Places the CSCF policy entry at the top or beginning of the policy list. Use this command in conjunction with the **aor** command.

Product

SCM

Privilege

Administrator

Syntax

before

Usage

Add this command before the **aor** command to place the entry at the beginning of the policy list.

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

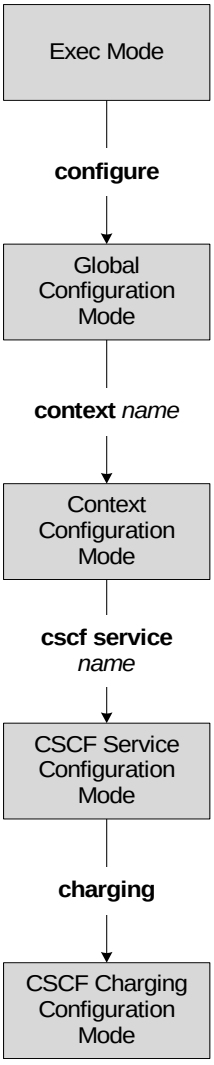
exit

Usage

Return to the previous mode.

Chapter 53
CSCF Charging Configuration Mode Commands

The CSCF Charging Configuration Mode is used to manage CSCF service policy profiles within the system.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exclude

Configures the service to exclude SIP requests from the Rf charging configuration.

Product

SCM

Privilege

Administrator

Syntax

[no] exclude { custom *sip_method* **| invite | notify | register | subscribe | update** }

no

Removes the exclusion of the specified SIP request message type.

custom *sip_method*

Specifies CUSTOM SIP requests that are to be excluded from Rf charging.
sip_method can be a name of any SIP method and be from 1 to 31 alpha and/or numeric characters.

invite

Specifies that INVITE SIP requests are to be excluded from Rf charging.

notify

Specifies that NOTIFY SIP requests are to be excluded from Rf charging.

register

Specifies that REGISTER SIP requests are to be excluded from Rf charging.

subscribe

Specifies that SUBSCRIBE SIP requests are to be excluded from Rf charging.

update

Specifies that UPDATE SIP requests are to be excluded from Rf charging.

Usage

Use this command to exclude specific SIP requests from Rf charging.

Example

The following command configures the service to exclude SIP REGISTER requests from Rf charging:

```
exclude register
```

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

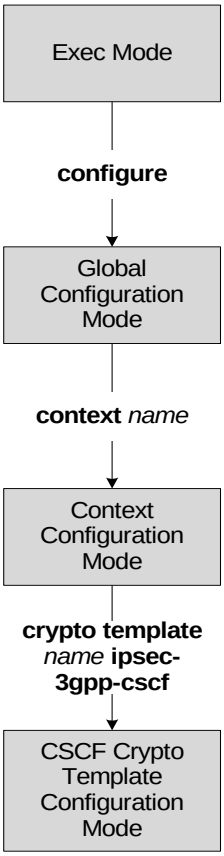
exit

Usage

Return to the previous mode.

Chapter 54
CSCF Crypto Template Configuration Mode Commands

The CSCF Crypto Template Configuration Mode is used to configure a P-CSCF IPsec policy. It includes most of the IPsec parameters and Internet Key Exchange version 1 (IKEv1) parameters for cryptographic and authentication algorithms etc. A P-CSCF service will not support IPSec without a configured crypto template. Only one crypto template can be configured per P-CSCF service.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec Mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Returns to the previous mode.

ipsec

Configures parameters for the 3GPP/3GPP2 P-CSCF security associations within this crypto template.

Product

SCM

Privilege

Security Administrator, Administrator

Syntax

ipsec transform-set list *list_name*

transform-set list *name*

transform-set: Specifies a context-level IPSec security association transform set to be used for deriving 3GPP/3GPP2 P-CSCF security associations from this crypto template.
list *list_name:* A space separated list of 3GPP/3GPP2 P-CSCF security association transform sets. *list_name* must be an existing 3GPP/3GPP2 P-CSCF transform set and be from 1 to 127 alpha and/or numeric characters.

Important: A minimum of one transform set is required. A maximum of four transform sets may be specified.

Usage

Use this command to configure parameters for the 3GPP/3GPP2 P-CSCF security associations within this crypto template.

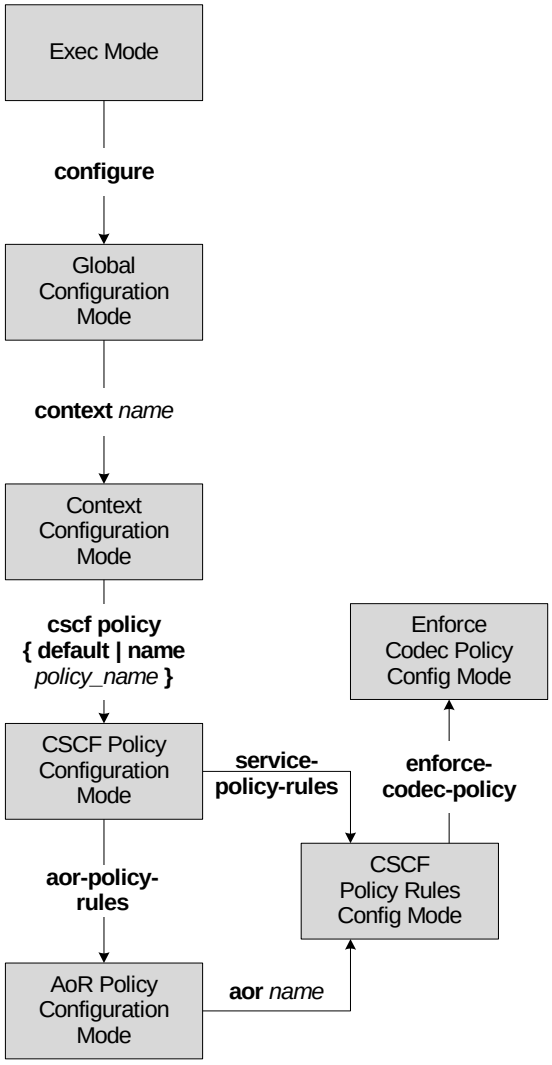
Example

The following command configures the 3GPP/3GPP2 P-CSCF transform set list name to *ikev1list1*:

ipsec transform-set list *ikev1list1*

Chapter 55
CSCF Enforce Codec Policy Configuration Mode Commands

The CSCF Enforce Codec Policy Configuration Mode is used to manage audio and video codec policies within the system. The parameters defined in this chapter are derived from IETF RFC 3551: “RTP Profile for Audio and Video Conferences with Minimal Control”.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

dynamic-codec

Creates a list of dynamic codecs supported by the system.

Product

SCM

Privilege

Administrator

Syntax

dynamic-codec { audio *encoding_name* **| video** *encoding_name* **} [** *clock_rate* **] [** *channels* **]**

default dynamic-codec

no dynamic-codec [*encoding_name* **] [** *clock_rate* **] [** *channels* **]**

---

audio *encoding_name* **| video** *encoding_name*

audio *encoding_name:* Specifies the encoding name of the dynamic audio codec added to the allowed codec list. *encoding_name* must be from 1 to 49 alpha and/or numeric characters.
video *encoding_name:* Specifies the encoding name of the dynamic video or audio-video codec added to the allowed codec list. *encoding_name* must be from 1 to 49 alpha and/or numeric characters.

[*clock_rate* **] [** *channels* **]**

clock_rate: Specifies the sampling rate of the codec. *clock_rate* must be an integer from 0 to 1000000.
channels: Specifies the number of channels required by the codec. *channels* must be an integer from 1 to 1000000.
Valid dynamic audio codecs:

Encoding Name	Clock Rate (Hz)	Channels
G726-40	8,000	1
G726-32	8,000	1
G726-24	8,000	1
G726-16	8,000	1
G729D	8,000	1
G729E	8,000	1
GSM-EFR	8,000	1
L8	Variable	Variable
RED	See RFC3551	
VDVI	Variable	1

Valid dynamic video codecs:

Encoding Name	Clock Rate (Hz)
H263-1998	90,000

`default`

Specifies that the default list of dynamic codecs is added to the allowed codecs list. Default dynamic codecs: H263 and AMR.

`no dynamic-codec [ `*`encoding_name`*` ] [ `*`clock_rate`*` ] [ `*`channels`*` ]`

Specifies that all dynamic codecs are removed from the allowed codecs list. If an *`encoding_name`* is specified, then only the codec specified by the *`encoding_name`* is removed. Furthermore, if a supporting *`clock_rate`* and/or *`channels`* are specified, then only the *`encoding_name`* with the specified *`clock_rate`* and/or *`channels`* is removed.

Usage

Use this commands to create a list of supported dynamic audio and video codecs in the system. When a request is received by the CSCF, the SDP fields in the message are checked to determine the codec being used. The codec in the SDP fields must match a codec in the allowed codec list or the CSCF rejects the request.

Example

The following command adds the GSM-EFR codec to the allowed dynamic codec list:

`dynamic-codec` *`GSM-EFR`*

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

static-codec

Creates a list of static codecs supported by the system.

Product

SCM

Privilege

Administrator

Syntax

static-codec { audio *payload_type* **| video** *payload_type* **}**

default static-codec

no static-codec [*payload_type* **]**

---

audio *payload_type* **| video** *payload_type*

audio *payload_type:* Specifies the audio codec added to the allowed codecs list. *payload_type* must be an integer from 0 to 95. Default value is 5.
Valid static audio codecs:

0: PCMU	7: LPC	14: MPA	21: unassigned
1: reserved	8: PCMA	15: G728	22: unassigned
2: reserved	9: G722	16: DVI4	23: unassigned
3: GSM	10: L16	17: DVI4	
4: G723	11: L16	18: G729	
5: DVI4	12: QCELP	19: reserved	
6: DVI4	13: CN	20: unassigned	

video *payload_type:* Specifies the video or audio-video codec added to the allowed codecs list. *payload_type* must be an integer from 0 to 95. Default value is 5.
Valid static video codecs:

24: unassigned	28: nv	32: MPV	72-76: reserved
25: CelB	29: unassigned	33: MP2T	77-95: unassigned
26: JPEG	30: unassigned	34: H263	
27: unassigned	31: H261	35-71: unassigned	

---

default

Specifies that the default list of static codecs is added to the allowed codecs list.
The default static codec is 5: DVI4.

no static-codec [*payload_type* **]**

Specifies that all static codecs are removed from the allowed codecs list. If a *payload_type* is specified, then only the codec specified by the *payload_type* is removed.

Usage

Use this commands to create a list of supported static audio and video codecs in the system. When a request is received by the CSCF, the SDP fields in the message are checked to determine the codec being used. The codec in the SDP fields must match a codec in the allowed codec list or the CSCF rejects the request.

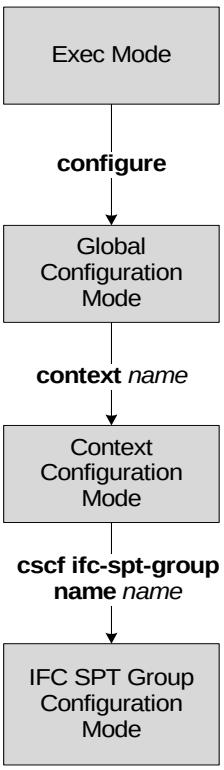
Example

The following command adds the G729 audio codec to the allowed codecs list:

static-codec *18*

Chapter 56
CSCF IFC SPT Group Mode Commands

The CSCF iFC SPT Group Configuration Mode is used to associate individual SPT conditions with an Initial Filter Criteria (iFC) Service Point Trigger (SPT) group.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

spt-condition

Assigns iFC SPT conditions to an existing iFC SPT group.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

`[ no ] spt-condition name` *`cond_name`*

`no`

Removes the specified CSCF iFC SPT condition from the iFC SPT group.

`spt-condition name` *`cond_name`*

Specifies the name of an existing iFC SPT condition.
`cond_name` must be from 1 to 39 alpha and/or numeric characters in length.

Usage

Use this command to associate individual SPT conditions with an iFC SPT group.

Important: An iFC SPT group may be associated with multiple SPT conditions.

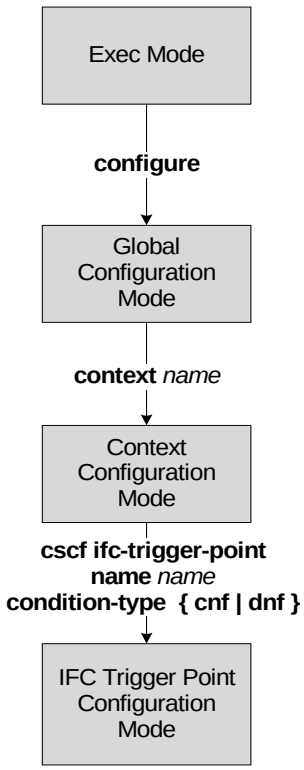
Example

The following command assigns cond2 to an iFC SPT group:

`spt-condition name` *`cond2`*

Chapter 57
CSCF IFC Trigger Point Mode Commands

The CSCF iFC Trigger Point Configuration Mode is used to associate an Initial Filter Criteria (iFC) Service Point Trigger (SPT) group with an iFC trigger point.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

spt-group

Assigns an existing iFC SPT group to an iFC trigger point.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

[no] spt-group name *group_name*

no

Removes the specified CSCF iFC SPT group from the iFC trigger point.

spt-group name *group_name*

Specifies the name of an existing iFC SPT group.
group_name must be from 1 to 39 alpha and/or numeric characters in length.

Important: An iFC SPT group can be assigned to more than one iFC trigger point.

Usage

Use this command to associate an iFC SPT group with an iFC trigger point.

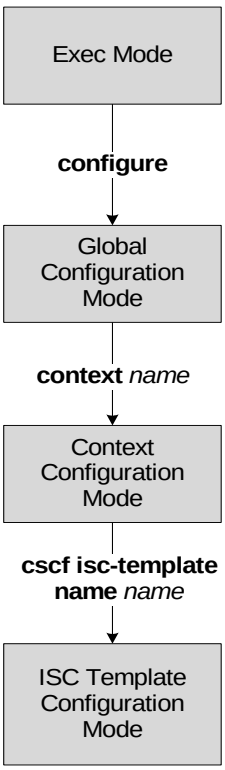
Example

The following command assigns an iFC SPT group named *group2* to an iFC trigger point:

spt-group name *group2*

Chapter 58
CSCF ISC Template Configuration Mode Commands

The CSCF ISC Template Configuration Mode is used to configure the IMS Service Control (ISC) interface within the system.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

cnsa

Core Network Service Authorization (CNSA) related commands used to create media profile and service ids.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

cnsa { media-profile-id *profile_id* **| service-id** *service_id* **[** *service_id* **]...[** *service_id* **] }**

no cnsa { media-profile-id | service-id [*service_id* **] [** *service_id* **]...[** *service_id* **] }**

media-profile *profile_id*

Specifies the cnsa media profile id.
profile_id must be an integer from 0 to 10.
The media profile id is assigned to a service policy using the **cnsa-media-profile** command under CSCF Service configuration.

Important: You can only create one media profile id per ISC template.

service-id *service_id*

Specifies the cnsa service id(s). These ids represent URN parameters which are ICSI (IMS Communication Service Identifier) values that are mapped to a service profile through a media profile id.
service_id must be from 1 to 79 alpha and/or numeric characters.

no cnsa { media-profile-id | service-id [*service_id* **] [** *service_id* **]... [** *service_id* **] }**

Removes a media profile or service id(s).

Usage

Use this command to configure cnsa media profile ids and service ids. Information for core network authorization is received from HSS. It contains a list of service ids and a media profile id. Since the media profile id is an integer value, the S-CSCF needs to have a static database that contains the mapping between the integer value and the subscribed media profile. The media profile id is assigned to this service policy using the **cnsa-media-profile** command under CSCF Service configuration.
The S-CSCF selects the service profile based on the media profile id set and the policies, such as enforce-codec-policy and video-sessions, will be matched with the incoming request. Other policies, if configured, will be ignored in this scenario.

Example

The following command defines the media profile id as 2:

```
cnsa media-profile-id 2
```

The following command defines several service ids:

```
cnsa service-id xxx:exampletelephony.version1 xxx:abc.com
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

filter-criteria

Configure the filter criteria to be used by this template.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

`[ no ] filter-criteria name` *`criteria_name`*

`no`

Removes the specified filter criteria.

`name` *`criteria_name`*

Specifies the name of existing filter criteria to be used by this template. The particular criteria applied to a subscriber will be based on the priority parameter.
`criteria_name` must be from 1 to 39 alpha and/or numeric characters in length.

Important: Filter criteria can be assigned to more than one ISC template.

Usage

Use this command to configure the filter criteria to be used by this template.

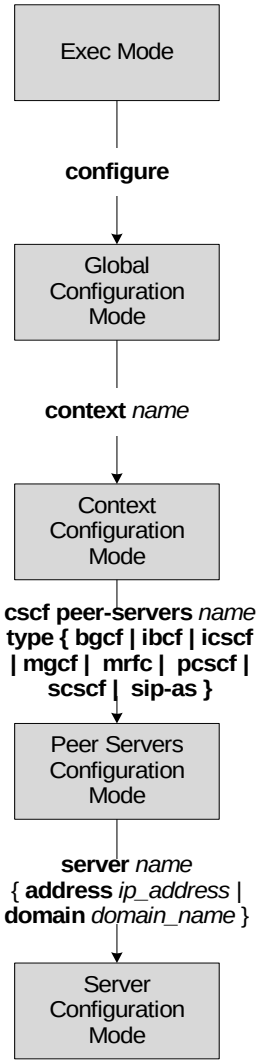
Example

The following command identifies the filter criteria *`criteria1`*:

`filter-criteria name` *`criteria1`*

Chapter 59
CSCF Peer Server Monitoring Configuration Mode Commands

The CSCF Peer Server Monitoring Configuration Mode is used to configure an individual peer server's monitoring parameters and operational mode. It also associates a network session template with the server.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

ims-capable

Indicates whether the peer server belongs to a 3GPP/IMS network or a non-IMS network such as the Internet. This command is used to determine at the S-CSCF whether SIP signaling inter-working is needed when the calls are forwarded to external networks.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

```
[ no ] ims-capable
```

no

Removes the identification of "IMS capable" from the selected peer server.

Usage

Use this command to identify a peer server as IMS capable allowing the S-CSCF to use SIP signalling inter-working when forwarding calls to non-IMS capable networks.

lro-selection-profile

Binds a CSCF last route profile with the peer server.

Product

SCM

Privilege

Administrator

Syntax

lro-selection-profile name *profile_name*

no lro-selection-profile

lro-selection-profile name *profile_name*

profile_name must be an existing CSCF last route profile and be from 1 to 79 alpha and/or numeric characters.

no lro-selection-profile

Removes CSCF last route profile from the peer server group.

Usage

Use this command to identify a CSCF last route profile to use for finding the correct Public Safety Answering Point (PSAP) during emergency calls.

Example

The following command assigns a CSCF last route profile named *lro1* to the peer server group:

lro-selection-profile name *lro1*

The following command removes a CSCF last route profile from the peer server group:

no lro-selection-profile

mode

Sets the peer server mode to either active or standby. By default, peer servers are in active mode.

Product

SCM

Privilege

Administrator

Syntax

```
mode { active | standby }
```

active

Defines the mode of the CSCF peer server as active.

standby

Defines the mode of the CSCF peer server as standby.

Usage

Use this command to set the peer server mode to either active or standby.

Example

The following command sets the peer server's mode to standby:

```
mode standby
```

monitor-status

Sets parameters for monitoring the status of peer servers.

Product

SCM

Privilege

Administrator

Syntax

```
monitor-status [ monitor-interval seconds ] [ monitor-message options ] [
monitor-response-timer seconds ]

no monitor-status
```

monitor-interval *seconds*

Default: 30
Specifies the interval that peer server monitoring will occur.
seconds must be an integer from 1 to 65535.

monitor-message options

Specifies that SIP message (OPTIONS) are to be sent periodically after each monitoring interval.

monitor-response-timer *seconds*

Default: 180
Specifies the interval that the CSCF will wait for responses from the peer server.
seconds must be an integer from 1 to 65535.

no

Disables peering server status monitoring.

Usage

Use this command to set parameters for monitoring the status of a peer server.

Example

The following command sets the monitoring interval to three minutes (*180* seconds) and the response timer to six minutes (*360* seconds):

```
monitor-status monitor-interval 180 monitor-response-timer 360
```

nw-session-template

Specifies a session template for sessions terminating from the peer server group.

Product

SCM

Privilege

Administrator

Syntax

nw-session-template name *template-name*

no nw-session-template

name *template-name*

template-name must be an existing session template created in the Session Template Configuration Mode.

no

Removes session template from the peer server group.

Usage

Use this command to identify a session template to use for sessions terminating from the peer server group.

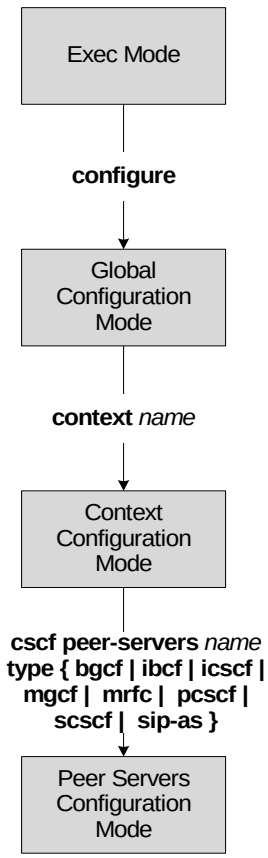
Example

The following command identifies a session template named *template-25* to use for sessions terminating from the peer server group:

nw-session-template *template-25*

Chapter 60
CSCF Peer Servers Configuration Mode Commands

The CSCF Peer Servers Configuration Mode is used to configure peer servers (for next-hop session routes) within the system.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

hunting-method

Configures the method by which servers in this group are contacted.

Product

SCM

Privilege

Administrator

Syntax

```
hunting-method { round-robin | sequence-on-failure | weighed }

default hunting-method
```

round-robin | sequence-on-failure | weighed

Specifies the hunting method for the servers in this group.
round-robin: Specifies that the servers will be used in round-robin fashion. This is the default setting.
sequence-on-failure: Specifies that the servers will be used sequentially if a failure occurs on a server (i.e., first peer server is always used, except on failure, during which next peer server in the list will be used).
weighed: Specifies that the peer servers in this group have a set "weight" that determines use as compared to the other like-configured peer servers. The actual weight of the peer server is configured in the **server** command in this mode.

default

Specifies that the servers will be used in round-robin fashion.

Usage

Use this command to configure the method that is used by the system to connect to servers in this group.

Example

The following command sets the hunting method for servers in this group to contact sequentially only when a server fails:

```
hunting-method sequence-on-failure
```

server

Configures the name, IP address, and port of servers belonging to this group and enters the Server Configuration Mode.

Product

SCM

Privilege

Administrator

Syntax

server *name* **{ address** *ip_address* **| domain** *domain_name* **} [port** *number* **] [transport { tcp | udp }] [weight** *number* **]**

no server *name*

name

Specifies a name for the server. *name* must be from 1 to 79 alpha and/or numeric characters in length.

address *ip_address*

Specifies the IP address of the server. *ip_address* is expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

domain *domain_name*

Specifies the domain name of the peer server. *domain_name* must be from 1 to 255 alpha and/or numeric characters in length.

port *number*

Specifies the port number of the server.
number must be an integer value from 1 to 65535.

transport { tcp | udp }

Specifies the transport type (TCP or UDP).

weight *number*

Default: 5
Specifies a weighted number for the specific peer server for load balancing purposes. *number* must be an integer value from 1 to 10. Higher weight implies larger server capability (and more routed requests).

Important: This keyword is only valid if the **weighed** keyword is applied to the **hunting-method** command in this mode.

no server *name*

Removes the specified server from the group.

Usage

Use this command to configure servers belonging to this group and enter the Server Configuration Mode. Entering this command results in the following prompt:

```
[context_name]hostname(config-server_name-peer-server)#
```

Server Configuration Mode commands are defined in the *CSCF Peer Server Monitoring Configuration Mode Commands* chapter.

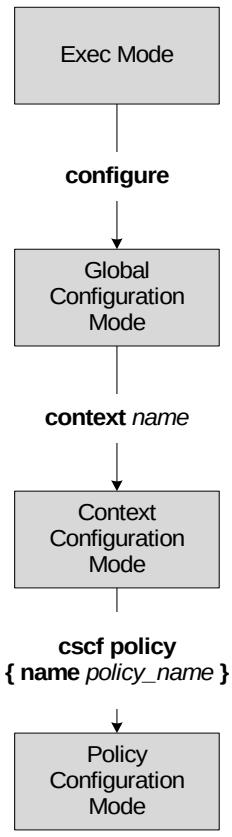
Example

The following command configures a server named *scscf5* with an IP address of *1.2.3.4* and a port number of *5060*:

```
server scscf5 address 1.2.3.4 port 5060
```

Chapter 61
CSCF Policy Configuration Mode Commands

The CSCF Policy Configuration Mode is used to manage AoR policy profiles within the system. User-defined profiles can be managed in this mode.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

aor-policy-rules

Specifies that the newly created policy is an AoR policy and enters the AoR Policy Rules Configuration Mode.

Product

SCM

Privilege

Administrator

Syntax

```
aor-policy-rules
```

Usage

Use this command to create an AoR policy group and enter the AoR Policy Rules Configuration Mode. Entering this command results in the following prompt:

```
[context_name]hostname(config-aor-policy)#
```

AoR Policy Configuration Mode commands are defined in the *CSCF AoR Policy Rules Configuration Mode Commands* chapter.

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

service-policy-rules

Specifies that the newly created policy is a service policy and enters the Service Policy Rules Configuration Mode.

Product

SCM

Privilege

Administrator

Syntax

service-policy-rules

Usage

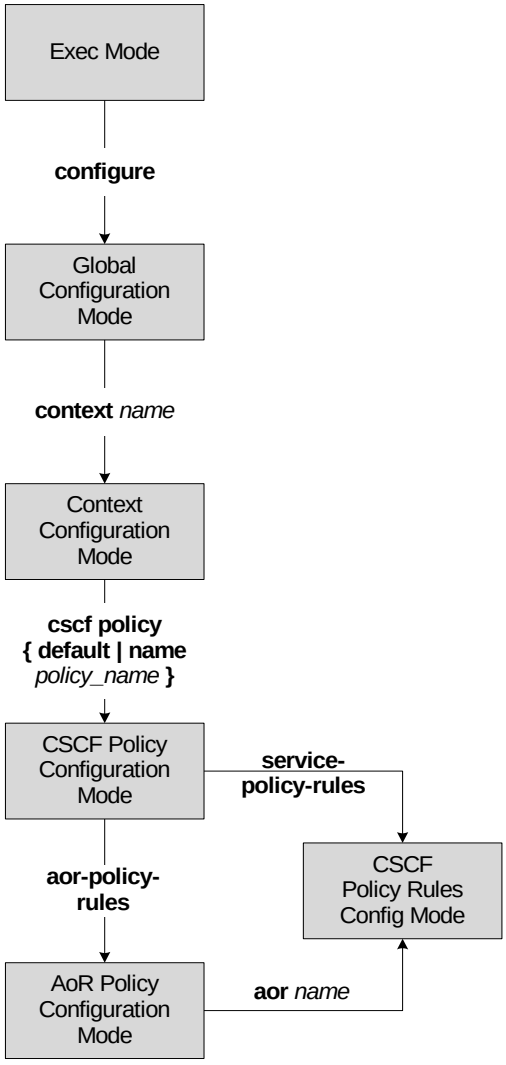
Use this command to create a service policy group and enter the CSCF Policy Rules Configuration Mode. Entering this command results in the following prompt:

```
[context_name]hostname(config-service-policy)#
```

Service Policy Rule Configuration Mode commands are defined in the *CSCF Policy Rules Configuration Mode Commands* chapter.

Chapter 62
CSCF Policy Rules Configuration Mode Commands

The CSCF Policy Rules Configuration Mode is used to manage CSCF AoR and service policy profiles within the system.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

allow-noauth

Configures the policy to allow unauthenticated access. Default is disabled.

Product

SCM

Privilege

Administrator

Syntax

```
[ default | no ] allow-noauth
```

default | no

Disables the allow-noauth functionality for this policy.

Usage

Use this command to allow access to subscribers without authenticating them.

allow-unsecure

Configures the policy to allow access to the system without a security association. Default is disabled.

Product

SCM

Privilege

Administrator

Syntax

```
[ default | no ] allow-unsecure
```

default | no

Disables the allow-unsecure functionality for this policy.

Usage

Use this command to enable the policy to provide subscriber access to system without a security association.

authorization

Configures the policy to allow early bandwidth authorization. Default is disabled.

Product

SCM

Privilege

Administrator

Syntax

```
[ default | no ] authorization early-bandwidth
```

default | no

Disables the early bandwidth authorization functionality for this policy.

Usage

Use this command to enable the policy to provide early bandwidth authorization.

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

enforce-codec-policy

Enters the Enforce Codec Policy Command Mode where allowed static and dynamic codec lists are managed.

Product

SCM

Privilege

Administrator

Syntax

```
[ default | no ] enforce-codec-policy
```

default | no

Disables the codec policy.

Usage

Use this command to enter the Enforce Codec Policy Configuration Mode.
Entering this command results in the following prompt:

```
[context_name]hostname(config-policy-enforce-codec)#
```

CSCF Enforce Codec Policy Mode commands are defined in the *Enforce Codec Policy Configuration Mode Commands* chapter in this guide.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

max-cscf-concurrent-sessions

Configures the maximum number of concurrent sessions allowed per subscriber.

Product

SCM

Privilege

Administrator

Syntax

max-cscf-concurrent-sessions *number*

default max-cscf-concurrent-sessions

number

Default: 5
Specifies the number of concurrent sessions allowed per subscriber for this policy. *number* must be an integer from 1 to 100.

default

Resets defaults for this command.

Usage

Use this command to set the maximum number of allowed sessions per subscriber for this policy.
If enabled, the **subscriber-policy-override** command in the CSCF Service Configuration Mode overrides the service-level policy.

Example

The following command sets the maximum number of concurrent sessions for a subscriber using this policy to 7:

max-cscf-concurrent-sessions 7

policy

Configures the overload response for this policy. When the P-CSCF/A-BG becomes congested, this overload policy is used to reject subsequent sessions or redirect them to another server.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

policy overload { redirect *address1* **[weight** *weight1* **] [** *address2* **[weight** *weight2* **]] ... | reject [use-reject-code { admin-prohibited | insufficient-resources }] }**

default policy overload

no policy overload redirect *address1*[*address2*] **...**

redirect *address1* **[weight** *weight1* **] [** *address2* **[weight** *weight2* **]] ...**

Specifies that upon policy overload, the system will redirect the session to another CSCF.
address1 must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
weight *weight1*: Defines the priority of the redirect address.
weight1 must be an integer from 1 to 10. Default is 1.

reject [use-reject-code { admin-prohibited | insufficient-resources }]

Specifies that upon policy overload, the system will reject the session. This is the default setting.
use-reject-code: Specifies that a reject code will be returned upon policy overload.

- **admin-prohibited**: Specifies that the "admin-prohibited" reject code will be returned upon policy overload.
- **insufficient-resources**: Specifies that the "insufficient resources" reject code will be returned upon policy overload. This is the default reject code.

default policy overload

Resets defaults for this command.

no policy overload redirect *address1* **[** *address2* **] ...**

Removes configured policy overload redirect address(es).

Usage

Use this command to define the response to an overload condition on the P-CSCF/A-BG using this AoR policy.

Example

The following command configures the policy overload response to redirect to a series of CSCFs with IP address of *1.2.3.4*, *1.2.3.5*, and *1.2.3.6* with respective priorities (weights) of *1*, *3*, and *2*:

```
policy overload redirect 1.2.3.4 weight 1 1.2.3.5 weight 3 1.2.3.6 weight
2
```

qos

Configures QoS bandwidth settings for uplink and downlink.

Product

SCM

Privilege

Administrator

Syntax

qos bandwidth { downlink| uplink } [peak *value* **]**

bandwidth { downlink| uplink }

downlink: Configures the downlink bandwidth.
uplink: Configures the uplink bandwidth.

peak *value*

Peak value of bandwidth in kilobits per second (kbit/s).
value must be an integer from 1 to 99999999.

Usage

The P-CSCF/A-BG fills the required bandwidth for downlink and uplink from the Session Description Protocol (SDP) in the message when communicating with an external policy server via Rx/Tx/Gq. Use this command to configure the peak uplink and downlink bandwidth to be used when the SDP does not contain bandwidth.

Example

Set the peak uplink bandwidth to *256* kbit/s:

qos bandwidth uplink peak *256*

video-sessions

Configures the policy to allow video bearers. Default is disabled.

Product

SCM

Privilege

Administrator

Syntax

```
[ default | no ] video-sessions
```

default | no

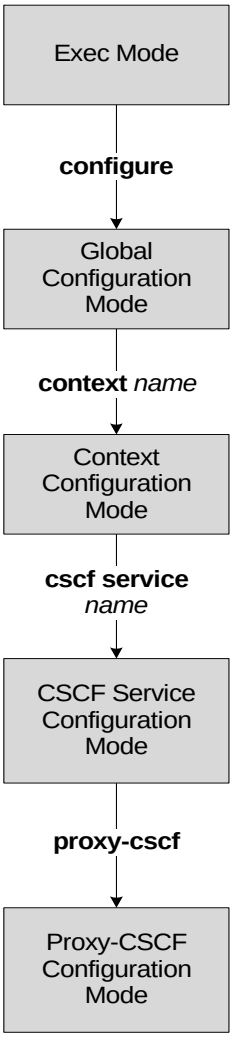
Disables the “allow video sessions” feature.

Usage

Use this command to allow video session via this policy.

Chapter 63
CSCF Proxy-CSCF Configuration Mode Commands

The Proxy-CSCF Configuration Mode is used to enable Diameter policy control within the service.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

allow

Enables the function to allow IMS interworking with RFC3261 SIP User Agents.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] allow rfc3261-ua-interworking
```

no

Disables the interworking capability.

Usage

Use this command to enable the P-CSCF/A-BG to allow IMS interworking with RFC3261 SIP User Agents.

diameter

This command:

- configures the Diameter dictionary used in this function.
- configures the policy control origin endpoint used in this function.
- enables the selection of a Diameter policy control peer server providing Rx/Tx/Gq applications for this service.
- configures the Diameter requested timeout value used in this function.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

diameter location-info { dictionary { e2custom01 | e2custom02 | e2custom03 | e2custom04 | e2custom05 | e2custom06 | e2custom07 | e2custom08 | e2custom09 | e2standard } | origin endpoint endpoint_name | peer-select peer *peer_name* **[peer-realm** *realm_name* **] [secondary-peer** *peer_name* **[sec-peer-realm** *realm_name* **]] | request-timeout** *sec***}**

diameter policy-control { dictionary { Gq-custom | Gq-standard | Rq-custom| Rx-rel8 | **Rx-standard | Tx-standard | custom01 | custom02 | custom03 | custom04 | custom05 | custom06 | custom07 | custom08 | custom09 } | origin endpoint endpoint_name | peer-select peer** *peer_name* **[peer-realm** *realm_name* **] [secondary-peer** *peer_name* **[sec-peer-realm** *realm_name* **]] |** request-timeout *sec* **}**

default diameter { location-info | policy-control } { **dictionary** | request-timeout }

no diameter { location-info | policy-control } [origin endpoint | peer-select]

location-info

Defines the E2 interface for location information.

dictionary { e2custom01...e2custom09 | e2standard }

custom01...custom09: Specifies that a customer-specific (custom) dictionary is to be used for expansion and behaviors.
e2standard: Specifies that the E2-Standard-Dictionary is to be used.

policy-control

Defines external policy control.

dictionary { Gq-custom | Gq-standard | Rq-custom| Rx-rel8 | Rx-standard | Tx-standard | custom01...custom09 }

Gq-custom: Specifies that the Gq Operax dictionary is to be used.
Gq-standard: Specifies that the Gq standard dictionary is to be used.
Rq-custom: Specifies that the Rq custom dictionary is to be used.
Rx-rel8: Specifies that the Rx Release 8 dictionary is to be used.
Rx-standard: Specifies that the Rx standard dictionary is to be used.
Tx-standard: Specifies that the Tx standard dictionary is to be used.
custom01...custom09: Specifies that a customer-specific (custom) dictionary is to be used.

origin endpoint *endpoint_name*

Specifies the Diameter location-info or policy control endpoint name.
endpoint_name must be the endpoint's name and an alpha and/or numeric string of 1 through 63 characters in length.

peer-select peer *peer_name*

Specifies the name of the Diameter location-info or policy control peer server.
peer_name must be from 1 to 63 alpha and/or numeric characters in length.
Diameter peer servers are configured through the **diameter endpoint** command in the Context Configuration Mode. The **diameter endpoint** command is a generic command and can be found in theCisco ASR 5000 Series Command Line Interface Reference.

peer-realm *realm_name*

Specifies the realm name for which the Diameter location-info or policy control peer server has responsibility.
realm_name must be from 1 to 63 alpha and/or numeric characters in length.

Important: If this keyword is not configured, the system defaults to the realm name configured for the selected peer server.

secondary-peer *peer_name*

Specifies the name of the secondary Diameter location-info or policy control peer server.
peer_name must be from 1 to 63 alpha and/or numeric characters in length.

sec-peer-realm *realm_name*

Specifies the realm name for which the secondary Diameter location-info or policy control peer server has responsibility.
realm_name must be from 1 to 63 alpha and/or numeric characters in length.

Important: If this keyword is not configured, the system defaults to the realm name configured for the selected peer server.

request-timeout *sec*

Specifies the Diameter location-info or policy control requested timeout value in seconds.
sec must be an integer from 1 to 300.
Default: 10

default diameter { location-info | policy-control } { dictionary | request-timeout }

Sets the Diameter's location-info or policy control dictionary or requested timeout value as the default.

no diameter { location-info | policy-control } [origin endpoint | peer-select]

Removes the Diameter location-info or policy control origin endpoint or Diameter peer from the service.

Usage

Use this command to:

- define the Diameter dictionary to use for the service.
- specify the Diameter origin endpoint.
- specify a Diameter location-info or policy control peer server to support Rx/Tx/Gq applications.
- specify the Diameter requested timeout value for this service.

Example

The following command configures the system to use the Tx standard Diameter dictionary for this service:

```
diameter policy-control dictionary Tx-standard
```

The following command sets the Diameter location-info origin endpoint to *test*:

```
diameter location-info origin endpoint test
```

The following command selects a Diameter policy control peer server with a name of *diam-2* and a realm name of *realm-6*:

```
diameter policy-control peer-select peer diam-2 peer-realm realm-6
```

emergency-sessions

Configures the function to allow anonymous and/or non-emergency registered subscribers to initiate emergency sessions.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

emergency-sessions [**anonymous** [**non-emergency-registered**] | **non-emergency-registered**]

[default | no] emergency-sessions

anonymous

Allow anonymous subscribers to initiate emergency sessions.

non-emergency-registered

Allow non-emergency registered subscribers to initiate emergency sessions.

default

Specifies that anonymous and non-emergency registered emergency sessions are allowed.

no

Disallows anonymous and/or non-emergency registered emergency sessions.

Usage

Use this command to configure the function to allow anonymous and/or non-emergency registered subscribers to initiate emergency sessions.

Example

The following command configures the function to allow only non-emergency registered subscribers to initiate emergency sessions:

```
emergency-sessions non-emergency-registered
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

interrogating-cscf-role

Enables the function to also perform as an Interrogating-CSCF.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] interrogating-cscf-role
```

no

Disables the Interrogating-CSCF role in this function.

Usage

Use this command to enable the P-CSCF/A-BG to also perform as an Interrogating-CSCF.

message-max-size

Configures the maximum message body size in MESSAGE method.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

message-max-size *limit*

[default | no] message-max-size

limit

Default: 1024
Configures the maximum SIP message size limit in bytes for any SIP message buffer.
limit must be an integer from 512 to 65535.

Important: Message body size should be less than the max-sipmsg-size set in the CSCF Service Configuration Mode.

default | no

Returns/sets the maximum SIP message size to 1024 bytes.

Usage

Use this command to configure the maximum SIP message size for any SIP message buffer.

Example

The following command limits the SIP message size to *4000* bytes:

message-max-size *4000*

network-id

Configures the Network Identifier.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

[no] network-id *id*

id

The Network Identifier of the entity.
id must be from 1 to 79 alpha and/or numeric characters in length.

no

Removes the configured Network Identifier of the entity.

Usage

The Network Identifier is used by the P-CSCF or A-BG to fill the P-Visited-Network-ID header.

Example

Sets the Network Identifier to *pcscf01.company.com:*

network-id *pcscf01.company.com*

plmn-id

Configures location specific mobile network identifiers used to help translate local emergency and service-related numbers. Default is disabled.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

plmn-id mcc *code* **mnc** *code*

no plmn-id

mcc *code*

Specifies the Mobile Country Code for the mobile access network. *code* must be a three-digit integer from 200 to 999.

mnc *code*

Specifies the Mobile Network Code for the mobile access network. *code* must be a two or three-digit integer from 00 to 999.

no plmn-id

Removes the access network configuration for this P-CSCF/A-BG service.

Usage

Use this command to help match location specific emergency/service numbers when configuring translations. The **mcc** and **mnc** values are compared against those received in p-access-network-info headers as per 3GPP TS 24.229. If **mnc** is not provided in the criteria only **mcc** is compared.

Example

The following command identifies the mobile network with a MCC of *123* and a MNC of *12*:

plmn-id mcc *123* **mnc** *12*

reg-service-route

Enables the function to use service routes when routing re-registrations.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] reg-service-route
```

no

Disables the ability to use service routes for re-registration.

Usage

Use this command to enable the P-CSCF/A-BG service to use service routes when routing re-registrations.

security-parameters

Enters the Security Configuration Mode in which Denial of Service (DOS) prevention commands can be configured.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

security-parameters

Usage

Use this command to enter the Security Configuration Mode.
Entering this command results in the following prompt:

```
[context_name]hostname(config-security-parameters)#
```

Security Configuration Mode commands are defined in the *CSCF Security Configuration Mode Commands* chapter in this guide.

sigcomp

Enables signaling compression for the P-CSCF/A-BG service and enters the Signaling Compression Configuration Mode.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] sigcomp
```

no

Disables signaling compression for the P-CSCF/A-BG service.

Usage

Use this command to enable signaling compression for the P-CSCF/A-BG service and enter the CSCF Signaling Compression Configuration Mode.
Entering this command results in the following prompt:

```
[context_name]hostname(config-sigcomp)#
```

Signaling Compression Configuration Mode commands are defined in the *CSCF Signaling Compression Configuration Mode Commands* chapter in this guide.

sip-header

Enable SIP P-Access-Network-Info (PANI) or P-User-Database (PUD) header insertion for the P-CSCF/A-BG service.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] sip-header insert { p-access-network-info | p-user-database }
```

p-access-network-info

Inserts PANI header in received request/response.

p-user-database

Inserts PUD header in SIP (REGISTER) message and Invite from I-CSCF to S-CSCF.

no

Disables SIP PANI or PUD header insertion for the P-CSCF/A-BG service.

Usage

Enabling this command allows PANI header insertion in received requests/responses on the P-CSCF or A-BG. In addition, it allows PUD header insertion in SIP (REGISTER) message and Invite from I-CSCF to S-CSCF.

Important: Use the **access-type** command to configure a ue-ip-address-range per access type. CSCF Service Configuration Mode commands are defined in the *CSCF Service Configuration Mode Commands* chapter in this guide.

sip-param

Enable the addition of "integrity-protected" parameter in the authorization header of a SIP (REGISTER) message for the P-CSCF/A-BG service.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] sip-param insert integrity-protected
```

no

Disables the addition of "integrity-protected" parameter in the authorization header of a SIP (REGISTER) message for the P-CSCF/A-BG service.

Usage

Enabling this command allows the P-CSCF or A-BG to add the "integrity-protected" parameter in the authorization header of a SIP (REGISTER) message. The parameter will be used by the S-CSCF to decide which authentication mode to use to authenticate the user.

Example

Enables the addition of **integrity-protected** parameter:

```
sip-param insert integrity-protected
```

Disables the addition of **integrity-protected** parameter:

```
no sip-param insert integrity-protected
```

store-session-path

Enables the P-CSCF or A-BG to store and process the session path information, which includes the Route list, Record-Route list, Service-Route list, and ViaList.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] store-session-path
```

no

Disables the storing of session path information by the P-CSCF or A-BG. In addition, the P-CSCF/A-BG will not overwrite the Route list, Record-Route list, Service-Route list, or ViaList in the in-dialog request and responses.

Usage

Enabling this command allows the P-CSCF or A-BG to store and process the session path information.

Example

Enables the storage and processing of session path information:

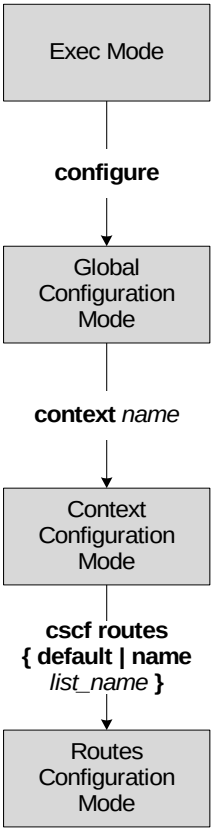
```
store-session-path
```

Disables the storage and processing of session path information:

```
no store-session-path
```

Chapter 64
CSCF Routes Configuration Mode Commands

The CSCF Routes Configuration Mode is used to configure session forwarding within the system.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

after

Places the CSCF route entry at the bottom or end of the route list. Use this command in conjunction with the **route** command.

Product

SCM (P-CSCF, S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

after

Usage

Add this command before the **route** command to place the entry at the end of the route list.

before

Places the CSCF route entry at the top or beginning of the route list. Use this command in conjunction with the **route** command.

Product

SCM (P-CSCF, S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

before

Usage

Add this command before the **route** command to place the entry at the beginning of the route list.

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

route

Configure the routing parameters for the context.

Product

SCM (P-CSCF, S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

route { domain *name* **| local { icscf | pcscf | scscf } | nexthop-address** *address* **| peer-servers** *group_name* **| vpn** *name* **} [[mod-req-uri] base-criteria** *criteria* **[filter-criteria1** *criteria* **] [filter-criteria2** *criteria* **]] [log]**

no route { domain *name* **| local { icscf | pcscf | scscf } | nexthop-address** *address* **| peer-servers** *group_name* **| vpn** *name* **} base-criteria** *criteria* **[filter-criteria1** *criteria* **] [filter-criteria2** *criteria* **]**

domain *name*

Specifies a valid next-hop domain name. *name* must be from 1 to 79 alpha and/or numeric characters in length.

local { icscf | pcscf | scscf }

Specifies a local interrogating, serving, or proxy call/session control function to which all calls processed by the context will be routed.

nexthop-address *ip_address*

Specifies a next-hop address.
ip_address must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

peer-servers *group_name*

Specifies a configured peer server group.
group_name must be the name of a configured peer server group on this system.

vpn *name*

Specifies a configured VPN context on the system.
name must be a configured context name.

mod-req-uri

Specifies that a route lookup should be performed and the request URI modified.

base-criteria *criteria*

Specifies the base criteria that packets will be compared against. The following criteria is supported:

- **access-type** *type*: Filters sessions based on a specific access-type used by the subscriber. Possible access types are:

- **3gpp-geran**: 3GPP Access Type
- **3gpp-utran-fdd**: 3GPP Access Type
- **3gpp-utran-tdd**: 3GPP Access type
- **3gpp2-1x**: 3GPP2 Access Type
- **3gpp2-1x-hrpd**: 3GPP2 Access Type
- **3gpp2-umb**: 3GPP2-UMB
- **adsl**: FixedLine Access Type
- **adsl2**: FixedLine Access Type
- **adsl2p**: FixedLine Access Type ADSL2+
- **docsis**: DOCSIS
- **gshdsl**: Fixed Line Access Type G.SHDSL
- **hdsl**: Fixed Line Access Type
- **hdsl2**: Fixed Line Access Type
- **idsl**: Fixed Line Access Type
- **ieee-80211**: WLAN Access Type
- **ieee-80211a**: WLAN Access Type
- **ieee-80211b**: WLAN Access Type
- **ieee-80211g**: WLAN Access Type
- **ieee-80216e**: Wireless MAN Access Type
- **radsl**: Fixed Line Access Type
- **sdsl**: Fixed Line Access Type
- **vdsl**: Fixed Line Access Type
- **any**: Filters all CSCF sessions.
- **carrier-id** *name*: Filters sessions based on the carrier's ID. *name* must be from 1 to 79 alpha and/or numeric characters in length.
- **destination aor** *aor*: Filters sessions based on the destination AoR. *aor* must be an existing AoR from 1 to 79 characters in length.

Important: The destination aor and carried-id criteria cannot occur in the same route rule.

- **plmn-id mcc** *mcc_code* **mnc** *mnc_code*: Filters sessions based on the mobile country and network codes. *mcc_code* must be a three-digit integer from 200 to 999. *mnc_code* must be a two or three-digit integer from 00 to 999.
- **source address** *ip_address*: Filters sessions based on source IP address. *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
- **source aor** *aor*: Filters sessions based on the source AoR. *aor* must be an existing AoR from 1 to 79 characters in length.
- **time-of-day**: Filters sessions based on the time of the day. Additional filter criteria for **time-of-day** is as follows:

- **day-of-month** *day*: Filters session based on the day of the month. *day* must be an integer from 1 to 31.
- **day-of-week** *day*: Filters session based on the day of the week. *day* must be an integer from 1 to 7 with 1 signifying Sunday and 7 signifying Saturday.
- **start** *date/time* **[end** *date/time* **]**: Filters sessions based on a start time to, optionally, an end time during the day. *date/time* must be integers in either of the following formats: YYYY:MM:DD:HH:mm or YYYY:MM:DD:mm:ss. YYYY: year range 2005 to 2099 MM: months (integer range 1 to 12) DD: days (integer range 1 to 31) HH: hours (integer range 0 to 23) mm: minutes (integer range 0 to 59) ss: seconds (integer range 0 to 59)
- **week-of-month** *week*: Filters sessions based on the week of the month. *week* must be an integer from 1 to 5.

Important: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

filter-criteria1 *criteria*

Specifies the filter criteria that packets that have passed the base criteria will be compared against. The following criteria is supported:

- **access-type** *type*: Filters sessions based on a specific access-type used by the subscriber. Possible access types are:
- **3gpp-geran**: 3GPP Access Type
- **3gpp-utran-fdd**: 3GPP Access Type
- **3gpp-utran-tdd**: 3GPP Access type
- **3gpp2-1x**: 3GPP2 Access Type
- **3gpp2-1x-hrpd**: 3GPP2 Access Type
- **3gpp2-umb**: 3GPP2-UMB
- **adsl**: FixedLine Access Type
- **adsl2**: FixedLine Access Type
- **adsl2p**: FixedLine Access Type ADSL2+
- **docsis**: DOCSIS
- **gshdsl**: Fixed Line Access Type G.SHDSL
- **hdsl**: Fixed Line Access Type
- **hdsl2**: Fixed Line Access Type
- **idsl**: Fixed Line Access Type
- **ieee-80211**: WLAN Access Type
- **ieee-80211a**: WLAN Access Type
- **ieee-80211b**: WLAN Access Type
- **ieee-80211g**: WLAN Access Type
- **ieee-80216e**: Wireless MAN Access Type
- **radsl**: Fixed Line Access Type

- **sdsl**: Fixed Line Access Type
- **vdsl**: Fixed Line Access Type
- **any**: Filters all CSCF sessions.
- **carrier-id** *name*: Filters sessions based on the carrier's ID. *name* must be from 1 to 79 alpha and/or numeric characters in length.
- **destination aor** *aor*: Filters sessions based on the destination AoR. *aor* must be an existing AoR from 1 to 79 characters in length.

Important: The destination aor and carried-id criteria cannot occur in the same route rule.

- **plmn-id mcc** *mcc_code* **mnc** *mnc_code*: Filters sessions based on the mobile country and network codes. *mcc_code* must be a three-digit integer from 200 to 999. *mnc_code* must be a two or three-digit integer from 00 to 999.
- **source address** *ip_address*: Filters sessions based on source IP address. *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
- **source aor** *aor*: Filters sessions based on the source AoR. *aor* must be an existing AoR from 1 to 79 characters in length.
- **time-of-day**: Filters sessions based on the time of the day. Additional filter criteria for **time-of-day** is as follows:
- **day-of-month** *day*: Filters session based on the day of the month. *day* must be an integer from 1 to 31.
- **day-of-week** *day*: Filters session based on the day of the week. *day* must be an integer from 1 to 7 with 1 signifying Sunday and 7 signifying Saturday.
- **start** *date/time* **[end** *date/time* **]**: Filters sessions based on a start time to, optionally, an end time during the day. *date/time* must be integers in either of the following formats: YYYY:MM:DD:HH:mm or YYYY:MM:DD:mm:ss. YYYY: year range 2005 to 2099 MM: months (integer range 1 to 12) DD: days (integer range 1 to 31) HH: hours (integer range 0 to 23) mm: minutes (integer range 0 to 59) ss: seconds (integer range 0 to 59)
- **week-of-month** *week*: Filters sessions based on the week of the month. *week* must be an integer from 1 to 5.

Important: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

filter-criteria2 *criteria*

Specifies the filter criteria that packets that have passed the base criteria and filter-criteria1 will be compared against. The following criteria is supported:

- **access-type** *type*: Filters sessions based on a specific access-type used by the subscriber. Possible access types are:
- **3gpp-geran**: 3GPP Access Type
- **3gpp-utran-fdd**: 3GPP Access Type
- **3gpp-utran-tdd**: 3GPP Access type
- **3gpp2-1x**: 3GPP2 Access Type

- **3gpp2-1x-hrpd**: 3GPP2 Access Type
- **3gpp2-umb**: 3GPP2-UMB
- **adsl**: FixedLine Access Type
- **adsl2**: FixedLine Access Type
- **adsl2p**: FixedLine Access Type ADSL2+
- **docsis**: DOCSIS
- **gshdsl**: Fixed Line Access Type G.SHDSL
- **hdsl**: Fixed Line Access Type
- **hdsl2**: Fixed Line Access Type
- **idsl**: Fixed Line Access Type
- **ieee-80211**: WLAN Access Type
- **ieee-80211a**: WLAN Access Type
- **ieee-80211b**: WLAN Access Type
- **ieee-80211g**: WLAN Access Type
- **ieee-80216e**: Wireless MAN Access Type
- **radsl**: Fixed Line Access Type
- **sdsl**: Fixed Line Access Type
- **vdsl**: Fixed Line Access Type
- **any**: Filters all CSCF sessions.
- **carrier-id** *name*: Filters sessions based on the carrier's ID. *name* must be from 1 to 79 alpha and/or numeric characters in length.
- **destination aor** *aor*: Filters sessions based on the destination AoR. *aor* must be an existing AoR from 1 to 79 characters in length.

Important: The destination aor and carried-id criteria cannot occur in the same route rule.

- **plmn-id mcc** *mcc_code* **mnc** *mnc_code*: Filters sessions based on the mobile country and network codes. *mcc_code* must be a three-digit integer from 200 to 999. *mnc_code* must be a two or three-digit integer from 00 to 999.
- **source address** *ip_address*: Filters sessions based on source IP address. *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
- **source aor** *aor*: Filters sessions based on the source AoR. *aor* must be an existing AoR from 1 to 79 characters in length.
- **time-of-day**: Filters sessions based on the time of the day. Additional filter criteria for **time-of-day** is as follows:
- **day-of-month** *day*: Filters session based on the day of the month. *day* must be an integer from 1 to 31.
- **day-of-week** *day*: Filters session based on the day of the week. *day* must be an integer from 1 to 7 with 1 signifying Sunday and 7 signifying Saturday.

- **start** *date/time* **[end** *date/time* **]**: Filters sessions based on a start time to, optionally, an end time during the day. *date/time* must be integers in either of the following formats: YYYY:MM:DD:HH:mm or YYYY:MM:DD:mm:ss. YYYY: year range 2005 to 2099 MM: months (integer range 1 to 12) DD: days (integer range 1 to 31) HH: hours (integer range 0 to 23) mm: minutes (integer range 0 to 59) ss: seconds (integer range 0 to 59)
- **week-of-month** *week*: Filters sessions based on the week of the month. *week* must be an integer from 1 to 5.

Important: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

log

Enables logging for CSCF sessions meeting the criteria specified in the ACL. The logs can be viewed by executing the **logging filter active facility cscf-acl-log** command in the Exec mode.

no route { domain *name* **| local { icscf | pcscf | scscf } | nexthop-address** *address* **| peer-servers** *group_name* **| vpn** *name* **} base-criteria** *criteria* **[filter-criteria1** *criteria* **] [filter-criteria2** *criteria* **]**

Removes the specified routing parameters for the CSCF service.

Usage

Use this command to configure routing parameters for the service.

Important: Use the **before** or **after** command to place the route entry in the route list.

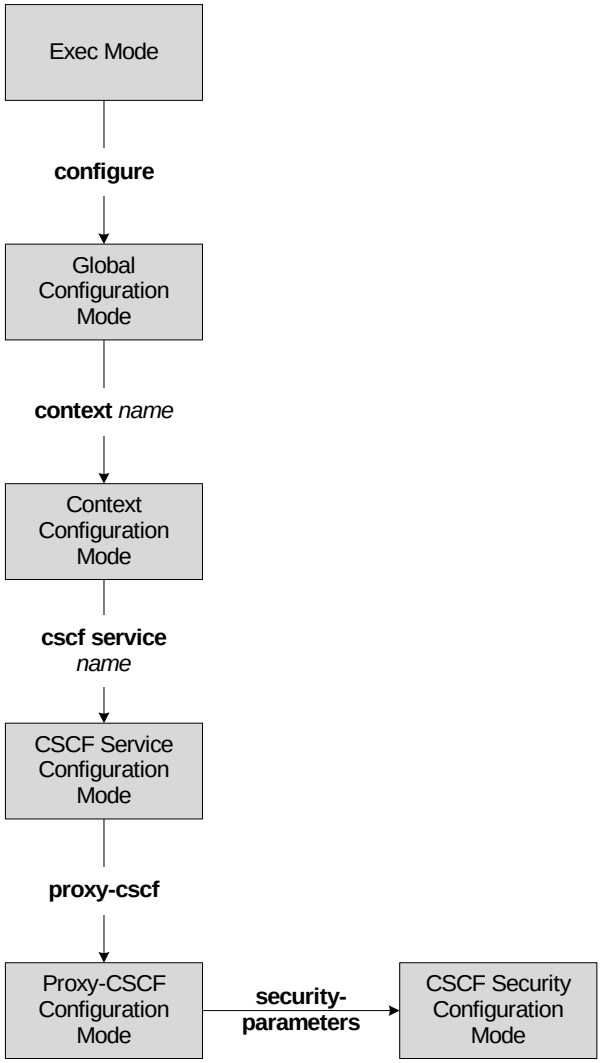
Example

The following command is placed at the end of the route list and routes sessions to a peer server group named *icscf_peer5*, filters sessions with a base criteria of the source address (*1.2.3.4*) and a filter criteria of the destination AoR (*$.@test.com*):

after route peer-servers *icscf_peer5* **base-criteria source address** *1.2.3.4* **filter-criteria1 destination aor** *$.@test.com*

Chapter 65
CSCF Security Configuration Mode Commands

The CSCF Security Configuration Mode is used to configure Denial of Service (DOS) prevention commands.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

auth-failure-weight

Sets a severity number for authorization failures used in calculating a value for determining when to suspend registration attempts.

Important: The system will ignore the configuration of this command unless the **dos-prevention** command has been enabled.

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator

Syntax

auth-failure-weight *weight*

default auth-failure-weight

weight

Default: 1
Assigns a weight to an authorization failure. Defines the severity of a single authorization failure. *weight* must be an integer from 1 to 5.

default

Sets /restores the default value assigned to the specified command.

Usage

Use this command to define the severity of an authorization failure. This parameter is used in calculating the current number of authorization failures to compare to the **per-aor-failure-limit** and the **per-ip-failure-limit**. Configuring this command with a lower number causes the system to suspend registration attempts with repeated authorization failures much sooner than when configured with a higher number.

Example

The following command assigns a weight of *3* to an authorization failure:

auth-failure-weight *3*

bad-request-weight

Sets a severity number for bad registration requests used in calculating a value for determining when to suspend registration attempts.

Important: The system will ignore the configuration of this command unless the **dos-prevention** command has been enabled.

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator

Syntax

bad-request-weight *weight*

default bad-request-weight

weight

Default: 2
Assigns a weight to a bad registration request. Defines the severity of a single bad request.
weight must be an integer from 1 to 5.

default

Sets /restores the default value assigned to the specified command.

Usage

Use this command to define the severity of bad registration request. This parameter is used in calculating the current number of request failures to compare to the **per-aor-failure-limit** and the **per-ip-failure-limit**. Configuring this command with a lower number causes the system to suspend registration attempts with repeated request failures much sooner than when configured with a higher number.

Example

The following command assigns a weight of *3* to a bad registration request:

bad-request-weight *3*

dos-prevention

Enables the denial of service prevention feature.

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] dos-prevention
```

`[ default | no ]`

Disables the denial of service prevention feature.

