay is set to *120* seconds in this example.

l2tp peer-dead-time *120*

lac-service

Enters the LAC Service Configuration Mode, or is used to add or remove a specified LAC service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

lac-service *name*

no lac-service *name*

no

Removes the specified lac-service from the current context.

name

Specifies the name of a LAC service to configure, add, or remove. It can be from 1 to 63 alpha and/or numeric characters in length and is case-sensitive.

Usage

Enter the LAC Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (i.e. resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Example

To add a new LAC service named *LAC1* and enter the LAC Service Configuration Mode, enter the following commands:

```
lac-service LAC1

Are you sure? [Yes|No]: Yes
```

To configure an existing LAC service named *LAC2*, enter the following command:

```
lac-service LAC2
```

To delete an existing LAC service named *LAC3*, enter the following command:

```
no lac-service LAC3
```

lawful-intercept

This command defines the acknowledgement parameters for the UDP event delivery interface. It also specifies the interface IP address(es) that go into the headers of the content and event delivery messages going to the DF.

Product

PDSN, HA, GGSN, PDIF,SGSN, ASN-GW, SCM

Privilege

Security Administrator, Administrator with LI-Administrator privileges

Syntax

lawful-intercept { acked-udp [num-retry *number* **] [timeout** *time* **] | event-attributes bsid | hand-off-policy send-start-intercept-with-pdp-active-iri | interception-point-policy { { sms-mo | sms-mt } { message-delivered | request-received } } | reprovision-target-policy resend-pdp-context-active-iri | src-ip-addr** *ip_address* **| sms-content-policy { exclude-content | include-content } | tcp** *tcp_option* **| unack-format use-service-address }**

default lawful-intercept { acked-udp { num-retry | timeout } | event-attributes bsid | hand-off-policy send-start-intercept-with-pdp-active-iri | interception-point-policy { sms-mo | sms-mt } | reprovision-target-policy resend-pdp-context-active-iri | sms-content-policy | tcp *tcp_option* **| unack-format use-service-address }**

no lawful-intercept { event-attributes bsid | hand-off-policy send-start-intercept-with-pdp-active-iri | reprovision-target-policy resend-pdp-context-active-iri | src-ip-addr *ip_address* **| tcp** *tcp_option* **| unack-format use-service-address }**

no

Disables the configuration parameters for selected keyword(s) for the Lawful Intercept configuration.

default

Sets the behavior of command/keyword to its default setting.

acked-udp

Entering this keyword, enables the acknowledged-UDP interface. After enter acked-udp, one or both of the following options can be entered:
num-retry *number*: Enter an integer between 1 and 100 to define the maximum number of retries for sending an unacknowledged message. Default is 20.
timeout *time*: Enter an integer between 1 and 100 to define the maximum number of seconds that the system waits before retransmitting an unacknowledged message. Default is 3.

event-attributes bsid

This keyword enables the transmission of base-station id in event attributes for intercepted PDSN.
By default this keyword is disabled.

hand-off-policy send-start-intercept-with-pdp-active-iri

This optional keyword enables a policy for hand-off in the case of ISRAU (inter-SGSN routing area update) and sends a 'start intercept' message with the PDP context LI event to the mediation server.
Default: Disabled.
This keyword is only applicable to the SGSN.

interception-point-policy

Configures the point of interception and the time of interception for an SMS. One of the following options must be selected to specify the point of interception include:

- **sms-mo**: point of interception for a mobile-originated SMS
- **sms-mt**: point of interception for a mobile-terminated SMS

After configuring the point of interception, one of the following options must be selected to configure the point in time for the interception:

- **message-delivered**: intercept when the SGSN receives notification from the SMSC/MS. This is the default for either SMS-MO or SMS-MT.
- **request-received**: intercept when the SGSN receives the request.

This keyword is only applicable to the SGSN.

reprovision-target-policy resend-pdp-context-active-iri

Reprovisions the target identity in case of duplicates and sends a PDP context active LI IRI event to the mediation server.
This keyword is only applicable to the SGSN.

sms-content-policy { exclude-content | include-content }

This optional keyword is used to define the SMS content policy and used to configure to send only the SMS header or SMS header and content in SMS IRI event. The delivery from/to the mobile subscriber a SMS event, which contains the content and header of the SMS, is generated and sent via the Delivery Function 2 to the LEA in the same way as the IRI. LEA can configure the SMS policy if an SMS event shall contain only SMS header, or SMS header and SMS content.
Default behaviour is to send SMS header and Content in SMS IRI.
Following options can be configured:

- **exclude-content**: Sets the policy to send only SMS header in IRI.
- **include-content**: Sets the policy to send SMS header and content both in IRI.

  By default it is enabled.

src-ip-address

ip_address: This is known as the source-address. It is an IPv4 address that identifies the system's interface, in the current context, from which the intercepted messages are forwarded to the DF according to the event delivery or content delivery provisioning done in the Exec Mode.

tcp *tcp_option*

Enables the use of TCP (in place of UDP) as the transport for sending the intercepted information to the DF. One of the following options must be configured:

- **application-heartbeat-messages timout minute** *dur*: In firewall enabled scenrio TCP connections get dropped by because of the connections being idle most of the time. This keyword enables the SGSN to send application level heart beat messages to the mediation server to

keep connection live. This keyword is used to enable/disable sending of heart beat messages. By default this mode is disabled

timeout minute *dur* sets the timeout duration for heartbeat timer. By default heart beat timer value is 5 minutes.

- **connection-retry-timer** *time*: configures the maximum time to wait before retrying to connect, in seconds. Default is 2 seconds. *time*: enter any integer from 1 to 65535.
- **content-delivery dest-addr** *ip_address*: configures the destination IP address of the DF3 to send the intercepted content (ie: data/CC). *ip_address*: enter an address in standard IPv4/IPv6 format. Must be followed by:
  - **dest-port** *port_num*: configures the destination port where the intercepted information is to be forwarded. *port_num:* enter any integer from 1 to 65535.
- **event-delivery dest-addr** *ip_address*: configures the destination address of the DF2 to send the intercepted events information (ie: IRI). *ip_address*: enter an address in standard IPv4/IPv6 format. Must be followed by:
  - **dest-port** *port_num*: configures the destination port where the intercepted information is to be forwarded. *port_num*: enter any integer from 1 to 65535.

unack-format use-service-address

This set of keywords instructs the system to use the service-address, in place of the source-address in the ip-headers of the intercepted messages that are forwarded to the DF according to the content delivery provisioning done in the Exec Mode. The service-address is an IPv4 address that identifies on which of the system's interfaces the intercept was received.

Important: This function requires that the Lawful Intercept provisioning (done in the Exec Mode) include the **udp-unack-format-1** for the **content delivery** keyword. Changing the configuration and the provisioning to enable/disable this feature can be done on the fly.

Usage

Use this command to configure the parameters controlling the forwarding of the intercepted messages to the DF.
For details on provisioning the Lawful Intercepts, refer to the Exec Mode.
For details on using the Lawful Intercept capability of the system, refer to the *System Administration Guide*.

Important: When monitoring for calls that are not yet active, the source-address information does not need to be configured immediately. However, it must be configured as soon as the call becomes active in order for Lawful Interception to function properly.

Example

To set the source-address in the current context to *198.162.100.10*, use the following command:

lawful-intercept src-ip-addr *198.162.100.10*

lawful-intercept dictionary

This command configures LI dictionary to support customer specific LI requirements.

Product

All

Privilege

Security Administrator, Administrator

Syntax

lawful-intercept dictionary { standard | *cust_dict* }

[default] lawful-intercept dictionary

default

Sets the LI dictionary to default; i.e. **standard**.

standard

Specifies the standard dictionary to be used for LI session.

cust_dict

Specifies the customer specific dictionaries; **custom1** through **custom10**, to be used to provision/interception for configured LI context.

Usage

Use this command to configure the LI dictionary to be used for LI requirements. LI dictionaries are context specific and will be applicable to provisions / interceptions for configured LI context.

Example

The following command specifies the standard LI dictionary to be used for LI requirements:

default lawful-intercept dictionary

lma-service

Creates an Local Mobility Anchor (LMA) service or specifies an existing LMA service and enters the LMA Service Configuration Mode for the current context.

Product

P-GW

Privilege

Administrator

Syntax

lma-service *service_name* **[-noconfirm]**

no lma-service *service_name*

service_name

Specifies the name of the LMA service. If *service_name* does not refer to an existing service, the new service is created if resources allow.
service_name must be from 1 to 63 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no lma-service *service_name*

Removes the specified LMA service from the context.

Usage

Enter the LMA Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:

```
[context_name]hostname(config-lma-service)#
```

LMA Service Configuration Mode commands are defined in the *LMA Service Configuration Mode Commands* chapter.
Use this command when configuring the following eHRPD and PMIP SAE components: P-GW.

Example

The following command enters the existing LMA Service Configuration Mode (or creates it if it does not already exist) for the service named *lma-service1*:

```
lma-service lma-service1
```

The following command will remove *lma-service1* from the system:

```
no lma-service lma-service1
```

Ins-service

Enters the LNS Service Configuration Mode, or is used to add or remove a specified LNS service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

lns-service *name*

no lns-service *name*

no

Removes the specified lac-service from the current context.

name

Specifies the name of a LNS service to configure, add, or remove. It can be from 1 to 63 alpha and/or numeric characters in length and is case-sensitive.

Usage

Enter the LNS Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (i.e. resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Example

To add a new LNS service named *LNS1* and enter the LNS Service Configuration Mode, enter the following commands:

```
lns-service LNS1

Are you sure? [Yes|No]: Yes
```

To configure an existing LNS service named *LNS2*, enter the following command:

```
lns-service LNS2
```

To delete an existing LNS service named *LNS3*, enter the following command:

```
no lns-service LNS3
```

logging

Modifies the logging options for a specified system log server for the current context.

Product

All

Privilege

Administrator

Syntax

[no] logging syslog *ip_address* **[event-verbosity { min | concise | full }] [facility** *facilities* **] [pdu-data { none | hex | hex-ascii }] [pdu-verbosity** *pdu_level* **] [rate** *value* **]**

---

no

Indicates that internal logging is to be disabled for the options specified.

---

syslog *ip_address*

Specifies the IP address of a system log server on the network.
ip_address must be an IPv4 IP address entered using dotted decimal notation or an IPv6 IP address using colon (:) separated notation.

---

event-verbosity { min | concise | full }

Specifies the level of detail to use in logging of events. Detail level must be one of the following:

- **min**: Displays minimal detail.
- **concise**: Displays summary detail.
- **full**: Displays full detail.

---

facility *facilities*

Default: **local7**
Specifies the local facility for which the system logging server's logging options shall be applied. Local facility must be one of the following:

- **local0**
- **local1**
- **local2**
- **local3**
- **local4**
- **local5**
- **local6**
- **local7**

Multiple system log servers can share the logging options of a given local facility. This allows for the logical grouping of system log servers and the options which affect all of those associated with the same local facility.

pdu-data { none | hex | hex-ascii }

Specifies output format for packet data units when logged. Format must be one of the following:

- **none**: Displays data in raw format.
- **hex**: Displays data in hexadecimal format.
- **hex-ascii**: Displays data in hexadecimal and ASCII format (similar to a main-frame dump).

pdu-verbosity *pdu_level*

Specifies the level of verboseness to use in logging of packet data units as a value from 1 to 5, where 5 is the most detailed.

rate *value*

Default: 1000
Specifies the rate at which log entries are allowed to be sent to the system log server. No more than the number specified by *value* will be sent to a system log server within any given one-second interval. *value* must be in the range from 0 through 100000.

Usage

Set the log servers to enable remote review of log data.

Example

The following sets the logging for events to the maximum for the local7 facility:

```
logging syslog 1.2.3.4 event-verbosity full
```

The following command sets the logging for packet data units to level 3 and sets the output format to the main-frame style hex-ascii for the local3 facility:

```
logging syslog 1.2.3.4 facility local3 pdu-data hex-ascii pdu-verbosity 3
```

The following sets the rate of information for the local1 facility:

```
logging syslog 1.2.3.4 facility local1 rate 100
```

The following disables internal logging to the system log server specified:

```
no logging syslog 1.2.3.4
```

mag-service

Creates an Mobile Access Gateway (MAG) service or specifies an existing MAG service and enters the MAG Service Configuration Mode for the current context.

Product

HSGW, S-GW

Privilege

Administrator

Syntax

mag-service *service_name* **[-noconfirm]**

no mag-service *service_name*

service_name

Specifies the name of the MAG service. If *service_name* does not refer to an existing service, the new service is created if resources allow.
service_name must be from 1 to 63 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no mag-service *service_name*

Removes the specified MAG service from the context.

Usage

Enter the MAG Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:

```
[context_name]hostname(config-mag-service)#
```

MAG Service Configuration Mode commands are defined in the *MAG Service Configuration Mode Commands* chapter.
Use this command when configuring the following eHRPD and PMIP SAE components: HSGW and S-GW.

Example

The following command enters the existing MAG Service Configuration Mode (or creates it if it does not already exist) for the service named *mag-service1*:

```
mag-service mag-service1
```

The following command will remove *mag-service1* from the system:

```
no mag-service mag-service1
```

map-service

This command creates a Mobile Application Part (MAP) Service instance and enters the MAP Service Configuration Mode to define or edit the MAP service parameters.

MAP is the SS7 protocol that provides the application layer required by some of the nodes in GPRS/UMTS networks to communicate with each other in order to provide services to mobile phone users. MAP is used by the serving GPRS support node (SGSN) to access SS7 network nodes such as a home location register (HLR) or a radio access network (RAN).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

map-service *srvc_name*

no map-service *srvc_name*

no

Remove the specified MAP service from the configuration for the current context.

srvc_name

A unique string of 1 to 63 alphanumeric characters that identify the specific MAP service.

Usage

Use this command to create, edit, or remove a MAP service configuration.

Important: For details about the commands and parameters, check the *MAP Service Configuration Mode* chapter.

Example

The following command creates a MAP service named *map_1*:

map-service *map_1*

The following command removes the configuration for a MAP service named *map_1* from the configuration for the current context:

no map-service *map_1*

mme-hss-service

Creates an Mobility Management Entity (MME)-HSS service or configures an existing MME HSS service and enters the MME-HSS Service Configuration Mode for EPC network in the current context.

Product

MME

Privilege

Administrator

Syntax

mme-hss-service *service_name* **[-noconfirm]**

no mme-hss-service *service_name*

service_name

Specifies the name of the MME HSS service. If *service_name* does not refer to an existing service, the new service is created if resources allow.
service_name must be from 1 to 63 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no mme-hss-service *service_name*

Removes the specified MME HSS service from the context.

Usage

Enter the MME HSS Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:

```
[context_name]hostname(config-mme-hss-service)#
```

MME HSS Service Configuration Mode commands are defined in the *MME HSS Service Configuration Mode Commands* chapter.
Use this command when configuring the eGTP SAE component(s); i.e. MME.

Example

The following command enters the existing MME HSS Service Configuration Mode (or creates it if it does not already exist) for the service named *mme-hss-service1*:

mme-hss-service *mme-hss-service1*

The following command will remove *mme-hss-service1* from the system:

no mme-hss-service *mme-hss-service1*

mme-service

Creates an Mobility Management Entity (MME) service or configures an existing MME service and enters the MME Service Configuration Mode for EPC networks in the current context.

Product

MME

Privilege

Administrator

Syntax

mme-service *service_name* **[-noconfirm]**

no mme-service *service_name*

no

Removes the specified MME service from the context.

service_name

Specifies the name of the MME service. If *service_name* does not refer to an existing service, the new service is created if resources allow.
service_name must be from 1 to 63 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Enter the MME Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 8 MME service can be configured on a system which is further limited to a maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:

```
[context_name]hostname(config-mme-service)#
```

MME Service Configuration Mode commands are defined in the *MME Service Configuration Mode Commands* chapter.

Caution: This is a critical configuration. The MME service can not be configured without this configuration. Any change to this configuration would lead to restarting the MME service and removing or disabling this configuration will stop the MME service.

Example

The following command enters the existing MME Service Configuration Mode (or creates it if it does not already exist) for the service named *mme-service1*:

```
mme-service mme-service1
```

The following command will remove *mme-service1* from the system:

```
no mme-service mme-service1
```

mobile-ip fa newcall

Configures settings that effect all FA services in the current context.

Product

FA

Privilege

Security Administrator, Administrator

Syntax

```
mobile-ip fa { multiple-dynamic-reg-per-nai | newcall duplicate-home-address { accept | reject }
```

```
no mobile-ip fa { multiple-dynamic-reg-per-nai | newcall duplicate-home-address }
```

`no mobile-ip fa { multiple-dynamic-reg-per-nai | newcall duplicate-home-address }`

`multiple-dynamic-reg-per-nai`: Disables all FA services in the current context from simultaneously setting up multiple dynamic home address registrations that have the same NAI.
`newcall duplicate-home-address`: Reset this option to its default of reject.

`multiple-dynamic-reg-per-nai`

This keyword allows all FA services in the current context to simultaneously setup multiple dynamic home address registrations that have the same NAI.

`duplicate-home-address { accept | reject }`

Default: **`reject`**
`accept`: The new call is accepted and the existing call is dropped.
`reject`: The new call is rejected with an Admin Prohibited code.

Usage

Use this command to set the behavior of all FA services in the current context.

Example

To configure all FA services to accept new calls and drop the existing call when the new call requests an IP address that is already in use by an existing call, enter the following command:

```
mobile-ip fa newcall duplicate-home-address accept
```

To enable all FA services in the current context to allow all FA services in the current context to simultaneously setup multiple dynamic home address registrations that have the same NAI, enter the following command:

```
mobile-ip fa multiple-dynamic-reg-per-nai
```

mobile-ip ha assignment-table

This command creates a Mobile IP HA assignment table and enters Mobile IP HA Assignment Table Configuration Mode.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

mobile-ip ha assignment-table *atable_name* **[-noconfirm]**

no mobile-ip ha assignment-table *atable_name*

no

This keyword deletes the specified assignment table

atable_name

The name of the MIP HA assignment table to create or edit.

-noconfirm

This keyword specifies that the assignment table should be created with no further confirmation by the user.

Usage

Use this command to create a new MIP HA assignment table or edit an existing MIP HA assignment table.

Important: A maximum of 8 MIP HA assignment tables can be configured per context with a maximum of 8 MIP HA assignment tables across all contexts.

Important: A maximum of 256 non-overlapping hoa-ranges can be configured per MIP HA Assignment table with a maximum of 256 non-overlapping hoa-ranges across all MIP HA Assignment tables.

Example

The following command creates a new MIP HA assignment table name *MIPHAtable1* and enters MIP HA Assignment Table Configuration Mode without asking for confirmation from the user:

mobile-ip ha assignment-table *MIPHAtable1*

mobile-ip ha newcall

Configures the behavior of all HA services when duplicate home addresses and duplicate IMSI sessions occur for new calls.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
mobile-ip ha newcall { duplicate-home-address { accept | reject } | duplicate-
imsi-session { allow | disallow | global-disallow } }

no mobile-ip ha  newcall { duplicate-home-address | duplicate-imsi-session }
```

```
no mobile-ip ha newcall { duplicate-home-address | duplicate-imsi-session
}
```

duplicate-home-address: Reset the option to its default of reject.
duplicate-imsi-session: Reset the option to its default of allow.

```
duplicate-home-address { accept | reject }
```

Default: **reject**
Configures the HA to either accept or reject new calls if the new call requests a static IP home address that is already assigned to an existing call from an IP address pool in the same destination context.
accept: The new call is accepted and the existing call is dropped.
reject: The new call is rejected with an Admin Prohibited code.

```
duplicate-imsi-session { allow | disallow | global-disallow }
```

Default: **allow**
Configures the HA to either permit or not permit multiple sessions for the same IMSI.
allow: Allows multiple sessions for the same IMSI.
disallow: If a Mobile node already has an active session and a new sessions is requested using the same IMSI, the currently active session is dropped and the new session is accepted.
global-disallow: Enables HA services in this context to accept a new session and disconnect any other session(s) having the same IMSI being processed in this context. In addition, a request is sent to all other contexts containing HA services to do the same.

Important: In order to ensure a single session per IMSI across all contexts containing HA services, the global-disallow option must be configured in every context.

Usage

Use this command to set the behavior of all HA services for new calls.

Example

To configure all HA services to accept new calls when the new call requests a static IP that is already assigned from an IP pool in the same destination context, enter the following command:

```
mobile-ip ha newcall duplicate-home-address accept
```

To configure all HA services to drop an active call and accept a new one that uses the same IMSI, enter the following command:

```
mobile-ip ha newcall duplicate-imsi-session disallow
```

mobile-ip ha reconnect

Sets the behavior of all HA services to reconnect dropped calls.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
mobile-ip { ha reconnect [ static-homeaddr [ dynamic-pool-allocation ] ] }
no mobile-ip { ha reconnect [ static-homeaddr [ dynamic-pool-allocation ] ] }
```

static-homeaddr

The home address is a static IP address.

dynamic-pool-allocation

Allows a dynamic pool to accept a static address allocation.

Usage

Use this command to reset the HA behavior for new calls.

Example

```
mobile-ip ha reconnect
mobile-ip ha reconnect static-homeaddr
mobile-ip ha reconnect static-homeaddr dynamic-pool-allocation
no mobile-ip ha reconnect
no mobile-ip ha reconnect static-homeaddr
```

mpls bgp forwarding

This command globally enables the MPLS BGP forwarding.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] mpls bgp forwarding
```

no

Disables MPLS BGP forwarding configured on the system.

Usage

Use this command to globally enable the MPLS BGP forwarding. By enabling this command, the BGP VPNv4 routes need not have an underlying LSP to forward the IP packets. If this command is not enabled, then the nexthop for the BGP routes must be reachable via LDP.

Caution: This command should be enabled ONLY when all the BGP peering where VPNv4 routes are exchanged are one hop away.

Example

Following command enables the MPLS BGP forwarding on system:

```
mpls bgp forwarding
```

nw-reachability server

This command adds/deletes a reachability-detect server and configures parameters for retrying the failure-detection process. When network reachability is enabled, a ping request is sent to this device. If there is no response after a specified number of retries, the network is deemed failed. Execute this command multiple times to configure multiple network reachability servers.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

nw-reachability server *server_name* **[interval** *seconds* **] [local-addr** *ip_addr* **] [num-retry** *num* **] [remote-addr** *ip_addr* **] [timeout** *seconds***]**

no nw-reachability server *server_name*

no

Delete the reference to the specified network reachability server.

server_name

A name for the network device that is sent ping packets to test for network reachability.

interval *seconds*

Default: 60 seconds
Specifies the frequency in seconds for sending ping requests.*seconds* must be an integer from 1 through 3600.

local-addr *ip_addr*

Specifies the IP address to be used as the source address of the ping packets; If this is unspecified, an arbitrary IP address that is configured in the context is used. *ip_addr* must be an IP v4 address in dotted decimal notation.

num-retry *num*

Default: 5
Specifies the number of retries before deciding that there is a network-failure. *num* must be an integer from 0 through 100.

remote-addr *ip_addr*

Specifies the IP address of a network element to use as the destination to send the ping packets for detecting network failure or reachability. *ip_addr* must be an IP v4 address in dotted decimal notation.

timeout *seconds*

Default: 3 seconds

Specifies how long to wait, in seconds, before retransmitting a ping request to the remote address. *seconds* must be an integer from 1 through 10.

Usage

Use this command to set up a network device on a destination network that is used ensure that Mobile IP sessions can reach the required network from the HA.

Important: Refer to the HA Configuration Mode command **policy nw-reachability-fail** to configure the action that should be taken when network reachability fails.

Important: Refer to the subscriber config mode command **nw-reachability-server** to bind the network reachability to a specific subscriber.

Important: Refer to the **nw-reachability server server_name** keyword of the **ip pool** command in this chapter to bind the network reachability server to an IP pool.

Example

To set a network device called InternetDevice with the IP address of *192.168.100.10* as the remote address that is pinged to determine network reachability and use the address *192.168.200.10* as the origination address of the ping packets sent, enter the following command:

nw-reachability server InternetDevice local-addr *192.168.200.10* **remote-addr** *192.168.100.10*

network-requested-pdp-context activate

Configures the mobile station(s) (MSs) for which network initiated PDP contexts are supported.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

network-requested-pdp-context activate address *ip_address* **dst-context** *context_name* **imsi** *imsi* **apn** *apn_name*

no network-requested-pdp-context activate { address *ip_address* **dst-context** *context_name* **}**

no

Disables the system's ability to accept network-requested PDP contexts on the specified interface.

address *ip_address*

Specifies the static IP address of the MS.
ip_address must be expressed in dotted decimal notation.

dst-context *context_name*

Specifies the name of the destination context configured on the system containing the static IP address pool in which the MS's IP address is configured.
context_name must be from 1 to 79 alpha and/or numeric characters and is case sensitive.

imsi *imsi*

Specifies the International Mobile Subscriber Identity (IMSI) of the MS.
imsi must be from 1 to 15 numeric characters.

apn *apn_name*

Specifies the Access Point Name (APN) that is passed to the SGSN by the system.
apn_name must be from 1 to 63 alpha and/or numeric characters and is case sensitive.

Usage

Use this command to specify the MS(s) for which network initiated PDP contexts are supported.
When a packet is received for an MS that does not currently have a PDP context established, the system checks the configuration of this parameter to determine if the destination IP address specified in the packet is specified by this parameter. If the address is not specified, then the system discards the packet. If the address is specified, the system uses the configured IMSI and APN to determine the appropriate SGSN from the Home Location Register (HLR). The system communicates with the HLR through the interworking node configured using the network-requested-pdp-context gsn-map command.
Once the session is established, the destination context specified by this command is used in place of the one either configured within the specified APN template or returned by a RADIUS server during authentication.

This command can be issued multiple times supporting network initiated PDP contexts for up to 1000 configured addresses per system context.

Example

The following command enables support for network initiated PDP contexts for an MS with a static IP address of *20.13.5.40* from a pool configured in the destination context pdn1 with an IMSI of *3319784450* that uses an APN template called *isp1*:

```
network-requested-pdp-context activate address 20.13.5.40 dst-context
pdn1 imsi 3319784450 apn isp1
```

network-requested-pdp-context gsn-map

Configures the IP address of the interworking node that is used by the system to communicate with the HLR and optionally sets the GTP version to use.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

network-requested-pdp-context gsn-map *ip_address* **[gtp-version { 0 | 1 }]**

no network-requested-pdp-context gsn-map

no

Deletes a previously configured gsn-map node.

ip_address

Specifies the IP address of the gsn-map node.
ip_address must be an IPv4 or IPv6 IP address entered using dotted decimal notation or an IPv6 IP address using colon (:) separated notation.

[gtp-version { 0 | 1 }]

Default: 1
Specifies the gtp version used.

Usage

Communications from the system to the HLR must go through a GSN-map interworking node that performs the protocol conversion from GTPC to SS7.
The UDP port for this communication is 2123.
Support for network requested PDP contexts must be configured within source contexts on the system. Only one gsn-map node can be configured per source context.
The source context also contains the GGSN service configuration that specifies the IP address of the Gn interface. If multiple GGSN services are configured in the source context, one is selected at random for initiating the Network Requested PDP Context Activation procedure.
Communication with the gsn-map node is done over the Gn interface configured for the GGSN service. The IP address of that interface is used as the system's source address.

Example

The following command configures the system to communicate with a gsn-map node having an IP address of *192.168.2.5*:

network-requested-pdp-context gsn-map *192.168.2.5*

network-requested-pdp-context hold-down-time

Configures the time duration to that the system will wait after the SGSN rejects an attempt for a network-requested PDP context creation for the subscriber.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

network-requested-pdp-context hold-down-time *time*

time

Default: 60
The time interval is measured in seconds and can be configured to any integer value between 0 and 86400.

Usage

Packets received during this time period would be discarded, rather than being used to cause another network-requested PDP context creation attempt for the same subscriber. After the time period has expired, any subsequent packets received would cause another network-requested PDP context creation procedure to begin.

Example

The following command configures a hold-down-time of *120* seconds:

network-requested-pdp-context hold-down-time *120*

network-requested-pdp-context interval

Configures the minimum amount of time that must elapse between the deletion of a network initiated PDP context and the creation of a new one for the same MS.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

network-requested-pdp-context interval *time*

time

Default: 60
Specifies the minimum amount of time that must pass before the system allows another network-requested PDP context for a specific MS after the previous context was deleted.
time is measured in seconds and can be configured to any integer value from 0 to 86400.

Usage

Once an MS deletes a PDP context that initiated from the network, the system automatically waits the amount of time configured by this parameter before allowing another network initiated PDP context for the same MS.

Example

The following command specifies that the system waits *120* seconds before allowing another network requested PDP context for an MS:

network-requested-pdp-context interval *120*

network-requested-pdp-context sgsn-cache-time

Configures the time duration that the GGSN keeps the SGSN/subscriber pair cached in its local memory.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

network-requested-pdp-context sgsn-cache-time *time*

time

Default: 300
The time interval is measured in seconds and can be configured to any integer value between 0 and 86400.

Usage

For an initial network-requested PDP context creation, the system contacts the HLR (via the GSN-MAP interworking node) to learn which SGSN is currently servicing the subscriber. The system keeps that information in cache memory for the configured time, so that future network-requested PDP context creations for that subscriber can be initiated without having to contact the HLR again.

Example

The following command configures an sgsn-cache-time of *500* seconds:

network-requested-pdp-context sgsn-cache-time *500*

operator

Configures a context-level operator account within the current context.

Product

All

Privilege

Security Administrator

Syntax

operator *user_name* **[encrypted] password** *password* **[ecs] [expiry-date** *date_time* **] [li-administration] [noecs] [timeout-absolute** *abs_seconds* **] [timeout-min-absolute** *abs_minutes* **] [timeout-idle** *idle_seconds* **] [timeout-min-idle** *idle_minutes* **]**

no operator *user_name*

no

Removes a previously configured context-level operator account.

user_name

Specifies a name for the account. *user_name* must be from 1 to 32 alpha and/or numeric characters.

[encrypted] password *password*

Specifies the password to use for the user which is being given context-level operator privileges within the current context. The **encrypted** keyword indicates the password specified uses encryption. *password* must be from 1 to 63 alpha and/or numeric characters without encryption and must be from 1 to 127 alpha and/or numeric characters when encryption has been indicated.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

ecs

Default: ACS-specific configuration commands not allowed.
Permits the specific user to access ACS-specific configuration commands from Exec Mode only.

expiry-date *date_time*

The date and time that this account expires. Enter the date and time in the format YYYY:MM:DD:HH:mm or YYYY:MM:DD:HH:mm:ss.
Where YYYY is the year, MM is the month, DD is the day of the month, HH is the hour, mm is minutes, and ss is seconds.

li-administration

Permits this user to execute Lawful Intercept commands.

Important: Users who have Lawful Intercept privileges are only given those privileges when connected to the system through a Secure Shell (SSH). If this user connects through a Telnet session or through the console port, Lawful Intercept privileges are not enabled.

noecs

Default: Enabled.
Prevents the specific user to access ACS-specific configuration commands.

timeout-absolute *abs_seconds*

Default: 0
This keyword is obsolete. It has been left in place for backward compatibility. If used a warning is issued and the value entered is rounded to the nearest whole minute.
Specifies the maximum amount of time, in seconds, the context-level operator may have a session active before the session is forcibly terminated. *abs_seconds* must be a value in the range from 0 through 300000000.
The special value 0 disables the absolute timeout.

timeout-min-absolute *abs_minutes*

Default: 0
Specifies the maximum amount of time, in minutes, the context-level operator may have a session active before the session is forcibly terminated. *abs_minutes* must be a value in the range from 0 through 300000000.
The special value 0 disables the absolute timeout.

timeout-idle *idle_seconds*

Default: 0
This keyword is obsolete. It has been left in place for backward compatibility. If used a warning is issued and the value entered is rounded to the nearest whole minute.
Specifies the maximum amount of idle time, in seconds, the context-level operator may have a session active before the session is terminated. *idle_seconds* must be an integer from 0 through 300000000.
The special value 0 disables the idle timeout.

timeout-min-idle *idle_minutes*

Default: 0
Specifies the maximum amount of idle time, in minutes, the context-level operator may have a session active before the session is terminated. *idle_minutes* must be a value in the range from 0 through 300000000.
The special value 0 disables the idle timeout.

Usage

Create new context-level operator or modify existing operator's options, in particular, the timeout values. Operator users have read-only privileges. They can maneuver across multiple contexts, but cannot perform configuration operations. Refer to the *Command Line Interface Overview* chapter for more information.

Important: A maximum of 128 administrative users and/or subscribers may be locally configured per context.

Example

The following command creates a context-level operator account named *user1* with ACS control:

```
operator user1 password secretPassword ecs
```

The following command removes a previously configured context-level operator account named *user1*:

```
no operator user1
```

optimize pdsn inter-service-handoff

Controls the optimization of the system's handling of inter-PDSN handoffs.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
optimize pdsn inter-service-handoff
```

```
[ default | no ] optimize pdsn inter-service-handoff
```

default

Resets the command to its default setting of enabled.

no

Disables the feature.