Usage

Use this command to enable the denial of service prevention feature. The default value for this command is disabled. When this command is enabled, the commands in this mode are enabled with default values configured.

Important: This command must be enabled before configuring other commands in this mode.

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the previous mode.

forking-contact-limit

Sets a limit on the number of contacts a user ID can register with the system.

Important: The system will ignore the configuration of this command unless the **dos-prevention** command has been enabled.

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator

Syntax

forking-contact-limit *limit*

default forking-contact-limit

limit

Default: 0
Sets the maximum number of contacts a user ID can register with the system. 0 specifies that unlimited contacts can be registered per user ID.
limit must be an integer from 0 to 10.

default

Sets /restores the default value assigned to the specified command.

Usage

Use this command to limit the number of contacts a user ID can register with the system.

Example

The following command limits all users to *2* registered contacts on the system:

forking-contact-limit *2*

greylist-duration

Configures the amount of time an AoR or IP address remains on a “grey list” after having crossed the registration authorization limit or the bad registration request limit.

Important: The system will ignore the configuration of this command unless the **dos-prevention** command has been enabled.

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator

Syntax

greylist-duration *time*

default greylist-duration

time

Default: 10
Defines the time, in minutes, that an AoR or IP address remains on a “grey list”.
time must be an integer from 5 to 1,440.

default

Sets /restores the default value assigned to the specified command.

Usage

Use this command to specify the amount of time AoRs or IP addresses remain on a “grey list” after having crossed the registration authorization limit or the bad registration request limit. Limits are described in the **per-aor-failure-limit** command and the **per-ip-failure-limit** command.

Example

The following command sets the duration AoRs or IP addresses remain on a “grey list” to *30* minutes:

greylist-duration *30*

per-aor-failure-limit

Sets a failure limit that, when exceeded, causes the suspension of registration attempts for the offending AoR.

Important: The system will ignore the configuration of this command unless the **dos-prevention** command has been enabled.

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator

Syntax

per-aor-failure-limit *limit*

default per-aor-failure-limit

limit

Default: 200
Defines the threshold for registration failures based on a calculation using weighted multipliers defined in **auth-failure-weight** and **bad-request-weight**.
limit must be an integer from 5 to 10,000.

default

Sets /restores the default value assigned to the specified command.

Usage

Use this command to set a failure limit for registration attempts from an identified AoR. The following calculation determines when this threshold is reached for a specific AoR:
Current authorization failures ÷ **auth-failure-weight** = current failures per AoR
or
Total bad registration requests ÷ **bad-request-weight** = current failures per AoR
If **auth-failure-weight** = *2* and **bad-request-weight** = *1*, and the **per-aor-failure-limit** = *100*, then the tolerance for registration authentication failures = 50 per AoR and the tolerance for bad registration requests = 100 per AoR.
When an AoR reaches the failure limit, it is added to a "grey list" for a period of time as defined by the **greylist-duration** command.

Example

The following command sets the AoR failure limit to *300*:

per-aor-failure-limit *300*

per-ip-failure-limit

Sets a failure limit that, when exceeded, causes the suspension of registration attempts for the offending IP address.

Important: The system will ignore the configuration of this command unless the **dos-prevention** command has been enabled.

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator

Syntax

per-ip-failure-limit *limit*

default per-ip-failure-limit

limit

Default: 100
Defines the threshold for registration failures based on a calculation using weighted multipliers defined in **auth-failure-weight** and **bad-request-weight**.
limit must be an integer from 5 to 10,000.

default

Sets /restores the default value assigned to the specified command.

Usage

Use this command to set a failure limit for registration attempts from an identified IP address. The following calculation determines when this threshold is reached for any IP address:
Current authorization failures ÷ **auth-failure-weight** = current failures per AoR
or
Total bad registration requests ÷ **bad-request-weight** = current failures per AoR
If **auth-failure-weight** = *2* and **bad-request-weight** = *1*, and the **per-ip-failure-limit** = *200*, then the tolerance for registration authentication failures = 100 per each IP address and the tolerance for bad registration requests = 200 per each IP address.
When an IP address reaches the failure limit, it is added to a "grey list" for a period of time as defined by the **greylist-duration** command.

Example

The following command sets the IP address registration failure limit to *200*:

per-ip-failure-limit *200*

threshold-rate

Configures the rate per second at which the system must receive bad requests before it considers the requests a DoS attack.

Important: The system will ignore the configuration of this command unless the **dos-prevention** command has been enabled.

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator

Syntax

threshold-rate *rate*

default threshold-rate

rate

Default: 1
Specifies the rate per second that the system must receive bad requests to determine that it is under a DoS attack.
rate must be an integer from 1 to 1,000.

default

Sets /restores the default value assigned to the specified command.

Usage

Use this command to specify the threshold rate for bad requests. For example, if a malicious user sends bad requests at a rate of 5 per second and this parameter is set to 10, the system will not consider itself under a DoS attack.

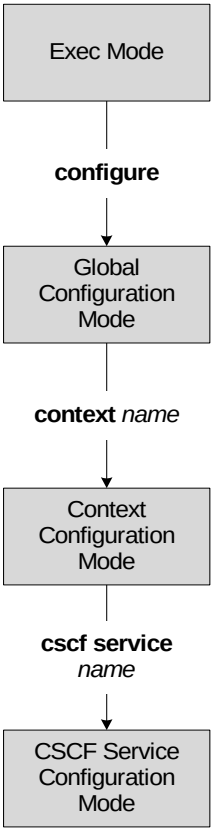
Example

The following command sets the threshold rate to *5* bad requests per second:

threshold-rate *5*

Chapter 66
CSCF Service Configuration Mode Commands

The CSCF Service Configuration Mode is used to create and manage CSCF services within the current context.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

access-service

Configures the name of the P-CSCF/A-BG access service from which the system receives requests and sends responses. The access service lets the core service know where a packet needs to be routed.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

access-service name *name*

no access-service [name *name* **]**

name *name*

Specifies the name of the P-CSCF/A-BG access service from which the system receives requests and sends responses.
name must be from 1 to 63 alpha and/or numeric characters.

Important: This command should only be issued in the core service configuration, however, multiple access services may be configured per core service.

no

Removes the access service.

Usage

Use this command to identify the name of the P-CSCF/A-BG access service from which the system receives requests and sends responses from/to the UEs. This command is used in systems that deploy two P-CSCF/A-BG services in bridging (Back-to-Back User Agent) mode configurations where an access service P-CSCF/A-BG faces the UE network and a core P-CSCF/A-BG faces the public network.

Example

The following command identifies the P-CSCF/A-BG access service named to the CSCF/A-BG core service:

access-service name *HA3*

access-type

Specifies the access types for IMS core.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

access-type { 3gpp-geran | 3gpp-utran-fdd | 3gpp-utran-tdd | 3gpp2-1x | 3gpp2-1x-hrpd | 3gpp2-umb | adsl | adsl2 | adsl2p | docsis | gshdsl | hdsl | hdsl2 | idsl | ieee-80211 | ieee-80211a | ieee-80211b | ieee-80211g | ieee-80216e | radsl | sdsl | vdsl } access-profile { default | name *access_profile_name* **} | ue-ip-address-range name** *ue_ip_name* **{ address** *ip_address_mask* **| range** *start_ip_address end_ip_address* **}**

no access-type { 3gpp-geran | 3gpp-utran-fdd | 3gpp-utran-tdd | 3gpp2-1x | 3gpp2-1x-hrpd | 3gpp2-umb | adsl | adsl2 | adsl2p | docsis | gshdsl | hdsl | hdsl2 | idsl | ieee-80211 | ieee-80211a | ieee-80211b | ieee-80211g | ieee-80216e | radsl | sdsl | vdsl } [access-profile | ue-ip-address-range [name *ue_ip_name* **]]**

---

access-type { 3gpp-geran | 3gpp-utran-fdd | 3gpp-utran-tdd | 3gpp2-1x | 3gpp2-1x-hrpd | 3gpp2-umb | adsl | adsl2 | adsl2p | docsis | gshdsl | hdsl | hdsl2 | idsl | ieee-80211 | ieee-80211a | ieee-80211b | ieee-80211g | ieee-80216e | radsl | sdsl | vdsl }

3gpp-geran: 3GPP Access Type
3gpp-utran-fdd: 3GPP Access Type
3gpp-utran-tdd: 3GPP Access type
3gpp2-1x: 3GPP2 Access Type
3gpp2-1x-hrpd: 3GPP2 Access Type
3gpp2-umb: 3GPP2-UMB
adsl: FixedLine Access Type
adsl2: FixedLine Access Type
adsl2p: FixedLine Access Type ADSL2+
docsis: DOCSIS
gshdsl: FixedLine Access Type G.SHDSL
hdsl: FixedLine Access Type
hdsl2: FixedLine Access Type
idsl: FixedLine Access Type
ieee-80211: WLAN Access Type
ieee-80211a: WLAN Access Type
ieee-80211b: WLAN Access Type
ieee-80211g: WLAN Access Type
ieee-80216e: Wireless MAN Access Type
radsl: FixedLine Access Type
sdsl: FixedLine Access Type
vdsl: FixedLine Access Type

access-profile {default | name *access_profile_name* **}**

Associates an access type with a CSCF access profile. Different access types can refer to the same access profile.

ue-ip-address-range name *ue_ip_name* **{ address** *ip_address_mask* **| range** *start_ip_address end_ip_address* **}**

Configures UE IP address/range for a specific access type.
ue_ip_name must be from 1 to 79 alpha and/or numeric characters.
address *ip_address_mask*: Specifies a combined IP address subnet mask bits to indicate what IP addresses the specific access-type applies to. *ip_address_mask* must be specified using the form "IP Address/Mask Bits" where the IP address must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6, and the mask bits are a numeric value, which is the number of bits in the subnet mask.
range *start_ip_address end_ip_address*: Configure UE IP range for specific access-type.

- *start_ip_address* specifies the beginning of the range of addresses.
- *end_ip_address* specifies the end of the range of addresses .
- *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

no access-type { 3gpp-geran | 3gpp-utran-fdd | 3gpp-utran-tdd | 3gpp2-1x | 3gpp2-1x-hrpd | 3gpp2-umb | adsl | adsl2 | adsl2p | docsis | gshdsl | hdsl | hdsl2 | idsl | ieee-80211 | ieee-80211a | ieee-80211b | ieee-80211g | ieee-80216e | radsl | sdsl | vdsl } [access-profile | ue-ip-address-range [name *ue_ip_name* **]]**

Removes the specified access type from a CSCF access profile or UE IP address/range.

Usage

Use this command to associated the access types for a specified CSCF access profile or UE IP address/range name.

Important: Use the **sip-header** command to enable SIP P-Access-Network-Info (PANI) header insertion. CSCF Proxy-CSCF Configuration Mode commands are defined in the *CSCF Proxy-CSCF Configuration Mode Commands* chapter in this guide.

Example

The following command identifies the access type adsl and assigns it to access profile *ap1*:

access-type adsl access-profile name *ap1*

allow-dereg

Allows the CSCF to send de-registration requests. Feature is disabled by default.

Product

SCM

Privilege

Administrator

Syntax

```
[ no ] allow-dereg
```

no

Disables the feature.

Usage

Use this command to allow the CSCF service to send de-registration requests.
If the UE stops sending keepalive packets, which ends the connection between the UE and the proxy, UE information is cleared from the Proxy-CSCF (P-CSCF) or Access Border Gateway (A-BG). If de-registration requests are enabled, any UE-related information that is shared with the Serving-CSCF (S-CSCF) will also be cleared.

bind

Binds the CSCF service to a logical IP interface and specifies the maximum number of sessions that can access this service over the specified interface.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
bind address ip_address [ access-ipsec-crypto-template template ] [ cscf-
hostname host_name ] [ max-sessions max# ] [ port number ] [ reserved-call-
capacity percentage] [ transport tcp ] [ use-serviceport-towards-network ]

no bind address
```

address *ip_address*

Specifies the IP address of the interface to which the service is being bound.
ip_address must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

access-ipsec-crypto-template *template*

Specifies the name of an existing IPSec CSCF crypto template to be used for accessing CSCF service by user equipment. Valid only for P-CSCF or A-BG.
template must be an existing IPSec CSCF crypto template and be from 1 to 127 alpha and/or numeric characters.

Important: The IPSec CSCF crypto template should be configured in the same context in which the P-CSCF is configured.

cscf-hostname *host_name*

Specifies the local host name of the CSCF service.
host_name must be an existing CSCF service name and be from 1 to 127 alpha and/or numeric characters.
Configuring this keyword associates the CSCF service with the AOR domain configured in the **default-aor-domain** command and uses the domain name in SIP headers.

Important: If this keyword is not configured, SIP headers will contain the IP address of the CSCF service instead of the domain name.

max-sessions *max#*

Default: 500,000
Specifies the maximum number of sessions managed by this service on this interface.
max# must be configured to any integer value from 0 to 500,000.

Important: The total session capacity of the system is 500,000. **max-sessions** is also limited by the capacity in the license generated for the service. If licenses for PDSN/GGSN/HA are generated for *x* number of sessions, then the license for the CSCF service will be generated at 500,000-*x*. Hardware configuration and installed features can also affect the maximum number of sessions that can be supported.

port *number*

Default: 5060
Specifies the UDP port number.
number must be an integer value from 1 to 65534.

reserved-call-capacity *percentage*

Default: 10
Specifies the call capacity percentage per session manager (sessmgr).
percentage must be an integer value from 1 to 50.

transport tcp

Enables TCP transport for the address.

use-serviceport-towards-network

Enables use of service port for sending and receiving UDP messages from network elements.

no bind address

Removes the binding of the service to a specified interface.

Usage

Use this command to associated the service with a specific logical IP address. This command also configures the identity of the CSCF in SIP headers as either the domain name of the CSCF service or the IP address.

Important: Multiple keywords can be used per bind command.

Example

The following command binds the CSCF service to a logical interface with an IP address of *1.2.3.4* and sets the maximum number of supported sessions for this interface at *250000*:

```
bind address 1.2.3.4 max-sessions 250000
```

charging

Enables Rf charging in this CSCF service for SIP messages.

Product

SCM

Privilege

Administrator

Syntax

```
[ default | no ] charging
```

default

Enables Rf charging in this CSCF service for SIP messages.

no

Disables Rf charging for this service.

Usage

Use this command to enable the RF charging feature in this service and enter the CSCF Charging Configuration Mode.
Entering this command results in the following prompt:

```
[context_name]hostname(config-cscf-charging)#
```

CSCF Charging Configuration Mode commands are defined in the *CSCF Charging Configuration Mode Commands* chapter in this guide.

cnsa-media-profile

Configures the media profile id to be set for a previously created service policy.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

[no] cnsa-media-profile *profile_id* **cscf-service-policy** *policy_name* **content-type { application-3gpp-ims-xml | application-pidf-diff-xml | application-pidf-partial-xml | application-pidf-xml | application-reginfo-xml | application-sdp | application-xml | message-sipfrag | multipart-mixed | multipart-related | text-plain }**

---

no

Removes the media profile from the service policy.

---

cnsa-media-profile *profile_id*

Specifies the media profile id.
profile_id must be an integer from 0 to 10 and be an existing media profile id in the system. CNSA media profile ids are created and maintained in the CSCF ISC Template Configuration Mode.

---

cscf-service-policy *policy_name*

Assigns the media profile id to a service policy.
policy_name must be from 1 to 63 alpha and/or numeric characters and be an existing policy name in the system. Service policies are created and maintained in the CSCF Policy Configuration Mode.

---

content-type { application-3gpp-ims-xml | application-pidf-diff-xml | application-pidf-partial-xml | application-pidf-xml | application-reginfo-xml | application-sdp | application-xml | message-sipfrag | multipart-mixed | multipart-related | text-plain }

Specifies the content type(s).
application-3gpp-ims-xml - format for exchanging information in SIP Requests and Responses as used within the 3GPP IM CN Subsystem
application-pidf-diff-xml - contains changed presence elements. Contains full presence document when there are many changes
application-pidf-partial-xml - contains only changed parts of PIDF-based presence information
application-pidf-xml - XML MIME entity that contains presence information
application-reginfo-xml - used in Notifications to SIP user agents about registration expiry
application-sdp - SDP session description
application-xml - content type for generic xml documents
message-sipfrag - contains subsets of well formed SIP messages
multipart-mixed - intended for use when the body parts are independent and need to be bundled in a particular order
multipart-related - intended for compound objects consisting of several inter-related body parts

text-plain - plain text

Important: You may specify multiple types of content.

Usage

Use this command to assign a media profile id to a service policy. The policies defined in the service policy apply to all subscribers using this service.
CNSA media profile ids are created and maintained in the CSCF ISC Template Configuration Mode. Service policies are created and maintained in the CSCF Policy Configuration Mode.

Example

The following command defines the media profile id as *2* and assigns it to *serv_policy3* with plain text content type.

cnsa-media-profile *2* **cscf-service-policy** *serv_policy3* **content-type** *text-plain*

core-service

Configures a core service if:

- CSCF services are run in bridging (Back-to-Back User Agent) mode
- A-BG is an Application-level Gateway (ALG) for Network Address Translation (NAT)

By default, no core-service name will be present.

Product

SCM (CSCF, A-BG)

Privilege

Administrator

Syntax

`[ no ] core-service name` *`service_name`*

`no`

Removes the core service.

`core-service name` *`service_name`*

Specifies the name of the core service.
`service_name` must be from 1 to 80 alpha and/or numeric characters.

Usage

Use this command to assign a core service to the CSCF/A-BG service.

Example

The following command identifies the core service:

`core-service name` *`service1`*

default-aor-domain

Configures the domain name of the service.

Product

SCM

Privilege

Administrator

Syntax

[no] default-aor-domain *alias*

no

Removes the domain name from the service.

default-aor-domain *alias*

Specifies the domain name for the service.
alias is the name of the domain for this service and must be from 1 to 79 alpha and/or numeric characters in length.

Usage

Use this command to define the domain name of the service.

Example

The following command defines the domain name of the CSCF service as *business.com*.

default-aor-domain *business.com*

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

history-info

Enables the addition of the history-info header to SIP requests in order to capture request URI information. By default, this command is disabled.

Product

SCM

Privilege

Administrator

Syntax

```
[ default | no ] history-info
```

default | no

Disables the inclusion of the history-info header.

Usage

Use this command to include the history-info header in SIP requests to capture the request URI information for routing or translation.

interface

Enables interface SIP statistic collection.

Product

SCM

Privilege

Administrator

Syntax

```
[ no ] interface statistics sip
```

default | no

Disables interface SIP statistic collection for this service.

Usage

Use this command to enable the collection of interface SIP statistics in this service.

ipv4-ipv6-interworking

Allows the P-CSCF to provide IPv4-IPv6 interworking when UEs are IPv6-only and the IMS core network is IPv4-only. Feature is disabled by default.

Product

SCM (P-CSCF)

Privilege

Administrator

Syntax

```
[ no ] ipv4-ipv6-interworking
```

no

Disables the feature.

Usage

Use this command to allow IPv4-IPv6 interworking functionality.

keepalive

Configures the CSCF to receive and respond to different types of keep-alive requests.

Product

SCM

Privilege

Administrator

Syntax

keepalive [expire-timer *sec* **[max-retry** *num* **] | max-retry** *num* **[expire-timer** *sec* **] | method { crlf | stun } [expire-timer** *sec* **[max-retry** *num* **] | max-retry** *num* **[expire-timer** *sec* **]]]**

default keepalive [expire-timer | max-retry [expire-timer] | method [expire-timer | max-retry]]

no keepalive [method { crlf | stun }]

expire-timer *sec*

Default: 29
This value is used according to timed-keepalives parameter present in Path header. UEs are expected to send keepalive messages according to this time interval.
sec must be an integer from 24 to 150.

max-retry *num*

Default: 3
Specifies the maximum number of times the CSCF waits for the UE to send a keepalive request before it deletes the user information.
num must be an integer from 1 to 10.

method { crlf | stun }

Default: both methods enabled.
Specifies the method of keepalive messages supported by the CSCF.
crlf: "\r\n" string (CRLF packets) sent by UE
stun: STUN protocol messages (rfc3489-bis)

default keepalive [expire-timer | max-retry [expire-timer] | method [expire-timer | max-retry]]

Returns the command to the default settings. All methods are enabled by default. See keywords above for specific defaults.

no keepalive [method { crlf | stun }]

Disables the specified method of keepalive messages.

Usage

Use this command to configure how the CSCF manages keepalive requests.

Example

The following example sets the expire timer to *40* and the maximum retry parameter to *5*:

```
keepalive expire-timer 40 max-retry 5
```

li-packet-cable

Enables the lawful intercept packet cable feature and configures Diameter for Lawful Intercept.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

li-packet-cable diameter { dictionary li-standard | origin endpoint *endpoint_name* **| peer-select peer** *peer_name* **[peer-realm** *peer_realm* **] [secondary-peer** *sec_peer_name* **] [sec-peer-realm** *sec_peer_realm* **] }**

default li-packet-cable diameter dictionary

no li-packet-cable diameter { origin endpoint | peer-select }

dictionary li-standard

Configures the li-standard Diameter dictionary.

origin endpoint *endpoint_name*

Specifies the Diameter endpoint.
endpoint_name must be a string of 1 through 63 characters in length.

peer-select peer *peer_name*

Specifies the Diameter lawful intercept peer.
peer_name must be a string of 1 through 63 characters in length.

peer-realm *peer_realm*

Specifies the Diameter lawful intercept peer realm.
peer_realm must be a string of 1 through 63 characters in length.

secondary-peer *sec_peer_name*

Specifies the Diameter lawful intercept secondary peer.
sec_peer_name must be a string of 1 through 63 characters in length.

sec-peer-realm *sec_peer_realm*

Specifies the Diameter lawful intercept secondary peer realm.
sec_peer_realm must be a string of 1 through 63 characters in length.

default li-packet-cable diameter dictionary

Configures the li-standard Diameter dictionary.

no li-packet-cable diameter { origin endpoint | peer-select }

Disables Diameter Lawful Intercept for the specified function.

Usage

Use this command to enable the lawful intercept packet cable feature and configure Diameter for Lawful Intercept.

Example

The following command defines a Diameter lawful intercept peer named *li-peer1*:

li-packet-cable diameter peer-select peer *li-peer1*

max-sipmsg-size

Configures the maximum SIP message size.

Product

SCM

Privilege

Administrator

Syntax

max-sipmsg-size *limit*

[default | no] max-sipmsg-size

limit

Default: 4096
Configures the SIP message size limit in bytes.
limit must be an integer from 1024 to 65535.

Important: Maximum SIP message size should be more than the message-max-size set in the CSCF Proxy-CSCF Configuration Mode.

default | no

Returns/sets the maximum SIP message size to 4096 bytes.

Usage

Use this command to configure the maximum SIP message size.

Example

The following command limits the SIP message size to *4500* bytes:

max-sipmsg-size *4500*

nat-policy

Configures a NAT (Network Address Translation) policy for the service if the CSCF service is performing one of the following functions:

- CSCF services are run in bridging (Back-to-Back User Agent) mode
- A-BG is an Application-level Gateway (ALG) for NAT

Product

SCM(CSCF, A-BG)

Privilege

Administrator

Syntax

nat-policy *policy_name* **private-address** { **address** *ip_address_mask* | **default** | **range** *start_ip_address end_ip_address* }

no nat-policy *policy_name*

---

nat-policy *policy_name*

Specifies a name for the NAT policy.
policy_name must be from 1 to 79 alpha and/or numeric characters.

---

private-address { address *ip_address_mask* **| default|range** *start_ip_address end_ip_address* **}**

Specifies the private-address policy type for nat-pool.
address *ip_address_mask*: Address for nat-policy policy type for nat-pool. Specifies a combined IP address subnet mask bits to indicate what IP addresses the specific policy type applies to.
ip_address_mask must be specified using the form "IP Address/Mask Bits" where the IP address must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6, and the mask bits are a numeric value, which is the number of bits in the subnet mask.
default: Default for nat-policy policy type for nat-pool. Default is defined as the address range specified by rfc1918.

- 10.0.0.0 - 10.255.255.255 (10/8 prefix)
- 172.16.0.0 - 172.31.255.255 (172.16/12 prefix)
- 192.168.0.0 - 192.168.255.255 (192.168/16 prefix)

range *start_ip_address end_ip_address*: Range for nat-policy policy type for nat-pool.

- *start_ip_address* specifies the beginning of the range of addresses.
- *end_ip_address* specifies the end of the range of addresses .
- *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

---

no nat-policy *policy_name*

Removes the specified NAT policy from the service.

Usage

Generally, if a SIP packet has a VIA address (physical address that identifies where the service is located) different from the Source address, ALG functionality is invoked. Even if the VIA and Source addresses are the same, however, this command allows the ALG functionality to be started. For ALG to start, the VIA address should belong to one of the nat-policy address ranges.

Example

The following command identifies the NAT policy named *policy1* with a private-address policy type of *10.10.10.10 255.255.255.0*:

```
nat-policy policy1 private-address address 10.10.10.10 255.255.255.0
```

The following command identifies the NAT policy named *policy2* with a private-address range policy type of *172.162.23.23 172.162.23.230*:

```
nat-policy policy2 private-address address 172.162.23.23 172.162.23.230
```

The following command identifies the NAT policy named *policy3* with a default policy type:

```
nat-policy policy3 private-address default
```

nat-pool

Configures a NAT (Network Address Translation) pool for the service if the CSCF service is performing one of the following functions:

- P-CSCF services are run in bridging (Back-to-Back User Agent) mode
- A-BG is an Application-level Gateway (ALG) for NAT

By default, no nat-pool name will be present.

Product

SCM(P-CSCF, A-BG)

Privilege

Administrator

Syntax

[no] nat-pool name *pool_name*

no

Removes the NAT pool from the service.

nat-pool name *pool_name*

Specifies the name of an existing NAT pool.
pool_name must be from 1 to 32 alpha and/or numeric characters.

Important: NAT pools are created in Context Configuration Mode with the **ip pool** command.

Usage

Use this command to assign a NAT pool to the P-CSCF/A-BG service.

Example

The following command identifies the NAT pool:

nat-pool name *pool2*

policy

Enables or disables early media support in P-CSCF and configures the congestion control threshold values that are to be monitored on this CSCF service.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
policy { allow-early-media | threshold congestion-control [ system-cpu-utilization percent ] [ tolerance percent ] }

[ default | no ] policy { allow-early-media | threshold congestion-control tolerance }
```

allow-early-media

Default: Enabled
Allows early media by doing QoS commit during QoS Authorization in P-CSCF.

threshold congestion-control

Enables congestion-control.

system-cpu-utilization *percent*

Default: 80
The average percent utilization of a CPU in a PSC/PSC2 running the CSCF service as measured in 10 second intervals.
percent can be configured to any integer value from 0 to 100. This value becomes the upper threshold for triggering the CPU-based congestion for CSCF services.

tolerance *percent*

Default: 5
The percentage under a configured threshold that dictates the point at which the condition is cleared.
percent is an integer value from 1 to 25.

default

Returns the command to the default settings. See keywords above for specific defaults.

no

Disables the functionality.

Usage

Use this command to set QoS support during either the initial SDP response or the 200OK response to the INVITE. When this CLI is enabled, QoS commit is done during initial SDP answer. When disabled, QoS commit is done during 200OK INVITE. By default, this command is enabled.
In addition, thresholds dictate the conditions for which congestion control is to be enabled and establish limits for defining the state of the CSCF service (congested or clear). The tolerance parameter establishes the threshold at which the condition is cleared.

Important: When congestion is triggered, new CSCF calls are not rejected.

Example
The following command sets the upper threshold for CPU utilization for triggering congestion control at *90%*.

```
policy threshold congestion-control system-cpu-utilization 90
```

The following command sets the tolerance to its default value of *5*.

```
default policy threshold congestion-control tolerance
```

policy-name

Assigns a previously created service policy to this service.

Product

SCM

Privilege

Administrator

Syntax

policy-name *name*

no policy-name

policy-name *name*

Specifies the name of the service policy being assigned to this service.
name must be from 1 to 79 alpha and/or numeric characters and be an existing policy name in the system.
Service policies are created and maintained in the CSCF Policy Configuration Mode.

no

Remove the assigned service policy from this service.

Usage

Use this command to assign a service policy to this service. The policies defined in the service policy apply to all subscribers using this service. Service policies are created and maintained in the CSCF Policy Configuration Mode.

Example

The following command assigns a service policy named *serv_policy3* to this service:

policy-name *serv_policy3*

proxy-cscf

Enables the Proxy-CSCF for the service and enters the Proxy-CSCF Configuration Mode. Default is disabled.

Product

SCM (P-CSCF)

Privilege

Administrator

Syntax

```
[ no ] proxy-cscf
```

no

Disables the P-CSCF for the service.

Usage

Use this command to enable the Proxy-CSCF feature and enter the Proxy-CSCF Configuration Mode. Entering this command results in the following prompt:

```
[context_name]hostname(config-cscf-service-proxy-cscf)#
```

Proxy-CSCF Configuration Mode commands are defined in the *CSCF Proxy-CSCF Configuration Mode Commands* chapter in this guide.

Important: The Proxy-CSCF is a license-enabled function of the Session Control Manager. Only one function (P-CSCF, S-CSCF, SIP Proxy, or A-BG) can be enabled per service.

recurse-on-redirect-resp

Enables the 3xx recursion feature. If enabled, the service will send further invites to the contacts specified upon receiving a 3xx redirect response. Default is disabled.

Product

SCM

Privilege

Administrator

Syntax

```
[ no ] recurse-on-redirect-resp
```

no

Disables the 3xx recursion feature.

Usage

When enabled and on receipt of a 3xx response, the service will collect the SIP URIs present in the Contact header(s) of 3xx and recursively contact each one of them until the call succeeds. The contacts are tried serially. There is a maximum implementation limit of 50 URIs. Each contact, in turn, can send a 3xx response. The service will honor them and append the new contacts. When disabled, the service treats a 3xx response as the final failure response and declares the call attempt “failed”. By default, this feature is disabled.

Example

Enable recursion on 3xx:

```
recurse-on-redirect-resp
```

Disable recursion on 3xx:

```
no recurse-on-redirect-resp
```

reject-on-cnsa-failure

Enables rejection of messages on Core Network Service Authorization failure. Default is disabled.

Product

SCM

Privilege

Administrator

Syntax

```
[ no ] reject-on-cnsa-failure
```

no

Disables the rejection of messages on Core Network Service Authorization failure.

Usage

Enables rejection of messages on Core Network Service Authorization failure. By default, this feature is disabled.
In a mobile originating case, S-CSCF checks for the presence of P-Preferred-Service (PPS) header. If the header is present, media profile authentication is successful and if the incoming ICSI (IMS Communication Service Identifier) value also matches with one of the values in the service_id list, then the request will be forwarded after replacing the PPS header with PAS (P-Asserted-Service). If media profile authentication fails, S-CSCF will check reject-on-cnsa-failure. If enabled, then call is rejected with 403 message. If disabled, a default ICSI is selected from the service_id list and will be put into PAS while forwarding the request by the S-CSCF on service authentication failure.
In PPS is not received by the S-CSCF and media profile authentication is successful, an ICSI from the service_id list, if present, is selected and will be added in PAS header. If media profile authentication fails, reject-on-cnsa-failure is checked. If enabled, call is rejected with 403 message. If disabled, PAS header is added if service_id list is present with an ICSI value.

Example

Enable rejection of messages on Core Network Service Authorization failure:

```
reject-on-cnsa-failure
```

Disable rejection of messages on Core Network Service Authorization failure:

```
no reject-on-cnsa-failure
```

release-call-on-media-loss

Release call on detection of media loss.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
release-call-on-media-loss media-type audio

no release-call-on-media-loss
```

no

Disables the release of SIP calls upon the detection of media loss.

Usage

Use this command to enable the release of SIP calls upon the detection of media loss.

Example

Enables the release of SIP calls upon the detection of media loss:

```
release-call-on-media-loss media-type audio
```

Enables the release of SIP calls upon the detection of media loss:

```
no release-call-on-media-loss
```

rfc3261-proxy

Enables RFC3261 proxy (SIP Proxy) for this service and enters the SIP Proxy Configuration Mode. Default is disabled.

Product

SCM (SIP Proxy)

Privilege

Administrator

Syntax

```
[ default | no ] rfc3261-proxy
```

default | no

Disables RFC3261 proxy in this service.

Usage

Use this command to enable the Sip Proxy feature and enter the SIP Proxy Configuration Mode. Entering this command results in the following prompt:

```
[context_name]hostname(config-cscf-service-rfc3261-proxy)#
```

SIP Proxy Configuration Mode commands are defined in the *CSCF SIP Proxy Configuration Mode Commands* chapter in this guide.

Important: The SIP Proxy is a license-enabled function of the Session Control Manager. Only one function (P-CSCF, S-CSCF, SIP Proxy, or A-BG) can be enabled per service.

serving-cscf

Enables Serving-CSCF for the service and enters the Serving-CSCF Command Mode. Default is disabled.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

```
[ no ] serving-cscf
```

no

Disables S-CSCF for the service.

Usage

Use this command to enable the Serving-CSCF feature and enter the Serving-CSCF Configuration Mode. Entering this command results in the following prompt:

```
[context_name]hostname(config-cscf-service-serving-cscf)#
```

Serving-CSCF Configuration Mode commands are defined in the *CSCF Serving-CSCF Configuration Mode Commands* chapter in this guide.

Important: The Serving-CSCF is a license-enabled function of the Session Control Manager. Only one function (P-CSCF, S-CSCF, SIP Proxy, or A-BG) can be enabled per service.

session-timer

Configures the session expiry for sessions (Session will expire at the configured value unless refreshed.) and the minimum number of seconds in a session timer (session-expires) value the system will allow.

Product

SCM

Privilege

Administrator

Syntax

session-timer { min-se *sec* **[session-expires** *sec* **] | session-expires** *sec* **[min-se** *sec* **] }**

default session-timer [min-se] [session-expires]

no session-timer

min-se *sec*

Default: 90
Specifies the minimum number of seconds the system will allow a session-expires value in a session request. *sec* must be an integer value between 90 and the value of the **session-expires** command.

session-expires *sec*

Default: 1800 (30 minutes)
Specifies the number of seconds a session is allowed exist before it expires. *sec* must be an integer value between 90 and 18000.

default session-timer [min-se] [session-expires]

Returns the command to the default settings.

no

Disables the session timer.

Usage

Use this command to set a session expiry value for all invites generated by the SCM and a minimum value for a session request session timer the system will allow. If a session is requested with a timer of less than this command's value, the system will reject the request with a "422 Session Interval Too Small" response code.

Example

The following command sets the session expiry for all sessions generated by the SCM to 60 minutes:

session-timer session-expires *3600*

strict-outbound

When enabled, the CSCF rejects registration without outbound parameters from an already registered AoR (the AoR would have included outbound parameters in a previous registration). When disabled, the CSCF allows registration without outbound parameters from the previously registered AoR.

Product

SCM

Privilege

Administrator

Syntax

```
[ no ] strict-outbound
```

no

Disables the feature. This is the default behavior.

Usage

Use this command to reject registration from a previously registered AoR if the AoR fails to register with outbound parameters but included them in the previous registration.

subscriber-policy-override

Configures the system to allow the subscriber-based policy to override the service-based policy. Default is disabled.

Product

SCM

Privilege

Administrator

Syntax

```
[ default | no ] subscriber-policy-override
```

default | no

Removes the subscriber policy override from the service.

Usage

By default, if a conflict occurs between the subscriber-based policy and the service-based policy, the service policy takes precedence. Use this command to override the default behavior of the system and allow the subscriber-based policy to overrule the service policy.

subscription

Enables the registration event package for the service and configures a system-wide subscription lifetime for all subscribers to the service.

Product

SCM

Privilege

Administrator

Syntax

```
subscription package reg [ lifetime { default sec | max sec [ default sec ] |
min sec [ max sec ] [ default sec ] } ]

[ default | no ] subscription package reg
```

package reg lifetime { default *sec* | max *sec* | min *sec* }

default *sec*: Specifies the default amount of time that a subscription can exist on the system. *sec* must be an integer from 60 to max sec -1. Default is 3761. default sec must be < or = to max sec and > or = to min sec.
The following keywords are specific to the S-CSCF functionality:
max *sec*: Specifies the maximum amount of time that a subscription can exist on the system. *sec* must be an integer from 60 to 2147483646. Default is 86400. max sec must be > or = to min sec.
min *sec*: Specifies the minimum amount of time that a subscription can exist on the system. *sec* must be an integer from 60 to max sec -1. Default is 60. min sec must be < or = to max sec.

default

Returns the command to the default settings.

no

Disables the registration event package for the service.

Usage

Use this command to enable the registration event package for the service and control the amount of time subscriptions are allowed to exist on this service.
The system responds to subscriptions in the following manner:
Using default values:

- If a subscription with an expiration value lower than the service's minimum (60) is received, the service will respond with a 423 Interval Too Small message.
- If a subscription with an expiration value higher than the service's maximum (2147483646) is received, the service will automatically reduce the expiration value to the default value.

If a subscription is received missing the "Expires" value, or the value is malformed, the service will automatically respond with 3761 in the 200OK message.

Example

The following command configures the maximum subscription lifetime to *43200* (12 hours):

subscription package reg lifetime max *43200*

tcp-proxy

Enables SIP TCP proxy for the CSCF service.

Product

SCM

Privilege

Administrator

Syntax

tcp-proxy [port *port_number* **]**

no tcp-proxy

port *port_number*

Default: 5062
Specifies the port used for SIP TCP proxy connections.
port_number must be an integer from 1 to 65534.

no

Disables SIP TCP proxy for the CSCF service

Usage

Use this command to enable SIP TCP proxy for the CSCF service.

Example

Enables SIP TCP proxy for the CSCF service on port *5062*:

tcp-proxy port*5062*

Disables SIP TCP proxy for the CSCF service:

no tcp-proxy

threshold

Configures the number of route failures that will trigger an alarm.

Product

SCM

Privilege

Administrator

Syntax

threshold route-failures *high_thresh* **[clear** *low_thresh* **]**

default threshold route-failures

route-failures *high_thresh*

Default: 5
The high threshold number of route failures that must be met or exceeded within the polling interval to generate an alert or alarm. *high_thresh* can be configured to any integer value between 0 and 60000.

clear *low_thresh*

Default: 5
The low threshold number of route failures that must be met or exceeded within the polling interval to clear an alert or alarm. *low_thresh* can be configured to any integer value between 0 and 60000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

default threshold route-failures

Returns the command to the default settings.

Usage

Use this command to set an alert or an alarm when the number of route failures exceeds the configured level. Alerts or alarms are triggered for the number of registration reply errors on the following rules:

- Enter condition: Actual number of route failures > High Threshold
- Clear condition: Actual number of route failures £ Low Threshold

Example

The following command configures a route failures threshold of *1000* and a low threshold of *500* for a system using the Alarm thresholding model:

threshold route-failures *1000* **clear** *500*

timeout

Sets timeout values for CSCF and SIP transactions.

Product

SCM

Privilege

Administrator

Syntax

```
timeout { hss-wait sec | no-answer sec | policy-interface sec | sip { 3gpp-d sec
| 3gpp-t1 msec | 3gpp-t2 sec | 3gpp-t4 sec | d sec | idle-tcp-connection msec |
invite-expiry sec | t1 msec | t2 sec | t4 sec } }
```

```
timeout { hss-wait | no-answer | policy-interface | sip { 3gpp-d | 3gpp-t1 |
3gpp-t2 | 3gpp-t4 | d | idle-tcp-connection msec | invite-expiry | t1 | t2 | t4
} }
```

hss-wait *sec*

Default: 5
This timer is used by S-CSCF with HSS interface for timeout.
sec must be an integer from 0 to 2147483646.

no-answer *sec*

Default: 100
This timer is specially used for No-Answer Call Feature executed by S-CSCF. The timer will be started as soon as 180 Ringing response is received and No-Answer call feature is enabled. The value of this timer should be always less than INVITE Timeout used by DC-SIP.
sec must be an integer from 0 to 2147483646.

policy-interface *sec*

Default: 5
This timer is used by the P-CSCF/A-BG with Policy interface for timeout.
sec must be an integer from 0 to 2147483646.

sip { 3gpp-d *sec* **| 3gpp-t1** *msec* **| 3gpp-t2** *sec* **| 3gpp-t4** *sec* **| d** *sec* **| idle-tcp-connection** *msec* **| invite-expiry** *sec* **| t1** *msec* **| t2** *sec* **| t4** *sec* **}**

Sets transaction and expiry timers for SIP.

- **3gpp-d** *sec*: This timer is used to control the retransmission of 200OK messages to INVITEs after an ACK is sent. The ACK transaction is cleared after this period. This timer is applicable only for unreliable transport. *sec* must be an integer from 0 to 2147483646. Default: 64*T1 (128 seconds, recommended minimum)
- **3gpp-t1** *msec*: This timer is used to control the time interval between each retransmission. The interval doubles after each retransmission. This is used by P-CSCF/A-BG only when it sending message toward the UE. Example: T1, 2T1, 4T2, etc. This timer is applicable only for unreliable

transport. *msec* must be an integer from 0 to 4294967294. Default: 2000 ms (2 secs, recommended minimum).

- **3gpp-t2** *sec*: This timer is used to control the period for which the request continues to get retransmitted. This is used by P-CSCF/A-BG only when it sending message toward the UE. This timer is applicable both for reliable and unreliable transport. *sec* must be an integer from 0 to 2147483646. Default: 16 seconds (recommended minimum).
- **3gpp-t4** *sec*: This timer is used to control the period for which the final response to non-invite transaction should be buffered. The buffered response for the retransmitted non-invite request should be sent within that interval. This timer is applicable only for unreliable transport. *sec* must be an integer from 0 to 2147483646. Default: 17 seconds (recommended minimum).
- d *sec*: This timer is used to control the retransmission of 200OK to INVITE after ACK is sent. The ACK transaction will be cleared after this interval. This timer is applicable only for unreliable transport. *sec* must be an integer from 0 to 2147483646. Default: 64*T1 (32 seconds, recommended minimum)
- idle-tcp-connection *msec*: This timer is used for closing idle TCP connections. If there is not activity in the TCP connection for the configuration duration, then the connection will be closed. *msec* must be an integer from 1000 (recommended minimum) to 4294967294. Default: 42000 milliseconds .
- invite-expiry *sec*: This timer is used by SIP while acting as UA Role and no final response is received for the INVITE request sent. This timer is applicable for both reliable and unreliable transport. *sec* must be an integer from 0 to 2147483646. Default: 100 seconds (recommended minimum).
- **t1** *msec*: Specifies the time interval (in microseconds) between each retransmission. The interval doubles after each retransmission, for example: T1, 2T1, 4T2, etc. This timer is applicable only for unreliable transport. *msec* must be an integer from 0 to 2147483646. Default: 500 milliseconds (recommended minimum).
- **t2** *sec*: This timer is used to control the period for which the request keeps getting retransmitted. This timer is applicable both for reliable and unreliable transport. *sec* must be an integer from 0 to 2147483646. The recommended minimum value for this parameter is 4 seconds. Default: 64*T1 (32 seconds)
- **t4** *sec*: This timer is used to control the period for which the final response to non-invite transaction should be buffered so as to send the buffered response for the retransmitted non-invite request within that interval. This timer is applicable only for unreliable transport. *sec* must be an integer from 0 to 2147483646. Default: 5 seconds (recommended minimum).

default

Returns the command to the default settings.

Usage

Use this command to configure SIP Stack timers and CSCF service specific timers.

Example

The following command sets the SIP d timer to *64* seconds:

```
timeout sip d 64
```

transport-switching

Sets the message size that triggers a transport protocol switch.

Product

SCM

Privilege

Administrator

Syntax

transport-switching policy protocol tcp trigger msg-size *size*

default transport-switching policy protocol tcp trigger msg-size

policy protocol tcp trigger msg-size *size*

Default: 1300
Specifies the size of the SIP message beyond which transport changes to TCP.
size can be configured to any integer value between 1300 and 65535.

default

Returns the size of the SIP message beyond which transport changes to TCP to 1300 bytes.

Usage

Use this command to configure the size of the SIP message beyond which transport changes to TCP.

Example

Switch to TCP transport protocol when the SIP message size is *4000* bytes or more:

transport-switching policy protocol tcp trigger msg-size *4000*

trusted-domain-entity

Adds trusted network nodes (or entities) to a table used by this service to identify those nodes that can be trusted with subscriber information.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

trusted-domain-entity *address* **[foreign-network]**

no trusted-domain-entity *address*

trusted-domain-entity *address*

Specifies the IP address of the network node identified as a trusted entity by this service. *address* must be either an IP address or a domain name. IP addresses must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6. Domain names must be entered using from 1 to 80 alpha and/or numeric characters.

foreign-network

Entity belongs to Foreign Network.

no

Removes an entry from this service's trusted domain table.

Usage

Use this command to identify to the service the network entities that can be trusted with subscriber information by this service.

Important: This command can be entered multiple times to identify multiple trusted network entities.

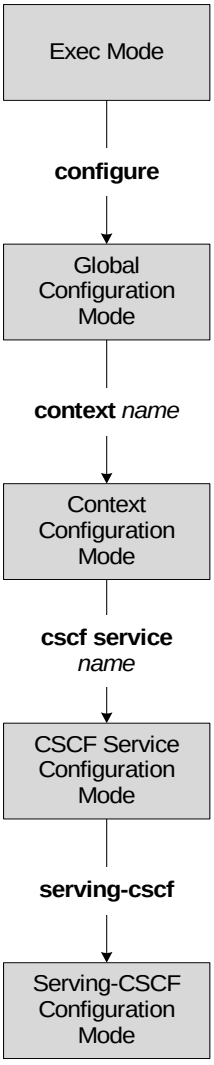
Example

The following command adds a network node with an IP address of *1.2.3.4* to this service's trusted domain table:

trusted-domain-entity *1.2.3.4*

Chapter 67
CSCF Serving-CSCF Configuration Mode Commands

The Serving-CSCF Configuration Mode is used to set various commands supporting the role of the CSCF service as a Serving CSCF.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

allow

Enables the function to allow IMS interworking with RFC3261 SIP User Agents.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

```
[ no ] allow rfc3261-ua-interworking
```

no

Disables the interworking capability.

Usage

Use this command to enable the S-CSCF to allow IMS interworking with RFC3261 SIP User Agents.

authentication

Configures the authentication method used by the S-CSCF service.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
authentication { aka-v1 value | allow-noauth [ invite | re-register| register ]
| allow-noipauth [ invite | re-register| register ] | allow-unsecure | aor-auth
| md5 value }

no authentication { aka-v1 | allow-noauth [ invite | re-register| register ] |
allow-noipauth [ invite | re-register| register ] | allow-unsecure | aor-auth |
md5 }
```

aka-v1 *value*

Specifies that AKA-v1 algorithm is used as the authentication type when accessing the CSCF service. *value* specifies a preference - the lower the value, the higher the preference. *value* must be an integer from 1 to 1000.

Important: In order to change a priority level, you must remove the original value and configure a new one.

allow-noauth [invite | re-register| register]

Specifies that access to the S-CSCF service is allowed if authentication fails.
invite: Specifies that access to the S-CSCF service is allowed if authentication fails on INVITE requests only.
re-register: Specifies that access to the S-CSCF service is allowed if authentication fails on RE-REGISTER requests when the request is integrity-protected only.
registration: Specifies that access to the S-CSCF service is allowed if authentication fails on REGISTER requests only.

allow-noipauth [invite | re-register| register]

Specifies that access to the S-CSCF service is allowed if early IMS-based IP authentication fails.
invite: Specifies that access to the S-CSCF service is allowed if early IMS-based IP authentication fails on INVITE requests only.
re-register: Specifies that access to the S-CSCF service is allowed if authentication fails on RE-REGISTER requests when the request is integrity-protected only.
registration: Specifies that access to the S-CSCF service is allowed if early IMS-based IP authentication fails on REGISTER requests only.

allow-unsecure

Specifies that un-secure access is allowed to the S-CSCF service.

aor-auth

Specifies that authentication is based on the AoR when accessing the S-CSCF service.

md5 *value*

Specifies that the MD5 algorithm is used as the authentication type for accessing the S-CSCF service. *value* specifies a preference - the lower the value, the higher the preference. *value* must be an integer from 1 to 1000.

Important: In order to change a priority level, you must remove the original value and configure a new one.

no authentication { aka-v1 | allow-noauth [invite | re-register| register] | allow-noipauth [invite | re-register| register] | allow-unsecure | aor-auth | md5 }

Disables the specified authentication method for the S-CSCF service.

Usage

Use this command to configure the authentication method used by the S-CSCF service.

Example

The following command configures the authentication method used by the S-CSCF service to MD5 with a preference of *3*:

authentication md5 *3*

diversion-info

Enabling this command prompts the service to add a diversion header (draft-levy-sip-diversion-08) when the call is diverted to a different endpoint due to a call feature. By default, diversion-info is disabled.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
[ default | no ] diversion-info
```

default | no

The service will not add a diversion header.

Usage

Use this command to enable the service to add a diversion header to call setup packets when calls are diverted due to the application of call features.

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

interrogating-cscf-role

Enables the function to also perform as an Interrogating-CSCF.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

```
[ no ] interrogating-cscf-role
```

no

Disables the Interrogating-CSCF role in this function.

Usage

Use this command to enable the S-CSCF to also perform as an Interrogating-CSCF.

policy

Configures the policy for Served User Routing in this S-CSCF service.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

```
[ default | no ] policy allow p-served-user-routing
```

allow p-served-user-routing

Enables Served User Routing functionality for this S-CSCF.

default | no

Disables Served User Routing functionality for this S-CSCF.

Usage

Use this command to enable/disable the policy for Served User Routing.

Example

The following command enables Served User Routing on this service:

```
policy allow p-served-user-routing
```

The following command disables Served User Routing on this service:

```
no policy allow p-served-user-routing
```

registration

Configures a registration lifetime for all subscribers to the service.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

registration lifetime { default *sec* **| max** *sec* **| min** *sec* **}**

default registration lifetime

{ max *sec* **| min** *sec* **| default** *sec* **}**

max *sec*: Specifies the maximum amount of time that a registration can exist on the system. *sec* must be an integer from 60 to 2147483646. Default is 86400. max *sec* must be > or = to min *sec*.
min *sec*: Specifies the minimum amount of time that a registration can exist on the system. *sec* must be an integer from 60 to **max** *sec* -1. Default is 60. min *sec* must be < or = to max *sec*.
default *sec*: Specifies the default amount of time that a registration can exist on the system. *sec* must be an integer from 60 to **max** *sec* -1. Default is 3761. default *sec* must be < or = to max *sec* and > or = to min *sec*.

default registration lifetime

Returns the command to the default settings.

Usage

Use this command to control the amount of time registrations are allowed to exist on this service.
The system responds to registrations in the following manner:
Using default values:

- If a registration with an expiration value lower than the service's minimum (60) is received, the service will respond with a 423 Interval Too Small message.
- If a registration with an expiration value higher than the service's maximum (2147483646) is received, the service will automatically reduce the expiration value to the default value.
- If a registration is received missing the "Expires" value, or the value is malformed, the service will automatically respond with 3761 in the 200OK message.

Example

The following command configures the maximum registration lifetime to *43200* (12 hours):

registration lifetime max *43200*

reliable-prov-resp

Enables/disables the reliability of provisional responses feature.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
reliable-prov-resp { mandatory | optional }

no reliable-prov-resp
```

mandatory | optional

mandatory: Both inbound and outbound will request reliability.
optional (default): Reliability is imposed by inbound side. Only if inbound call requests reliability will outbound also request reliability.

no

Disables the reliability of provisional responses feature.

Usage

Use this command to enable/disable the reliability of provisional responses feature.