Usage

When more than one PDSN service is defined in a context, each PDSN-Service acts as an independent PDSN. When a Mobile Node (MN) moves from one PDSN service to another PDSN service, by rule, it is an inter-PDSN handoff. This command optimizes PDSN handoffs between PDSN Services that are defined in the same context in the system.
The default for this parameter is enabled. The no keyword disables this functionality.
When enabled, the system treats handoffs happening between two PDSN services in the same context as an inter-PDSN handoff. Existing PPP session states and connection information is reused. If the inter-PDSN handoff requires a PPP restart, then PPP is restarted. The optimized inter-service-handoff may not restart the PPP during handoffs allowing the MN to keep the same IP address for the Simple IP session.

Example

```
optimize pdsn inter-service-handoff
```

pdg-service

Creates a new PDG service or specifies an existing PDG service and enters the PDG Service Configuration Mode. A maximum of 16 PDG services can be created. This limit applies per ASR 5000 chassis and per context.

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

pdg-service *name*

no pdg-service *name*

pdg-service *name*

Specifies the name of a new or existing PDG service.
name must be from 1 to 63 alpha and/or numeric characters and must be unique across all FNG services within the same context and across all contexts.

no pdg-service *name*

Deletes the specified PDG service.

Usage

Use this command in Context Configuration Mode to create a new PDG service or modify an existing one. Executing this command enters the PDG Service Configuration Mode.

Example

The following command configures an PDG service named *pdg_service_1* and enters the PDG Service Configuration Mode:

pdg-service *pdg_service_1*

pdif-service

Creates a new, or specifies an existing, PDIF service and enters the PDIF Service Configuration Mode.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

[no] pdif-service *name* **[-noconfirm]**

name

Specifies the name of a new or existing PDIF service. *name* must be from 1 to 63 alpha and/or numeric characters.

Usage

Use this command to create a new or enter an existing PDIF service.
Entering this command results in the following prompt:
[*context_name*]*hostname*(config-pdif-service)#
PDIF Service Configuration Mode commands are defined in the *PDIF Service Configuration Mode Commands* chapter.

Example

The following command configures a PDIF service called *pdif2* and enters the PDIF Service Configuration Mode:

pdif-service *pdif2*

pdsn-service

Creates/deletes a packet data service or specifies an existing PDSN service for which to enter the Packet Data Service Configuration Mode for the current context.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

pdsn-service *name*

no

Indicates the packet data service specified is to be removed.

name

Specifies the name of the PDSN service to configure. If *name* does not refer to an existing service, the new service is created if resources allow. *name* must be from 1 to 63 alpha and/or numeric characters.

Usage

Enter the PDSN Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (i.e. resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Example

The following command will enter the PDSN Service Configuration Mode creating the service *sampleService*, if necessary.

pdsn-service *sampleService*

The following command will remove *sampleService* as being a defined PDSN service.

no pdsn-service *sampleService*

pgw-service

Creates an P-GW service or specifies an existing P-GW service and enters the P-GW Service Configuration Mode for the current context.

Product

P-GW

Privilege

Administrator

Syntax

pgw-service *service_name* **[-noconfirm]**

no pgw-service *service_name*

service_name

Specifies the name of the P-GW service. If *service_name* does not refer to an existing service, the new service is created if resources allow.
service_name must be from 1 to 63 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no pgw-service *service_name*

Removes the specified P-GW service from the context.

Usage

Enter the P-GW Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:

```
[context_name]hostname(config-pgw-service)#
```

P-GW Service Configuration Mode commands are defined in the *P-GW Service Configuration Mode Commands* chapter.
Use this command when configuring the following eHRPD and SAE components: P-GW.

Example

The following command enters the existing P-GW Service Configuration Mode (or creates it if it does not already exist) for the service named *pgw-service1*:

```
pgw-service pgw-service1
```

The following command will remove *pgw-service1* from the system:

```
no pgw-service pgw-service1
```

policy

Enters an existing accounting policy or creates a new one where accounting parameters are configured.

Product

HSGW, P-GW, S-GW

Privilege

Administrator

Syntax

[no] policy accounting *name*

no

Removes the specified accounting policy from the context.

name

Specifies the name of the existing or new accounting policy. *name* must be from 1 to 63 alpha and/or numeric characters.

Usage

Use this command to enter the Accounting Policy Configuration mode to edit an existing accounting policy or configure an new policy.
Entering this command results in the following prompt:

```
[context_name]hostname(config-accounting-policy)#
```

Accounting Policy Configuration Mode commands are defined in the *Accounting Policy Configuration Mode Commands* chapter.

Example

The following command enters the Accounting Policy Configuration Mode for a policy named *acct5*:

policy accounting *acct5*

policy-group

This command deletes/creates and enters the Policy-Group Configuration Mode within the current destination context for flow-based traffic policing to a subscriber session flow.

Product

PDSN, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

[no] policy-group name *policy_group*

no

Deletes configured policy group within the context.

policy_group

Specifies the name of Policy-Group and can consist of from 1 to 15 alpha and/or numeric characters in length and is case sensitive.

Usage

Use this command to form a policy group from a set of configured Policy-Maps. A policy group supports up to 16 policies for a subscriber session flow.

Example

Following command configures a policy group *policy_group1* for a subscriber session flow.

policy-group name *policy_group1*

policy-map

This command deletes/creates and enters the Traffic Policy-Map Configuration Mode within the current destination context to configure the flow-based traffic policing for a subscriber session flow.

Product

PDSN, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

[no] policy-map name *policy_name*

no

Deletes configured Policy-Map within the context.

policy_name

Specifies the name of Policy-Map and must consist of from 1 to 15 alpha and/or numeric characters in length and is case sensitive.

Usage

Use this command to enter Traffic Policy-Map Configuration Mode and to set the Class-Map and corresponding traffic flow treatment to traffic policy for a subscriber session flow.

Example

Following command configures a policy map *policy1* where other flow treatments is configured.

policy-map name *policy1*

ppp

Configures point-to-point protocol parameters for the current context.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

ppp { acfc { receive { allow | deny } | transmit { apply | ignore | reject} } | auth-retry suppress-aaa-auth | chap fixed-challenge-length *length* **| dormant send-lcp-terminate | echo-max-retransmissions** *num_retries* **| echo-retransmit-timeout** *msec* **| first-lcp-retransmit-timeout** *milliseconds* **| lcp-authentication-discard retry-alternate** *num_discard* **| lcp-authentication-reject retry-alternate | lcp-start-delay** *delay* **| lcp-terminate connect-state | lcp-terminate mip-lifetime-expiry | lcp-terminate mip-revocation | max-authentication-attempts** *num* **| max-configuration-nak** *num* **| max-retransmissions** *number* **| max-terminate** *number* **| mru** *packet_size* **| negotiate default-value-options | peer-authentication** *user_name* **[encrypted] password** *password* **] | pfc { receive { allow | deny } | transmit { apply | ignore | reject} } | reject-peer-authentication | renegotiation retain-ip-address | retransmit-timeout** *milliseconds* **}**

no ppp { auth-retry suppress-aaa-auth | chap fixed-challenge-length | dormant send-lcp-terminate | lcp-authentication-descard retry-alternate *num_discard* **| lcp-authentication-reject retry-alternate | lcp-start-delay | lcp-terminate connect-state | reject-peer-authentication | renegotiation retain-ip-address }**

default lcp-authentication-descard retry-alternate *num_discard*

default

Restores the system defaults for the specific command/keyword.

no ppp { auth-retry suppress-aaa-auth | chap fixed-challenge-length | dormant send-lcp-terminate | lcp-authentication-discard retry-alternate *num_discard* **| lcp-authentication-reject retry-alternate | lcp-start-delay | lcp-terminate connect-state | lcp-terminate mip-lifetime-expiry | lcp-terminate mip-revocation | negotiate default-value-options | reject-peer-authentication | renegotiation retain-ip-address }**

Disables, deletes, or resets the specified option.
In case of **no ppp renegotiation retain-ip-address** the initially allocated IP address will be released and a new IP address will be allocated during PPP renegotiation.

acfc { receive { allow | deny } | transmit { apply | ignore | reject} }

Configures PPP Address and Control Field Compression (ACFC) parameters.
receive { allow | deny }
Default: **allow**

This keyword specifies whether to allow Address and Control Field Compressed PPP packets received from the Peer. During LCP negotiation, the local PPP side indicates whether it can handle ACFC compressed PPP packets.
When allow is specified, the local PPP side indicates that it can process ACFC compressed PPP packets and compressed packets are allowed. When deny is specified, the local PPP side indicates that it cannot handle ACFC compressed packets and compressed packets are not allowed.
transmit { apply | ignore | reject }
Default: **ignore**
Specifies how Address and Control Field Compression should be applied for PPP packets transmitted to the Peer. During LCP negotiation, the Peer indicates whether it can handle ACFC compressed PPP packets. When apply is specified, if the peer requests ACFC, the request is accepted and ACFC is applied for transmitted PPP packets. When ignore is specified, if the peer requests ACFC, the request is accepted, but ACFC is not applied for transmitted PPP packets. When reject is specified, if the peer requests ACFC, the request is rejected and ACFC is not applied to transmitted packets.

auth-retry suppress-aaa-auth

Default: **no auth-retry suppress-aaa-auth**
This option does not allow PPP authentication retries to the AAA server after the AAA server has already authenticated a session. PPP locally stores the username and password, or challenge response, after a successful PPP authentication. If the Mobile Node retries the PAP request or CHAP-Response packet to the PDSN, PPP locally compares the incoming username, password or Challenge Response with the information stored from the previous successful authentication. If it matches, PAP ACK or CHAP Success is sent back to the Mobile Node, without performing AAA authentication. If the incoming information does not match with what is stored locally, then AAA authentication is attempted. The locally stored PPP authentication information is cleared once the session reaches a connected state.

Important: This option is not supported in conjunction with the GGSN product.

chap fixed-challenge-length *length*

Default: Disabled. PAP CHAP uses a random challenge length.
Normally PPP CHAP uses a random challenge length from 17 to 32 bytes. This command allows you to configure a specific fixed challenge length of from 4 through 32 bytes.
length must be an integer from 4 through 32.

dormant send-lcp-terminate

Indicates a link control protocol (LCP) terminate message is enabled for dormant sessions.

Important: This option is not supported in conjunction with the GGSN product.

echo-max-retransmissions *num_retries*

Default: 3
Configures the maximum number of retransmissions of LCP ECHO_REQ before a session is terminated in an always-on session.
num_retries must be a value in the range of 1 to 16.

echo-retransmit-timeout *msec*

Default: 3000

Configures the timeout, in milliseconds, before trying LCP ECHO_REQ for an always-on session.
msec must be a value in the range of 100 to 5000.

first-lcp-retransmit-timeout *milliseconds*

Default: 3000
Specifies the number of milliseconds to wait before attempting to retransmit control packets. This value configures the first retry. All subsequent retries are controlled by the value configured for the ppp **retransmit-timeout** keyword.
milliseconds must be a value in the range 100 through 5000.

lcp-authentication-discard retry-alternate *num_discard*

Default: Disabled.
This keyword sets the number of discards up to which authentication option is discarded during LCP negotiation and retries starts to allow alternate authentication option.
num_discard must be an integer from 0 through 5. Recommended value is 2.

lcp-authentication-reject retry-alternate

Default: Disabled. No alternate authentication option will be retried.
The action that is taken if the authentication option is rejected during LCP negotiation and retry the allowed alternate authentication option.

lcp-start-delay *delay*

Default: 0
The delay in milliseconds before link control protocol (LCP) is started. *delay* must be an integer from 0 through 5000.

lcp-terminate connect-state

This option enables sending an LCP terminate message to the Mobile Node when a PPP session is disconnected if the PPP session was already in a connected state.
Note that if the no keyword is used with this option, the PDSN must still send LCP Terminate in the event of an LCP/PCP negotiation failure or PPP authentication failure, which happens during connecting state.

Important: This option is not supported in conjunction with the GGSN product.

lcp-terminate mip-lifetime-expiry

This option configures the PDSN to send a LCP Terminate Request when a MIP Session is terminated due to MIP Lifetime expiry (default).
Note that if the no keyword is used with this option, the PDSN does not send a LCP Terminate Request when a MIP session is terminated due to MIP Lifetime expiry.

lcp-terminate mip-revocation

This option configures the PDSN to send a LCP Terminate Request when a MIP Session is terminated due to a Revocation being received from the HA (default).
Note that if the no keyword is used with this option, the PDSN does not send a LCP Terminate Request when a MIP session is terminated due to a Revocation being received from the HA.

max-authentication-attempts *num*

Default: 1
Configures the maximum number of time the PPP authentication attempt is allowed.
num must be an integer in the range from 1 through 10.

max-configuration-nak *num*

Default: 10
This command configures the maximum number of consecutive configuration REJ/NAKs that can be sent during CP negotiations, before the CP is terminated.
num must be an integer in the range from 1 through 20.

max-retransmission *number*

Default: 5
Specifies the maximum number of times control packets will be retransmitted. *number* must be a value from 1 to 16.

max-terminate *number*

Default: 2
Sets the maximum number of PPP LCP Terminate Requests transmitted to the Mobile Node. *number* must be an integer from 0 through 16.

Important: This option is not supported in conjunction with the GGSN product.

mru *packet_size*

Default: 1500
Specifies the maximum packet size that can be received in bytes. *packet_size* must be an integer from 128 to 1500.

negotiate default-value-options

Default: Disabled
Enable the inclusion of configuration options with default values in PPP configuration requests.
The PPP standard states that configuration options with default values should not be included in Configuration Request (LCP, IPCP etc) packets. If the option is missing in the Configuration Request, the peer PPP assumes the default value for that configuration option.
When negotiate default-value-options is enabled, configuration options with default values are included in the PPP configuration Requests.

peer-authenticate *user_name* **[[encrypted] password** *password* **]**

Specifies the user name and an optional password required for point-to-point protocol peer connection authentications. *user_name* must be from 1 to 63 alpha and/or numeric characters. The keyword **password** is optional and if specified *password* must be from 1 to 63 alpha and/or numeric characters. The password specified must be in an encrypted format if the optional keyword **encrypted** was specified. The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

pfc { receive { allow | deny } | transmit { apply | ignore | reject} }

Configures Protocol Field Compression (PFC) parameters.
receive { allow | deny }
Default: allow
This keyword specifies whether to allow Protocol Field Compression (PFC) for PPP packets received from the Peer. During LCP negotiation, the local PPP side indicates whether it can handle Protocol Field Compressed PPP packets.
When allow is specified, the peer is allowed to request PFC during LCP negotiation. When deny is specified, the Peer is not allowed to request PFC during LCP negotiation.
transmit { apply | ignore | reject }
Default: ignore
This keyword specifies how Protocol field Compression should be applied for PPP packets transmitted to the Peer. During LCP negotiation, the Peer indicates whether it can handle PFC compressed PPP packets.
When apply is specified, if the peer requests PFC, it is accepted and PFC is applied for transmitted PPP packets. When ignore is specified, If the peer requests PFC, it is accepted but PFC is not applied for transmitted packets. When reject is specified, all requests for PCF from the peer are rejected.

reject-peer-authentication

Default: Enabled
If disabled, re-enables the system to reject peer requests for authentication.

renegotiation retain-ip-address

Default: Enabled
If enable retain the currently allocated IP address for the session during PPP renegotiation (Simple IP) between FA and Mobile node.
If disabled, the initially allocated IP address will be released and a new IP address will be allocated during PPP renegotiation.

retransmit-timeout *milliseconds*

Default: 3000
Specifies the number of milliseconds to wait before attempting to retransmit control packets.
milliseconds must be a value in the range 100 through 5000.

Usage

Modify the context PPP options to ensure authentication and communication for PPP sessions have fewer dropped sessions.

Example

The following commands set various PPP options.

```
ppp dormant send-lcp-terminate

ppp max-retransmission 3

ppp peer-authenticate user1 password secretPwd

ppp peer-authenticate user1
```

```
ppp retransmit-timeout 1000
```

The following command disables the sending of LCP terminate messages for dormant sessions.

```
no ppp dormant send-lcp-terminate
```

ppp magic-number

This command manages magic number checking during LCP Echo message handling.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
ppp magic-number receive ignore
```

```
[ no | default ] ppp magic-number receive ignore
```

no

Disables the specified behavior.

default

Restores the system defaults for the specific command/keyword.

receive ignore

Default: Disabled.
Ignores the checking of magic number at PDSN during LCP Echo message handling.
If a valid magic numbers were negotiated for the PPP endpoints during LCP negotiation and LCP Echo Request/Response have invalid magic numbers, enabling of this command will ignore the checking of magic number during LCP Echo message handling.

Usage

Use this command to allow the system to ignore invalid magic number during LCP Echo Request/Response handling.

Example

The following command allows the invalid magic number during LCP Echo Request/Response negotiation:

```
ppp magic-number receive ignore
```

ppp statistics

This command changes the manor in which some PPP statistics are calculated.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
ppp statistics success-sessions { lcp-max-retry | misc-reasons | remote-terminated }

no ppp statistics success-sessions { lcp-max-retry | misc-reasons | remote-terminated }
```

no

Disable the specified behavior.

lcp-max-retry

Alters statistics calculations so that statistic ppp successful session is the sum of successful sessions and lcp-max-retry.

misc-reasons

Alters statistics calculations so that statistic ppp successful session is the sum of successful sessions and misc-reasons.

remote-terminated

Alters statistics calculations so that statistic ppp successful session is the sum of successful sessions and remote-terminated.

Usage

Use this command to alter how certain PPP statistics are calculated.

Caution: Use caution when using this command. This command alters the way that some PPP statistics are calculated. Please consult your designated service representative before using this command

Example

The following command alters the statistic ppp successful session so that it displays the sum of successful sessions and lcp-max-retry:

```
ppp statistics success-sessions lcp-max-retry
```

The following command disables the alteration of the statistic ppp successful session:

```
no ppp statistics success-sessions lcp-max-retry
```

proxy-dns intercept-list

Enters the HA Proxy DNS Configuration Mode and defines a name of a redirect rules list for the domain name servers associated with a particular FA or group of FAs.

Important: HA Proxy DNS Intercept is a license-enabled feature.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

`[ no ] proxy-dns intercept-list` *`name`*

`no`

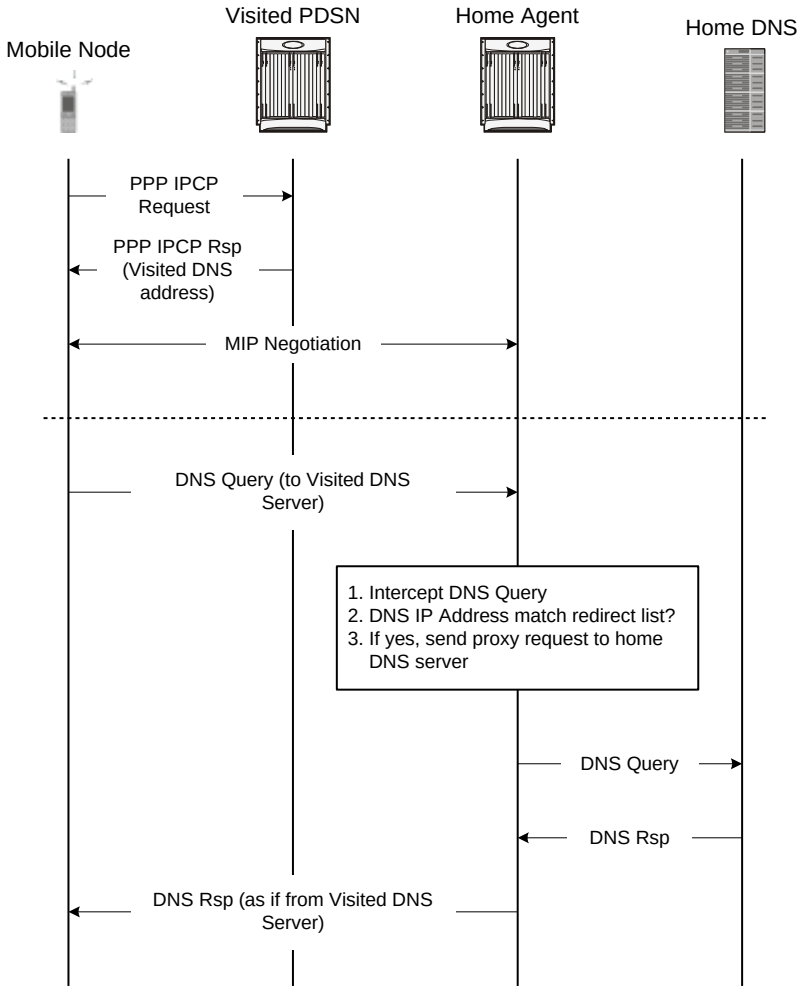
Removes the intercept list from the system.

`proxy-dns intercept-list` *`name`*

Defines the rules list and enters the Proxy DNS Configuration Mode.
`name` must be a string from 1 to 63 characters in length.

Usage

Use this command to define a name for a list of rules pertaining to the IP addresses associated with the foreign network's DNS. Up to 128 rules of any type can be configured per rules list.
Upon entering the command, the system switches to the HA Proxy DNS Configuration Mode where the lists can be defines. Up to 64 separate rules lists can be configured in a single AAA context.
This command and the commands in the HA Proxy DNS Configuration Mode provide a solution to the Mobile IP problem that occurs when a MIP subscriber, with a legacy MN or MN that does not support IS-835D, receives a DNS server address from a foreign network that is unreachable from the home network. The following flow shows the steps that occur when this feature is enabled:



By configuring the Proxy DNS feature on the Home Agent, the foreign DNS address is intercepted and replaced with a home DNS address while the call is being handled by the home network.

Example

The following command creates a proxy DNS rules list named *list1* and places the CLI in the HA Proxy DNS Configuration Mode:

```
proxy-dns intercept-list list1
```

radius accounting

Configures the current context's RADIUS accounting function options.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius accounting { archive [stop-only] | deadtime *dead_minutes* **| detect-dead-server { consecutive-failures** *count* **| keepalive | response-timeout** *seconds* **} | interim interval** *seconds* **| max-outstanding** *msgs* **| max-pdu-size** *octets* **| max-retries** *tries* **| max-transmissions** *trans* **| timeout** *idle_seconds* **| unestablished-sessions }**

no radius accounting { archive | detect-dead-server | interim interval | max-transmissions | unestablished-sessions }

default radius accounting { deadtime | detect-dead-server | interim interval *seconds* **| max-outstanding | max-pdu-size | max-retries | max-transmissions | timeout }**

---

no

Removes earlier configuration for the specified keyword.

---

default

Configures this command with the default settings.

---

archive [stop-only]

Default: enabled
Enables archiving of RADIUS Accounting messages in the system after the accounting message has exhausted retries to all available RADIUS Accounting servers. All RADIUS Accounting messages generated by a session are delivered to the RADIUS Accounting server in serial. That is, previous RADIUS Accounting messages from the same call must be delivered and acknowledged by the RADIUS Accounting server before the next RADIUS Accounting message is sent to the RADIUS Accounting server.
stop-only specifies archiving of STOP accounting messages only.

---

deadtime *dead_minutes*

Default: 10
Specifies the number of minutes to wait before attempting to communicate with a server which has been marked as unreachable. *dead_minutes* must be an integer from 0 through 65535.

---

detect-dead-server { consecutive-failures *count* **| keepalive | response-timeout** *seconds* **}**

consecutive-failures *count*: Default: 4. Specifies the number of consecutive failures, for each AAA manager, before a server is marked as unreachable. *count* must be an integer from 0 through 1000.

keepalive: Enables the AAA server alive-dead detect mechanism based on sending keepalive authentication messages to all authentication servers. Default is disabled.
response-timeout *seconds*: Specifies the number of seconds for each AAA manager to wait for a response to any message before a server is detected as failed, or in a down state. *seconds* must be an integer from 1 through 65535.

Important: If both **consecutive-failures** and **response-timeout** are configured, then both parameters have to be met before a server is considered unreachable, or dead.

interim interval *seconds*

Default: Disabled
Specifies the time interval (in seconds) for sending accounting INTERIM-UPDATE records. *seconds* must be an integer from 50 through 40000000.

Important: If RADIUS is used as the accounting protocol for the GGSN product, other commands are used to trigger periodic accounting updates. However, these commands would cause RADIUS STOP/START packets to be sent as opposed to INTERIM-UPDATE packets. Also note that accounting interim interval settings received from a RADIUS server take precedence over those configured on the system.

max-outstanding *msgs*

Default: 256
Specifies the maximum number of outstanding messages a single AAA manager instance will queue. *msgs* must be an integer from 1 through 4000.

max-pdu-size *octets*

Default: 4096
Specifies the maximum sized packet data unit which can be accepted/generated in bytes (octets). *octets* must be an integer from 512 through 4096.

max-retries *tries*

Default: 5
Specifies the maximum number of times communication with a AAA server will be attempted before it is marked as unreachable and the detect dead servers consecutive failures count is incremented. *tries* must be an integer from 0 through 65535.
Once the maximum number of retries is reached this is considered a single failure for the consecutive failures count for detecting dead servers.

max-transmissions *trans*

Default: Disabled
Sets the maximum number of transmissions for a RADIUS Accounting message before the message is declared as failed. *trans* must be an integer from 1 through 65535.

timeout *seconds*

Default: 3
Specifies the amount of time to wait for a response from a RADIUS server before retransmitting a request. *seconds* must be an integer from 1 through 65535.

unestablished-sessions

Indicates RADIUS STOP events are to be generated for sessions which were initiated but never fully established.

Usage

Manage the RADIUS accounting options according to the RADIUS server used for the context.

Example

The following commands specify accounting options.

```
radius accounting detect-dead-server consecutive-failures 5
radius accounting max-pdu-size 1024
radius accounting timeout 16
```

The following commands disable/clear the options.

```
no radius accounting interim interval 10
no radius accounting unestablished-sessions
```

radius accounting algorithm

This command specifies the fail-over/load-balancing algorithm to select the RADIUS accounting server(s) to which accounting data must be sent.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius accounting algorithm { first-n *n* **| first-server | round-robin }**

default radius accounting algorithm

default

Configures this command with the default settings.
Default: **first-server**

first-n *n*

Default: 1 (Disabled)
Specifies that the AGW must send accounting data to *n* (more than one) AAA servers based on their priority. The full set of accounting data is sent to each of the *n* AAA servers. Response from any one of the servers would suffice to proceed with the call. On receiving an ACK from any one of the servers, all retries are stopped.
n is the number of AAA servers to which accounting data will be sent, and must be an integer from 2 through 128.

first-server

Specifies that the context must send accounting data to the RADIUS server with the highest configured priority. In the event that this server becomes unreachable, accounting data is sent to the server with the next-highest configured priority. This is the default algorithm.

round-robin

Specifies that the context must load balance sending accounting data among all of the defined RADIUS servers. Accounting data is sent in a circular queue fashion on a per Session Manager task basis, where data is sent to the next available server and restarts at the beginning of the list of configured servers. The order of the list is based upon the configured relative priority of the servers.

Usage

Use this command to specify the algorithm to select the RADIUS accounting server(s) to which accounting data must be sent.

Example

The following command specifies to use the round-robin algorithm to select the RADIUS server:

```
radius accounting algorithm round-robin
```

radius accounting apn-to-be-included

Configures the APN name to be included for RADIUS accounting.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
radius accounting apn-to-be-included { gi | gn }

default radius accounting apn-to-be-included
```

default

Configures this command with the default settings.

gi

Specifies the usage of Gi APN name in the RADIUS accounting request. Gi APN represents the APN received in the Create PDP context request message from the SGSN.

gn

Specifies the usage of Gn APN name in the RADIUS accounting request. Gn APN represents the APN selected by the GGSN.

Usage

Use this command to configure the APN name for RADIUS Accounting. This can be set to either gi or gn.

Example

The following command specifies the usage of Gn APN name in the RADIUS accounting request:

```
radius accounting apn-to-be-included gn
```

radius accounting billing-version

This command configures billing-system version of RADIUS accounting servers.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius accounting billing-version *version*

default radius accounting billing-version

default

Configures this command with the default setting.
Default: 0

version

Specifies the billing-system version, and must be an integer from 0 through 4294967295.

Usage

Use this command to configure the billing-system version of RADIUS accounting servers.

Example

The following command configures the billing-system version of RADIUS accounting servers as *10*:

radius accounting billing-version *10*

radius accounting gtp trigger-policy

This command configures the RADIUS accounting trigger policy for GTP messages.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
radius accounting gtp trigger-policy [ standard | ggsn-preservation-mode ]

default radius accounting gtp trigger-policy
```

default

Resets the RADIUS accounting trigger policy to standard behavior for GTP session.

standard

This keyword sets the RADIUS accounting trigger policy to standard behavior which is configured for GTP session for GGSN service.

ggsn-preservation-mode

This keyword sends RADIUS Accounting Start when the GTP message with private extension of preservation mode is received from SGSN.

Important: This is a customer-specific keyword and needs customer-specific license to use this feature. For more information on GGSN preservation mode, refer *GGSN Service Mode Commands* chapter.

Usage

Use this command to set the trigger policy for the AAA accounting for a GTP session.

Example

The following command sets the RADIUS accounting trigger policy for GTP session to standard:

```
default radius accounting gtp trigger-policy
```

radius accounting ha policy

Configures the RADIUS accounting policy for HA sessions.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
radius accounting ha policy { session-start-stop | custom1-aaa-res-mgmt }
```

session-start-stop

Specifies to send Accounting Start when the session is connected, and send Accounting Stop when the session is disconnected. This is the default behavior.

custom1-aaa-res-mgmt

Accounting Start/Stop messages are generated to assist special resource management done by AAA servers. It is similar to the session-start-stop accounting policy, except for the following differences:

- Accounting Start is also generated during MIP session handoffs.
- No Accounting stop is generated when an existing session is overwritten and the new session continues to use the IP address assigned for the old session.
- Accounting Start is generated when a new call overwrites an existing session.

Usage

Use this command to set the behavior of the AAA accounting for an HA session.

Example

Use the following command to set the HA accounting policy to **custom1-aaa-res-mgmt**:

```
radius accounting ha policy custom1-aaa-res-mgmt
```

radius accounting interim volume

This command configures the volume of uplink and downlink volume octet counts that triggers RADIUS interim accounting.

Product

GGSN, PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
radius accounting interim volume { downlink bytes uplink bytes | total bytes |
uplink bytes downlink bytes }

no radius accounting interim volume
```

no

Disables volume based RADIUS accounting.

downlink *bytes* **uplink** *bytes*

Specifies the downlink to uplink volume limit for RADIUS Interim accounting, in bytes.
bytes must be an integer from 100000 through 4000000000.

total *bytes*

Specifies the total volume limit for RADIUS interim accounting in bytes.
bytes must be an integer from 100000 through 4000000000.

uplink *bytes* **downlink** *bytes*

Specifies the uplink to downlink volume limit for RADIUS interim accounting in bytes.
bytes must be an integer from 100000 through 4000000000.

Usage

Use this command to trigger RADIUS interim accounting based on the volume of uplink and downlink bytes.

Example

The following command triggers RADIUS interim accounting when the total volume of uplink and downlink bytes reaches *110000*:

```
radius accounting interim volume total 110000
```

radius accounting ip remote-address

This command configures IP remote address-based RADIUS accounting parameters.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

`[ no ] radius accounting ip remote-address { collection | list` *`list_id`* **`}`**

`no`

Removes earlier configuration for the specified keyword.

`collection`

Enables collecting and reporting Remote-Address-Based accounting in RADIUS Accounting. This should be enabled in the AAA Context. It is disabled by default.

`list` *`list_id`*

Enters the Remote Address List Configuration Mode. This mode configures a list of remote addresses that can be referenced by the subscriber's profile.
`list_id` must be an integer from 1 through 65535.

Usage

This command is used as part of the Remote Address-based Accounting feature to both configure remote IP address lists and enable the collection of accounting data for the addresses in those lists on a per-subscriber basis.
Individual subscriber can be associated to remote IP address lists through the configuration/specification of an attribute in their local or RADIUS profile. (Refer to the **`radius accounting`** command in the Subscriber Configuration mode.) When configured/specified, accounting data is collected pertaining to the subscriber's communication with any of the remote addresses specified in the list.
Once this functionality is configured on the system and in the subscriber profiles, it must be enabled by executing this command with the collection keyword.

Example

```
radius accounting ip remote-address collection
```

radius accounting keepalive

Configures the keepalive authentication parameters for the RADIUS accounting server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius accounting keepalive { calling-station-id id | consecutive-response
number | framed-ip-address ip_address | interval seconds | retries number |
timeout seconds | username name }

no radius accounting keepalive framed-ip-address

default radius accounting keepalive { calling-station-id | consecutive-response
| interval | retries | timeout | username }
```

no

Removes configuration for the specified keyword.

default

Configures this command with the default settings.

calling-station-id *id*

Configures the Calling-Station-Id to be used for the keepalive authentication.
id must be an alpha and/or numeric string of 1 through 15 characters in length.
Default: 000000000000000

consecutive-response *number*

Configures the number of consecutive authentication response after which the server is marked as reachable.
number must be an integer from 1 through 5.
Default: 1

framed-ip-address *ip_address*

Configures the framed-ip-address to be used for the keepalive accounting.
ip_address must be specified using the standard IPv4 dotted decimal notation.

interval *seconds*

Configures the time interval between the two keepalive access requests.
Default: 30 seconds

retries *number*

Configures the number of times the keepalive access request to be sent before marking the server as unreachable.

number must be an integer from 3 through 10.
Default: 3

timeout *seconds*

Configures the time interval between each keepalive access request retries.
seconds must be an integer from 1 through 30.
Default: 3

username *name*

Configures the username to be used for the authentication.
name must be an alpha and/or numeric string of 1 through 127 characters in length.
Default: Test-Username

Usage

Configures the keepalive authentication parameters for the RADIUS accounting server.

Example

The following command sets the user name for the RADIUS keepalive access requests to *Test-Username2*:

```
radius accounting keepalive username Test-Username2
```

The following command sets the number of retries to *4*:

```
radius accounting keepalive retries 4
```

radius accounting rp

Configures the current context's RADIUS accounting R-P originated call options.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
radius accounting rp { handoff-stop { immediate | wait-active-stop } | tod
minute hour | trigger-event { active-handoff | active-start-param-change |
active-stop } | trigger-policy { airlink-usage [ counter-rollover ] | custom [
active-handoff | active-start-param-change | active-stop ] | standard } |
trigger-stop-start }

no radius accounting rp { tod minute hour | trigger-event { active-handoff |
active-start-param-change | active-stop } | trigger-stop-start }

default radius accounting rp { handoff-stop | trigger-policy }
```

no

Removes earlier configuration for the specified keyword.

default

Configures this command with the default settings.

handoff-stop { immediate | wait-active-stop }

Default: **wait-active-stop**
Specifies the behavior of generating accounting STOP when handoff occurs.

- **immediate**: Indicates that accounting STOP should be generated immediately on handoff, i.e. not to wait active-stop from the old PCF.
- **wait-active-stop**: Indicates that accounting STOP is generated only when active-stop received from the old PCF when handoff occurs.

tod *minute hour*

Specifies the time of day a RADIUS event is to be generated for accounting. Up to four different times of the day may be specified through separate commands.
minute must be an integer from 0 through 59.
hour must be an integer from 0 through 23.

trigger-event { active-handoff | active-start-param-change | active-stop }

Default:**active-handoff**: Disabled
active-start-param-change: Enabled
active-stop: Disabled
Configures the events for which a RADIUS event is generated for accounting as one of the following:

- **active-handoff**: Disables a single R-P event (and therefore a RADIUS accounting event) when an Active PCF-to-PFC Handoff occurs. Instead, two R-P events occur (one for the Connection Setup, and the second for the Active-Start).
- **active-start-param-change**: Disables an R-P event (and therefore a RADIUS accounting event) when an Active-Start is received from the PCF and there has been a parameter change.
- **active-stop**: Disables an R-P event (and therefore a RADIUS accounting event) when an Active-Stop is received from the PCF.

Important: This keyword has been obsoleted by the **trigger-policy** keyword. Note that if this command is used, if the context configuration is displayed, radius accounting rp configuration is represented in terms of the trigger-policy.

trigger-policy { airlink-usage [counter-rollover] | custom [active-handoff | active-start-param-change | active-stop] | standard }

Default:**airlink-usage**: Disabled
custom:
- **active-handoff**: Disabled
- **active-start-param-change**: Disabled
- **active-stop**: Disabled
- **standard**: Enabled

Configures the overall accounting policy for R-P sessions as one of the following:
- **airlink-usage [counter-rollover]**: Designates the use of Airlink-Usage RADIUS accounting policy for R-P, which generates a start on Active-Starts, and a stop on Active-Stops.

If the **counter-rollover** option is enabled, the system generates a STOP/START pair before input/output data octet counts (or input/output data packet counts) become larger than (2^32 - 1) in value. This setting is used to guarantee that a 32-bit octet count in any STOP message has not wrapped to larger than 2^32 thus ensuring the accuracy of the count. The system, may, at its discretion, send the STOP/START pair at any time, so long as it does so before the 32-bit counter has wrapped. Note that a STOP/START pair is never generated unless the subscriber RP session is in the Active state, since octet/packet counts are not accumulated when in the Dormant state.
- **custom**: Specifies the use of custom RADIUS accounting policy for R-P. The custom policy can consist of the following:
- **active-handoff**: Enables a single R-P event (and therefore a RADIUS accounting event) when an Active PCF-to-PFC Handoff occurs. Normally two R-P events will occur (one for the Connection Setup, and the second for the Active-Start).
- **active-start-param-change**: Enables an R-P event (and therefore a RADIUS accounting event) when an Active-Start is received from the PCF and there has been a parameter change.

Important: Note that a custom trigger policy with only **active-start-param-change** enabled is identical to the **standard** trigger-policy.

- **active-stop**: Enables an R-P event (and therefore a RADIUS accounting event) when an Active-Stop is received from the PCF.

Important: If the **radius accounting rp trigger-policy custom** command is executed without any of the optional keywords, all custom options are disabled.

- **standard**: Specifies the use of Standard RADIUS accounting policy for R-P in accordance with IS-835B.

trigger-stop-start

Specifies that a stop/start RADIUS accounting pair should be sent to the RADIUS server when an applicable R-P event occurs.

Usage

Use this command to configure the events for which a RADIUS event is sent to the server when the accounting procedures vary between servers.

Example

The following command enables an R-P event (and therefore a RADIUS accounting event) when an Active-Stop is received from the PCF:

```
radius accounting rp trigger-event active-stop
```

The following command generates the STOP only when active-stop received from the old PCF when handoff occurs:

```
default radius accounting rp handoff-stop
```

radius accounting server

Configures RADIUS accounting server(s) in the current context for accounting.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius [mediation-device] accounting server *ip_address* **[encrypted] key** *value* **[acct-on { enable | disable }] [acct-off { enable | disable }] [max** *msgs* **] [oldports] [port** *port_number* **] [priority** *priority* **] [type { mediation-device | standard }] [admin-status { enable | disable }] [-noconfirm]**

no radius [mediation-device] accounting server *ip_address* **[oldports | port** *port_number* **]**

no

Removes the server or server port(s) specified from the list of configured servers.

mediation-device

Enables mediation-device specific AAA transactions use to communicate with this RADIUS server.

Important: If this option is not used, the system, by default, enables standard AAA transactions.

ip_address

Specifies the IP address of the accounting server. *ip_address* must be specified in dotted decimal notation for IPv4 or colon notation for IPv6. A maximum of 128 RADIUS servers can be configured per context. This limit includes accounting and authentication servers.

[encrypted] key *value*

Specifies the shared secret key used to authenticate the client to the servers. The **encrypted** keyword indicates the key specified is encrypted. The key *value* must be a string of 1 to 15 alpha and/or numeric characters or a string of 1 to 30 alpha and/or numeric characters when encrypted.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **key** keyword is the encrypted version of the plaint text key. Only the encrypted key is saved as part of the configuration file.

acct-on { enable | disable }

Default: **disable**
Enables and disables sending of the Accounting-On message when a new RADIUS server is added to the configuration.
When enabled, the Accounting-On message is sent when a new RADIUS server is added in the configuration. However, if for some reason the Accounting-On message cannot be sent at the time of server configuration

(for example, if the interface is down), then the message is sent as soon as possible. Once the Accounting-On message is sent, if it is not responded to after the configured RADIUS accounting timeout, the message is retried the configured number of RADIUS accounting retries. Once all retries have been exhausted, the system no longer attempts to send the Accounting-On message for this server.

acct-off { enable | disable }

Default: **enable**
Disables and enables the sending of the Accounting-Off message when a RADIUS server is removed from the configuration.
The Accounting-Off message is sent when a RADIUS server is removed from the configuration, or when there is an orderly shutdown. However, if for some reason the Accounting-On message cannot be sent at this time, it is never sent. The Accounting-Off message is sent only once, regardless of how many accounting retries are enabled.

max *msgs*

Default: 0
Specifies the maximum number of outstanding messages that may be allowed to the server. *msgs* must be an integer from 1 through 256.

oldports

Sets the UDP communication port to the out of date standardized default for RADIUS communications to 1646.

port *port_number*

Default: 1813
Specifies the port number to use for communications. *port_number* must be an integer from 0 through 65535.

priority *priority*

Default: 1000
Specifies the relative priority of this accounting server. The priority is used in server selection for determining which server to send accounting data to. *priority* must be an integer from 1 through 1000, where 1 is the highest priority. When configuring two or more servers with the same priority you will be asked to confirm that you want to do this. If you use the **-noconfirm** option, you are not asked for confirmation and multiple servers could be assigned the same priority.

type { mediation-device | standard }

Default: **standard**
mediation-device: Obsolete keyword.
Specifies the type of AAA transactions to use to communicate with this RADIUS server.
standard: Use standard AAA transactions.

admin-status { enable | disable }

Enables or disables the RADIUS authentication/accounting/ charging server functionality, and saves the status setting in the configuration file to re-establish the set status at reboot.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

This command is used to configure the RADIUS accounting servers with which the system is to communicate for accounting.
Up to 128 RADIUS servers can be configured per context. The servers can be configured as Accounting, Authentication, charging servers, or any combination thereof.

Example

```
radius accounting server 1.2.3.4 key sharedKey port 1024 max 127
```

```
radius accounting server 1.2.5.6 encrypted key scrambledKey oldports
priority10
```

```
no radius accounting server 1.2.5.6
```

The following command sets the accounting server with mediation device transaction for AAA server *1.2.3.4*:

```
radius mediation-device accounting server 1.2.3.4 key sharedKey port 1024
max 127
```

radius algorithm

Configures the RADIUS authentication server selection algorithm for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius algorithm { first-server | round-robin }

default radius algorithm
```

default

Configures this command with the default settings.

first-server | round-robin

Default: **first-server**
first-server: Authentication data is sent to the first available server based upon the relative priority of each configured server.
round-robin: Authentication data is sent in a circular queue fashion on a per Session Manager task basis where data is sent to the next available server and restarts at the beginning of the list of configured servers. The order of the list is based upon the configure relative priority of the servers.

Usage

Set the context's RADIUS server selection algorithm to ensuring proper load distribution through the servers available.

Example

```
radius algorithm first-server

radius algorithm round-robin
```

radius allow

Sets the system behavior for allowing subscriber sessions when RADIUS accounting and/or authentication is unavailable.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] radius allow { accounting-down | authentication-down }
```

no

Removes earlier configuration for the specified keyword.

authentication-down

Default: Disabled
Allows sessions while authentication is not available (down).

accounting-down

Default: Enabled
Allows sessions while accounting is unavailable (down).

Usage

Allow sessions during system troubles when the risk of IP address and/or subscriber spoofing is minimal. The denial of sessions may cause dissatisfaction with subscribers at the cost/expense of verification and/or accounting data.

Example

```
radius allow authentication-down

no radius allow authentication-down

radius allow accounting-down

no radius allow accounting-down
```

radius attribute

Configures the system's RADIUS identification parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius attribute { nas-identifier id | nas-ip-address address *primary_address* **[backup** *second_address* **] [nexthop-forwarding-address** *nexthop_address* **] [vlan** *vlan_id* **] [mpls-label input** *in_label_value* **output** *out_label_value1 out_label_value1* **] }**

no radius attribute { nas-identifier | nas-ip-address }

default radius attribute nas-identifier

no

Removes earlier configuration for the specified keyword.

default

Configures this command with the default settings.

nas-identifier *id*

Specifies the attribute name by which the system will be identified in Access-Request messages. *id* must be a case-sensitive alpha and/or numeric string of 1 through 32 characters in length.

nas-ip-address address *primary_address*

Specifies the AAA interface IP address(es) to used to identify the system. Up to two addresses can be configured.
primary_address : The IP address of the primary interface to use in the current context. This must be specified in dotted decimal notation for IPv4 or colon notation for IPv6.

backup *second_address*

Specifies the IP address of the secondary interface to use in the current context. This must be in dotted decimal notation for IPv4 or colon notation for IPv6.

mpls-label input *in_label_value* **| output** *out_label_value1* **[** *out_label_value2* **]**

This command configures the traffic from the specified AAA client NAS IP address to use the specified MPLS labels.

- *in_label_value* is the MPLS label that identifies inbound traffic destined for the configured NAS IP address.

- *out_label_value1* and *out_label_value2* identify the MPLS labels to be added to the packets sent from the specified NAS IP address.
  - *out_label_value1* is the inner output label.
  - *out_label_value2* is the outer output label.

MPLS label values must be an integer from 16 to 1048575.

Important: This option is available only when nexthop-forwarding gateway is also configured with **nexthop-forwarding-address** keyword.

nexthop-forwarding-address *nexthop_address*

Configures the next hop IP address for this NAS IP address.
nexthop_address must be an IPv4 address or an IPv6 address in standard format.

vlan *vlan_id*

Configures VLAN ID to be associated with the next-hop IP address.
vlan_id must be an integer from 1 through 4094.

Usage

This is necessary for NetWare Access Server usage such as the system must be identified to the NAS.
The system supports the concept of the active nas-ip-address. The active nas-ip-address is defined as the current source ip address for RADIUS messages being used by the system. This is the content of the nas-ip-address attribute in each RADIUS message.
The system will always have exactly one active nas-ip-address. The active nas-ip-address will start as the primary nas-ip-address. However, the active nas-ip-address may switch from the primary to the backup, or the backup to the primary. The following events will occur when the active nas-ip-address is switched:

- All current in-process RADIUS accounting messages from the entire system are cancelled. The accounting message is re-sent, with retries preserved, using the ne w active nas-ip-address. Acct-Delay-Time, however, is updated to reflect the time that has occurred since the accounting event. The value of Event-Timestamp is preserved.
- All current in-process RADIUS authentication messages from the entire system are cancelled. The authentication message is re-sent, with retries preserved, using the new active nas-ip-address. The value of Event-Timestamp is preserved.
- All subsequent in-process RADIUS requests uses the new active nas-ip-address.

The system uses a revertive algorithm when transitioning active NAS IP addresses as described below:

- If the configured primary nas-ip-address transitions from UP to DOWN, and the backup nas-ip-address is UP, then the active nas-ip-address switches from the primary to the backup nas-ip-address
- If the backup nas-ip-address is active, and the primary nas-ip-address transitions from DOWN to UP, then the active nas-ip-address switches from the backup to the primary nas-ip-address

Example

```
radius attribute nas-ip-address 1.2.3.4

no radius attribute nas-identifier sampleID
```

radius authenticate

Enables (allows) and disables (prevents) the authentication of user names that are blank or empty. This is enabled by default.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] radius authenticate null-username
```

default

Configures this command with the default settings for authenticating, sending Access-Request messages to the AAA server, all user names, including NULL user names.

no

Disables sending an Access-Request message to the AAA server for user names (NAI) that are blank.

Usage

Use this command to disable, or re-enable, sending Access-Request messages to the AAA server for user names (NAI) that are blank (NULL).

Example

To disable sending Access-Request messages for user names (NAI) that are blank, enter the following command:

```
no radius authenticate null-username
```

To re-enable sending Access-Request messages for user names (NAI) that are blank, enter the following command:

```
radius authenticate null-username
```

radius authenticate apn-to-be-included

Configures the APN name to be included for RADIUS authentication.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default ] radius authenticate apn-to-be-included { gi | gn }
```

default

Configures this command with the default settings.

gi

Specifies the usage of Gi APN name in the RADIUS authentication request. Gi APN represents the APN received in the Create PDP Context Request message from the SGSN.

gn

Specifies the usage of Gn APN name in the RADIUS authentication request. Gn APN represents the APN selected by the GGSN.

Usage

Use this command to configure the APN name for RADIUS authentication. This can be set to either gi or gn.

Example

The following command specifies the usage of Gn APN name in the RADIUS authentication request.

```
radius authenticate apn-to-be-included gn
```

radius authenticator-validation

Enables (allows) and disables (prevents) the MD5 authentication of RADIUS user. This is enabled by default.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] radius authenticator-validation
```

no

Disables MD5 authentication validation for an Access-Request message to the AAA server.

default

Enables MD5 authentication validation for an Access-Request message to the AAA server.

no

Disable sending an Access-Request message to the AAA server for usernames (NAI) that are blank.

Usage

Use this command to disable, or re-enable, sending Access-Request messages to the AAA server for MD5 validation.

Example

To disable MD5 authentication validation for Access-Request messages for usernames (NAI), enter the following command:

```
no radius authenticator-validation
```

To enable MD5 authentication validation for Access-Request messages for usernames (NAI), enter the following command:

```
radius radius authenticator-validation
```

radius change-authorize-nas-ip

Defines the NAS IP address and UDP port on which the current context will listen for Change of Authorization (COA) messages and Disconnect Messages (DM). If the NAS IP address is not defined with this command, any COA or DM messages from the RADIUS server are returned with a Destination Unreachable error.

Product

PDSN, FA, HA, GGSN, LNS

Privilege

Security Administrator, Administrator

Syntax

[no] radius change-authorize-nas-ip *ip_address* **[encrypted] key** *value* **[port** *port* **] [event-timestamp-window** *window* **] [no-nas-identification-check] [no-reverse-path-forward-check] [mpls-label input** *in_label_value* **| output** *out_label_value1* **[** *out_label_value2* **]**

no

Deletes the NAS IP address information which disables the system from receiving and responding to COA and DM messages from the RADIUS server.

ip_address

Specifies the NAS IP address of the current context's AAA interface that was defined with the **radius attribute** command.
ip_address can either be an IPv4 address expressed in dotted decimal notation, or an IPv6 address expressed in colon notation.

[encrypted] key *value*

Specifies the shared secret key used to authenticate the client to the servers. The **encrypted** keyword indicates the key specified is encrypted. The key *value* must be a string of 1 to 15 alpha and/or numeric characters or a string of 1 to 30 alpha and/or numeric characters when encrypted.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **key** keyword is the encrypted version of the plain text key. Only the encrypted key is saved as part of the configuration file.

port *port*

Default: 3799
The UDP port on which to listen for COA and DM messages.

event-timestamp-window *window*

Default: 300 seconds
window must be an integer from 0 through 4294967295.
When a COA or DM request is received with an event-time-stamp, if the current-time is greater than received-pkt-event-time-stamp plus event-time-stamp-window, the packet is silently discarded
When a COA or DM request is received without the event-timestamp attribute, the packet is silently discarded.

If *window* is specified as 0 (zero), this feature is disabled; the event-time-stamp attribute in COA or DM messages is ignored and the event-time-stamp attribute is not included in NAK or ACK messages.

no-nas-identification-check

Disables the context from checking the NAS Identifier/ NAS IP Address while receiving the CoA/DM requests.
By default this check is enabled.

no-reverse-path-forward-check

Disables the context from checking whether received COA or DM packets are from one of the AAA servers configured in the current context. Only the src-ip address in the received COA or DM request is validated and the port and key are ignored.
reverse-path-forward-check is enabled by default.
When reverse-path-forward-check is disabled, CoA and DM messages are accepted from any AAA server.

mpls-label input *in_label_value* **| output** *out_label_value1* **[** *out_label_value2* **]**

This command configures COA traffic to use the specified MPLS labels.

- *in_label_value* is the MPLS label that identifies inbound COA traffic.
- *out_label_value1* and *out_label_value2* identify the MPLS labels to be added to COA response.
  - *out_label_value1* is the inner output label.
  - *out_label_value2* is the outer output label.

MPLS label values must be an integer from 16 to 1048575.

Usage

Use this command to enable the current context to listen for COA and DM messages.
Any one of the following RADIUS attributes may be used to identify the subscriber:

- **3GPP-IMSI**: The subscriber's IMSI. It may include the 3GPP-NSAPI attribute to delete a single PDP context rather than all of the PDP contexts of the subscriber when used with the GGSN product.
- **Framed-IP-address**: The subscriber's IP address.
- **Acct-Session-Id**: Identifies a subscriber session or PDP context.

Important: For the GGSN product, the value for Acct-Session-Id that is mandated by 3GPP is used instead of the special value for Acct-Session-Id that we use in the RADIUS messages we exchange with a RADIUS accounting server.

Important: When this command is used in conjunction with the GGSN, CoA functionality is not supported.

Example

Specify the IP address *192.168.100.10* as the NAS IP address, a key value of *123456* and use the default port of *3799*, by entering the following command:

```
radius change-authorize-nas-ip 192.168.100.10 key 123456
```

Following disables the nas-identification-check for the above parameters:

```
radius change-authorize-nas-ip 192.168.100.10 key 123456 no-nas-
identification-check
```

radius charging

Configures basic RADIUS options for Active Charging Services.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no | default] radius charging { deadtime *dead_minutes* **| detect-dead-server { consecutive-failures** *count* **| response-timeout seconds } | max-outstanding** *msgs* **| max-retries** *tries* **| max-transmissions** *transmissions* **| timeout** *idle_seconds* **}**

no

Removes configuration for the specified keyword.

default

Configures this command with the default settings.

deadtime *dead_minutes*

Default: 10
Specifies the number of minutes to wait before attempting to communicate with a server which has been marked as unreachable. *dead_minutes* must be an integer from 0 through 65535.

detect-dead-server { consecutive-failures *count* **| response-timeout** *seconds* **}**

consecutive-failures *count*: Default: 4. Specifies the number of consecutive failures, for each AAA manager, before a server is marked as unreachable. *count* must be an integer from 0 through 1000.
response-timeout *seconds*: Specifies the number of seconds for each AAA manager to wait for a response to any message before a server is detected as failed, or in a down state.

max-outstanding *msgs*

Default: 256
Specifies the maximum number of outstanding messages a single AAA manager instance will queue. *msgs* must be an integer from 1 through 4000.

max-retries *tries*

Default: 5
Specifies the maximum number of times communication with a AAA server will be attempted before it is marked as unreachable and the detect dead servers consecutive failures count is incremented. *tries* must be an integer from 0 through 65535.

max-transmissions *transmissions*

Default: Disabled

Sets the maximum number of re-transmissions for RADIUS authentication requests. This limit is used in conjunction with the **max-retries** for each server.
When failing to communicate with a RADIUS sever, the subscriber is failed once all of the configured RADIUS servers have been exhausted or once the configured number of maximum transmissions is reached. For example, if 3 servers are configured and if the configured max-retries is 3 and max-transmissions is 12, then the primary server is tried 4 times (once plus 3 retries), the secondary server is tried 4 times, and then a third server is tried 4 times. If there is a fourth server, it is not tried because the maximum number of transmissions (12) has been reached.
transmissions must be an integer from 1 through 65535.

timeout *idle_seconds*

Default: 3
Specifies the number of seconds to wait for a response from the RADIUS server before re-sending the messages. *idle_seconds* must be an integer from 1 through 65535.

Usage

Manage the basic Charging Service RADIUS options according to the RADIUS server used for the context.

Example

```
radius charging detect-dead-server consecutive-failures 6
radius charging timeout 300
```

radius charging accounting algorithm

This command specifies the fail-over/load-balancing algorithm to be used for selecting RADIUS servers for charging services.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

radius charging accounting algorithm { first-n *n* **| first-server | round-robin }**

first-n *n*

Default: 1 (Disabled)
Specifies that the AGW must send accounting data to *n* (more than one) AAA servers based on their priority. Response from any one of the *n* AAA servers would suffice to proceed with the call. The full set of accounting data is sent to each of the *n* AAA servers.
n is the number of AAA servers to which accounting data will be sent, and must be an integer from 2 through 128.

first-server

Specifies that the context must send accounting data to the RADIUS server with the highest configured priority. In the event that this server becomes unreachable, accounting data is sent to the server with the next-highest configured priority. This is the default algorithm.

round-robin

Specifies that the context must load balance sending accounting data among all of the defined RADIUS servers. Accounting data is sent in a circular queue fashion on a per Session Manager task basis, where data is sent to the next available server and restarts at the beginning of the list of configured servers. The order of the list is based upon the configured relative priority of the servers.

Usage

Use this command to specify the accounting algorithm to use to select RADIUS servers for charging services configured in the current context.

Example

The following command specifies to use the round-robin algorithm to select the RADIUS server:

```
radius charging accounting algorithm round-robin
```

radius charging accounting server

Configures RADIUS charging accounting servers in the current context for Active Charging Services prepaid accounting.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius charging accounting server ip_address [ encrypted ] key value [ max msgs
] [ max-rate max_rate ] [ oldports ] [ port port_number ] [ priority priority ]
[ admin-status { enable | disable } ] [ -noconfirm ]

no radius charging accounting server ip_address [ oldports | port port_number ]
```

no

Removes the server or server port(s) specified from the list of configured servers.

ip_address

Specifies IP address of the accounting server. *ip_address* must be specified using the standard IPv4 dotted decimal notation. A maximum of 128 RADIUS servers can be configured per context. This limit includes accounting and authentication servers.