Example

The following command sets the reliability of provisional responses feature to mandatory:

```
reliable-prov-resp mandatory
```

sifc

Enables Shared Initial Filter Criteria (SiFC) functionality. This command is disabled by default.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
[ default | no ] sifc
```

default | no

Disables shared iFC functionality for this S-CSCF.

Usage

Use this command to configure the S-CSCF to share iFC functionality.
If both the HSS and the S-CSCF support this feature, subsets of iFC may be shared by several service profiles. The HSS downloads the unique identifiers of the shared iFC sets to the S-CSCF. The S-CSCF uses a locally administered database to map the downloaded identifiers onto the shared iFC sets.
If the S-CSCF does not support this feature, the HSS will not download identifiers of shared iFC sets.

sip-request

Configures SIP Request-related configuration in this S-CSCF service.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

sip-request re-route { **max-attempts** *attempts* | **response-code** *code* }

default sip-request re-route max-attempts

no sip-request re-route response-code *code*

re-route

Specify SIP Request re-route related configuration.

max-attempts *attempts*

Specifies the maximum number of re-route attempts that a S-CSCF should allow for a given call before passing the negative response upstream.
attempts must be an integer from 1 to 10.
Default: 2

response-code *code*

Specifies the list of Response codes that will be considered as re-routable responses to a call attempt.
code must be a three-digit integer from 400 to 699.

Important: You may configure a maximum of five response code values per S-CSCF service.

default sip-request re-route max-attempts

Specifies a maximum number of two re-route attempts that a S-CSCF should allow for a given call before passing the negative response upstream.

no sip-request re-route response-code *code*

Disables the specified Response code.

Usage

Use this command to configure:

- list of Response codes that will be considered as re-routable responses to a call attempt.
- the maximum number of re-route attempts that a S-CSCF should allow for a given call before passing the negative response upstream.

Example

The following command configures the maximum number of re-route attempts to *5*:

```
sip-request re-route max-attempts 5
```

tas

Configures the S-CSCF to perform Telephony Application Server (TAS) functions.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

```
[ default | no ] tas
```

default | no

Disables the TAS feature for this S-CSCF.

Usage

Use this command to configure the S-CSCF to perform TAS functions.

tas-service

Identifies the name of the service configured on the system performing Telephony Application Server (TAS) functions.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

tas-service *name*

no tas-service

name

Specifies the name of the service configured on the system performing TAS functions. *name* must be from 1 to 63 alpha and/or numeric characters and be an existing service.

no

Removes the TAS name from the S-CSCF configuration.

Usage

Use this command to identify the name of the service configured on the system performing TAS functions

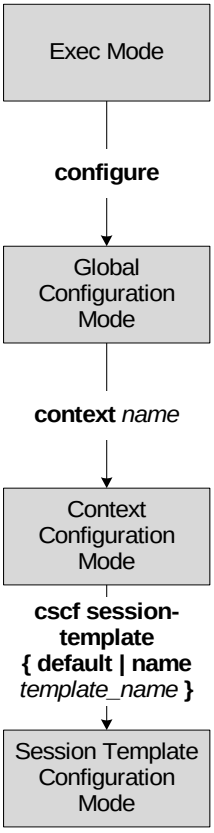
Example

The following command identifies the TAS service name as *scscf3*:

tas-service *scscf3*

Chapter 68
CSCF Session Template Configuration Mode Commands

The CSCF Session Template Configuration Mode is used to classify users and/or domains (AoRs) within the system.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

inbound-cscf-acl

Configures the ACL to use for inbound sessions using this template.

Product

SCM

Privilege

Administrator

Syntax

inbound-cscf-acl { default | name *acl_name* **}**

no inbound-cscf-acl name *acl_name*

default | name *acl_name*

default: Specifies that the default ACL should be used for inbound sessions using this template.
name *acl_name*: Specifies an existing ACL to use for inbound sessions using this template. *acl_name* must be the name of an existing ACL.

no inbound-cscf-acl name *acl_name*

Removes the ACL from this template.

Usage

Use this command to identify an ACL to use on inbound sessions using this template.

Example

The following command sets the inbound ACL for this template to an ACL named *acl_in22*:

inbound-cscf-acl name *acl_in22*

outbound-cscf-acl

Configures the ACL to use for outbound sessions using this template.

Product

SCM

Privilege

Administrator

Syntax

outbound-cscf-acl { default | name *acl_name* **}**

no outbound-cscf-acl name *acl_name*

default | name *acl_name*

default: Specifies that the default ACL should be used for outbound sessions using this template.
name *acl_name*: Specifies an existing ACL to use for outbound sessions using this template. *acl_name* must be the name of an existing ACL.

no outbound-cscf-acl name *acl_name*

Removes the ACL from this template.

Usage

Use this command to identify an ACL to use on outbound sessions using this template.

Example

The following command sets the outbound ACL for this template to an ACL named *acl_out22*:

outbound-cscf-acl name *acl_out22*

policy-profile

Configures an AoR policy group to be used for sessions using this template.

Product

SCM

Privilege

Administrator

Syntax

policy-profile { default | name *profile_name* **}**

no policy-profile name *profile_name*

default | name *profile_name*

default: Specifies that the default policy group will be used for sessions using this template.
name *profile_name*: Specifies an existing policy group. *profile_name* must be an existing CSCF policy group.

no policy-profile name *profile_name*

Removes the policy group from the template.

Usage

Use this command to specify a policy group for the template.

Example

The following command specifies that a policy group called *aor_grp1* will be used for sessions using this template:

policy-profile name *aor_grp1*

route-list

Configures a route group to be used for sessions using this template.

Product

SCM

Privilege

Administrator

Syntax

route-list { default | name *group_name* **}**

no route-list name *group_name*

default | name *group_name*

default: Specifies that the default route group will be used for sessions using this template.
name *group_name*: Specifies an existing route group. *group_name* must be an existing peer server group.

no route-list name *group_name*

Removes the route group from this template.

Usage

Use this command to specify a route group for the template.

Example

The following command specifies an accounting server group called *route_grp2* that will be used for sessions using this template:

route-list name *route_grp2*

translation-list

Configures a translation list to be used for sessions using this template.

Product

SCM

Privilege

Administrator

Syntax

translation-list { default | name *list_name* **}**

no translation-list name *list_name*

default | name *list_name*

default: Specifies that the default translation list will be used for sessions using this template.
name *list_name*: Specifies an existing translation list. *list_name* must be an existing translation list.

no translation-list name *list_name*

Removes the translation list from this template.

Usage

Use this command to specify a translation list for the template.

Example

The following command specifies a translation list called *trans_list6*:

translation-list name *trans_list6*

urn-service-list

Configures an URN service list to be used for sessions using this template.

Product

SCM

Privilege

Administrator

Syntax

urn-service-list { default | name *list_name* **}**

no urn-service-list name *list_name*

---

default | name *list_name*

default: Specifies that the default URN service list will be used for sessions using this template.
name *list_name*: Specifies an existing URN service list name. *list_name* must be from 1 to 79 alpha and/or numeric characters and be an existing URN service list.

---

no urn-service-list name *list_name*

Removes the service list from this template.

Usage

Use this command to specify a URN service list for this template. URN service lists are configured in the URN Service List Configuration Mode.

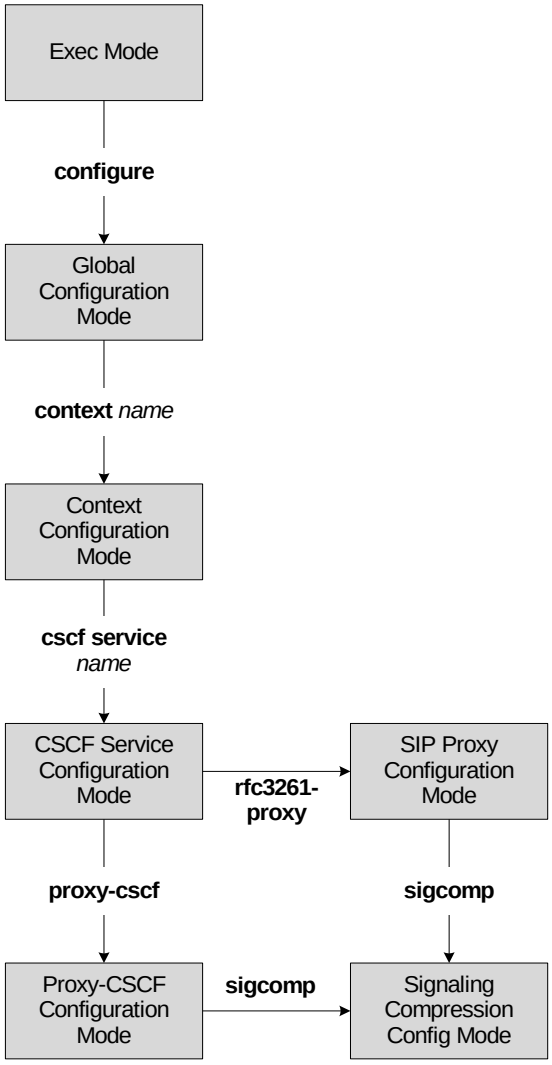
Example

The following command specifies that a URN service list named *urn_list5* will be used for sessions using this template:

urn-service-list name *urn_list5*

Chapter 69
CSCF Signalling Compression Configuration Mode Commands

The CSCF Signalling Compression Configuration Mode is used to set memory allocation parameters in support of SIP signalling compression. More information regarding signalling compression refer to the IETF RFC 3320 “Signaling Compression (SigComp)”.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

compression-mode

Configures the dynamic compression mode to be used while sending a SigComp message. Simple dynamic mode is the default.

Product

SCM

Privilege

Administrator

Syntax

```
compression-mode { multiple-dynamic | simple-dynamic | static | update-dynamic }

default compression-mode
```

multiple-dynamic | simple-dynamic | static | update-dynamic

Default: **simple-dynamic**
multiple-dynamic: A maximum of four dynamic states will be created per compartment. The dynamic states are updated for each message by deleting the oldest dynamic state and creating the new one. The dynamic states will be updated in FIFO (First In, First Out) order.
simple-dynamic: Only one dynamic state will be created per compartment. The same state will be used for compression.
static: No dynamic states will be created. Only static dictionary will be used for compression.
update-dynamic: Only one dynamic state will be created per compartment, but the dynamic state will be updated for every new message.

default compression-mode

Returns the dynamic compression mode to simple dynamic.

Usage

Use this command to configure the dynamic compression mode to be used.

Example

The following command sets the compression mode to multiple dynamic:

```
compression-mode multiple-dynamic
```

The following command completely disables the creation of dynamic states for compression:

```
compression-mode static
```

decompression-memory-size

Sets the amount of memory available for decompressing one SigComp message. A portion of the allocated memory is used to buffer the message before it is decompressed. The memory is allocated for each SigComp message and is reclaimed once decompression is completed.

Product

SCM

Privilege

Administrator

Syntax

```
decompression-memory-size { 128k | 16k | 32k | 64k | 8k }

default decompression-memory-size
```

128k | 16k | 32k | 64k | 8k

Default: **8k**
Specifies the amount of memory (in kilobytes) to allocate for decompressing one SigComp message.

default

Returns the command to the default settings.

Usage

Use this command to set the memory size used to decompress a single SigComp message.

Example

The following command sets the memory size for decompressing SigComp messages to 16k:

```
decompression-memory-size 16k
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

state-memory-size

Sets the memory allocated to a compartment for the creation of state. Compartments are application-specific groupings of messages that relate to a peer endpoint. The system allocates memory per compartment. The memory is reclaimed when the system determines that the compartment is no longer required.

Product

SCM

Privilege

Administrator

Syntax

```
state-memory-size { 4k | 8k }

default state-memory-size
```

4k | 8k

Default: **4k**
Specifies the amount of memory to allocate to a compartment for the creation of state.

default

Returns the command to the default settings.

Usage

Use this command to specify a memory size allocated to message groupings for the creation of state.

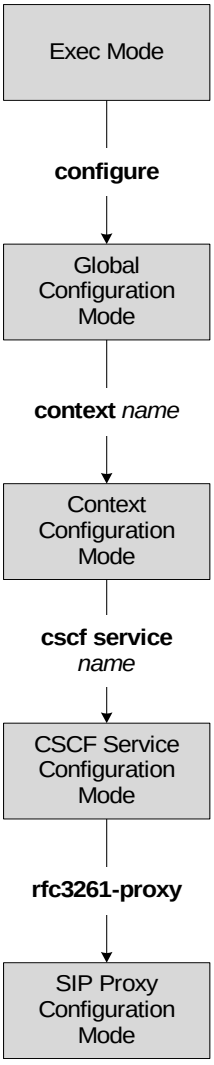
Example

The following command sets the state memory size to **8k**:

```
state-memory-size 8k
```

Chapter 70
CSCF SIP Proxy Configuration Mode Commands

The SIP Proxy Configuration Mode is used to set various commands supporting the role of the CSCF service as a RFC3261-compliant SIP proxy server.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

as-call

Enabling this command causes request-URIs in INVITE messages to be updated with the result of the translation before being passed to an Application Server. This command is disabled by default.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
[ default | no ] as-call invite-request-uri update
```

default | no

The translation result is ignored.

Usage

Use this command to update the request-URI in INVITE messages with the result of the translation before passing it to an AS.

authentication

Configures the authentication method used by the CSCF service.

Product

SCM (SIP Proxy)

Privilege

Administrator

Syntax

```
authentication { aka-v1 value | allow-noauth [ invite | re-register| register ]
| allow-noipauth [ invite | re-register| register ] | allow-unsecure | aor-auth
| md5 value }

no authentication { aka-v1 | allow-noauth [ invite | re-register| register ] |
allow-noipauth [ invite | re-register| register ] | allow-unsecure | aor-auth |
md5 }
```

aka-v1 *value*

Specifies that AKA-v1 algorithm is used as the authentication type when accessing the CSCF service. *value* specifies a preference - the lower the value, the higher the preference. *value* must be an integer from 1 to 1000.

Important: In order to change a priority level, you must remove the original value and configure a new one.

allow-noauth [invite | re-register| register]

Specifies that access to the CSCF service is allowed if authentication fails.
invite: Specifies that access to the CSCF service is allowed if authentication fails on INVITE requests only.
re-register: Specifies that access to the CSCF service is allowed if authentication fails on RE-REGISTER requests when the request is integrity-protected only.
registration: Specifies that access to the CSCF service is allowed if authentication fails on REGISTER requests only.

allow-noipauth [invite | re-register| register]

Specifies that access to the CSCF service is allowed if early IMS-based IP authentication fails.
invite: Specifies that access to the CSCF service is allowed if early IMS-based IP authentication fails on INVITE requests only.
re-register: Specifies that access to the CSCF service is allowed if authentication fails on RE-REGISTER requests when the request is integrity-protected only.
registration: Specifies that access to the CSCF service is allowed if early IMS-based IP authentication fails on REGISTER requests only.

allow-unsecure

Specifies that un-secure access is allowed to the CSCF service.

aor-auth

Specifies that authentication is based on the AoR when accessing the CSCF service.

md5 *value*

Specifies that the MD5 algorithm is used as the authentication type for accessing the CSCF service. *value* specifies a preference - the lower the value, the higher the preference. *value* must be an integer from 1 to 1000.

Important: In order to change a priority level, you must remove the original value and configure a new one.

no authentication { aka-v1 | allow-noauth [invite | re-register| register] | allow-noipauth [invite | re-register| register] | allow-unsecure | aor-auth | md5 }

Disables the specified authentication method for the CSCF service.

Usage

Use this command to configure the authentication method used by the CSCF service.

Example

The following command configures the authentication method used by the CSCF service to MD5 with a preference of *3*:

```
authentication md5 3
```

diversion-info

Enabling this command prompts the service to add a diversion header (draft-levy-sip-diversion-08) when the call is diverted to a different endpoint due to a call feature. By default diversion-info is disabled.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
[ default | no ] diversion-info
```

default | no

The service will not add a diversion header.

Usage

Use this command to enable the service to add a diversion header to call setup packets when calls are diverted due to the application of call features.

emergency-sessions

Configures the function to allow anonymous and/or non-emergency registered subscribers to initiate emergency sessions.

Product

SCM (SIP Proxy)

Privilege

Administrator

Syntax

```
emergency-sessions [ anonymous [ non-emergency-registered ] | non-emergency-registered ]

[ default | no ] emergency-sessions
```

anonymous

Allow anonymous subscribers to initiate emergency sessions.

non-emergency-registered

Allow non-emergency registered subscribers to initiate emergency sessions.

default

Specifies that anonymous and non-emergency registered emergency sessions are allowed.

no

Disallows anonymous and/or non-emergency registered emergency sessions.

Usage

Use this command to configure the function to allow anonymous and/or non-emergency registered subscribers to initiate emergency sessions.

Example

The following command configures the function to allow only non-emergency registered subscribers to initiate emergency sessions:

```
emergency-sessions non-emergency-registered
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

registration

Configures a registration lifetime for all subscribers to the service.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

registration lifetime { default *sec* **| max** *sec* **| min** *sec* **}**

default registration lifetime

{ max *sec* **| min** *sec* **| default** *sec* **}**

default *sec*: Specifies the default amount of time that a registration can exist on the system. *sec* must be an integer from 60 to **max** *sec* -1. Default is 3761. default *sec* must be < or = to max *sec* and > or = to min *sec*.
max *sec*: Specifies the maximum amount of time that a registration can exist on the system. *sec* must be an integer from 60 to 2147483646. Default is 86400. max *sec* must be > or = to min *sec*.
min *sec*: Specifies the minimum amount of time that a registration can exist on the system. *sec* must be an integer from 60 to **max** *sec* -1. Default is 60. min *sec* must be < or = to max *sec*.

default registration lifetime

Returns the command to the default settings.

Usage

Use this command to control the amount of time registrations are allowed to exist on this service.
The system responds to registrations in the following manner:
Using default values:

- If a registration with an expiration value lower than the service's minimum (60) is received, the service will respond with a 423 Interval Too Small message.
- If a registration with an expiration value higher than the service's maximum (2147483646) is received, the service will automatically reduce the expiration value to the default value.
- If a registration is received missing the "Expires" value, or the value is malformed, the service will automatically respond with 3761 in the 200OK message.

Example

The following command configures the maximum registration lifetime to *43200* (12 hours):

registration lifetime max *43200*

reliable-prov-resp

Enables/disables the reliability of provisional responses feature.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
reliable-prov-resp { mandatory | optional }

no reliable-prov-resp
```

mandatory | optional

mandatory: Both inbound and outbound will request reliability.
optional (default): Reliability is imposed by inbound side. Only if inbound call requests reliability will outbound also request reliability.

no

Disables the reliability of provisional responses feature.

Usage

Use this command to enable/disable the reliability of provisional responses feature.

Example

The following command sets the reliability of provisional responses feature to mandatory:

```
reliable-prov-resp mandatory
```

The following command disables the reliability of provisional responses feature:

```
no reliable-prov-resp
```

sifc

Enables Shared Initial Filter Criteria (SiFC) functionality. This command is disabled by default.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
[ default | no ] sifc
```

default | no

Disables shared iFC functionality for this SIP Proxy.

Usage

Use this command to configure the SIP Proxy to share iFC functionality.
If both the HSS and the SIP Proxy support this feature, subsets of iFC may be shared by several service profiles. The HSS downloads the unique identifiers of the shared iFC sets to the SIP Proxy. The SIP Proxy uses a locally administered database to map the downloaded identifiers onto the shared iFC sets.
If the SIP Proxy does not support this feature, the HSS will not download identifiers of shared iFC sets.

sigcomp

Enables signaling compression for the SIP Proxy service and enters the Signaling Compression Configuration Mode.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
[ no ] sigcomp
```

no

Disables signaling compression for the CSCF service.

Usage

Use this command to enable signaling compression for the SIP Proxy service and enter the CSCF Signaling Compression Configuration Mode.
Entering this command results in the following prompt:

```
[context_name]hostname(config-sigcomp)#
```

Signaling Compression Configuration Mode commands are defined in the *CSCF Signaling Compression Configuration Mode Commands* chapter in this guide.

tas

Configures the SIP Proxy to perform Telephony Application Server (TAS) functions.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
[ default | no ] tas
```

default | no

Disables the TAS feature for this SIP Proxy.

Usage

Use this command to configure the SIP Proxy to perform TAS functions.

tas-service

Identifies the name of the service configured on the system performing Telephony Application Server (TAS) functions.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

tas-service *name*

[default | no] tas-service

name

Specifies the name of the service configured on the system performing TAS functions. *name* must be from 1 to 63 alpha and/or numeric characters and be an existing service.

default | no

Removes the TAS name from the SIP Proxy configuration.

Usage

Use this command to identify the name of the service configured on the system performing TAS functions. The ims-sh-service commands are defined in the Context Configuration Mode Commands chapter in this guide.

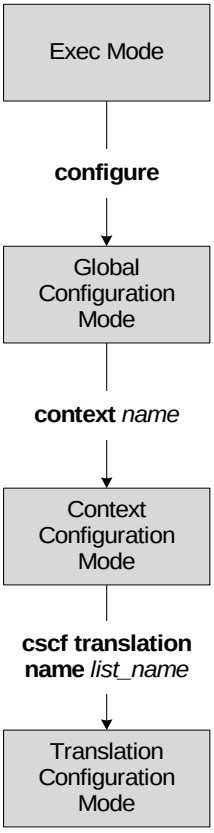
Example

The following command identifies the TAS service name as *scscf3*:

tas-service *scscf3*

Chapter 71
CSCF Translation Configuration Mode Commands

The CSCF Translation Configuration Mode is used to configure session re-addressing within the system.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

after

Places the CSCF translation entry at the bottom or end of the translation list. Use this command in conjunction with the **uri-readdress** command.

Product

SCM

Privilege

Administrator

Syntax

after

Usage

Add this command before the **uri-readdress** command to place the entry at the end of the translation list.

before

Places the CSCF translation entry at the top or beginning of the translation list. Use this command in conjunction with the **uri-readdress** command.

Product

SCM

Privilege

Administrator

Syntax

before

Usage

Add this command before the **uri-readdress** command to place the entry at the beginning of the translation list.

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

uri-readdress

Configures readdress criteria for URI translations.

Product

SCM

Privilege

Administrator

Syntax

uri-readdress type *trans_type* **[log] { base-criteria** *criteria* **} [filter-criteria1** *criteria* **] [filter-criteria2** *criteria* **]**

no uri-readdress type *trans_type* **{ base-criteria** *criteria* **} [filter-criteria1** *criteria* **] [filter-criteria2** *criteria* **]**

---

type *trans_type*

Specifies that the translation list (*trans_type*) entry is to be identified as one of the following:
blocking-cid: Identifies the translation list entry type as “call ID blocking”.
cancel-blocking-cid: Identifies the translation list entry type as “cancel call ID blocking”.
cancel-cid: Identifies the translation list entry type as “cancel call ID display”.
cancel-cw: Identifies the translation list entry type as “cancel call-waiting”.
cfbl-off: Identifies the translation list entry type as “call forward busy line off”.
cfbl-on: Identifies the translation list entry type as “call forward busy line on”.
cfna-off: Identifies the translation list entry type as “call forward no answer off”.
cfna-on: Identifies the translation list entry type as “call forward no answer on”.
cfu-off: Identifies the translation list entry type as “call forward unconditional off”.
cfu-on: Identifies the translation list entry type as “call forward unconditional on”.
cid: Identifies the translation list entry type as “call ID display”.
cw-off: Identifies the translation list entry type as “call-waiting off”.
cw-on: Identifies the translation list entry type as “call-waiting on”.
directory-assistance: Identifies the translation list entry type as “directory assistance”.
emergency: Identifies the translation list entry type as “emergency”.
international: Identifies the translation list entry type as “international”.
local: Identifies the translation list entry type as “local”.
long-distance: Identifies the translation list entry type as “long-distance”.
none: Identifies the translation list entry type as “any”.
operator-assistance: Identifies the translation list entry type as “operator assistance”.
premium-service: Identifies the translation list entry type as “premium service”.
service: Identifies the translation list entry type as “special service”.
tollfree: Identifies the translation list entry type as “toll free”.

---

log

Enables logging for CSCF sessions meeting the readdress criteria for URI translations.

---

base-criteria *criteria*

Specifies the base criteria that packets will be compared against. The following criteria is supported:

- **any**: Filters all CSCF sessions.

- **destination aor** *aor*: Filters sessions based on the destination AoR. *aor* must be an existing AoR from 1 to 79 characters in length.

Important: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

- **plmn-id mcc** *mcc_code* **mnc** *mnc_code*: Filters sessions based on the mobile country and network codes. *mcc_code* must be a three-digit integer from 200 to 999. *mnc_code* must be either a two or three-digit integer from 00 to 999 or **any** (any MNC code).
- **source address** *ip_address*: Filters sessions based on source IP address. *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
- **source aor** *aor*: Filters sessions based on the source AoR. *aor* must be an existing AoR from 1 to 79 characters in length.

filter-criteria1 *criteria*

Specifies the filter criteria that packets that have passed the base criteria will be compared against. The following criteria is supported:

- **any**: Filters all CSCF sessions.
- **destination aor** *aor*: Filters sessions based on the destination AoR. *aor* must be an existing AoR from 1 to 79 characters in length.

Important: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

- **plmn-id mcc** *mcc_code* **mnc** *mnc_code*: Filters sessions based on the mobile country and network codes. *mcc_code* must be a three-digit integer from 200 to 999. *mnc_code* must be either a two or three-digit integer from 00 to 999 or **any** (any MNC code).
- **source address** *ip_address*: Filters sessions based on source IP address. *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
- **source aor** *aor*: Filters sessions based on the source AoR. *aor* must be an existing AoR from 1 to 79 characters in length.

filter-criteria2 *criteria*

Specifies the filter criteria that packets that have passed the base criteria and filter criteria1 will be compared against. The following criteria is supported:

- **any**: Filters all CSCF sessions.
- **destination aor** *aor*: Filters sessions based on the destination AoR. *aor* must be an existing AoR from 1 to 79 characters in length.

Important: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

- **plmn-id mcc** *mcc_code* **mnc** *mnc_code*: Filters sessions based on the mobile country and network codes. *mcc_code* must be a three-digit integer from 200 to 999. *mnc_code* must be either a two or three-digit integer from 00 to 999 or **any** (any MNC code).

- **source address** *ip_address*: Filters sessions based on source IP address. *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
- **source aor** *aor*: Filters sessions based on the source AoR. *aor* must be an existing AoR from 1 to 79 characters in length.

no uri-readdress type *trans_type* **{ base-criteria** *criteria* **} [filter-criteria1** *criteria* **] [filter-criteria2** *criteria* **]**

Remove the readdress configuration.

Usage

Use this command to readdress URIs based on specified criteria and enters the URI Readdress Configuration Mode. Readdressing can be used for:

- **Mobility**: When roaming in a visited domain.
- **Service Aliases**: Resolving well-known addresses via SIP-AS.
- **Number Translation**: Adding or deleting prefixes such as +1 to/from PSTN numbers.
- **Voice VPNs**: Using inter-office extensions to dial remote offices.

Entering this command results in the following prompt:

```
[context_name]hostname(config-uri-readdress)#
```

URI readdress commands are defined in the *CSCF URI Readdress Configuration Mode Commands* chapter of this reference.

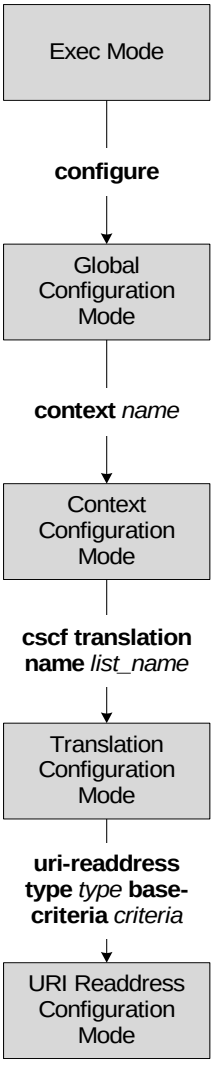
Example

The following command readdresses sessions to a domain named *service.com*, filters sessions with a base criteria of the source address (*1.2.3.4*) and a filter criteria of the destination AoR (*$.@test.com*):

```
uri-readdress type service base-criteria source address 1.2.3.4 filter-criteria1 destination aor $.@test.com
```

Chapter 72
CSCF URI Readdress Configuration Mode Commands

The URI Readdress Configuration Mode is used to set URI translations.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

action

Adjusts a target address to route sessions to appropriate locations.

Product

SCM

Privilege

Administrator, Config-administrator

Syntax

```
action { addstring| deletenum_chars| modifystring} positionnumtarget {
destination | source } { aor | domain | user }

no action
```

add *string* | **delete** *num_chars* | **modify** *string*

add *string*: Adds a specified string to a location indicated by the **position** keyword for the targeted source or destination address component (aor, domain, or user). *string* must be from 1 to 79 alpha and/or numeric characters.
delete *num_chars*: Deletes a number of characters starting from a location specified by the **position** keyword for the targeted source or destination address component (aor, domain, or user). *num_chars* must be an integer from 1 to 79.
modify *string*: Modifies a specified string in a location starting with the **position** keyword for the targeted source or destination address component (aor, domain, or user). The number of characters in the *string* variable will replace the same number in the address. *string* must be from 1 to 79 alpha and/or numeric characters.

position *num*

Specifies the position in the target string where the action is to occur. *num* must be an integer from 1 to 79.

target { destination | source }

Species that the action is to occur within the source or destination address.

aor | domain | user

aor: Specifies that the action is applied to AoRs in the targeted source or destination address.
domain: Specifies that the action is applied to domains in the targeted source or destination address.
user: Specifies that the action is applied to users in the targeted source or destination address.

no

Disables target address to route sessions.

Usage

Use this command to manipulate SIP packets matching the criteria in the uri-readdress command.

Example

The following command prepends a "+1" to a destination AoR:

```
action add +1 position 1 target destination aor
```

The following command removes the first two characters from the destination AoR:

```
action delete 2 position 1 target destination aor
```

The following command replaces characters 2 through 4 with the characters "abc" in the destination AoR:

```
action modify abc position 2 target destination aor
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

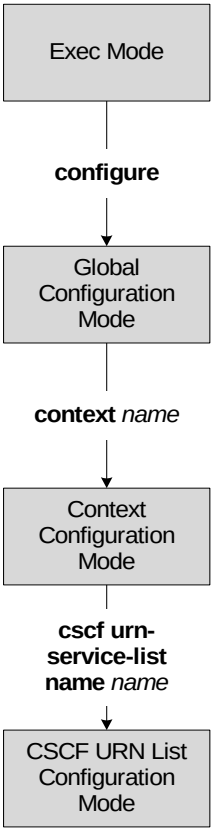
exit

Usage

Return to the previous mode.

Chapter 73
CSCF URN List Configuration Mode Commands

The CSCF URN List Configuration Mode is used to map URNs to URIs for emergency and local call services.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

cscf-urn-service-mapping

Adds an entry to the service URN mapping table that maps uniform resource names (URNs) to URIs in order to direct specific service-oriented identifiers to the proper location in a network. The table is used after CSCF translation if the result is a local service.

Product

SCM

Privilege

Administrator

Syntax

[no] cscf-urn-service-mapping urn *urn* **uri** *uri*

no

Removes an entry from the service URN mapping table.

urn *urn*

Specifies the URN to be routed via a URL to the appropriate destination. *urn* must be from 1 to 79 alpha and/or numeric characters.

uri *uri*

Specifies the URI used to route the URN to the appropriate location. *uri* must be from 1 to 79 alpha and/or numeric characters.

Usage

Use this command to add an entry to the service URN mapping table that routes a translated URN to a URI for local services.

Important: Service URN mapping tables are limited to 30 URN to URI mapping entries.

Example

The following command map URN *business* to URI *corp@123.45.678.9:5020* and adds it to the service URN mapping table:

cscf-urn-service-mapping urn *business* **uri** *corp@123.45.678.9:5020*

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

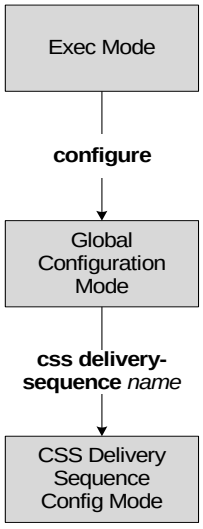
Usage

Return to the previous mode.

Chapter 74
CSS Delivery Sequence Configuration Mode Commands

The CSS Delivery Sequence Configuration Mode is used to configure the order in which traffic is delivered to Content Service Steering (CSS) services and their associated content servers.

Important: This is a restricted configuration mode. In StarOS 9.0 and later, this configuration mode is deprecated.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

This is a restricted command. In StarOS 9.0 and later, this command is deprecated.

exit

This is a restricted command. In StarOS 9.0 and later, this command is deprecated.

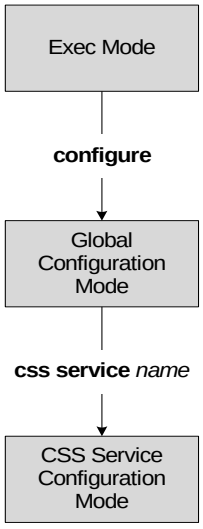
redirect service (any)

This is a restricted command. In StarOS 9.0 and later, this command is deprecated.

Chapter 75
CSS Service Configuration Mode Commands

The CSS Service Configuration Mode is used to configure properties for Content Service Steering (CSS) services. A CSS service binds a set of delivery interfaces to a service name and specifies a recovery mechanism.

Important: This is a restricted configuration mode. In StarOS 9.0 and later, this configuration mode is deprecated.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

This is a restricted command. In StarOS 9.0 and later, this command is deprecated.

exit

This is a restricted command. In StarOS 9.0 and later, this command is deprecated.

recovery

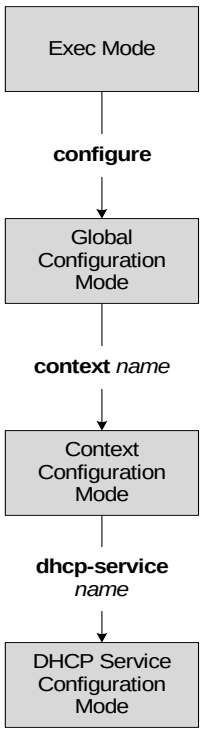
This is a restricted command. In StarOS 9.0 and later, this command is deprecated.

server-interface

This is a restricted command. In StarOS 9.0 and later, this command is deprecated.

Chapter 76
DHCP Service Configuration Mode Commands

The Dynamic Host Control Protocol (DHCP) Configuration Mode is used to create and manage DHCP service instances for the current context.



bind

This command binds the DHCP service to a logical IP interface facilitating the system's connection to the DHCP server. This command also configures traffic from the specified DHCP service bind address to use the specified Multiple Protocol Label Switching (MPLS) labels.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

bind address *ip_address* **[nexthop-forwarding-address** *nexthop_ip_address* **[mpls-label input** *in_mpls_label_value* **output** *out_mpls_label_value1* **[** *out_mpls_label_value2* **]]]**

no bind address *ip_address*

no

Removes a previously configured binding.

ip_address

Specifies the IP address of an interface in the current context through which the communication with the DHCP server occurs. *ip_address* must be expressed in dotted decimal notation.

nexthop-forwarding-address *nexthop_ip_address*

Specifies the next hop gateway address for in MPLS network to which the packets with MPLS labels will be forwarded.
nexthop_ip_address must be expressed in IPv4/IPv6 notation.

mpls-label input *in_mpls_label_value*

This keywork specifies the MPLS label to identify inbound traffic destined for the configured DHCP service bind address *ip_address*.
in_mpls_label_value is the MPLS label that will identify inbound traffic destined for the configured DHCP service and must be an integer from 16 through 1048575.

Important: This keyword is license-enabled and available with valid MPLS feature license only.

Caution: For DHCP over MPLS feature to work in StarOS 9.0 onward **dhcp ip vrf** command must be configured in DHCP service. Without **dhcp ip vrf** command the DHCP service using MPLS labels will not be started and as a part of DHCP over MPLS configuration in StarOS 9.0 onward this keyword is a critical parameter for the DHCP-Service. Any change in its value will result in DHCP-service restart and clearing of the existing calls.

output *out_mpls_label_value1* **[** *out_mpls_label_value2* **]**

This keyword adds the MPLS label to the outbound traffic sent from the configured DHCP service bind address *ip_address*. The labels *out_mpls_label_value1* and *out_mpls_label_value2* identify the MPLS labels to be added to packets sent from the specified dhcp service bind address. *out_mpls_label_value1* is the inner output label and must be an integer from 16 through 1048575. *out_mpls_label_value2* is the outer output label and must be an integer from 16 through 1048575.

Important: This keyword is license-enabled and available with valid MPLS feature license only.

Usage

Use this command to associate or tie the DHCP service to a specific logical IP address previously configured in the current context and bound to a port. Once bound, the logical IP address or interface is used in the giaddr field of the DHCP packets.
When this command is executed, the DHCP service is started and begins the process of requesting addresses from the DHCP server and storing them in cache memory for allocation to PDP contexts.
This command can also be used to configure MPLS labels for inbound and outbound traffic through this DHCP address.
Only one interface can be bound to a service.
For DHCP over MPLS feature to work in StarOS 9.0 onward **dhcp ip vrf** command must be configured in DHCP service. Without **dhcp ip vrf** command the DHCP service using MPLS labels will not be started.

Caution: As a part of DHCP over MPLS configuration **mpls-label input** keyword in **bind address** command is also a critical parameter for the DHCP-Service. Any change in its value will result in DHCP-service restart and clearing of the existing calls.

Example

The following command binds the DHCP service to the interface with an IP address of 192.168.1.210:

```
bind address 192.168.1.210
```

default

Restores DHCP service parameters to their factory default settings.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
default { dhcp { deadtime | detect-dead-server { consecutive-failures } |
server-selection-algorithm } | lease-duration | max-retransmissions |
retransmission-timeout | T1-threshold | T2-threshold }
```

`dhcp { deadtime | detect-dead-server { consecutive-failures } | server-selection-algorithm }`

Restores the following DHCP parameters to their respective default settings:

- **`deadtime`** : Default 10 minutes
- **`detect-dead-server`** { **`consecutive-failures`** } : Default 5
- **`server-selection-algorithm`** : Default First-server

`lease-duration`

Restores the lease-duration parameter to its default setting of 86400 seconds.

`max-retransmissions`

Restores the max-retransmissions parameter to its default setting of 5.

`retransmission-timeout`

Restores the retransmission-timeout parameter to its default setting of 3000 milli-seconds.

`T1-threshold`

Restores the T1-threshold parameter to its default setting of 50%.

`T2-threshold`

Restores the T2-threshold parameter to its default setting of 88%.

Usage

After system parameters have been modified, this command is used to set/restore specific parameters to their default values.

Example

The following command restores the dhcp deadtime parameter to its default setting of 10 minutes:

```
default dhcp deadtime
```

dhcp client-identifier

This command configures behavior relating to inclusion of client identifier DHCP option in DHCP messages.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
dhcp client-identifier { msisdn | none }

default dhcp client-identifier
```

default

Sets the behavior of DHCP client identifier to default; i.e. not to include client identifier option in any DHCP message.

msisdn

Default: disabled
Specifies that subscriber's MSISDN be included in client-identifier option of the relevant DHCP messages.

Important: This keyword is GGSN license controlled.

none

Default: enabled
Specifies that DHCP client-identifier option would not be included in any DHCP messages. This is the default behavior.

Usage

Use this command to configure behavior relating to inclusion or exclusion of DHCP client identifier option from DHCP messages.

Example

The following command specifies that DHCP client-identifier option be excluded from DHCP messages:

```
dhcp client-identifier none
```

dhcp deadtime

Configures the amount of time that the system waits prior to re-communicating with a DHCP server that was previously marked as down.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

dhcp deadtime *max_time*

max_time

Default: 10 minutes
Specifies the maximum amount of time to wait before communicating with DHCP server that were previously unreachable.
max_time is measured in minutes and can be configured to any integer value from 1 to 65535.

Usage

If the system is unable to communicate with a configured DHCP server, after a pre-configured number of failures the system marks the server as being down.
This command specifies the amount of time that the system waits prior to attempting to communicate with the downed server.

Important: If all DHCP servers are down, the system will immediately treat all DHCP servers as active, regardless of the deadtime that is specified.

Refer to the **dhcp detect-dead-server** and **max-retransmissions** commands for additional information on the process the system uses to mark a server as down.

Example

The following command configures the system to wait 20 minutes before attempting to re-communicate with a dhcp server that was marked as down:

dhcp deadtime *20*

dhcp detect-dead-server

Configures the number of consecutive communication failures that could occur before the system marks a DHCP server as down.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

dhcp detect-dead-server consecutive-failures *max_number*

consecutive-failures *max_number*

Default: 5
Specifies the number of failures that could occur before marking a DHCP server as down.
max_number could be configured to any integer value from 1 to 1000.

Usage

This command works in conjunction with the *max-retransmissions* parameter to set a limit to the number of communication failures that can occur with a configured DHCP server.
The *max-retransmissions* parameter limits the number of attempts to communicate with a server. Once that limit is reached, the system treats it as a single failure. This parameter limits the number of consecutive failures that can occur before the system marks the server as down and communicate with the server of next highest priority.
If all of the configured servers are down, the system ignores the detect-dead-server configuration and attempt to communicate with highest priority server again.
If the system receives a message from a DHCP server that was previously marked as down, the system immediately treats it as being active.

Example

The following command configures the system to allow 8 consecutive communication failures with a DHCP server before it marks it as down:

dhcp detect-dead-server consecutive-failures *8*

dhcp ip vrf

This command provides the DHCP-over-MPLS support and associates the specific DHCP service with a pre-configured Virtual Routing and Forwarding (VRF) Context instance for virtual routing and forwarding.

Product

All

Privilege

Security Administrator, Administrator

Syntax

dhcp ip vrf *vrf_name*

no dhc ip vrf

no

Removes/disassociates configured IP Virtual Routing and Forwarding (VRF) context instance.

vrf_name

Specifies the name of a pre-configured VRF context instance to be associated with a DHCP service. *vrf_name* is name of a pre-configured virtual routing and forwarding (VRF) context configured in context configuration mode and associated with the IP Pool used by the DHCP service.

Usage

Use this command to enable the DHCP-over-MPLS support and to associate/disassociate a pre-configured VRF context to a DHCP service for this feature.
By default the VRF is NULL, which means that DHCP service is bound with binding address given by **bind address** command only.
VRF is not a critical parameter for the DHCP Service but bind address is a critical parameter for DHCP Service, and while starting DHCP Service, if this command is configured, then the bind address should be present in that VRF, and If this command is not configured, bind address should be present in the context where DHCP Service is configured.
For DHCP over MPLS feature to work in StarOS 9.0 onward this command must be configured in DHCP service. Without this command the DHCP service using MPLS labels will not be started.

Caution: As a part of this configuration **mpls-label input** keyword in **bind address** command is also a critical parameter for the DHCP-Service. Any change in its value will result in DHCP-service restart and clearing of the existing calls.

Example

Following command associates VRF context instance *dhcp_vrf1* with this DHCP service:

dhcp ip vrf *dhcp_vrf1*

dhcp server

Configures DHCP servers with which the DHCP service is to communicate.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

dhcp server *ip_address* **[priority** *priority* **]**

no dhcp server *ip_address*

no

Deletes a previously configured DHCP server.

ip_address

Specifies the IP address of the DHCP server expressed in dotted decimal notation.

priority *priority*

Specifies the priority of the server if multiple servers are configured.
priority can be configured to any integer value from 1 to 1000. 1 is the highest priority.

Usage

Use this command to configure the DHCP server(s) that the system is to communicate with. Multiple servers can be configured each with their own priority. Up to 20 DHCP servers can be configured.
All DHCP messages are sent/received on UDP port 67.

Important: If a server is removed, all calls having an IP address allocated from the server will be released.

Example

The following command configures a DHCP server with an IP address of 192.168.1.200 and a priority of 1:

dhcp server *192.168.1.200* **priority** *1*

dhcp server selection-algorithm

Specifies the algorithm used to select DHCP servers with which to communicate when multiple servers are configured.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
dhcp server selection-algorithm { first-server | round-robin }
```

first-server

Default: Enabled
Selects the first-server algorithm to be used. This algorithm dictates that the system select the DHCP servers according to their priority starting with the highest priority server. The system communicates with the server of the next highest priority only when the previous server is unreachable.

round-robin

Default: Disabled
Selects the round-robin algorithm to be used. This algorithm dictates that the system communicates with the servers in a circular queue according to the server's configured priority starting with the highest priority server. The next request is communicated with the next highest priority server, and so on until all of the servers have been used. At this point, the system starts from the highest priority server.

Usage

Use this command to determine how configured DHCP servers are utilized by the system.

Example

The following command configures the DHCP service to use the round-robin selection algorithm:

```
dhcp server selection-algorithm round-robin
```

end

Exits the context configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the context configuration mode and returns to the global configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the global configuration mode.

lease-duration

Configures the minimum and maximum allowable lease times that are accepted in responses from DHCP servers.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

lease-duration min *min_time* **max** *max_time*

min *min_time*

Default: 600
Specifies the minimum acceptable lease time.
min_time is measured in seconds and can be configured to any integer value from 600 to 3600.

max *max_time*

Default: 86400
Specifies the maximum acceptable lease time.
max_time is measured in seconds and can be configured to any integer value from 10800 to 4294967295.

Usage

To reduce the call setup time, the system requests IP addresses from the DHCP server in blocks rather than on a call-by-call basis. Each address received has a corresponding lease time, or time that it is valid. The values configured by command represent the minimum and maximum times that the system allows and negotiates for the lease(s).
If the DHCP server responds with values that are out of the range specified by the min and max values, the system accumulates warning statistics. Responses that fall below the minimum value are rejected by the system and the system contacts the DHCP server with the next highest priority. Responses that are greater than the maximum value are accepted.
When half of the lease time has expired, the system automatically requests a lease renewal from the DHCP server. This is configured using the **T1-threshold** command.

Example

The following command configures the minimum allowable lease time for the system to be 1000 and the maximum to be 36000:

lease-duration min *1000* **max** *36000*

max-retransmissions

Configures the maximum number of times that the system attempts to communicate with unresponsive DHCP server before it is considered a failure.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

max-retransmissions *max_number*

max_number

Default: 5
Specifies the maximum number of re-attempts the system tries when no response is received from a DHCP server.
max_number can be configured to any integer value from 1 to 20.

Usage

This command works in conjunction with the *dhcp detect-dead-server* parameter to set a limit to the number of communication failures that can occur with a configured DHCP server.
When the value specified by this parameter is met, a failure is logged. The *dhcp detect-dead-server* parameter specifies the number of consecutive failures that could occur before the server is marked as down.
In addition, the **retransmission-timeout** command controls the amount of time between re-tries.

Example

The following command configures the maximum number of times the system re-attempts communication with a DHCP server that is unresponsive to 5:

max-retransmissions *5*

retransmission-timeout

Configures the amount of time that must pass with no response before the system re-attempts to communicate with the DHCP server.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

retransmission-timeout *time*

time

Default: 10000
Specifies the time that the system waits before retrying to communicate with the DHCP server.
time is measured in milliseconds and can be configured to any integer value from 100 to 20000.

Usage

This command works in conjunction with the **max-retransmissions** command to establish a limit on the number of times that communication with a DHCP server is attempted before a failure is logged. This parameter specifies the time between retries.

Example

The following command configures a retry timeout of 1000 milliseconds:

retransmission-timeout *1000*

T1-threshold

Configures the DHCP T1 timer as a percentage of the allocated IP address lease.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

T1-threshold *percentage*

percentage

Default: 50%
The percentage of the allocated IP address lease time at which the DHCP call-line state is changed to "RENEWING". It can be configured to any integer value from 40 to 66%.

Usage

This command is used to identify the time at which a subscriber must renew their DHCP lease as a percentage of the overall lease time. (Refer to the **lease-duration** command in this chapter for information on configuring the IP address lease period.)
For example, if the lease-duration was configured to have a maximum value of 12000 seconds, and this command is configured to 40%, then the subscriber would enter the RENEWING state after 4800 seconds.

Example

The following command configures the T1 threshold to 40%:

T1-threshold *40*

T2-threshold

Configures the DHCP T2 timer as a percentage of the allocated IP address lease.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

T2-threshold *percentage*

percentage

Default: 88%
The percentage of the allocated IP address lease time at which the DHCP call-line state is changed to "REBINDING". It can be configured to any integer value from 67 to 99%.

Usage

This command is used to identify the time at which a subscriber re-binds their DHCP leased IP address as a percentage of the overall lease time. (Refer to the **lease-duration** command in this chapter for information on configuring the IP address lease period.)
For example, if the lease-duration was configured to have a maximum value of 12000 seconds, and this command is configured to 70%, then the subscriber would enter the REBINDING state after 8400 seconds.

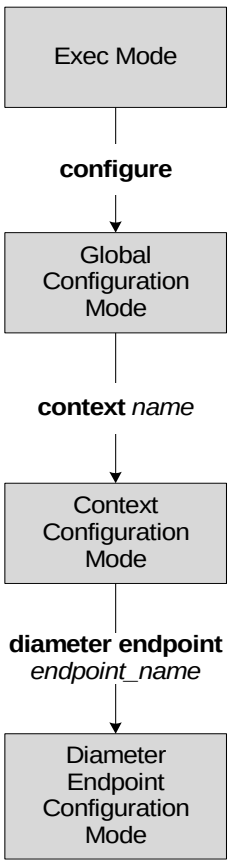
Example

The following command configures the T1 threshold to 70%:

T2-threshold *70*

Chapter 77
Diameter Endpoint Configuration Mode Commands

Diameter Endpoint Configuration Mode is accessed from the Context Configuration Mode. The base Diameter protocol operation is configured in the Diameter Endpoint Configuration Mode.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

cea-timeout

This command configures the Capabilities-Exchange-Answer (CEA) message timeout duration for Diameter sessions.

Product

All

Privilege

Security Administrator, Administrator

Syntax

cea-timeout *timeout*

default cea-timeout

default

Configures the default CEA timeout setting.

timeout

Specifies the timeout duration, in seconds, to make the system wait for this duration for CEA message.
timeout must be an integer from 1 through 120.
Default: 30 seconds

Usage

Use this command to configure the CEA timer, i.e., how long to wait for the Capabilities-Exchange-Answer message.

Example

The following command sets the Diameter CEA timeout to *16* seconds:

cea-timeout *16*

connection retry-timeout

This command configures the Diameter Connection Retry Timeout parameter.

Product

All

Privilege

Security Administrator, Administrator

Syntax

connection retry-timeout *timeout*

default connection retry-timeout

default

Configures the default Connection Retry Timeout setting.

timeout

Specifies the connection retry timeout duration, in seconds, and must be an integer from 1 through 3600.
Default: 30 seconds

Usage

Use this command to configure the Diameter Connection Retry Timeout parameter.

Example

The following command sets the Diameter Connection Retry Timer to *120* seconds:

connection retry-timeout *120*

connection timeout

This command configures the Diameter Connection Timeout parameter.

Product

All

Privilege

Security Administrator, Administrator

Syntax

connection timeout *timeout*

default connection timeout

default

Configures the default Diameter Connection Timeout setting.

connection timeout *timeout*

timeout specifies the connection timeout duration, in seconds, and must be an integer from 1 through 30.
Default: 30 seconds

Usage

Use this command to configure the Diameter Connection Timeout parameter.

Example

The following command sets Diameter connection timeout to *16* seconds:

connection timeout *16*

device-watchdog-request

This command manages transport failure algorithm and configures the number of Device Watchdog Requests (DWRs) that will be sent before a connection is closed.

Product

All

Privilege

Security Administrator, Administrator

Syntax

device-watchdog-request max-retries *retry_count*

default device-watchdog-request max-retries

default

Configures the default setting.

retry_count

Specifies the maximum number of DWRs, and must be an integer from 1 through 10.
Default: 1

Usage

Use this command to configure the number of DWRs to be sent before closing the connection from a Diameter endpoint.

Example

The following command sets the DWRs to *3*:

device-watchdog-request max-retries *3*

dpa-timeout

This command configures the Disconnect-Peer-Answer (DPA) message timeout duration for Diameter session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

dpa-timeout *timeout*

default dpa-timeout

default

Configures the default DPA message timeout setting.

timeout

Specifies the DPA message timeout duration, in seconds, and must be an integer from 1 through 60.
Default: 30 seconds

Usage

Use this command to set the timer for DPA message timeout during Diameter connection session. This makes the system wait for this duration for DPA message.

Example

The following command sets the Diameter DPA timeout to *16* seconds:

dpa-timeout *16*

end

This command returns the CLI prompt to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec mode.

exit

This command exits the Diameter Endpoint Configuration mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

max-outstanding

This command specifies the maximum number of Diameter messages that any application can send to any one peer, awaiting responses.

Product

All

Privilege

Security Administrator, Administrator

Syntax

max-outstanding *messages*

{ default | no } max-outstanding

no

Disables the maximum outstanding messages configuration.

default

Configures the default setting.

messages

Specifies the maximum outstanding peer transmit window size setting, and must be an integer from 1 through 4096.
Default: 256

Usage

Use this command to set the unanswered Diameter messages that any application may send to any one peer, awaiting responses. An application will not send any more Diameter messages to that peer until it has disposed of at least one of those queued messages. It disposes a message by either receiving a valid response or by discarding the message due to no response.

Example

The following command sets the Diameter maximum outstanding messages setting to *1024*:

max-outstanding *1024*

origin address

This command has been deprecated. See the origin host and origin realm commands.

origin host

This command sets the origin host for the Diameter endpoint.

Product

All

Privilege

Security Administrator, Administrator

Syntax

origin host *host_name* **address** *ip_address* **[port** *port_number* **] [accept-incoming-connections] [address** *ip_address_secondary* **]**

no origin host *host_name* **address** *ip_address* **[port** *port_number* **]**

no

Removes the origin host configuration.

host_name

Specifies the host name to bind the Diameter endpoint.
host_name must be the local Diameter host name, and must be a string of 1 through 255 characters in length.

address *ip_address*

Specifies the IP address to bind the Diameter endpoint. This address must be one of the addresses of a chassis interface configured within the context in which Diameter is configured.
ip_address must either be an IPv4 address expressed in dotted decimal notation, or an IPv6 address expressed in colon notation.

port *port_number*

Specifies the port number for the Diameter endpoint (on inbound connections).
port_number must be an integer from 1 through 65535.

accept-incoming-connections

Specifies to accept inbound connection requests for the specified host.

address *ip_address_secondary*

Specifies the secondary bind address for the Diameter endpoint. This address must be one of the addresses of a chassis interface configured within the context in which Diameter is configured.
ip_address_secondary must either be an IPv4 address expressed in dotted decimal notation, or an IPv6 address expressed in colon notation.

Usage

Use this command to set the bind address for the Diameter endpoint.

Diameter agent on chassis listens to standard TCP port 3868 and also supports the acceptance of any incoming TCP connection from external server.
The command **origin host** *host-name* must be entered exactly once. Alternatively, the **origin host** *host-name* **address** *ip_address* **[port** *port_number* **]** command may be entered one or more times. The host names should be unique across all endpoints within the context. The address values or address/port combinations should be unique across all endpoints within the context.

Example
The following command sets the origin host name to *test* and the IP address to *1.1.1.1*:

```
origin host test address 1.1.1.1
```

origin realm

This command configures the realm to use in conjunction with the origin host.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] origin realm *realm_name*

no

Removes the origin realm configuration.

realm_name

Specifies the realm to bind the Diameter endpoint. The realm is the Diameter identity. The originator's realm must be present in all Diameter messages. The origin realm can typically be a company or service name. *realm_name* must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage

Use this command to set the realm for the Diameter endpoint.
Diameter agent on chassis listens to standard TCP port 3868 and also supports the acceptance of any incoming TCP connection from external server.

Example

The following command sets the origin realm to *companyx*:

origin realm *companyx*

peer

This command specifies a peer address for the Diameter endpoint.

Product

All

Privilege

Security Administrator, Administrator

Syntax

peer *peer_name* **[realm** *realm_name* **] { address** *ip_address* **[[port** *port_number* **] [connect-on-application-access] [send-dpr-before-disconnect disconnect-cause** *disconnect_cause* **] [sctp]] +**

no peer *peer_name* **[realm** *realm_name* **]**

no

Removes the specified peer configuration.

peer_name

Specifies the peer's name.
peer_name must be an alpha and/or numeric string of 1 through 63 characters in length, and allows punctuation characters.

realm *realm_name*

Specifies the realm of this peer.
realm_name must be an alpha and/or numeric string of 1 through 127 characters in length. The realm name can be a company or service name.

address *ip_address*

Specifies the Diameter peer IP address. This address must be the IP address of the device the chassis is communicating with.
ip_address can either be an IPv4 address expressed in dotted decimal notation, or an IPv6 address expressed in colon notation.

port *port_number*

Specifies the port number for this Diameter peer.
port_number must be an integer from 1 through 65535.

connect-on-application-access

Specifies to activate peer on first application access.

send-dpr-before-disconnect

Specifies to send Disconnect-Peer-Request (DPR).

disconnect-cause

Specifies to send Disconnect-Peer-Request to the specified peer with the specified disconnect reason. The disconnect cause must be an integer from 0 through 2, for one of the following:

- REBOOTING(0)
- BUSY(1)
- DO_NOT_WANT_TO_TALK_TO_YOU(2)

sctp

To use Stream Control Transmission Protocol (SCTP) for this peer.

+

Indicates that more than one of the previous keywords can be entered within a single command.

Usage

Use this command to add a peer to the Diameter endpoint.

Example

The following command adds the peer named *test* with IP address *1.1.1.1* using port *126*:

peer *test* **address** *1.1.1.1* **port** *126*

response-timeout

This command configures the Response Timeout parameter.

Product

All

Privilege

Security Administrator, Administrator

Syntax

response-timeout *timeout*

default response-timeout

default

Configures the default Response Timeout setting.

timeout

Specifies the response timeout duration, in seconds, and must be an integer from 1 through 300.
Default: 60 seconds

Usage

Use this command to configure the Response Timeout parameter.

Example

The following command sets the response timeout to *100* seconds:

response-timeout *100*

route-entry

This command creates an entry in the route table for Diameter peer.

Product

All

Privilege

Security Administrator, Administrator

Syntax

route-entry { [host *host_name* **] [peer** *peer_id* **[weight** *priority* **]] [realm** *realm_name* **{ application credit-control peer** *peer_id* **[weight** *value* **] | peer** *peer_id* **[weight** *value* **] }] }**

no route-entry { [host *host_name* **] [peer** *peer_id* **] [realm** *realm_name* **{ application credit-control peer** *peer_id* **| peer** *peer_id* **}] }**

no

Disables the specified route-entry table configuration.

host *host_name*

Specifies the Diameter server's host name.
host_name must be an alpha and/or numeric string of 1 through 63 characters in length.

realm *realm_name*

Specifies the realm name. The realm may typically be a company or service name.
realm_name must be an alpha and/or numeric string of 1 through 127 characters in length.

application credit-control

Specifies the credit control application, i.e. DCCA or RADIUS.

peer *peer_id*

Specifies the peer ID of Diameter endpoint route.
peer_id must be an alpha and/or numeric string of 1 through 63 characters in length.

weight *priority*

Specifies the priority for a peer in the route table.
The peer with the highest weight is used. If multiple peers have the highest weight, selection is by round-robin mechanism.
priority must be an integer from 0 through 255.
Default: 10

Usage

Use this command to create a route table for Diameter application.

When a Diameter client starts to establish a session with a realm/application, the system searches the route table for the best match. If an entry has no host specified, then the entry is considered to match the requested value. Similarly, if an entry has no realm or application specified, then the entry is considered to match any such requested value. The best match algorithm is to prefer specific matches for whatever was requested, i.e., either realm/application or host/realm/application. If there are no such matches, then system looks for route table entries that have wildcards.

Example

The following command creates a route entry with the host name *dcca_host1* and peer ID *dcca_peer* with priority weight of *10*:

```
route-entry host dcca_host1 peer dcca_peer weight 10
```

route-failure

This command controls how action after failure or recovery after failure is performed for the route table.

Product

GGSN, ECS

Privilege

Security Administrator, Administrator

Syntax

```
route-failure { deadtime seconds | recovery-threshold percent percentage |
result-code result_code | threshold counter }

default route-failure { deadtime | recovery-threshold | threshold }

no route-failure result-code result_code
```

no

Disables the route-failure configuration.

default

Configures the default setting for the specified parameter.

deadtime *seconds*

Specifies the time duration, in seconds, for which system keeps the route FAILED status. When this time expires, the system changes the status to AVAILABLE.
seconds must be the deadtime duration, in seconds, and must be an integer from 1 through 86400.
Default: 60 seconds

recovery-threshold percent *percentage*

Specifies how to reset the failure counter when provisionally changing the status from FAILED to AVAILABLE.
For example, if a failure counter of 16 caused the status to change to FAILED. After the configured deadtime expires, the status changes to AVAILABLE. If this keyword is configured with 75 percent, the failure counter will be reset to 12, i.e., 75 percent of 16.
percentage must be the value in percentage of the counter which caused FAILED, and must be an integer from 1 through 99.
Default: 90 percent

result-code *result_code*

Configures which answer messages are to be treated as failures, in addition to requests that time out.
Up to 16 different result codes can be specified.
result_code must be an integer from 0 through 4,294,967,295.

threshold *counter*

Configures the number of errors that causes the status to become FAILED.

counter must be an integer from 0 through 4,294,967,295.
The error counter begins at zero, and whenever there is a good response it decrements (but not below zero) or increments (but not above this threshold).
Default: 16

Usage

Use this command to control how failure/recovery is performed for the route table. After a session is established, it is possible for the session to encounter errors or Diameter redirection messages that cause the Diameter protocol to re-use the route table to switch to a different route.
Each Diameter client within the chassis maintains counters relating to the status of each of its connections to different hosts (when the destination is realm/application without a specific host, the host name is kept as "", i.e., blank).
Moreover, those counters are further divided according to which peer is used to reach each host. Each Diameter client maintains a status of each peer-to-host combination. Under normal good conditions the status will be AVAILABLE, while error conditions might cause the status to be FAILED.
Only combinations that are AVAILABLE will be used. If none are AVAILABLE, then system attempts the secondary peer if failover is configured and system can find an AVAILABLE combination there. If nothing is AVAILABLE, system uses a FAILED combination.

Example

The following command configures the time duration for route failure to *90* seconds:

```
route-failure deadtime 90
```

tls

This command enables/disables the Transport Layer Security (TLS) support between a Diameter client and Diameter server node.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

tls { certificate *certificate* **| password** *password* **| privatekey** *private_key* **}**

default tls

default

Disables the TLS support at Diameter endpoint.

certificate *certificate*

Specifies the certificate for TLS support.
certificate must be an encrypted certificate, and must be an alpha and/or numeric string of 700 through 900 characters in length.

password *password*

Specifies the password for TLS support.
password must be an encrypted password, and must be an alpha and/or numeric string of 6 through 50 characters in length.

privatekey *private_key*

Specifies the private key for TLS support.
private_key must be an encrypted key, and must be an alpha and/or numeric string of 900 through 1500 characters in length.

Usage

Use this command to configure TLS support between a Diameter client and Diameter server node. By default, TLS is disabled.

Important: Both the Diameter client and server must be configured with TLS enabled or TLS disabled; otherwise, the Diameter connection will be rejected.

Example

The following commands enable the TLS between a Diameter client and Diameter server node:

tls certificate *"-----BEGIN CERTIFICATE-----*
\nMIICGDCCAYECAgEBMA0GCSqGSIb3DQEBBAUAMFcxCzAJBgNVBAYTAlVTMRMwEQYD\nVQQKE

tls password *password_for_TLS*

use-proxy

This command enables/disables Diameter proxy for the Diameter endpoint.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] use-proxy
```

no

Disables Diameter proxy for the current endpoint.
This command at endpoint level will actually equip an application to use Diameter proxy to route all its messages to external peer.

Usage

By default, the use-proxy configuration is disabled.
This command equips an application to use Diameter proxy to route all its messages to external peer. The proxy acts as an application gateway for Diameter. It gets the configuration information at process startup and decides which Diameter peer has to be contacted for each application. It establishes the peer connection upon finding no peer connection already exists.
Each proxy task will automatically select one of the host names configured with the **origin host** CLI command. Multiple proxy tasks will not use the same host names, so there should be at least as many host names as proxy tasks. Otherwise, some proxy tasks will not be able to perform Diameter functionality. The chassis automatically selects which proxy tasks are used by which managers (i.e., ACSMgrs/SessMgrs), without verifying whether the proxy task is able to perform Diameter functionality.
To be able to run this command, the Diameter proxy must be enabled. In the Global Configuration Mode, see the **require diameter-proxy** CLI command.

Example

The following command enables Diameter proxy for the current endpoint:

```
use-proxy
```

The following command disables Diameter proxy for the current endpoint:

```
no use-proxy
```

vsa-support

This command allows DIABASE to use vendor IDs configured in the dictionary for negotiation of the Diameter peers' capabilities irrespective of the supported vendor IDs received in CEA message.

Product

GGSN

Privilege

Administrator

Syntax

```
vsa-support { all-from-dictionary | negotiated-vendor-ids }

default vsa-support
```

default

This default configuration allows the DIABASE to use the vendor IDs satisfying capabilities negotiation.

all-from-dictionary

This keyword allows DIABASE to use the vendor IDs from the dictionary as indicated in the CER message from Diameter peers.

negotiated-vendor-ids

This keyword allows DIABASE to use the supported vendor IDs satisfying capability negotiation.

Usage

Use this command to set DIABASE to use the vendor IDs from the dictionary or use the vendor IDs satisfying the capabilities negotiation.

Example

The following command enables DIABASE to use the vendor IDs specified in the dictionary:

```
vsa-support all-from-dictionary
```

watchdog-timeout

This command configures the Watchdog Timeout parameter.

Product

All

Privilege

Security Administrator, Administrator

Syntax

watchdog-timeout *timeout*

{ default | no } watchdog-timeout

no

Disables the watchdog timeout configuration.

default

Configures the default watchdog timeout setting.

timeout

Specifies the timeout duration, in seconds, and must be an integer from 6 through 30.
Default: 30 seconds

Usage

Use this command to configure the Watchdog Timeout parameter for the Diameter endpoint. If this timer expires before getting a response from the destination, other route to the same destination is tried, as long as the retry count setting has not been exceeded (see the device-watchdog-request CLI command) and as long as the response timer has not expired (see the response-timeout CLI command).

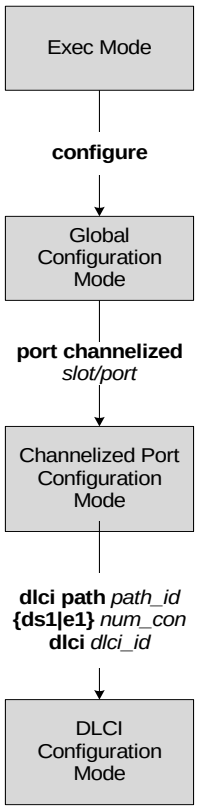
Example

The following command sets the watchdog timeout setting to *15* seconds:

watchdog-timeout *15*

Chapter 78
DLCI Configuration Mode Commands

The DLCI configuration mode provides the commands to configure, bind and manage the DLCI associated with a specific port defined in the parent configuration mode, Channelized Port configuration mode.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

bind link

This command configures an association (binds) between an IP interface or a pre-configured routing SS7/Frame Relay link and the specific port being configured with the Channelized Port configuration commands.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] bind link peer-nsei *nse_id* **ns-vci** *ns-vc_id*

peer-nsei *nse_id*

Defines the end-point network service entity identifier (NSEI). The NSEI must be an integer from 0 to 65535.

ns-vc-id *ns-vc_id*

Defines the network service virtual circuit identifier (NSVCI). The NSVCI must be an integer from 0 to 65535.

no

Deletes the bind configuration from the Operator Policy.

Usage

Bind this port to network service entity 2 and network service VC 234.

Example

bind link peer-nsei *2* **ns-vci** *234*

end

Exits this sub-configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode and return to the Exec mode.

exit

Exits the this sub-configuration mode and returns to the parent configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the previous configuration mode.

shaping

Defines egress traffic shaping to control flow for this DLCI.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

shaping *type*

default shaping

shaping *type*

The following types of shaping provide flow management:

- **cir:** Commited Info Rate
- **cir-eir:** Commited Info Rate with Excess Rate
- **ppr:** Peak Packet Rate
- **wfq:** Weighted Fair Queuing

default

Resets the DLCI configuration to the system default.

Usage

Use this command to identify the type of signal shaping to be used on the DLCI.

Example

shaping *cir*

shutdown

Terminates all processes supporting the port or blocks the shutting down of the port. Conversely, this command with the **no** keyword enables the port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] shutdown
```

no

Enables the port's administrative state. When omitted the card is shutdown (removed from service).

Usage

Shut down a port prior to re-cabling and/or other maintenance activities.
This command with the **no** keyword is required to bring a port into service.

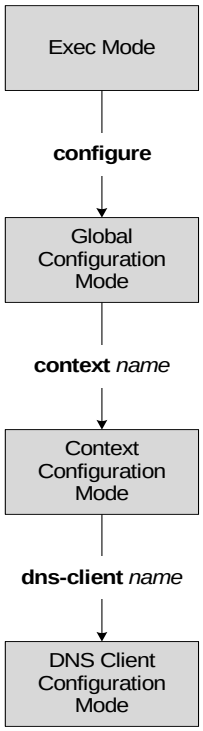
Example

Use the following command to disable the DLCI:

```
no shutdown
```

Chapter 79
DNS Client Configuration Mode Commands

The DNS Client Configuration Mode is used to manage the system's DNS interface and caching parameters.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

bind address

Binds the DNS client to a pre-configured logical IP interface.

Product

MME, SCM, SGSN

Privilege

Security Administrator, Administrator

Syntax

bind address *ip_address* **[port** *number* **]**

no bind address

no

Removes the binding of the client to a specified interface.

ip_address

Specifies the IP address of the interface to which the DNS client is being bound. *ip_address* must be expressed in IPv4 dotted decimal notation.

port *number*

Default: 6011
Specifies the UDP port number of the interface to which the DNS client is being bound. *number* must be an integer value from 1 to 65535.

Usage

Use this command to associated the client with a specific logical IP address.

Example

The following command binds the DNS client to a logical interface with an IP address of *1.2.3.4* and a port number of *6000*:

bind address *1.2.3.4* **port** *6000*

cache algorithm

Configures the method of use of the DNS VPN and session cache.

Product

MME, SCM, SGSN

Privilege

Security Administrator, Administrator

Syntax

cache algorithm { central | local } { FIFO | LRU | LFU }

default cache algorithm { central | local }

default

Sets the DNS VPN and session cache method to default setting.

central | local

central: Specifies the central proclet (VPN manager)
local: Specifies the local proclet (session manager)

FIFO | LRU | LFU

FIFO: First in first out. This is the default setting for the central proclet.
LRU: Least recently used. This is the default value for the local proclet.
LFU: Least frequently used.

Usage

Use this command to configure the method by which entries are added and removed from the DNS cache.

Example

The following command configures the cache algorithm for the central proclet to least frequently used (LFU):

cache algorithm central lfu

cache size

Configures the maximum number of entries allowed in the DNS cache.

Product

MME, SCM, SGSN

Privilege

Security Administrator, Administrator

Syntax

cache size { central | local } *max_size*

default cache size { central | local }

default

Sets the maximum number of entries allowed in the DNS cache to default setting.

{ central | local } *max_size*

central *max_size*: Specifies the maximum number of entries allowed in the central proclet cache. *max_size* must be an integer value from 100 to 65535 in length. The default value for the central proclet is 50000.
local *max_size*: Specifies the maximum number of entries allowed in the local proclet cache. *max_size* must be an integer value from 100 to 65535 in length. The default value for the local proclet is 1000.

Usage

Use this command to configure the maximum number of entries allowed in the DNS cache.

Example

The following command configures the cache size of the central proclet to *20000*:

cache size central *20000*

cache ttl

Configures the DNS cache time to live (TTL) for positive and negative responses.

Product

MME, SCM, SGSN

Privilege

Security Administrator, Administrator

Syntax

cache ttl { negative | positive } *seconds*

default cache ttl { negative | positive }

no cache [ttl { negative | positive }]

no

Disables any or all configured DNS cache parameters.

default

Sets the DNS cache time to live for positive and negative responses to default setting.

{ negative | positive } *seconds*

negative *seconds*: Specifies the time to live for negative responses. *seconds* must be an integer value from 60 to 86400. The default value is 60 seconds.
positive *seconds*: Specifies the time to live for positive responses. *seconds* must be an integer value from 60 to 86400. The default value is 86400 seconds (1 day).

Usage

Use this command to adjust the DNS cache time to live.

Example

The following commands set the TTL DNS cache to *90* seconds for negative responses and *43200* seconds for positive responses:

cache ttl negative *90*

cache ttl positive *43200*

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax `end`

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax `exit`

Usage

Return to the previous mode.

resolver

Configure the number of DNS query retries and the retransmission interval once the response timer times out.

Product

MME, SGSN

Privilege

Security Administrator, Administrator

Syntax

resolver { number-of-retries *retries* **| retransmission-interval** *time* **}**

default { number-of-retries | retransmission-interval }

default

Use this keyword to reset the specified resolver configuration to the default.

number-of-retries *retries*

Configures the number of DNS query retries on DNS response timeout.
retries: enter an integer from 0 to 4. Default is 2 retries.

retransmission-interval *time*

Configures the initial retransmission interval, in seconds, for retransmission after the DNS response timeout. The retransmission interval doubles after each retry when only one server is configured. In case both primary and secondary servers are configured, the retransmission time is doubled for the last retry.
time: enter an integer from 2 to 5. Default is 3 seconds.

Usage

Set the DNS retransmission retries or the retransmission interval. Issue the command twice to configure both parameters, one-at-a-time.

Example

The following command sets the DNS resolver retries to *4*:

resolver number-of-retries *4*

round-robin answers

This command configures the DNS client to return the DNS results in round-robin fashion if multiple results are available for a DNS query.

Product

MME, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] round-robin-answers
```

no

Removes the configured round robin method for DNS answer.

default

Disabled the round robin method for DNS answer.

Usage

Use this command to configure the DNS client to return the DNS results in round-robin fashion if multiple results are available for a DNS query.

Example

The following command configures the DNS client to use round robin method for DNS query answers:

```
default ] round-robin-answers
```

Chapter 80
EAP Authentication Configuration Mode Commands

The EAP Authentication Configuration Mode is used to configure the EAP authentication methods for the crypto template.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

eap-aka

Configures shared key values for the EAP-AKA authentication method used by subscribers using this crypto template.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

eap-aka { encrypted key *hex* **| key** *hex* **}**

encrypted key *hex*

Specifies that the shared key is to be encrypted. *hex* must be a 16-character alpha and/or numeric string or a hexadecimal number beginning with “0x”.

key *hex*

Specifies that the shared key is to be transmitted in clear text. *hex* must be a 16-character alpha and/or numeric string or a hexadecimal number beginning with “0x”.

Usage

Use this command to set shared key parameters for subscribers using the EAP-AKA authentication method.

Example

The following command configures a clear-text shared key value for the EAP-AKA method:

eap-aka key *aa11223344556677*

eap-gtc

Configures shared key values for the EAP-GTC authentication method used by subscribers using this crypto template.

Product

PDIF, ASN GW

Privilege

Security Administrator, Administrator

Syntax

eap-gtc { encrypted key *value* **| key** *value* **}**

encrypted key *value*

Specifies that the shared key is to be encrypted. *value* must be a 16-character alpha and/or numeric string.

key *value*

Specifies that the shared key is to be transmitted in clear text. *value* must be a 16-character alpha and/or numeric string.

Usage

Use this command to set shared key parameters for subscribers using the EAP-GTC authentication method.

Example

The following command configures a clear-text shared key value for the EAP-GTC method:

eap-GTC key *aa11223344556677*

eap-md5

Configures shared key values for the EAP-MD5 authentication method used by subscribers using this crypto template.

Product

PDIF, ASN GW

Privilege

Security Administrator, Administrator

Syntax

eap-md5 { encrypted key *value* **| key** *value* **}**

encrypted key *value*

Specifies that the shared key is to be encrypted. *value* must be a 16-character alpha and/or numeric string.

key *value*

Specifies that the shared key is to be transmitted in clear text. *value* must be a 16-character alpha and/or numeric string.

Usage

Use this command to set shared key parameters for subscribers using the EAP-MD5 authentication method.

Example

The following command configures a clear-text shared key value for the EAP-MD5 method:

eap-md5 key *aa11223344556677*

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec Mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

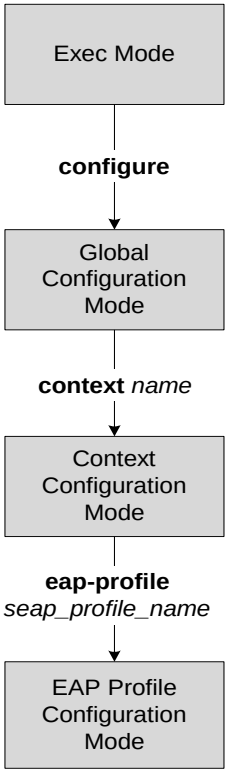
exit

Usage

Returns to the previous mode.

Chapter 81
EAP Configuration Mode Commands

The EAP Configuration Mode is used to configure parameters comprising an Extensible Authentication Profile used to support EAP authentication on the system.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec Mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Returns to the previous mode.

max-retry

Configures the maximum number of times the system will retry communicating with another EAP device.

Product

PDIF, ASN GW

Privilege

Security Administrator, Administrator

Syntax

max-retry *num*

default max-retry

num

Default: 16
Specifies the number of times to retry EAP communication with another device. *num* must be an integer from 1 to 65535.

Usage

Use this command to set a maximum retry number for communicating with other EAP devices.

Example

The following command sets the maximum number of retries to *50*:

max-retry *50*

mode

Configures the system as one of three types of EAP devices: authenticator pass-through, authenticator server, or peer.

Product

PDIF, ASN GW

Privilege

Security Administrator, Administrator

Syntax

```
mode { authenticator-pass-through | authenticator-server | peer }

default mode
```

default

Configures the default mode of Authenticator-pass-through.

authenticator-pass-through

Configures the system as an authenticator pass-through allowing EAP authentication to be performed by another server.
This is the default setting for this command.

authenticator-server

Configures the system as an authenticator server. This allows the system to respond to EAP requests.

peer

Configures the system as a peer device requiring it to make EAP requests of another server or pass-through device.

Usage

Use this command to configure the system to perform as one of three types of EAP devices and configure settings in an EAP mode.
EAP Mode Configuration Mode commands are defined in the EAP Mode Configuration Mode Commands chapter.

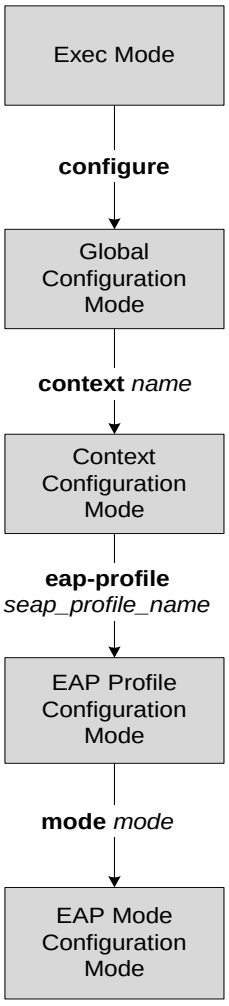
Example

The following command configures the system to perform as an authenticator pass-through:

```
mode authenticator-pass-through
```

Chapter 82
EAP Mode Configuration Mode Commands

The EAP Mode Configuration Mode is used to configure EAP authentication method supported by the system.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec Mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Returns to the previous mode.

method

Configures the EAP method used for authentication.

Product

PDIF, ASN GW

Privilege

Security Administrator, Administrator

Syntax

method { eap-aka | eap-gtc | eap-md5 } [priority *num* **]**

eap-aka | eap-gtc | eap-md5

Specifies one of the following methods:

- **eap-aka:** Specifies that the EAP-AKA method is to be used for authentication.
- **eap-gtc:** Specifies that the EAP-GTC method is to be used for authentication.
- **eap-md5:** Specifies that the EAP-MD5 method is to be used for authentication.

priority *num*

Specifies a priority order for a specific EAP authentication method. *num* must be an integer fro 1 to 65535.

Usage

Use this command to specify the EAP authentication method(s) to use and to place multiple methods in priority order.

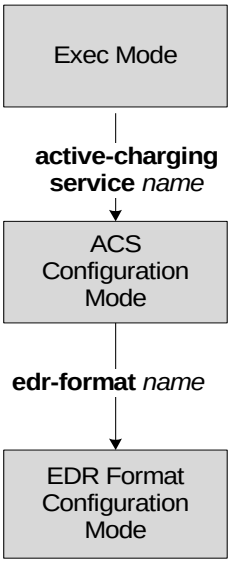
Example

The following command sets EAP-AKA as one of the EAP authentication methods and places it as priority of 3:

method eap-aka priority *3*

Chapter 83
EDR Format Configuration Mode Commands

The EDR Format Configuration Mode enables configuring Event Detail Record (EDR) formats.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

attribute

This command specifies the order of fields in EDRs.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
attribute attribute { [ format { MM/DD/YY-HH:MM:SS | MM/DD/YYYY-HH:MM:SS |
YYYY/MM/DD-HH:MM:SS | YYYYMMDDHHMMSS | seconds } ] [ localtime ] | [ { ip | tcp
} { bytes | pkts } { downlink | uplink } ] priority priority }

no attribute attribute [ priority priority ]
```

no

Removes the specified attribute.

attribute

Specifies the attribute.
attribute must be one of the following:

Attributes	Description
radius-called-station-id	Called Station ID of the mobile handling the flow.
radius-calling-station-id	Calling Station ID of the mobile handling the flow.
radius-fa-nas-identifier	RADIUS NAS identifier of Foreign Agent (FA).
radius-fa-nas-ip-address	RADIUS IP address of Foreign Agent (FA).
radius-nas-identifier	RADIUS NAS identifier.
radius-nas-ip-address	RADIUS NAS IP address. Note that this attribute is interchangeable with **sn-st16-ip-addr** for the user.
radius-user-name	User name associated with the flow.
sn-3gpp2-always-on	This option is obsolete. To configure this attribute see the rule-variable command.
sn-3gpp2-bsid	This option is obsolete. To configure this attribute see the rule-variable command.
sn-3gpp2-esn	This option is obsolete. To configure this attribute see the rule-variable command.

Attributes	Description
sn-3gpp2-ip-qos	This option is obsolete. To configure this attribute see the rule-variable command.
sn-3gpp2-ip-technology	This option is obsolete. To configure this attribute see the rule-variable command.
sn-3gpp2-release-indicator	This option is obsolete. To configure this attribute see the rule-variable command.
sn-3gpp2-service-option	This option is obsolete. To configure this attribute see the rule-variable command.
sn-3gpp2-session-begin	This option is obsolete. To configure this attribute see the rule-variable command.
sn-3gpp2-session-continue	This option is obsolete. To configure this attribute see the rule-variable command.
sn-acct-session-id	Unique session identifier for accounting.

Attributes	Description
sn-app-protocol	Application protocol for the flow. A value indicating the protocol, such as one of the following: • ACS_PROTO_UNKNOWN = 0 • ACS_PROTO_IP=2 • ACS_PROTO_TCP=3 • ACS_PROTO_UDP=4 • ACS_PROTO_HTTP=5 • ACS_PROTO_HTTPS=6 • ACS_PROTO_FTP=7 • ACS_PROTO_FTP_CONTROL=8 • ACS_PROTO_FTP_DATA=9 • ACS_PROTO_WTP=10 • ACS_PROTO_WSP=11 • ACS_PROTO_WTP_WSP_CONNECTION_ORIENTED=12 • ACS_PROTO_WSP_CONNECTION_LESS=13 • ACS_PROTO_DNS=14 • ACS_PROTO_ICMP=15 • ACS_PROTO_POP3=16 • ACS_PROTO_SIP=17 • ACS_PROTO_SDP=18 • ACS_PROTO_SMTP=19 • ACS_PROTO_EMAIL=20 • ACS_PROTO_MMS=21 • ACS_PROTO_FILE_TRANSFER=22 • ACS_PROTO_WWW=23 • ACS_PROTO_RTP=24 • ACS_PROTO_RTSP=25 • ACS_PROTO_ICMPv6=31
sn-cf-category-classification-used	For Category-based Content Filtering, specifies the last classification used by system for the flow, or blank if classification was never successfully performed. For URL Blacklisting, specifies category of the blacklisted URL in the Blacklist database.

Attributes	Description
sn-cf-category-flow-action	For Category-based Content Filtering, specifies the last action taken for the flow, or blank if content filtering was never performed. The following are the possible values: • allow • content-insert • discard • redirect-url • terminate-flow For URL Blacklisting, specifies the last action taken for the flow, or blank if Blacklist matching was never performed. The following are the possible values: • discard • terminate-flow • redirect-url • www-reply-code-terminate-flow
sn-cf-category-policy	Specifies the category policy identifier that was used by Category-based Content Filtering for the flow, or blank if content filtering was never attempted for the flow.
sn-cf-category-rating-type	For Category-based Content Filtering, specifies the type, either "static" or "dynamic" that was last successfully performed for the flow, or blank if content filtering was never successful for the flow. For URL Blacklisting, specifies "blacklisting".
sn-cf-category-unknown-url	Identifier for unknown URL under content filtering action. It holds either "1" for unknown URLs or "0" for the URLs having static rating in its database.
sn-closure-reason	Reason for the termination of the flow/EDR: • 0: Normal end of flow • 1: End of flow by handoff processing • 2: Subscriber session terminated • 3: Inter-chassis Session Recovery switchover • 12: Completion of transaction
sn-content-label	Identifier of text label for content-id.
sn-correlation-id	RADIUS correlation identifier.
sn-direction	Direction of the first packet for the flow. It has following values: • toMobile: This value appears when direction of first packet is towards mobile node. • fromMobile: This value appears when direction of first packet is towards mobile node. • unknown: This value appears when the original originator of a flow can not be determined (e.g. a flow that is interrupted due to a Inter-chassis Session Recovery switchover).
sn-duration	Duration between the last and first packet for the record.
sn-end-time [format *format* **] localtime**	Timestamp for last packet of flow in UTC.

Attributes	Description
sn-fa-correlation-id	RADIUS Correlation Identifier of the Foreign Agent (FA).
sn-fa-ip-address	Foreign Agent (FA) IP address
sn-filler-blank	Keeps attributes place blank.
sn-filler-zero	Fills '0' for this attribute place.
sn-flow-end-time	The time of flow-end EDR generation—when EDRs are generated at hagr, session-end, timeout, or normal-end-signaling conditions. **sn-start-time** and **sn-end-time** fields of flow end-condition EDRs cannot be used to determine the duration of the flow if intermediate EDRs are generated (rule-match or transaction-complete or any other intermediate EDR). **sn-start-time** field in an EDR gives the time the first packet was received after the last EDR was generated. So, whenever an EDR is generated, this field is reset to the time the EDR gets generated. So the **sn-start-time** field in flow end-condition EDRs may not have the time of the first packet received on that flow. It will have the time at which the last EDR was generated or the first packet time if no EDR was generated for that flow. **sn-end-time** field gives the time at which the last packet on the flow was received. Flow end-condition EDRs may not be generated immediately after receiving the last packet. For example, in case of session-end or timeout EDRs, last packet time and EDR generation time may be different. **sn-flow-start-time** gives the time of the first packet of the flow (irrespective of whether intermediate EDRs were generated), and **sn-flow-end-time** gives the time when EDRs are generated at hagr, session-end, timeout or normal-end-signaling conditions. The values of these fields will be populated in EDRs only for hagr, session-end, timeout and normal-end-signaling EDRs.
sn-flow-id	Flow-id assigned internally by the ACS module to each flow.
sn-flow-start-time	The time of the first packet of the flow (irrespective of whether intermediate EDRs were generated). Also see, **sn-flow-end-time**.
sn-format-name	Name of the EDR/UDR format used.
sn-group-id	Sequence group ID of the record.
sn-ha-ip-address	Home Agent (HA) IP address.
sn-nat-binding-timer	Port chunk hold timer.
sn-nat-gmt-offset	GMT offset of the node generating NAT bind record.
sn-nat-ip	NAT IP address of the port chunk.
sn-nat-last-activity-time-gmt	The time when the last flow in a specific NAT set of flows was seen.
sn-nat-port-block-end	Last port number of the port chunk.
sn-nat-port-block-start	Starting port number of the port chunk.
sn-nat-port-chunk-alloc-dealloc-flag	Indicates whether the port chunk is allocated or released.
sn-nat-port-chunk-alloc-time-gmt	Indicates when the port chunk was allocated.

Attributes	Description
sn-nat-port-chunk-dealloc-time-gmt	Indicates when the port chunk was released.
sn-nat-realm-name	Name of the NAT realm.
sn-nat-subscribers-per-ip-address	Subscriber(s) per NAT IP address.
sn-parent-protocol	Indicates parent protocol of flow.
sn-rulebase	Name of the ACS rulebase applied.
sn-sequence-no	Unique sequence number (per **sn-sequence-group** and **radius-nas-ip-address**) of EDR identifier and linearly increasing in EDR file.
sn-server-port	TCP/UDP port number of the server in a subscriber's data flow.
sn-st16-ip-addr	IP address of the chassis handling this flow.
sn-start-time [format *format* **] localtime**	Timestamp for last packet of flow in UTC.
sn-subscriber-nat-flow-ip	NAT IP address of NAT-enabled subscriber.
sn-subscriber-nat-flow-port	NAT port number of NAT-enabled subscriber.
sn-subscriber-port	TCP/UDP port number of the Mobile handling subscriber data flow.
sn-volume-amt { ip | tcp } { bytes | pkts } { uplink | downlink }	Protocol-specific uplink/downlink volume amount in bytes/packets for EDR.
sn-volume-dropped-amt { ip | tcp } { bytes | packets } { downlink | uplink }	Protocol-specific uplink/downlink dropped volume amount in bytes/packets for EDR.
sn-volume-ip-with-rtsp-or-rtp bytes { downlink | priority | uplink }	Shows the collected EDRs that contains the total bytes of an RTSP flow and the RTP flows controlled by it in uplink or downlink direction, or CSV position priority of this field. If **uplink** or **downlink** is not specified it shows the total of both.
transaction-downlink-bytes	Total downlink bytes for the transaction.
transaction-downlink-packets	Total downlink packets for the transaction.
transaction-uplink-bytes	Total uplink bytes for the transaction.
transaction-uplink-packets	Total uplink packets for the transaction.

format { MM/DD/YY-HH:MM:SS | MM/DD/YYYY-HH:MM:SS | YYYY/MM/DD-HH:MM:SS | YYYYMMDDHHMMSS | seconds }

Specifies the timestamp format.

localtime

Specifies timestamps with the local time. By default, timestamps are displayed in GMT.

{ ip | tcp } { bytes | pkts } { downlink | uplink }

Specifies bytes/packets sent/received from/by mobile.

priority *priority*

Specifies the position priority of the value within the EDR record. Lower numbered priorities (across all **attribute**, **event-label**, and **rule-variable**) occur first.
priority must be an integer from 1 through 65535. Up to 50 position priorities (across all **attribute**, **event-label**, and **rule-variable**) can be configured.

Usage

Use this command to set the attributes and priority for EDR file format.
A particular field in EDR format can be entered multiple times at different priorities. While removing the EDR field using the **no attribute** command either you can remove all occurrences of a particular field by specifying the field name or a single occurrence by additionally specifying the optional **priority** keyword.

Example

The following is an example of this command:

```
attribute radius-user-name priority 12
```

end

This command returns the CLI prompt to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec Mode.

event-label

This command specifies an optional event ID to use in the generated billing records.

Product

All

Privilege

Security Administrator, Administrator

Syntax

event-label *label* **priority** *priority*

no event-label

no

Removes previously configured event label for EDR attribute.

label

Specifies event label for attribute to be used for EDR format.
label must be an alpha and/or numeric string of 1 through 63 characters in length.

priority *priority*

Indicates the CSV position of event ID in EDR record.
priority must be an integer from 1 through 65535.

Usage

Use this command to set the event ID and its position in EDR file format.

Example

event-label *radius_csv1* priority *23*

exit

This command exits the EDR Format Configuration Mode and returns to the ACS Configuration Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the ACS Configuration Mode.

rule-variable

Specifies the order of fields in the EDR.

Product

All

Privilege

Security Administrator, Administrator

Syntax

rule-variable *protocol rule* **priority** *priority* **[in-quotes]**

no rule-variable *protocol rule* **[priority** *priority* **]**

---

no

Removes the previously configured rule variable protocol rule and/or priority for EDR attribute.

---

protocol rule

Specifies the rule variable for EDR format.
protocol must be one of the following with specified rule:

- **bearer 3gpp**: 3GPP bearer-related configuration:
  - **charging-id**: Charging ID of the bearer flow
  - **imei**: IMEI or IMEISV (depending on the case) associated with the bearer flow. Only available in StarOS 8.1 and later releases.
  - **rat-type**: RAT type associated with the bearer flow. Only available in StarOS 8.1 and later releases.
  - **sgsn-address**: SGSN associated with the bearer flow. Only available in StarOS 8.1 and later releases. For MIPv6 calls, sgsn-address field is populated with HSGW address.
  - **user-location-information**: User location information associated with the bearer flow. Only available in StarOS 8.1 and later releases.
- **bearer 3gpp2**: 3GPP2 bearer-related configuration:
  - **always-on**
  - **bsid**
  - **esn**
  - **ip-qos**
  - **ip-technology**
  - **release-indicator**
  - **service-option**
  - **session-begin**
  - **session-continue**
- **bearer ggsn-address**: GGSN IP address field. For MIPv6 calls, ggsn-address field in EDR will be populated with PGW address.

- **dns**: Domain Name System (DNS) related configuration:
  - **answer-name**
  - **previous-state**
  - **query-name**
  - **return-code**
  - **state**
  - **tid**
- **file-transfer**: File transfer related configuration:
  - **chunk-number**
  - **current-chunk-length**
  - **declared-chunk-length**
  - **declared-file-size**
  - **filename**
  - **previous-state**
  - **state**
  - **transferred-file-size**
- **ftp**: File Transfer Protocol (FTP) related configuration:
  - **client-ip-address**
  - **client-port**
  - **command name**
  - **connection-type**
  - **filename**
  - **pdu-length**
  - **pdu-type**
  - **previous-state**
  - **reply code**
  - **server-ip-address**
  - **server-port**
  - **session-length**
  - **state**
  - **url**
  - **user**
- **http**: Hypertext Transport Protocol (HTTP) related configuration:
  - **attribute-in-data**— dynamic header field in application payload
  - **attribute-in-url**—dynamic header field in URL
  - **content disposition**
  - **content length**

- **content type**
- **header-length**
- **host**
- **payload-length**
- **pdu-length**
- **previous-state**
- **referer**
- **reply code**
- **request method**
- **session-length**
- **state**
- **transaction-length**
- **transfer-encoding**
- **uri**
- **url**
- **user-agent**
- **version**
- **x-header**—extension header

- **icmp**: Internet Control Message Protocol (ICMP) related configuration:
  - **code**
  - **type**
- **icmpv6**: Internet Control Message Protocol Version 6 (ICMPv6) related configuration:
  - **code**
  - **type**
- **imap**: Internet Message Access Protocol (IMAP) related configuration:
  - **cc**
  - **command**
  - **content**
  - **date**
  - **final-reply**
  - **from**
  - **mail-size**
  - **mailbox-size**
  - **message-type**
  - **previous-state**
  - **session-length**
  - **session-previous-state**

- **session-state**
- **state**
- **subject**
- **to**

- **ip**: Internet Protocol (IP) related configuration:
  - **dst-address**
  - **protocol**
  - **server-ip-address**
  - **src-address**
  - **subscriber-ip-address**
  - **total-length**
  - **version**
- **mms**: Multimedia Message Service (MMS) related configuration:
  - **bcc**
  - **cc**
  - **content location**
  - **content type**
  - **date [format { MM/DD/YYYY-HH:MM:SS | YYYY/MM/DD-HH:MM:SS }]**
  - **from**
  - **message-size**
  - **previous-state**
  - **response status**
  - **state**
  - **subject**
  - **tid**
  - **to**
- **p2p protocol:** Peer-to-peer protocol related configuration
- **pop3**: Post Office Protocol version 3 (POP3) related configuration:
  - **command name**
  - **mail-size**
  - **pdu-length**
  - **pdu-type**
  - **previous-state**
  - **reply status**
  - **session-length**
  - **state**
  - **user-name**

- **rtcp:** RTP Control Protocol (RTCP) related configuration:
  - **control-session-flow-id**
  - **jitter**
  - **rtsp-id**
  - **uri**
- **rtp**: Real-time Transfer Protocol (RTP) related configuration:
  - **control-session-flow-id**
  - **pdu-length**
  - **rtsp-id**
  - **session-length**
  - **uri**
- **rtsp**: Real Time Streaming Protocol (RTSP) related configuration:
  - **command-id**
  - **content type**
  - **date**
  - **previous-state**
  - **reply code**
  - **request method 1**: play method
  - **request method 2**: setup method
  - **request method 3**: pause method
  - **request method 4**: record method
  - **request method 5**: options method
  - **request method 6**: redirect method
  - **request method 7**: describe method
  - **request method 8**: announce method
  - **request method 9**: teardown method
  - **request method 10**: get-parameter method
  - **request method 11**: set-parameter method
  - **request packet**
  - **rtp-uri**
  - **session-id**
  - **session-length**
  - **state**
  - **uri**
  - **uri sub-part**
  - **user-agent**
- **sdp**: Session Description Protocol (SDP) related configuration:

- **connection-ip-address**
- **media-audio-port**
- **media-video-port**

- **secure-http**: HTTPS related configuration
- **sip**: Session Initiation Protocol (SIP) related configuration:
  - **call-id**
  - **content type**
  - **from**
  - **previous-state**
  - **reply code**
  - **request method**
  - **request packet**
  - **state**
  - **to**
  - **uri**
  - **uri sub-part**
- **smtp**: Simple Mail Transfer Protocol (SMTP) related configuration:
  - **command name**
  - **mail-size**
  - **pdu-length**
  - **previous-state**
  - **recipient**
  - **reply status**
  - **sender**
  - **session-length**
  - **state**
- **tcp**: Transmission Control Protocol (TCP) related configuration:
  - **dst-port**
  - **duplicate**
  - **flag**
  - **out-of-order**
  - **payload-length**
  - **previous-state**
  - **src-port**
  - **state**
- **traffic-type**: Traffic type of flow (voice or non-voice depending upon flow type).
- **udp**: User Datagram Protocol (UDP) related configuration:

- **dst-port**
- **src-port**

- **voip-duration**: Duration of voice call, in seconds. For a flow in which voice call end is detected, output will be a non-zero value. For other flows it will be zero.
- **wsp**: Wireless Session Protocol (WSP) related configuration
  - **content type**
  - **host**
  - **pdu-length**
  - **pdu-type**
  - **reply code**
  - **session-length**
  - **tid**
  - **total-length**
  - **url**
  - **user-agent**
- **wtp**: Wireless Transaction Protocol (WTP) related configuration
  - **gtr**—Group Transmission Flag
  - **pdu-length**
  - **pdu-type**
  - **previous-state**
  - **state**
  - **tid**
  - **transaction class**
  - **ttr**—Trailer Transmission flag

Important: For more information on protocol-based rules, see the *ACS Ruledef Configuration Mode Commands* chapter.

priority *priority*

Specifies the CSV position of protocol rule related information in EDR.
priority must be an integer from 1 through 65535.

in-quotes

Specifies placing double quotes (“ ”) around the specified EDR field in the EDR.

Important: At the present time this keyword is only valid for the MMS protocol **to** and **subject** fields. **rule-variable mms to priority** *priority* **[in-quotes] rule-variable mms subject priority** *priority* **[in-quotes]**

Usage

Use this command to set the rule variables priority for EDR file format.
A particular field in an EDR format can be entered multiple times at different priorities. While removing the EDR field using the **no rule-variable** command you can remove all occurrences of a particular field by specifying the field name or a single occurrence by additionally specifying the optional **priority** keyword.

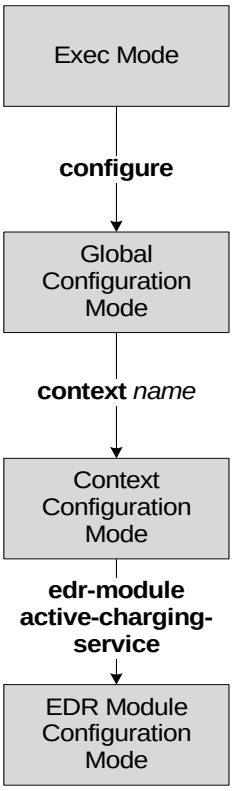
Example

The following is an example of this command:

```
rule-variable tcp dst-port priority 36
```

Chapter 84
EDR Module Configuration Mode Commands

The EDR Module Configuration Mode is accessed from the Context Configuration Mode.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

cdr

This command configures the EDR/UDR file parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
cdr [ [ push-interval value ] [ push-trigger space-usage-percent
trigger_percentage ] [ remove-file-after-transfer ] [ transfer-mode { pull |
push primary { encrypted-url encrypted_url | url url } [ via local-context ] [
secondary { encrypted-secondary-url encrypted_secondary_url | url secondary_url
} ] } ] + | use-harddisk ]

no cdr [ remove-file-after-transfer | use harddisk ] +

default cdr [ push-interval | push-trigger space-usage-percent | remove-file-
after-transfer | transfer-mode [ push via ] | use harddisk ] +
```

no

Disables the configured CDR storage and CDR file processing in this mode:

- **remove-file-after-transfer**: Retains a copy of the file even after it has been pushed or pulled to another server.
- **use-harddisk**: Disables data storage on the SMC hard disk.

Important: **use-harddisk** keyword is only available on an ASR 5000 chassis.

default

Configures the default setting for the specified keyword(s):

- **push-interval**: 300 seconds
- **push-trigger**: 80 percent
- **remove-file-after-transfer**: Disabled
- **transfer mode**: Pull
- **push via**: LC is used for push
- **use harddisk**: Disabled

Important: **use-harddisk** keyword is available only on the ASR 5000 chassis.

push-interval *value*

Specifies the transfer interval, in seconds, to push EDR and UDR files to an external file server. *value* must be an integer from 60 through 3600.

Default: 300 seconds

push-trigger space-usage-percent *trigger_percentage*

Specifies the EDR/UDR disk space utilization percentage, upon reaching which an automatic push is triggered and files are transferred to the configured external server.
trigger_percentage specifies the EDR/UDR disk utilization percentage for triggering push, and must be an integer from 10 through 80.
Default: 80 percent

remove-file-after-transfer

Specifies that the system must delete EDR/UDR files after they are transferred to the external file server.
Default: Disabled

transfer-mode { pull | push primary { encrypted-url *encrypted_url* **| url** *url* **} [via local-context] [secondary { encrypted-secondary-url** *encrypted_secondary_url* **| secondary-url** *secondary_url* **}] }**

Specifies the EDR/UDR file transfer mode—how the EDR and UDR files are transferred to an external file server.

- **pull**: Specifies that the L-ESS is to pull the CDR files.
- **push**: Specifies that the system is to push CDR files to the configured L-ESS.
- **primary encrypted-url** *encrypted_url*: Specifies the primary URL location in encrypted format to which the system pushes the CDR files.

  encrypted_url must be the location name in an encrypted format, and must be an alpha and/or numeric string of 1 through 1024 characters in length.
- **primary url** *url*: Specifies the primary URL location to which the system pushes the CDR files.

  url must be an alpha and/or numeric string of 1 through 1024 characters in the "*//user:password@host:[port]/directory*" format.
- **via local-context**: Configuration to select LC/SPIO for transfer of CDRs. The system pushes the EDR files via SPIO in the local context.
- **encrypted-secondary-url** *encrypted_secondary_url*: Specifies the secondary URL location in encrypted format to which the system pushes the CDR files when the primary location is unreachable or fails.

  encrypted_secondary_url must be the location name in an encrypted format, and must be an alpha and/or numeric string of 1 through 1024 characters in length.
- **secondary-url** *secondary_url*: Specifies the secondary URL location to which the system pushes the CDR files when the primary location is unreachable or fails.

  secondary_url must be an alpha and/or numeric string of 1 through 1024 characters in *//user:password@host:[port]/directory* format.

use-harddisk

Specifies that on ASR 5000 chassis the hard disk on the SMC be used to store EDR/UDR files. On configuring to use the hard disk for EDR/UDR storage, EDR/UDR files are transferred from RAMFS on the PSC to the hard disk on the SMC.
Default: Disabled

Important: **use-harddisk** keyword is only available on ASR 5000 chassis.

+

Indicates that more than one of the previous keywords can be entered within a single command.

Usage

Use this command to configure how the charging data records (CDR) are moved and stored.
Run this command on the ASR 5000 only from the context where you have configured the EDR/UDR module. Running this command in any other context will cause a failure and deliver an error message.
Run this command on the ASR 5000 chassis only from the local context. Running this command in any other context will cause a failure and result in an error message.
The **use-harddisk** keyword is only available on ASR 5000 chassis. This command can be run only in a context where CDRMOD is running. Configuring in any other context will result in failure with the message "Failure: Please Check if CDRMOD is running in this context or not."
This config can be applied either in the EDR/UDR module, but will be applicable both to the EDR and UDR modules. Configuring in one of the modules prevents the configuration to be done in the other module.
If PUSH transfer mode is selected, the L-ESS server URL to which the CDR files need to be transferred to must be specified. The configuration allows a primary and a secondary server to be configured. Configuring the secondary server is optional. Whenever a file transfer to the primary server fails for four consecutive times, the files will be transferred to the secondary server. The transfer will switch back to the original primary server when:

- Four consecutive transfer failures to the secondary server occur
- After switching from the primary server, 30 minutes elapses

When changing **transfer-mode** from pull to push, disable the PULL from L-ESS and then change the transfer mode to push. Make sure that the push server URL configured is accessible from the local context. Also, make sure that the base directory that is mentioned contains udr directory created within it.
When changing **transfer-mode** from push to pull, after changing, enable PULL on the L-ESS. Any of the ongoing PUSH activity will continue till all the scheduled file transfers are completed. If there is no PUSH activity going on at the time of this configuration change, all the PUSH related configuration is nullified immediately.

Example

The following command retains a copy of the data file after it has been transferred to the storage location:

```
no cdr remove-file-after-transfer
```

end

This command returns the CLI prompt to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec Mode.

exit

This command exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

file

This command configures EDR file parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

file [charging-service-name { include | omit }] [compression { gzip | none }] [current-prefix *string* **] [delete-timeout** *seconds* **] [directory** *directory_name* **] [edr-format-name] [exclude-checksum-record] [field-separator { hyphen | omit | underscore }] [file-sequence-number rulebase-seq-num] [headers] [name** *file_name* **] [reset-indicator] [rotation [num-records** *number* **| time** *seconds* **| volume** *bytes* **]] [sequence-number { length** *length* **| omit | padded | padded-six-length | unpadded }] [storage-limit** *limit* **] [single-edr-format] [time-stamp { expanded-format | rotated-format | unix-format }] [trailing-text** *string* **] [trap-on-file-delete] [xor-final-record] +**

default file [charging-service-name] [compression] [current-prefix] [delete-timeout] [directory] [edr-format-name] [field-separator] [file-sequence-number] [headers] [name] [reset-indicator] [rotation { num-records | time | volume }] [sequence-number] [storage-limit] [time-stamp] [trailing-text] +

---

default

Configures the default setting for the specified keyword(s).

---

charging-service-name { include | omit }

Specifies the inclusion/exclusion of charging service name in the file name.

- **include**: Specifies to include the charging service name in EDR file name.
- **omit**: Specifies to exclude the charging service name in EDR file name.

---

compression { gzip | none }

Specifies compression of EDR files.

- **gzip**: Enables GNU zip compression of the EDR file at approximately 10:1 ratio.
- **none**: Disables Gzip compression.

---

current-prefix *string*

Specifies a string to add to the beginning of the EDR file that is currently being used to store EDR records. *string* must be an alpha and/or numeric string of 1 through 31 characters in length.
Default: curr

delete-timeout *seconds*

Specifies a time period, in seconds, when completed EDR files are deleted. By default, files are never deleted.
seconds must be an integer from 3600 through 31536000.
Default: Disabled

directory *directory_name*

Specifies a subdirectory in the default directory in which to store EDR files.
directory_name must be an alpha and/or numeric string of 1 through 191 characters in length.
Default: /records/edr

edr-format-name

Specifies creation of separate files for EDRs that have different formats. The EDR format name will be included in the file name.

exclude-checksum-record

When entered, this keyword excludes the final record containing #CHECKSUM followed by the 32-bit Cyclic redundancy check (CRC) of all preceding records from the EDR file.
Default: Disabled, inserts checksum record into the EDR file header.

field-separator [hyphen | omit | underscore]

Specifies the field inclusion/exclusion type of separators between two fields of EDR file name:

- **hyphen**: Specifies the field separator as "-" (hyphen) symbol between two fields.
- **omit**: Removes or omits the field separator between two fields.
- **underscore**: Specifies the field separator as "_" (underscore) symbol between two fields.

file-sequence-number rulebase-seq-num

Specifies that the file name sequence numbers be unique per rulebase and EDR format name combination.

headers

Includes a file header summarizing the record layout.

name *file_name*

Default: edr
Specifies a string to be used as the base file name for EDR files.
file_name must be an alpha and/or numeric string of 1 through 31 characters in length. The file name format is as follows:
base_rulebase_format_sequencenum_timestamp

- *base*: Specifies type of record in file or contains the operator-specified string.

  Default: edr
- *rulebase*: Specifies the name of the ACS rulebase. EDRs from different rulebases go into different EDR files.
- *format*: Specifies the name of the EDR format if **single-edr-format** is specified else the format field (and the trailing underscore) is omitted from the file name.
- *sequencenum*: This is a 5-digit sequence number to detect the missing file sequence. It is unique among all EDR files on the system.

- *timestamp*: Contains a timestamp based on file creation time in UTC time in MMDDYYYYHHMMSS format.

EDR files that have not been closed have a string added to the beginning of their filenames.
Filename for an EDR file in CSV format that contains information for rule base named *rulebase1* and an EDR schema named *edr_schema1* appears as follows:
edr_rulebase1_edr_schema1_00005_01302006143409
If the file name is not configured it will create files for EDRs/UDRs/FDRs (xDRs) with following template with limits to 256 characters:
basename_ChargSvcName_timestamp_SeqNumResetIndicator_FileSeqNumber

- *basename*: A global-based configurable text string that is unique per system that uniquely identifies the global location of the system running ACS.
- *ChargSvcName*: A system context-based configurable text string that uniquely identifies a specific context-based charging service
- *timestamp*: Date and time at the instance of file creation. Date and time in the form of "MMDDYYYYHHmmSS" where HH is a 24-hour value from 00-23
- *SeqNumResetIndicator*: A one-byte counter used to discern the potential for duplicated FileSeqNumber with a range of 0 to 255, which is incremented by a value of 1 for the following conditions:
  - Failure of an ACS software process on an individual PAC/PSC.
  - Failure of the system such that a second system takes over. (For example: a backup or standby system put in place according to Interchassis Session Recovery.)
  - File Sequence Number (FileSeqNumber) rollover from 999999999 to 0
- *FileSeqNumber*: Unique file sequence number for the file with 9 digit integer having range from 000000000 to 999999999. It is unique on each system.

File name for a closed xDR file in CSV format that contains information for ACS system *xyz_city1* and charging service name *preapaid2* with timestamp *12311969190000*, and file sequence number counter reset indicator to *002* for file sequence number *034939002* appears as follows:
xyz_city1_preapaid2_12311969190000_002_034939002
File name for a running xDR file, not closed, in CSV format that contains information for the same parameters for file sequence number *034939003* prefixed with *curr_* and appears as follows:
curr_xyz_city1_preapaid2_12311969190000_002_034939002

reset-indicator

Specifies inclusion of the reset indicator counter value from 0 through 255 in EDR file name, and is incremented (by one) whenever any of the following conditions occur:

- An ACSMgr/SessMgr process fails.
- A peer chassis has taken over in compliance with our Interchassis Session Recovery feature.
- The sequence number, see **sequence-number** keyword, has rolled over to zero.

rotation { num-records *number* **| time** *seconds* **| volume** *bytes* **}**

Specifies when to close an EDR file and create a new one.

- **num-records** *number*: Specifies the number of records that should be added to the file. When the number of records in the file reaches the specified value, the file is complete.

  number must be an integer 100 through 10240.

  Default: 1024

- **time** *seconds*: Specifies the period of time to wait before closing the EDR file and creating a new one.

  seconds must be an integer from 30 through 86400.

  Default: 3600 seconds

- **volume** *bytes*: Specifies the maximum size of the EDR file before closing it and creating a new one.

  bytes must be an integer from 51200 to 62914560. Note that a higher setting may improve the compression ratio when the compression keyword is set to gzip.

  Default: 102400 bytes

sequence-number { length *length* **| omit | padded | padded-six-length | unpadded }**

Specifies including/excluding sequence number in the file name.

- **length** *length*: Includes the sequence number with the specified length.

  length must be the file sequence number length with preceding zeroes in the file name, and must be an integer from 1 through 9.

  > ***Important:*** The **length** configuration is applicable in both EDR and UDR modules. When applied in both modules without the **file udr-seq-num** configuration, the minimum among the two values will come into effect for both the modules. With the **file udr-seq-num** config, each module will use its own value of length.

- **omit**: Excludes the sequence number from the file name.
- **padded**: Includes the padded sequence number with preceding zeros in the file name. This is the default setting.
- **padded-six-length**: Includes the padded sequence number with six preceding zeros in the file name.
- **unpadded**: Includes the unpadded sequence number in the file name.

Default: **padded**

single-edr-format

Creates separate files for EDRs having different formats.
Default: Disabled

storage-limit *limit*

Specifies deleting files when the specified amount of space, in bytes, is used up for EDR/UDR file storage on the PSC/PAC RAM.
On the ASR 5000, *limit* must be an integer from 10485760 through 268435456.
On an ASR 5000 chassis, *limit* must be an integer from 10485760 through 536870912.
Default: 33554432

Important: On the ASR 5000 the total storage limit is 268435456 bytes (256 MB). This limit is for both UDR and EDR files combined. On an ASR 5000 chassis the total storage limit is 536870912 bytes (512 MB). This limit is for both UDR and EDR files combined.

time-stamp { expanded-format | rotated-format | unix-format }

Specifies the timestamp of when the file was created be included in the file name.

- **expanded-format**: Specifies the UTC MMDDYYYYHHMMSS format.
- **rotated-format**: Specifies the time stamp format to YYYYMMDDHHMMSS format.
- **unix-format**: Specifies the UNIX format of *x.y*, where *x* is the number of seconds since 1/1/1970 and *y* is the fractional portion of the current second that has elapsed.

trailing-text *string*

Specifies the inclusion of arbitrary text string in the file name.
string must be an alpha and/or numeric string of 1 through 30 characters in length.

trap-on-file-delete

This keyword instructs the system to send an SNMP notification (trap) when an EDR/UDR file is deleted due to lack of space.
Default: Disabled

xor-final-record

Specifies inserting an xor checksum (in place of the CRC checksum) into the EDR file header if the **exclude-checksum-record** is left at its default setting.
Default: Disabled

+

More than one of the previous keywords can be entered within a single command.

Usage

Use this command to configure EDR file characteristics.

Example

The following command sets the prefix of the current active EDR file to *Current*:

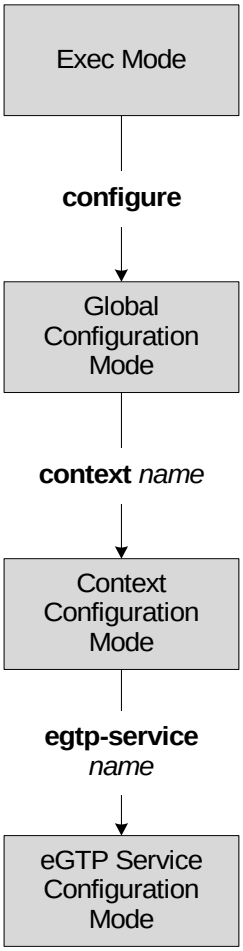
```
file current-prefix Current
```

The following command sets the base file name to *EDRfile*:

```
file name EDRfile
```

Chapter 85
eGTP Service Configuration Mode Commands

The eGTP Service Configuration Mode is used to create and manage eGTP interface types and associated parameters.



associate

Configures an association with a GTP-U service where parameters are applied to the GTP-U data flow.

Product

P-GW

Privilege

Administrator

Syntax

associate gtpu-service *name*

no associate gtpu-service

no

Removes the association to the configured GTP-U service from this service.

gtpu-service *name*

Associates a GTP-U service with this eGTP service. *name* must be from 1 to 63 alpha and/or numeric characters.

Usage

Use this command to associate a GTP-U service with this eGTP service.

Example

The following command associates this eGTP service with a GTP-U service named *gtpu3*:

associate gtpu-service *gtpu3*

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax`end`

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax`exit`

Usage

Return to the previous mode.

gtpc

Configure the GPRS Tunneling Protocol Control (GTP-C) plane settings for this service.

Product

MME, P-GW, S-GW

Privilege

Administrator

Syntax

gtpc { bind { ipv4-address *ipv4_address* **[ipv6-address** *ipv6_address* **] | ipv6-address** *ipv6_address* **[ipv4-address** *ipv4_address* **] } | echo-interval** *seconds* **| ip qos-dscp {** *forwarding_type* **} | max-retransmissions** *num* **| retransmission-timeout** *seconds* **}**

no gtpc { bind { ipv4-address *ipv4_address* **[ipv6-address** *ipv6_address* **] | ipv6-address** *ipv6_address* **[ipv4-address** *ipv4_address* **] } | echo-interval }**

default gtpc { echo-interval | ip qos-dscp | max-retransmissions | retransmission-timeout }

---

no

Disables or removes the configured GTP-C setting.

---

default

Resets the specified parameter to its default value.

---

bind { ipv4-address *ipv4_address* **[ipv6-address** *ipv6_address* **] | ipv6-address** *ipv6_address* **[ipv4-address** *iv4p_address* **] }**

Binds the service to an interface with an IPv4 address, IPv6 address or both.
ipv4-address *ipv4_address* **[ipv6-address** *ipv6_address* **]**: Binds this service to the IPv4 address of a configured interface. Optionally, bind the service to a configured interface with an IPv6 address. *ipv4_address* must be entered as a standard IPv4 address in dotted decimal notation. *ipv6_address* must be entered as a standard IPv6 address in colon-separated notation.
ipv6-address *ipv6_address* **[ipv4-address** *ipv4_address* **]**: Binds this service to the IPv6 address of a configured interface. Optionally, bind the service to a configured interface with an IPv4 address. *ip6_address* must be entered as a standard IPv6 address in colon-separated notation. *ipv4_address* must be entered as a standard IPv4 address in dotted decimal notation.

---

echo-interval *seconds*

Default: 60
Configures the duration between the sending of echo messages. *seconds* must be an integer value from 60 to 3600.

---

ip qos-dscp { *forwarding_type* **}**

Default: **af11**

Specifies the IP QoS DSCP per-hop behavior to be marked on the outer header of signalling packets originating from the LTE component. This is a standards-based feature (RFC 2597). The following forwarding types are supported:
af11: Designates the use of Assured Forwarding 11 per-hop behavior
af12: Designates the use of Assured Forwarding 12 per-hop behavior
af13: Designates the use of Assured Forwarding 13 per-hop behavior
af21: Designates the use of Assured Forwarding 21 per-hop behavior
af22: Designates the use of Assured Forwarding 22 per-hop behavior
af23: Designates the use of Assured Forwarding 23 per-hop behavior
af31: Designates the use of Assured Forwarding 31 per-hop behavior
af32: Designates the use of Assured Forwarding 32 per-hop behavior
af33: Designates the use of Assured Forwarding 33 per-hop behavior
af41: Designates the use of Assured Forwarding 41 per-hop behavior
af42: Designates the use of Assured Forwarding 42 per-hop behavior
af43: Designates the use of Assured Forwarding 43 per-hop behavior
be: Designates the use of Best Effort forwarding per-hop behavior
ef: Designates the use of Expedited Forwarding per-hop behavior typically dedicated to low-loss, low-latency traffic.
The assured forwarding behavior groups are listed in the table below.

	Class 1	Class 2	Class 3	Class 4
Low Drop	AF11	AF21	AF31	AF41
Medium Drop	AF12	AF22	AF32	AF42
High Drop	AF13	AF23	AF33	AF43

Traffic marked with a higher class is given priority during congestion periods. If congestion occurs to traffic with the same class, the packets with the higher AF value are dropped first.

max-retransmissions *num*

Default: 4
Configures the maximum number of retries for packets. *num* must be an integer from 0 through 15.

retransmission-timeout *seconds*

Default: 5
Configures the control packet (echo message) retransmission timeout in GTP, in seconds. *seconds* must be an integer value from 1 through 20.

Usage

Use this command to configure GTP-C settings for the current service. This interface assumes the characteristics of an S11 reference point on the S-GW or MME.

Example
The following command binds the service to a GTP-C interface with an IP address of *112.334.556.778*:

```
gtpc bind address 112.334.556.778
```

interface-type

Configures the interface type used by this service.

Product

MME, P-GW, S-GW

Privilege

Administrator

Syntax

```
interface-type { interface-mme | interface-pgw-ingress | interface-sgsn |
interface-sgw-egress | interface-sgw-ingress }
```

{ interface-mme | interface-pgw-ingress | interface-sgsn | interface-sgw-egress | interface-sgw-ingress }

interface-mme: Specifies that the interface has the characteristics of an eGTP MME S11 reference point to/from an S-GW.
interface-pgw-ingress: Specifies that the interface has the characteristics of an eGTP P-GW S5/S8 reference point from an S-GW. The interface assumes the characteristics of either a GTP-C (control Plane) or GTP-U (user plane) reference point.
interface-sgsn: Specifies that the interface has the characteristics of an eGTP S-GW S4 reference point to/from an SGSN.
interface-sgw-egress: Specifies that the interface has the characteristics of an eGTP S-GW S5/S8 reference point to an eGTP P-GW. The interface assumes the characteristics of either a GTP-C (control Plane) or GTP-U (user plane) reference point.
interface-sgw-ingress: Specifies that the interface has the characteristics of:

- an eGTP-C S-GW S11 reference point from the MME.
- an eGTP-U S-GW S1-U reference point from the eNodeB.

Usage

Use this command to specify the type of interface this service uses. By configuring this command, the interface takes on the characteristics of the selected type.

Example

The following command configures the interface bound to this service to maintain the characteristics of an eGTP-C S-GW S11 reference point from an MME:

```
interface-type interface-sgw-ingress
```

validation-mode

Configures the type of validation to be performed on messages received by this service.

Product

P-GW

Privilege

Administrator

Syntax

```
validation-mode { custom1 | standard }

default validation-mode
```

default

Returns the command to the default setting of **standard**.

{ custom1 | standard }

custom1: Specifies that the message should be validated based on a vendor-specific set of mandatort elements.
standard: Specifies that the message should be validated based on the set of mandatort elements as defined in 3GPP 29.274.