[encrypted] key *value*

Specifies the shared secret key used to authenticate the client to the servers. The **encrypted** keyword indicates the key specified is encrypted. The key *value* must be a string of 1 to 15 alpha and/or numeric characters, or when encrypted a string of 1 to 30 alpha and/or numeric characters.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **key** keyword is the encrypted version of the plaint text key. Only the encrypted key is saved as part of the configuration file.

max *msgs*

Default: 0
Specifies the maximum number of outstanding messages that may be allowed to the server.
msgs must be integer from 0 through 4000.

max-rate *max_rate*

Default: Disabled
Specifies the rate (number of messages per second), at which the authentication messages should be sent to the RADIUS server.
max_rate must be an integer from 1 through 1000.

oldports

Sets the UDP communication port to the out of date standardized default for RADIUS communications to 1646.

port *port_number*

Default: 1813
Specifies the port number to use for communications. *port_number* must be an integer from 0 through 65535.

priority *priority*

Default: 1000
Specifies the relative priority of this accounting server. The priority is used in server selection for determining which server to send accounting data to. *priority* must be a value in the range 1 through 1000 where 1 is the highest priority.

admin-status { enable | disable }

Enables or disables the RADIUS authentication/ accounting/charging server functionality, and saves the status setting in the configuration file to re-establish the set status at reboot.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

This command is used to configure the RADIUS charging accounting server(s) with which the system is to communicate for Active Charging Services prepaid accounting requests.
Up to 128 AAA servers can be configured per context when the system is functioning as a PDSN and/or HA.
Up to 16 servers are supported per context when the system is functioning as a GGSN.

Example

```
radius charging accounting server 1.2.3.4 key sharedKey port 1024 max 127

radius charging accounting server 1.2.5.6 encrypted key scrambledKey
oldports priority 10

no radius charging accounting server 1.2.5.6
```

radius charging algorithm

Configures the RADIUS authentication server selection algorithm for Active Charging Services for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius charging algorithm { first-server | round-robin }

default radius charging algorithm
```

default

Configures this command with the default settings.
Default: **first-server**

first-server

Accounting data is sent to the first available server based upon the relative priority of each configured server.

round-robin

Accounting data is sent in a circular queue fashion on a per Session Manager task basis where data is sent to the next available server and restarts at the beginning of the list of configured servers. The order of the list is based upon the configured relative priority of the servers.

Usage

Set the context's RADIUS server selection algorithm for Active Charging Services to ensure proper load distribution through the servers available.

Example

```
radius algorithm first-server

radius algorithm round-robin
```

radius charging server

Configures the RADIUS charging server(s) in the current context for Active Charging Services prepaid authentication.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius charging server *ip_address* **[encrypted] key** *value* **[max** *msgs* **] [max-rate** *max_rate* **] [oldports] [port** *port_number* **] [priority** *priority* **] [admin-status { enable | disable }] [-noconfirm]**

no radius charging server *ip_address* **[oldports | port** *port_number* **]**

---

no

Removes the server or server port(s) specified from the list of configured servers.

---

ip_address

Specifies the IP address of the server. *ip_address* must be specified using the standard IPv4 dotted decimal notation. A maximum of 128 RADIUS servers can be configured per context. This limit includes accounting and authentication servers.

[encrypted] key *value*

Specifies the shared secret key used to authenticate the client to the servers. The **encrypted** keyword indicates the key specified is encrypted. The key *value* must be a string of 1 to 15 alpha and/or numeric characters, or when encrypted a string of 1 to 30 alpha and/or numeric characters.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **key** keyword is the encrypted version of the plain text key. Only the encrypted key is saved as part of the configuration file.

---

max *msgs*

Default: 256
Specifies the maximum number of outstanding messages that may be allowed to the server.
msgs must be an integer from 0 through 4000.

---

max-rate *max_rate*

Default: Disabled
Specifies the rate (number of messages per second), at which the authentication messages should be sent to the RADIUS server.
max_rate must be an integer from 1 through 1000.

---

oldports

Sets the UDP communication port to the old default for RADIUS communications to 1645.

port *port_number*

Default: 1812
Specifies the port number to use for communications. *port_number* must be an integer from 0 through 65535.

priority *priority*

Default: 1000
Specifies the relative priority of this accounting server. The priority is used in server selection for determining which server to send accounting data to. *priority* must be a value in the range 1 through 1000 where 1 is the highest priority.

admin-status { enable | disable }

Enables or disables the RADIUS authentication/accounting/charging server functionality and saves the status setting in the configuration file to re-establish the set status at reboot.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

This command is used to configure the RADIUS charging server(s) with which the system is to communicate for Active Charging Services prepaid authentication requests.
Up to 128 AAA servers can be configured per context when the system is functioning as a PDSN and/or HA. Up to 16 servers are supported per context when the system is functioning as a GGSN.

Example

```
radius charging server 1.2.3.4 key sharedKey port 1024 max 127

radius charging server  1.2.5.6 encrypted key scrambledKey oldports
priority 10 ]

no radius server 1.2.5.6
```

radius dictionary

This command configures the RADIUS dictionary for RADIUS prepaid charging.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius dictionary *dictionary*

default radius dictionary

default

Configures the default dictionary.

dictionary *dictionary*

Specifies the dictionary to use.
The possible values are described in the following table.

Table 17. RADIUS Dictionary Types

Dictionary	Description
3gpp	This dictionary consists of all the attributes in the standard dictionary, and all of the attributes specified in 3GPP 32.015.
3gpp2	This dictionary consists of all the attributes in the standard dictionary, and all of the attributes specified in IS-835-A.
3gpp2-835	This dictionary consists of all the attributes in the standard dictionary, and all of the attributes specified in IS-835.
custom*XX*	These are customized dictionaries. For information on custom dictionaries, please contact your local service representative. *XX* is the integer value of the custom dictionary. ***Important:*** RADIUS dictionary *custom23* should be used in conjunction with Active Charging Service (ACS).
standard	This dictionary consists only of the attributes specified in RFC 2865, RFC 2866, and RFC 2869.
starent	This dictionary consists of all the attributes in the starent-vsa1 dictionary and incorporates additional VSAs by using a two-byte VSA Type field. This dictionary is the master-set of all of the attributes in all of the dictionaries supported by the system.

Dictionary	Description
starent-835	This dictionary consists of all of the attributes in the starent-vsa1-835 dictionary and incorporates additional VSAs by using a two-byte VSA Type field. This dictionary is the master-set of all of the attributes in all of the -835 dictionaries supported by the system.
starent-vsa1	This dictionary consists not only of the 3gpp2 dictionary, but also includes vendor-specific attributes (VSAs) as well. The VSAs in this dictionary support a one-byte wide VSA Type field in order to support certain RADIUS applications. The one-byte limit allows support for only 256 VSAs (0–255). This is the default dictionary.
starent-vsa1-835	This dictionary consists not only of the 3gpp2-835 dictionary, but also includes vendor-specific attributes (VSAs) as well. The VSAs in this dictionary support a one-byte wide VSA Type field in order to support certain RADIUS applications. The one-byte limit allows support for only 256 VSAs (0–255). This is the default dictionary.

Usage

Use this command to assign the RADIUS dictionary according to the RADIUS server used for the context.

Example

The following command sets *custom23* as dictionary for prepaid charging:

```
radius dictionary custom23
```

radius group

This command has been deprecated and is replaced by AAA Server Group configurations. See the *AAA Server Group Configuration Mode Commands* chapter.

radius ip vrf

This command associates the default AAA group with a Virtual Routing and Forwarding (VRF) Context instance for GRE tunnel interface configuration. By default the VRF is NULL, which means that default AAA group is associated with global routing table.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius ip vrf *vrf_name*

no radius ip vrf

no

Removes/disassociates configured IP Virtual Routing and Forwarding (VRF) context instance.

vrf_name

Specifies the name of a pre-configured VRF context instance.
vrf_name is name of a pre-configured virtual routing and forwarding (VRF) context configured in Context Configuration Mode through **ip vrf** command.

Usage

Use this command to associate/disassociate a pre-configured VRF context for a GRE tunnel interface.
By default the VRF is NULL, which means that default AAA group is associated with global routing table.

Example

Following command associates VRF context instance *GRE_vrf1* with this AAA group:

radius ip vrf *GRE_vrf1*

radius keepalive

Configures the keepalive authentication parameters for the RADIUS server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[default] radius keepalive [calling-station-id *id* **| consecutive-response** *number* **| encrypted | interval** *seconds* **| password | retries** *number* **| timeout** *seconds* **| username** *name* **| valid-response access-accept [access-reject]]**

default

Configures this command with the default settings.

calling-station-id *id*

Configures the Calling-Station-Id to be used for the keepalive authentication. *id* must be an alpha and/or numeric string of 1 through 15 characters in length.
Default: 000000000000000

consecutive-response *number*

Configures the number of consecutive authentication response after which the server is marked as reachable. *number* must be integer from 1 through 5.
Default: 1

encrypted password

Designates use of encryption for the password. *password* must be an alpha and/or numeric string of 1 through 64 characters in length.
Default: Test-Password

interval *seconds*

Configures the time interval between the two keepalive access requests.
Default: 30 seconds

password

Configures the password to be used for the authentication. *password* must be an alpha and/or numeric string of 1 through 64 characters in length.
Default: Test-Password

retries *number*

Configures the number of times the keepalive access request to be sent before marking the server as unreachable. *number* must be an integer from 3 through 10.
Default: 3

timeout *seconds*

Configures the time interval between each keepalive access request retries. *seconds* must be an integer from 1 through 30.
Default: 3 seconds

username *name*

Configures the username to be used for the authentication. *name* must be an alpha and/or numeric string of 1 through 127 characters in length.
Default: Test-Username

valid-response access-accept [*access-reject* **]**

Configures the valid response for the authentication request.
If *access-reject* is configured, then both access-accept and access-reject are considered as success for the keepalive authentication request.
If *access-reject* is not configured, then only access-accept is considered as success for the keepalive access request.
Default: **keepalive valid-response access-accept**

Usage

Use this command to configure the Keepalive Authentication parameters for the RADIUS server.

Example

The following command sets the user name for the RADIUS keepalive access requests to *Test-Username2*:

```
radius keepalive username Test-Username2
```

The following command sets the number of retries to *4*:

```
radius keepalive retries 4
```

radius mediation-device

See the **radius accounting server** command.

radius probe-interval

Configures the interval duration between two RADIUS authentication probes.

Product

GGSN, HA

Privilege

Security Administrator, Administrator

Syntax

radius probe-interval *seconds*

default radius probe-interval

default

Configures this command with the default settings.

seconds

Default: 3
Specifies the amount of time in seconds to wait before sending another probe authentication request to a RADIUS server. *seconds* must be an integer from 1 through 65535.

Usage

Use this command for Home Agent Geographical Redundancy (HAGR) support to set the duration between two authentication probes to the RADIUS serve.

Example

Following command sets the authentication probe interval to 30 seconds.

radius probe-interval *30*

radius probe-max-retries

Configures the number of retries for RADIUS authentication probe response.

Product

GGSN, HA

Privilege

Security Administrator, Administrator

Syntax

radius probe-max-retries *retries*

default radius probe-max-retries

default

Configures this command with the default settings.

retries

Default: 5
Specifies the number of retries for RADIUS authentication probe response before the authentication is declared as failed.
retries must be an integer from 1 through 65535.

Usage

Use this command for Interchassis Session Recovery (ICSR) support to set the number of attempts to send RADIUS authentication probe without a response before the authentication is declared as failed.

Example

The following command sets the maximum number of retries to *6*:

radius probe-max-retries *6*

radius probe-timeout

Configures the timeout duration to wait for a response for RADIUS authentication probes.

Product

GGSN, HA

Privilege

Security Administrator, Administrator

Syntax

radius probe-timeout *idle_seconds*

default radius probe-timeout

default

Configures the default setting.

idle_seconds

Default: 3
Specifies the number of seconds to wait for response from the RADIUS server before resending the authentication probe.
idle_seconds must be an integer from 1 through 65535.

Usage

Use this command for Interchassis Session Recovery (ICSR) support to set the duration to wait for response before re-sending the RADIUS authentication probe to the RADIUS server.

Example

The following command sets the authentication probe timeout to *120* seconds:

radius probe-timeout *120*

radius server

Configures RADIUS authentication server(s) in the current context for authentication.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius server *ip_address* **[encrypted] key** *value* **[max** *msgs* **] [max-rate** *max_rate* **] [oldports] [port** *port_number* **] [priority** *priority* **] [probe | no-probe] [probe-username** *user_name* **] [probe-password [encrypted] password** *password* **] [type { mediation-device | standard }] [admin-status { enable | disable }] [-noconfirm]**

no radius server *ip_address* **[oldports | port** *port_number* **]**

no

Removes the server or server port(s) specified from the list of configured servers.

ip_address

Specifies the IP address of the server. *ip_address* must be specified in dotted decimal notation for IPv4 or colon notation for IPv6. A maximum of 128 RADIUS servers can be configured per context. This limit includes accounting and authentication servers.

[encrypted] key *value*

Specifies the shared secret key used to authenticate the client to the servers. The **encrypted** keyword indicates the key specified is encrypted. The key *value* must be a string of 1 to 15 alpha and/or numeric characters or a string of 1 to 30 alpha and/or numeric characters when encrypted.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **key** keyword is the encrypted version of the plain text key. Only the encrypted key is saved as part of the configuration file.

max *msgs*

Default: 256
Specifies the maximum number of outstanding messages that may be allowed to the server.
msgs must be an integer from 0 through 4000.

max-rate *max_rate*

Specifies the rate (number of messages per second), at which the authentication messages should be sent to the RADIUS server.
max_rate must be an integer from 1 through 1000.
Default: disabled

oldports

Sets the UDP communication port to the old default for RADIUS communications to 1645.

port *port_number*

Default: 1812
Specifies the port number to use for communications.
port_number must be an integer from 1 through 65535.

priority *priority*

Default: 1000
Specifies the relative priority of this accounting server. The priority is used in server selection for determining which server to send accounting data to. *priority* must be a value in the range 1 through 1000 where 1 is the highest priority. When configuring two or more servers with the same priority you will be asked to confirm that you want to do this. If you use the **-noconfirm** option, you are not asked for confirmation and multiple servers could be assigned the same priority.

probe

Enable probe messages to be sent to the specified RADIUS server.

no-probe

Disable probe messages from being sent to the specified RADIUS server. This is the default behavior.

probe-username *username*

The user name sent to the RADIUS server to authenticate probe messages. *user_name* must be an alpha and/or numeric string of 1 through 127 characters in length.

probe-password [encrypted] password *password*

The password sent to the RADIUS server to authenticate probe messages.
encrypted: This keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.
password *password*: Specifies the probe-user password for authentication. *password* must be an alpha and/or numeric string of 1 through 63 characters in length.

type { mediation-device | standard }

Specifies the type of transactions the RADIUS server accepts.
mediation-device: Specifies mediation-device specific AAA transactions. This device is available if you purchased a transaction control services license. Contact your local sales representative for licensing information.
standard: Specifies standard AAA transactions. (Default)

admin-status { enable | disable }

Enables or disables the RADIUS authentication/accounting/charging server functionality, and saves the status setting in the configuration file to re-establish the set status at reboot.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

This command is used to configure the RADIUS authentication server(s) with which the system is to communicate for authentication.
Up to 128 RADIUS servers can be configured per context. The servers can be configured as Accounting, Authentication, charging servers, or any combination thereof.

Example

```
radius server 1.2.3.4 key sharedKey port 1024 max 127
radius server 1.2.5.6 encrypted key scrambledKey oldports priority 10
no radius server 1.2.5.6
```

route-access-list extended

This command configures an access list for filtering routes based on a specified range of IP addresses.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

route-access-list extended *identifier* **{ deny | permit } ip { *network_parameter* } { *mask_parameter* }**

no route-access-list extended *identifier* **{ deny | permit } ip { *network_parameter* } { *mask_parameter* }**

---

no

Deletes the specified route access list.

---

identifier

A value to identify the route access list.
identifier must be an integer from 100 through 999.

---

deny

Deny routes that match the specified criteria.

---

permit

Permit routes that match the specified criteria.

---

network_parameter

This specifies the network portion of the route to match. The network portion of the route is mandatory and must be expressed in one of the following ways:
ip_address wildcard_mask: A network address and wildcard mask expressed in IPv4 dotted decimal notation. (192.168.100.0 0.0.0.255)
any : Match any network address.
host *network_address* : Match the specified network address exactly. *network_address* must be an IPv4 address specified in dotted decimal notation.

---

mask_parameter

This specifies the mask portion of the route to match. The mask portion of the route is mandatory and must be expressed in one of the following ways;
mask_address wildcard_mask: A mask address and wildcard mask expressed in IPv4 dotted decimal notation. (255.255.255.0 0.0.0.255)
any : Match any network mask.
host *mask_address* : Match the specified mask address exactly. *mask_address* must be an IPv4 address specified in dotted decimal notation.

Usage

Use this command to create an extended route-access-list that matches routes based on network addresses and masks.

Example

Use the following command to create an extended route-access-list:

```
route-access-list extended 100 permit ip 192.168.100.0 0.0.0.255
255.255.255.0 0.0.0.255
```

route-access-list named

This command configures an access list for filtering routes based on a network address and net mask.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

route-access-list named *list_name* **{ deny | permit } { *ip_address/mask* | any } [exact-match]**

no route-access-list named *list_name* **{ deny | permit } { *ip_address/mask* | any } [exact-match]**

no

Deletes the specified route access list.

list_name

A name that identifies the route access list. *list_name* must be a string of 1 through 79 alphanumeric characters in length.

deny

Deny routes that match the specified criteria.

permit

Permit routes that match the specified criteria.

ip_address/mask

The IP address (in dotted-decimal notation) and the number of subnet bits, representing the subnet mask in shorthand. This variable must be entered in the dotted-decimal notation/subnet bits format (1.1.1.1/24).

any

Match any route.

exact-match

Match the IP address prefix exactly.

Usage

Use this command to create route-access lists that specify routes that are accepted.

Example

Use the following command to create a route access list named *list27* that permits routes that match *192.168.1.0/24* exactly:

```
route-access-list named list27 permit 192.168.1.0/24 exact-match
```

To delete the list, use the following command:

```
no route-access-list named list27 permit 192.168.1.0/24 exact-match
```

route-access-list standard

This command configures an access-list for filtering routes based on network addresses.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

route-access-list standard *identifier* **{ permit | deny } { ***ip_address wildcard_mask* **| any | host** *network_address* **}**

no route-access-list standard *identifier* **{ permit | deny } { ***ip_address wildcard_mask* **| any | host** *network_address* **}**

no

Deletes the specified route access list.

identifier

This is a value that identifies the route-access-list. This must be an integer from 1 through 99.

deny

Deny routes that match the specified criteria.

permit

Permit routes that match the specified criteria.

ip_address wildcard_mask

The IP address and subnet mask to match for routes. Both *ip_address* and *wildcard_mask* must be entered in IPv4 dotted decimal notation. (192.168.100.0 255.255.255.0)

any

Match any route.

host *network_address*

Routes must match the specified network address as if it had a 32-bit network mask. *network_address* must be an IPv4 address specified in dotted decimal notation.

Usage

Use this command to create route-access-lists that specify routes that are accepted.

Example

Use the following command to create a route access list with an identifier of *10* that permits routes:

```
route-access-list standard 10 permit 192.168.1.0 255.255.255.0
```

To delete the list, use the following command:

```
no route-access-list standard 10 permit 192.168.1.0 255.255.255.0
```

route-map

This command creates a route-map that is used by the routing features and enters Route-map Configuration mode. A route-map allows redistribution of routes. A routemap has a list of match and set commands associated with it. The match commands specify the conditions under which redistribution is allowed and the set commands specify the particular redistribution actions to be performed if the criteria specified by match commands are met. Route-maps are used for detailed control over route distribution between routing processes. Up to eight route-maps can be created in each context. Refer to the *Route-map Configuration Mode Commands* chapter for more information.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

route-map *map_name* **{ deny | permit }** *seq_number*

no route-map *map_name*

no

Deletes the specified route-map.

map_name

The name of the route-map to create or edit. This is a string of characters from 1 through 69 characters long.

deny

If the deny parameter is specified and the match command criteria are met, the route is not redistributed and any other route maps with the same map name are not examined. Set commands have no affect on deny route-maps.

permit

If the permit parameter is specified, and the match criteria are met, the route is redistributed as specified by set actions. If the match criteria are not met, the next route map with the same name is tested.

seq_number

The sequence number that indicates the position a new route map is to have in the list of route maps already configured with the same name. Route maps with the same name are tested in ascending order of their sequence numbers. This must be an integer from 1 through 65535.

Usage

Use this command to create route maps that allow redistribution of routes based on specified criteria and set parameters for the routes that get redistributed. The chassis supports a maximum of 64 route maps per context.

Example

To create a route map named map1 that permits routes that match the specified criteria, use the following command:

```
route-map map1 permit 10
```

To delete the route-map, enter the following command:

```
no route-map map1 permit 10
```

router

This command enables the OSPF routing functionality and enters the OSPF Configuration Mode. Refer to the *OSPF Configuration Mode Commands* chapter for details on OSPF Configuration mode commands.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

router { **ospf rip** | **bgp** *as_number* | **ospfv3** }

no

Disables the specified routing support in the current context.

ospf

Enable OSPF routing in this context and enter OSPF Configuration Mode.

bgp *as_number*

Enable a BGP routing service for this context and assign it the specified AS number. *as_number* must be an integer from 1 through 65535.

Important: BGP routing is supported only for use with the HA.

ospfv3

Enable OSPFv3 routing in this context and enter OSPFv3 Configuration mode.

Usage

Use this command to enable and configure OSPF and BGP routing in the current context.

Important: You must obtain and install a valid OSPF or BGP-4 feature use license key to use OSPF and BGP routing features. Refer to the *System Administration Guide* for details on obtaining and installing feature use license keys.

Example

The following command enables the OSPF routing functionality and enters the OSPF Configuration Mode:

```
router ospf
```

The following command enables a BGP routing service with an AS number of *100*, and enters the BGP Configuration Mode:

```
router bgp 100
```

server

Configures remote server access protocols for the current context. This command is used to enter the specified protocols configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
server { ftpd | named | sshd | telnetd | tftpd }
no server { ftpd | named | sshd | telnetd | tftpd } [ kill ]
```

no

Disables the specified service.

ftpd

Enters the FTP Server Configuration Mode.

Important: The FTPD server can only be configured in the local context.

named

Starts the named server.

sshd

Enters the SSH Server Configuration Mode.

Important: The SSHD server allows only three unsuccessful login attempts before closing a login session attempt.

telnetd

Enters the Telnet Server Configuration Mode.

Important: The TELNET server allows only three unsuccessful login attempts before closing a login session attempt.

tftpd

Enters the TFTP Server Configuration Mode.

Important: The TFTPD server can only be configured in the local context.

kill

Indicates all instances of the server are to be stopped.
This option only works with the **ftpd**, **sshd**, **telnetd**, and **tftpd** commands.

Usage

Enter the Context Configuration Mode for the appropriate, previously defined context, to set the server option(s). Repeat the command as needed to enable/disable more than one option server daemon.

Example

```
server ftpd

server named

no server tftpd

server sshd

server telnetd

no server telnetd kill
```

service-redundancy-protocol

Configures Interchassis Session Redundancy services for the current context. This command is used to enter the Service Redundancy Protocol Configuration Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
service-redundancy-protocol
```

Usage

Enter the configuration mode to set the service redundancy protocol options.

Example

The following command enters Service Redundancy Protocol Configuration Mode.