Usage

Use this command to specify the type of validation performed on messages received by this service. The information elements contained in messages have mandatory elements and conditional elements. The standard set of elements, as defined by 3GPP 29.274 is checked if this command is set to “standard”. The custom1 setting is for a vendor-specific set of mandatory elements.

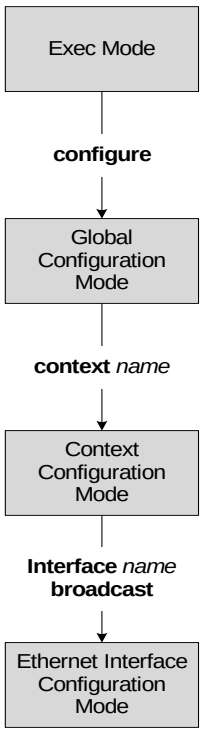
Example

The flowering command sets the validation mode for incoming messages to standard:

```
validation-mode standard
```

Chapter 86
Ethernet Interface Configuration Mode Commands

The Ethernet Interface Configuration Mode is used to create and manage the IP interfaces for addresses, address resolution options, etc.



crypto-map

Applies the specified IPSec crypto-map to this interface.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

crypto-map *map_name* **[secondary-address** *sec_ip_addr* **]**

no

Deletes the application of the crypto map on this interface.

map_name

Specifies the name of the crypto map being applied. The name can be from 1 to 127 alpha and/or numeric characters and is case sensitive.

secondary-address *sec_ip_addr*

Applies the crypto map to the secondary address for this interface that is specified by *sec_ip_addr*. *sec_ip_addr* must be specified using the standard IPv4/IPv6 notation.

Usage

In order for ISAKMP and/or manual crypto maps to work, they must be applied to a specific interface using this command. Dynamic crypto maps should **not** be applied to interfaces.
The crypto map must be configured in the same context as the interface.

Example

To apply the IPSEC crypto map named cmap1 to this interface, use the following command:

crypto-map *cmap1*

description

Configures the description text for the current interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

description *text*

no description

no

Clears the description for the interface.

text

Specifies the descriptive text to use. *text* must be 0 to 79 alpha and/or numeric characters with no spaces or a quoted string of printable characters

Usage

Set the description to provide useful information on the interface's primary function, services, end users, etc. Any information useful may be provided.

Example

description *sampleInterfaceDescriptiveText*

end

Exits the interface configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the interface configuration mode and returns to the context configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the context configuration mode.

ip

Configures the IP options for the current interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip { access-group *acl_name* **{ in | out } [** *priority-value* **] | address** *ip_address ip_mask* **[secondary | srp-activate] | arp { arpa | timeout** *seconds* **} }**

no ip { access-group *acl_name* **{ in | out } | address** *ip_address* **| arp { arpa | timeout } }**

no

Disables and/or restores the option to the system default.

access-group *acl_name* **{ in | out } [** *priority-value* **]**

acl_name specifies the access control list to be added/removed from the group. The ACL rules must be configured in the same context as the interface.
In Release 8.1 and later, *acl_name* must be an alpha and/or numeric string of 1 through 47 characters in length.
In Release 8.0 and earlier, *acl_name* must be an alpha and/or numeric string of 1 through 79 characters in length.
The direction must also be specified as either inbound or outbound using the keywords **in** and **out**, respectively.
priority-value: Default: 0. If more than one ACL is applied, *priority-value* specifies the priority in which they will be compared against the packet. If not specified, the priority is set to 0. *priority-value* must be an integer from 0 through 4294967295. If access groups in the list have the same priority, the last one entered is used first.

Important: Up to 8 ACLs can be applied to a group provided that the number of rules configured within the ACL(s) does not exceed the 128 rule limit for the interface.

address *ip_address ip_mask* **[secondary | srp-activate]**

Configures the IP address for the interface specifying the networking mask as well. *ip_address* and *ip_mask* must be specified using the standard IPv4/IPv6 notation.
The **secondary** keyword is used to configure a secondary IP address on the interface. This is referred to as multi-homing of the interface.
The **srp-activate** Activates the IP address for Interchassis Session Redundancy.

arp { arpa | timeout *seconds* **}**

Important: These keywords have been replaced by the **R_arp** command in the Global Configuration Mode. For backwards compatibility, however, these keywords are accepted as valid.

Usage

Create and manage the IP interfaces for the associated context.

Example

The following command configures the access group for the current context:

ip access-group *sampleAccessGroup*

ip address *1.2.3.4 0.0.0.128* **secondary**

The following command sets the address resolution protocol timeout.

ip arp timeout *1800*

The following commands remove the associated IP address and disable ARP for the interface, respectively.

no ip address *1.2.3.4*

no ip arp arpa

ip mtu

Configures the Maximum Transmission Unit (MTU) for this IP interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip mtu *mtu-size*

no

Deletes the MTU value.

Usage

On ASR 5000 we support IP MTU with a normal interface and point-to-point interface (for OLC port).
On ST16 we only support IP MTU with point-to-point interface.
The maximum MTU size allowed with an OLC port is 1600, the maximum MTU size allowed with an Ethernet port is 2048. The default MTU size is 1500.

Example

The following command sets the MTU value to the default.

ip mtu *1500*

ip ospf authentication-key

This command configures the password for the authentication with neighboring routers.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospf authentication-key [encrypted] password *auth_key*

no ip ospf authentication-key

no

Deletes the authentication key.

encrypted

Use this keyword if you are pasting a previously encrypted authentication key into the CLI command.

password *auth_key*

The password to use for authentication. *authentication_key* is a string variable, from 1 through 16 alphanumeric characters, that denotes the authentication password. This variable is entered in clear text format.

Usage

Use this command to set the authentication key used when authenticating with neighboring routers.

Example

To set the authentication key to 123abc, use the following command;

ip ospf authentication-key password *123abc*

Use the following command to delete the authentication key;

no ip ospf authentication-key

ip ospf authentication-type

This command configures the OSPF authentication method to be used with OSPF neighbors over the logical interface.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
ip ospf authentication-type { message-digest | null | text }
```

```
no ip ospf authentication-type { message-digest | null | text }
```

no

Disable this function.

message-digest

Set the OSPF authentication type to use the message digest (MD) authentication method.

null

Set the OSPF authentication type to use no authentication, thus disabling either MD or clear text methods.

text

Set the OSPF authentication type to use the clear text authentication method.

Usage

Use this command to set the type of authentication to use when authenticating with neighboring routers.

Example

To set the authentication type to use clear text, enter the following command;

```
ip ospf authentication-type text
```

ip ospf cost

This command configures the cost associated with sending a packet over the logical interface.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospf cost *value*

no ip ospf cost

no

Disable this function.

value

Default: 10
The cost to assign to OSPF packets. This must be an integer from 1 through 65535.

Usage

Use this command to set the cost associated with routes from the interface.

Example

Use the following command to set the cost to 20;

ip ospf cost *20*

Use the following command to disable the cost setting;

no ip ospf cost

ip ospf intervals

This command configures the interval or delay type, and the interval or delay time in seconds, for OSPF communications.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospf { dead-interval *value* **| hello-interval** *value* **| retransmit-interval** *value* **| transmit-delay** *value* **}**

no ip ospf { dead-interval | hello-interval | retransmit-interval | transmit-delay }

no

Deletes the value set and returns the value to its default.

dead-interval *value*

Default: 40
The interval, in seconds, that the router should wait, during which time no packets are received and after the router considers a neighboring router to be off-line. *value* must be an integer from 1 through 65535.

hello-interval *value*

Default: 10
The interval, in seconds between sending hello packets. *value* must be an integer from 1 through 65535.

retransmit-interval *value*

Default: 5
The interval, in seconds, between LSA (Link State Advertisement) retransmissions. *value* must be an integer from 1 through 65535.

transmit-delay *value*

Default: 1
The interval, in seconds, that the router should wait before transmitting a packet. *value* must be an integer from 1 through 65535.

Usage

Use this command to set the intervals or delays for OSPF communications.

Example

To set the dead-interval to 100, use the following command;

```
ip ospf dead-interval 100
```

To delete the setting for the dead-interval and reset the dead-interval value to its default of 40, use the following command’

```
no ip ospf dead-interval
```

ip ospf message-digest-key

This command enables the use of MD5-based OSPF authentication.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospf message-digest-key *key_id* **md5 [encrypted] password** *authentication_key*

no ip ospf message-digest-key *key_id*

no

Deletes the key.

message-digest-key key_id

Specifies the key identifier number. key_id must be an integer from 1 through 255.

encrypted

Use this if you are pasting a previously encrypted authentication key into the CLI command.

password *authentication_key*

The password to use for authentication. *authentication_key* is a string variable, from 1 through 16 alphanumeric characters, that denotes the authentication password. This variable is entered in clear text format.

Usage

Use this command to create an authentication key that uses MD5-based OSPF authentication.

Example

To create a key with the ID of 25 and a password of 123abc, use the following command;

ip ospf message-digest-key *25* **md5 password** *123abc*

To delete the same key, enter the following command;

no ip ospf message-digest-key *25*

ip ospf network

Configures the OSPF network type.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
ip ospf network { broadcast | non-broadcast | point-to-multipoint | point-to-point }
```

```
no ip ospf network
```

no

Disable this function.

broadcast

Sets the network type to broadcast.

non-broadcast

Sets the network type to non-broadcast multi access (NBMA).

point-to-multipoint

Sets the network type to point-to-multipoint.

point-to-point

Sets the network type to point-to-point.

Usage

Use this command to specify the OSPF network type.

Example

To set the OSPF network type to broadcast, enter the following command;

```
ip ospf network broadcast
```

To disable the OSPF network type, enter the following command;

```
no ip ospf network
```

ip ospf priority

This command designates the OSPF router priority.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospf priority *value*

no ip ospf priority *value*

no

Disable this function.

value

The priority value to assign. This must be an integer from 0 through 255.

Usage

Use this command to set the OSPF router priority.

Example

To set the priority to 25, enter the following command:

ip ospf priority *25*

To disable the priority, enter the following command:

no ip ospf priority

ipv6 access-group

Specifies the name of the ACL group to assign the interface to. You can filter for either inbound or outbound traffic.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

`[ no ] ipv6 access-group` *`group name`* **`{ in | out } { priority-value }`**

`no`

Removes a previously configured access group association.

`group_name`

Specifies the name of the access group. group_name must be an alpha and/or numeric string of 1 to 79 characters.

`in`

Applies the filter to the inbound traffic.
Specify a priority_value for the access group from 0 to 4294967295. The lower values indicate a higher priority.

`out`

Applies the filter to the outbound traffic.
Specify a priority-value for the access group from 0 to 4294967295. The lower values indicate a higher priority.

`priority-value`

Default: 0
Specifies the priority of the access group. 0 is the highest priority. If priority-value is not specified the priority is set to 0. priority-value must be a value from 0 to 4294967295.
If access groups in the list have the same priority, the last one entered is used first.

Usage

Use this command to specify the ACL group to assign the interface to. Specify an ACL group name with this command.

Important: Up to 8 ACLs can be applied to a group provided that the number of rules configured within the ACL(s) does not exceed the 128 rule limit for the interface.

Example

Use the following command to associate the group_1 access group with the current IPv6 profile for inbound access:

ipv6 access-group *group_1* **in** *1*

ipv6 address

Specifies the address and subnet mask.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

ipv6 address *ip_address*

ip_address

Specifies an individual host IP address to add to this host pool.
ip_address is the IP address in colon separated notation.

Usage

Configures the IPv6 address and subnet mask for a specific interface.

ipv6 router advertisement

Enables or disables the system to send IPv6 router advertisements.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ipv6 router advertisement
```

Usage

Enables sending of router advertisements on the interface. All of the pool prefixes in the context (belonging to the interface) will be advertised in the router advertisement.
The router-lifetime in the advertisement is sent as 0 to indicate to the receiver that the sender cannot be a default-router. For all the prefixes (pools), the valid and preferred lifetime are sent as default. The router-advertisement is sent every 600 seconds.
If the pool-prefix is deleted, then an router-advertisement is sent for that particular prefix with the valid and preferred time set to 0.

policy-forward

Configure the system for redirecting the HA packets to new HA during existing HA upgradation.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

policy-forward { icmp unreachable next-hop *ip address* **| unconnected-address next-system** *ip address* **}**

no policy-forward unconnected-address

no policy-forward unconnected-address

Deletes the policy forwarding configuration for unconnected address for the current interface.

icmp unreachable next-hop *ip address*

Specifies routing of Internet Control Message Protocol (icmp) unreachable is required in overlapping pool configuration. *ip address* must be an IP address expressed in IPv4/IPv6 notation.

unconnected-address next-system *ip address*

Specifies address of next system HA to handle processing during HA upgrade.
ip address must be an IP address expressed in IPv4/IPv6 notation.

Usage

Use this command to set the redirecting policy for IP packets from existing HA to new HA during upgradation. To configure this command both keyword will be in separate interface.

Important: It is a customer specific command.

Example

To configure existing HA system for redirecting the HA packets to new HA during existing HA upgrade enter the following commands:

policy-forward unconnected-address next-system *ip address*

policy-forward icmp unreachable next-hop *ip address*

pool-share-protocol

Configure the primary or secondary system for the IP pool sharing protocol and enter IPSP configuration mode.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
pool-share-protocol { primary address | secondary address } [ mode { active |
inactive | check-config } ]

no pool-share-protocol
```

no pool-share-protocol

Deletes the IP pool sharing protocol information from the current interface.

primary *address*

On the secondary system, define the IP address of an interface on the primary system that has identical IP pools configured for use with the IP pool sharing protocol. *address* must be an IP address expressed in IP v4 dotted decimal notation.

secondary *address*

On the primary system, define the IP address of an interface on the secondary system that has identical IP pools configured for use with the IP pool sharing protocol. *address* must be an IP address expressed in IP v4 dotted decimal notation.

mode {active | inactive | check-config}

This is an optional command to manage the mode for IP pool sharing protocol for primary or secondary HA.
active: Activates the IP pool sharing protocol mode.
inactive: Inactivates the IP pool sharing protocol mode.
check-config: Verify the IP pool sharing protocol configuration.

Usage

Use this command to set the IP address of the primary or secondary system for use with the IP pool sharing protocol and enter ipsp configuration mode. This command must be configured for an interface in each context that has IP pools configured. Refer to the System Administration and Configuration Guide for information on configuring and using the IP pool sharing protocol.

Important: Both the primary and secondary systems must be in the same subnet.

Important: For information on configuring and using IPSP refer to the System Administration and Configuration Guide.

Important: To reserve free addresses on primary HA for this command use reserved-free-percentage command in *IPSP Configuration Mode Commands* of this guide.

Example

To configure a secondary system with an IP address of 192.168.100.10 for use with the IP pool sharing protocol, enter the following command:

```
pool-share-protocol secondary 192.168.100.10
```

To inactivate a secondary system with an IP address of 192.168.100.10 for use with the IP pool sharing protocol, enter the following command:

```
pool-share-protocol secondary 192.168.100.10 mode inactive
```

port-switch-on-L3-fail

This command causes the line card port to which the current interface is bound to switch over to the port on the redundant line card when connectivity to the specified IP address is lost.

Product

All

Privilege

Security Administrator, Administrator

Syntax

port-switch-on-L3-fail address { *ip_address* | *ipv6_address* } [minimum-switchover-period *switch_time*] [interval *int_time*] [timeout *time_out*] [num-retry *number*]

no port-switch-on-L3-fail

no

Disable port switchover on failure.

ip_address

The IP address to monitor for connectivity. ‘ ip_address must be in either ipv4 format or IPv6 format

minimum-switchover-period *switch_time*

Default: 120 seconds
After a switchover occurs, another switchover cannot occur until the amount of time specified has elapsed. *switch_time* must be an integer in the range from 1 to 3600.

interval *int_time*

Default: 60 seconds
This specifies how often, in seconds, monitoring packets are sent to the IP address being monitored. *int_time* must be an integer in the range from 1 to 3600.

timeout *time_out*

Default: 3 seconds
This specifies how long to wait without a reply before resending monitoring packets to the IP address being monitored. *time_out* must be an integer in the range from 1 to 10.

num-retry *number*

Default: 5
This value specifies how many times to retry sending monitor packets to the IP address being monitored before performing the switchover operation. *number* must be an integer in the range from 1 to 100.

Usage

Use this command to monitor a destination in your network to test for L3 connectivity. The destination being monitored should be reachable from both the active and standby line cards.

Example

The following command enables port switchover on connectivity failure to the IP address 192.168.10.100 using default values:

```
port-switch-on-L3-fail address 192.168.10.100
```

The following command disables port switchover on connectivity failure:

```
no port-switch-on-L3-fail
```

vlan-map

This command sets a single next-hop IP address so that multiple vlans can use a single next-hop gateway. **vlan-map** is associated with a specific interface.

Product

PDSN, HA, SGSN

Privilege

Security Administrator, Administrator

Syntax

vlan-map next-hop *ip_address*

next-hop *ip_address*

This keyword defines an IP address for the next-hop gateway.
ip_address: Can be either an IPv4 or IPv6 address in standard format.

Usage

Use vlan-map to combine multiple vlan links to go through a single IP address. This feature is used in conjunction with nexthop forwarding and overlapping IP pools.
After configuring the vlan-map, move to the Port Ethernet configuration mode to attach the vlan-map to a specific vlan.

Example

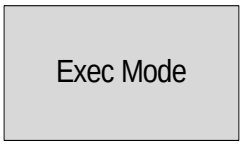
The following command sets an IPv4 for a next-hop gateway.

vlan-map next-hop *123.123.123.1*

Chapter 87
Exec Mode Commands (A-C)

This section includes the commands **aaa test** through **crypto-group**

The Exec Mode is the initial entry point into the command line interface system. Exec mode commands are useful in troubleshooting and basic system monitoring.



aaa test

This command tests AAA functionality between the system and a remote server.

Product

PDSN, HA, GGSN, SGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator

Syntax

aaa test { accounting username *user_name* **| authenticate** *user_name password* **| session** *user_name password* **}**

accounting username *user_name*

Tests RADIUS or GTPP accounting functionality for the specified user.
user_name must be the name of a user configured on the RADIUS or CFG server.

Important: GTPP is used only in conjunction with the GGSN or SGSN product.

authenticate *user_name password*

Tests RADIUS authentication functionality for the specified user.
user_name is the name of a user configured on the RADIUS server. *password* is the user's password.

session *user_name password*

Tests both RADIUS authentication and RADIUS or GTPP accounting functionality for the specified user.
user_name is the name of a user configured on the RADIUS server. *password* is the user's password.

Important: GTPP is used only in conjunction with the GGSN or SGSN product.

Usage

This command is used to test RADIUS-based authentication and RADIUS or GTPP accounting. This command may be useful for diagnosing problems with subscribers and access to the system and/or billing data.

Example

The following command verifies accounting for a user named *user1*:

aaa test accounting username *user1*

The following command tests authentication for a user named *user1* with the password *abc123*:

aaa test authentication *user1 abc123*

The following command tests both accounting and authentication for the user named *user1* with the password *abc123*:

aaa test session *user1 abc123*

active-charging service

This command creates an active charging service.

Product

ACS

Privilege

Security Administrator, Administrator, Operator

Syntax

active-charging service *acs_service_name* **[-noconfirm]**

acs_service_name

Specifies name of the active charging service.
acs_service_name must be the name of the active charging service and must be an alpha and/or numeric string of 1 through 15 characters in length.
If the named service does not exist, it is created, and the CLI mode changes to the ACS Configuration Mode wherein the service can be configured.
If the named service already exists, the CLI mode changes to the ACS Configuration mode wherein the specified active charging service can be configured.

-noconfirm

Specifies that the command must execute without any additional prompt and confirmation from the user.

Usage

Use this command to create an active charging service in the system. This command can be used directly in Exec Mode after issuing the **require active-charging** command in the Global Configuration Mode. This command allows an operator (rather than security administrators and administrators) to configure the ACS functionality only.

Important: Operators need special CLI privilege for ACS functionality to be able to use this CLI command.

Example

The following command creates an active charging service named *test*:

active-charging service *test*

alarm

This command is used to disable the internal audible alarm on the system management card.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
alarm cutoff
```

Usage

Alarm cutoff disables the audible alarm. The alarm may be enabled following this command if an event within the system results in the audible alarm being enabled.

Example

```
alarm cutoff
```

autoconfirm

This command disables or enables confirmation for certain commands. This command affects the current CLI session only.

Important: Use the **autoconfirm** command in the Global Configuration Mode to change the behavior for all future CLI sessions.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
[ no ] autoconfirm
```

Usage

When **autoconfirm** is enabled, certain commands ask you to answer yes or no to confirm that you want to execute the command. When **autoconfirm** is disabled, the confirmation questions never appear. Disabling **autoconfirm** is active for the current session only.
By default **autoconfirm** is enabled.

Example

The following command enables command confirmation:

```
autoconfirm
```

The following command disables command confirmation for the duration of the current CLI session:

```
no autoconfirm
```

bulkstats force

This command is used to manage the system statistics for collection and delivery to the configured server.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
bulkstats force { gather | transfer }
```

gather

Immediately collects the system statistics.

transfer

Immediately send the currently collected statistics to the configured server.

Usage

When the current system statistics are desired immediately as opposed to the normal scheduled collection and delivery intervals issue this command.
Troubleshooting the system may require the review of statistics at times when the scheduled delivery is not timely.

Example

The following causes the chassis to immediately collect system statistics. This would be in anticipation of a transfer command.

```
bulkstats force gather
```

The following command causes the chassis to immediately send all collected statistics to the configured server.

```
bulkstats force transfer
```

card halt

This command halts a card. A card reboot must be issued to bring the card back into service after it is halted.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

card halt *slot_num* **[-force] [-noconfirm]**

slot_num

Indicates the slot number of the card of interest.

-force

Over-rides any warnings to force the card to be halted.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Halt a card to stop the card for maintenance or emergency situations.

Caution: Caution should be taken in using this command as halting a card which has no redundancy card available may cause a service interruption and loss of active sessions.

Caution: The **-force** and **-noconfirm** options should only be used concurrently by experienced users as this will cause an immediate halt regardless of warnings and no confirmation from the user.

Important: This command is not supported on all platforms.

Example

The following command temporarily stops the card in slot *1*.

```
card halt 1
```

The following commands force the card to halt and indicate no confirmation is to take place, respectively.

```
card halt 17 -force -noconfirm
```

```
card halt 17 -noconfirm
```

card lc switch

This is the command for managing the line cards and their active/standby status.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

card lc switch to *target_slot* **[-noconfirm]**

switch to *target_slot*

Indicates the card which is to become the active card specified as *target_slot*.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Line card switch overs change the active/standby status of a line card. This is useful when there is a maintenance activity on the active card which requires removing the card from service.

Caution: Caution should be taken in using this command. Depending on the amount of bandwidth/traffic being switched, some subscribers may experience service interruptions.

Important: This command is not supported on all platforms.

Example

The following command switches the active/standby status of the line cards where one of the cards is in slot *17*. This command only executes after the user provides confirmation of the request.

card lc switch to *17*

The following switches the active/standby status of the line cards where one of the cards is in slot *17*. This command executes immediately with no additional user confirmation.

card lc switch to *17* **-noconfirm**

card lc upgrade

This command upgrades the programmables on the line card.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
card lc upgrade slot_number { flash | fpga }
```

upgrade

Upgrades programmables on the specified line card. Must be followed by a slot number of the card to upgrade.

Caution: This command should only be used if instructed by or working with Technical Support.

flash

This keyword indicates the linear flash function and is most commonly used with the OLC (ATM optical line card) and CLC (Frame Relay optical line card) cards.
The system automatically senses the line card type so this keyword is obsoleted for releases 10.0 and higher.

fpga

For release 9.0, this keyword indicates the upgrade destination for the QGLC and XGLC.
The system automatically senses the line card type so this keyword is obsoleted for releases 10.0 and higher.

Usage

This command upgrades the firmware on the line card.

Important: This command is not supported on all platforms.

Example

The following command initiates an ATM line card upgrade on slot number *35*:

```
card lc upgrade 35 flash
```

card pac

This command moves processes from the source PAC to the destination PAC or disables the PAC from accepting any new calls.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

card pac { migrate from *src_slot* **to** *dst_slot* **| busy-out } [-noconfirm]**

no card pac busy-out

no card pac busy-out

Disables busy-out. The PAC is re-enabled to accept new calls.

migrate from *src_slot* **to** *dst_slot*

This keyword moves processes from the specified source PAC to the specified destination PAC. The command prompt is returned once the command is initiated. The card migration is completed in background. *src_slot* indicates the source slot number of the card whose processes will be migrated from. *dst_slot* indicates the destination slot number of the card processes will be migrated to.

busy-out

When busy-out is enabled on a PAC, the PAC stops receiving new calls but continues to process calls it currently has until they are completed. The command prompt is returned once the command is initiated. The busy-out procedure is completed in background.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

card pac migrate: Migrating a packet accelerator card changes the active/standby status of a packet accelerator card. This results in the active sessions/processes being moved to the newly active PAC. This is useful when there is a maintenance activity on the active card which requires removing the card from service. The destination slot specified must contain a packet accelerator card which is in the standby state for the command to complete successfully.

Caution: Caution should be taken in using this command. Depending on the number of active sessions being migrated, some subscribers may experience service interruptions.

card pac busy-out: Using busy-out to refuse new calls on a PAC allows you to take a card out of service without any interruptions to the end user. An individual system can be taken completely out of service gracefully by enabling busy-out on all PACs and waiting for current calls to complete. The **show card** info command shows if busy-out is enabled.

Important: When a PAC fails, is migrated, or is restarted for any reason busy-out is reset to disabled, the default behavior.

Important: This command is not supported on all platforms.

Example

The following command migrates the active processes from the PAC card in slot *12* to the card in slot *14*. This command only executes after the user provides confirmation about the request.

```
card pac migrate from 12 to 14
```

The following command sets the PAC in slot 1 to stop accepting new calls:

```
card pac busy-out 1
```

card psc

This command moves processes from the source PSC to the destination PSC or disables the PSC from accepting any new calls.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

card psc { migrate from *src_slot* **to** *dst_slot* **| busy-out } [-noconfirm]**

no card psc busy-out

no card psc busy-out

Disables busy-out. The PSC is re-enabled to accept new calls.

migrate from *src_slot* **to** *dst_slot*

This keyword moves processes from the specified source PSC to the specified destination PSC. The command prompt is returned once the command is initiated. The card migration is completed in background. *src_slot* indicates the source slot number of the card whose processes will be migrated from. *dst_slot* indicates the destination slot number of the card processes will be migrated to.

busy-out

When busy-out is enabled on a PSC, the PSC stops receiving new calls but continues to process calls it currently has until they are completed. The command prompt is returned once the command is initiated. The busy-out procedure is completed in background.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Migrating a packet accelerator card changes the active/standby status of a packet accelerator card. This results in the active sessions/processes being moved to the newly active PSC. This is useful when there is a maintenance activity on the active card which requires removing the card from service.
The destination slot specified must contain a packet accelerator card which is in the standby state for the command to complete successfully.

Caution: Caution should be taken in using this command. Depending on the number of active sessions being migrated, some subscribers may experience service interruptions.

Using busy-out to refuse new calls on a PSC allows you to take a card out of service without any interruptions to the end user. An individual system can be taken completely out of service gracefully by enabling busy-out on all PSCs and waiting for current calls to complete. The **show card** info command shows if busy-out is enabled.

Important: When a PSC fails, is migrated, or is restarted for any reason busy-out is reset to disabled, the default behavior.

Important: This command is not supported on all platforms.

Example

The following command migrates the active processes from the PSC card in slot *12* to the card in slot *14*. This command only executes after the user provides confirmation of the request.

```
card psc migrate from 12 to 14
```

The following command sets the PSC in slot 1 to stop accepting new calls:

```
card psc busy-out 1
```

card psc upgrade

This command upgrades the programmables on the PSC card.

Product

All

Privilege

Security Administrator, Administrator

Syntax

card psc upgrade *slot_number*

upgrade

Upgrades programmables on the specified card. Must be followed by a slot number of card to upgrade.

Caution: This command should only be used if instructed by or working with Technical Support.

Usage

You can only initiate an upgrade if:

- there is no migration occurring
- the card is active or standby
- there is no online upgrade in progress

Important: The following operations are not allowed while a card is upgrading: change pac edc requirement (config) change card [no] shutdown (config) change card active (config) change card redundancy (config) card halt (exec) card reboot (exec) start an online upgrade

Important: Level unlock operations are ignored while a card is upgrading.

Important: This command is not supported on all platforms.

Example

The following command initiates a PSC upgrade on slot number *10*:

card psc upgrade *10*

card reboot

This performs a reset of the target card. Rebooting a packet processing or line card will result in the card downloading the image from the system management card.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

card reboot *target_slot* **[-force] [-noconfirm]**

target_slot

Indicates the slot number of the card which is the target of the reboot.

-force

Indicates the reboot is to take place ignoring any state or usage warnings that might be generated.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

A reboot is used to reset the card and receive a new download. This may be useful when a card is not responding or when it is necessary to cause the card to reload its image and restart.

Important: Caution should be taken in using this command as rebooting a card which has no redundancy card available may cause a service interruption and loss of active sessions.

Caution: The **-force** and **-noconfirm** options should only be used concurrently by experienced users as this will cause an immediate reboot regardless of warnings and no confirmation from the user.

Important: This command is not supported on all platforms.

Example

The following will cause the card in slot *8* to reboot without any confirmation from the user. The card will not reboot if there are any warnings generated.

```
card reboot 8 -noconfirm
```

The following command will cause the card in slot *8* to reboot regardless of any warnings. The user must provide confirmation prior to this command executing.

card reboot *8* **-force**

The following command will cause the card in slot *8* to reboot regardless of any warnings with no additional user confirmation.

card reboot *8* **-force -noconfirm**

card restart

This performs a soft-reset of the target card causing all application processes to restart.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
card restart target_slot [ -force ] [ -noconfirm ]
```

target_slot

Indicates the slot number of the card which is the target of the restart.

-force

Indicates the restart is to take place ignoring any state or usage warnings that might be generated.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Restarting a card may be useful when a card is not performing as expected (performance drop, increased response delays, etc.). A restart may be preferred to a reboot as the card becomes available in less time than a reboot.
When this command is issued for an active card, the user is prompted for confirmation unless the -force and/or -noconfirm keywords are used. Because the reboot of standby or redundant cards is non-service impacting, the reboot proceeds immediately after the command execution without user confirmation.

Important: Caution should be taken in using this command as restarting a card which has no redundant card available may cause a service interruption and loss of active sessions.

Important: This command is not supported on all platforms.

Caution: The **-force** and **-noconfirm** options should only be used concurrently by experienced users as this will cause an immediate restart regardless of warnings and no confirmation from the user.

Example

The following will cause the card in slot *8* to restart without any confirmation from the user. The card will not reboot if there are any warnings generated.

```
card restart 8 -noconfirm
```

The following command will cause the card in slot *8* to restart regardless of any warnings. The user must provide confirmation prior to this command executing.

```
card restart 8 -force
```

The following command will cause the card in slot *8* to restart regardless of any warnings with no additional user confirmation.

```
card restart 8 -force -noconfirm
```

card smc

This is command is for managing the switch processor cards and their active/standby status and synchronizing the filesystem between the active device and the standby device.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
card smc { switchover | synchronize filesystem [ /flash | /hd | /pcmcia1 | all ]
[ checkonly ] [ reverse ] } [ -noconfirm ]
```

`-noconfirm`

Executes the command without any additional prompt and confirmation from the user.

`switchover`

Switches control from the active SMC to the defined standby SMC.

`synchronize filesystem [ /flash | /hd | /pcmcia1 | all ] [ checkonly ] [ reverse ]`

`/flash`: Synchronizes only the filesystem on the standby SMC's /flash device.
`/hd`: Synchronizes only the filesystem on the standby SMC's hard drive.
`/pcmcia1`: Synchronizes only the filesystem on the standby SMC's /pcmcia1 device.
`all`: Synchronizes file systems on all available matching local devices (/flash, /pcmcia1).
`checkonly`: Displays a list of files that could be synchronized, without executing any synchronization actions.
`reverse`: When used, the specified operation is performed from the standby SMC to the active SMC.

Usage

The switch over of an SMC changes the active/standby status of an SMC card. This is useful when there is a maintenance activity on the active card which requires removing the card from service.
Each SMC contains independent local devices, namely a CompactFlash (/flash) and a PCMCIA card slot (/pcmcia1). Either of these devices may contain system files such as binary software images, configuration text files, boot system files, and others used to control and manage the system. This command allows the files contained on the active (currently managed) SMC to be synchronized, or mirrored, on the like local device(s) contained on the standby SMC.

Important: Only file systems on matching local devices are synchronized. For example, if the active SMC contains two local devices (/flash and /pcmcia1) and the standby SMC contains only one local device (/flash), then synchronization only occurs on the matching local device (i.e. /flash).

Important: This command is not supported on all platforms.

Example

The following command switches the active/standby status of the switch processor cards. This command only executes after the user provides confirmation of the request.

```
card smc switchover
```

The following command switches the active/standby status of the SMCs and executes immediately with no additional user confirmation:

```
card smc switchover -noconfirm
```

The following command synchronizes the file systems on all available matching local devices (/flash, /pcmcia1):

```
card smc synchronize filesystem all
```

The following command checks to see what files could be synchronized but no synchronization is performed:

```
card smc synchronize filesystem checkonly
```

card smc upgrade

This command updates the programmables on the SMC.

Product

All

Privilege

Security Administrator, Administrator

Syntax

card smc upgrade *slot_number*

upgrade

Upgrades programmables on the specified card. Must be followed by a slot number of card to upgrade.

Caution: This command should only be used if instructed by or working with Technical Support.

Usage

You can only initiate an upgrade if:

- there is no migration occurring
- the card is active or standby
- there is no online upgrade in progress

Important: The following operations are not allowed while a card is upgrading: change pac edc requirement (config) change card [no] shutdown (config) change card active (config) change card redundancy (config) card halt (exec) card reboot (exec) start an online upgrade

Important: Level unlock operations are ignored while a card is upgrading.

Important: This command is not supported on all platforms.

Example

The following command initiates an SMC upgrade in slot *10*:

card smc upgrade *10*

Caution: This command should only be used if instructed by or working with Technical Support.

card spc

This is command is for managing the switch processor cards and their active/standby status and synchronizing the filesystem between the active device and the standby device.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
card spc { switchover | synchronize filesystem [ /flash | /pcmcia1 | /pcmcia2 |
all ] [ checkonly ] [ reverse ] } [ -noconfirm ]
```

`-noconfirm`

Executes the command without any additional prompt and confirmation from the user.

`switchover`

Switches control from the active SPC to the defined standby SPC.

`synchronize filesystem [ /flash | /pcmcia1 | /pcmcia2 | all ] [ checkonly ] [ reverse ]`

`/flash`: Synchronizes only the filesystem on the standby SPC's /flash device.
`/pcmcia1`: Synchronizes only the filesystem on the standby SPC's /pcmcia1 device.
`/pcmcia2`: Synchronizes only the filesystem on the standby SPC's /pcmcia2 device.
`all`: Synchronizes file systems on all available matching local devices (/flash, /pcmcia1, /pcmcia2).
`checkonly`: Displays a list of files that could be synchronized, without executing any synchronization actions.
`reverse`: When used, the specified operation is performed from the standby SPC to the active SPC.

Usage

The switch over of an SPC changes the active/standby status of an SPC card. This is useful when there is a maintenance activity on the active card which requires removing the card from service.
Each SPC contains independent local devices, namely a CompactFlash (/flash) and two PCMCIA card slots (/pcmcia1 and /pcmcia2). Any of these devices may contain system files such as binary software images, configuration text files, boot system files, and others used to control and manage the system. This command allows the files contained on the active (currently managed) SPC to be synchronized, or mirrored, on the like local device(s) contained on the standby SPC.

Important: Only file systems on matching local devices are synchronized. For example, if the active SPC contains two local devices (/flash and /pcmcia1) and the standby SPC contains only one local device (/flash), then synchronization only occurs on the matching local device (i.e. /flash).

Important: This command is not supported on all platforms.

Example

The following command switches the active/standby status of the switch processor cards. This command only executes after the user provides confirmation of the request.

```
card spc switchover
```

The following command switches the active/standby status of the switch processor cards and executes immediately with no additional user confirmation;

```
card spc switchover -noconfirm
```

The following command synchronizes the file systems on all available matching local devices (/flash, /pcmcia1, /pcmcia2);

```
card spc synchronize filesystem all
```

The following command checks to see what files could be synchronized but no synchronization is performed;

```
card spc synchronize filesystem checkonly
```

card spio

This is the command for managing the switch processor I/O cards and their active/standby status.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

`card spio switch to` *`slot#`* **`[ -noconfirm ]`**

`slot#`

The slot number of the SPIO card that you want to switch to be the active card. The currently active SPIO card is put in standby mode and the SPIO card in the specified slot number is made active.

`-noconfirm`

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Switch over changes the active/standby status of a SPIO card. This is useful when there is a maintenance activity on the active card which requires removing the card from service.

Important: This command is not supported on all platforms.

Example

The following command switches the active/standby status of the switch processor I/O cards. This command only executes after the user provides confirmation of the request.

```
card spio switch
```

The following switches the active/standby status of the switch processor I/O cards. This command executes immediately with no additional user confirmation.

```
card lc switch -noconfirm
```

cdr-push

This command initiates manual push of CDR files to L-ESS.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

cdr-push { all | local-filename *file_name* **}**

all

Specifies to push all CDR files to the configured URL.

local-filename *file_name*

Specifies to push the specified file to the configured URL.
file_name must be the absolute path of local file name to push, and must be a string of 1 through 1023 characters in length.

Usage

Use this command to manually push CDR files to the configured L-ESS.
For information on configuring the L-ESS, see the **cdr** command in the EDR Module Configuration Mode Commands/UDR Module Configuration Mode Commands chapters.
On the ASR 5000, this command must be run only from the context where the EDR/UDR module is configured. Running in any other context would fail with the following reason: “Failure: Manual PUSH of CDRs supported in the context where EDR/UDR module is configured”
On ASR 5000 chassis, run this command only from the local context. If you are in any other context, you will see this failure message: “Failure: Manual PUSH of CDRs supported only in the local context”

Example

The following command pushes all CDR files to the URL:

```
cdr-push all
```

clear

The following commands clear a variety of items including statistics, conditions, alarms, sessions, and files:

clear aaa

This command clears all AAA statistics in the current context.

Product

PDSN, GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear aaa local counters
```

Usage

Clearing the AAA statistics which may be useful when monitoring the statistics manually. Clearing resets the counters to zero.

The keyword **local** is not intended to imply the local context defined for all systems. Rather, the keyword **local** indicates the statistics within the current context are to be cleared.

Example

The following command zeroes out all the AAA statistics in the current context.

```
clear aaa local counters
```

clear active-charging analyzer statistics

This command is used to clear protocol analyzer statistics.

Product

ACS

Privilege

Security Administrator, Administrator, Operator

Syntax

clear active-charging analyzer statistics [name *protocol_name* **] [| { grep** *grep_options* **| more }]**

---

name *protocol_name*

Clears statistics for the specified protocol analyzer.
If this keyword is not specified all statistics are cleared.
protocol_name must be one of the following:

- **dns**
- **file-transfer**
- **ftp**
- **http**
- **icmp**
- **icmpv6**
- **imap**
- **ip**
- **ipv6**
- **mms**
- **p2p [application]**: Peer-to-peer analyzer. The supported applications are:
  - **applejuice**
  - **ares**
  - **bittorrent**
  - **ddlink**
  - **directconnect**
  - **edonkey**
  - **fasttrack**
  - **feidian**
  - **filetopia**
  - **fring**
  - **gadu_gadu**
  - **gnutella**

- halflife2
- hamachivpn
- imesh
- irc
- iskoot
- jabber
- manolito
- msn
- mute
- orb
- oscar
- pando
- popo
- pplive
- ppstream
- qq
- qqlive
- skinny
- skype
- slingbox
- sopcast
- soulseek
- steam
- tvants
- tvuplayer
- uusee
- vpnx
- vtun
- winmx
- winny
- wofwarcraft
- xbox
- yahoo
- zattoo

- pop3
- rtcp
- rtp

- **rtsp**
- **sdp**
- **secure-http**
- **sip**
- **smtp**
- **tcp**
- **udp**
- **wsp**
- **wtp**

grep *grep_options* **|** **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to clear ACS analyzer statistics.

Example

The following command clears active charging service analyzer information for TCP analyzer:

```
clear active-charging analyzer statistics name tcp
```

clear active-charging charging-action statistics

This command is used to clear ACS charging action statistics.

Product

ACS

Privilege

Security Administrator, Administrator, Operator

Syntax

clear active-charging charging-action statistics [name *string* **] [| { grep** *grep_options* **| more }]**

name *string*

Clears detailed information for specific protocol analyzer.
string must be the name of an existing charging action.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to clear active charging action statistics.

Example

The following command clears active charging action statistics information for charging action named **pre-paid**:

```
clear active-charging charging-action statistics name pre-paid
```

clear active-charging content-filtering category statistics

This command is used to clear category-based content filtering statistics for the specified rulebase.

Product

CF

Privilege

Security Administrator, Administrator, Operator

Syntax

clear active-charging content-filtering category statistics [rulebase name *rulebase_name* **| all] [| { grep** *grep_options* **| more }]**

all

Clears the statistics of each and every configured rulebase.

rulebase_name

rulebase_name must be the name of an existing rulebase, and must be an alpha and/or numeric string of 1 through 15 characters in length.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to category-based content filtering statistics.

Example

The following command clears category-based content filtering statistics information for Rulebase named *cf_rule1*:

clear active-charging content-filtering category statistics rulebase name *cf_rule1*

clear active-charging credit-control statistics

This command clears credit control statistics.

Product

ACS

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear active-charging credit-control statistics [ group group_name ]
```

group *group_name*

Clears statistics for the specified credit control group.
group_name must be the name of a credit control group, and must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to clear credit control statistics.

Example

The following command clears statistics information for credit control:

```
clear active-charging credit-control statistics
```

clear active-charging edr-format statistics

Clears ACS statistics for the specified EDR format.

Product

ACS

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear active-charging edr-format statistics [ name edr_format ]
```

name *edr_format*

Specifies name of the EDR format for which you want to clear the statistics.
edr_format must be the name of a configured EDR format, and must be an alpha and/or numeric string of 1 through 63 characters in length.

Important: If an EDR format name is not specified statistics for all EDR formats are cleared.

Usage

Use this command to clear the accumulated statistics for the specified EDR format.

Example

The following command clears the statistics for all EDR formats:

```
clear active-charging edr-format statistics
```

clear active-charging edr-udr-file statistics

This command is used to clear EDR/UDR file related statistics.

Product

ACS

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear active-charging edr-udr-file statistics
```

Usage

Use this command to clear EDR and UDR file statistics.

Example

The following command clears statistical information for EDR and UDR files:

```
clear active-charging edr-udr-file statistics
```

clear active-charging firewall statistics

This command clears Active Charging Stateful Firewall statistics.

Product

FW

Privilege

Security Administrator, Administrator, Operator

Syntax

clear active-charging firewall statistics [callid *call_id* **| domain-name** *domain_name* **| nat-realm** *nat_realm* **| protocol { icmp | ip | other | tcp | udp } | username** *user_name* **] [acsmgr instance** *instance_id* **] [| { grep** *grep_options* **| more }]**

acsmgr instance *instance_id*

Specifies an ACS Manager instance ID.
instance_id must be an integer from 1 through 65535.

callid *call_id*

Specifies a call identification number.
call_id must be an eight-digit HEX number.

domain-name *domain_name*

Specifies a domain name for the statistics.
domain_name must be a string of 1 through 127 characters in length.

nat-realm *nat_realm*

Specifies a NAT realm name for the statistics.
nat_realm must be a string of 1 through 31 characters in length.

protocol { icmp | ip | other | tcp | udp }

Specifies protocol for the stats.

- **icmp**
- **ip**
- **other**: Protocols other than TCP, UDP, and ICMP
- **tcp**
- **udp**

username *user_name*

Specifies a user name for the statistics.
user_name must be a string of 1 through 127 characters in length.

grep *grep_options* | **more**

Indicates that the output of the command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to clear Stateful Firewall statistics.

Example

The following command clears all Stateful Firewall statistics:

```
clear active-charging firewall statistics
```

clear active-charging firewall track-list

This command clears the list of servers being tracked for involvement in any Denial-of-Service (DOS) attacks.

Product

FW

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear active-charging firewall track-list attacking-servers
```

Usage

Use this command to clear the list of servers being tracked for involvement in any DOS attacks.

Example

The following command clears the list of servers being tracked for involvement in any DOS attacks:

```
clear active-charging firewall track-list attacking-servers
```

clear active-charging fw-and-nat policy statistics

This command clears statistics for all or a specific firewall-and-NAT policy.

Product

FW, NAT

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear active-charging fw-and-nat policy statistics { all | name policy_name } [
| { grep grep_options | more } ]
```

all

Displays information for all firewall-and-NAT policies configured.

name *policy_name*

Displays information for the specified firewall-and-NAT policy.
policy_name must be the name of a firewall-and-NAT policy, and must be an alpha and/or numeric string of 1 through 63 characters in length.

grep *grep_options*| **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to clear statistics for all or a specific firewall-and-NAT policy.

Example

The following command clears statistics for the firewall-and-NAT policy named *test123*:

```
clear active-charging fw-and-nat policy statistics name test123
```

clear active-charging group-of-ruledefs statistics

This command clears statistical information related to Active Charging Service group of ruledefs.

Product

ACS

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear active-charging group-of-ruledefs statistics [ name group_of_ruledefs ] [
| { grep grep_options | more } ]
```

name *group_of_ruledefs*

Specifies name of the group of ruledefs for which statistics must be cleared. *group_of_ruledefs* must be the name of an existing group of ruledefs, and must be a string of 1 through 63 characters in length.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to clear statistical information related to all or specified Active Charging Service group of ruledefs.

Example

The following command clears statistical information related to the group of ruledefs named *ruledef_group12*:

```
clear active-charging group-of-ruledefs statistics name ruledef_group12
```

clear active-charging nat statistics

This command clears NAT realm statistics.

Product

NAT

Privilege

Security Administrator, Administrator, Operator

Syntax

clear active-charging nat statistics [nat-realm *nat_realm* **] [| { grep** *grep_options* **| more }]**

clear active-charging nat statistics

This command when issued in the local context clears statistics for all NAT realms in all contexts. When issued in a specific context, this command clears statistics for all NAT realms in that context.

clear active-charging nat statistics nat-realm *nat_realm*

This command when issued in the local context clears statistics for the specified NAT realm in all contexts. When issued in a specific context, this command clears statistics for the specified NAT realm in that context.

nat-realm *nat_realm*

Specifies name of the NAT realm.
nat_realm must be an alpha and/or numeric string of 1 through 31 characters in length.

grep *grep_options* **| more**

Specifies that the command's output be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to clear NAT realm statistics.

Example

The following command when issued in the local context, clears NAT realm statistics for NAT realms named *test135* in all contexts:

clear active-charging nat statistics nat-realm *test135*

clear active-charging rulebase statistics

This command clears ACS rulebase statistics.

Product

ACS

Privilege

Security Administrator, Administrator, Operator

Syntax

clear active-charging rulebase statistics [name *rulebase_name* **] [| { grep** *grep_options* **| more }]**

rulebase_name

Clears statistics for specified ACS rulebase.
rulebase_name must be the name of an existing rulebase, and must be an alpha and/or numeric string of 1 through 15 characters in length.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to clear ACS rulebase statistics.

Example

The following command clears statistics for the ACS rulebase named *postpaid*:

clear active-charging rulebase statistics name *postpaid*

clear active-charging ruledef statistics

This command clears ACS rule definition statistics.

Product

ACS

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear active-charging ruledef statistics [ charging | firewall | name
ruledef_name ] [ | { grep grep_options | more } ]
```

charging

Clears statistics for all configured Charging ruledefs.

firewall

Clears statistics for all configured Stateful Firewall ruledefs.

name *ruledef_name*

Clears statistics for the specified ACS ruledef.
ruledef_name must be the name of an existing ruledef, and must be an alpha and/or numeric string of 1 through 63 characters in length.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to clear ACS ruledef statistics.

Example

The following command clears all ruledef statistics:

```
clear active-charging ruledef statistics
```

clear active-charging subsystem

This command clears all ACS subsystem information.

Product

ACS

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear active-charging subsystem
```

Usage

Use this command to clear all ACS subsystem information.

Example

The following command clears all ACS subsystem information:

```
clear active-charging subsystem
```

clear active-charging tcp-proxy statistics

This command clears ACS TCP Proxy statistics.

Product

ACS

Privilege

Security Administrator, Administrator, Operator

Syntax

clear active-charging tcp-proxy statistics [rulebase *rulebase_name* **]**

rulebase *rulebase_name*

Clears TCP Proxy statistics for the specified rulebase.
rulebase_name must be the name of a rulebase, and must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to clear all ACS TCP Proxy statistics.

Example

The following command clears ACS TCP Proxy statistics for the rulebase named *test14*:

clear active-charging tcp-proxy statistics rulebase *test14*

clear active-charging url-blacklisting statistics

This command clears URL Blacklisting feature related statistics.

Product

CF

Privilege

Security Administrator, Administrator, Operator

Syntax

clear active-charging url-blacklisting statistics [rulebase name *rulebase_name* **] [| { grep** *grep_options* **| more }]**

rulebase name *rulebase_name*

Clears URL Blacklisting information for the specified rulebase.
rulebase_name must be the name of a rulebase, and must be a string of 1 through 63 characters in length.

grep *grep_options* **| more**

Specifies that the output of the command must be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to clear URL Blacklisting feature related statistics, optionally for a specific rulebase.

Example

The following command clears URL Blacklisting feature related statistics for *rulebase12*:

clear active-charging url-blacklisting statistics rulebase name *rulebase12*

clear administrator

This command ends the session of an administrative user specified by either user name or session ID.

Product

All

Privilege

Security Administrator, Administrator

Syntax

clear administrator { name *user_name* **| session id** *id_num***}**

name *user_name*

Identifies the user name of the administrative user.

session id *id_num*

Identifies the ID number of the administrative user session as displayed in the **show administrators session id** command output.

Usage

This command is used to terminate command line interface sessions for other administrative users.

Example

The following command ends the session of the administrative user identified as user1:

```
clear administrator name user1
```

The following command ends the session of the administrative user with the session ID of 3:

```
clear administrator session id 3
```

clear alarm

Clears outstanding alarm conditions

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

clear alarm { all | chassis | id *num* **| port** *slot/port* **| slot** *slot* **}**

all

Clear all outstanding alarms

chassis

Clears chassis-wide and fan tray alarms

id *num*

Clears a specific alarm by its internal alarm ID. *num* is the internal alarm identification number.

port *slot/port*

Clears alarms for the specified port. *slot/port* is the port to clear alarms for.*slot* is the slot that the card is installed in and *port* is the port on that card.

slot *slot*

Clears alarms for the specified slot. *slot* is the slot to clear alarms for.

Usage

Use this command to clear outstanding alarm conditions.

Example

To clear all outstanding alarms, use the following command:

```
clear alarm all
```

To clear all alarms for slot 7, enter the following command:

```
clear alarm slot 7
```

clear asngw-service

This command clears the service session statistics of an ASN GW service specified by either service name or trusted peer address.

Product

All

Privilege

Security Administrator, Administrator

Syntax

clear asngw-service statistics [name *svc_name* **| peer-address** *ip_address* **]**

name *svc_name*

Identifies the name of the ASN GW service to clear all service statistics.

peer-address *ip_address*

Identifies the IP address of the ASN GW peer to clear all service statistics.

Usage

This command is used to terminate command line interface sessions for ASN GW services.

Example

The following command clears the service session statistics of ASN GW service named as asn_svc1:

clear asngw-service statistics name *asn_svc1*

clear asnpc-service

This command clears the service session statistics of an ASN paging controller service specified by either ASN PC service name or trusted paging controller peer address.

Product

All

Privilege

Security Administrator, Administrator

Syntax

clear asnpc-service statistics [name *svc_name* **| peer-address** *ip_address* **]**

name *svc_name*

Identifies the name of the ASN PC service to clear all service session statistics.

peer-address *ip_address*

Identifies the IP address of the ASN PC peer to clear all service statistics.

Usage

This command is used to terminate command line interface sessions for ASN PC services.

Example

The following command clears the service session statistics of ASN PC service named as asnpc_svc1:

clear asnpc-service statistics name *asnpc_svc1*

clear apn statistics

Deletes all previously gathered statistics for either a specific APN or all APNs configured with the given context.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear apn statistics [ name apn_name ]
```

name *apn_name*

Specifies the name of a specific APN configured in the context for which to clear statistics.
apn_name is the name of the APN and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

Usage

Statistics for a single APN can be cleared using the **name** keyword. Statistics for all APNs in the context can be deleted by entering the command with no keywords.
If this command is executed from within the local context with no keywords, statistics will be cleared for every APN configured on the system regardless of context. In addition, if the name keyword is used when executing from within the local context, statistics for all APNs configured with the specified name will be cleared regardless of context.

Example

The following command clears statistics for an apn called isp1:

```
clear apn statistics isp1
```

clear bcmcs statistics

Clears BCMCS statistics.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator

Syntax

clear bcmcs statistics [pdsn-service *service_name* **]**

pdsn-service *service_name*

Defines a specific PDSN service for which to clear BCMCS-specific statistics. This value must be a string consisting of up to 63 characters.

Usage

Use this command to clear accumulated BCMCS statistics. You may specify an individual PDSN or peer to selectively clear statistics.

Example

clear bcmcs statistics
clear bcmcs statistics pdsn-service ***service_name***

clear blacklisted-gtpu-bind-address

Clears the GTP-U loopback address blacklisted by a specific RNC as defined for a specific IuPS Service configuration.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

clear blacklisted-gtpu-bind-address *ip_address* **rnc-id** *rnc_id* **mcc** *mcc_num* **mnc** *mnc_num* **iups-service** *name*

ip_address

Specifies the IP loopback address that has been blacklisted. This loopback address was originally defined with the **associate-gtpu-bind-addfress** command in the Radio-Network-Controller configuration mode of the IuPS Service.
ip_address must be specified using the standard IPv4 dotted decimal notation.

Usage

This command enables this loopback address to be used for future RAB-assignment requests.

Example

clear blacklisted-gtpu-bind-address ***1.1.1.1*** **rnc-id** ***2*** **mcc** ***123*** **mnc** ***321*** **iups-service** ***iups1***

clear bssap+ statistics

Clears/deletes the statistics for Base Station System Application Part plus in a Gs service sessions.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

clear bssap+ statistics [gs-service *gs_svc_name* **] [vlr { name** *vlr_name* **| isdn-number** *E164_ISDN_Num* **}]**

gs-service *gs_svc_name*

Specifies the name of a specific Gs service to clear the BSSAP+ information.
gs_svc_name is the name of a configured Gs service for which BSSAP+ is applied and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

vlr { name *vlr_name* **| isdn-number** *E164_ISDN_Num* **}**

Specifies the name of the VLR or SS7 address in E.164 ISDN format to clear the BSSAP+ information.
name *vlr_name* is name of the VLR must be an alpha and/or numeric string of 1 to 63 characters.
E164_VLR_num is an ISDN number for VLR per E.164 number plan and must be an numerical string of 1 to 15 digits.

Usage

Use this command to delete or clear the statistics of BSSAP+ application on a system.

Example

The following command clears the information about BSSAP+ in a Gs service named *gssvc1*.

```
clear bssap+ statistics gs-service gssvc1
```

clear bulkstats

Clears counters and accumulated bulk statistics related information.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear bulkstats { counters | data }
```

counters

Clears the counters maintained by the system's "bulkstats" facility.

data

Clears any accumulated data that has not been transferred. This includes any "completed" files that haven't been successfully transferred.

Usage

Once bulk statistics collection is enabled, the system stores the information until the specified transfer criteria is met or until a manual transfer is initiated. The system maintains counters for the "bulkstats" software facility. (Refer to the **data** keyword for the **show bulkstats** command for information on viewing the counters.)

This command can be used to delete bulk statistics information that has been collected but not transferred and/or to clear the counters that have been maintained.

Example

The following command clears bulk statistics-related counters:

```
clear bulkstats counters
```

clear config

This command replaces the active configuration source file with an empty configuration where possible.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
clear config [ -noconfirm ]
```

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Clear the current configuration when a complete over right is desired or if it is necessary to start from an empty configuration.

Important: Clearing the configuration will cause the active configuration source file to be empty and of no use in configuring the system to an active state providing service.

Important: It is suggested that this command only be performed on configurations which have been backed up for easy restoration.

Example

The following command clears the active configuration after the user provides confirmation of the request.

```
clear config
```

The following command clears the active configuration source file immediately with no user confirmation.

```
clear config -noconfirm
```

clear congestion-control statistics

Clears the congestion control statistics for all instances of the specified manager type.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear congestion-control statistics { a11mgr | asngwmgr | asnpcmgr | hamgr |
gtpcmgr | ipsecmgr | imsimgr | l2tpmgr }
```

a11mgr

Clears the statistics for all A11 Manager instances.

asngwmgr

Clears the statistics for all ASN GW Manager instances

asnpcmgr

Clears the statistics for all ASN PC-LR Manager instances

hamgr

Clears the statistics for all HA Manager instances.

gtpcmgr

Clears the statistics for all GTPC Manager instances.

ipsecmgr

Clears the statistics for all IPSEC Manager instances.

imsimgr

Clears the statistics for all IMSI Manager instances.

l2tpmgr

Clears the statistics for all L2TP Manager instances.

Usage

Use this command to statistics for all instances of the specified manager.

Important: When this command is issued in any context other than the local context, only instances of the specified manager for the current context have the statistics cleared. When the current context is the local context, all instances of the specified manager type in all contexts have the statistics cleared.

Example

Clear the statistics for all instances of the A11 manger, by entering the following command:

```
clear congestion-control statistics a11mgr
```

clear content-filtering category statistics

This command clears the Category-based Content Filtering application statistics.

Product

CF

Privilege

Security Administrator, Administrator, Operator

Syntax

clear content-filtering category statistics [facility srdbmgr instance *instance_value* **]**

facility srdbmgr instance *instance_value*

Clears logged events for the specified SRDB Manager instance.
instance_value must be an integer from 1 through 8.
In StarOS 9.0 and later releases, *instance_value* must be an integer from 1 through 10000.

Usage

Use this command to clear all Category-based Content Filtering application statistics, or statistics for a specific SRDB Manager instance.

Example

The following command clears all Category-based Content Filtering application statistics:

```
clear content-filtering category statistics
```

clear crash

The clear crash command removes a specific crash file or all crash files.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

clear crash [list | number *crash_num* **]**

list | number *crash_num*

list: removes all crash files.
number *crash_num*: removes only the crash file specified as *crash_num* which must be within the range of 1 through 30.

Usage

CLear crashes for general maintenance activities in cleaning out old, unused, or files which are of no importance.

Example

The following will remove all crash files.

```
clear crash list
```

The following command will remove only crash file *27*.

```
clear crash number 27
```

clear credit-control statistics

This command is used to clear credit control statistics.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator

Syntax

clear credit-control statistics cc-service *cc_service_name*

cc-service *cc_service_name*

Specifies the credit control service name.
cc_service_name must be an existing Credit Control service, and must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to clear active credit control statistics.

Example

The following command clears the configured credit control statistics for a service named *service1*:

clear credit-control statistics cc-service *service1*

clear crypto

The clear crypto command clears crypto associations or crypto statistics.

Product

PDSN, HA, GGSN, PDG/TTG, PDIF, SCM

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear crypto { isakmp [ tag map_name | peer peer_ip ] | security-association {
counters tag map_name [ tx | rx ] | tag map_name | peer peer_ip } | statistics {
ikev2 | ipsec-3gpp-cscf } [service-ip-address ip-address | service-name name ] }
```

isakmp [tag *map_name* **| peer** *peer_ip* **]**

When no keywords are specified, this command clears all of the ISAKMP security associations for the current context.
tag *map_name*: Clears the ISAKMP SAs for the specified crypto map. *map_name* is the name of an existing crypto map.
peer *peer_ip*: Deletes the ISAKMP SAs for the specified peer. *peer_ip* must be entered in standard IPv4 notation.

security-association { counters map *map_name* **[tx | rx] | tag** *map_name* **| peer** *peer_ip* **}**

counters tag *map_name* **[tx | rx]**: Resets the counters for the specified crypto map. *map_name* is the name of an existing crypto map. **tx** specifies that only the transmit SA counters are reset. **rx** specifies that only the receive SA counters are reset. If neither **tx** or **rx** are specified, both transmit and receive SA counters are reset.
tag *map_name*: Tears down a Security Association (SA) for the specified crypto map. *map_name* is the name of an existing crypto map.
peer *peer_ip*: Clears the SAs for all tunnels who have the peer at the specified IP address. *peer_ip* must be entered in standard IPv4 notation.

Caution: Modification(s) to an existing crypto map and/or ISAKMP policy configuration will not take effect until the related security association has been cleared.

statistics { ikev2 | ipsec-3gpp-cscf } [service-ip-address *ip-address* **| service-name** *name* **]**

ikev2: Clears global IKEv2 statistics for the current context.
ipsec-3gpp-cscf: Clears global CSCF IPSec statistics for the current context.
service-ip-address *ip-address*: Clears statistics for the specified service-ip address. **service-name** *name*: Clears statistics for the specified service name.

Usage

Clear SAs and apply changes to the crypto map or clear the crypto statistics for this context.

Example

The following clears all IKEv2 crypto statistics for the current context:

```
clear crypto statistics ikev2
```

clear cscf service

Resets statistics counters for a specific CSCF service, all CSCF services, or for all services within a specified context (VPN).

Product

SCM

Privilege

Security Administrator, Administrator, Operator

Syntax

clear cscf service { diameter { location-info | policy-control} statistics [service-name *service_name* **| vpn-name** *name* **] | li-packet-cable statistics [service-name** *service_name***] | performance-counters name** *service_name* **| statistics name** *service_name* **{ all | calls | ip-security | message | package-name { message-summary | presence | reg | winfo } | registrations | sigcomp | tcp | vpn-name** *name* **} }**

---

diameter { location-info | policy-control } statistics [service-name *service_name* **| vpn-name** *name* **]**

Clears Diameter (DPECA) statistics on the CSCF Rx interface with the configuration information.
service-name *service_name*: Specifies the name of a CSCF service for which the statistics will be reset. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.
vpn-name *name*: Specifies the name of a context in which all statistics for all services will be reset. *name* must be an existing context and be from 1 to 79 alpha and/or numeric characters.

---

li-packet-cable statistics [service-name *service_name* **]**

Clears Lawful Intercept statistics.
service-name *service_name*: Clears Lawful Intercept statistics for a specific CSCF service configured on this system. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

---

performance-counters name *service_name*

Clears all CSCF performance counters for a specific CSCF service configured on this system.
service_name must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters

---

statistics name *service_name* **{ all | calls | ip-security | message | package-name { message-summary | presence | reg | winfo } | registrations | sigcomp | tcp | vpn-name** *name* **}**

Clears service statistics for a specific CSCF service configured on this system. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.
all: Clears all CSCF service statistics.
calls: Clears statistics related to CSCF calls.
ip-security: Clears statistics related to CSCF IPSec.
message: Clears statistics for the SIP method MESSAGE.
package-name: Clears statistics for the associated event package.

- **message-summary**: Clears statistics for the “message-summary” event package.
- **presence**: Clears statistics for the “presence” event package.
- **reg**: Clears statistics for the “reg” event package.
- **winfo**: Clears statistics for the “watcher-info” event package.

registrations: Clears statistics related to CSCF registrations, re-registrations, and de-registrations.
sigcomp: Clears statistics related to CSCF sigcomp.
tcp: Displays session statistics related to CSCF TCP.
vpn-name *name*: Clears statistics for a specific CSCF service configured in a specific context on this system. *name* must be an existing context and be from 1 to 79 alpha and/or numeric characters.

Important: This keyword must be followed by another statistics-related keyword.

Usage

Use this command to reset statistics counters for CSCF services. This command will reset the counters in the output of the **show cscf service statistics** command.

Important: This command will not clear current registered users and current CSCF sessions.

Example

The following command resets all statistics for a service named *cscf1*:

```
clear cscf service statistics name cscf1 all
```

clear cscf sessions

Clears statistics for CSCF sessions on this system.

Product

SCM

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear cscf sessions { counters { calls | subscription } service service_name |
service service_name { all | aor aor | session-id id  }
```

counters { calls | subscription } service *service_name*

Clears counters for all CSCF sessions matching the filter criteria.
calls: Counters associated with calls in CSCF service.
subscription: Counters associated with subscriptions in CSCF service.
service *service_name*: Counters on specific CSCF service. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

service *service_name* **{ all | aor** *aor* **| session-id** *id* **}**

Clears session information for all CSCF sessions matching the filter criteria.
service *service_name*: Session statistics on specific CSCF service. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

- **all**: Specifies that session statistics are to be cleared for all sessions on this service.
- **aor** *aor*: Specifies that session statistics are to be cleared for sessions at this specific AoR. *aor* must be an existing AoR and be from 1 to 79 alpha and/or numeric characters.
- **session-id** *id*: Specifies that session statistics are to be cleared for sessions with this ID. *id* must be an existing session ID and be from 1 to 63 alpha and/or numeric characters.

Usage

Use this command to clear session information for CSCF sessions.

Example

The following command resets all session statistics for a service named *cscf1*:

```
clear cscf sessions service cscf1 all
```

clear cscf sip

Resets SIP statistics counters for a specific CSCF service, all CSCF services, or for all services within a specified context (VPN) or interface.

Product

SCM

Privilege

Security Administrator, Administrator, Operator

Syntax

clear cscf sip statistics [name *service_name* **[interface { domain name** *domain_name* **| ip address** *ip_address* **} | vpn-name** *name* **]**

name *service_name*

Specifies the name of a CSCF service for which the SIP statistics will be reset. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

interface { domain name *domain_name* **| ip address** *ip_address* **}**

SIP statistics will be reset in this interface.
domain name *domain_name*: Specifies the domain associated with the CSCF service. *domain_name* must be an existing domain and be from 1 to 64 alpha and/or numeric characters.
ip address *ip_address*: Specifies the destination or source ip address associated with the CSCF service.

vpn-name *name*

Specifies the name of a context in which all SIP statistics for all services will be reset. *name* must be an existing context and be from 1 to 79 alpha and/or numeric characters.

Usage

Use this command to reset SIP counters found in the output of the **show cscf sip** command.

Example

The following command resets the SIP statistics for a service named *cscf1*:

clear cscf sip statistics name *cscf1*

clear cscf subscription

Clears all subscriptions for a named service or for individual subscribers within the service.

Product

SCM

Privilege

Security Administrator, Administrator, Operator

Syntax

clear cscf subscription service *service_name* **{ all | from-aor** *subscriber_aor* **to-aor** *resource_aor* **}**

service *service_name*

Specifies the name of a CSCF service for which the subscription(s) will be cleared. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

all | from-aor *subscriber_aor* **to-aor** *resource_aor*

all: Removes all CSCF subscriptions for the specified service.
from-aor *subscriber_aor*: Removes all CSCF subscriptions for a specified subscriber in a specified service.
subscribed-to *resource_aor*: Removes all CSCF subscriptions for a specified subscriber in a specified service with a specified subscribed-to resource AoR.

Usage

Use this command to clear subscriptions to enforce policies. This command initiates a SUBSCRIBE request with Expires as 0 in the corresponding subscription dialog.

Example

The following command clear all subscriptions for a CSCF service named *cscf1*:

```
clear cscf subscription service cscf1 all
```

clear diameter aaa-statistics

This command clears Diameter AAA statistics.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear diameter aaa-statistics [ all | [ group aaa_group ] server diameter_server
] [ | { grep grep_options | more } ]
```

all

Clears all Diameter server statistics.

group *aaa_group*

Clears Diameter server statistics for the specified AAA group.
aaa_group must be the name of a AAA group, and must be a string of 1 through 64 characters in length.

server *diameter_server*

Clears Diameter server statistics for the specified Diameter server.
diameter_server must be the name of a Diameter server, and must be a string of 1 through 64 characters in length.

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified.
A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to clear Diameter AAA statistics.

Example

The following command clears Diameter server statistics for the specified AAA group:

```
clear diameter aaa-statistics group aaa_group
```

clear diameter statistics

This command clears Diameter statistics.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear diameter statistics [ [ proxy ] endpoint endpoint_name [ peer-host host_id
[ peer-realm realm_id ] ] ] [ | { grep grep_options | more } ]
```

endpoint *endpoint_name*

Clears endpoint related statistics.
endpoint_name must be the name of an endpoint, and must be a string of 1 through 63 characters in length.

proxy

Clears proxy related statistics.

peer-host *host_id*

Clears statistics for the specified Diameter peer host ID.
host_id must be the Diameter peer host ID, and must be a string 1 through 255 characters in length.

peer-realm *realm_id*

Clears statistics for the specified Diameter peer realm.
realm_id must be the Diameter peer realm ID, and must be a string 1 through 127 characters in length.

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified.
A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to clear Diameter statistics.

Example

The following command clears all Diameter statistics for the specified endpoint:

```
clear diameter statistics endpoint endpoint_name
```

clear dhcp statistics

Deletes all previously gathered statistics for either a specific DHCP server or all DHCP servers configured within the given context.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear dhcp statistics [ dhcp-service svc_name | server ip_address ]
```

dhcp-service *svc_name*

The name of a specific DHCP service for which to clear statistics.
svc_name is the name of the DHCP service and can be from 1 to 63 alpha and/or numeric characters in length and is case sensitive.

server *ip_address*

Specifies the IP address of a specific DHCP server configured in the context for which to clear statistics.
ip_address must be entered in dotted decimal notation.

Usage

Statistics for a single server can be cleared using the **server** keyword. Statistics for all DHCP servers in the context can be deleted by entering the command with no keywords.
This command can be executed from any context configured on the system.
If this command is executed from within the local context with no keywords, statistics will be cleared for every DHCP server configured on the system regardless of context. In addition, if the server keyword is used when executing from within the local context, statistics for all DHCP servers configured with the specified name will be cleared regardless of context.

Example

The following command clears statistics for all configured DHCP servers within the context:

```
clear dhcp statistics
```

clear dns-client

Clears DNS cache and/or statistics for a specified DNS client.

Product

SCM

Privilege

Security Administrator, Administrator, Operator

Syntax

clear dns-client *name* **{ cache [query-name** *name* **| query-type { A | SRV }] | statistics }**

dns-client *name*

Defines the name of the DNS client whose cache and/or statistics are being cleared. *name* must be an existing DNS client and be from 1 to 255 alpha and/or numeric characters in length.

cache [query-name *name* **| query-type { A | SRV }]**

Specifies that the cache for the defined DNS client is to be cleared.
query-name *name*: Filters DNS results based on the domain name. *name* must be from 1 to 255 characters in length. *name* is the domain name used to perform the DNS query. *name* is different from the actual domain name which is resolved. For example, to resolve the SIP server for *service.com*, the query name is *_sip._udp.service.com* and the query type is **SRV**.
query-type:

- **A**: Filters DNS results based on domain IP address records (A records).
- **SRV**: Filters DNS results based on service host records (SRV records).

statistics

Specifies that statistics for the defined DNS client are to be cleared.

Usage

Use this command to clear DNS cache and/or statistics for a specified DNS client.

Example

The following command clears statistics for a DNS client named *domain1.com*:

clear dns-client *domain1.com* **statistics**

clear egtpc

Clears enhanced GPRS Tunneling Protocol control plane statistics and counters found in show command outputs and bulk statistics associated with all eGTP-C-related services or those defined by the parameters in this command.

Product

MME, P-GW, S-GW

Privilege

Operator

Syntax

clear egtpc statistics [egtp-service *name* **| interface-type { interface-mme | interface-pgw-ingress | interface-sgw-egress | interface-sgw-ingress } | mme-address** *ip_address* **| pgw-address** *ip_address* **| sgw-address** *ip_address* **]**

egtp-service *name*

Clears all statistics and counters associated with a specific eGTP service name. *name* must be an existing eGTP service name and be from 1 to 63 alpha and/or numeric characters.

interface-type { interface-mme | interface-pgw-ingress | interface-sgw-egress | interface-sgw-ingress }

interface-mme: Clears statistics and counters derived from all MME interface types associated with this system.
interface-pgw-ingress: Clears statistics and counters derived from all P-GW ingress interface types associated with this system.
interface-sgw-egress: Clears statistics and counters derived from all S-GW egress interface types associated with this system.
interface-sgw-ingress: Clears statistics and counters derived from all S-GW ingress interface types associated with this system.

mme-address *ip_address*

Clears all statistics and counters derived from a specific MME IP address. *ip_address* must be an existing MME IP address and be specified in dotted decimal notation (for IPv4) or colon-separated notation (for IPv6).

pgw-address *ip_address*

Clears all statistics and counters derived from a specific P-GW IP address. *ip_address* must be an existing P-GW IP address and be specified in dotted decimal notation (for IPv4) or colon-separated notation (for IPv6).

sgw-address *ip_address*

Clears all statistics and counters derived from a specific S-GW IP address. *ip_address* must be an existing S-GW IP address and be specified in dotted decimal notation (for IPv4) or colon-separated notation (for IPv6).

Usage

Use this command to clear running statistics and counters found in show command and bulk statistics outputs for all eGTP-C-related services or for specific interfaces, services, or IP addresses as specified by parameters in this command.

Example

The following command clears eGTP-C statistics and counter associated with all P-GW ingress interfaces configured on this system:

```
clear egtpc statistics interface-type interface-pgw-ingress
```

The following command clears eGTP-C statistics and counter associated with all MME interfaces configured on this system:

```
clear egtpc statistics interface-type interface-mme
```

clear firewall

This command is obsolete.

clear gmm-sm statistics

Deletes all previously gathered GMM-SM statistics within the given context based on the specified criteria.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

clear gmm-sm statistics [gmm-only | sm-only] [gprs-service *srvc_name* **[nsei** *nse_id* **| routing-area mcc** *mcc_id* **mnc** *mnc_id* **lac** *lac_id* **rac** *rac_id* **]] | [sgsn-service** *srvc_name* **[rnc mcc** *mcc_id* **mnc** *mnc_id* **rnc-id** *rnc_id* **| routing area mcc** *mcc_id* **mnc** *mnc_id* **lac** *lac_id* **rac** *rac_id* **]]**

gmm-only

Enter this keyword to display only GPRS mobility management (GMM) information for other specified keyword parameters for the current context.

sm-only

Enter this keyword to display only session management (SM) information for other specified keyword parameters for the current context.

gprs-service *srvc_name*

Enter this keyword to display the statistics for the specified GPRS service. The display request can be narrowed by adding additional keywords.
srvc_name must be an alphanumeric string of 1 to 63 alphanumeric characters.

nsei

Enter this keyword to display the GMM/SM session statistics for the identified network service entity (NSEI).

sgsn-service *srvc_name*

Enter this keyword to display the statistics for the specified SGSN service. The display request can be narrowed by adding additional keywords.
srvc_name must be an alphanumeric string of 1 to 63 alphanumeric characters.

rnc

Enter this keyword to fine-tune the display of the GMM/SM session statistics just for the specified (rnc-id) radio network controller (RNC).

rnc-id *rnc_id*

Enter this keyword to identify the specific RNC.
rnc_id must be an integer from 0 through 4095.

routing-area mcc *mcc_id* **mnc** *mnc_id* **lac** *lac_id* **rac** *rac_id*

Enter the **routing-area** keyword to fine-tune the display of the GMM/SM session statistics for a specified routing area (RA) identified by the MCC, MNC, LAC and RAC.

mcc *mcc_id*

Enter this keyword to specify the mobile country code (MCC) as part of the identification of the RNC or RA. *mcc_id* must be an integer from 100 through 999.

mnc *mnc_id*

Enter this keyword to specify the mobile network code (MNC) as part of the identification of the RNC or RA. *mnc_id* must be an integer from 00 through 999.

lac *lac_id*

Enter this keyword to specify the location area code (LAC) as part of the identification of the RNC or RA. *lac_id* must be an integer from 1 through 65535.

rac *rac_id*

Enter this keyword to specify the routing area code (RAC) as part of the identification of the RNC or RA. *rac_id* must be an integer from 1 through 255.

Usage

Use this command to delete statistics for the GMM/SM session configurations for SGSN services.

Example

The following command deletes GMM/SM statistics for a specific routing area defined for the GPRS service:

```
clear gmm-sm statistics gprs-service gprs1 routing-area mcc 123 mcc 131
lac 24 rac 11
```

The following command clears all collected information for GMM/SM statistics:

```
clear gmm-sm statistics verbose
```

clear gtpc statistics

Deletes all previously gathered GTPC (GTPv0, GTPv1-C, GTPv1-U) statistics within the given context based on the specified criteria.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

clear gtpc statistics [apn *apn_name* **] [custom1] [ggsn-service** *ggsn_name* **] [sgsn-address** *sgsn_address* **]**

apn *apn_name*

Specifies the name of an APN configured in the context for which to delete GTPC statistics.
apn_name can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

custom1

Clears the statistics of GTP-C messages for preservation mode and free of charge service.
This keyword is customer-specific license enabled and used for Preservation-Mode and Free-of-Charge Service which are enabled under customer-specific license. For more information on this support, contact your local representative.

ggsn-service *ggsn_name*

Specifies the name of a GGSN service configured in the context for which to delete GTPC statistics.
ggsn_name can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

sgsn-address *sgsn_address*

Specifies the IP address of an SGSN for which to delete GTPC statistics.
sgsn_address must be expressed in dotted decimal notation.

Usage

GT-C statistics can be cleared for a single APN, GGSN service, or SGSN. All GTPC statistics in the context can be deleted by entering the command with no keywords.
This command can be executed from any context configured on the system.
If this command is executed from within the local context with no keywords, all GTPC statistics will be cleared regardless of context.
GTPP statistics are not affected by this command.

Example

The following command clears all GTPC statistics within the context:

```
clear gtpc statistics
```

clear gtpp statistics

Deletes all previously gathered GTPP statistics within the given context based for either single or all charging gateway functions (CGFs).

Product

GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear gtpp statistics [ cgf-address ip-address ]
```

cgf-address *cgf_address*

Deletes statistics for a particular CGF.
cgf_address is the IP address of the CGF for which statistics are to be deleted. It must be expressed in dotted decimal notation

Usage

Statistics for a single CGF can be cleared using the **cgf-address** keyword. Statistics for all CGFs in the context can be deleted by entering the command with no keywords.
This command can be executed from any context configured on the system.
If this command is executed from within the local context with no keywords, statistics will be cleared for every CGF configured on the system regardless of context. In addition, if the cgf-address keyword is used when executing from within the local context, statistics for all CGFs configured with the specified name will be cleared regardless of context.

Example

The following command deletes all GTPP statistics for a CGF with an IP address of 192.168.1.42:

```
clear gtpp statistics cgf-address 192.168.1.42
```

clear gtpp storage-server local file statistics

This command clears AAA proxy GTPP group level statistics for CDRs stored on the local SMC hard disk.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear gtpp storage-server local file statistics [ group name name ]
```

Usage

If executed from the local context, this command clears statistics for all GTPP groups configured on the system. If executed from the context within which the storage servers (SMC hard disk) is configured, statistics are deleted for only that context.

clear gtpp storage-server statistics

Clears statistics for configured GTPP storage servers (GSS).

Product

GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear gtpp storage-server statistics
```

Usage

If executed from the local context, this command clears statistics for all GTPP storage servers configured on the system. If executed from the context within which the servers are configured, statistics are deleted for only those servers.

clear gtpu statistics

Clears enhanced GPRS Tunneling Protocol user plane statistics and counters found in show command outputs and bulk statistics associated with all GTP-U-related services or those defined by the parameters in this command.

Product

P-GW, S-GW

Privilege

Operator

Syntax

clear gtpu statistics [gtpu-service *name* **| peer-address** *ip_address* **]**

gtpu-service *name*

Clears all statistics and counters associated with a specific GTP-U service name. *name* must be an existing GTP-U service name and be from 1 to 63 alpha and/or numeric characters.

peer-address *ip_address*

Clears all statistics and counters derived from a specific peer IP address. *ip_address* must be an existing peer IPv4 or IPv6 address and be specified in dotted decimal notation (for IPv4) or colon-separated notation (for IPv6).

Usage

Use this command to clear running statistics and counters found in show command and bulk statistics outputs for all GTP-U-related services or for specific services or IP addresses as specified by parameters in this command.

Example

The following command clears GTP-U statistics and counter associated with a GTP-U service name *gtpu-12* configured on this system:

clear gtpu statistics gtpu-service *gtpu-12*

clear hd-storage-policy

Clears statistic information for HD storage policies configured on the system.

Product

HSGW, P-GW, S-GW

Privilege

Operator

Syntax

clear hd-storage-policy statistics { all | name *name* **}**

statistics { all | name *name* **}**

all: Specifies that ACR statistic information for all HD storage policies configured on the system is to be cleared.
name *name*: Specifies that ACR statistic information for an HD storage policy with the specified name is to be cleared.

Usage

Use this command to clear statistics for HD storage policies configured on the system.

Example

The following command clears statistics for an HD storage policy named *pgwsgw*:

clear hd-storage-policy statistics name *pgwsgw*

clear hsgw-service

Clears statistic information for HSGW services configured on the system.

Product

HSGW

Privilege

Operator

Syntax

clear hsgw-service statistics { all | name *name* **}**

statistics { all | name *name* **}**

all: Specifies that HSGW service statistic information for all HSGW services configured on the system is to be cleared.
name *name*: Specifies that HSGW service statistic information for an HSGW service with the specified name is to be cleared.

Usage

Use this command to clear statistics for HSGW services configured on the system.

Example

The following command clears statistics for an HSGW service named *hsgw3*:

clear hsgw-servicey statistics name *hsgw3*

clear ims-authorization

This command clears statistics for all or for a specified IMS Authorization Service.

Product

GGSN, SCM

Privilege

Security Administrator, Administrator, Operator

Syntax

clear ims-authorization { policy-control statistics [ims-auth-service *service_name* **] | service statistics [name** *service_name* **] } [| { grep** *grep_options* **| more }]**

ims-auth-service *service_name*

Clears statistics for the specified IMSA service.
service_name must be the name of an IMSA service, and must be a string of 1 through 64 characters in length.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to clear IMSA Service statistics.

Example

The following command clears IMSA policy-control statistics for an IMSA service named *test_service*:

```
clear ims-authorization policy-control statistics ims-auth-service
test_service
```

clear ip access-group statistics

This command clears all interface ACL statistics and the context level ACL statistics that have been configured in the current context. Be aware that updating an access list also causes all ip access-groups utilizing the list to be cleared.

Product

PDSN, GGSN. ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
clear ip access-group statistics
```

Usage

Use this command to clear all interface ACL statistics and the context level ACL statistics that have been configured in the current context.

Example

The following command clears the ACL statistics:

```
clear ip access-group statistics
```

clear ip arp

Clears the address resolution protocol cache for a given IP address.

Product

All

Privilege

Security Administrator, Administrator

Syntax

clear ip arp *ip_address*

ip_address

Specifies the IP address for which to clear the ARP cache. *ip_address* must be specified using the standard IPv4 dotted decimal notation.

Usage

Clear the ARP cache when network changes have occurred for the case where the cached data may cause undue overhead in routing of packets.

Example

The following command clears the ARP cache for the IP address *1.2.3.4*:

clear ip arp *1.2.3.4*

clear ip bgp peer

Resets BGP connections for all peers or for specified peers in the current context.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

clear ip bgp peer { *ip_address* | all | as *as_num* } [in | out | soft | vpnv4]

ip_address

The IP address of the neighbor for which BGP connections should be reset. *ip_address* is an IPv4 address in dotted-decimal notation.

all

Reset BGP connections for all peers.

as *as_num*

Reset BGP connections for all peers in the specified AS. *as_num* must be an integer from 1 through 65535.

in

Soft reconfigure inbound updates.

out

Soft reconfigure outbound updates.

soft

Soft reconfigure inbound and outbound updates.

vpnv4

Clears bgp sessions with the vpnv4 address family.

Usage

Use this command to BGP information for the current context.

Example

The following command resets BGP connections for all neighbors:

```
clear ip bgp peer all
```

clear ip localhosts

This command removes the host specified from the current context's local host list for IP address mappings.

Product

All

Privilege

Security Administrator, Administrator

Syntax

clear ip localhosts [*host_name* **]**

host_name

Specifies the name of the host to be removed. Value must be a string from 1 to 1023 characters. When omitted, all local host name mappings will be removed.

Usage

Clear a host name when it is no longer valid for the current context to access. The host name specified will be unrecognized by the current context once the command is performed.

Example

clear ip localhosts

clear ip localhosts *1.2.3.4*

clear ip localhosts *remoteABC*

clear ip ospf process

Clears OSPF database information for the current context and re-establishes neighbor adjacency.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
clear ip ospf process
```

Usage

Use this command to clear the OSPF database information for the current context and re-establishes neighbor adjacency.

Example

The following command clears the OSPF database information for the current context and re-establishes neighbor adjacency:

```
clear ip ospf process
```

clear ipv6 neighbors

Clears an ipv6 address from the neighbor cache.

Product

PDIF

Privilege

Administrator, Security Administrator

Syntax

clear ipv6 neighbors *ip_address*

Usage

Clears a specific address from the neighbor cache.

Example

Use the following example to clear *3ffe:ffff:101::230:6eff:fe04:d9aa/48*:

clear ipv6 neighbors *3ffe:ffff:101::230:6eff:fe04:d9aa/48*

clear l2tp

Clears all or specific L2TP statistics or clears and disconnects all or specified sessions or tunnels.

Product

PDSN, GGSN, LNS

Privilege

Security Administrator, Administrator, Operator

Syntax

statistics [lac-service *service_name* **| lns-service** *service_name* **| peer-address** *ip_address* **]**

With no optional keywords specified, this command clears all L2TP statistics for the current context.
lac-service *service_name*: Clears all L2TP statistics for the specified LAC service in the current context.
lns-service *service_name*: Clears all L2TP statistics for the specified LNS service in the current context.
peer-address *ip_address*: Clears all L2TP statistics for the destination (peer LNS) at the specified IP address. The IP address is specified using the standard IPv4 dotted decimal notation.

tunnels { all [clear-sa] | callid *call_id* **| lac-service** *service_name* **[clear-sa] | peer-address** *ip_address* **[clear-sa] }**

all: Clears all tunnels in the current context.
lac-service service_name: Clears all tunnels in the current context that belong to the specified LAC service and closes the tunnels.
lns-service service_name: Clears all tunnels in the current context that belong to the specified LNS service and closes the tunnels.
peer-address ip_address: Clears all tunnels in the current context whose destination (peer LNS) is the system at the specified IP address. The IP address is specified using the standard IPv4 dotted decimal notation.
callid call_id: Uses the unique identifier that specifies a particular tunnel in the system to clear that tunnel and disconnect it. The output of the command **show l2tp tunnels** contains a field labeled Callid Hint which lists the call id information to use with this command. This is an 8-Byte Hexadecimal number.
clear-sa: If any security associations have been established they are cleared.

Usage

Clear L2TP all or specific L2TP statistics or clear sessions in a tunnel and disconnect the tunnel.

Example

To clear all L2TP statistics for the current context, use the following command:

```
clear l2tp statistics
```

To clear all L2TP statistics for the LAC service named lac1, use the following command:

```
clear l2tp statistics lac-service lac1
```

Use the following command to clear L2TP statistics for the LNS peer at the IP address 10.10.10.100:

```
clear l2tp statistics peer-address 10.10.10.100
```

The following command clears and closes all tunnels in the current context:

```
clear l2tp tunnels all
```

The following command clears and closes all tunnels for the LAC service named lac2:

```
clear l2tp tunnels lac-service lac2
```

The following command clears and closes all tunnels the peer at the IP address 10.10.10.110:

```
clear l2tp tunnels peer-address 10.10.10.110
```

clear lawful-intercept

Clears information pertaining to lawful interception capability.

Product

PDSN, HA, LNS, GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear lawful-intercept statistics
```

statistics

Clears lawful-intercept statistics.

Usage

Use this command to clear statistics pertaining to Lawful Intercept functionality.

Important: You must log in to the system through a Secure Shell (SSH) using a system account that has li-administrator privileges to use this command. For details on using the Lawful Intercept capability of the system, refer to System Administration and Configuration Guide.

Example

The following clears all statistics for the Lawful Intercept functionality.

```
clear lawful-intercept statistics
```

clear lma-service statistics

Clears Local Mobility Anchor statistics and counters found in show command outputs and bulk statistics associated with all LMA services or a specific service defined by the parameter in this command.

Product

P-GW

Privilege

Operator

Syntax

clear lma-service statistics [name *service_name* **]**

name *service_name*

Clears statistics and counters for a specific LMA service name. *name* must be an existing LMA service name and be from 1 to 63 alpha and/or numeric characters.

Usage

Use this command to clear statistics and counters in show command outputs and bulk statistics for all LMA services or for a specific LMA service.

Example

The following command clears statistics and counters for an LMA service named *lma3*:

clear lma-service statistics name *lma3*

clear local-user

Clears information pertaining to local-user administrative accounts.

Product

All

Privilege

Security Administrator

Syntax

clear local-user { database [-noconfirm] | statistics | username *name* **lockout }**

database [-noconfirm]

Clears the local-user database. This command deletes all information for all local-user accounts.

Caution: Use this command only in the event of security concerns or to address concerns of the local-user account database integrity.

statistics

Clears statistics pertaining to local-user accounts.

userame *name* **lockout**

Removes lockouts associated with specific local-user accounts.
name is the name of the local-user account and can consist of from 3 to 16 alpha and/or numeric characters and is case sensitive.

Usage

This command can be used to remove local-user account lockouts, reset local-user-related statistics to 0, or to delete the local-user database.

Example

The following command removes the lockout placed on a local-user account named *SecureAdmin*:

clear local-user username *SecureAdmin* **lockout**

clear mag-service statistics

Clears Mobile Access Gateway statistics and counters found in show command outputs and bulk statistics associated with all MAG services or a specific service defined by the parameter in this command.

Product

HSGW, S-GW

Privilege

Operator

Syntax

clear mag-service statistics [name *service_name* **]**

name *service_name*

Clears statistics and counters for a specific MAG service name. *name* must be an existing MAG service name and be from 1 to 63 alpha and/or numeric characters.

Usage

Use this command to clears statistics and counters in show command outputs and bulk statistics for all MAG services or for a specific MAG service.

Example

The following command clears statistics and counters for a MAG service named *mag1*

clear mag-service statistics name *mag1*

clear maximum-temperatures

Clears information pertaining to component maximum temperatures.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear maximum-temperatures
```

Usage

Reset the timestamp to the current time and clear previous maximum temperatures for all temperature monitored components. This may be useful when preparing to study system performance, monitor usage, or trouble shoot the administrative interfaces.

Example

The following command resets the maximum temperature statistics for all monitored chassis components.

```
clear maximum-temperatures
```

clear mipfa statistics

This command clears the statistics for the mobile IP foreign agent. The statistics for a specific foreign agent service may be cleared by explicit command.

Product

PDSN, GGSN. ASN-GW

Privilege

Security Administrator, Administrator, Operator

Syntax

clear mipfa statistics [fa-service *name* **| peer-address** *ip_address* **]**

fa-service *name* **| peer-address** *ip_address*

fa-service *name*: Indicates the statistics for a specific service are to be cleared where the service is as specified by *name*. "Total sessions" counters for all peers associated with the service are also reset. *name* must be an existing FA service name.
peer-address *ip_address*: Indicates the statistics for the specific IP address, *ip_address*, are to be cleared. "Total sessions" counter for the specified peer is also reset. The IP address is specified using the standard IPv4 dotted decimal notation.

Usage

Clear all statistics for the MIP foreign agent or for a specific service. This may be useful in monitoring performance and troubleshooting as the statistics may be cleared at a well known time and then collected and transferred for review.

Example

The following clears all statistics for the mobile IP foreign agent.

```
clear mipfa statistics
```

The following command clears the statistics for the example service only.

```
clear mipfa statistics fa-service sampleService
```

```
clear mipfa statistics peer-address 1.2.3.4
```

clear mipha statistics

This command clears the statistics for the mobile IP home agent. The statistics for a home agent service may be cleared by explicit command.

Product

HA

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear mipha statistics [ ha-service name | peer-address ip_address ]
```

ha-service *name* **| peer-address** *ip_address*

ha-service *name*: indicates the statistics for a specific service are to be cleared where the service is as specified by *name*. "Total sessions" counters for all peers associated with the service are also reset. *name* must be an existing HA service name.
peer-address *ip_address*: indicates the statistics for the specific IP address, are to be cleared. "Total sessions" counter for the specified peer is also reset. The IP address is specified using the standard IPv4 dotted decimal notation.

Usage

Clear all statistics for the MIP home agent or for a specific service. This may be useful in monitoring performance and troubleshooting as the statistics may be cleared at a well known time and then collected and transferred for review.

Example

The following clears all statistics for the mobile IP foreign agent.

```
clear mipha statistics
```

The following command clears the statistics for the example service only.

```
clear mipha statistics ha-service sampleService
```

```
clear mipha statistics peer-address 1.2.3.4
```

clear mme-service db statistics

This command clears the MME database statistics for MME sessions for all or specific session instances on this system.

Product

MME

Privilege

Inspector

Syntax

clear mme-service db statistics [instance *smgr_instance* **]**

instance *smgr_instance*

This keyword specifies that MME database statistics are to be removed for a specific instance of session manager running for MME service.
smgr_instance must be specified as an instance ID in the range 0 through 4294967295. If instance is not specified database statistics of all instances will be removed.

Usage

Use this command to clear/remove database statistics for all or a particular instance of session manager for MME services on this system.

Example

The following command removes/clears the database statistics of all instances of the MME service on a system:

```
clear mme-service db statistics
```

clear mme-service db record

This command clears the MME database records all instances of session manager running for MME service filtered with IMSI or GUTI as criteria.

Product

MME

Privilege

Inspector

Syntax

clear mme-service db record { imsi *imsi_identifier* **| callid** *call_id* **| guti plmn** *plmn_id* **group-id** *mme_grp_id* **code** *mme_code* **m-tmsi** *mtmsi_value* **} [| { grep** *grep_options* **| more }]**

imsi *imsi_identifier*

This keyword specifies the filter criteria as International Mobile Subscriber Identity (IMSI) *imsi_identifier* to clear the database records of a session instance.
imsi_identifier is a 15 character IMSI field which identifies the subscriber's home country and carrier. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘). For example; ‘$’.

callid *call_id*

This keyword specifies the filter criteria as call id *call_id* to clear the database records of a session instance.
call_id must be specified as an 8-byte hexadecimal number.

guti plmn *plmn_id* **group-id** *mme_grp_id* **code** *mme_code* **m-tmsi** *mtmsi_value*

This set of keyword specifies the filter criteria as Globally Unique Temporary Identifier (GUTI) to clear the database records for MME service.
The GUTI is constructed from the GUMMEI and the M-TMSI where GUMMEI is constructed from PLMN (MMC and MNC) *plmn_id* and MME Identifier is constructed from an MME Group ID (MMEGI) *mme_grp_id* and an MME Code (MMEC) *mme_code*.
Within the MME, the mobile is identified by the M-TMSI *mtmsi_value*

Usage

Use this command to clear/remove database records for all or a particular instance of session manager for MME services on this system with IMSI or GUTI as filter criteria.

Example

The following command clears the summary database records of a session instance for subscriber having IMSI as *123455432112345* in the MME service:

```
clear mme-service db record imsi 123455432112345
```

clear mme-service statistics

This command clears the service statistics of an MME service specified by various criteria.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

```
clear mme-service statistics [ emm-only [ mme-service mme_svc_name | peer-id
peer_identifier ] ] | esm-only [ mme-service mme_svc_name | peer-id
peer_identifier ] | s1ap [ mme-service mme_svc_name | peer-id peer_identifier ]
| sctp [ mme-service mme_svc_name ] ]
```

emm-only

This keyword sets the filter criteria as MME service name or peer MME identifier to clear all EPS mobility management (EMM) related statistics.

esm-only

This keyword sets the filter criteria as MME service name or peer MME identifier to clear all EPS session management (ESM) related statistics.

s1ap

This keyword sets the filter criteria as MME service name of peer MME identifier to clear all S1-AP statistics.

sctp

This keyword sets the filter criteria as MME service name of peer MME identifier to clear all SCTP statistics.

mme-service *mme_svc_name*

This keyword sets the filter criteria as MME service name to clear all service statistics.

peer-id *peer_identifier*

This keyword sets the filter criteria as identifier of MME peer to clear all service statistics.

Usage

This command is used to clear the statistical information of an MME service based on various filter criteria.

Example

The following command clears the service session statistics of all MME service on a system:

```
clear mme-service statistics
```

clear mme-service statistics

This command clears the service statistics of an MME service specified by various criteria.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

```
clear mme-service statistics [ emm-only [ mme-service mme_svc_name | peer-id
peer_identifier ] ] | esm-only [ mme-service mme_svc_name | peer-id
peer_identifier ] | s1ap [ mme-service mme_svc_name | peer-id peer_identifier ]
| sctp [ mme-service mme_svc_name ] ]
```

emm-only

This keyword sets the filter criteria as MME service name or peer MME identifier to clear all EPS mobility management (EMM) related statistics.

esm-only

This keyword sets the filter criteria as MME service name or peer MME identifier to clear all EPS session management (ESM) related statistics.

s1ap

This keyword sets the filter criteria as MME service name of peer MME identifier to clear all S1-AP statistics.

sctp

This keyword sets the filter criteria as MME service name of peer MME identifier to clear all SCTP statistics.

mme-service *mme_svc_name*

This keyword sets the filter criteria as MME service name to clear all service statistics.

peer-id *peer_identifier*

This keyword sets the filter criteria as identifier of MME peer to clear all service statistics.

Usage

This command is used to clear the statistical information of an MME service based on various filter criteria.

Example

The following command clears the service session statistics of all MME service on a system:

```
clear mme-service statistics
```

clear multicast-sessions

Disconnects broadcast-multicast sessions based on specified criteria.

Product

PDSN, GGSN

Privilege

Security Administrator Operator

Syntax

clearmulticast-sessions [-noconfirm] [*keywords*] [verbose]

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

---

all

Disconnects all multicast sessions.

---

callid *call_id*

Clears the call specified by *call_id*. The call ID must be specified as an 8-digit hexadecimal number.

---

card-num *psc_num*

The slot number of the packet processing by which the multicast session is processed. *psc_num* is a slot number from 1 through 7 or 10 through 16

---

flowid *id*

Clears calls for a specific BCMCS flow, defined by *id*. The flow ID must be a hexidecimal number

---

flowid-type [flow | program]

Clears multicast sessions according to the type of flow.
flow: Clears all multicast sessions for the flow ID type “flow”.
program: Clears all multicast sessions for the flow ID type “program”.

---

mcast-address *ipv4_address*

Clear multicast sessions for a specific multicast address. Must be followed by the IP address of an interface, using dotted decimal notation.

---

pcf *ipv4_address*

Clears multicast sessions connected via the packet control function defined by *ipv4_address*. The address must be specified using the standard IPv4 dotted decimal notation.

---

pdsn_service *name*

Clears multicast sessions connected to the packet data service *name*. The packet data service must have been previously configured.

verbose

Indicates the output should provide as much information as possible. If this option is not specified then the output is the standard level which is the concise mode.

Usage

Clear multicast sessions to aid in troubleshooting the system when no additional subscribers may connect or when a specific service or remote address may be having connection problems. This command may also be useful when preparing for maintenance activities such that connects may be cleared to perform any necessary procedures.
The keywords are filters that modify or filter the criteria for deciding which sessions to clear and are described below. Multiple keywords can be entered on a command line.
When multiple keywords are specified, the multicast sessions deleted must meet the specifications of all of the keywords.

Example

The following command clears the broadcast-multicast sessions having multicast address *1.2.3.4*:

```
clear multicast-sessions mcast-address 1.2.3.4
```

The following command clears the broadcast-multicast session(s) having call id *00004e22*:

```
clear multicast-sessions callid 00004e22
```

clear orbem statistics

Clears the CORBA element manager interface related statistics.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear orbem statistics
```

Usage

Clear the statistics to reset them to zero for the object request broker element manager interface. This may be useful when preparing to study system performance, monitor usage, or trouble shoot the administrative interfaces.

Example

The following command resets the statistics for the ORB element manager.

```
clear orbem statistics
```

clear pdg-service statistics

Deletes all previously gathered statistics for a specific PDG service or all PDG services configured within a context.

Product

PDG/TTG

Privilege

Security Administrator, Administrator, Operator

Syntax

clear pdg-service statistics [name *service_name* **]**

name *service_name*

Specifies the name of a specific PDG service configured in the context for which to clear statistics. *service_name* is the name of the PDG service and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

Usage

Usage Statistics for a single PDG service can be cleared using the name keyword. Statistics for all PDG services in the context can be deleted by entering the command with no keywords.
If this command is executed from within the local context with no keywords, statistics will be cleared for every PDG service configured on the system regardless of context. In addition, if the name keyword is used when executing from within the local context, statistics for all PDG services configured with the specified name will be cleared regardless of context.

Example

Example(s) The following command clears statistics for a PDG service named *pdg1*:

clear pdg-service statistics *pdg1*

clear pgw-service

Clears PDN Gateway statistics and counters found in show command outputs and bulk statistics associated with all P-GW services or a specific service defined by the parameter in this command.

Product

P-GW

Privilege

Operator

Syntax

```
clear pgw-service statistics { all | name service_name }
```

all

Clears statistics and counters for all P-GW services on the system.

name *service_name*

Clears statistics and counters for a specific P-GW service name. *name* must be an existing P-GW service name and be from 1 to 63 alpha and/or numeric characters.

Usage

Use this command to clear statistics and counters in show command outputs and bulk statistics for all P-GW services or for a specific P-GW service.

Example

The following command clears statistics and counters for an P-GW service named *pgw5*:

```
clear lma-service statistics name pgw5
```

clear port

Clears port related statistics.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

clear port { datalink counters { all | *slot/port* } | npu counters { all | *slot/port* [untagged | vlan *tag_id*] }

datalink

Clear the data link port statistics.

npu

Clear statistics for the network processing unit port.

all

Clear counters for all datalink or NPU ports.

slot/port

Clear the statistics for the specified slot and port number.

untagged

Clear NPU statistics for all ports that do not have a VLAN tag.

vlan *tag_id*

Clear NPU statistics for the port that has the specified VLAN tag ID. *tag_id* must be a previously configured VLAN tag id.

Usage

Manually clear the statistics for a specified port. This is useful when preparing to trouble shoot or monitor the system.

Example

The following command clears the data link related statistics for port 1 in slot 17.

clear port datalink counters *17/1*

The following command clears the network processing unit related statistics for port 1 in slot 17.

clear port npu counters *17/1*

clear ppp statistics

Clears point-to-point protocol related statistics. All PPP statistics may be cleared or just those for a specific packet data service may be cleared.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

clear ppp statistics [ggsn-service *ggsn_name* **| lns-service** *lns_name* **| pcf-address [** *pcf_ip_addr* **| all] | pdsn-service** *pdsn_name* **]**

ggsn-service *ggsn_name*

Display statistics only for the time the session is connected to the specified *ggsn_name*.

lns-service *lns_name*

Display statistics only for the time the session is connected to the specified *lns_name*.

pcf-address [*pcf_ip_addr* **| all]**

Display statistics only for the time the session is connected to the specified PCF (Packet Control Function) or for all PCFs. pcf_ip_addr must be specified using the standard IPv4 dotted decimal notation.

pdsn-service *pdsn_name*

Specifies the service as *pdsn_name* which is to have only its statistics cleared.

Usage

Allows you to manually reset PPP statistics when it is desired to have counts begin again from a specific point in time.

Example

The following clears the statistics for all PPP counters and services.

```
clear ppp statistics
```

The following clears only the point-to-point protocol statistics for the service named *sampleService*.

```
clear ppp statistics pdsn-service sampleService
```

clear prepaid 3gpp2 statistics

This command clears all of the statistics counters for 3GPP2 Pre-paid accounting. Statistics may be cleared for all services or for an individual service.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

clear prepaid 3gpp2 statistics { all | { ggsn-service | ha-service | lns-service | pdsn-service } { all | name *service_name* **} }**

all

This keyword clears prepaid statistics for all services.

ggsn-service

Clear statistics for GGSN service(s).

ha-service

Clear statistics for HA service(s).

lns-service

Clear statistics for LNS service(s).

pdsn-service

Clear statistics for PDSN service(s).

{ all | name *service_name* **}**

all: Clear statistics for all services of the specified type.
name *service_name*: Clear statistics for the service named *service_name* of the specified service type.

Usage

Use this command to clear Pre-paid statistics for a particular named service or for all services.

Example

To clear statistics for a PDSN service name PDSN1, enter the following command:

clear prepaid 3gpp2 statistics pdsn-service name *PDSN1*

clear prepaid wimax

This command clears all of the statistics counters for WiMAX prepaid accounting. Statistics may be cleared for all services or for an individual service.

Product

ASN GW

Privilege

Operator

Syntax

```
clear prepaid wimax statistics { all | asngw-service { all | name service_name }
| ha-service { all | name service_name } }
```

all

This keyword clears prepaid statistics for all services.

asngw-service

Clears prepaid statistics for ASN GW service(s).

ha-service

Clears prepaid accounting statistics for HA service(s).

{ all | name *service_name* **}**

all: Clears statistics for all services of the specified type.
name *service_name*: Clears statistics for the service named *service_name* of the specified service type.

Usage

Use this command to clear prepaid WiMAX accounting statistics for named service or for all services.

Example

The following command clears prepaid WiMAX accounting statistics for an ASN GW service name *asn1*:

```
clear prepaid wimax statistics asngw-service name asn1
```

clear qos npu stats

Clears information pertaining to NPU QoS priority queue bandwidth allocation and sharing.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

clear qos npu stats inter-subscriber traffic slot *slot_num*

inter-subscriber traffic slot *slot_num*

Clears inter-subscriber traffic statistics for the application or line card installed in the specified slot. *slot_num* indicates the number of the chassis slot in which the card is installed and can be configured to any integer value from 1 through 48.

Usage

Allows you to manually reset statistics pertaining to NPU QoS priority queue bandwidth allocation.

Example

The following command clears statistics for a card installed in chassis slot 4:

clear qos npu stats inter-subscriber traffic slot *4*

clear radius accounting archive

This command clears archived RADIUS accounting messages associated with a AAA group, or all the archived RADIUS accounting messages in the context in which the command is executed depending on the option chosen. The scope of the command is limited to the context in which it is executed including for local context.

Important: This command is only available in StarOS 8.3 and later. For more information, please contact your local service representative.

Product

All

Privilege

Security Administrator, Administrator

Syntax

clear radius accounting archive { all | radius group *group_name* **} [-noconfirm]**

all

Clears all archived RADIUS accounting messages in the context.

radius group *group_name*

Clears all archived RADIUS accounting messages for the specified group.
group_name must be the name of a RADIUS group, and must be a string of 0 through 64 characters in length.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to clear the archived RADIUS accounting messages associated with a AAA group, or all the archived RADIUS accounting messages in the context in which the command is executed.

Example

Use the following command to clear all archived RADIUS accounting messages for the group named *test12*.

clear radius accounting archive radius group *test12*

clear radius counters

Clears statistics for RADIUS servers and server group. The statistics for all RADIUS servers or server group may be cleared or only a specified server.

Product

PDSN, GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator

Syntax

clear radius counters { all | radius group *group_name* **| server** *ip_address* **[port** *number* **] }**

all | radius group *group_name* **| server** *ip_address* **[port** *number* **]**

all: Clears statistics for all servers.
server *ip_address* **[port** *number* **]**: Clears statistics only for the server specified by *ip_address*. Optionally specify the port which is to have its RADIUS statistics cleared, where port number must be an integer from 0 through 65535. *ip_address* must be specified using the standard IPv4 dotted decimal notation.
radius group *group_name*: Clears all configured authentication / accounting servers in the specified RADIUS group. *group_name* must be name of server group configured in specific context for authentication/accounting, and must be a string of 1 through 63 characters in length.

Usage

Clear the statistics to reset them to zero prior to logging or monitoring the system for troubleshooting, performance measurements, etc.

Example

The following command clears the statistics for all RADIUS servers.

```
clear radius counters all
```

The following command resets the statistics only for the server *1.2.3.4*.

```
clear radius counters server 1.2.3.4
```

The following command resets the statistics only for the server group named *star1*.

```
clear radius counters radius group star1
```

clear rohc statistics

This command clears statistics and counters collected since the last reload or clear command was issued for ROHC IP header compression.

Product

PDSN

Privilege

Administrator, Config-administrator, Operator, Inspector

Syntax

clear rohc statistics [pdsn-service *pdsnsvc_name < asngwsvc_name >*

pdsn-service *pdsnsvc_name*

Clear ROHC statistics and counters for the specified PDSN service.

asngwsvc_name

Usage

Use this command to clear ROHC statistics for all services or for a specific PDSN.

Example

The following command clears ROHC statistics and counters for the PDSN service named *pdsn1*:

clear rohc statistics pdsn-service *pdsn1*

clear rp service-option

Clears the R-P interface service option statistics.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator

Syntax

clear rp service-option statistics [number *option_num* **| pdsn-service** *pdsn_name* **]**

number *option_num* **| pdsn-service** *pdsn_name*

Default: clear the statistics for all service options and all packet data services.
number *option_num*: specifies the R-P service option number for which the statistics are to be cleared. *option_num* must be a value in the range 0 through 1000.
pdsn-service *pdsn_name*: specifies the service as *pdsn_name* which is to have only its statistics cleared.

Usage

Clear the R-P service option statistics prior to monitoring the system for bench marking or for detecting areas of further research.

Example

The following resets the service option statistics for service option 23 and packet data service *sampleService*, respectively.

```
clear rp service-option statistics number 23

clear rp service-option statistics pdsn-service sampleService
```

clear rp statistics

Clears the R-P interface statistics. The statistics for a specific packet data server or peer node may be cleared if specified.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator

Syntax

clear rp statistics [pdsn-service *name* **| peer-address [** *peer_address* **| all]]**

pdsn-service *name* **| peer-address [** *peer_address* **| all]**

Default: clear all R-P associated statistics.
pdsn-service *name*: specifies the packet data service specified by *name* is to have its statistics reset.
peer-address [*peer_address* **| all]**: specifies that statistics for the specified peer, or all peers, are to be cleared. *ip_address* must be specified using the standard IPv4 dotted decimal notation.

Usage

Clear the statistics to prepare for monitoring the system.

Example

The following command resets all the associated statistics for the R-P interfaces.

```
clear rp statistics
```

The following clears the statistics for the packet data service *sampleService*.

```
clear rp statistics pdsn-service sampleService
```

The following command resets the statistics associated with peer node with IP address *1.2.3.4*.

```
clear rp statistics peer-address 1.2.3.4
```

clear session disconnect-reasons

Clears the session disconnect reason statistics for all sessions on the system.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear session disconnect-reasons
```

Usage

Sets the counters for session disconnect reasons to zero (0) in preparation for a monitoring or troubleshooting session.

Example

```
clear session disconnect-reasons
```

clear session setuptime

Clears the session setup time statistics for PCFs or SGSNs. If no keyword is specified the summary statistics displayed by the **show session setuptime** command are cleared.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

clear session setuptime { pcf { *pcf_addr* | all } | sgsn { *sgsn_addr* | all } }

pcf { *pcf_addr* | all }

pcf_addr: Clear the setup time counters for the PCF at the specified IP address. *pcf_addr* must ba an IP v4 addresses expressed in dotted decimal notation.
all: Clear the setup time counters for all PCFs.

sgsn { *sgsn_addr* | all }

sgsn_addr: Clear the setup time counters for the SGSN at the specified IP address. *sgsn_addr* must ba an IP v4 addresses expressed in dotted decimal notation.
all: Clear the setup time counters for all SGSNs.

Usage

Sets the counters for session disconnect reasons to zero (0) in preparation for a monitoring or troubleshooting session.

Example

To clear the statistics for the PCF at IP address 192.168.100.10, enter the following command:

clear session setuptime pcf *192.168.100.10*

clear session subsystem

Clears all session subsystem statistics for the current context.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear session subsystem
```

Usage

Clear the statistics in preparation for a troubleshooting or monitoring session so that the counters are at a well known values.

Example

```
clear session subsystem
```

clear sgtpu statistics

Clears all SGTPU statistics for the current context.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

clear sgtpu statistics [ggsn-address *ipv4_address* **| iups-service** *iups_srvc_name* **| rnc-address** *ipv4_address* **| sgtp-service** *sgtp_srvc_name* **| gprs-service** *gprs_srvc_name* **nsei** *nse_id* **]**

Usage

Clear the statistics in preparation for a troubleshooting or monitoring session so that the counters.

Example

clear sgtpu statistics gprs-service *SGSN1Gprs1* **nsei** *2445*

clear sgw-service statistics

Clears Serving Gateway statistics and counters found in show command outputs and bulk statistics associated with all S-GW services or a specific service defined by the parameter in this command.

Product

S-GW

Privilege

Operator

Syntax

clear sgw-service statistics { all | name *service_name* **}**

all

Clears statistics and counters for all S-GW services configured on the system.

name *service_name*

Clears statistics and counters for a specific S-GW service name. *service_name* must be an existing S-GW service name and be from 1 to 63 alpha and/or numeric characters.

Usage

Use this command to clears statistics and counters in show command outputs and bulk statistics for all S-GW services or for a specific S-GW service.

Example

The following command clears statistics and counters for an S-GW service named *sgw3*:

clear sgw-service statistics name *sgw3*

clear snmp trap

Clears all SNMP event trap notifications from the buffer.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear snmp trap { history | statistics }
```

history

Clears all SNMP historical trap information from system buffer.

statistics

Clears all SNMP event trap information from system buffer.

Usage

Use this command to empty the buffer of all SNMP trap notifications.

Example

Following command clears the all historical SNMP traps from the system buffer:

```
clear snmp trap history
```

clear srp checkpoint statistics

Clears the SRP checkpoint interface statistics.

Product

HA, GGSN PDIF

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear srp checkpoint statistics
```

Usage

Clears the srp checkpoint statistics to prepare for srp monitoring.

Example

The following command resets all the associated statistics for srp checkpoint.

```
clear srp checkpoint statistics
```

clear srp statistics

Clears the SRP statistics.

Product

HA, GGSN PDIF

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear srp statistics
```

Usage

Clears the srp statistics to prepare for srp monitoring.

Example

The following command resets all the associated statistics for srp.