```
service-redundancy-protocol
```

sgw-service

Creates an S-GW service or specifies an existing S-GW service and enters the S-GW Service Configuration Mode for the current context.

Product

S-GW

Privilege

Administrator

Syntax

sgw-service *service_name* **[-noconfirm]**

no sgw-service *service_name*

service_name

Specifies the name of the S-GW service. If *service_name* does not refer to an existing service, the new service is created if resources allow.
service_name must be from 1 to 63 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no sgw-service *service_name*

Removes the specified S-GW service from the context.

Usage

Enter the S-GW Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:

```
[context_name]hostname(config-sgw-service)#
```

S-GW Service Configuration Mode commands are defined in the *S-GW Service Configuration Mode Commands* chapter.
Use this command when configuring the following SAE components: S-GW.

Example

The following command enters the existing S-GW Service Configuration Mode (or creates it if it does not already exist) for the service named *sgw-service1*:

```
sgw-service sgw-service1
```

The following command will remove *spgw-service1* from the system:

```
no sgw-service sgw-service1
```

sgsn-service

This command creates an SGSN service instance and enters the SGSN Service Configuration Mode. This mode configures or edits the configuration for an SGSN service which controls the SGSN functionality.

An SGSN mediates access to GPRS/UMTS network resources on behalf of user equipment (UE) and implements the packet scheduling policy between different QoS classes. It is responsible for establishing the packet data protocol (PDP) context with the GGSN.

Important: For details about the commands and parameters, check the *SGSN Service Configuration Mode* chapter.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sgsn-service *srvc_name*

no sgsn-service *srvc_name*

no

Remove the configuration for the specified SGSN service from the configuration of the current context.

srvc_name

A unique string of 1 to 63 alphanumeric characters that identify the specific SGSN service.

Usage

Use this command to create, edit, or remove an SGSN service

Example

The following command creates an SGSN service named *sgsn1* in the current context:

sgsn-service *sgsn1*

The following command removes the sgsn service named *sgsn1* from the configuration for the current context:

no sgsn-service *sgsn1*

sgtp-service

This command creates an SGTP service instance and enters the SGTP Service Configuration Mode. This mode configures the GPRS Tunneling Protocol (GTP) related settings required by the SGSN to support GTP-C (control plane) messaging and GTP-U (user data plane) messaging.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sgtp-service *svc_name*

no sgtp-service *svc_name*

no

Remove the configuration for the specified SGTP service from the configuration of the current context.

svc_name

A unique string of 1 to 63 alphanumeric characters that identify the specific SGTP service.

Usage

Use this command to create, edit, or remove an SGTP service

Example

The following command creates an SGTP service named *sgtp1* in the current context:

sgtp-service *sgtp1*

The following command removes the sgsn service named *sgtp1* from the configuration for the current context:

no sgtp-service *sgtp1*

ssh

Generates public and private keys for use with the configured SSH server for the current context and sets the public/private key pair to specified values.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ssh { generate key | key *data* **length** *octets* **} [type { v1-rsa | v2-rsa | v2-dsa }]**

no ssh key [type { v1-rsa | v2-rsa | v2-dsa }]

no ssh key [type { v1-rsa | v2-rsa | v2-dsa }]

This command clears configured SSH keys. If type is not specified, all SSH keys are cleared.

generate key

This command generates a public/private key pair which is to be used by the SSH server. The generated key pair is in use until the command is issued again.

key *data* **length** *octets*

This command sets the public/private key pair to be used by the system where *data* is the encrypted key and *length* is the length of the encrypted key in octets. *data* must be an alpha and/or numeric string of 1 to 1023 characters and *octets* must be a value in the range of 0 through 65535.

[type { v1-rsa | v2-rsa | v2-dsa }]

Specifies the type of SSH key to generate. If type is not specified, all three key types types are generated.
v1-rsa: SSH v1 RSA host key only
v2-rsa: SSH v2 DSA host key only
v2-dsa: SSH v2 RSA host key only

Important: For maximum security, it is recommended that only SSH v2 be used. **v2-rsa** is the recommended key type.

Usage

Generate secure shell keys for use in public key authentication.

Example

```
ssh generate key
```

ssh key *g6j93fw59cx* **length** *128*

subscriber

Configures the specified subscriber for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

subscriber { default | name *user_name* **} asn-service-info mobility [ipv4 | ipv6 | ipv6-ipv4]**

no subscriber { default | name *user_name* **}**

no

Indicates the subscriber specified is to be removed from the list of allowed users for the current context.

default | name *user_name*

default: Enters the Subscriber Configuration Mode for the context's default subscriber settings.
name *user_name*: Specifies the user which is to be allowed to use the services of the current context. user_name must be from 1 to 127 alpha and/or numeric characters.
asn-service-info mobility: This configuration indicates the type of mobility supported and enabled in the ASN.

Usage

Enter the Subscriber Configuration Mode for actual users as well as for a default subscriber for the current context.
NAS uses the specfied parameter for asn-service-info mobility to indicate and pack the mobility support field for IPv4, IPv6, or both, in the Service-Info attribute in the Access-request. RADIUS sends back this attribute in the Access-accept message by indicating respective bits to authorize the service indicated by NAS.

Important: A maximum of 128 subscribers and/or administrative users may be locally configured per context.

Example

subscriber default

no subscriber default

subscriber name *user1*

no subscriber name *user1*

threshold available-ip-pool-group

Configures context-level thresholds for IP pool utilization for the system.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold available-ip-pool-group *low_thresh* **[clear** *high_thresh* **]**

low_thresh

Default: 10
The low threshold IP pool utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
low_thresh can be configured to any integer value between 0 and 100.

clear *high_thresh*

Default: 10
The high threshold IP pool utilization percentage that maintains a previously generated alarm condition. If the utilization percentage rises above the high threshold within the polling interval, a clear alarm will be generated.
high_thresh can be configured to any integer value between 0 and 100. The default is 10

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

When IP address pools are configured on the system, they can be assigned to a group. IP address pool utilization thresholds generate alerts or alarms based on the utilization percentage of all IP address contained in the pool group during the specified polling interval.
All configured public IP address pools that were not assigned to a group are treated as belonging to the same group. Individual configured static or private pools are each treated as their own group.
Alerts or alarms are triggered for IP address pool utilization based on the following rules:

- **Enter Condition**: Actual IP address utilization percentage per pool group ≤ Low Threshold
- **Clear Condition**: Actual IP address utilization percentage per pool group > High Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
The following table describes the possible methods for configuring IP pool utilization thresholds:

Table 18. IP Pool Utilization Thresholds - Configuration Methods

Method	Description

Method	Description
Context-level	A single IP pool utilization threshold can be configured for all IP pool groups within a given system context. If a single threshold is configured for all pool groups, separate alerts or alarms can be generated for each group. This command configures that threshold.
IP address pool-level	Each individual IP address pool can be configured with its own threshold. Thresholds configured for individual pools take precedence over the context-level threshold that would otherwise be applied (if configured). In the event that two IP address pools belonging to the same pool group are configured with different thresholds, the system uses the pool configuration that has the greatest low threshold for that group.

Example

The following command configures a context-level IP pool utilization low threshold percentage of *10* and a high threshold of *35* for an system using the Alarm thresholding model:

```
threshold available-ip-pool-group 10 clear 35
```

threshold ha-service init-rrq-rcvd-rate

Set an alarm or alert based on the average number of calls setup per second for an HA service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold ha-service init-rrq-rcvd-rate *high_thresh* **[clear** *low_thresh* **]**

no threshold ha-service init-rrq-rcvd-rate

no

Deletes the alert or alarm.

high_thresh

Default: 0
The high threshold average number of calls setup per second must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 1000000.

clear *low_thresh*

Default: 0
The low threshold average number of calls setup per second that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 1000000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the average number of calls setup per second is equal to or less than a specified number of calls per second.
Alerts or alarms are triggered for the number of calls setup per second based on the following rules:

- **Enter Condition**: Actual number of calls setup per second > High Threshold
- **Clear Condition**: Actual number of calls setup per second ≤ Low Threshold

Example

The following command configures a number of calls setup per second threshold of *1000* and a low threshold of *500* for a system using the Alarm thresholding model:

threshold ha-service init-rrq-rcvd-rate *1000* **clear** *500*

threshold ip-pool-free

Set an alarm or alert based on the percentage of IP addresses that are unassigned in an IP pool. This command affects all IP pools in the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold ip-pool-free *low_thresh* **[clear** *high_thresh* **]**

low_thresh

Default: 0
The low threshold percentage of addresses available in an IP pool that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100.

clear *high_thresh*

Default: 0
The high threshold percentage of addresses available in an IP pool that maintains a previously generated alarm condition. If the utilization percentage rises above the high threshold within the polling interval, a clear alarm will be generated. It may be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

Use this command to set an alert or an alarm when the number of unassigned IP addresses in any pool is equal to or less than a specified percentage of the total number of addresses in the pool.
Alerts or alarms are triggered for percentage of IP address pool free based on the following rules:

- **Enter Condition**: Actual percentage of IP addresses free per pool ≤ Low Threshold
- **Clear Condition**: Actual percentage of IP addresses free per pool > High Threshold

Important: This command is overridden by the settings of the **alert-threshold** keyword of the **ip pool** command.

Example

The following command configures a context-level IP pool percentage of IP addresses that are unused low threshold percentage of *10* and a high threshold of *35* for an system using the Alarm thresholding model:

```
threshold ip-pool-free 10 clear 35
```

threshold ip-pool-hold

Set an alert based on the percentage of IP addresses from an IP pool that are on hold. This command affects all IP pools in the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold ip-pool-hold *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold percentage of addresses on hold in an IP pool that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100.

clear *low_thresh*

Default: 0
The low threshold percentage of addresses on hold in an IP pool that maintains a previously generated alarm condition. If the utilization percentage rises below the low threshold within the polling interval, a clear alarm will be generated. It may be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the percentage of IP addresses on hold in any pool is equal to or greater than a specified percentage of the total number of addresses in the pool.
Alerts or alarms are triggered for percentage of IP address pool addresses on hold based on the following rules:

- **Enter Condition**: Actual percentage of IP addresses on hold per pool > High Threshold
- **Clear Condition**: Actual percentage of IP addresses on hold per pool ≤ Low Threshold

Important: This command is overridden by the settings of the **alert-threshold** keyword of the **ip pool** command.

Example

The following command configures a context-level IP pool percentage of IP addresses that are on high threshold percentage of *35* and a low threshold of *10* for an system using the Alarm thresholding model:

```
threshold ip-pool-hold 35 clear 10
```

threshold ip-pool-release

Set an alert based on the percentage of IP addresses from an IP pool that are in the release state. This command affects all IP pools in the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold ip-pool-release *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold percentage of addresses in the release state in an IP pool that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100.

clear *low_thresh*

Default:0
The low threshold percentage of addresses in the release state in an IP pool that maintains a previously generated alarm condition. If the utilization percentage rises below the low threshold within the polling interval, a clear alarm will be generated. It may be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

Use this command to set an alert or an alarm when the number of IP addresses the release state in any pool is equal to or greater than a specified percentage of the total number of addresses in the pool.
Alerts or alarms are triggered for percentage of IP address pool addresses in the release state based on the following rules:

- **Enter Condition**: Actual percentage of IP addresses in the release state per pool > High Threshold
- **Clear Condition**: Actual percentage of IP addresses in the release state per pool ≤ Low Threshold

Important: This command is overridden by the settings of the **alert-threshold** keyword of the **ip pool** command.

Example

The following command configures a context-level IP pool percentage of IP addresses that are in the release state high threshold percentage of *35* and a low threshold of *10* for an system using the Alarm thresholding model:

```
threshold ip-pool-release 35 clear 10
```

threshold ip-pool-used

This command sets an alert based on the percentage of IP addresses that have been assigned from an IP pool. This command affects all IP pools in the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold ip-pool-used *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold percentage of addresses assigned from an IP pool that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100.

clear *low_thresh*

Default: 0
The low threshold percentage of addresses assigned from an IP pool that maintains a previously generated alarm condition. If the utilization percentage rises above the high threshold within the polling interval, a clear alarm will be generated. It may be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

Use this command to set an alert or an alarm when the number of IP addresses assigned from any pool is equal to or greater than a specified percentage of the total number of addresses in the pool.
Alerts or alarms are triggered for percentage of IP address pool addresses used based on the following rules:

- **Enter Condition**: Actual percentage of IP addresses used per pool > High Threshold
- **Clear Condition**: Actual percentage of IP addresses used per pool ≤ Low Threshold

Important: This command is overridden by the settings of the **alert-threshold** keyword of the **ip pool** command.

Example

The following command configures a context-level IP pool percentage of IP addresses that are used high threshold percentage of *35* and a low threshold of *10* for an system using the Alarm thresholding model:

```
threshold ip-pool-used 35 clear 10
```

threshold monitoring

Enables thresholding.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] threshold monitoring available-ip-pool-group
```

no

Disables threshold monitoring for the specified value.

available-ip-pool-group

Enables threshold monitoring for IP pool thresholds at the context level and the IP address pool-level. Refer to the **threshold available-ip-pool-group** command, the threshold ip-pool-x commands and the alert-threshold keyword of the **ip pool** command for additional information on these values.

Usage

Thresholding on the system is used to monitor the system for conditions that could potentially cause errors or outage. Typically, these conditions are temporary (i.e high CPU utilization, or packet collisions on a network) and are quickly resolved. However, continuous or large numbers of these error conditions within a specific time interval may be indicative of larger, more severe issues. The purpose of thresholding is to help identify potentially severe conditions so that immediate action can be taken to minimize and/or avoid system downtime.

Thresholding reports conditions using one of the following mechanisms:

- **SNMP traps:** SNMP traps have been created that indicate the condition (high threshold crossing and/or clear) of each of the monitored values. Complete descriptions and other information pertaining to these traps is located in the starentMIB(8164).starentTraps(2) section of the *SNMP MIB Reference*.

The generation of specific traps can be enabled or disabled on the system allowing you to view only those traps that are most important to you.

- **Logs:** The system provides a facility called threshold for which active and event logs can be generated. As with other system facilities, logs are generated Log messages pertaining to the condition of a monitored value are generated with a severity level of WARNING.
- **Alarm System:** High threshold alarms generated within the specified polling interval are considered "outstanding" until a the condition no longer exists and/or a condition clear alarm is generated.

"Outstanding" alarms are reported to through the system's alarm subsystem and are viewable through the system's CLI.

The following table indicates the reporting mechanisms supported by each of the above models.

Table 19. Thresholding Reporting Mechanisms by Model

Model	SNMP Traps	Logs	Alarm System

Model	SNMP Traps	Logs	Alarm System
Alert	X	X	
Alarm	X	X	X

Refer to the **threshold poll** command in Global Configuration Mode Commands for information on configuring the polling interval over which IP address pool utilization is monitored.

Example
the following command enables threshold monitoring for IP pool thresholds at the context level and the IP address pool-level:

```
threshold monitoring available-ip-pool-group
```

threshold pdsn-service init-rrq-rcvd-rate

Set an alarm or alert based on the average number of calls setup per second for a PDSN service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold pdsn-service init-rrq-rcvd-rate *high_thresh* **[clear** *low_thresh* **]**

no threshold pdsn-service init-rrq-rcvd-rate

no

Deletes the alert or alarm.

high_thresh

Default: 0
The high threshold average number of calls setup per second must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 1000000.

clear *low_thresh*

Default:0
The low threshold average number of calls setup per second that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 1000000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the average number of calls setup per second is equal to or less than a specified number of calls per second.
Alerts or alarms are triggered for the number of calls setup per second based on the following rules:

- **Enter Condition**: Actual number of calls setup per second > High Threshold
- **Clear Condition**: Actual number of calls setup per second ≤ Low Threshold

Example

The following command configures a number of calls setup per second threshold of *1000* and a low threshold of *500* for a system using the Alarm thresholding model:

threshold pdsn-service init-rrq-rcvd-rate *1000* **clear** *500*

udr-module active-charging-service

This command creates the User Data Record (UDR) module and enters the UDR Module Configuration Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
udr-module active-charging-service
```

Usage

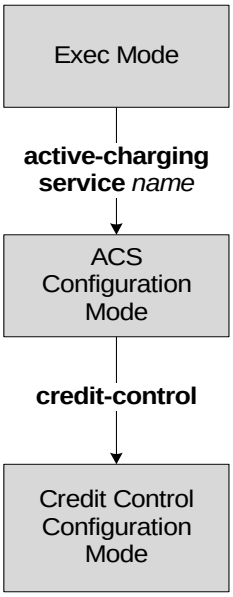
Use this command to create the UDR module for the context, and configure the UDR module for active charging service records. You must be in a non-local context when specifying this command, and you must use the same context when specifying the EDR module command.

Example

```
udr-module active-charging-service
```

Chapter 39
Credit Control Configuration Mode Commands

The Credit Control Configuration Mode is used to configure prepaid services for Diameter/RADIUS applications.



apn-name-to-be-included

This command configures whether the virtual or real APN name is sent in Credit Control Application (CCA) messaging.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
apn-name-to-be-included { gn | virtual }

default apn-name-to-be-included
```

default

Configures the default setting for this command.
Default: **gn**

gn

Sends Gn APN name in the CCA messages.

virtual

Sends virtual APN name, if configured in the APN Configuration Mode, in the CCA messages.

Usage

Use this command to configure the APN information in CCA messages. Virtual APN name can be set to be sent in CCA messages if it is configured in the APN Configuration Mode.

Example

The following command sets the virtual APN name to be sent in CCA message:

```
apn-name-to-be-included virtual
```

diameter dictionary

This command configures the Diameter Credit Control dictionary for the Active Charging Service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
diameter dictionary { dcca-custom1 | dcca-custom10 | dcca-custom11 | dcca-
custom12 | dcca-custom13 | dcca-custom14 | dcca-custom15 | dcca-custom16 | dcca-
custom17 | dcca-custom18 | dcca-custom19 | dcca-custom2 | dcca-custom20 | dcca-
custom3 | dcca-custom4 | dcca-custom5 | dcca-custom6 | dcca-custom7 | dcca-
custom8 | dcca-custom9 | standard }

default diameter dictionary
```

default

Configures the default setting for this command.
Default: standard dictionary

dcca-custom1 ... dcca-custom20

Specifies a custom Diameter dictionary.

standard

Specifies the standard Diameter dictionary.
Default: Enabled

Usage

Use this command to select the Diameter dictionary for Active Charging Service.

Example

The following command selects the standard Diameter dictionary:

```
diameter dictionary standard
```

diameter gsu-with-only-infinite-quota

This command configures whether to accept/reject CCA messages that contain **Granted-Service-Unit** AVP with only infinite quota grants from the server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
diameter gsu-with-only-infinite-quota { accept-credit-control-answer | reject-credit-control-answer }

default diameter gsu-with-only-infinite-quota
```

default

Configures the default setting for this command.
Default: **reject-credit-control-answer**

accept-credit-control-answer

Specifies to accept the Credit-Control-Answer message.

reject-credit-control-answer

Specifies to reject the Credit-Control-Answer message.

Usage

Use this command to accept/reject CCA messages that contain **Granted-Service-Unit** AVP with only infinite quota grants from the server.

Example

The following command specifies to accept CCA with **Granted-Service-Unit** AVP containing only Infinite quota:

```
diameter gsu-with-only-infinite-quota accept-credit-control- answer
```

diameter ignore-returned-rulebase-id

This command configures to accept/ignore rulebase ID in **Rulebase-Id** AVP returned by the Diameter server in CCA message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] diameter ignore-returned-rulebase-id
```

default

Configures the default setting for this command.
Default: Accept

no

Specifies to accept the rulebase ID received from Diameter server in CCA.

Usage

Use this command to ignore/accept rulebase ID returned from the Diameter server in CCA.

Example

This following command specifies to ignore rulebase ID returned from Diameter server in CCA:

```
diameter ignore-returned-rulebase-id
```

diameter mscc-per-ccr-update

This command configures sending single/multiple **Multiple-Services-Credit-Control** (MSCC) AVP in CCR-U messages.

Important: This command is only available in StarOS 8.3 and later.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
diameter mscc-per-ccr-update { multiple | single }

default diameter mscc-per-ccr-update
```

`default`

Configures the default setting for this command.
Default: **`multiple`**

`multiple`

Specifies sending multiple **Multiple-Services-Credit-Control** AVP in a single CCR-U message.

`single`

Specifies sending only one **Multiple-Services-Credit-Control** AVP in a CCR-U message.

Usage

Use this command to configure sending single/multiple **Multiple-Services-Credit-Control** AVP in CCR-U messages.

Example

The following command configures sending a single MSCC AVP in CCR-U messages:

```
diameter mscc-per-ccr-update single
```

diameter origin host

This command is obsolete. See the diameter origin endpoint command.

diameter origin endpoint

This command configures the Diameter Credit Control Origin Endpoint.

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter origin endpoint *endpoint_name* **[realm** *realm_name* **]**

no diameter origin endpoint

no

Removes the Diameter Credit Control Origin Endpoint configuration.

endpoint_name

Specifies the Diameter Credit Control Origin Endpoint.
endpoint_name must be the endpoint's name, and an alpha and/or numeric string of 1 through 63 characters in length.

realm *realm_name*

Specifies the Diameter Credit Control Realm ID.
realm_name must be a string of 1 through 127 characters in length.

Usage

Use this command to configure the Diameter Credit Control Origin Endpoint.
The endpoint to configure should be pre-configured. For information on creating and configuring a Diameter endpoint, in the Context Configuration Mode, see the **diameter endpoint** command.

Example

The following command configures a Diameter Credit Control Origin Endpoint named *test*:

diameter origin endpoint *test*

diameter peer-select

This command configures the Diameter credit control primary and secondary hosts for DCCA.

Product

All

Privilege

Security Administrator, Administrator

Syntax

In StarOS 8.x:

diameter peer-select peer *peer_name* **[realm** *realm_name* **] [secondary-peer** *secondary_peer_name* **[realm** *realm_name* **]] [imsi-based start-value** *imsi_start_value* **end-value** *imsi_end_value* **]**

no diameter peer-select [imsi-based start-value *imsi_start_value* **end-value** *imsi_end_value* **]**

In StarOS 9.0 and later for UMTS deployments:

diameter peer-select peer *peer_name* **[realm** *realm_name* **] [secondary-peer** *secondary_peer_name* **[realm** *realm_name* **]] [imsi-based { [prefix | suffix]** *imsi/prefix/suffix_start_value* **} [to** *imsi/prefix/suffix_end_value* **]]**

no diameter peer-select [imsi-based { [prefix | suffix] *imsi/prefix/suffix_start_value* **} [to** *imsi/prefix/suffix_end_value* **]**

---

no

Removes previously configured Diameter credit control peer selection setting.

---

peer *peer_name*

Specifies the primary host name.
peer_name must be an alpha and/or numeric string of 1 through 63 characters in length, and can contain punctuation characters.

---

imsi-based start-value *imsi_start_value* **end-value** *imsi_end_value*

Available only in StarOS 8.3 and earlier releases.
Specifies peer selection based on International Mobile Subscriber Identification (IMSI) range.
start-value *imsi_start_value* specifies the start of range in integer value of IMSI, and **end-value** *imsi_end_value* specifies the end of range in integer value of IMSI.

---

imsi-based { [prefix | suffix] *imsi/prefix/suffix_start_value* **} [to** *imsi/prefix/suffix_end_value* **]**

In this release, available only for UMTS deployments.
Specifies peer selection based on IMSI prefix or suffix or IMSI range.
prefix: Specifies the prefix range
suffix: Specifies the suffix range

imsi/prefix/suffix_start_value: Specifies the IMSI/prefix/suffix start value. *prefix/suffix* must be IMSI prefix/suffix, and must be an integer from 1 through 15 characters in length.
imsi/prefix/suffix_end_value: Specifies the IMSI/prefix/suffix end value. *prefix/suffix* must be IMSI prefix/suffix, and must be an integer from 1 through 15 characters in length, and must be greater than the start value.

Important: If prefix/suffix is used, the lengths of both start and end prefix/suffix must be equal. If the **prefix** or **suffix** keyword is not specified, it will be considered as suffix.

realm *realm_name*

The *realm_name* must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters. The realm may typically be a company or service name.

secondary-peer *secondary_peer_name*

Specifies a name for the secondary host to be used for failover processing. When the route-table does not find an AVAILABLE route, the secondary host performs a failover processing if the diameter session failover command is set.
secondary_peer_name must be an alpha and/or numeric string of 1 through 63 characters in length, and can contain punctuation characters.

Usage

Use this command to configure Diameter credit control host selection.
If the **diameter peer-select** command is not configured, and if multiple peers are configured in the endpoint, the available peers configured in the endpoint are automatically chosen in a load-balanced round-robin manner.
In StarOS 9.0 and later, a prefix or suffix of IMSI or IMSI range can be configured. If prefix or suffix keyword is not specified, it will be considered as suffix. Up to 64 peer selects can be configured. At any time either prefix or suffix mode can be used in one DCCA config. If the prefix/suffix mode is used, the start and end prefix/suffix lengths must be equal.
StarOS 9.0 and later supports peer selection using prefix or suffix of IMSI or IMSI range. Subscribers are now assigned to a primary OCS instance based on the value of the IMSI prefix or suffix of a length of 1 to 15 digits. If the prefix or suffix keyword is not specified, it will be considered as suffix. Up to 64 peer selects can be configured. At a time either prefix or suffix mode can be used in one DCCA config. If prefix or suffix mode is used, the lengths of all prefix/suffix must be equal.
Each primary OCS may have a designated secondary OCS in case of failure of the primary. It will be the responsibility of the GGSN to use the appropriate secondary OCS in case of primary failure. The secondary OCS for each primary OCS will be one of the existing set of OCSs.

Example

The following command configures a Diameter credit control peer named *test* and the realm *companyx*:

```
diameter peer-select peer test realm companyx
```

The following command configures IMSI-based Diameter credit control peer selection in the IMSI range of *1234567890* to *1234567899*:

```
diameter peer-select peer star imsi-based start-value 1234567890 end-value 1234567899
```

The following command configures IMSI-based DCCA peer selection with IMSI suffix of *100* through *200*:

```
diameter peer-select peer test_peer realm test_realm secondary-peer
test_sec_realm realm test_realm2 imsi-based suffix 100 to 200
```

diameter pending-timeout

This command configures the maximum time period to wait for response from a Diameter peer.

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter pending-timeout *duration*

default diameter pending-timeout

default

Disables DCCA resending message at pending-timeout.

duration

Specifies the timeout duration in seconds.
duration must be an integer from 1 through 300.

after-expiry-try-secondary-host

This keyword is deprecated. This can now be managed using the **retry-after-tx-expiry** and **go-offline-after-tx-expiry** keywords in the failure-handling command.

Usage

Use this command to set the maximum time for Diameter credit control to receive a response from its peer. DCCA refers to this as the Tx Timer. Typically, this should be configured to a value smaller than the response-timeout value of Diameter Endpoint Configuration Mode. That value is typically too large for DCCA's purposes.
If DCCA gets a “no available routes” error before pending-timeout expires, then DCCA tries to send to the secondary host (if one has been configured). If DCCA gets no response and pending-timeout expires, then DCCA either tries the secondary host or gives up. This can now be managed using the failure-handling command.
If routing has failed, i.e., the attempt to the primary host, as well as, the attempt to the secondary host (if that has been configured), then the processing configured by the failure-handling CLI command is performed.
The routing (i.e., returning a good response, no response or an error response such as "no available routes") is controlled by Diameter Endpoint Configuration Mode. That uses a watchdog timer (called Tw Timer) to attempt a different route to a host. Multiple routes could be attempted. If there's no response before the endpoint's configured response-timeout expires, then "no available routes" is the routing result. The routing logic remembers the status of routes, so it can return "no available routes" immediately, without using any timers.
The default case will disable DCCA resending message at Tx (pending-timeout). So messages are retried only at Tw (device watchdog timeout) by diabase or at response-timeout by DCCA.

Example

The following command configures a Diameter Credit Control Pending Timeout setting of *20* seconds:

```
diameter pending-timeout 20
```

diameter result-code

This command enables sending GTP Create-PDP-Context-Rsp message with cause code based on the DCCA result code.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
diameter result-code { authorization-rejected | user-unknown } use-gtp-cause-code { authentication-failure | no-resource-available }

default diameter result-code { authorization-rejected | user-unknown } use-gtp-cause-code
```

authorization-rejected

Result code received as DIAMETER_AUTHORIZATION_REJECTED(5003).

user-unknown

Result code received as DIAMETER_USER_UNKNOWN(5030).

use-gtp-cause-code

Cause code to be sent in GTP response.

authentication-failure

To send GTP cause code GTP_USER_AUTHENTICATION_FAILED in GTP response.

no-resource-available

To send GTP cause code GTP_NO_RESOURCES_AVAILABLE in GTP response (default cause code).

Usage

On receiving result-code as AUTHORIZATION-REJECTED or DIAMETER_USER_UNKNOWN from DCCA server, the cause code can either be sent as GTP_NO_RESOURCE_AVAILABLE or GTP_AUTHENTICATION_FAILED in GTP create-PDP-Context response message, based on this CLI configuration. By default, GTP_NO_RESOURCE_AVAILABLE is sent.

Example

The following command sets the deny cause as user authentication failure when the CCA-Initial has the result code DIAMETER_AUTHORIZATION_REJECTED(5003):

```
diameter result-code authorization-rejected use-gtp-cause-code authentication-failure
```

diameter send-ccri

This command configures when to send CCR-Initial for the subscriber session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
diameter send-ccri { session-start | traffic-start }

default diameter send-ccri
```

default

Configures the default setting for this command.
Default: **session-start**

session-start

Specifies to send CCR-I when the PDP context is being established (on receiving Create-PDP-Context-Request).

traffic-start

Specifies to delay sending CCR-I until the first data packet received from the subscriber.

Usage

Use this command to configure when to send CCR-Initial for the subscriber session.

Example

The following command configures to send CCR-I on traffic detection and not on context creation:

```
diameter send-ccri traffic-start
```

diameter session failover

This command enables/disables Diameter Credit Control Session Failover. When enabled, the secondary peer is used in the event the main peer is unreachable.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] diameter session failover
```

default

Configures the default setting for this command.
Default: Depends on the **failure-handling** configuration

no

If the primary server is not reachable, failover is not triggered and the session is torn down. No failover action is taken.

Usage

Use this command to enable/disable Diameter Credit Control Session Failover.
The failure-handling configuration comes into effect only if **diameter session failover** is present in the configuration. The failover can be overridden by the server in the response message, and it takes precedence.

Example

The following command enables Diameter Credit Control Session Failover:

```
diameter session failover
```

end

Returns the CLI prompt to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec mode.

exit

Exits the current mode and returns to the ACS Configuration Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the ACS Configuration Mode.

failure-handling

This command configures the Diameter Credit Control Failure Handling (CCFH) behavior in the event of communication failure with the prepaid server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
failure-handling { initial-request | terminate-request | update-request } { continue [ go-offline-after-tx-expiry | retry-after-tx-expiry ] | retry-and-terminate [ retry-after-tx-expiry ] | terminate }

default failure-handling [ initial-request | terminate-request | update-request ]
```

default failure-handling [initial-request | terminate-request | update-request]

Configures the default CCFH setting.
initial-request: The default setting is **terminate**.
update-request: The default setting is **retry-and-terminate**.
terminate-request: The default setting is **retry-and-terminate**.

initial-request

Specifies the message type as CCR-Initial.

terminate-request

Specifies the message type as CCR-Terminate.

update-request

Specifies the message type as CCR-Update.

continue

Specifies the CCFH setting as continue. The online session is converted into offline session. The associated PDP Context is established (new sessions) or not released (ongoing sessions).

retry-and-terminate

Specifies the CCFH setting as retry-and-terminate. The user session will continue for the duration of one retry attempt with the prepaid server. In case there is no response from both primary and secondary servers the session is torn down.

terminate

Specifies the CCFH setting as terminate. All type of sessions (initial or update) are terminated in case of failure.

go-offline-after-tx-expiry

Specifies to start offline charging after Tx expiry.

retry-after-tx-expiry

Specifies to retry after Tx expiry. Enables secondary-host, if up, to take over after Tx expiry.

Usage

Use this command to select the CCFH behavior. The specified behavior is used for sessions when no behavior is specified by the prepaid server. By default, the CCFH is taken care at response-timeout except for terminate setting.
If the Credit-Control-Failure-Handling AVP is received from the server, the received setting will be applied to all the message types.
The following table indicates the CCFH behavior for the combination of different CCFH settings, and the corresponding CLI commands.