```
clear srp statistics
```

clear subscribers

Disconnects subscribers based on specified criteria.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

clear subscribers [*keywords* **] [verbose] [-noconfirm]**

The keywords are filters that modify or filter the criteria for deciding which subscriber sessions to clear and are described below. Multiple keywords can be entered on a command line.
When multiple keywords are specified, the subscriber sessions deleted must meet the specifications of all of the keywords.
For example; if you enter the following command:

clear subscribers ip-pool *pool1* **card-num** *1*

Only subscriber sessions that were assigned an IP address from the IP pool named *pool1* and are also being processed by the processing card in slot *1* are cleared. All other subscriber sessions that do not meet these criteria remain and are not cleared.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Important: The Operator privilege does not have access to this keyword.

active

Only disconnects subscribers who currently have active sessions.

all

Disconnects all subscribers.

Important: The Operator privilege does not have access to this keyword.

apn *name*

Clears all PDP contexts accessing a specific access point name (APN).
apn_name is the name of the APN and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

asn-peer-address *ip_address*

Clears information for subscribers on an ASN GW trusted peer.
ip_address is the IPv4 address of the ASN GW peer server in dotted decimal notation.

asngw-service *service_name*

Clears counters for subscribers accessing the ASN GW service.
service_name must be an existing service and be from 1 to 63 alpha and/or numeric characters in length.

asnpc-service *service_name*

Clears counters for subscribers accessing the ASN PC service.
service_name must be an existing service and be from 1 to 63 alpha and/or numeric characters in length.

callid *id*

Clears the call specified by *call_id*. The call ID must be specified as a 4-byte hexadecimal number.

card-num *card_num*

The slot number of the processing card by which the subscriber session is processed. *card_num* is a slot number from 1 through 7 or 10 through 16.

ccoa-only

This option clears the subscribers that registered a MIP co-located COA directly with the HA.
This option is only valid when MIPHA session license is enabled.

configured-idle-timeout [< | > | greater-than | less-than] *value*

Disconnects subscribers whose idle timeout matches the specified criteria. A value of 0 (zero) indicates that the subscribers idle timeout is disabled.
<: Filters output so that only information less than the specified value is cleared.
>: Filters output so that only information greater than the specified value is cleared.
greater-than: Filters output so that only information greater than the specified value is cleared.
less-than: Filters output so that only information less than the specified value is cleared.
value: If no other filtering options are specified only output matching *value* is cleared. If *value* is not specified all data is cleared. *value* must be an integer from 0 through 4294967295.

connected-time [< | > | greater-than | less-than] *value*

Disconnects subscribers who have been connected for the specified length of time.
<: Filters output so that only information less than the specified value is cleared.
>: Filters output so that only information greater than the specified value is cleared.
greater-than: Filters output so that only information greater than the specified value is cleared.
less-than: Filters output so that only information less than the specified value is cleared.
value: If no other filtering options are specified only output matching *value* is cleared. If *value* is not specified all data is cleared. *value* must be an integer from 0 through 4294967295.

cscf-service *service_name*

Clears all subscribers from the specified CSCF service.
service_name must be an existing service and be from 1 to 63 alpha and/or numeric characters.

css-delivery-sequence *name*

Important: This is a restricted keyword. In StarOS 9.0 and later, this keyword is obsoleted.

css-service *name*

Important: This is a restricted keyword. In StarOS 9.0 and later, this keyword is obsoleted.

dhcp-server *address*

Clears all PDP contexts that currently possess an IP address assigned from a specific DHCP server.
dhcp_address is the IP address of the DHCP server expressed in dotted decimal notation.

dormant

Only disconnect subscriber sessions that are dormant (not transmitting or receiving data).

fa *address*

Disconnects all subscribers connected to the foreign agent specified by *fa_address*. The address must be specified using the standard IPv4 dotted decimal notation.

fa-service *name*

Disconnects all subscribers connected to the foreign agent specified by *fa_name*. The foreign agent name must have been previously defined.

firewall { not-required | required }

Clears all subscriber information for the specified subscribers:
not-required: Subscribers for whom firewall processing is not-required.
required: Subscribers for whom firewall processing is required.

firewall-policy *fw_policy_name*

This keyword is obsolete.

ggsn-service *name*

Clears all PDP contexts accessing a specific GGSN service.
ggsn_name is the name of the APN and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

gprs-service *name*

Clears all PDP contexts associated with the 2G SGSN. This keyword can be used with filtering keywords that are part of the **clear subscriber** command set.
Using this keyword can trigger a network-initiated service request (paging) procedure.
name identifies a specific GPRS service configuration. The name consists of 1 to 63 alphanumeric characters.

gsm-traffic-class { background | conversational | interactive { *priority* **} | streaming }**

Subscribers whose traffic matches the specified 3GPP traffic class.

- **background**: 3GPP QoS background class.
- **conversational**: 3GPP QoS conversational class.

- **interactive**: 3GPP QoS interactive class. Must be followed by a traffic priority. priority can be configured to any integer value from 1 to 3.
- **streaming**: 3GPP QoS streaming class.

gtp-version

Displays the specific GTP version number. Must be followed by one of the supported GTP versions (0 or 1). The following filter keywords are valid with this command:
active-charging-service, apn, asngw-service, asnpc-service, asn-peer-address, bearer-establishment, callid, card-num, coaa-only, configured-idle-timeout, connected-time, cscf-service, dhcp-server, fa, fa-service, firewall, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, ha, ha-ipsec-service, ha-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, lac, lac-service, lns, lns-service, long-duration-time-left, mip-udp-tunnel-only, mipv6ha-service, msid, msisdn, network-requested, network-type, pcf, pdg-service, pdif-service, pdsn-service, plmn-type, rulebase, rx-data, session-time-left, sgsn-address, sgsn-service, tx-data, username, grep, more

ha *address*

Disconnects all subscribers connected to the home agent specified by *ha_address*. The address must be specified using the standard IPv4 dotted decimal notation.

ha-ipsec-only

Disconnects all MIP HA sessions with IPsec tunnels.

ha-service *name*

Disconnects all subscribers connected to the home agent specified by *ha_name*. The home agent name must have been previously defined.

hsgw-service *name*

Disconnects subscribers using this HRPD Serving Gateway (HSGW) service configured on this system. *name* must be an existing HSGW service and be from 1 to 63 alpha and/or numeric characters.

idle-time [< | > | greater-than | less-than] *value*

Disconnects subscribers whose idle time matches the specified length of time.
<: Filters output so that only information less than the specified value is cleared.
>: Filters output so that only information greater than the specified value is cleared.
greater-than: Filters output so that only information greater than the specified value is cleared.
less-than: Filters output so that only information less than the specified value is cleared.
value: If no other filtering options are specified only output matching *value* is cleared. If *value* is not specified all data is cleared. *value* must be an integer from 0 through 4294967295.

ims-auth-service *name*

Disconnects subscribers using this IMS Authorization Service configured on this system. *name* must be an existing IMS Authorization Service and be from 1 to 63 alpha and/or numeric characters.

imsi *id*

Disconnects the subscriber with the specified id. The IMSI (International Mobile Subscriber Identity) ID is a 50-bit field which identifies the subscriber's home country and carrier. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do

not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘). For example; ‘$’.

ip-alloc-method {aaa-assigned | dhcp [relay-agent | proxy-client] | dynamic-pool | l2tp-lns-assigned | mip-ha-assigned | ms-provided-static | not-ms-provided-static | static pool }

Displays the specific IP Allocation Method. Must be followed by one of the IP Allocation Methods:

- **aaa-assigned**: Selects subscribers whose IP Addresses were assigned by AAA.
- **dhcp**: Selects subscribers whose IP Addresses were assigned by DHCP.
- **relay-agent**: Selects subscribers whose IP Addresses were assigned by the DHCP Relay Agent
- **proxy-client**: Selects subscribers whose IP Addresses were assigned by the DHCP Proxy Client
- **dynamic-pool**: Selects subscribers whose IP Addresses were assigned from a dynamic IP address pool.
- **l2tp-lns-assigned**: Selects subscribers whose IP Addresses were assigned by the Layer 2 Tunneling Protocol Network Server.
- **mip-ha-assigned**: Selects subscribers whose IP Addresses were assigned by the Mobile IP Home Agent.
- **ms-provided-static**: Selects subscribers whose IP Addresses were provided by the Mobile Station.
- **not-ms-provided-static**: Selects subscribers whose IP Addresses were not provided by the Mobile Station.
- **static-pool**: Selects subscribers whose IP Addresses were assigned from a static IP address pool.

ip-address *address*

Disconnects all subscribers connected to the specified *ip_address*. The address must be specified using the standard IPv4 dotted decimal notation.

ip-pool *name*

Disconnects all subscribers assigned addresses from the IP address pool *pool_name*. *pool_name* must be the name of an existing IP pool or IP pool group.

ipv6-address *address*

Clears all subscribers connected to the specified IPv6 *address*.

ipv6-prefix *prefix*

Clears subscribers from a specific IPv6 address prefix.

lac *address*

Disconnects all calls to the peer LAC (L2TP access concentrator) specified by *address*. The address must be specified using the standard IPv4 dotted decimal notation.

lac-service *name*

Disconnects all calls for this LAC service. *name* is a string of 1 to 63 characters.

lma-service *name*

Disconnects subscribers using this LMA service configured on this system. *name* must be an existing LMA service and be from 1 to 63 alpha and/or numeric characters.

lns *address*

Disconnects calls to the peer LNS (L2TP network server) specified by *address*. The address must be specified using the standard IPv4 dotted decimal notation.

lns-service *name*

Disconnects calls associated with the LNS service named *name*. *name* is a string of 1 to 63 characters.

long-duration-time-left [< | > | greater-than | less-than] *value*

Disconnects subscriber sessions whose time left for the maximum duration of their session matches the length of time specified.
<: Filters output so that only information less than the specified value is cleared.
>: Filters output so that only information greater than the specified value is cleared.
greater-than: Filters output so that only information greater than the specified value is cleared.
less-than: Filters output so that only information less than the specified value is cleared.
value: If no other filtering options are specified only output matching *value* is cleared. If *value* is not specified all data is cleared. *value* must be an integer from 0 through 4294967295.

mag-service *name*

Disconnects subscribers using this Mobile Access Gateway (MAG) service configured on this system. *name* must be an existing MAG service and be from 1 to 63 alpha and/or numeric characters.

mip-udp-tunnel-only

This option clears the subscribers that negotiated MIP-UDP tunneling with the HA.
This option is only valid when MIP NAT Traversal license is enabled.

mme-address *ipv4_addr*

Disconnects subscribers using this peer Mobility Management Entity (MME). *ipv4_addr* must be an existing peer MME IPv4 address and be specified in dotted decimal notation.

mme-only

Disconnects all MME subscriber sessions on the system.

mme-service *name*

Disconnects subscribers using this MME service configured on this system. *name* must be an existing MME service and be from 1 to 63 alpha and/or numeric characters.

msid *id*

Disconnects the mobile user identified by *ms_id*. *ms_id* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘). For example; ‘$’.

In case of **enforce imsi-min equivalence** is enabled on the chassis and MIN or IMSI numbers supplied, this filter will clear subscribers with a corresponding MSID (MIN or IMSI) whose lower 10 digits matches to lower 10 digits of the supplied MSID.
clear subscribers msid *111110123456789* or
clear subscribers msid *0123456789*
will clear any subscriber with a MSID that match the lower 10 digits of MSID supplied, i.e. 0123456789.

---

msisdn *msisdn*

Clears information for the mobile user identified by Mobile Subscriber ISDN Number (MSISDN). *msisdn* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI.

---

nat { not-required | required [nat-ip *nat_ip_address* **| nat-realm** *nat_realm* **] }**

Clears all subscriber information for the specified subscribers:
not-required: Subscribers for whom NAT processing is not required.
required: Subscribers for whom NAT processing is required.

Important: The **nat-ip** keyword is only available in StarOS 8.3 and later.

---

nat-ip *nat_ip_address*: Subscribers for whom NAT processing is enabled and are using the specified NAT IP address. *nat_ip_address* specifies the NAT IP address and must be a standard IPv4 address.
nat-realm *nat_realm*: Subscribers for whom NAT processing is enabled and are using the specified NAT realm. *nat_realm* specifies the NAT realm name and must be a string from 1 through 63 characters in length.

---

network-requested

Disconnect subscriber sessions that were initiated by the GGSN network requested create PDP context procedure.

---

network-type { gre | ipv4 | ipv6 | ipip | l2tp | mobile-ip | proxy-mobile-ip }

Disconnects subscriber sessions based on the network type. The following network types can be selected:

- **gre**: Generic Routing Encapsulation (GRE) per RFC 2784
- **ipv4**: Internet Protocol version 4 (IPv4)
- **ipv6**: Internet Protocol version 6 (IPv6)
- **ipip**: IP-in-IP encapsulation per RFC 2003
- **l2tp**: Layer 2 Tunneling Protocol encryption per RFC 2661
- **mobile-ip**: Mobile IP
- **proxy-mobile-ip**: Proxy Mobile IP

---

pcf [< | > | less-than | greater-than] *ipv4_address* **[[< | > | less-than | greater-than]** *ipv4_address* **]**

Displays information for subscribers connected via the packet control function with a specific or range of IP address *ipv4_ddress*. The address must be specified using the standard IPv4 dotted decimal notation.

- **<**: Filters output so that only information less than the specified IPv4 address value is displayed.

- **>**: Filters output so that only information greater than the specified IPv4 address value is displayed.
- **less-than**: Filters output so that only information less than the specified IPv4 address value is displayed.
- **greater-than**:Filters output so that only information greater than the specified IPv4 address value is displayed.

Note: It is possible to define a limited range of IP addresses by using the less-than and greater-than options to define minimum and maximum values.

---

pdsn-service *name*

Disconnect all subscribers connected to the packet data service *pdsn_name*. The packet data service must have been previously configured.

---

pdg-service *service_name*

Disconnects subscriber sessions that are using the PDG service.
*service_name*must be an existing service and be from 1 to 63 alpha and/or numeric characters.

---

pdif-service *service_name*

Clears counters for subscribers accessing the Packet Data Interworking Function (PDIF) service.
service_name must be an existing service and be from 1 to 63 alpha and/or numeric characters.

---

pgw-only { all | imsi *id* **ebi** *id* **| pgw-service** *name* **| sgw-address** *ipv4_addr* **}**

all: Disconnects all subscribers for all P-GW services on this system.
imsi *id* **ebi** *id*: Disconnects subscribers based on their International Mobile Subscriber Identification (IMSI). *id* must be the 3 digit MCC (Mobile Country Code), follow by the 2 or 3 digits of the MNC (Mobile Network Code) and the MSIN (Mobile Subscriber Identification Number). *id* should not exceed 15 digits.
Example: 123-45-678910234 must be entered as 12345678910234
The EBI (EPS Bearer Identity) *id* must be a valid EBI and be an integer value from 5 to 15.
pgw-service*name*: Disconnects all subscribers using this P-GW service. *name* must be an existing P-GW service and be from 1 to 63 alpha and/or numeric characters.
sgw-address*ipv4_addr*: Disconnects all subscribers using this S-GW IP address. *ipv4_addr* must be an existing IPv4 address and be specified in dotted-decimal notation.

---

plmn-type { home | roaming |visiting }

For GGSN, disconnect subscribers whose subscriber type matches the specified type.

---

qci { *number* **}**

Disconnects subscribers based on their QCI identity. *number* must be an integer value from 0 to 9.

---

rx-data [< | > | greater-than | less-than] *value*

Disconnects subscribers who have received the specified number of bytes of data.
<: Filters output so that only information less than the specified value is cleared.
>: Filters output so that only information greater than the specified value is cleared.
greater-than: Filters output so that only information greater than the specified value is cleared.
less-than: Filters output so that only information less than the specified value is cleared.
value: If no other filtering options are specified only output matching *value* is cleared. If *value* is not specified all data is cleared. value must be an integer from 0 through 18446744073709551615.

s5-proto { gtp | pmip }

Disconnects subscribers based on their S5 interface protocol type.
gtp: Indicates that the GTP protocol is used on the S5 interface for the subscribers being disconnected.
pmip: Indicates that the PMIP protocol is used on the S5 interface for the subscribers being disconnected.

session-time-left [< | > | greater-than | less-than] *value*

The amount of time left for the subscriber session.
<: Filters output so that only information less than the specified value is cleared.
>: Filters output so that only information greater than the specified value is cleared.
greater-than: Filters output so that only information greater than the specified value is cleared.
less-than: Filters output so that only information less than the specified value is cleared.
value: If no other filtering options are specified only output matching *value* is cleared. If *value* is not specified all data is cleared. *value* must be an integer from 0 through 4294967295.

sgsn-address *address*

Clears all PDP contexts currently being facilitated by a specific SGSN.
address is the IP address of the SGSN expressed in dotted decimal notation.

sgsn-service *name*

Clears all PDP contexts associated with SGSN. This keyword can be used with filtering keywords that are part of the **clear subscriber** command set.
Using this keyword can trigger a network-initiated service request (paging) procedure.
name identifies a specific SGSN-service configuration. The name consists of 1 to 63 alphanumeric characters.

sgw-only

Disconnects all S-GW subscriber sessions on the system.

sgw-service *name*

Disconnects subscribers using this Serving Gateway (S-GW) service configured on this system. *name* must be an existing S-GW service and be from 1 to 63 alpha and/or numeric characters.

tx-data [< | > | greater-than | less-than] *value*

Disconnects subscribers who have transmitted the specified number of bytes of data.
<: Filters output so that only information less than the specified value is cleared.
>: Filters output so that only information greater than the specified value is cleared.
greater-than: Filters output so that only information greater than the specified value is cleared.
less-than: Filters output so that only information less than the specified value is cleared.
value: If no other filtering options are specified only output matching *value* is cleared. If *value* is not specified all data is cleared. value must be an integer from 0 through 18446744073709551615.

username *name*

Disconnect the subscriber with the specified username
name is the username of the subscriber to be cleared. *name* must be a sequence of characters and/or wildcard characters ('$' and '*') from 1 to 127 characters in length. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as wildcard enclose them in single quotes (‘). For example; ‘$’.

verbose

Indicates the output should provide as much information as possible. If this option is not specified then the output is the standard level which is the concise mode.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Clear subscribers sessions to aid in troubleshooting the system when no additional subscribers may connect or when a specific service or remote address may be having connection problems. This command may also be useful when preparing for maintenance activities such that connects may be cleared to perform any necessary procedures.
Releated commands to clear subscription data - *for SGSN use only*

- **admin-disconnect-behavior clear-subscription** - for a 2G SGSN, this command in the GPRS Service configuration mode enables the SGSN to clear subscription data after the administrative disconnect - **clear subscribers all** has been issued.
- **admin-disconnect-behavior clear-subscription** - for a 3G SGSN, this command in the SGSN Service configuration mode enables the SGSN to clear subscription data after the administrative disconnect - **clear subscribers all** has been issued.

Example

The following examples illustrate the basic command usage as well as the redirection of the command output. Not all options are exemplified as all options follow the same basic constructs.
The following are basic subscriber clearing examples.

```
clear subscribers username user1

clear subscribers ha sampleService

clear subscribers ip-pool poolName verbose
```

The following command disconnects users connected to the foreign agent with IP address *1.2.3.4*.

```
clear subscribers fa 1.2.3.4
```

The following redirects the output of the command to the more command for paging of the output to allow easier viewing of all output by the user. This example highlights the use of the verbose option as well.

```
clear subscribers all verbose | more
```

clear super-charger

Deletes the subscriber's backed-up subscription data.

Product

SGSN

Privilege

Administrator, Security Administrator

Syntax

```
clear super-charger { imsi | all }
```

imsi

Defines a specific subscriber's international mobile subscriber identity (IMSI) number.
imsi - up to 15 digits. This number includes the MCC (mobile country code), the MNC (mobile network code) and the MSIN (mobile station identification number),

all

Instructs the SGSN to delete subscription data for all super charger subscribers.

Usage

Use this command to clear (delete) the subscription data records for one or all subscribers with super charger subscription configuration

Example

The following command deletes the backed up records for the subscriber identified by the IMSI *90121882144672*.

```
clear super-charger imsi 90121882144672
```

cli

This command specifies command line interface (CLI) session behavior

Product

All

Privilege

Security Administrator, Administrator, Operator, inspector

Syntax

```
cli { history | stop-on-first-error }

no cli { history | stop-on-first-error }
```

no

Disables the specified keyword functionality.

history

Default: Enabled
Enables command line history for the current command line session.

stop-on-first-error

Default: Disabled
When this is enabled, when a configuration file is loaded, on the first syntax error the system stops loading the configuration file.

Usage

This command controls CLI settings pertaining to the maintenance of a per-session command history and syntax error monitoring during configuration file loading.
By default, the system maintains a list of commands executed during each CLI session. This list is referred to as a history.
In addition, the system can be configured to stop loading a configuration if a syntax error is detected. By default, the system identifies the error but continues to process the configuration file.

Example

The following command disables the keeping of a CLI history for the current session:

```
no cli history
```

clock set

Sets the system time.

Product

All

Privilege

Security Administrator, Administrator

Syntax

clock set *date_time*

date_time

Specifies the date and time to set the system clock. Specified as YYYY:MM:DD:HH:mm or YYYY:MM:DD:HH:mm:ss. Where YYYY is a 4-digit year, MM is a 2-digit month in the range 01 through 12, DD is a 2-digit day in the range 01 through 31, HH is a 2-digit hour in the range 00 through 23, mm is a 2-digit minute in the range 00 through 59, and ss is a 2 digit second in the range 00 through 59.

Usage

Set the clock to adjust the system clock for such things as timing drift, day-light savings adjustment, etc. New settings are immediately applied to all CPUs in the system.

Important: This command should only be used if there is no NTP server enabled for any context. If NTP is running on the system, this command returns a failure.

Example

The following commands set the system clock where one sets the exact second as well.

clock set *2003:08:23:02:30*

clock set *2003:08:23:02:30:30*

configure

Sets the mode to the global configure mode. May also be used to set the mode to the configure mode and pre-load the configuration referred to by the options.

Product

All

Privilege

Security Administrator, Administrator

Syntax

configure [*url* **[verbose]]**

url

Specifies the location of a configuration file to pre-load. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

- ST16:
  - **[file:]{ /flash | /pcmcia1 | /pcmcia2 } [/***directory* **]/***file_name*
  - **tftp://{** *host***[** *:port#* **] } [/***directory* **]/***file_name*
  - **[http: | ftp: | sftp:]// [** *username* **[** *:password* **] @] {** *host* **} [** *:port#* **] [/***directory* **]/***file_name*
- ASR 5000:
  - **[file:]{ /flash | /pcmcia1 | /hd } [/***directory* **]/***file_name*
  - **tftp://{** *host***[** *:port#* **] } [/***directory* **]/***file_name*
  - **[http: | ftp: | sftp:]//[** *username* **[** *:password***] @] {** *host* **} [** *:port#* **] [/***directory* **]/***file_name*

Important: Use of the SMC hard drive is not supported in this release.

directory is the directory name.
filename is the actual file of interest.
username is the user to be authenticated.
password is the password to use for authentication.
host is the IP address or host name of the server.
port# is the logical port number that the communication protocol is to use.

verbose

Displays each the line number and actual line content from the configuration as it is processed.

Usage

If no URL is specified, executing this command causes the CLI to enter the Global Configuration Mode.
If a URL is specified, executing this command loads the specified configuration file.

Example

The following simply changes the mode to the command line interface global configuration mode.

```
configure
```

The following command loads a configuration file from the node *sampleNode* given the path specified and a local file, respectively.

```
configure ftp://sampleNode/pub/glob.cfg
```

```
configure /pcmcia1/pub/glob.cfg verbose
```

context

Sets the current context to the context specified.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

context *name*

name

Specifies the context of interest. Must be a previously defined context.

Usage

Change the current context when it is desired to configure and/or manage a specific context.

Example

The following sets the current context to the *sampleContext* context.

context *sampleContext*

copy

Copies files from one location to another. Allows files to be copied to/from locally as well as from one remote location to another.

Product

All

Privilege

Security Administrator, Administrator

Syntax

copy *from_url to_url* **[passive] [-noconfirm]**

from_url

Specifies the source of the copy. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

- ST16:
  - **[file:]{ /flash | /pcmcia1 | /pcmcia2 }[/***directory* **]/***file_name*
  - **tftp://{** *host***[** *:port#* **] }[/***directory* **]/***file_name*
  - **[http: | ftp: | sftp:]//[***username* **[** *:password* **]@] { ***host* **}[** *:port#* **][/***directory* **]/***file_name*
- ASR 5000:
  - **[file:]{ /flash | /pcmcia1 | /hd }[/***directory* **]/***file_name*
  - **tftp://{** *host*[*:port#*] **}[/***directory* **]/***file_name*
  - **[http: | ftp: | sftp:]//[** *username* **[** *:password* **]@] { ***host* **}[** *:port#* **][/***directory* **]/***file_name*

Important: Use of the SMC hard drive is not supported in this release.

directory is the directory name.
filename is the actual file of interest.
username is the user to be authenticated.
password is the password to use for authentication.
host is the IP address or host name of the server.
port# is the logical port number that the communication protocol is to use.

to_url

Specifies the destination of the copy. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

- ST16:
  - **[file:] { /flash | /pcmcia1 | /pcmcia2 }[/***directory* **] /***file_name*
  - **tftp:// {** *host***[** *:port#* **] } [/***directory* **] /***file_name*

- **[ftp: | sftp:]//[** *username* **[** *:password* **] @] { host } [** *:port#* **] [** */directory* **] /***file_name*

- ASR 5000:
  - **[file:]{ /flash | /pcmcia1 | /hd }[** */directory* **] /***file_name*
  - **tftp://{** *host***[** *:port#* **] } [** */directory* **] /***file_name*
  - **[ftp: | sftp:] / / [** *username* **[** *:password* **] @] { host } [** *:port#* **] [** */directory* **] /***file_name*

Important: Use of the SMC hard drive is not supported in this release.

directory is the directory name.
filename is the actual file of interest.
username is the user to be authenticated.
password is the password to use for authentication.
host is the IP address or host name of the server.
port# is the logical port number that the communication protocol is to use.

passive

Indicates the file copy is to use the passive mode.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Important: Use of the **-noconfirm** option allows the over writing of an existing file if the destination file already exists.

Usage

Copy configuration files, log files, etc.,to provide backups of data through the network.

Example

The following copies files from the local */flash/pub* directory to remote node *remoteABC*'s */pcmcia2/pub* directory with and without confirmation respectively.

copy *http://remoteABC/pub/june.cfg /flash/pub/june.cfg*

copy *tftp://remoteABC/pub/june.cfg /pcmcia2/pub/june.cfg* **-noconfirm**

The following copies files from remote node *remoteABC* to remote node *remote123*.

copy *ftp://remoteABC/pub/may.cfg ftp://remote123/pub/may.cfg*

crash copy

Copies individual crash files (one-at-a-time) and optionally the core dump file from the stored crash records on the chassis to a user-specified location.

Product

All

Privilege

Security Administrator, Administrator

Syntax

crash copy number *number* **url** *to_url* **[core]**

number *number*

The identification number of the crash record. *number* must be an integer representing a valid record number selected from a range of 1 to 120. To determine the numeric identity of a specific crash file, use the **show crash list** command in Exec mode.

url *to_url*

Specifies the destination of the copy. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

- ST16:
  - **[file:] { /flash | /pcmcia1 | /pcmcia2 } [/***directory* **] /**
  - **tftp:// { ***host* **[:***port#* **] } [/***directory* **] /**
  - **[ftp: | sftp:]//[***username* **[:***password* **] @] { ***host* **} [:***port#* **] [/***directory* **] /**
- ASR 5000:
  - **[file:] { /flash | /pcmcia1 | /hd } [/***directory* **] /**
  - **tftp://{ ***host***[:***port#* **] } [/***directory* **] /**
  - **[ftp: | sftp:]//[***username* **[:***password* **] @] { ***host* **} [:***port#* **] [/***directory* **] /**

Important: Use of the SMC hard drive is not supported in this release.

directory: the name of the target directory.
username: the username to be authenticated to provide access to targeted server.
password: the username's password to be authenticated.
host: the IP address or host name of the targeted server.
port#: the number of the target server's logical port used for the selected communication protocol.

Important: Do **not** specify a target filename as this will prevent the file from writing to the target server. The system generates and provides a timestamp-based filename that appears at the destination when the copy command completes.

core

Including this keyword as part of the command instructs the system to copy the core dump to the targeted storage server. The core cannot be copied alone; it must be part of a **crash copy** action included when copying a crash file.

Usage

Copy crash files of core dump to another location for backup or analysis.

Example

The following uses **ftp** to copy stored record number 5 and the core dump from the crash record list to a targeted remote node directory called *crasharchive* through port *22* of the targeted server *remoteABC* with access through user *homeboy* whose password is *secret.7.word*.

```
crash copy number 5 url ftp://homeboy:secret.7.word@
remoteABC:22/crasharchive/ core
```

crypto-group

Allows the manual switchover of redundant IPSec tunnels belonging to a specific crypto group.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

crypto-group name *group_name* **activate { primary | secondary }**

group_name

group_name is the name of the crypto group to which the tunnels to be switched are associated.

activate { primary | secondary }

Allows you to specify which tunnel to activate (i.e. is to facilitate user traffic):

- **primary**: Switch traffic to the primary tunnel in the group.
- **secondary**: Switch traffic to the secondary tunnel in the group.

Usage

This command is used in conjunction with the Redundant IPSec Tunnel Fail-over feature.
Use this command to manually switch traffic to a specific tunnel in a crypto group if the automatic switchover options have been disabled. Refer to the **switchover** command in the Crypto Group configuration mode for more information.

Example

The following command manually switches user traffic to the secondary tunnel in the crypto group called *group1*:

crypto-group *group1* **activate secondary**

Chapter 88
Exec Modes Commands (D-S)

This chapter contains the commands in the Exec Mode from **debug** to **start crypto security-association**.

debug

The following commands send information to the logging facility for review:

debug ip

Enables/disables the debug options for IP debugging. If logging is enabled, results are sent to the logging system.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

`[ no ] debug ip { arp | interface | route }`

`no`

Indicates the IP debugging is to be disabled for the IP interfaces/function specified.

`arp | interface` *`name`* **`| route`**

Specifies which IP interfaces/function to debug.
`arp`: indicates debug is to be enabled for the address resolution protocol.
`interface`: indicates debug is to be enabled for the IP interfaces.
`route`: indicates debug is to be enabled for the route selection and updates.

Usage

The debug IP command is valuable when troubleshooting network problems between nodes. The debugging is stopped by using the **`no`** keyword.

Caution: Issuing this command could negatively impact system performance depending on system configuration and/or loading.

Example

The following commands enable/disable debugging for ARP.

```
debug ip arpno debug ip arp
```

The following enables/disables debugging for IP interfaces.

```
debug ip interface
```

```
no debug ip interface
```

The following enables/disables debugging for routing.

```
debug ip routeno debug ip route
```

debug ip bgp

This command enables BGP debug flags. If logging is enabled, results are sent to the logging system.

Product

HA

Privilege

Security Administrator, Administrator, Operator

Syntax

```
[ no ] debug ip bgp { all | event | filters | fsm | keepalives | updates {
inbound | outbound } }
```

no

Disable the specified BGP debug flags.

all

Enable all BGP debug flags.

event

Enable debugging of all BGP protocol events.

filters

Enable debugging of all BGP filters.

fsm

Enable debugging of BGP Finite State Machine

keepalives

Enable debugging of all BGP keepalives.

updates {inbound | outbound}

Enable debugging of BGP updates.
inbound: Debug all BGP inbound updates.
outbound: Debug all BGP outbound updates.

Usage

Use this command to enable or disable BGP debug flags.

Example

The following command disables all BGP debug flags enabled by any of the debug ip bgp commands:

```
no debug ip bgp all
```

The following command enables all BGP debug flags:

```
debug ip bgp all
```

debug ip ospf all

This command enables all OSPF debug flags. If logging is enabled, results are sent to the logging system.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
[ no ] debugipospf all
```

no

Disable all OSPF debug flags.

Usage

Use this command to enable or disable all OSPF debug flags.

Example

The following command disables all OPSF debug flags enabled by any of the debug ip ospf commands:

```
no debug ip ospf all
```

The following command enables all OSPF debug flags:

```
debug ip ospf all
```

debug ip ospf event

This command enables debugging of OSPF protocol events. If logging is enabled, results are sent to the logging system. If no keywords are specified, all events are enabled for debugging.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
[ no ] debug ip ospf event [ abr | asbr | vl | lsa | os | router ]
```

no

Disable debugging the specified OSPF event. If no keywords are specified, all events are disabled.

abr

Specifies debugging of ABR events.

asbr

Specifies debugging of ASBR events.

vl

Specifies debugging of VL events.

lsa

Specifies debugging of link state advertisement (LSA) events.

os

Specifies debugging of OS events.

router

Specifies debugging of router events.

Usage

Use this command to output debug information for OSPF events.

Example

To enable all event debug information, enter the following command;

```
debug ip ospf event
```

To disable all event debug information, enter the following command;

```
no debug ip ospf event
```

debug ip ospf ism

This command enables OSPF Interface State Machine (ISM) troubleshooting, based on ISM information type. If no keywords are specified all ISM information types are enabled. If logging is enabled, results are sent to the logging system.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
[ no ] debug ip ospf ism [ events | status | timers ]
```

no

Disable debugging the specified ISM information. If no keywords are specified, all information is disabled.

events

Enable debugging ISM event information.

status

Enable debugging ISM status information.

timers

Enable debugging ISM timer information.

Usage

Use this command to output ISM debug information.

Example

To enable all ISM debug information, enter the following command;

```
debug ip ospf ism
```

To disable all ISM debug information, enter the following command;

```
no debug ip ospf ism
```

debug ip ospf lsa

This command enables troubleshooting on OSPF Link State Advertisements (LSAs), based on the specific LSA option. If no keywords are specified, all options are enabled. If logging is enabled, results are sent to the logging system.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
[ no ] debug ip ospf lsa [ flooding | generate | install | refresh | maxage | refresh ]
```

no

Disables the specified LSA debug information. If no keyword is specified, all LSA debug information is disabled.

flooding

Enable LSA flooding information.

generate

Enable LSA generation information.

install

Enable LSA install information.

maxage

Enable LSA maxage information in seconds. The maxage is equal to 3600 seconds.

refresh

Enable LSA refresh information.

Usage

Use this command to output debug information for LSAs.

Example

To enable all LSA debug information, enter the following command;

```
debug ip ospf lsa
```

To disable all LSA debug information, enter the following command;

```
no debug ip ospf lsa
```

debug ip ospf nsm

This command enables troubleshooting OSPF Neighbor State Machines (NSMs), based on the specific NSM information type. If no keyword is specified, all NSM information types are enabled. If logging is enabled, results are sent to the logging system.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
[ no ] debug ip ospf nsm [ status | events | timers ]
```

no

Disables the debugging the specified NSM information type. If no keyword is specified, all information types are disabled.

events

Enables debugging NSM event information.

status

Enables debugging NSM status information.

timers

Enables debugging NSM timer information.

Usage

Use this command to output debug information for OSPF NSMs

Example

To enable all NSM debug information, enter the following command;

```
debug ip ospf nsm
```

To disable all NSM debug information, enter the following command;

```
no debug ip ospf nsm
```

debug ip ospf packet

This command enables troubleshooting of specific OSPF packet information. If logging is enabled, results are sent to the logging system.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
[ no ] debug ip ospf packet { all | dd | hello | ls-ack | ls-request | ls-update
} [ send | recv ] [ detail ]
```

no

Disable debugging of the specified packet information.

all

Enable debugging all OSPF packet information.

dd

Enable debugging database descriptions.

hello

Enable debugging hello packets.

ls-ack

Enable debugging link state acknowledgements.

ls-request

Enable debugging link state requests.

ls-update

Enable debugging link state updates.

send

Enable debugging only on sent packets.

recv

Enable debugging only on received packets.

detail

Enable detailed information in the debug output.

Usage

Use this command to output specific OSPF packet information.

Example

To enable all packet debug information, enter the following command;

```
debug ip ospf packet all
```

To disable all route debug information, enter the following command;

```
no debug ip ospf packet all
```

debug ip ospf route

This command sets the route calculation method to use in debugging OSPF routes. If no route calculation method is specified, all methods are enabled. If logging is enabled, results are sent to the logging system.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
[ no ] debug ip ospf route [ ase | ia | install | spf ]
```

no

Disables debugging of route information. If no keyword is specified all information types are disabled.

ase

Enables debugging information on external route calculations.

ia

Enables debugging information on Inter-Area route calculations.

install

Enables debugging information on route installation.

spf

Enables debugging information on SPF route calculations.

Usage

Use this command to output debug information for OSPF routes.

Example

To enable all route debug information, enter the following command;

```
debug ip ospf route
```

To disable all route debug information, enter the following command;

```
no debug ip ospf route
```

debug ip ospf router

This command sets the debug option for OSPF router information. If no keyword is specified, all router information is enabled. If logging is enabled, results are sent to the logging system.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
[ no ] debug ip ospf router [ interface | redistribute ]
```

no

Disables the specified router debug information. If no keyword is specified, all router information is disabled.

interface

Enables router interface information.

redistribute

Enables router redistribute information.

Usage

Use this command to output debug information for the OSPF router.

Example

To enable all router debug information, enter the following command;

```
debug ip ospf router
```

To disable all router debug information, enter the following command;

```
no debug ip ospf router
```

default terminal

Restores the system default value for the terminal options.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
default terminal { length | width }
```

length | width

length: reset the terminal length to the system default.
width: restores the system default terminal width.

Usage

Restore the default terminal settings when the current paging and display wraps inappropriately or pages to soon.

Example

The following sets the default length then width in two commands.

```
default terminal length

default terminal width
```

delete

Removes the specified file(s) permanently from the local.

Product

All

Privilege

Security Administrator, Administrator

Syntax

delete *filepath* **[-noconfirm]**

filepath

Specifies the location of the file to delete. The path must be formatted according to the following format: Specifies the source of the copy. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

- ST16:
  - **[file:] { /flash | /pcmcia1 | /pcmcia2 }[/***directory* **]/***file_name*
- ASR 5000:
  - **[file:] { /flash | /pcmcia1 | /hd }[/***directory* **] /***file_name*

Important: Use of the SMC hard drive is not supported in this release.

directory is the directory name
filename is the actual file of interest

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Important: Use of the **-noconfirm** option should be done with extra care to ensure the file is specified accurately as there is no method of recovering a file that has been deleted.

Usage

Deleting files is a maintenance activity which may be part of periodic routine procedures to reduce system space utilization.

Example

The following removes files from the local */flash/pub* directory.

```
delete /flash/pub/june03.cfg
```

dhcp force

Tests the lease-renewal for DHCP-assigned IP addresses for a particular subscriber.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator

Syntax

dhcp force lease-renewal { callid *id* **| imsi** *imsi* **[nsapi** *nsapi* **] | msid** *msid* **}**

callid *id*

Clears the call specified by *call_id*. The call ID must be specified as a 4-byte hexadecimal number.

imsi *msid*

Disconnects the subscriber with the specified msid. The IMSI (International Mobile Subscriber Identity) ID is a 50-bit field which identifies the subscriber's home country and carrier. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘). For example; ‘$’.

nsapi *nsapi*

A specific Network Service Access Point Identifier (NSAPI).
nsapi is an integer value from 5 to 15.

msid *id*

Disconnects the mobile user identified by *ms_id*. *ms_id* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘). For example; ‘$’.

Usage

Use this command tests a forced IP address lease renewal for a specific subscriber.

Example

The following command tests DHCP lease renewal for a subscriber with an MSID of 1234567:

dhcp force lease-renewal msid *1234567*

dhcp test

Tests DHCP functions for a particular DHCP service.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator

Syntax

dhcp test dhcp-service *svc_name* **[all | server** *ip_address* **]**

dhcp-service *svc_name*

The name of the DHCP service. It can be from 1 to 63 alpha and/or numeric characters in length and is case sensitive.

all

Tests DHCP functionality for all servers.

server *ip_address*

Tests DHCP functionality for the server.
ip_address is the IP address of the DHCP server in dotted-decimal notation.

Usage

Once DHCP functionality is configured on the system, this command can be used to verify that it is configured properly and that it can successfully communicate with the DHCP server.
Executing this command causes the system to request and allocate an IP address and then release it.
If a specific DHCP server is not specified, then each server configured in the service is tested.

Example

The following command tests the systems ability to get an IP address from all servers a DHCP service called DHCP-Gi is configured to communicate with:

dhcp test dhcp-service *DHCP-Gi* **all**

diameter disable endpoint

This command disables a diameter peer without removing the peer's configuration.

Product

PDIF, SCM

Privilege

Security Administrator, Administrator

Syntax

diameter disable endpoint *endpoint_name* **peer** *peer_id*

endpoint *endpoint_name*

Specifies the endpoint in which the peer is configured.
endpoint_name must be the name of the endpoint, and must be an alpha and/or numeric string of 1 through 63 characters in length.

peer *peer_id*

Specifies the peer to be disabled.
peer_id must be the diameter peer host name, and must be a string of 1 through 63 characters in length.

Usage

Use this command to administratively disable a diameter peer without removing the peer configuration. This command will tear down all connections on the specified peer (by sending a DPR if the configuration demands the same at peer level configuration). The peer will remain in disabled state until it is enabled again. Also see the **diameter enable endpoint** command.

Example

This command disables the diameter peer *peer12*:

diameter disable endpoint *endpoint1* **peer** *peer12*

diameter enable endpoint

This command enables a diameter peer that is disabled.

Product

PDIF, SCM

Privilege

Security Administrator, Administrator

Syntax

diameter enable endpoint *endpoint_name* **peer** *peer_id*

endpoint *endpoint_name*

Specifies the endpoint in which the peer is configured.
endpoint_name must be the endpoint name, and must be a string of 1 through 63 characters in length.

peer *peer_id*

Specifies the peer to be enabled.
peer_id must be the diameter peer host name, and must be a string of 1 through 63 characters in length.

Usage

Use this command to administratively enable a diameter peer. Also see the **diameter disable endpoint** command.

Example

This command enables the diameter peer *peer12*:

diameter enable endpoint *endpoint1* **peer** *peer12*

diameter reset connection

This command resets individual TCP/SCTP connections.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

diameter reset connection { endpoint *endpoint_name* **peer** *peer_id* **}**

endpoint *endpoint_name*

Resets connection to the specified endpoint.
endpoint_name must be the endpoint name, and must be an alpha and/or numeric string of 1 through 63 characters in length.

peer *peer_id*

Resets connection to the specified peer.
peer_id must be the Diameter peer host name, and must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to reset the TCP/SCTP connections for the specified endpoint/peer. With this command, the connection will be closed temporarily after DPR/DPA. If there is any traffic to be sent to the particular peer, then the connection will be re-established.
This command overrides the endpoint configured in any other configuration mode.
This command is applicable only when the specified peer is enabled.

Example

This command resets connection to the endpoint named *test123*:

diameter reset connection endpoint *test123*

diameter reset route failure

This command resets the failed route status of Diameter destination-host combination via peer to AVAILABLE status.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

diameter reset route failure [endpoint *endpoint_name* **] [host** *host_name* **] [peer** *peer_id* **]**

endpoint *endpoint_name*

Resets paths to the specified endpoint.
endpoint_name must be a string of 1 through 63 characters in length.

host *host_name*

Resets the FAILED status of all Diameter destination-host combination routes via peer for every Diameter client within the chassis having a specific host name to AVAILABLE.
host_name must be the Diameter host name, and must be a string of 1 through 63 characters in length.

peer *peer_id*

Resets the FAILED status of all Diameter destination-host combination routes via a peer having specific peer-Id for every Diameter client within the chassis to AVAILABLE.
peer_id must be the Diameter peer host name, and must be a string of 1through 63 characters in length.

Usage

Use this command to reset the FAILED status of all Diameter destination-host combination routes via peer for every Diameter client within the chassis to AVAILABLE status.
This command also resets the failure counts used to determine the AVAILABLE/FAILED status of destination-host combination.
When executed from local context, this command matches all contexts. If an optional keyword is not supplied, a wildcard is used for the value.
The status of every matching combination of destination-host via peer for every matching Diameter client within the chassis will be reset to AVAILABLE. The failure counts that are used to determine AVAILABLE/FAILED status will also be reset.
Also see the **route-entry** and **route-failure** CLI commands in the Diameter Endpoint Configuration Mode.
Default value: N/A

Example

The following command resets the FAILED status of all Diameter destination-host combination routes via peer for every Diameter client within the chassis for specified endpoint name to AVAILABLE.

diameter reset route failure endpoint *endpoint_name*

directory

Lists the files in a specified location.

Product

All

Privilege

Security Administrator, Administrator

Syntax

directory *filepath* **[-size] [-reverse] [-time]**

filepath

Specifies the directory path to list the contained files. The path must be formatted according to the following format:
Specifies the source of the copy. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

- ST16:
  - **[file:] { /flash | /pcmcia1 | /pcmcia2 }[/***directory* **] /***file_name*
- ASR 5000:
  - **[file:] { /flash | /pcmcia1 | /hd }[/***directory* **] /***file_name*

Important: Use of the SMC hard drive is not supported in this release.

directory is the directory name
filename is the actual file of interest

-size

Indicates the size of each file should be displayed in the output.

-reverse

Indicates the order of files listed should be in descending order (z-aZ-A9-0). Default is to sort in ascending order (0-9A-Za-z).

-time

Indicates the last modification timestamp of each file should be displayed in the output.

Usage

Lists such things as log and crash files from multiple nodes within the network.
The optional arguments may be specified individually or in any combination.

Example

The following command will list the files in the local */flash/pub* directory sorted in reverse order.

```
directory /flash/pub -reverse
```

disable

Prevents the system from making requests of a selected RADIUS server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

disable radius [accounting | charging [accounting]] server *address* **[port** *num* **] [group** *name* **]**

accounting | charging | charging accounting

Specifies the type of RADIUS server to disable.

server *address*

Identifies the RADIUS server by IP address.
address is specified using the standard IPv4 or IPv6 dotted decimal notation.

port *num*

Default: 1812 (authentication) 1813 (accounting)
Specifies the port number of the RADIUS server being disabled.
num must be the configured port number of the RADIUS server being disabled and be 0 to 65535 numeric characters in length.

group *name*

Default: default
Specifies the RADIUS group to which the server belongs. Use this option in the event that the RADIUS server belongs to multiple groups and you only want to disable the server within the specific group.
name must be the name of a configured RADIUS Server group and be 1 to 63 characters in length.

Usage

Use this command to gracefully stop the system from making requests of a specific RADIUS server.

Example

The following command disables a RADIUS accounting server with an IP address of 1.2.3.4, the default accounting server port number, and that resides in the "Group5" server group:

disable radius accounting server *1.2.3.4* **group** *Group5*

dns-client

This command performs DNS query on the basis of specified DNS client name, DNS query domain name, and type of query criteria.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
dns-client dns_client_name [ query-type { A | AAAA | NAPTR | SRV }] query-name
query_domain_name
```

dns-client *dns_client_name*

Defines the name of the DNS client whose cache and/or statistics are to be queried. *dns_client_name* is an existing DNS client and must be from alpha and/or numeric string of 1 through 64 characters.

query-type { A | NAPTR | SRV }]

Default: **A**

This keyword specifies that the type of query to perform for the defined DNS client is to be displayed.

- **A**: Filters DNS results based on domain IPv4 address records (A records). This is the defualt query type.
- **AAAA**: Filters DNS results based on domain IPv6 address records (AAAA records)..
- **NAPTR**: Filters DNS results based on Naming Authority Pointer records (NAPTR).
- **SRV**: Filters DNS results based on service host records (SRV records).

query-name *query_domain_name*

This keyword filters the DNS results based on the query domain name.
query_domain_name must be from 1 to 255 characters in length. *query_domain_name* is the domain name used to perform the DNS query and is different from the actual domain name which is resolved. For example, to resolve the SIP server for *service.com*, the query name is *_sip._udp.service.com* and the query type is **SRV**.

Usage

Use this command to perform DNS query on the basis of DNS Client name and filters the query results based on query type and query name. This command also populates the result into DNS Cache. This command used the current context to DNS request.

Example

The following command displays statistics for a DNS client named *test_dns* with query type for IP address as *A* and query name as *domain1.com*.

dns-client *test_dns* **query-type A query-name** *domain1.com*

enable

Allows the system to start making requests of a selected RADIUS server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

enable radius [accounting | charging | [accounting]] server *address* **[port** *num* **] [group** *name* **]**

accounting | charging | charging accounting

Specifies the type of RADIUS server to enable.

server *address*

Identifies the RADIUS server by IP address.
address is specified using the standard IPv4 or IPv6 dotted decimal notation.

port *num*

Default: 1812 (authentication) 1813 (accounting)
Specifies the port number of the RADIUS server being enabled.
num must be the configured port number of the RADIUS server being enabled and must be 0 to 65535 numeric characters in length.

group *name*

Default: default
Specifies the RADIUS group to which the server belongs. Use this option in the event that the RADIUS server belongs to multiple groups and you only want to disable the server within the specific group.
name must be the name of a configured RADIUS Server group and be 1 to 63 characters in length.

Usage

Use this command to allow the system to start making requests of a specific RADIUS server.

Example

The following command enables a RADIUS accounting server with an IP address of 1.2.3.4, the default accounting server port number, and that resides in the "Group5" server group:

enable radius accounting server *1.2.3.4* **group** *Group5*

exit

Exits the current CLI session.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

exit

Usage

Use this command to close the current CLI session.

filesystem format

Used to format the PCMCIA card or the Compact Flash on the SMC.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ST16:

```
filesystem format { /flash | /pcmcia1 | /pcmcia2 } [ otherspc ]
```

ASR 5000:

```
filesystem format { /flash | /pcmcia1 | /hd } [ othersmc ]
```

{/flash | /pcmcia1 | /pcmcia2} or { /flash | /pcmcia1 | /hd }

Format the file system on the specified device.

Important: Use of the SMC hard drive is not supported in this release.

[othersmc]

Format the file system on the standby SMC.

Usage

Clear all directories and files from the PCMCIA card(s) and/or the Compact Flash and re-establish the file system.

Example

The following command formats the PCMCIA card located in slot 1 on the SMC:

```
filesystem format /pcmcia1
```

filesystem repair

Used to repair the file system on a PCMCIA card or the Compact Flash on the SMC.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ST16:

```
filesystem repair {/flash | /pcmcia1 | /pcmcia2 } [checkonly] [
otherspc ]
```

ASR 5000:

```
filesystem repair {/flash | /pcmcia1 | /hd } [checkonly] [
othersmc ]
```

`{/flash | /pcmcia1 | /pcmcia2 } or {/flash | /pcmcia1 | /hd }`

Repair the file system on the specified device.

Important: Use of the SMC hard drive is not supported in this release.

`[ checkonly ]`

Check, but do not repair, the file system.

`[ othersmc ]`

Repair the file system on the standby SMC.

Usage

Repair the file system on a PCMCIA card or the Compact Flash.

Example

The following command repairs the file system on the PCMCIA card located in slot 1 on the SMC:

```
filesystem format /pcmcia1
```

gtpc test echo

Tests the ability of a GGSN service to exchange GTP-C echo request messages with the specified SGSN(s).

Product

GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

gtpc test echo src-address *gn_address* **{ all | sgsn-address** *ip_address* **}**

src-address *gn_address*

Specifies the IP address of a Gn interface configured on the system.
gn_address must be expressed in dotted decimal notation.

Important: The IP address of the system's Gn interface must be bound to a configured GGSN service prior to executing this command.

all

Specifies that GTP-C echo requests will be sent to all SGSNs that currently have sessions with the GGSN service.

sgsn-address *ip_address*

Specifies that GTP-C echo requests will be sent to a specific SGSN.
ip_address is the address of the SGSN to send the requests to and must be expressed in dotted decimal notation.

Usage

This command tests the GGSN's ability to exchange GPRS Tunneling Protocol control plane (GTP-C) packets with the specified SGSNs which can be useful troubleshooting and/or monitoring.
This command must be executed from within the context in which the GGSN service is configured.
Refer also to the gtpu test command.

Example

The following command issues GTP-C echo packets from a GGSN service bound to address 192.168.157.32 to an SGSN with an address of 192.168.157.2:

gtpc test echo src-address *192.168.157.32* **sgsn-address** *192.168.157.2*

gtpp interim now

Check points current GTPP accounting messages and identifies which types of interim CDRs are to be generated and sent to the external charging/storage servers (e.g., a CFG or a GSS). The impact of this command is immediate.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

gtpp interim now [active-charging egcdr | apn *apn_name* **| callid** *call_id* **| cdr-types { gcdr | mcdr | scdr } | dhcp-server** *ip_address* **| gprs-service** *svc_name*| **ggsn-service** *svc_name* **| imsi** *imsi* **[ip-address** *sub_address* **[username** *name* **] now | nsapi** *nsapi* **[ip-address** *sub-address* **[username** *name* **] | username** *name* **]] | ip-address** *sub_address* **[username** *name* **] | ip-pool** *pool_name* **| mcc** *mcc_number* **mnc** *mnc_number* **| msisdn** *msisdn_num* **| sgsn-address** *ip_address* **| sgsn-service** *svc_name* **| username** *name* **] +**

active-charging

This feature is specific to the GGSN and is documented separately. See .

apn *apn_name*

Initiates GTPP interim accounting for all PDP contexts accessing the specified APN.
apn_name can be from 1 to 62, case sensitive, alphanumeric characters.

callid *call_id*

Identifies a specific call.
call_id must be followed by an 8-digit HEX number.

cdr-types { mcdr | scdr }

Specifies the CDR types to be generated by the SGSN:
This keyword is specific to the SGSN.
gcdr - Instructs the GGSN to only generate G-CDRs.
mcdr - Instructs the SGSN to only generate M-CDRs
scdr - Instructs the SGSN to only generate S-CDRs.

dhcp-server *ip_address*

Identifies the DHCP server where the IP address (defined with the **ip address** keyword) was allocated.
Must be followed by the IP address of the DHCP server.
ip_address: Must be specified using dotted decimal notation.

ggsn-address *ip_address*

This keyword is specific to the GGSN.
Specifies the IP address of the interface to the GGSN.
ip_address: Must be specified using dotted decimal notation.

ggsn-service *svc_name*

This keyword is specific to the GGSN.
Initiates GTPP interim accounting for all PDP contexts currently being facilitated by the specified GGSN service.
svc_name can be from 1 to 63 , case sensitive, alphanumeric characters.

gprs-service *svc_name*

This keyword is specific to the SGSN.
Initiates GTPP interim accounting for all PDP contexts currently being facilitated by the specified GPRS service.
This keyword is specific to the SGSN.
svc_name can be from 1 to 63 , case sensitive, alphanumeric characters.. Must be an already defined GPRS service name.

imsi *imsi* **[ip-address** *sub_address* **[username** *name* **] | nsapi** *nsapi* **[ip-address** *sub-address* **[username** *name* **] | username** *name* **]]**

Initiates GTPP interim accounting for a specific International Mobile Subscriber Identity (IMSI) number. The request could be further filtered using any of the following keywords:

- **ip-address**: Interim accounting will be performed for the address specified by *sub_address*. The command can be further filtered by specifying a specific username (*name*) with that address.
- **nsapi**: Interim accounting will be performed for a specific Network Service Access Point Identifier (NSAPI). *nsapi* is an integer value from 5 to 15. The command can be further filtered by specifying a specific ip address (*sub_address*) and/or a username (*name*) with that address, or just a specific username.

ip-address *sub_address* **[username** *name* **]**

Initiates GTPP interim accounting for the address specified.
sub_address is the IP address of the subscriber and must be expressed in dotted decimal notation.
The command can be further filtered by specifying **username** with that address.
name is the subscriber's name and can be a sequence of characters and/or wildcard characters ('$' and '*') from 1 to 127 characters in length. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as wildcard enclose them in single quotes (‘). For example; ‘$’.

ip-pool *pool_name*

This keyword is applicable to the GGSN only.
Initiates GTPP interim accounting for all PDP contexts that were allocated IP addresses from the specified pool.
pool_name can be from 1 to 31 alpha and/or numeric characters and is case sensitive.

mcc *mcc_number* **mnc** *mnc_number*

mcc_number Specifies the mobile country code (MCC) portion of the PLMN's identifier and can be configured to any 3-digit integer value between 100 and 999.
mnc_number Specifies the mobile network code (MNC) portion of the PLMN's identifier and can be configured to any 2 or 3 digit integer value between 00 and 999.

msisdn *msisdn_num*

This keyword configures the SGSN to include the Mobile Subscribers Integrated Services Digital Network identifier in generated CDRs (M-CDRs and/or the S-CDRs).
This keyword is applicable for SGSN only.
msisdn_number - Must be followed by a valid MSISDN number, consisting of of 1 to 15 digits.

sgsn-address *ip_address*

This keyword is specific to the GGSN.
Initiates GTPP interim accounting for all PDP contexts currently being facilitated by the specified SGSN.
ip_address is the IP address of the SGSN and must be expressed in dotted decimal notation.

sgsn-service *svc_name*

Initiates GTPP interim accounting for all PDP contexts currently being facilitated by the specified SGSN service.
This keyword is specific to the SGSN.
svc_name can be from 1 to 63 , case sensitive, alphanumeric characters.. Must be an already defined SGSN service name.

username *name*

Initiates GTPP interim accounting for all PDP contexts for the subscriber specified.
name is the subscriber's name and can be from 1 to 127 alpha and/or numeric characters and is case sensitive.

+

More than one of the above keywords can be entered within a single command.

Usage

This command causes GTPP accounting CDRs to immediately be generated for all active sessions that are in the current context. If executed within the local context, CDRs will be generated for all active sessions regardless of context.
The sending of the CDRs is paced so as not to overload the accounting server.

Example

The following command causes CDRs to immediately be generated:

```
gtpp interim now
```

gtpp interim now active-charging egcdr

Check points current GTPP accounting messages for active charging immediately.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

gtpp interim now active-charging egcdr [callid *call_id* **| imsi** *imsi* **| msid** *msid* **| rulebase** *rbase_name* **| session-id** *sess_id* **| username** *name* **]**

callid *call_id*

Initiates GTPP interim accounting for a session with the specific call ID. *call_id* must be an 8-digit hexadecimal number.

imsi *imsi*

Initiates GTPP interim accounting for a specific International Mobile Subscriber Identity (IMSI) number. *imsi* must be a sequence of hexadecimal digits and wildcard characters - $ matches a single character and * matches multiple characters

msid *msid*

Initiates GTPP interim accounting for a specific Mobile Station Identifier (MSID) number. *msid* must be a sequence of up to 24 digits and wildcard characters - $ matches a single character and * matches multiple characters

rulebase *rbase_name*

Initiates GTPP interim accounting for sessions that use the named active charging rulebase. *rbase_name* must be an alpha and/or numeric string of from 1 through 24 characters.

session-id *sess_id*

Initiates GTPP interim accounting for a specific active charging session. *sess_id* must be the name of a current active charging session.

username *name*

Initiates GTPP interim accounting for all PDP contexts for the subscriber specified.
name is the subscriber's name and can be from 1 to 127 alpha and/or numeric characters and is case sensitive.

Usage

This command causes GTPP accounting eG-CDRs to immediately be generated for active charging sessions that meet the specified criteria.
The sending of the CDRs is paced so as not to overload the accounting server.

Example

The following command causes eG-CDRs to immediately be generated for active charging sessions using the rulebase named rulbase1:

```
gtpp interim now active-charging egcdr rulebase rulebase1
```

gtpp storage-server commit

Causes the GTPP storage server to save all buffered packets to the hard drive.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
gtpp storage-server commit now
```

Usage

Upon execution, this command is relayed by the system to the GTPP Storage Server (GSS) causing the GSS to save all buffered packets to the hard drive. It also causes the GSS to delete all CDRs that have been acknowledged by the CGF. The deleted CDRs are saved in a separate file.
Note that this command must be executed from within the context in which the GSS is configured.
Refer to the **gtpp storage-server** command in the Context Configuration Mode for more information.

gtpp test

Tests the system's ability to communicate with configured CGF(s).

Product

GGSN

Privilege

Operator, Config-Administrator, Administrator

Syntax

gtpp test [accounting { all | cgf-server *cgf_address* **}] | [storage-server [address** *ip-addr* **port** *udp-port* **]]**

all

Tests all CGFs configured within the given context.

cgf-server *cgf_address*

Tests a specific CGF configured within the given context.
ip_address is the IP address of the CGF expressed in dotted decimal notation.

storage-server [address *ip-address* **port** *udp-port*]

Test the connectivity and provide round trip time for the echo request sent to GTPP Storage-Server configured in the requested context.
ip_address is the IP address of the GSS expressed in dotted decimal notation and *udp-port* is the port defined for GTPP Storage Server.

Usage

This command is used to verify the configuration of and test the system's ability to communicate with one or all configured GSS/CGFs for monitoring or troubleshooting purposes.
When executed, this command causes the system to send GTPP echo packets to the specified GSS/CGF(s). The command's response will display whether the GSS/CGF is active or unreachable.

Example

The following command tests communication with a CGF having an IP address of 192.168.1.5:

```
gtpp test accounting cgf-server  192.168.1.5
```

The following command tests communication with a GSS configured in requested context

```
gtpp test storage-server
```

The following command verify communication with a GSS, having IP address *192.156.12.10* and port *50000*, without configuring it in a context

```
gtpp test storage-server address  192.156.12.10 port  50000
```

gtpu test echo

Tests the ability of a GGSN service to exchange GTP-U echo request messages with the specified SGSN(s).

Product

GGSN

Privilege

Operator, Config-Administrator, Administrator

Syntax

gtpu test echo src-address *gn_address* **{ all | sgsn-address** *ip_address* **}**

src-address *gn_address*

Specifies the IP address of a Gn interface configured on the system.
gn_address must be expressed in dotted decimal notation.

Important: The IP address of the system's Gn interface must be bound to a configured GGSN service prior to executing this command.

all

Specifies that GTP-U echo requests will be sent to all SGSNs that currently have sessions with the GGSN service.

sgsn-address *ip_address*

Specifies that GTP-U echo requests will be sent to a specific SGSN.
ip_address is the address of the SGSN to send the requests to and must be expressed in dotted decimal notation.

Usage

This command tests the GGSN's ability to exchange GPRS Tunneling Protocol user plane (GTP-U) packets with the specified SGSNs which can be useful troubleshooting and/or monitoring.
This command must be executed from within the context in which the GGSN service is configured.
Refer also to the gtpc test command.