CCFH Setting	CLI Command	Behavior at Tx	Behavior at RT	Secondary is Up	Secondary is Down
Initial-request Message Type					
Continue	**initial-request continue**	N/A	Continue	Secondary takes over after RT	Offline after another RT. No more quota requests are performed for any rating group within the session after DCCA failure (even if connectivity to DCCA is restored)
	initial-request continue go-offline-after-tx-expiry	Offline	N/A	Offline at Tx	Offline at Tx
	initial-request continue retry-after-tx-expiry	Continue	N/A	Secondary takes over after Tx	Offline after another Tx
Retry-and-terminate	**initial-request retry-and-terminate**	N/A	Retry	Secondary takes over after RT	Terminate after another RT
	initial-request retry-and-terminate retry-after-tx-expiry	Retry	N/A	Secondary takes over after Tx	Terminate after another Tx
Terminate	**initial-request terminate**	Terminate	N/A	Terminate after Tx	Terminate after Tx
Update-request Message Type					
Continue	**update-request continue**	N/A	Continue	Secondary takes over after RT	Offline after another RT

CCFH Setting	CLI Command	Behavior at Tx	Behavior at RT	Secondary is Up	Secondary is Down
	update-request continue go-offline-after-tx-expiry	Offline	N/A	Offline at Tx	Offline at Tx
	update-request continue retry-after-tx-expiry	Continue	N/A	Secondary takes over after Tx	Offline after another Tx
Retry-and-terminate	**update-request retry-and-terminate**	N/A	Retry	Secondary takes over after RT	Sends CCR-T after another RT
	update-request retry-and-terminate retry-after-tx-expiry	Retry	N/A	Secondary takes over after Tx	Sends CCR-T after another Tx
Terminate	**update-request terminate**	Terminate	N/A	Sends CCR-T after Tx	Sends CCR-T after Tx
Terminate-request Message Type					
Continue	**terminate-request continue**	N/A	Retry	CCR-T is sent to secondary after RT	Terminate after another RT
	terminate-request continue go-offline-after-tx-expiry	Retry	N/A	CCR-T is sent to secondary after Tx	Terminate after another Tx
	terminate-request continue retry-after-tx-expiry	Retry	N/A	CCR-T is sent to secondary after Tx	Terminate after another Tx
Retry-and-terminate	**terminate-request retry-and-terminate**	N/A	Retry	CCR-T is sent to secondary after RT	Terminate after another RT
	terminate-request retry-and-terminate retry-after-tx-expiry	Retry	N/A	CCR-T is sent to secondary after Tx	Terminate after another Tx
Terminate	**terminate-request terminate**	Terminate	N/A	Terminate after Tx	Terminate after Tx

Example

The following command sets the Credit Control Failure Handling behavior for initial request message type to **retry-and-terminate**:

```
failure-handling initial-request retry-and-terminate
```

mode

This command configures the Prepaid Credit Control mode to RADIUS or Diameter.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
mode { diameter | radius }

default mode
```

default

Configures the default prepaid credit control mode.
Default: **diameter**

diameter

Enables Diameter Credit Control Application (DCCA) for prepaid charging.

radius

Enables RADIUS Credit Control for prepaid charging.

Usage

Use this command to configure the prepaid charging application mode between Diameter or RADIUS credit control.

Example

The following command specifies to use RADIUS prepaid credit control application:

```
mode radius
```

pending-traffic-treatment

This command controls the pass/drop treatment of traffic while waiting for definitive credit information from the server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
pending-traffic-treatment { { { forced-reauth | trigger | validity-expired }
drop | pass } | { { noquota | quota-exhausted } buffer | drop | pass } }

default pending-traffic-treatment { forced-reauth | noquota | quota-exhausted |
trigger | validity-expired }
```

default

Configures the default setting for this command.
Default: **drop**

forced-reauth

Sets the Diameter credit control pending traffic treatment to forced reauthorization.

trigger

Sets the Diameter credit control pending traffic treatment to trigger.

validity-expired

Sets the Diameter credit control pending traffic treatment to validity expired.

noquota

Sets the Diameter credit control pending traffic treatment to no quota.

quota-exhausted

Sets the Diameter credit control pending traffic treatment to quota exhausted.

buffer

Specifies to tentatively count/time traffic, and then buffer traffic pending arrival of quota. Buffered traffic will be forwarded and fully charged against the quota when the quota is eventually obtained and the traffic is passed.

drop

Specifies to drop any traffic when there is no quota present.

pass

Specifies to pass all traffic more or less regardless of quota state.

Usage

Use this command to set the Diameter credit control pending traffic treatment while waiting for definitive credit information from the server.

This CLI command is different than the **failure-handling** CLI command, which specifies behavior in the face of an actual timeout or error, as opposed to the behavior while waiting. See also the **buffering-limit** CLI command in Active Charging Service Configuration Mode.

Example

The following command sets the Diameter credit control pending traffic treatment to drop any traffic when there is no quota present:

```
pending-traffic-treatment noquota drop
```

quota

This command is used to set various time-based quotas in the prepaid credit control service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

{ default | no } quota { holding-time | validity-time }

holding-time *holding_time*

Specifies the Quota Holding Time (QHT).
holding_time must be an integer from 1 through 4000000000.

validity-time *validity_time*

Specifies the validity lifetime of the quota.
validity_time must be an integer from 1 through 65535.

Usage

Use this command to set the prepaid credit control quotas.

Example

The following command sets the prepaid credit control request holding time to *30000* seconds:

quota holding-time *30000*

quota request-trigger

This command configures the action on the packet that triggers the credit control application to request quota.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
quota request-trigger { exclude-packet-causing-trigger | include-packet-causing-trigger }

{ default | no } quota request-trigger
```

default quota request-trigger

Configures the default setting for this command.
Default: **include-packet-causing-trigger**

no

Same as the **default quota request-trigger** command.

exclude-packet-causing-trigger

Specifies to exclude the packet causing threshold limit violation trigger.

include-packet-causing-trigger

Specifies to include the packet causing threshold limit violation trigger.

Usage

Use this command to configure action on the packet that triggers the credit control application to request quota, whether the packet should be excluded/included in the utilization information within the quota request.

Example

The following command sets the system to exclude the packets causing threshold limit triggers from accounting of prepaid credit of a subscriber:

```
quota request-trigger exclude-packet-causing-trigger
```

quota time-threshold

This command configures the time threshold limit for subscriber quota in the prepaid credit control service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

quota time-threshold { *abs_time_value* | percent *percent_value* }

{ default | no } quota time-threshold

default

Configures the default setting for this command.
Default: Disabled

no

Disables time threshold for prepaid credit control quota.

abs_time_value

Specifies the absolute threshold time in seconds for configured time quota in prepaid credit control charging. *abs_time_value* must be an integer from 1 through 86400. To disable this assign 0.
Default: 0 (Disabled)

percent *percent_value*

Specifies the time threshold value in percentage of configured time quota in DCCA.
percent_value must be an integer from 1 through 100.

Usage

Use this command to set the time threshold for prepaid credit control quotas.

Example

The following command sets the prepaid credit control time threshold to *400* seconds:

quota time-threshold *400*

quota units-threshold

This command is used to set the unit threshold limit for subscriber quota in the prepaid credit control service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

quota unit-threshold { *abs_unit_value* | percent *percent_value* }

{ default | no } quota units-threshold

default

Configures the default setting for this command.
Default: Disabled

no

Disables unit threshold for DCCA quota.

abs_unit_value

Specifies the absolute threshold value in units for the configured units quota in prepaid credit control application.
abs_unit_value must be an integer from 1 through 4000000000. To disable this assign 0.
Default: 0 (Disabled)

percent *percent_value*

Specifies the time threshold value in percentage of configured units quota in DCCA.
percent_value must be an integer from 1 through 100.

Usage

Use this command to set the units threshold for prepaid credit control quotas.

Example

The following command sets the prepaid credit control time threshold to *160400* units:

quota units-threshold *160400*

quota volume-threshold

This command is used to set the volume threshold limit for subscriber quota in the prepaid credit control service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

quota volume-threshold { *abs_vol_value* | percent *percent_value* }

{ default | no } quota volume-threshold

default

Configures the default setting for this command.
Default: Disabled

no

Disables volume threshold for prepaid credit control quota.

abs_vol_value

Specifies the absolute threshold volume in bytes to configured volume quota in prepaid credit control.
abs_vol_value must be an integer from 1 through 4000000000. To disable this assign 0.
Default: 0 (Disabled)

percent *percent_value*

Specifies the volume threshold value in percentage of configured volume quota in prepaid credit control.
percent_value must be an integer from 1 through 100.

Usage

Use this command to set the volume threshold for prepaid credit control quotas.

Example

The following command sets the prepaid credit control volume threshold to *160400* bytes:

quota volume-threshold *160400*

radius usage-reporting-algorithm

This command configures the usage reporting algorithm for RADIUS prepaid using DCCA.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius usage-reporting-algorithm { cumulative | relative }

default radius usage-reporting-algorithm

default

Configures the default setting for this command.
Default: **cumulative**

cumulative

Specifies that the total accumulated usage of quota be reported in every accounting interim.

relative

Specifies that the quota usage be reported per accounting interim, i.e. since the previous usage report.

Usage

Use this command to configure the usage reporting algorithm for RADIUS prepaid using DCCA.

Example

The following command configures the usage reporting algorithm for RADIUS prepaid using DCCA to *relative*:

radius usage-reporting-algorithm relative

timestamp-rounding

This command configures how to convert exact time into the units that are used in quotas.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
timestamp-rounding { ceiling | floor | roundoff }

default timestamp-rounding
```

default

Configures the default timestamp-rounding setting.
Default: **roundoff**

ceiling

This keyword round-off to the smallest integer greater than the fraction.
If the fractional part of the seconds is greater than 0, then this keyword adds 1 to the number of seconds and discard the fraction.

floor

This keyword always discards the fractional part of the second.

roundoff

This keyword sets the fractional part of the seconds to nearest integer value. If fractional value is greater than or equal to 0.5 it adds 1 to the number of seconds and discards the fractional part of second.

Usage

Use this command to configure how to convert exact time into the units that are used in quotas for CCA charging.
The specified rounding will be performed before system attempts any calculation. For example using round-off, if the start time is 1.4, and the end time is 1.6, then the calculated duration will be 1 (i.e., 2 – 1 = 1).

Example

The following command sets the CCA timestamp to nearest integer value second; i.e. 34:12.23 to 34:12.00:

```
timestamp-rounding roundoff
```

trigger type

This command enables or disables triggering a credit reauthorization when the named values in the subscriber session changes.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] trigger type { cellid | lac | qos | rat | sgsn } +
default trigger type
```

default

Sets the default trigger type setting.

no

Removes the previously configured trigger type.

cellid

Sets the trigger based on change in cell identity or service area code (SAC).

lac

Sets the trigger based on change in Location Area Code.

qos

Sets the trigger based on change in the Quality of Service (QoS).

rat

Sets the trigger based on change in the Radio Access Technology (RAT).

sgsn

Sets the trigger based on change in the IP address of SGSN.

+

Indicates that more than one of the previous keywords can be entered within a single command.

Usage

Use this command to set the credit control reauthorization trigger.

Example

The following command selects a credit control trigger as **lac**:

```
trigger type lac
```

usage-reporting

This command configures the ACS Credit Control usage reporting type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
usage-reporting quotas-to-report based-on-grant

default usage-reporting quotas-to-report
```

default

Configures the default setting for this command.
Default: Disabled

Usage

Use this command to configure reporting usage only for granted quota. On issuing this command, the **Used-Service-Unit** AVP will report quotas based on grant i.e, only the quotas present in the **Granted-Service-Unit** AVP.
With this command only the units for which the quota was granted by the DCCA server will be reported irrespective of the reporting reason.

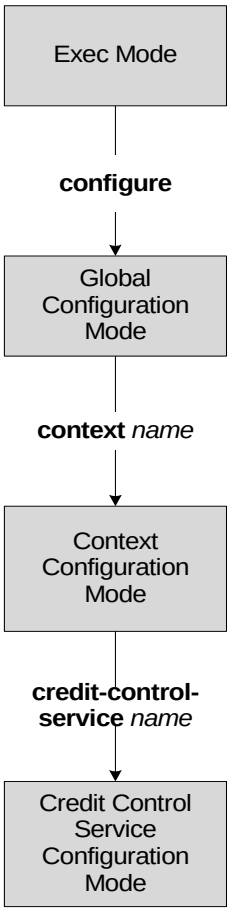
Example

The following command configures to report usage based only on granted quota:

```
usage-reporting quotas-to-report based-on-grant
```

Chapter 40
Credit Control Service Configuration Mode Commands

The Credit Control Service Configuration Mode is used to create and manage Credit Control Service.



diameter dictionary

This command configures the Diameter dictionary to be used for this Credit Control Service instance.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
diameter dictionary { custom1 | standard }

default diameter dictionary
```

default

Configures the default setting.

dictionary { custom1 | standard }

Specifies the Diameter dictionary to be used.
custom1: Specifies the custom dictionary **custom1**.
standard: Specifies the standard dictionary.

Usage

Use this command to configure the Diameter dictionary to be used for this Credit Control Service instance.

Example

The following command configures the standard Diameter dictionary:

```
diameter dictionary standard
```

diameter endpoint

This command configures the Diameter Credit Control Interface Endpoint.

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter endpoint *endpoint_name*

{ default | no } diameter endpoint

default

Configures the default setting.

no

Removes the previous Diameter endpoint configuration.

endpoint_name

Specifies the Diameter endpoint name.
endpoint_name must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to configure the Diameter Credit Control Interface Endpoint.

Example

The following command configures the Diameter Credit Control Interface Endpoint named *test135*:

diameter endpoint *test135*

end

This command exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec mode.

exit

This command exits the current configuration mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

failure-handling

This command configures the Diameter failure handling behavior.

Product

All

Privilege

Security Administrator, Administrator

Syntax

failure-handling { initial-request | terminate-request | update-request } { diameter-result-code *result_code* **[to** *result_code* **] | peer-unavailable | request-timeout } action { continue | retry-and-continue | retry-and-terminate | terminate }**

{ default | no } failure-handling { initial-request | terminate-request | update-request } { diameter-result-code *result_code* **[to** *result_code* **] | peer-unavailable | request-timeout }**

default

Configures the default setting.

no

Removes the previous failure handling configuration.

initial-request | terminate-request | update-request

initial-request: Specifies failure handling for Initial Request.
terminate-request: Specifies failure handling for Terminate Request.
update-request: Specifies failure handling for Update Request.

diameter-result-code | peer-unavailable | request-timeout

diameter-result-code *result_code* **[to** *result_code* **]**: Specifies Diameter result code(s) for failure handling.
result_code must be an integer from 3000 through 9999.
to *result_code*: Specifies the range of Diameter result codes.
peer-unavailable: Specifies failure handling for peer being unavailable.
request-timeout: Specifies failure handling for request timeouts.

action { continue | retry-and-continue | retry-and-terminate | terminate }

Specifies the failure handling action.
continue: Continue the session without credit control.
retry-and-continue: Retry and, even if credit control is not available, continue.
retry-and-terminate: Retry and then terminate.
terminate: Terminate the session.

Usage

Use this command to configure the Diameter failure handling behavior.

Example

The following command configures initial request failure handling behavior for Diameter result codes *3001* to *4001* with terminate action:

```
failure-handling initial-request diameter-result-code 3001 to 4001
action terminate
```

request timeout

This command configures the timeout period for Diameter requests.

Product

All

Privilege

Security Administrator, Administrator

Syntax

request timeout *timeout*

{ default | no } request timeout

default

Configures the default setting.

no

Removes the previous request timeout configuration.

timeout

Specifies the timeout period in seconds, and must be an integer from 1 through 300.

Usage

Use this command to configure the Diameter request timeout value, after which the request is deemed to have failed. This timeout is an overall timeout, and encompasses all retries with the server(s).

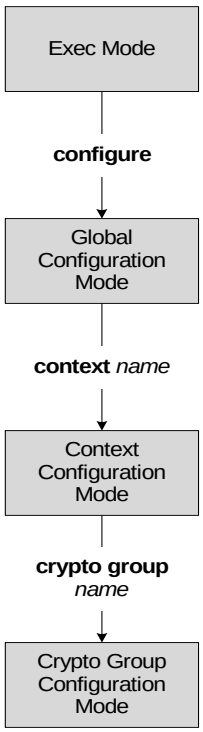
Example

The following command configures the timeout period to *150* seconds:

request timeout *150*

Chapter 41
Crypto Group Configuration Mode Commands

The Crypto Group Configuration Mode is used to configure crypto (tunnel) groups for providing fail-over redundancy for IPSec tunnels to packet data networks (PDNs).



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the context configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the context configuration mode.

match address

Associates an access control list (ACL) to the crypto group.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

[no] match address *acl_name* **[** *preference* **]**

no

Deletes a previously configured ACL association.

acl_name

The name of the ACL being matched to the crypto group.

preference

The priority of the ACL.
The ACL preference is factored when a single packet matches the criteria of more than one ACL.
preference can be configured to any integer value from 0 to 4294967295. "0" is the highest priority.
If multiple ACLs are assigned the same priority, the last one entered will be used first.

Important: The priorities are only compared for ACLs matched to other groups or to policy ACLs (those applied to the entire context).

Usage

IP ACLs are associated with crypto groups using this command. Both the crypto group and the ACLs must be configured in the same context.
ISAKMP crypto maps can then be associated with the crypto group. This allows user traffic matching the rules of the ACL to be handled according to the policies configured as part of the crypto map.

Example

The following command associates an ACL called *corporate_acl* to the crypto group:

```
match address  corporate_acl
```

match ip pool

Matches the specified IP pool to the current crypto group. This command can be used multiple times to match more than one IP pool.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

[no] match ip pool pool-name *pool_name*

no

Delete the matching statement for the specified IP pool from the crypto group.

pool_name

The name of an existing IP pool that should be matched.

Usage

Use this command to set the names of IP pools that should be matched in the current crypto group.

Example

The following command sets a rule for the current crypto group that will match an IP pool named **ippool1**:

match ip pool pool-name *ippool1*

switchover

Configures the fail-over properties for the crypto group as part of the Redundant IPSec Fail-Over feature.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] switchover auto [ do-not-revert ]
```

no

Disables the automatic switchover of tunnels. This applies to both primary-to-secondary and secondary-to-primary switches.

auto

Default: Enabled
Allows the automatic switchover of tunnels.

do-not-revert

Default: Disabled
Disables the automatic switchover of secondary tunnels to primary tunnels.

Usage

This command configures the fail-over options for the Redundant IPSec Fail-over feature.
If the automatic fail-over options are disabled, tunneled traffic must be manually switched to the alternate tunnel (or manually activated if no alternate tunnel is configured and available) using the following command in the Exec Mode:

```
crypto-group group_name activate { primary | secondary }
```

For a definition of this command, see the **crypto-group** section of the Exec Mode Commands chapter of this guide.

Example

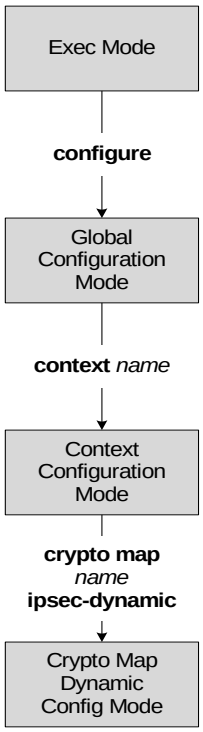
The following command disables the automatic secondary-to-primary switchover:

```
switchover auto do-not-revert
```

Chapter 42
Crypto Map Dynamic Configuration Mode Commands

The Crypto Map Dynamic Configuration Mode is used to configure IPSec tunnels that are created as needed to facilitate subscriber sessions using Mobile IP or L2TP.

Modification(s) to an existing dynamic crypto map configuration will not take effect until the related security association has been cleared. Refer to the clear crypto security-association command located in the Exec Mode Commands chapter of the Command Line Interface Reference for more information.



end

Returns the CLI prompt to to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the DYnamic Crypto Map configuration mode and returns to the context configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the context configuration mode.

set

Configures parameters for the dynamic crypto map.

Product

PDSN, HA, GGSN, PDIF

Privilege

Security Administrator, Administrator

Syntax

set { control-dont-fragment { clear-bit | copy-bit | set-bit } | isakmp natt [keepalive *time* **] | pfs { group1 | group2 | group5} | phase1-idtype { id-key-id | ipv4-address } [mode { aggressive | main }] | phase2-idtype { ipv4-address | ipv4-address-subnet} | security-association lifetime { keepalive | kilo-bytes** *kbytes* **| seconds** *secs* **} | transform-set** *transform_name* **[transform-set** *transform_name2 ...* **transform-set** *transform_name6* **] }**
no set { pfs | security-association lifetime {keepalive | kilo-bytes | seconds } | phase1-idtype | phase2-idtype | transform-set *transform_name* **[transform-set** *transform_name2 ...* **transform-set** *transform_name6* **] }**

---

no

Deletes the specified parameter or resets the specified parameter to the default value.

---

control-dont-fragment { clear-bit | copy-bit | set-bit }

Controls the don't fragment (DF) bit in the outer IP header of the IPsec tunnel data packet. Options are:

- **clear-bit**: Clears the DF bit from the outer IP header (sets it to 0).
- **copy-bit**: Copies the DF bit from the inner IP header to the outer IP header. This is the default action.
- **set-bit**: Sets the DF bit in the outer IP header (sets it to 1).

---

isakmp natt [keepalive *time* **]**

Enable IPSec NAT Traversal.
keepalive *time*: The time to keep the NAT connection alive in seconds. *time* must be an integer of from 1 through 3600 seconds.
must be an integer of from 1 through 3600 seconds.

---

pfs { group1 | group2 | group5 }

Specifies the modp Oakley group (also known as the Diffie-Hellman (D-H) group) that is used to determine the length of the base prime numbers that are used for Perfect Forward Secrecy (PFS).

- **group1** : Diffie-Hellman Group1 (768-bit modp)
- **group2** :- Diffie-Hellman Group2 (1024-bit modp)
- **group5** :- Diffie-Hellman Group5 (1536-bit modp)

phase1-idtype { id-key-id | ipv4-address } [mode { aggressive | main }]

Sets the IKE negotiations Phase 1 payload identifier.
Default: ipv4-address
id-key-id: Use ID_KEY_ID as the Phase 1 payload identifier.
ipv4-address: Use IPV4_ADDR as the Phase 1 payload identifier.
mode { aggressive | main }: Specify the IKE mode.

phase2-idtype { ipv4-address | ipv4-address-subnet }

Sets the IKE negotiations Phase 2 payload identifier.
Default: ipv4-address-subnet
ipv4-address: Use IPV4_ADDR as the Phase 2 payload identifier.
ipv4-address-subnet: Use IPV4_ADDR_SUBNET as the Phase 2 payload identifier.

security-association lifetime { keepalive | kilo-bytes *kbytes* **| seconds** *secs* **}**

Defaults:

- keepalive: Disabled
- **kilo-bytes:** 4608000 kbytes
- **seconds:** 28800 seconds

This keyword specifies the parameters that determine the length of time an IKE Security Association (SA) is active when no data is passing through a tunnel. When the lifetime expires, the tunnel is torn down. Whichever parameter is reached first expires the SA lifetime.

- **keepalive** : The SA lifetime expires only when a keepalive message is not responded to by the far end.
- **kilo-bytes** kbytes : This specifies the amount of data in kilobytes to allow through the tunnel before the SA lifetime expires. kbytes must be an integer from 2560 through 4294967294.
- **seconds** secs : The number of seconds to wait before the SA lifetime expires. secs must be an integer from 1200 through 86400.

Important: If the dynamic crypto map is being used in conjunction with Mobile IP and the Mobile IP renewal timer is less than the crypto map's SA lifetime (either in terms of kilobytes or seconds), then the **keepalive** parameter **must** be configured.

transform-set *transform_name* **[transform-set** *transform_name2 ...*
transform-set *transform_name6* **]**

This keyword specifies the name of a transform set configured in the same context that will be associated with the crypto map. Refer to the command **crypto ipsec transform-set** for information on creating transform sets.
You can repeat this keyword up to 6 times on the command line to specify multiple transform sets.
trasnform_name is the name of the transform set and must be an alpha and/or numeric string from 1 to 127 characters and is case sensitive.

Usage

Use this command to set parameters for a dynamic crypto map.

Example

The following command sets the PFS group to Group1:

```
set pfs group1
```

The following command sets the SA lifetime to 50000 KB:

```
set security-association lifetime kilo-bytes 50000
```

The following command sets the SA lifetime to 10000 seconds:

```
set security-association lifetime seconds 10000
```

The following command enables the SA to re-key when the tunnel lifetime expires:

```
set security-association lifetime keepalive
```

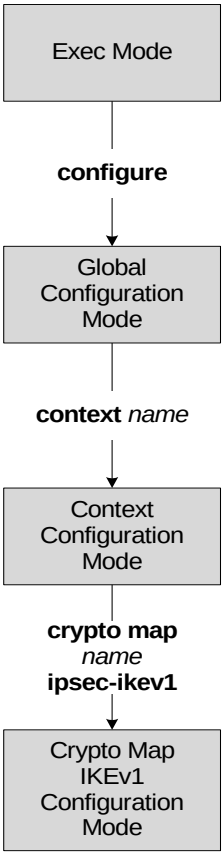
The following command defines transform sets tset1 and tset2:

```
set transform-set tset1 transform-set tset2
```

Chapter 43
Crypto Map IKEv1 Configuration Mode Commands

The Crypto Map IKEv1 Configuration Mode is used to configure properties for IPSec tunnels that will be created using the Internet Key Exchange (IKE) that operates within the framework of the Internet Key Exchange version 1 (IKEv1).

Modification(s) to an existing IKEv1 crypto map configuration will not take effect until the related security association has been cleared. Refer to the clear crypto security-association command located in the Exec Mode Commands chapter of the Command Line Interface Reference for more information.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the context configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the context configuration mode.

match address

Matches or associates the crypto map to an access control list (ACL) configured in the same context.

Product

PDSN, HA, GGSN, SCM

Privilege

Security Administrator, Administrator

Syntax

[no] match address *acl_name priority*

no

Removes a previously matched ACL.

acl_name

The name of the ACL that the crypto map is to be matched with.
acl_name can be from 1 to 79 alpha and/or numeric characters and is case sensitive.

priority

Default: 0
Specifies the preference of the ACL. The ACL preference is factored when a single packet matches the criteria of more than one ACL.
The preference can be configured to any integer value from 0 to 4294967295. “0” is the highest priority.

Important: The priorities are only compared for ACLs matched to other crypto maps or to policy ACLs (those applied to the entire context).

Usage

ACLs matched to crypto maps are referred to as crypto ACLs. Crypto ACLs define the criteria that must be met in order for a subscriber data packet to routed over an IPSec tunnel.
Prior to routing, the system examines the properties of each subscriber data packet. If the packet properties match the criteria specified in the crypto ACL, the system will initiate the IPSec policy dictated by the crypto map.

Example

The following command sets the crypto map ACL to the ACL named *ACLlist1* and sets the crypto maps priority to the highest level.

```
match address ACLlist1 0
```

match crypto group

Matches or associates the crypto map a crypto group configured in the same context.

Product

PDSN, HA, GGSN, SCM

Privilege

Security Administrator, Administrator

Syntax

`[ no ] match crypto group` *`group_name`* **`{ primary | secondary }`**

`no`

Deletes a previously configured crypto group association.

`group_name`

The name of the crypto group and can consist of from 1 to 127 alpha and/or numeric characters in length and is case sensitive.

`primary`

Specifies that the policies configured as part of this crypto map will be used for the primary tunnel in the Redundant IPSec Tunnel Failover feature.

`secondary`

Specifies that the policies configured as part of this crypto map will be used for the secondary tunnel in the Redundant IPSec Tunnel Failover feature.

Usage

Use this command to dictate the primary and secondary tunnel policies used for the Redundant IPSec Tunnel Failover feature.
At least two policies must be configured to use this feature. One policy must be configured as the primary, the other as the secondary.

Example

The following command associates the crypto map to a crypto group called *`group1`* and dictates that it will serve as the primary tunnel policy:

`match crypto group` *`group1`* **`primary`**

match ip pool

Matches the specified IP pool to the current IKEv1 crypto map. This command can be used multiple times to change more than one IP pool.

Product

PDSN, HA, GGSN, SCM

Privilege

Security Administrator, Administrator

Syntax

`[ no ] match ip pool pool-name` *`pool_name`*

`no`

Delete the matching statement for the specified IP pool from the crypto map.

`pool_name`

The name of an existing IP pool that should be matched.

Usage

Use this command to set the names of IP pools that should be matched in the current crypto map.

Important: If an IP address pool that is matched to a IKEv1 crypto map is resized, removed, or added, the corresponding security association must be cleared in order for the change to take effect. Refer to the **`clear crypto`** command in the Exec mode for information on clearing security associations.

Example

The following command sets a rule for the current crypto map that will match an IP pool named *`ippool1`*:

`match ip pool pool-name` *`ippool1`*

set

Configures parameters for the dynamic crypto map.

Product

PDSN, HA, GGSN, SCM

Privilege

Security Administrator, Administrator

Syntax

set { control-dont-fragment { clear-bit | copy-bit | set-bit } | ikev1 natt [keepalive *time* **] | pfs { group1 | group2 | group5 } | phase1-idtype { id-key-id | ipv4-address [mode { aggressive | main }] | phase2-idtype { ipv4-address | ipv4-address-subnet } | security-association lifetime { disable-phase2-rekey | keepalive | kilo-bytes** *kbytes* **| seconds** *secs* **}** transform-set *transform_name* **[transform-set** *transform_name2 ...* **transform-set** *transform_name6* **]**
no set { ikev1 natt | pfs | phase1-idtype | phase2-idtype | security-association lifetime { disable-phase2-rekey | keepalive | kilo-bytes | seconds } | transform-set *transform_name* **[transform-set** *transform_name2 ...* **transform-set** *transform_name6* **]**

---

control-dont-fragment { clear-bit | copy-bit | set-bit }

Controls the don't fragment (DF) bit in the outer IP header of the IPsec tunnel data packet. Options are:

- **clear-bit**: Clears the DF bit from the outer IP header (sets it to 0).
- **copy-bit**: Copies the DF bit from the inner IP header to the outer IP header. This is the default action.
- **set-bit** : Sets the DF bit in the outer IP header (sets it to 1).

---

ikev1 natt [keepalive *time* **]**

Specifies IKE parameters.
natt: Enables IPSec NAT Traversal.
keepalive *time*: The time to keep the NAT connection alive in seconds. *time* must be an integer of from 1 through 3600 seconds.

---

pfs { group1 | group2 | group5 }

Specifies the modp Oakley group (also known as the Diffie-Hellman (D-H) group) that is used to determine the length of the base prime numbers that are used for Perfect Forward Secrecy (PFS).

- **group1** : Diffie-Hellman Group1 (768-bit modp)
- **group2** :- Diffie-Hellman Group2 (1024-bit modp)
- **group5** :- Diffie-Hellman Group5 (1536-bit modp)

---

phase1-idtype { id-key-id | ipv4-address [mode { aggressive | main }]

Sets the IKE negotiations Phase 1 payload identifier. Default: id-key-id
id-key-id: ID KEY ID
ipv4-address: ID IPV4 Address

- mode: Configures IKE mode
- aggressive: IKE negotiation mode: AGGRESSIVE
- main: IKE negotiation mode: MAIN

phase2-idtype { ipv4-address | ipv4-address-subnet }

Sets the IKE negotiations Phase 2 payload identifier.
Default: ipv4-address-subnet

- **ipv4-address**: Use IPV4_ADDR as the Phase 2 payload identifier.
- **ipv4-address-subnet**: Use IPV4_ADDR_SUBNET as the Phase 2 payload identifier.

security-association lifetime { disable-phase2-rekey | keepalive | kilo-bytes *kbytes* **| seconds** *secs* **}**

Defaults:

- **disable-phase2-rekey**: Rekeying is enabled by default
- **keepalive**: Disabled
- **kilo-bytes:** 4608000 kbytes
- **seconds:** 28800 seconds

This keyword specifies the parameters that determine the length of time an IKE Security Association (SA) is active when no data is passing through a tunnel. When the lifetime expires, the tunnel is torn down. Whichever parameter is reached first expires the SA lifetime.

- **disable-phase2-rekey** : If this keyword is specified, when the lifetime expires, the Phase2 SA is not rekeyed.
- **keepalive** : The SA lifetime expires only when a keepalive message is not responded to by the far end.
- **kilo-bytes** kbytes : This specifies the amount of data in kilobytes to allow through the tunnel before the SA lifetime expires. kbytes must be an integer from 2560 through 4294967294.
- **seconds** secs : The number of seconds to wait before the SA lifetime expires. secs must be an integer from 1200 through 86400.

Important: If the dynamic crypto map is being used in conjunction with Mobile IP and the Mobile IP renewal timer is less than the crypto map's SA lifetime (either in terms of kilobytes or seconds), then the **keepalive** parameter **must** be configured.

transform-set *transform_name* **[transform-set** *transform_name2 ...*
transform-set *transform_name6* **]**

This keyword specifies the name of a transform set configured in the same context that will be associated with the crypto map. Refer to the command **crypto ipsec transform-set** for information on creating transform sets.
You can repeat this keyword up to 6 times on the command line to specify multiple transform sets.
transform_name is the name of the transform set and must be an alpha and/or numeric string from 1 to 127 characters and is case sensitive.

no

Deletes the specified parameter or resets the specified parameter to the default value.

Usage

Use this command to set parameters for a dynamic crypto map.

Example

The following command sets the PFS group to Group1:

```
set pfs group1
```

The following command sets the SA lifetime to 50000 KB:

```
set security-association lifetime kilo-bytes 50000
```

The following command sets the SA lifetime to 10000 seconds:

```
set security-association lifetime seconds 10000
```

The following command enables the SA to re-key when the tunnel lifetime expires:

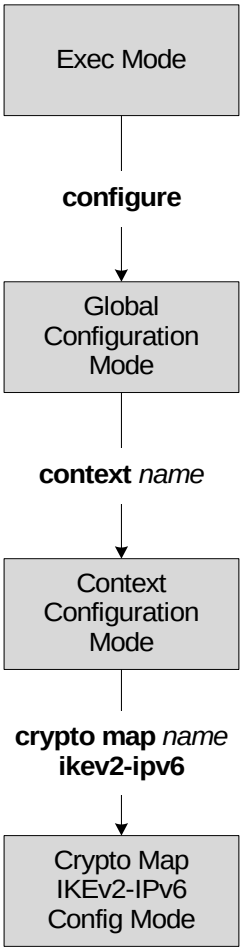
```
set security-association lifetime keepalive
```

The following command defines transform sets tset1 and tset2.

```
set transform-set tset1 transform-set tset2
```

Chapter 44
Crypto Map IKEv2-IPv6 Configuration Mode Commands

The Crypto Map IKEv2-IPv6 Configuration Mode is used to configure an IKEv2 IPsec policy for secure X3 interface tunneling between a P-GW and a lawful intercept server.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

authentication

Configures the subscriber authentication method used for the P-GW lawful intercept service.

Product

P-GW

Privilege

Administrator

Syntax

authentication pre-shared-key { encrypted key *value* **| key** *value* **}**

pre-shared-key { encrypted key *value* **| key** *value* **}**

Specifies that a pre-shared key is to be used for authenticating a subscriber in the PDIF service.
encrypted key *value*: Specifies that the pre-shared key used for authentication is encrypted. *value* must be between 1 and 255 alpha and/or numeric characters.
key *value*: Specifies that the pre-shared key used for authentication is clear text. *value* must be between 1 and 255 alpha and/or numeric characters.

Usage

Use this command to specify the type of authentication performed for subscribers attempting to access the P-GW service using this crypto map.

Example

The following command sets the authentication method to an open key value of *6d79706173776f7264*:

authentication pre-shared-key key *6d79706173776f7264*

control-dont-fragment

Controls the don’t fragment (DF) bit in the outer IP header of the IPsec tunnel data packet.

Product

P-GW

Privilege

Administrator

Syntax

```
control-dont-fragment { clear-bit | copy-bit | set-bit }
```

{ clear-bit | copy-bit | set-bit }

clear-bit: Clears the DF bit from the outer IP header (sets it to 0).
copy-bit: Copies the DF bit from the inner IP header to the outer IP header. This is the default action.
set-bit: Sets the DF bit in the outer IP header (sets it to 1).

Usage

A packet is encapsulated in IPsec headers at both ends. The new packet can copy the DF bit from the original unencapsulated packet into the outer IP header, or it can set the DF bit if there is not one in the original packet. It can also clear a DF bit that it does not need.

Example

The following command sets the DF bit in the outer IP header:

```
control-dont-fragment set-bit
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec Mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Returns to the previous mode.

ikev2-ikesa

Configures parameters for the IKEv2 IKE Security Associations within this crypto template.

Product

P-GW

Privilege

Administrator

Syntax

ikev2-ikesa { max-retransmissions *number* **| rekey | setup-timer** *sec* **}**

default ikev2-ikesa { max-retransmissions | rekey | setup-timer }

no ikev2-ikesa rekey

default

Restores the selected keyword to its default value.

no ikev2-ikesa

Disables a previously enabled parameter.

max-retransmissions *number*

Default: 5
Specifies the maximum number of retransmissions of an IKEv2 IKE exchange request if a response has not been received. *number* must be an integer from 1 to 8.

rekey

Specifies if IKESA rekeying should occur before the configured lifetime expires (at approximately 90% of the lifetime interval). Default is not to re-key.

setup-timer *sec*

Default: 60
Specifies the number of seconds before a IKEv2 IKE Security Association, that is not fully established, is terminated. *sec* must be an integer from 1 to 3600.

Usage

Use this command to configure parameters for the IKEv2 IKE Security Associations within this crypto template.

Example

The following command configures the maximum number of IKEv2 IKESA request retransmissions to 7:

```
ikev2-ikesa max-retransmissions 7
```

match

Matches or associates the crypto map to an access control list (ACL) configured in the same context.

Product

P-GW

Privilege

Administrator

Syntax

match address *acl_name* **[** *priority* **]**

no match address

no

Removes a previously matched ACL.

acl_name

The name of the ACL that the crypto map is to be matched with.
acl_name can be from 1 to 79 alpha and/or numeric characters and is case sensitive.

priority

Default: 0
Specifies the preference of the ACL. The ACL preference is factored when a single packet matches the criteria of more than one ACL.
The preference can be configured to any integer value from 0 to 4294967295. “0” is the highest priority.

Important: The priorities are only compared for ACLs matched to other crypto maps or to policy ACLs (those applied to the entire context).

Usage

ACLs matched to crypto maps are referred to as crypto ACLs. Crypto ACLs define the criteria that must be met in order for a subscriber data packet to routed over an IPSec tunnel.
Prior to routing, the system examines the properties of each subscriber data packet. If the packet properties match the criteria specified in the crypto ACL, the system will initiate the IPSec policy dictated by the crypto map.

Example

The following command sets the crypto map ACL to the ACL named *acl-list1* and sets the crypto maps priority to the highest level.

match address *acl-list1 0*

payload

Creates a new, or specifies an existing, crypto template payload and enters the Crypto Template Payload Configuration Mode.

Product

P-GW

Privilege

Administrator

Syntax

payload *name* **match ipv6**

no payload *name*

name

Specifies the name of a new or existing crypto template payload. *name* must be from 1 to 127 alpha and/or numeric characters.

match ipv6

Filters IPSec IPv6 Child Security Association creation requests for subscriber calls using this payload. Further filtering can be performed by applying the following:

Usage

Use this command to create a new or enter an existing crypto template payload. The payload mechanism is a means of associating parameters for the Security Association (SA) being negotiated.
Two payloads are required: one each for MIP and IKEv2. The first payload is used for establishing the initial Child SA Tunnel Inner Address (TIA) which will be torn down. The second payload is used for establishing the remaining Child SAs. Note that if there is no second payload defined with home-address as the *ip-address-allocation* then no MIP call can be established, just a Simple IP call.
Currently, the only available match is for ChildSA, although other matches are planned for future releases.
Entering this command results in the following prompt:
[*ctxt_name*]*hostname*(cfg-crypto-<*name*>-ikev2-tunnel-payload)#
Crypto Template IKEv2-IPv6 Payload Configuration Mode commands are defined in the Crypto Template IKEv2-IPv6 Payload Configuration Mode Commands chapter.

Example

The following command configures a crypto template payload called *payload5* and enters the Crypto Template IKEv2-IPv6 Payload Configuration Mode:

payload *payload5* **match ipv6**

peer

Configures the IP address of a peer IPsec server.

Product

P-GW

Privilege

Administrator

Syntax

peer *ip_address*

no peer

no

Removes the configured peer server IP address.

ip_address

Specifies the IP address of a peer IPsec server. *ip_address* must be specified in IPv4 dotted decimal notation or IPv6 colon separated notation.

Usage

Use this command to specify a peer IPsec peer server. The IPsec peer server can also be the Lawful Intercept server.

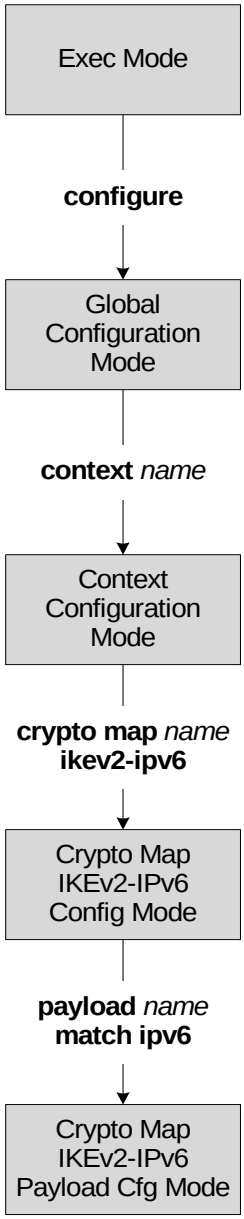
Example

The following command configures the system to recognize an IPsec peer server with an IPv6 address of *fe80::200:f8ff:fe21:67cf*:

peer *fe80::200:f8ff:fe21:67cf*

Chapter 45
Crypto Map IKEv2-IPv6 Payload Configuration Mode Commands

The Crypto Map IKEv2-IPv6 Payload Configuration Mode is used to assign the correct IPsec transform-set from a list of up to four different transform-sets, and to assign Mobile IP addresses.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec Mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Returns to the previous mode.

ipsec

Configures the IPsec transform set to be used for this crypto template payload.

Product

P-GW

Privilege

Administrator

Syntax

ipsec transform-set list *name*

no ipsec transform-set list

list *name*

Specifies the context configured IPsec transform set name to be used in the crypto template payload. This is a space-separated list. From 1 to 4 transform sets can be entered. *name* must be from 1 to 127 alpha and/or numeric characters.

Usage

Use this command to list the IPsec transform set(s) to use in this crypto template payload.

Example

The following command configures IPsec transform sets named *ipset1* and *ipset2* to be used in this crypto template payload:

ipsec transform-set list *ipset1 ipset2*

lifetime

Configures the number of seconds for IPsec Child SAs derived from this crypto template payload to exist.

Product

P-GW

Privilege

Administrator

Syntax

lifetime *sec* **[kilobytes** *kbytes* **]**

default lifetime

default

Returns the lifetime value to the default setting of 86400.

sec

Default: 86400
Specifies the number of seconds for IPsec Child Security Associations derived from this crypto template payload to exist. *sec* must be an integer from 60 to 604800.

kilobytes *kbytes*

Specifies lifetime in kilo-bytes for IPsec Child Security Associations derived from this Crypto Map. *kbytes* must be an integer value from 1 to 2147483648.

Usage

Use this command to configure the number of seconds for IPsec Child Security Associations derived from this crypto template payload to exist.

Example

The following command configures the IPsec child SA lifetime to be 120 seconds:

lifetime *120*

rekey

Configures child security association rekeying.

Product

P-GW

Privilege

Administrator

Syntax

```
rekey [ keepalive ]

[ default | no ] rekey
```

default

Returns the feature to the default setting of disabled.

no

Disables this feature.

keepalive

If specified, a session will be rekeyed even if there has been no data exchanged since the last rekeying operation. By default rekeying is only performed if there has been data exchanged since the previous rekey.

Usage

Use this command to enable or disable the ability to rekey IPsec Child SAs after approximately 90% of the Child SA lifetime has expired. The default, and recommended setting, is not to perform rekeying. No rekeying means the PDIF will not originate rekeying operations and will not process CHILD SA rekeying requests from the MS.

Example

The following command disables rekeying:

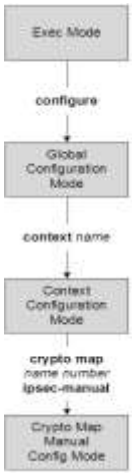
```
no rekey
```

Chapter 46
Crypto Map Manual Configuration Mode Commands

The Crypto Map Manual Configuration Mode is used to configure static IPSec tunnel properties.

Modification(s) to an existing crypto map manual configuration will not take effect until the related security association has been cleared. Refer to the clear crypto security-association command located in the Exec Mode Commands chapter of the Command Line Interface Reference for more information.

Important: Because manual crypto map configurations require the use of static security keys (associations), they are not as secure as crypto maps that rely on dynamically configured keys. Therefore, it is recommended that they only be used for testing purposes.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the context configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the context configuration mode.

match address

Matches or associates the crypto map to an access control list (ACL) configured in the same context.

Product

PDSN, HA, GGSN, PDIF

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] match address acl_name [ priority ]
```

no

Removes a previously matched ACL.

acl_name

The name of the ACL that the crypto map is to be matched with.
acl_name can be from 1 to 47 alpha and/or numeric characters and is case sensitive.

priority

Default: 0
Specifies the preference of the ACL. The ACL preference is factored when a single packet matches the criteria of more than one ACL.
The preference can be configured to any integer value from 0 to 4294967295. “0” is the highest priority.

Important: The priorities are only compared for ACLs matched to other crypto maps or to policy ACLs (those applied to the entire context).

Usage

ACLs matched to crypto maps are referred to as crypto ACLs. Crypto ACLs define the criteria that must be met in order for a subscriber data packet to routed over an IPSec tunnel.
Prior to routing, the system examines the properties of each subscriber data packet. If the packet properties match the criteria specified in the crypto ACL, the system will initiate the IPSec policy dictated by the crypto map.

Example

The following command sets the crypto map ACL to the ACL named **ACLlist1** and sets the crypto maps priority to the highest level.

```
match address ACLlist1 0
```

set control-dont-fragment

Controls the don't fragment (DF) bit in the outer IP header of the IPsec tunnel data packet.

Product

PDSN, HA, GGSN, PDIF

Privilege

Security Administrator, Administrator

Syntax

```
set control-dont-fragment { clear-bit | copy-bit | set-bit }

default set control-dont-fragment { clear-bit | copy-bit | set-bit }
```

clear-bit

Clears the DF bit from the outer IP header (sets it to 0).

copy-bit

Copies the DF bit from the inner IP header to the outer IP header. This is the default action.

default

Sets / Restores default value assigned to a specified parameter.

set-bit

Sets the DF bit in the outer IP header (sets it to 1).

Usage

Use this command to clear, copy, or set the don't fragment (DF) bit in the outer IP header of the IPsec tunnel data packet.

Example

The following command sets the DF bit in the outer IP header.

```
set control-dont-fragment set-bit
```

set peer

Configures the IP address of the peer security gateway that the system will establish the IPSec tunnel with.

Product

PDSN, HA, GGSN, PDIF

Privilege

Security Administrator, Administrator

Syntax

[no] set peer *gw_address*

no

Removes a previously configured peer address.

gw_address

The IP address of the peer security gateway with which the IPSec tunnel will be established.

Usage

Once the manual crypto map is fully configured and applied to an interface, the system will establish an IPsec tunnel with the security gateway specified by this command.
Because the tunnel relies on statically configured parameters, once created, it never expires; it exists until its configuration is deleted.

Example

The following command configures a security gateway address of 192.168.1.100 for the crypto map to establish a tunnel with.

set peer *192.168.1.100*

set session-key

Configures session key parameters for the manual crypto map.

Product

PDSN, HA, GGSN, PDIF

Privilege

Security Administrator, Administrator

Syntax

```
set session-key { inbound | outbound } { ah ah_spi [ encrypted ] key ah_key
| esp esp_spi [ encrypted ] cipher encryption_key [ encrypted ]
authenticator auth_key }
no set session-key { inbound | outbound }
```

no

Removes previously configured session key information.

inbound

Specifies that the key(s) will be used for tunnels carrying data sent by the security gateway.

outbound

Specifies that the key(s) will be used for tunnels carrying data sent by the system.

ah *ah_spi*

Configures the following session key information for the Authentication Header (AH) protocol:
ah_spi: The security parameter index (SPI) used to identify the AH security association (SA) between the system and the security gateway.
The SPI can be configured to any integer value from 256 to 4294967295.

encrypted

Indicates the key provided is encrypted.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **key**, **cipher**, and/or **authenticator** keyword is the encrypted version of the plain text key. Only the encrypted key is saved as part of the configuration file.

key *ah_key*

Configures the following session key information for the Authentication Header (AH) protocol:
ah_key: The key used by the system to de/encapsulate IP packets using the AH protocol.
The key must be entered as either a string or a hexadecimal number beginning with "0x".

esp *esp_spi*

Configures security parameter index (SPI) for the Encapsulating Security Payload (ESP) protocol. The SPI is used to identify the ESP security association (SA) between the system and the security gateway.
esp_spi : The SPI value. It can be configured to any integer value from 256 to 4294967295.

cipher *encryption_key*

Specifies the key used by the system to de/encrypt the payloads of IP packets using the ESP protocol. *encryption_key* must be entered as either a string or a hexadecimal number beginning with “0x”.

authenticator *auth_key*

Specifies the key used by the system to authenticate the IP packets once encryption has been performed. *auth_key* must be entered as either a string or a hexadecimal number beginning with “0x”.

Usage

Manual crypto maps rely on the use of statically configured keys to establish IPSec tunnels. This command allows the configuration of the static keys.
Identical keys must be configured on both the system and the security gateway in order for the tunnel to be established.
This command can be entered up to two time for the same crypto map: once to configure inbound key properties, and once to configure outbound key properties.

Example

The following command configures a manual crypto map with the following session key properties:

- Keys are for tunnels initiated by the system to the security gateway.
- ESP will be used with an SPI of 310.
- Encryption key is sd23r9skd0fi3as.
- Authentication key is sfd23408imi9yn.

```
set session-key outbound esp 310 cipher sd23r9skd0fi3as authenticator
sfd23408imi9yn
```

set transform-set

Configures the name of a transform set that the crypto map is associated with.

Product

PDSN, HA, GGSN, PDIF

Privilege

Security Administrator, Administrator

Syntax

[no] set transform-set *transform_name*

no

Removes a previously configured transform set association.

transform_name

Specifies the name of the transform set and must be an alpha and/or numeric string from 1 to 127 characters and is case sensitive.

Usage

System transform sets contain the IPSec policy definitions for crypto maps. Refer to the command *crypto ipsec transform-set* for information on creating transform sets.

Important: Transform sets must be configured prior to configuring session key information for the crypto map.

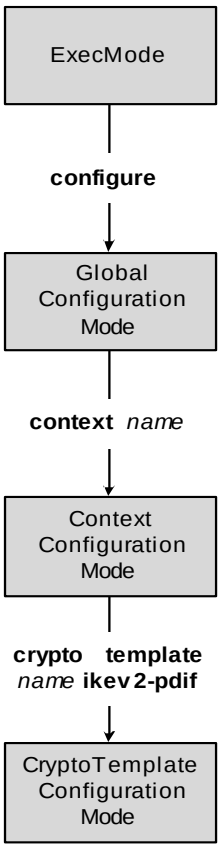
Example

The following command associates a transform set named esp_tset with the crypto map:

set transform-set *esp_tset*

Chapter 47
Crypto Template Configuration Mode Commands

The Crypto Template Configuration Mode is used to configure an IKEv2 IPsec policy. It includes most of the IPsec parameters and IKEv2 parameters for cryptographic and authentication algorithms etc. A security gateway service will not function without a configured crypto template. Only one crypto template can be configured per service.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

authentication

Configures the subscriber authentication method used for the PDIF service.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

authentication { eap-profile *name* **[second-phase eap-profile** *name* **] | gateway { encrypted key** *value* **| key** *value* **} | pre-shared-key { encrypted key** *value* **| key** *value* **} }**

eap-profile *name* **[second-phase eap-profile** *name* **]**

Specifies that authentication is to be performed using a named EAP profile. *name* must be from 1 to 127 alpha and/or numeric characters. Entering this keyword places the CLI in the EAP Authentication Configuration Mode.
A second-phase eap profile name is only required for installations using multiple authentication. *name* must be from 1 to 127 alpha and/or numeric characters.

gateway { encrypted key *value* **| key** *value* **}**

Specifies the pre-shared gateway key used for gateway authentication.
encrypted key *value*: Specifies that the pre-shared key used for authentication is encrypted. *value* must be between 1 and 255 alpha and/or numeric characters.
key *value*: Specifies that the pre-shared key used for authentication is clear text. *value* must be between 1 and 255 alpha and/or numeric characters.

pre-shared-key { encrypted key *value* **| key** *value* **}**

Specifies that a pre-shared key is to be used for authenticating a subscriber in the service.
encrypted key *value*: Specifies that the pre-shared key used for authentication is encrypted. *value* must be between 1 and 255 alpha and/or numeric characters.
key *value*: Specifies that the pre-shared key used for authentication is clear text. *value* must be between 1 and 255 alpha and/or numeric characters.

Usage

Use this command to specify the type of authentication performed for subscribers attempting to access the service using this crypto template.
Entering the **authentication eap-profile** command results in the following prompt:
[*context_name*]*hostname*(cfg-crypto-tmpl-eap-key)#
EAP Authentication Configuration Mode commands are defined in the “EAP Authentication Configuration Mode Commands” chapter.

Example

The following command enables authentication via an EAP profile named *eap23* for subscribers using the service with this crypto template:

authentication eap-profile *eap23*

certificate

Used to bind an X.509 trusted certificate to a crypto template.

Product

PDIF

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

[no] certificate name *name*

no

Removes any applied certificate or prevents the certificate from being included in the Auth Exchange response payload.

name *name*

An alpha and/or numeric string of 1 - 127 characters.

Usage

Can be used to bind an X.509 certificate to a template, or include or exclude it from the Auth Exchange response payload.

Example

Use the following example to prevent a certificate from being included in the Auth Exchange payload:

```
no certificate
```

control-dont-fragment

Controls the don't fragment (DF) bit in the outer IP header of the IPsec tunnel data packet.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
control-dont-fragment { clear-bit | copy-bit | set-bit }
```

Usage

Options are:

- **clear-bit**: Clears the DF bit from the outer IP header (sets it to 0).
- **copy-bit**: Copies the DF bit from the inner IP header to the outer IP header. This is the default action.
- **set-bit**: Sets the DF bit in the outer IP header (sets it to 1).

Usage

A packet is encapsulated in IPsec headers at both ends. The new packet can copy the DF bit from the original unencapsulated packet into the outer IP header, or it can set the DF bit if there is not one in the original packet. It can also clear a DF bit that it does not need.

Example

The following command sets the DF bit in the outer IP header:

```
control-dont-fragment set-bit
```

default

Restores the default values for the selected parameter.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
default { authentication gateway | certificate | dns-handling | dos cookie-
challenge detect-dos-attack | ikev2-ikesa { ignore-rekeying-requests |
keepalive-user-activity | max-retransmission | mobike | policy error-
notification | rekey | retransmission-timeout | setup-timer } | keepalive | nai
| natt }
```

`authentication gateway`

Configures the default pre-shared gateway key used for authentication.

`certificate`

Configures the system to remove the certificate for a given crypto template.

`dns-handling`

Configures the system to use normal dns handling.

`dos cookie-challenge detect-dos-attack`

Configures the system to disable any Denial of Service attacks.

`ikev2-ikesa { ignore-rekeying-requests | keepalive | max-retransmission | mobike | policy error-notification | rekey | retransmission-timeout | setup-timer }`

Configures the system to use the following ikev2-ikesa defaults:

- **`ignore-rekeying-requests:`** Ignore any IKE_SA rekeying requests received.
- **`keepalive-user-activity:`** Keepalive messages received from peer will not reset the user inactivity timer.
- **`max-retransmission:`** Set the number of IKEv2 IKE exchange request retransmissions if the corresponding response has not been received. Deault is 5.
- **`mobike:`** Set MOBIKE to disable.
- **`policy error-notification:`** Set the default policy error notification method to send error notify messages to the MS.
- **`rekey:`** Set the default rekeying of IKE_SA to disabled.

- **retransmission-timeout:** Set the maximum number of milliseconds to elapse before an IKEv2 IKE exchange request is retransmitted if the corresponding IKEv2 IKE exchange response has not been received to 500.
- **setup timer:** Set the number of seconds to elapse before a non-fully-established IKEv2 IKE SA is terminated to 60.

keepalive

Enable Dead Peer Detection for all SAs derived from this crypto template.

nai

Set the default NAI parameters to be used for the crypto template (IDr) to none

natt

Enable NAT-T initiation for all SAs derived from this crypto template.

Usage

Use these commands to restore default parameters.

Example

Use the following command to disable MOBIKE by default:

```
default mobike
```

dns-handling

Adds a custom option to define the ways a DNS address is returned based on proscribed circumstances described below.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
[ default ] dns-handling { normal | custom }
```

default

Configures the default condition as **normal**. By default, PDIF always returns the DNS address in the config payload in the second authentication phase if one is received from either the configuration or the HA.

normal

This is the default action. PDIF always returns the DNS address in the config payload in the second authentication phase if one is received from either the configuration or the HA.

custom

Configures the PDIF to behave as described in the Usage section below.

Usage

During IKEv2 session setup, MS may or may not include INTERNAL_IP4_DNS in the Config Payload (CP). PDIF may obtain one or more DNS addresses for the subscriber in DNS NVSE from a proxy-MIP Registration Reply message. If Multiple Authentication is used, these DNS addresses may be also received in Diameter AVPs during the first authentication phase, or in RADIUS attributes in the Access Accept messages during the second authentication phase.

In **normal** mode, by default PDIF always returns the DNS address in the config payload in the second authentication phase if one is received from either the configuration or the HA.

In **custom** mode, depending on the number of INTERNAL_IP4_DNS, PDIF supports the following behaviors:

- If MS includes no INTERNAL_IP4_DNS in Config Payload: PDIF doesn't return any INTERNAL_IP4_DNS option to MS, whether or not PDIF has received one(s) in DNS NVSE from HA or from local configurations.
- If MS requests one or more INTERNAL_IP4_DNS(s) in Config Payload, and if P-MIP NVSE doesn't contain any DNS address or DNS address not present in any config, PDIF omits INTERNAL_IP4_DNS option to MS in the Config Payload.
- And if P-MIP NVSE includes one DNS address (a.a.a.a / 0.0.0.0), then PDIF sends one INTERNAL_IP4_DNS option in Config Payload back to the MS.
- If Primary DNS is a.a.a.a and Secondary DNS is 0.0.0.0, then a.a.a.a is returned (i.e. only one instance of DNS attribute present in the config payload).

- If Primary DNS is 0.0.0.0 and Secondary DNS is a.a.a.a, then a.a.a.a is returned (i.e. only one instance of DNS attribute present in the config payload). PDIF does not take 0.0.0.0 as a valid DNS address that can be assigned to the MS.
- And if P-MIP NVSE includes two DNS addresses (a.a.a.a and b.b.b.b) or configurations exists for these two addresses, then PDIF sends two INTERNAL_IP4_DNSs in the CP for the MS (typically known as primary and secondary DNS addresses).

Example

The following configuration applies the **custom** dns-handling mode:

```
dns-handling custom
```

dos cookie-challenge notify-payload

Configure the cookie challenge params for IKEv2 INFO Exchange notify payloads for the given crypto template.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
dos cookie-challenge notify-payload [ half-open-sess-count { start integer |
stop integer } ]

default cookie-challenge detect-dos-attack

no cookie-challenge detect-dos-attack
```

default

Default is to disabled condition.

no

Prevents Denial of Service cookie transmission. This is the default condition.

half-open-sess-count *start* | *stop*

The **half-open-sess-count** is the number of half-open sessions per IPsec manager. A session is defined as half-open if a PDIF has responded to an IKEv2 INIT Request with an IKEv2 INIT Response, but no further message was received on that particular IKE SA.

- *start*: The functionality will start when the current half-open-sess-count exceeds the start count. The start count is an integer from 0 to 100000.
- *stop*: The functionality will stop when the current half-open-sess-count drops below the stop count. The stop count number is an integer from 0 to 100000. It is always less than or equal to the start count number

Important: The start count value 0 is a special case whereby this feature is always enabled. In this event, both **Start** and **Stop** must be 0.

Usage

This feature (which is disabled by default) helps prevent malicious Denial of Service attacks against the server by sending a challenge cookie. If the response from the sender does not incorporate the expected cookie data, the packets are dropped.

Example

The following example configures the cookie challenge to begin when the half-open-sess-count reaches 50000 and stops when it drops below 20000:

dos cookie-challenge notify-payload half-open-sess-count start *50000* **stop** *20000*

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec Mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Returns to the previous mode.

ikev2-ikesa

Configures parameters for the IKEv2 IKE Security Associations within this crypto template.

Product

PDIF

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

```
ikev2-ikesa { keepalive-user-activity | max-retransmissions number |
retransmission-timeout msec | policy error-notification [ invalid-message-id |
invalid-syntax ] rekey | setup-timer sec | transform-set list name }

default ikev2-ikesa { max-retransmissions | policy error-notification [ invalid-
message-id | invalid-syntax ] rekey | retransmission-timeout | setup-timer }

no ikev2-ikesa { keepalive-user-activity | list name / policy error-notification
[ invalid-message-id | invalid-syntax ] | rekey }
```

no ikev2-ikesa

Disables a previously enabled parameter.

keepalive-user-activity

Default is no keepalive-user-activity. Activate to reset the user inactivity timer when keepalive messages are received from peer.

max-retransmissions *number*

Default: 5
Specifies the maximum number of retransmissions of an IKEv2 IKE exchange request if a response has not been received. *number* must be an integer from 1 to 8.

policy error-notification

Default is to enable. Default policy is to generate an IKEv2 Invalid Message ID error when PDIF receives an out-of-sequence packet.

retransmission-timeout *msec*

Default: 500
Specifies the timeout period in milliseconds before a retransmission of an IKEv2 IKE exchange request is sent (if the corresponding response has not been received). *msec* must be and integer from 300 to 15000.

rekey

Specifies if IKESA rekeying should occur before the configured lifetime expires (at approximately 90% of the lifetime interval). Default is not to re-key.

setup-timer *sec*

Default: 16
Specifies the number of seconds before a IKEv2 IKE Security Association, that is not fully established, is terminated. *sec* must be an integer from 1 to 3600.

transform-set list *name*

Specifies the name of context-level configured IKEv2 IKE Security Association transform set. *name* must be an existing IKEv2 IKESA Transform Set and be from 1 to 127 alpha and/or numeric characters.

list

A space-separated list of IKEv2-IKESA SA transform sets to be used for deriving IKEv2 IKE Security Associations from this crypto template. A minimum of one transform-set is required; maximum configurable is six.

Usage

Use this command to configure parameters for the IKEv2 IKE Security Associations within this crypto template.

Example

The following command configures the maximum number of IKEv2 IKESA request retransmissions to *7*:

```
ikev2-ikesa max-retransmissions 7
```

The following command configures the IKEv2 IKESA request retransmission timeout to *400*:

```
ikev2-ikesa retransmission-timeout 400
```

The following command configures the IKEv2 IKESA transform set list name to *ikesa43*:

```
ikev2-ikesa transform-set list ikesa43
```

keepalive

Configures keepalive or dead peer detection for security associations used within this crypto template.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

keepalive [interval *sec* **] [timeout** *sec* **] [num-retry** *num* **]**

default keepalive [interval] [timeout] [num-retry]

no keepalive

no

Disables keepalive messaging.

interval *sec*

Default: 10
Specifies the amount of time in seconds that must elapse before the next keepalive request is sent. *sec* must be an integer from 10 to 3600.

timeout *sec*

Default: 10
Specifies the amount of time in seconds that the system will wait without receiving a reply before retrying the keepalive request. *sec* must be an integer from 10 to 3600.

num-retry *num*

Default: 2
Specifies the number of times the system will retry a non-responsive peer before defining the peer as off-line or out-of-service. *num* must be an integer from 1 to 100.

Usage

Use this command to set parameters associated with determining the availability of peer servers.

Example

The following command sets a keepalive interval to three minutes, the timeout to 30 seconds, and the retry attempts number to *5*:

keepalive interval *180* **timeout** *30* **num-retry** *5*

nai

Configures the NAI parameters to be used for the crypto template IDr.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

[default | no] nai idr *name* **id-type {rfc822-addr | fqdn | ip-addr | key-id }**

Default

Configures the default command **no nai idr**. As a result, the default behavior is for the PDIF-service IP address to be sent as the IDr value of type ID_IP_ADDR.

no

no nai idr configures the value whereby the PDIF service IP address is sent as the IDr value with the type ID_IP_ADDR. This is the default condition.

idr *name*

name is a string of up to 79 alpha and/or numeric characters.

id-type { rfc822-addr | fqdn | ip-addr | key-id }

Configures the NAI IDr **id-type** parameter. If no id-type is specified, then rfc822-addr is assumed.

- **rfc822-addr**: configures NAI Type ID_RFC822_ADDR.
- **fqdn**: configures NAI Type ID_FQDN.
- **ip-addr**: configures NAI Type ID_IP_ADDR.
- **key-id**: configures NAI Type ID_KEY_ID.

Usage

The configured IDr is sent from the PDIF to the MS in the first IKEv2 AUTH response.

Example

The following command configures the NAI IDr to the default condition.

```
no naiidr
```

natt

Configures Network Address Translation - Traversal (NAT-T) for all security associations associated with this crypto template. This feature is disabled by default.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] natt [ send-keepalive ]
```

default

Disables NAT-T for all security associations associated with this crypto template.

no

Disables NAT-T for all security associations associated with this crypto template.

send-keepalive

Sends NAT-Traversal keepalive messages.

Usage

Use this command to configure NAT-T for security associations within this crypto template.

Example

The following command disables NAT-T for this crypto template:

```
no natt
```

payload

Creates a new, or specifies an existing, crypto template payload and enters the Crypto Template Payload Configuration Mode.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

[no] payload *name* **match childsa [match { ipv4 | ipv6 }]**

no

Removes a currently configured crypto template payload.

name

Specifies the name of a new or existing crypto template payload. *name* must be from 1 to 127 alpha and/or numeric characters.

match childsa [match { ipv4 | ipv6 }

Filters IPSec Child Security Association creation requests for subscriber calls using this payload. Further filtering can be performed by applying the following:

- **ipv4**: Configures this payload to be applicable to IPSec Child Security Association requests for IPv4.
- **ipv6**: Configures this payload to be applicable to IPSec Child Security Association requests for IPv6.

Usage

Use this command to create a new or enter an existing crypto template payload. The payload mechanism is a means of associating parameters for the Security Association (SA) being negotiated.
Two payloads are required: one each for MIP and IKEv2. The first payload is used for establishing the initial Child SA Tunnel Inner Address (TIA) which will be torn down. The second payload is used for establishing the remaining Child SAs. Note that if there is no second payload defined with home-address as the *ip-address-allocation* then no MIP call can be established, just a Simple IP call.
Currently, the only available match is for ChildSA, although other matches are planned for future releases. Omitting the second match parameter for either IPv4 or IPv6 will make the payload applicable to all IP address pools.
Crypto Template Payload Configuration Mode commands are defined in the Crypto Template Payload Configuration Mode Commands chapter.

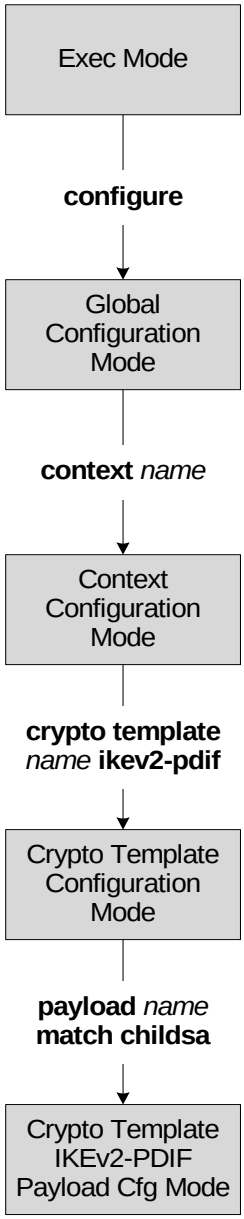
Example

The following command configures a crypto template payload called *payload5* and enters the Crypto Template Payload Configuration Mode:

payload *payload5* **match childsa**

Chapter 48
Crypto Template IKEv2-PDIF Payload Configuration Mode Commands

The Crypto Template IKEv2-PDIF Payload Configuration Mode is used to assign the correct IPsec transform-set from a list of up to four different transform-sets, and to assign Mobile IP addresses. There should be two payloads configured. The first must have a dynamic addressing scheme as this is how the ChildSA gets a TIA address. The second payload supplies the ChildSA with a HoA, which is the default setting for *ip-address-allocation*.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

default

Sets or restores the default value for the specified parameter.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
default { ignore-rekeying-requests | ip-address-allocation lifetime | maximum-child-sa | rekey | tsi | tsr }
```

ignore-rekeying-requests

Configures the system to ignore IPSec SA rekey requests.

ip-address-allocation

Configures the crypto map payload IP address allocation scheme to be the home address.

lifetime

Configures the default lifetime for IPSec Child SAs derived from this crypto template. **lifetime:** 86400 seconds.

maximum-child-sa

Configures the maximum number of IPSec Child SAs to be derived from an IKEv2 IKE SA by default.

rekey

Configures the system to disable Child SA rekeying.

tsi

Configures the default TSi payload to be that of the mobile endpoint.

tsr

Configures the default TSr payload option.

Usage

Configures system defaults.

Example

Use the following configuration to set the TSi payload start-address to be that of the mobile endpoint:

```
default tsi
```

default

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec Mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Returns to the previous mode.

ignore-rekeying-requests

Ignores CHILD SA rekey requests from the PDIF.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

ignore-rekeying-requests

Usage

Prevents creation of a CHILD SA based on this crypto template.

Example

The following command prevents creation of a CHILD SA based on this crypto template:

```
ignore-rekeying-requests
```

ip-address-allocation

Configures IP address allocation for subscribers using this crypto template payload. Configure two payloads per crypto template. The first must have a dynamic address to assign a TIA to the ChildSA. The second payload is configured after a successful MIP initiation and can use the default HoA option.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
ip-address-allocation { dynamic | home-address | static }

default ip-address-allocation
```

dynamic

Specifies that the IP address for the subscriber is allocated from a dynamic IP pool.

home-address

Specifies that the IP address for the subscriber is allocated by the Home Agent. This is the default setting for this command.

static

Specifies that the IP address for the subscriber is a static simple IP address.

Usage

Use this command to configure how ChildSA payloads are allocated IP addresses for this crypto template.

Example

The following command is for the first ChildSA and will ensure that it gets a TIA address from an IP address pool:

```
ip-address-allocation dynamic
```

The following command is for the second ChildSA and will ensure that it gets a HoA address from the HA:

```
default ip-address-allocation
```

ipsec

Configures the IPsec transform set to be used for this crypto template payload.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

[no] ipsec transform-set list *name*

no

Specifies the IPsec transform set to be deleted. This is a space-separated list. From 1 to 4 transform sets can be entered. *name* must be from 1 to 127 alpha and/or numeric characters.

list *name*

Specifies the context configured IPsec transform set name to be used in the crypto template payload. This is a space-separated list. From 1 to 4 transform sets can be entered. *name* must be from 1 to 127 alpha and/or numeric characters.

Usage

Use this command to list the IPsec transform set(s) to use in this crypto template payload.

Example

The following command configures IPsec transform sets named *ipset1* and *ipset2* to be used in this crypto template payload:

ipsec transform-set list *ipset1 ipset2*

lifetime

Configures the number of seconds for IPsec Child SAs derived from this crypto template payload to exist.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

lifetime *sec*

default lifetime

sec

Default: 86400
Specifies the number of seconds for IPSec Child Security Associations derived from this crypto template payload to exist. *sec* must be an integer from 60 to 86400.

default lifetime

Sets the lifetime to its default value of 86400 seconds.

Usage

Use this command to configure the number of seconds for IPsec Child Security Associations derived from this crypto template payload to exist.

Example

The following command configures the IPsec child SA lifetime to be 120 seconds:

lifetime *120*

maximum-child-sa

Configures the maximum number of IPsec child security associations that can be derived from a single IKEv2 IKE security association.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

maximum-child-sa *num*

default maximum-child-sa

num

Default: 1
Specifies the maximum number of IPsec child security associations that can be derived from a single IKEv2 IKE security association. *num* must be 1.

default maximum-child-sa

Sets the maximum number of Child SAs to its default value of 1.

Usage

Use this command to configure the maximum number of IPsec child security associations that can be derived from a single IKEv2 IKE security association.

Example

The following command configures the maximum number of child SAs to 1:

maximum-child-sa *1*

rekey

Configures IPSec Child Security Association rekeying.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] rekey [ keepalive ]
```

no

Disables this feature.

keepalive

If specified, a session will be rekeyed even if there has been no data exchanged since the last rekeying operation. By default, rekeying is only performed if there has been data exchanged since the previous rekey.

Usage

Use this command to enable or disable the ability to rekey IPSec Child SAs after approximately 90% of the Child SA lifetime has expired. The default, and recommended setting, is not to perform rekeying. No rekeying means the PDIF will not originate rekeying operations and will not process CHILD SA rekeying requests from the UE.

Example

The following command disables rekeying:

```
no rekey
```

tsi

Configures the IKEv2 Initiator Traffic Selector (TSI) payload address options.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

tsi start-address { any { end-address any } | endpoint { end-address *endpoint* **} }**

any { end-address any }

Configures the TSi payload to allow all all IP addresses.

endpoint { end-address *endpoint* **}**

Configures the TSi payload start-address to be that of the Mobile endpoint. This is the default value. *endpoint* is the mobile endpoint netmask.

Usage

On receiving a successful IKE_SA_INIT Response from PDIF, the MS sends an IKE_ AUTH Request for the first EAP-AKA authentication. If the MS is capable of doing multiple-authentication, it includes the MULTI_AUTH_SUPPORTED Notify payload in the IKE_AUTH Request. MS also includes an IDi payload containing the NAI, SA, TSi, TSr, and CP (requesting IP address and DNS address) payloads.

Example

Use the following example to configure a TSi payload that allows all addresses:

```
tsi start-address any end-address any
```

tsr

Configures the IKEv2 Responder Traffic Selector (TSr) payload address options.

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

tsi start-address *ipv4 address* **end-address** *ipv4 address*

start-address *ipv4 address*

Configures the TSi payload to include the TSr start IPv4 address of an address range for the Phase 1 multiple traffic selector feature.

end-address *ipv4 address*

Configures the TSi payload start-address to include the TSr end IPv4 address of an address range for the Phase 1 multiple traffic selector feature.

Usage

As part of Phase 1 of the Multiple Traffic Selector feature, this command is used to specify an IPv4 address range in the single TSr payload that the PDG/TTG returns in the last IKE_AUTH message. This TSr is Child SA-specific.

Example

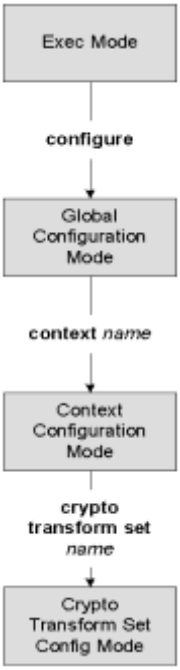
Use the following example to configure a TSr payload that specifies an IPv4 address range for the payload:

tsr start-address *ipv4 address* **end-address** *ipv4 address*

Chapter 49
Crypto Transform Set Configuration Mode Commands

The Crypto Transform Set Configuration Mode is used to configure properties for system transform sets.

Transform Sets are used to define IPSec security associations (SAs). IPSec SAs specify the IPSec protocols to use to protect packets.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the context configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the context configuration mode.

mode

Configures the IPSec encapsulation mode.

Product

PDSN, HA, GGSN, PDIF, SCM

Privilege

Security Administrator, Administrator

Syntax

```
mode { transport | tunnel }
```

transport

Default: Disabled
Specifies that the transform set only protects the upper layer protocol data portions of an IP datagram, leaving the IP header information unprotected.

Important: This mode should only be used if the communications end-point is also the cryptographic end-point.

tunnel

Default: Enabled
Specifies that the transform set protects the entire IP datagram as displayed in the following figure.
This mode should be used if the communications end-point is different from the cryptographic end-point as in a VPN.

Usage

This command specifies the encapsulation mode for the transform set.

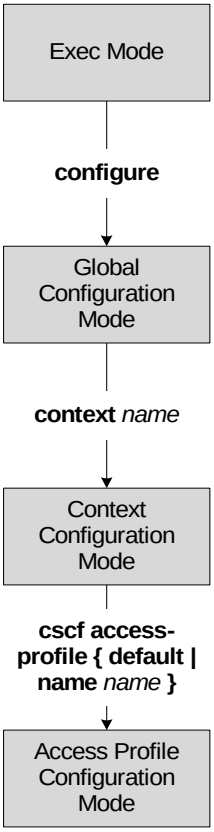
Example

The following command configures the transforms set's encapsulation mode to transport:

```
mode transport
```

Chapter 50
CSCF Access Profile Configuration Mode Commands

The Access Profile Configuration Mode is used to set commands supporting the use of signaling compression, authentication, and SIP timers for subscribers accessing the system from varying network types.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

access-security-type

Sets the type of access security for a P-CSCF/A-BG.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] access-security-type ipsec-3gpp-cscf
```

no

Disables the selected access security type.

ipsec-3gpp-cscf

Security mechanism 3GPP/3GPP2 IPSec.

Usage

Use this command to enable or disable an access security type for a P-CSCF or A-BG.

Example

Enables 3GPP/3GPP2 IPSec access security on P-CSCF or A-BG:

```
access-security-type ipsec-3gpp-cscf
```

Disables 3GPP/3GPP2 IPSec access security on P-CSCF or A-BG:

```
no access-security-type ipsec-3gpp-cscf
```

authentication

Sets the authentication method to use for subscribers using this access profile.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] authentication { aka-v1 | md5 }
```

no

Disables the selected authentication type.

aka-v1 | md5

aka-v1: Specifies that the AKA-v1 algorithm will be used for subscribers using this access profile.
md5: Specifies that the MD5 algorithm will be used for subscribers using this access profile. This is the default setting for this command.

Usage

Use this command to set the authentication method used for subscribers using this access profile.

Example

The following command sets the authentication type for subscribers using this access profile to **md5**:

```
authentication md5
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

sigcomp

Enables signalling compression for the Access Profile.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] sigcomp [ force ]
```

no

Disables signalling compression for the Access Profile.

force

Specifies that signaling compression is to be forced for the access type. When this feature is enabled, messages received by the P-CSCF/A-BG that are not compressed are rejected.

Usage

Use this command to enable signalling compression for the specific Access Profile.

timeout

Sets timeout values for CSCF and SIP transactions for subscribers using this Access Profile.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
timeout sip { 3gpp-d sec | 3gpp-t1 msec | 3gpp-t2 sec | 3gpp-t4 sec | d sec |
invite-expiry sec | t1 msec | t2 sec | t4 sec }

default timeout sip { 3gpp-d | 3gpp-t1 | 3gpp-t2 | 3gpp-t4 | d | invite-expiry |
t1 | t2 | t4 }
```

---

sip { 3gpp-d *sec* **| 3gpp-t1** *msec* **| 3gpp-t2** *sec* **| 3gpp-t4** *sec* **| d** *sec* **| invite-expiry** *sec* **| t1** *msec* **| t2** *sec* **| t4** *sec* **}**

Sets transaction and expiry timers for SIP.
3gpp-d *sec*: This time is used to control the retransmission of 200OK messages to INVITEs after an ACK is sent. The ACK transaction is cleared after this period. This timer is applicable only for unreliable transport.
sec must be an integer from 0 to 2147483646.
Default: 64*T1 (128 seconds, recommended minimum)
3gpp-t1 *msec*: This timer is used to control the time interval between each retransmission. The interval doubles after each retransmission. This is used by P-CSCF/A-BG only when it sending message toward the UE. Example: T1, 2T1, 4T2, etc. This timer is applicable only for unreliable transport.
msec must be an integer from 0 to 2147483646.
Default: 2000 ms (2 secs, recommended minimum).
3gpp-t2 *sec*: This timer is used to control the period for which the request continues to get retransmitted. This is used by P-CSCF/A-BG only when it sending message toward the UE. This timer is applicable both for reliable and unreliable transport.
sec must be an integer from 0 to 2147483646.
Default: 16 seconds (recommended minimum).
3gpp-t4 *sec*: This timer is used to control the period for which the final response to non-invite transaction should be buffered. The buffered response for the retransmitted non-invite request should be sent within that interval. This timer is applicable only for unreliable transport.
sec must be an integer from 0 to 2147483646.
Default: 17 seconds (recommended minimum).
d *sec*: This time is used to control the retransmission of 200OK to INVITE after ACK is sent. The ACK transaction will be cleared after this interval. This timer is applicable only for unreliable transport.
sec must be an integer from 0 to 2147483646.
Default: 64*T1 (32 seconds, recommended minimum)
invite-expiry *sec*: This timer is used by SIP while acting as UA Role and no final response is received for the INVITE request sent. This timer is applicable for both reliable and unreliable transport.
sec must be an integer from 0 to 2147483646.
Default: 100 seconds (recommended minimum).
t1 *msec*: Specifies the time interval (in milliseconds) between each retransmission. The interval doubles after each retransmission, for example: T1, 2T1, 4T2, etc. This timer is applicable only for unreliable transport.

msec must be an integer from 0 to 2147483646.
Default: 500 milliseconds (recommended minimum).
t2 *sec*: This timer is used to control the period for which the request keeps getting retransmitted. This timer is applicable both for reliable and unreliable transport.
sec must be an integer from 0 to 2147483646. The recommended minimum value for this parameter is 4 seconds.
Default: 64*T1 (32 seconds)
t4 *sec*: This timer is used to control the period for which the final response to non-invite transaction should be buffered so as to send the buffered response for the retransmitted non-invite request within that interval. This timer is applicable only for unreliable transport.
sec must be an integer from 0 to 2147483646.
Default: 5 seconds (recommended minimum).

default

Sets/restores default value assigned for specified parameter.

Usage

Use this command to configure SIP Stack timers and CSCF service specific timers for subscriber traffic using this Access Profile.

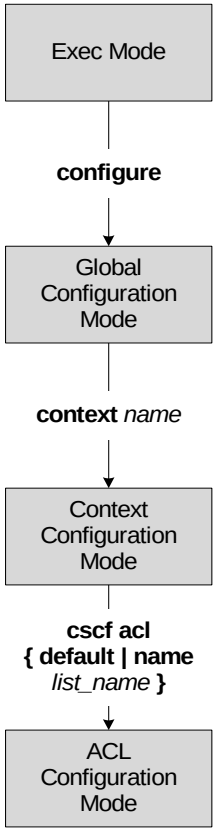
Example

The following command sets the SIP d timer to *64* seconds:

```
timeout sip d 64
```

Chapter 51
CSCF ACL Configuration Mode Commands

The CSCF ACL (Access Control List) Configuration Mode is used to configure session permissions (permit/deny access) within the system.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

after

Places the CSCF ACL entry at the bottom or end of the ACL. Use this command in conjunction with the **permit** and/or **deny** commands.

Product

SCM

Privilege

Administrator

Syntax

after

Usage

Add this command before the **permit** and/or **deny** commands to place the entry at the end of the ACL.

before

Places the CSCF ACL entry at the beginning or top of the ACL. Use this command in conjunction with the **permit** and/or **deny** commands.

Product

SCM

Privilege

Administrator

Syntax

before

Usage

Add this command before the **permit** and/or **deny** commands to place the entry at the beginning of the ACL.

deny

Configures the system to deny subscriber sessions based on criteria matching the received packet.

Product

SCM

Privilege

Administrator

Syntax

deny { any | destination aor *aor* **| log { any | destination aor** *aor* **| source { address** *ip_address* **| aor** *aor* **} | source { address** *ip_address* **| aor** *aor* **} }**

no deny { any | destination aor *aor* **| source { address** *ip_address* **| aor** *aor* **} }**

any

Filters all CSCF sessions.

destination aor *aor*

Filters sessions based on the destination AoR. *aor* must be an existing AoR from 1 to 79 characters in length.

Important: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

log { any | destination aor *aor* **| source { address** *ip_address* **| aor** *aor* **} }**

Enables logging for CSCF sessions meeting the criteria specified in the ACL. The logs can be viewed by executing the **logging filter active facility acl-log** command in the Exec mode. Specifies the criteria that packets will be compared against. The following criteria is supported:

- **any**
- **destination aor** *aor*
- **source address** *ip_address*
- **source aor** *aor*

source { address *ip_address* **| aor** *aor* **}**

Filters session based on the source IP address or AoR.

- *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
- *aor* must be an existing AoR from 1 to 79 characters in length.

Important: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

no deny { any | destination aor *aor* **| source { address** *ip_address* **| aor** *aor* **} }**

Removes specified filter criteria.

Usage

Specifies the subscriber sessions to deny based on the criteria specified.

Example

The following command denies access to subscribers with a source address of *1.2.3.4*:

deny source address *1.2.3.4*

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

permit

Configures the system to allow subscriber sessions based on criteria matching the received packet.

Product

SCM

Privilege

Administrator

Syntax

permit { any | destination aor *aor* **| log { any | destination aor** *aor* **| source { address** *ip_address* **| aor** *aor* **} | source { address** *ip_address* **| aor** *aor* **} }**

no permit { any | destination aor *aor* **| source { address** *ip_address* **| aor** *aor* **}}**

any

Filters all CSCF sessions.

destination aor *aor*

Filters sessions based on the destination AoR.
aor must be an existing AoR from 1 to 79 characters in length.

Important: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

log { any | destination aor *aor* **| source { address** *ip_address* **| aor** *aor* **}}**

Enables logging for CSCF sessions meeting the criteria specified in the ACL. The logs can be viewed by executing the **logging filter active facility acl-log** command in the Exec mode.
Specifies the criteria that packets will be compared against. The following criteria is supported:

- **any**
- **destination aor** *aor*
- **source address** *ip_address*
- **source aor** *aor*

source { address *ip_address* **| aor** *aor* **}**

Filters session based on the source IP address or AoR.

- *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
- *aor* must be an existing AoR from 1 to 79 characters in length.

Important: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

no permit { any | destination aor *aor* **| source { address** *ip_address* **| aor** *aor* **} }**

Removes specified filter criteria.

Usage

Specifies the subscriber sessions to permit based on the criteria specified.

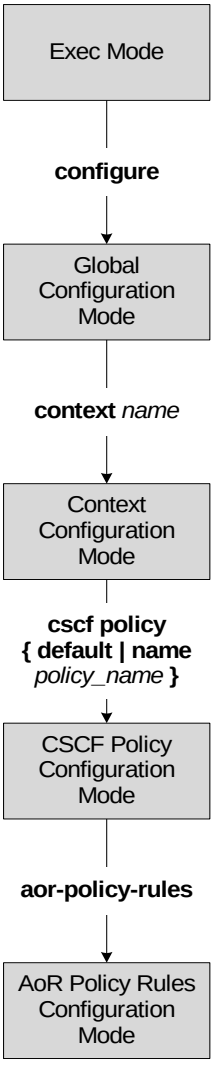
Example

The following command permits access to subscribers with a destination AoR of *$.@abc123.com*

permit destination aor *$.@abc123.com*

Chapter 52
CSCF AoR Policy Rules Configuration Mode Commands

The CSCF AoR Policy Rules Configuration Mode is used to manage AoR policy profiles within the system. Both default and user-defined profiles can be managed in this mode.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

after

Places the CSCF policy entry at the bottom or end of the policy list. Use this command in conjunction with the **aor** command.

Product

SCM

Privilege

Administrator

Syntax

after

Usage

Add this command before the **aor** command to place the entry at the end of the policy list.

aor

Configures an AoR profile and enters the AoR Profile Configuration Mode.

Product

SCM

Privilege

Administrator

Syntax

[no] aor *aor_name*

no

Removes the AoR profile from the system.

aor_name

Specifies a name for the AoR profile.
aor_name must be from 1 to 79 alpha and/or numeric characters in length.

Usage

Use this command to create or modify an AoR profile and enter the CSCF Policy Rules Configuration Mode. Entering this command results in the following prompt:
[*context_name*]*hostname*(config-*aor_name*-aor)#
CSCF Policy Rules Configuration Mode commands are defined in the CSCFPolicy Rules Configuration Mode Commands chapter of this guide.

Example

The following command creates an AoR profile named *aor5* and enters the AoR Profile Configuration Mode:

aor *aor5*

before