Example

The following command issues GTP-U echo packets from a GGSN service bound to address 192.168.157.43 to an SGSN with an address of 192.168.1.52:

gtpu test echo src-address *192.168.157.43* **sgsn-address** *192.168.157.2*

gtpv0 test echo

Tests the ability of a GGSN service to exchange GTPv0 echo request messages with the specified SGSN(s).

Product

GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

gtpv0 test echo src-address *gn_address* **{ all | sgsn-address** *ip_address* **}**

src-address *gn_address*

Specifies the IP address of a Gn interface configured on the system.
gn_address must be expressed in dotted decimal notation.

Important: The IP address of the system's Gn interface must be bound to a configured GGSN service prior to executing this command.

all

Specifies that GTPv0 echo requests will be sent to all SGSNs that currently have sessions with the GGSN service.

sgsn-address *ip_address*

Specifies that GTPv0 echo requests will be sent to a specific SGSN.
ip_address is the address of the SGSN to send the requests to and must be expressed in dotted decimal notation.

Usage

This command tests the GGSN's ability to exchange GPRS Tunneling Protocol version 0 (GTPv0) packets with the specified SGSNs which can be useful troubleshooting and/or monitoring.
This command must be executed from within the context in which the GGSN service is configured.
Refer also to the gtpc test and gtpu test commands.

Example

The following command issues GTPv0 echo packets from a GGSN service bound to address 192.168.1.33 to an SGSN with an address of 192.168.1.42:

gtpv0 test echo src-address *192.168.1.33* **sgsn-address** *192.168.1.42*

hd raid

Performs the RAID management operations on the ASR 5000 hard drive.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
hd raid { check | { create { local1 | remote1 } [ -force ] [ -noconfirm ] } | {
overwrite { local1 | remote1 } [ -force ] [ -noconfirm ] } | { select { local1 |
remote1 } [ -force ] [ -noconfirm ] } | { insert { local1 | remote1 } [ -force ]
[ -noconfirm ] } | { remove { local1 | remote1 } [ -force ] [ -noconfirm ] } }
```

check

Starts a background check on RAID disks unless the RAID is running in degraded mode.
-noconfirm: instructs system not to display “are you sure” prompts.. **-force:** instructs the system to enforce the action and override warnings.

create *local1* | *remote1*

Overwrites the specified disk to create a new RAID that could run in degraded mode.on the specified drive:
local1: specifies the RAID is to be established on the primary SMC. *remote1:* specifies the RAID is to be established on the backup SMC.
-noconfirm: instructs system not to display “are you sure” prompts.. **-force:** instructs the system to enforce the action and override warnings.

overwrite *local1* | *remote1*

Overwrites the specified disk and adds it to the current running RAID to construct a fully mirrored array.
local1: specifies the primary SMC is to be added to the current RAID. *remote1:* specifies the backup SMC is to be added to the current RAID.
-noconfirm: instructs system not to display “are you sure” prompts.. **-force:** instructs the system to enforce the action and override warnings.

select *local1* | *remote1*

Selects the specified disk to assemble a RAID when two unrelated RAID disks are present in the system. The resulting RAID runs in degraded mode.
local1: specifies the primary SMC is to assemble the RAID. *remote1:* specifies the backup SMC is to assemble the RAID.
-noconfirm: instructs system not to display “are you sure” prompts.. **-force:** instructs the system to enforce the action and override warnings.

insert *local1* | *remote1*

Inserts the specified disk to the running RAID causing it to recover from degraded mode.
local1: specifies the primary SMC is to be inserted into the RAID. *remote1:* specifies the backup SMC is to be inserted into the RAID.

-noconfirm: instructs system not to display “are you sure” prompts.. **-force:** instructs the system to enforce the action and override warnings.

remove local1 | remote1

Removes the specified disk from the running RAID causing it to run in degraded mode or to fail.
local1: specifies the primary SMC is to be removed from the RAID. *remote1:* specifies the backup SMC is to be removed from the RAID.
-noconfirm: instructs system not to display “are you sure” prompts.. **-force:** instructs the system to enforce the action and override warnings.

Usage

All commands need confirmation unless the **-noconfirm** is included in the command. If the result will bring down a running RAID, you have to force the command using **-force**.
RAID commands are needed to intervene in the following situations:

- the hard disk controller task can not determine the correct operation,
- administrator action is required by policy
- the administrator wants to wipe out an unused disk.

In an automated system, the policies created with this CLI address the possibility of a manually partitioned disk, a disk resulting from a different version of software, a partially constructed disk, or the case of two unrelated disks in the system.
To reduce administrator intervention, a set of policies can be configured to set the default action using the commands in the HD RAID configuration mode. These **hd raid** commands are described in the HD RAID Configuration Mode chapter of the Command Line Interface Reference.

Example

The following instructs the system to setup a RAID on the primary SMC hard drive.

```
hd raid create local1 -force
```

host

Used to resolve the IP address or logical host name information via DNS query.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

host { *host_name* **|** *host_ip_address* **}**

host_name **|** *host_ip_address*

Specifies host for which IP information is to be displayed.
host_name: specifies the logical host name for which the IP address is to be displayed (via DNS lookup).
host_ip_address: specifies the IP address for which the associated logical host name(s) are to be displayed (via reverse DNS lookup).

Usage

Verify DNS information which affects connections and packet routing.

Example

The following will resolve the host information for *remoteABC* and *1.2.3.4*.

host *remoteABC*

host *1.2.3.4*

interface sent gratuitous-arp

Use this command to configure the system to allow the manual generation of G-ARPs in case of a failure during inter-node online upgrade. If the chassis is not active, an error message displays.

Product

All

Privilege

Security Administrator, Administrator, Operator, or Inspector with li-administrator permissions

Syntax

interface *name* **send gratuitous-arp** *ip-address*

Usage

This command generates a G-ARP for the IP-ADDR specified and sends it out for the interface.

Example

The following generate a G-ARP for IP address *192.168.100.10.*

interface *interface_1* **send gratuitous-arp** *192.168.100.10*

lawful-intercept

This command provisions/de-provisions the lawful interception of data for the specified subscriber session.

Product

PDSN, HA, LNS, GGSN, PDIF, SGSN, ASN-GW

Privilege

Security Administrator, or Administrator, Operator, or Inspector with li-administrator permissions

Syntax

lawful-intercept { { [imei *imei_value*] **[imsi** *imsi_value*] **[ip-addr** *intercept_ip_addr* **] [msid** *ms_id* **] [msisdn** *msisdn_value* **] [username** *subscriber_name* **] + } [active-only] [allow-multiple-match] [calltype***call_type* **] [intercept-id** *li_id* **] [li-context** *ctxt_name* **] { content-delivery { none | udp-unack-format-1 dest-addr** *df_ip_address* **dest-port** *df_port_no* **} event-delivery { none | udp-unack-format-1 | udp-ack-format-1 dest-addr** *df_ip_address* **dest-port** *df_port_no* **} } }**

no lawful-intercept [all] { [imei *imei_value* **] [imsi** *imsi_value* **] [ip-addr** *intercept_ip_addr* **] [msid** *ms_id* **] [msisdn***msisdn_value* **] [username** *subscriber_name* **] + } [calltype** *call_type* **] [content-delivery {none | udp-unack-format-1 dest-addr** *df_ip_address* **dest-port** *df_port_no* **} event-delivery [none | udp-ack-format | udp-unack-format] dest-addr** *ip_address* **dest-port** *port_no*

---

no

De-provisions a previously configured lawful-intercept.

---

all

De-provisions all previously configured lawful-intercept warrant information. This Keyword is used to clear all warrant information in a single command **no lawful-intercept all**.

---

imei *imei_value*

Specifies the unique International Mobile Equipment Identifier (IMEI) which identifies the targeted device being used for a subscriber session to be intercepted.
imei_value: consists of 1 to 16 digits.

---

imsi *imsi_value*

Specifies the international mobile subscriber identity (IMSI) of the subscriber session to be intercepted.
imsi_value is an integer value from 1 to 15 characters.

---

ip-addr *intercept_ip_addr*

Specifies the IP address assigned for the subscriber session or to the mobile station to be targeted for interception.
intercept_ip_addr must be an IPv4/IPv6 address in desired notation.

msid *ms_id*

Specifies the mobile station identification (MSID) number, assigned by the home service provider, to be intercepted.
ms_id must be from 7 to 16 digits specified as an IMSI, MIN, or RMI.

msisdn *msisdn_value*

Specifies the unique mobile subscriber ISDN (telephone) number.
msisdn_value: consists of 1 to 15 digits.

username *subscriber_name*

Specifies the previously configured NAI username of the subscriber to be intercepted.
subscriber_name is an alphanumeric string of 1 to 127 characters.
Use of this keyword is not supported by the SGSN during LI provisioning or de-provisioning.

+

Indicates that multiple keywords can be specified in a single command entry. When the "+" appears in the syntax, any of the keywords that appear prior to the "+" can be entered in any order.
This functionality is not supported by the SGSN during LI provisioning or de-provisioning.

active-only

Dictates that the interception applies only to calls currently in progress and not those that have not started.
Use of this keyword is not supported by the SGSN during LI provisioning or de-provisioning.

allow-multiple-match

When used, interception is provided for up to 10 subscribers matching the specified criteria. This feature is disabled by default.
Use of this keyword is not supported by the SGSN during LI provisioning.

calltype *call_type*

The type of call for the specified subscriber session. *call_type* must be one of the following:

- **asngw**
- **mme**
- **pgw**
- **sgw**
- **ggsn**
- **pdif**
- **pdsn**
- **sgsn**
- **cscf**
- **ha**
- **lns**

Note that specifying call type is not mandatory while provisioning on SGSN and GGSN targets for any type of event and content delivery format.

content-delivery

Specifies the format in which the intercepted data contentdata content comprised of GTPU messages CC information is to be delivered to the DF.

event-delivery

Specifies the format in which intercepted control messagescontrol messages (such as attach/detach or RAU messages) IRI event messages are to be delivered to the DF.

intercept-id *li_id*

This is an arbitrary identification number, assigned by the provisioner, to identify this intercept definition. *li_id* must be an integer from 1 to 4294967295.

li-context *ctxt_name*

Identifies the destination context for intercepted packets. This keyword is mandatory if provisioning is done in a different context.
ctxt_name must be an alpha/numeric string of 1 to 79 characters that specifies the name of an existing context.

none

Indicates that the intercepted data, specified as either delivery-type (content or event), is not to be sent to the DF.
Entering **none** automatically activates the active-only provisioning method.

udp-unack-format-1

Dictates that the specified information type (content or event) is to be delivered using the udp-unack-format-1 which does not support acknowledgement messages for delivered information.

udp-ack-format-1

Dictates that the event information type is to be delivered using the udp-ack-format-1 which supports acknowledgement messages for delivered information.

dest-addr *df_ip_address*

The IP address of the DF to which the system sends intercepted data. *df_ip_address*must be an IPv4/IPv6 address in desired notation.

dest-port *df_port_no*

The port of the DF to which the system sends intercepted data. *df_port_no* can be any integer value from 1 to 65535.

Usage

Use this command to initiate a lawful Intercept of data for a subscriber. This command is not available to system accounts that do not have li-administrator privileges.

Important: You must log in to the system through a Secure Shell (SSH) using a system account that has li-administrator privileges to use this command. For details on using the Lawful Intercept capability of the system, refer to the System Administration and Configuration Guide.

Example

To lawfully intercept data from a subscriber session with an MSID of 0000100048, assign an intercept ID of 102, set the destination address to 192.168.100.10 and the destination port to 100, enter the following command:

```
lawful-intercept msid 0000100048 intercept-id 102 content-delivery udp-
unack-format-1 dest-addr 192.168.100.10 dest-port 100 event-delivery none
```

lawful-intercept packet-cable

This command provisions/de-provisions the LI Call Content interception for PDSN or CSCF session.

Product

PDSN, SCM

Privilege

Security Administrator, or Administrator, Operator, or Inspector with li-administrator permissions

Syntax

lawful-intercept packet-cable {content-delivery {df-setup content id *df_cont_id* **calltype {cscf | pdsn } dest-addr** *df_ip_address* **dest-port** *df_port_no* **li-context** *li_ctxt_name* **| intercept-request content id** *intercept_cont_id* **calltype {cscf | pdsn } filter-spec src-ip-addr** *src_ip_address* **} | event-delivery username** *subscriber_name* **intercept id** *intercept_id* **] }**

no lawful-intercept packet-cable {content-delivery content id *df_cont_id* **calltype { cscf | pdsn } | event-delivery username** *subscriber_name* **calltype { cscf | pdsn } }**

no

De-provisions a previously configured lawful-intercept.

df-setup content id *df_cont_id*

Specifies the DF setup and content identifier for subscriber to be intercepted.
df_cont_id must be an integer from 1 to 4294967295.

intercept-request content id *intercept_cont_id*

This is an arbitrary identification number, assigned by the provisioner, to identify this intercept definition.
intercept_cont_id must be an integer from 1 to 4294967295.

calltype {cscf | pdsn}

The type of call for the specified subscriber session.
pdsn: specifies the CDMA 2000 networks subscriber session.
cscf: specifies the SCM/IMS networks subscriber session.

content-delivery

Specifies the format in which the intercepted data content is to be delivered to the DF.

event-delivery

Specifies the format in which intercepted control messages IRI event messages are to be delivered to the DF.

username *subscriber_name*

Specifies the previously configured NAI username of the subscriber to be intercepted.
subscriber_name is an alphanumeric string of 1 to 127 characters.

li-context *li_ctxt_name*

Identifies the destination context for intercepted packets. This keyword is mandatory if provisioning is done in a different context.
ctxt_name must be an alpha/numeric string of 1 to 79 characters that specifies the name of an existing context.

dest-addr *df_ip_address*

The IP address of the DF to which the system sends intercepted data. *df_ip_address* must be an IPv4/IPv6 address in desired notation.

dest-port *df_port_no*

The port of the DF to which the system sends intercepted data. *df_port_no* can be any integer value from 1 to 65535.

filter-spec src-ip-addr *src_ip_address*

The IP address of the source filter from which the system retrieves intercepted data. *src_ip_address* must be an IPv4/IPv6 address in desired notation.

Usage

Use this command to initiate a packet-cable lawful Intercept for a PDSN or CSCF subscriber. This command is not available to system accounts that do not have li-administrator privileges.

Important: You must log in to the system through a Secure Shell (SSH) using a system account that has li-administrator privileges to use this command. For details on using the Lawful Intercept capability of the system, refer to the *System Administration and Configuration Guide*.

Example

Following command enables the LI Call Content interception for CSCF with with DF setup having content id *10203* with destination address *1.2.3.4*, port *2300* and LI context *li_cscf1*:

```
lawful-intercept packet-cable content-delivery df-setup content id 10203
calltype cscf dest-addr 1.2.3.4 dest-port 2300 li-context li_cscf1
```

lawful-intercept ssdf

This command is used to configure and provision the SSDF generic interface for LI Call Content interception during CSCF session in IMS network.

Product

SCM

Privilege

Security Administrator, or Administrator, Operator, or Inspector with li-administrator permissions

Syntax

lawful-intercept ssdf dest-addr *df_ip_address* **dest-port** *df_port_no* **serial-number** *sr_num* **version** *vr_num* **[li-context** *li_ctxt_name* **]**

[no] lawful-intercept ssdf [li-context *li_ctxt_name* **] dest-addr** *df_ip_address* **dest-port** *df_port_no*

no

De-provisions a previously configured lawful-intercept.

dest-addr *df_ip_address*

The IP address of the DF to which the system sends intercepted data. *df_ip_address* must be an IPv4/IPv6 address in desired notation.

dest-port *df_port_no*

The port of the DF to which the system sends intercepted data. *df_port_no* can be any integer value from 1 to 65535.

li-context *li_ctxt_name*

Identifies the destination context for intercepted packets. This keyword is mandatory if provisioning is done in a different context.
ctxt_name must be an alpha/numeric string of 1 to 79 characters that specifies the name of an existing context.

serial-number *sr_num*

Identifies the Serial Number of the Access Function (AF) for validation which is to be provisioned on SSDF interface.
sr_num must be an ASCII string of 1 to 79 characters that represents the serial number of the access function equipment..

version *sr_num*

Identifies the software version of the software running on the Access Function (AF) for validation which is to be provisioned on SSDF interface.
ver_num must be an ASCII string of 1 to 79 characters that represents the software version running on the access function equipment..

Usage

Use this command to configure/provision the SSDF generic interface for lawful Intercept on a CSCF function. This command is not available to system accounts that do not have li-administrator privileges.

Important: You must log in to the system through a Secure Shell (SSH) using a system account that has li-administrator privileges to use this command. For details on using the Lawful Intercept capability of the system, refer to the *System Administration and Configuration Guide*.

Example

Following command configures the SSDF interface with AF number *10203* software version *2* with destination address *1.2.3.4*, port *2300* and LI context *li_cscf1*:

```
lawful-intercept ssdf dest-address 1.2.3.4 dest-port 2300 serial-
number10203 version2 li-context li_cscf1
```

logging active

Enables/disables logging for active internal log files.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

logging active [copy runtime filters] [event-verbosity *event_level*] **[pdu-data** *format* **] [pdu-verbosity** *pdu_level* **]**

no logging active

no

Indicates the internal logging is to be disabled.

copy runtime filters

When this command is issued, it makes a copy of the runtime filters and makes that copy the filters for the current logging session.

event-verbosity *event_level*

Specifies the level of verboseness to use in logging of events as one of:

- min - displays minimal information about the event. Information includes event name, facility, event ID, severity level, date, and time.
- concise - displays detailed information about the event, but does not provide the event source within the system.
- full - displays detailed information about event, including source information, identifying where within the system the event was generated.

pdu-data *format*

Specifies output format for packet data units when logged as one of:

- none - output is in raw format (unformatted).
- hex - output being displayed in hexadecimal format.
- hex-ascii - output being displayed in hexadecimal and ASCII similar to a main-frame dump.

pdu-verbosity *pdu_level*

Specifies the level of verboseness to use in logging of packet data units as a value from 1 to 5 where 5 is the most detailed.

Usage

Adjust the active logging levels when excessive log file sizes are being generated or, conversely, not enough information is being sent to the active log files for adequate troubleshooting support. The **no** keyword is used to disable internal logging.

Important: A maximum of 50,000 events may be stored in each log. Enabling more events for logging may cause the log to be filled in a much shorter time period. This may reduce the effectiveness of the log data as a shorter time period of event data may make troubleshooting more difficult.

Important: Once a log has reached the 50,000 event limit the oldest events will be discarded as new log entries are created.

Example

The following sets the active logging for events to the maximum.

```
logging active event-verbosity full
```

The following command sets the active logging for packet data units to level 3 and sets the output format to the main-frame style hex-ascii.

```
logging active pdu-data hex-ascii pdu-verbosity  3
```

The following disables internal logging.

```
no logging active
```

logging filter

Sets the logging filtering options for all or individual facilities.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
logging filter active facility facility level severity_level [ critical-info |
no-critical-info ]
```

active

Indicates only active processes are to have logging options set.

facility *facility*

Specifies the facility to modify the filtering of logged information for as one of:

- **a10**: A10 interface facility
- **a11**: A11 interface facility
- **a11mgr**: A11 Manager facility
- **aaa-client**: AAA client facility
- **aaamgr**: AAA manager logging facility
- **aaaproxy**: AAA Proxy facility
- **acl-log**: Access Control List logging facility
- **acsctrl**: Active Charging Service (ACS) Controller facility
- **acsmgr**: Active Charging Service (ACS) Manager facility
- **alarmctrl**: Alarm Controller facility
- **all**: All facilities
- **asf**: Voice Application Server Framework logging facility
- **asfprt**: ASF Protocol Task (SIP) logging facility
- **asngwmgr**: ASN Gateway Manager facility
- **asnlrmgr**: ASN Paging/Location-Registry Manager facility
- **bgp**: Border Gateway Protocol (BGP) facility
- **cli**: CLI logging facility
- **cscf**: IMS/MMD CSCF
- **cscfmgr**: SIP CSCF Manager facility
- **csp**: Card Slot Port controller facility
- **css**: Content Service Selection (CSS) facility
- **css-sig**: Content Service Selection (CSS) RADIUS Signaling facility

- **dcardctrl**: IPSEC Daughtercard Controller logging facility (not used at this time)
- **dcardmgr**: IPSEC Daughtercard Manager logging facility (Not used at this time)
- **dhcp**: DHCP facility (GGSN product only)
- **dhost**: Distributed Host logging facility
- **diameter**: Diameter endpoint logging facility
- **diameter-acct**: Diameter Accounting
- **diameter-auth**: Diameter Authentication
- **diameter-ecs**: ACS Diameter signaling facility
- **diameter-svc**: Diameter Service
- **diamproxy**: DiamProxy logging facility
- **dpath**: IPSEC Data Path facility
- **drvctrl**: Driver Controller facility
- **egtpc**: eGTP-C logging facility
- **egtpmgr**: eGTP manager logging facility
- **egtpu**: eGTP-U logging facility
- **evlog**: Event log facility
- **famgr**: Foreign Agent manager logging facility
- **firewall**: Firewall logging facility
- **gss-gcdr**: GTPP Storage Server GCDR facility
- **gtpc**: GTP-C protocol logging facility (GGSN product only)
- **gtpcmgr**: GTP-C protocol Manager logging facility (GGSN product only)
- **gtpp**: GTP-PRIME protocol logging facility (GGSN product only)
- **gtpu**: GTP-U protocol logging facility (GGSN product only)
- **h248prt**: H.248 Protocol logging facility
- **hamgr**: Home Agent manager logging facility
- **hat**: High Availability Task (HAT) process facility
- **ims-authorizatn**: IMS Authorization Service facility
- **ip-arp**: IP Address Resolution Protocol facility
- **ip-interface**: IP interface facility
- **ip-route**: IP route facility
- **ipsec**: IP Security logging facility
- **ipsgmgr**: IP Services Gateway facility
- **ipsp**: IP Pool Sharing Protocol logging facility
- **l2tp-control**: L2TP control logging facility
- **l2tp-data**: L2TP data logging facility
- **l2tpdemux**: L2TP Demux Manager logging facility
- **l2tpmgr**: L2TP Manager logging facility

- **li**: Lawful intercept facility (Logs are visible only to system accounts with li-administrator privileges.)
- **magmgr**: Mobile Access Gateway manager logging facility
- **mme-app**: Mobility Management Entity Application logging facility
- **mmedemux**: Mobility Management Entity Demux Manager logging facility
- **mme-hss**: Mobility Management Entity logging facility
- **mme-misc**: Mobility Management Entity Miscellaneous logging facility
- **mobile-ip**: Mobile IP processes
- **mobile-ip-data**: Mobile IP data facility
- **mobile-ipv6**: Mobile IPv6 logging facility
- **multicast-proxy**: Multicast Proxy logging facility
- **nas**: Network Access Signaling logging facility
- **netwstrg**: Network Storage facility
- **npuctrl**: Network Processor Unit Control facility
- **npumgr**: Network Processor Unit Manager facility
- **nsctrl**: Charging Service Controller facility (supported in conjunction with ECSv1)
- **nsmgr**: Charging Service Manager facility
- **nsproc**: Charging Service process facility
- **orbs**: Object Request Broker System logging facility
- **ospf**: OSPF logging facility
- **pdg**: PDG logging facility
- **pgw**: PDN Gateway logging facility
- **ppp**: PPP link and packet facilities
- **radius-acct**: RADIUS accounting logging facility
- **radius-auth**: RADIUS authentication logging facility
- **radius-coa**: RADIUS change of authorization and radius disconnect
- **rct**: Recovery Control Task logging facility
- **rdt**: Redirect Task logging facility
- **resmgr**: Resource Manager logging facility
- **rip**: RIP logging facility (RIP is not supported at this time.)
- **rohc**: RObust Header Compression facility
- **rsvp**: Reservation Protocol logging facility
- **sct**: Shared Configuration Task logging facility
- **sessctrl**: Session Controller logging facility
- **sessmgr**: Session Manager logging facility
- **sft**: Switch Fabric Task logging facility
- **sgw**: Serving Gateway logging facility
- **sipcdprt**: Sip Call Distributor facility

- **sitmain**: System Initialization Task main logging facility
- **snmp**: SNMP logging facility
- **srdb**: Static Rating Database
- **srp**: Service Redundancy Protocol (SRP) logging facility
- **ssh-ipsec**: SSH IP Security logging facility **stat:** Statistics logging facility
- stat: Statistics logging facility
- **system**: System logging facility
- **tacacsplus**: TACACS+ Protocol logging facility
- **threshold**: threshold logging facility
- **ttg**: TTG logging facility
- **udr**: User detail record facility (used with the Charging Service)
- **user-data**: User data logging facility
- **user-l3tunnel**: User layer-3 tunnel logging facility
- **vpn**: Virtual Private Network logging facility
- **wimax-data**: WiMAX DATA
- **wimax-r6**: WiMAX R6

level *severity_level*

Specifies the level of information to be logged from the following list which is ordered from highest to lowest:

- critical - display critical events
- error - display error events and all events with a higher severity level
- warning - display warning events and all events with a higher severity level
- unusual - display unusual events and all events with a higher severity level
- info - display info events and all events with a higher severity level
- trace - display trace events and all events with a higher severity level
- debug - display all events

critical-info | no-critical-info

Default: critical-info enabled.
critical-info: specifies that events with a category attribute of critical information are to be displayed. Examples of these types of events can be seen at bootup when system processes and tasks are being initiated.
no-critical-info: specifies that events with a category attribute of critical information are not to be displayed.

Usage

Apply filters for logged data to collect only that data which is of interest.

Important: A maximum of 50,000 events may be stored in each log. Enabling more events for logging may cause the log to be filled in a much shorter time period. This may reduce the effectiveness of the log data as a shorter time period of event data may make troubleshooting more difficult.

Important: Once a log has reached the 50,000 event limit the oldest events will be discarded as new log entries are created.

Caution: Issuing this command could negatively impact system performance depending on the amount of system activity at the time of execution and/or the type of facility(ies) being logged.

Example

The following are selected examples used to illustrate the various options. Not all facilities will be explicitly shown as each follows the same syntax for options.

The following sets the level to log only warning information for all facilities.

```
logging filter active facility  all level warning
```

The following enables the logging of critical information for the SNMP facility while setting the level to error.

```
logging filter active facility snmp level error critical-info
```

logging trace

Enables/disables the logging of trace information for specific calls, mobiles, or network addresses.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

logging trace { callid *call_id* **| ipaddr** *ip_address* **| msid** *ms_id* **| username** *user_name* **}**

no logging trace { callid *call_id* **| ipaddr** *ip_address* **| msid** *ms_id* **| username** *user_name* **}**

no

Indicates the logging of trace information is to be disabled.

callid *call_id* **| ipaddr** *ip_address* **| msid** *ms_id* **| username** *user_name*

callid *call_id*: specifies the exact call instance ID which is to have trace data logged. *call_id* is specified as a 4-byte hexadecimal number.
ipaddr *ip_address*: specifies the IP address for which trace information is to be logged. *ip_address* must be specified using the standard IPv4 dotted decimal notation.
msid *ms_id*: specifies the mobile subscriber ID for which trace information is to be logged. *ms_id* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI.
username *user_name*: specifies a user who is to have trace information logged. *user_name* must refer to a previously configured user.

Usage

A trace log is useful in troubleshooting subscriber problems as well as for system verification by using a test subscriber. The **no** keyword is used to stop the logging of trace information.

Important: A maximum of 50,000 events may be stored in each log. Enabling more events for logging may cause the log to be filled in a much shorter time period. This may reduce the effectiveness of the log data as a shorter time period of event data may make troubleshooting more difficult.

Important: Once a log has reached the 50,000 event limit the oldest events will be discarded as new log entries are created.

Caution: Issuing this command could negatively impact system performance depending on the number of subscribers connected and the amount of data being passed.

Example

The following commands enables/disables trace information for user *user1*.

logging trace username *user1***no logging trace username** *user1*

The following commands will enable/disable trace information logging for the user assigned IP address *1.2.3.4*.

logging trace ipaddr *1.2.3.4***no logging trace ipaddr** *1.2.3.4*

The following enables/disables logging of trace information for call ID *FE80AA12*.

logging trace callid *fe80aa12***no logging trace callid** *fe80aa12*

logs checkpoint

Performs check pointing operations on log data. Check pointing identifies logged data as previously viewed or marked. Check pointing results in log information since the last check point being displayed only, i.e., check pointed log data is not available for viewing.

Individual logs may have up to 50,000 events in the active log. Check pointing the logs will then result in at most 50,000 events being in the inactive log files. This gives a maximum of 100,000 events in total which are available for each facility logged.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
logs checkpoint
```

Usage

Check point log data to a set the log contents to a well know point prior to special activities taking place. This command may also be a part of periodic regular maintenance to manage log data.
The check pointing of logs moves the current log data to the inactive logs. Only the most recently check pointed data is retained in the inactive logs. A subsequent check pointing of the logs will result in the prior check pointed inactive log data being cleared and replaced with the newly check pointed data.
The check pointing of log data moves the active log data to be retained as the inactive log data. This results in the active log data, if displayed, having no data earlier than the point in time when the check pointing occurred.

Important: Check pointing of logs should be done periodically to avoid the logs becoming full. Logs which have 50,000 events logged will discard the oldest events first when new events are to be logged.

Example

```
logs checkpoint
```

mkdir

Creates a new directory in the local file system or in remote locations as specified.

Product

All

Privilege

Security Administrator, Administrator

Syntax

mkdir *filepath*

filepath

Specifies the directory path to create. The path must be formatted as follows:
Specifies the source of the copy. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

- ST16:
  - [**file:**]{ **/flash** | **/pcmcia1** | **/pcmcia2** }[**/***directory*]**/***file_name*
- ASR 5000:
  - [**file:**]{ **/flash** | **/pcmcia1** | **/hd** }[**/***directory*]**/***file_name*

Important: Use of the SMC hard drive is not supported in this release.

directory is the directory name
filename is the actual file of interest

Usage

Create new directories as part of periodic maintenance activities to better organize stored files.

Example

The following creates the directory */flash/pub* in the local flash storage.

```
mkdir /flash/pub
```

monitor protocol

Enters the system's protocol monitoring utility.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
monitor protocol
```

Usage

Useful for troubleshooting, this command provides a tool for monitoring protocol transactions between the system and other network nodes including the mobile station(s).
The following protocols can be monitored:

- SNMP
- RADIUS Authentication
- RADIUS Accounting
- A11 (R-P Interface) (PDSN only)
- Mobile IPv4
- A11MGR
- PPP
- A10 (PDSN only)
- User L3 (User Layer 3 protocols)
- L2TP
- L2TPMGR
- L2TP Data
- GTPC
- GTPCMGR
- GTPU
- GTPP

- DHCP (GGSN only)
- CDR
- DHCPV6
- RADIUS COA
- MIP Tunnel
- L3 Tunnel (Layer 3 Tunnel Protocols)

- CSS Data
- CSS Signaling

- EC Diameter (Diameter Enhanced Charging)
- SIP
- IPSec IKE Inter-Node
- IPSec IKE Subscriber
- IPSG RADIUS Signal
- ROHC (Robust Header Compression) (PDSN only)
- WiMAX R6
- WiMAX Data
- SRP
- BCMCS SERV AUTH
- RSVP
- Mobile IPv6
- ASNGWMGR
- ASNPCMGR
- STUN
- SCTP
- M3UA
- SCCP
- TCAP
- MAP
- RANAP
- GMM
- GPRS-NS
- BSSGP
- CAP
- SSCOP
- SSCFNNI
- MTP3
- LLC
- SNDCP
- BSSAP+
- SMS
- PHS-Control
- PHS-Data

- DNS Client
- HNBAP: Enabling this option will display the HNB Application Part (HNBAP) protocol packets.
- RUA: Enabling this option will display the RANAP User Adaptation (RUA) protocol packets.
- MTP2
- EGTPC
- App Specific Diameter
- PHS-EAPOL
- ICAP
- S1-AP
- NAS

Once the protocol has been selected, the utility monitors and displays every relative protocol message transaction.
Protocol monitoring is performed on a context-by-context-basis. Therefore, the messages displayed are only those that are transmitted/received within the system context from which the utility was executed.

Caution: Protocol monitoring can be intrusive to subscriber sessions and could impact system performance. Therefore, it should only be used as a troubleshooting tool.

Example
The following command opens the protocol monitoring utility:

```
monitor protocol
```

monitor subscriber

Enables the system's subscriber monitoring utility.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

monitor subscriber [asn-peer-address *bs_peer_address* **| callid** *call_id* **| imsi** *imsi_value* **| ipaddr** *ip_address* **| ipv6addr** *ipv6_address* **| ipsg-peer-address** *ipsg_peer_address* **| msid ms_***id* **| msisdn** *msisdn* **| next-call | pcf** *pcf_address* **| pdif-peer-address** *pdif_peer_address* **| peer-fa** *peer_fa_address* **| peer-lac** *lac_peer_address* **| sgsn-address** *sgsn_address* **| type { 1xrtt | asngw | asnpc | closedrp | evdorev0 | evdoreva |** interrogating-cscf **| ggsn [Next-Call By APN] | ha | ipsg | lns | mme | pdif | proxy-cscf | rfc3261-proxy | serving-cscf } next-call | type bcmcs { next-call | next-service-request} | username** *user_name***| Next-Call By APN]**

asn-peer-address *bs_peer_address*

Specifies the peer ASN Base Station IP address. Must be followed by IPv4 address in dotted decimal notation.

callid *call_id*

Specifies the call identification number assigned to the subscriber session by the system to be monitored. *call_id* is specified as a 4-byte hexadecimal number.

imsi *imsi_value*

Specifies the International Mobile Subscriber Identity (IMSI) of the subscriber session to be monitored. *imsi_value* is an integer value from 1 to 15 characters.

ipaddr *ip_address*

Specifies the IP address of the subscriber session to be monitored.
ip_address must be specified using dotted decimal notation.

ipv6addr *ipv6_address*

Specifies the IPv6 address of the subscriber session to be monitored.
ipv6_address must be an IPv6 IP address entered using colon (:) separated notation.

ipsg-peer-address *ipsg_peer_address*

Specifies the peer IPSG IP address. Must be followed by IPv4 address in dotted decimal notation.

msid *ms_id*

Specifies the mobile subscriber identification number to be monitored.

ms_id must be from 7 to 16 digits specified as an IMSI, MIN, or RMI.

msisdn *msisdn*

Specifies the Mobile Subscriber ISDN number to be monitored.
msisdn must be from 7 to 16 digits specified as an IMSI, MIN, or RMI.

next-call

Specifies that the system will monitor the next incoming subscriber session.

pcf *pcf_address*

Specifies the PCF IP address. Must be followed by IPv4 address in dotted decimal notation.

pdif-peer-address *pdif_peer_address*

Specifies the peer PDIF IP address. Must be followed by IPv4 address in dotted decimal notation.

peer-fa *peer_fa_address*

Specifies the peer FA IP address. Must be followed by IPv4 address in dotted decimal notation.

peer-lac *lac_peer_address*

Specifies the peer LAC IP address. Must be followed by IPv4 address in dotted decimal notation.

sgsn-address *sgsn_address*

Specifies the SGSN IP address. Must be followed by IPv4 address in dotted decimal notation.

type { 1xrtt | asngw | asnpc | evdorev0 | evdoreva | interrogating-cscf | ggsn [Next-Call By APN] | ha | ipsg | lns | mme | openrp | | pdif | proxy-cscf | rfc3261-proxy | serving-cscf } next-call

Allows monitoring for specific subscriber types established in the system when next call occurs.

- **1xrtt**: Displays logs for cdma2000 1xRTT call session subscriber
- **asngw**: Displays logs for ASN GW call session subscriber
- **asnpc**: Displays logs for ASN PC/LR call session subscriber
- **evdorev0**: Displays logs for cdma2000 EVDO Rev0 call session subscriber
- **evdoreva**: Displays logs for cdma2000 EVDO RevA call session subscriber
- **interrogating-cscf**: Displays logs for Interrogating CSCF subscriber
- **ggsn**: Displays logs for UMTS GGSN call session subscriber
- **Next-Call By APN**: Display logs for next call on APN basis, where APN name can be any of Gi or Gn apn.
- **ha**: Displays logs for Home Agent call session subscriber
- **ipsg**: Displays logs for IPSG call session subscriber
- **lns**: Displays logs for LNS call session subscriber
- **mme**: Displays logs for MME session subscribers.
- **openrp**: Displays logs for OpenRP subscriber

- **pdif**: Displays logs for PDIF call session subscriber
- **proxy-cscf**: Displays logs for Proxy CSCF subscriber
- **rfc3261-proxy-cscf**: Displays logs for non-ims-proxy (RFC-3261 proxy) subscriber
- **serving-cscf**: Displays logs for Serving CSCF subscriber

type bcmcs {*next-call | next-service-request***}**

Specifies the type of BCMCS call for the subscriber.

username *user_name*

Specifies the username of the subscriber to be monitored.
user_name refers to a previously configured user.

Usage

The monitor subscriber utility provides a useful tool for monitoring information about and the activity of either a single subscriber or all subscribers with active sessions within a given context.
The following items can be monitored:

- Control events
- Data events
- Event ID information
- Inbound events
- Outbound events
- Protocols (identical to those monitored by command)

Once the criteria has been selected, the utility will monitor and display every relative piece of information on the subscriber(s).

Important: Option Y for performing multi-call traces is only supported for use with the GGSN. This option is available when monitoring is performed using the "Next-Call" option. It allows you monitor up to 11 primary PDP contexts for a single subscriber.

Subscriber monitoring is performed on a context-by-context-basis. Therefore, the information displayed will be only that which is collected within the system context from which the utility was executed.

Caution: Subscriber monitoring can be intrusive to subscriber sessions and could impact system performance. Therefore, it should only be used as a troubleshooting tool.

Example

The following command enables monitoring for user *user1*.

```
monitor subscriber username user1
```

The following command will enable monitoring for the user assigned IP address *1.2.3.4*.

```
monitor subscriber ip-address 1.2.3.4
```

The following enables monitoring for call ID *FE80AA12*.

```
monitor subscriber callid fe80aa12
```

newcall policy

Configures new call policies for busy-out conditions.

Product

PDSN, GGSN, MME, HA, LNS, P-CSCF, ASN GW, ASN PC/LR, SGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

newcall policy { asngw-service | asnpc-service | sgsn-service } {all | name *service_name* **} reject**

newcall policy cscf-service { all | name *service_name* **} { redirect** *target_ip_address* **[weight** *weight_num* **] [** *target_ipaddress2* **[weight** *weight_num* **] ... target_ip_address16 [weight** *weight_num* **] | reject }**

newcall policy { fa-service | lns-service | mipv6ha-service } { all | name *service_name* **} reject**

newcall policy { ha-service | pdsn-service} { all | name *service_name* **} { redirect** *target_ip_address* **[weight** *weight_num* **] [** *target_ipaddress2* **[weight** *weight_num* **] ... target_ip_address16 [weight** *weight_num* **] | reject }**

newcall policy ggsn-service { apn name *apn_name* **| all | name** *ggsn-service-name* **} reject**

no newcall policy { fa-service | **ggsn-service | ha-service | mipv6ha-service | pdsn-service| lns-service } { all | name** *service_name* **}**

newcall policy mme-service {all | name *service_name* **} reject**

no newcall policy { ha-service | pdsn-service } { all | name *service_name* **} redirect** *target_ip_address* **[weight***weight_num* **] [** *target_ip_address2* **[weight** *weight_num* **] ... target_ip_address16 [weight***weight_num* **]**

no newcall policy ggsn-service { apnname *apn_name* **| all | name** *ggsn-service-name* **} reject**

no newcall policy { asngw-service | asnpc-service } { all | name *service_name* **}**

no newcall policy mme-service { all | name *service_name* **}**

---

no

Disables the new call policy for all or specified service of a service type.

---

newcall policy { asngw-service | asnpc-service } { all | name *service_name* **} reject**

Creates a new call policy to reject the calls based on the specified ASN GW or ASN PC/LR service name or all services of this type.

asngw-service: Specifies the type of service as ASN GW for which new call policy is configured.
asnpc-service: Specifies the type of service as ASN PC/LR for which new call policy is configured.
name *service_name*: Specifies the name of the service for which new call policy is configured. service_name is name of a configured ASN GW or ASN PC/LR service.
reject: Specifies that the policy rejects new incoming calls. Depending on the type of service that the policy is applied to, the reason codes are reported as part of the reply to indicate the rejection. For ASN GW and ASN PC/LR service rejection code is 81H (Registration Denied - administratively prohibited).

---

newcall policy { cscf-service | fa-service | lns-service | mipv6ha-service } { all | name *service_name* **} reject**

Creates a new call policy that rejects calls based on the specified access point name.

---

no newcall policy { cscf-service | fa-service | ggsn-service| ha-service | mipv6ha-service | pdsn-service | } { all | name *service_name* **}**

Removes a previously configured new call policy for the specified service

---

no newcall policy { ha-service | pdsn-service } { all | name *service_name* **} redirect** *target_ip_address* **[weight** *weight_num* **] [** *target_ip_address2* **[weight** *weight_num* **] ... target_ip_address16 [weight** *weight_num* **]**

Deletes up to 16 IP addresses from the redirect policy. The IP addresses must be expressed in IP v4 dotted decimal notation

---

cscf-service | fa-service | ggsn-service| ha-service | lns-service | mipv6ha-service | pdsn-service | }

Specifies the type of service for which to configure a new call policy. The following services are supported:

- **cscf-service**: A Call/Session Control Function service
- **fa-service**: A Foreign Agent service
- **ggsn-service**: A Gateway GPRS Support Node service
- **ha-service**: A Home Agent service
- **lns-service**: An L2TP Network Server service
- **mipv6ha-service**: A Mobile IPv6 Home Agent service
- **pdsn-service**: A Packet Data Serving Node service

{ all | name *service_name* **}**

Specifies a filter for the new call policy. Whether the new call policy will be applied to all configured services or a specific one.

- **all**: Specifies that the new call policy will be applied to all instances of the selected service type.
- **name**: *service_name*: Specifies the name of a specific instance of the selected service type. service_name can be between 1 and 63 alpha and/or numeric characters and is case sensitive.

---

redirect *target_ip_address* **[weight** *weight_num* **] [** *target_ip_address2* **[weight** *weight_num* **] ... target_ip_address16 [weight** *weight_num* **]**

Configures the busy-out action. When a redirect policy is invoked, the service rejects new sessions and provides the IP address of an alternate destination. This command can be issued multiple times.
address: The IP address of an alternate destination expressed in IP v4 dotted decimal notation. Up to 16 IP addresses can be specified either in one command or by issuing the redirect command multiple times. If you

try to add more than 16 IP addresses to the redirect policy the CLI issues an error message. If you specify an IP address and weight that already exists in the redirect policy the new values override the existing values.
weight *weight_num*: When multiple addresses are specified, they are selected in a weighted round-robin scheme. Entries with higher weights are more likely to be chosen. If a weight is not specified the entry is automatically assigned a weight of 1. *weight_num* must be an integer from 1 through 10.
Depending on the type of service that the policy is applied to, the following reason codes are reported as part of the reply:

- **ha service:** 88H (Registration Denied - unknown home agent address)
- **pdsn service:** 88H (Registration Denied - unknown PDSN address)

Important: The redirect option is not supported for use with FA and GGSN services.

newcall policy mme-service} {all | name *service_name*} **reject**

Creates a new call policy to reject the calls based on the specified MME service name or all MME services on the system.
name *service_name*: Specifies the name of the MME service for which new call policy is configured. *service_name* is name of a configured MME service.
reject: Specifies that the policy rejects new incoming calls. Depending on the type of service that the policy is applied to, the reason codes are reported as part of the reply to indicate the rejection. For MME service rejection code is 81H (Registration Denied - administratively prohibited).

reject

Specifies that the policy rejects new incoming calls. Depending on the type of service that the policy is applied to, the following reason codes are reported as part of the reply to indicate the rejection:

- **asngw service**: 81H (Registration Denied - administratively prohibited)
- **fa service:** 41H (administratively prohibited)

Important: When the newcall policy is set to reject for the FA service, the Busy Bit is set in the Agent Advertisement. Any further RRQs will be rejected with this code value.

- **ggsn service:** C7H (Rejected - no resources available)
- **ha service:** 81H (Registration Denied - administratively prohibited)
- **mipv6ha-service**: 81H (Registration Denied - administratively prohibited)
- **mme service:** 81H (Registration Denied - administratively prohibited)
- **pdsn service:** 81H (Registration Denied - administratively prohibited)

Usage

This command is used to busy-out specific system services prior to planned maintenance or for troubleshooting.

Example

The following command creates a new call policy to re-direct all new calls for all PDSN services to a device having an IP address of 192.168.1.23:

newcall policy pdsn-service all redirect *192.168.1.23*

The following command creates a new call policy to reject all new calls for a GGSN service called ggsn1:

newcall policy ggsn-service name *ggsn1* **reject**

The following command creates a new call policy to reject all new calls for an MME service called MME1:

newcall policy mme-service name *MME1* **reject**

password change

Provides a mechanism for local-user administrative users to change their passwords.

Product

All

Privilege

All local-user administrative levels except as noted below

Syntax

password change [local-user *name* **]**

local-user *name*

Specifies the name of the local-user administrative user for which to change the password. *name* can be from 3 to 16 alpha and/or numeric characters in length and is case sensitive.

Important: This keyword is only available to local-users with an authorization level of security-administrator.

Usage

This command provides a mechanism for local-user administrative users to change their passwords. In addition, it also provides a mechanism for security-administrator local-users to change the password for other local-user accounts.

If the **local-user** keyword is not entered, the system prompts the user for their current password and for the new password. New passwords take effect at the next login. Users that have had their password changed by a security-administrator are prompted to change their passwords at their next login.

New passwords must meet the criteria dictated by the **local-user password** command options in the Global Configuration Mode.

Important: The system does not allow the changing of passwords unless the time limit specified by the **local-user password min-change-interval** has been reached.

Example

The following command, executed by a security-administrator, resets the password for a local-user name operator12:

```
password change local-user operator12
```

ping

Verifies ability to communicate with a remote node in the network by passing data packets between and measuring the response.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Important: Inspector privileges are granted for all variables except **count**. To initiate a ping count, you must have a minimum privilege level of Operator.

Syntax

ping *host_ip_address* **[broadcast] [count** *num_packets* **] [pattern** *packet_pattern* **] [size** *octet_count* **] [src {** *src_host_name* **|** *src_host_ip_address* **}] [| { grep** *grep_options* **| more }]**

host_ip_address

Identifies the remote node to which the ability to communicate with is to be verified.
host_ip_address: specifies the remote node using the node's assigned IP address specified using the standard IPv4 dotted decimal notation.

broadcast

Sends ping packets to broadcast addresses.

count *num_packets*

Default: 5
Specifies the number of packets to send to the remote host for verification. *num_packets* must be within the range 1 through 10000.

pattern *packet_pattern*

Default: each octet of the packet is encoded with the octet number of the packet.
Specifies a pattern to use to fill the internet control message protocol packets with. *packet_pattern* must be specified in hexadecimal format with a value in the range hexadecimal 0x0000 through 0xFFFF. *packet_pattern* must begin with a '0x' followed by up to 4 hexadecimal digits.

size *octet_count*

Default: 56
Specifies the number of bytes each IP datagram. *octet_count* must be a value in the range 40 through 18432.

src { src_*host_name* **| src**_*host_ip_address* **}**

Default: originating system's IP address
Specifies an IP address to use in the packets as the source node.

src_host_name: specifies the source node using the node's logical host name which must be resolved via DNS lookup.
src_host_ip_address: specifies the source node using the node's assigned IP address specified using the standard IPv4 dotted decimal notation.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in *Command Line Interface Reference*.

Usage

This command is useful in verifying network routing and if a remote node is able to respond at the IP layer.

Example

The following command is the most basic and will report the results of trying to communication with remote node *remoteABC*.

ping *remoteABC*

The following will verify communication with the remote node *1.2.3.4* using *1000* packets.

ping *1.2.3.4* **count** *1000*

The following verifies communication with remote node remoteABC while making it appears as though the source is remote node with IP address 1.2.3.4.

ping *remoteABC* **src** *1.2.3.4*

Important: It is important to note that the responses from the remote host to the ping packets will be rerouted to the host specified as the source.

ping6

Ping options for IPv6 addresses

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

ping6 { hostname | ipv6 address } [count *num* **] [flood] [pattern** *val* **] [size** *val* **] [src** *val* **] [interface** *string* **]**

hostname

Name of the host to be pinged.

ipv6 address

IPv6 address of host to be pinged.

count*num*

Sets the number of ping packets to be sent. *num* must be an integer between 1 - 10,000.

flood

Configures ping6 to send packets as quickly as possible, or 100 per second, whichever is faster.

pattern *val*

Specifies hex pattern to fill ICMP packets. *val* is in the range 0x0 - 0ffff

size *val*

Size of ICMP datagram in bytes. val is an integer from 40 - 18432. Default is 56.

src *val*

Specifies the source IP address.

interface *string*

Specifies the originating source interface name.

Usage

Ping command for IPv6. Note that the command is just “ping6, and not “pingv6.”

Example

Use this command to ping the IPv6 address *2001:0db8:85a3:0000:0000:8a2e:0370:7334*

ping6 *2001:0db8:85a3:0000:0000:8a2e:0370:7334*

port

Performs a manual switchover to an available redundant/standby line card or SPIO port.

Default: none.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

port switch to *slot#* **/** *port#*

slot#

Identifies the physical chassis slot where the line card or SPIO card is installed.

port#

Identifies the physical port on the line card or SPIO to automatically switch to.

Usage

This command is used to specify the redundant port on a Line Card (LC). When port redundancy is enabled, if an external network device or cable failure occurs that causes a link down failure on the port, then the redundant port is used.

Important: This command is not supported on all platforms.

Example

port switch to *17/1*

ppp echo-test

Verifies the point-to-point link by sending link control protocol packets to the targeted users. This command will not

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

ppp echo-test { callid *call_id* **| imsi** *imsi_id* **| ipaddr** *ip_address* **| msid** *ms_id* **| username** *user_name* **} [** *num_packets* **] [| { grep** *grep_options* **| more }]**

callid *call_id*

Specifies the exact call instance ID which is to have its PPP link verified. *call_id* is specified as a 4-byte hexadecimal number.

imsi *imsi_id*

Specifies the International Mobile Subscriber Identifier (IMSI) which is to have its PPP link verified.

ipaddr *ip_address*

Specifies the IP address which is to have its PPP link verified. *ip_address* must be specified using the standard IPv4 dotted decimal notation.

msid *ms_id*

Specifies the mobile subscriber ID which is to have its PPP link verified. *ms_id* must be from 7 to 16 digits specified as an MIN, or RMI.

username *user_name*

Specifies a user which is to have its PPP link verified. *user_name* must refer to a previously configured user.

num_packets

Default 1
Specifies the number of test packets to generate. *num_packets* must be a value in the range from 1 through 1000000.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in *Command Line Interface Reference*.

Usage

Use the echo test to verify the point-to-point protocol communications.

Caution: Issuing this command could negatively impact system performance depending on the number of subscribers using the same name and/or if the number of packets used in the test is large.

Example

The following command tests the PPP link to user *user1*.

```
ppp echo-test username user1
```

The following command tests the PPP link to the user assigned IP address *1.2.3.4*.

```
ppp echo-test ipaddr 1.2.3.4
```

The following tests the PPP link associated with call ID *FE80AA12*.

```
ppp echo-test callid fe80aa12
```

radius interim

Check points current RADIUS accounting messages immediately

Product

PDSN, GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator

Syntax

```
radius interim accounting now
```

Usage

The interim command may be part of a regiment of periodic activities to maintain the chassis.
This command may also be useful in preparation for system monitoring or troubleshooting to set the list of messages to be displayed at a well known time.

radius test

Verifies the RADIUS servers functions for accounting and authentication.

Product

PDSN, GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator

Syntax

radius test { accounting | authentication | probe authentication server *ip_addr* **port** *port_no* **[username** *username* **password** *password* **] } { all | [on] | off] | radius group** *group_name user_name* **| server** *server_name* **port** *server_port* **}** *user_name password*

---

accounting

Test accounting server functionality.

---

authentication

Test authentication server functionality.

---

all | radius group *group_name user_name* **| server** *server_name* **port** *server_port*

all: indicates all configured servers are to be tested.
server *server_name* **port** *server_port*: indicates only the server specified as *server_name* and *server_port* is to be tested. The server must have been previously configured.
radius group *group_name user_name*: tests all configured authentication servers in a specific RADIUS group for specific user. Must be followed by the RADIUS group name and user name. *group_name* will be a string of size 1 to 63 character and specifies the name of server group configured in specific context for authentication/accounting.

---

on/off

Allows the user to turn radius test accounting on or off.

---

user_name

Specifies the RADIUS user who is to be verified. The user must have been previously configured.

---

password

Specifies the RADIUS user who is to have authentication verified. *password* is only applicable when the **authentication** keyword is specified.

Usage

Test the RADIUS accounting for troubleshooting the system for specific users or to verify all the system RADIUS accounting functions.

Example

The following verifies all RADIUS servers.

```
radius test accounting all
radius test authentication all
```

The following verifies the RADIUS accounting and authentication for user *user1* for the *sampleServer*.

```
radius test accounting server sampleServer port 5000 user1
radius test authentication server sampleServer port 5000 user1 dummyPwd
```

The following commands will verify the RADIUS accounting and authentication for RADIUS server group *star1* for the current context:

```
radius test accounting server sampleServer port 5000 user1
radius test authentication server sampleServer port 5000 user1 dummyPwd
radius test authentication all
```

The following verifies the RADIUS authentication server group *star1* for user *user1*.

```
radius test authentication radius group star1 user1
```

reload

Invokes a full system reboot.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
reload [ -noconfirm ]
```

-noconfirm

Execute the command without any additional prompts or confirmation from the user.

Usage

The system performs a hardware reset and reloads the highest priority boot image and configuration file specified in the boot.sys file. Refer to the **boot system priority** command in the Global Configuration Mode for additional information on configuring boot images, configuration files and priorities.

Important: To avoid the abrupt termination of subscriber sessions, it is recommended that a new call policy be configured and executed prior to invoking the reload command. This sets busy-out conditions for the system and allows active sessions to terminate gracefully. Refer to the **newcall** command in the Exec Mode for additional information.

Caution: Issuing this command causes the system to become unavailable for session processing until the reboot process is complete.

Example

The following command performs a hardware reset on the system:

```
reload
```

rename

Changes the name of an existing local file.

Product

All

Privilege

Security Administrator, Administrator

Syntax

rename *from_filepath to_filepath* **[-noconfirm]**

from_filepath

Specifies the path to the file/directory to be renamed. The path must be formatted according to the following format:
Specifies the source of the copy. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

- ST16:
  - [**file:**]{ **/flash** | **/pcmcia1** | **/pcmcia2** }[**/***directory*]**/***file_name*
- ASR 5000:
  - [**file:**]{ **/flash** | **/pcmcia1** | **/hd** }[**/***directory*]**/***file_name*

Important: Use of the SMC hard drive is not supported in this release.

directory is the directory name
filename is the actual file of interest

to_filepath

Specifies the new name of file/directory. The path must be formatted according to the following formats:
Specifies the source of the copy. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

- ST16:
  - [**file:**]{ **/flash** | **/pcmcia1** | **/pcmcia2** }[**/***directory*]**/***file_name*
- ASR 5000:
  - [**file:**]{ **/flash** | **/pcmcia1** | **/hd** }[**/***directory*]**/***file_name*

Important: Use of the SMC hard drive is not supported in this release.

directory is the directory name
filename is the actual file of interest

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Important: Extreme caution should be taken when using the **-noconfirm** option. The paths to the source and the destination should be verified prior to performing the command.

Usage

Rename files as part of regular system maintenance in conjunction with the delete command.

Example

The following renames the directory */pub* in the local PCMCIA1 device.

```
rename /pcmcia1/pub /pcmcia1/pub_old
```

reveal disabled commands

Enables the input of commands for features that do not have license keys installed. The output of the command **show cli** indicates when this is enabled. This command effects the current CLI session only. This is disabled by default.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
[ no ] reveal disabled commands
```

no

Do not show disabled commands.

Usage

When this is enabled and a disabled command is entered, a message is displayed that informs you that the required feature is not enabled and also lists the name of the feature that you need to support the command. When this is disabled and a disabled command is entered, the CLI does not acknowledge the existence of the command and displays a message that the keyword is unrecognized.

Example

Set the CLI to accept disabled commands and display the required feature for the current CLI session with the following command:

```
reveal disabled commands
```

Set the CLI to reject disabled commands and return an error message for the current CLI session:

```
no reveal disabled commands
```

rlogin

Attempts to connect to a remote host.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

rlogin { *host_name* | *host_ip_address* } [user *user_name*]

host_name | *host_ip_address*

Identifies the remote node to attempt to connect to.
host_name: specifies the remote node using the node's logical host name which must be resolved via DNS lookup.
host_ip_address: specifies the remote node using the node's assigned IP address specified using the standard IPv4 dotted decimal notation.

user *user_name*

Specifies a user name to attempt to connect as. *user_name* must be from to 1023 alpha and/or numeric characters.

Usage

Connect to remote network elements using rlogin.

Important: **rlogin** is not a secure method of connecting to a remote host. **ssh** should be used whenever possible for security reasons.

Example

The following connects to remote host *remoteABC* as user *user1*.

```
rlogin remoteABC user user1
```

The following connects to remote host *1.2.3.4* without any default user.

```
rlogin 1.2.3.4
```

rmdir

Removes (deletes) a local directory.

Product

All

Privilege

Security Administrator, Administrator

Syntax

rmdir *path* **[force]**

path

Specifies the directory path to remove. The must be formatted according to the following formats:
Specifies the source of the copy. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

- ST16:

  [file:]{ /flash | /pcmcia1 | /pcmcia2 }[/*directory* **]/***file_name*

- ASR 5000:

  [file:]{ /flash | /pcmcia1 | /hd }[/*directory* **]/***file_name*

directory is the directory name
filename is the actual file of interest

force

Over-rides any warnings to force deletion of the directory and any files contained therein.

Important: Use of the **force** keyword should be done with care to ensure the directory is specified accurately as there is no method to recover a directory which has been removed.

Usage

Remove old directories as part of regular maintenance.

Example

The following removes the local directory */pcmcia1/pub*.

```
rmdir /pcmcia1/pub
```

rotate-hd-file

This command rotates the current temp file manually.

Product

SGW, PGW, HSGW

Privilege

Security Administrator, Administrator

Syntax

rotate-hd-file diameter [name *policy_name* **]**

[name *policy_name* **]**

Specifies the hd-storage policy name. *policy_name* must be and existing HD Storage Policy name and must be an alpha and/or numeric string of 0 through 63 characters in length.

Usage

Use this command to manually rotate the Diameter HD stored files.

Example

The following command rotates Diameter files in the HD storage drive for files stored using the HD storage policy named CDR1:

rotate-hd-file diameter name *CDR1*

save configuration

Saves the current contexts configuration to a local or remote location.

Product

All

Privilege

Security Administrator, Administrator

Syntax

save configuration *url* **[-redundant] [-noconfirm] [showsecrets] [verbose]**

url

Default: saves to the location of the active configuration currently loaded.
Specifies the location to store the configuration file(s). *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:
Specifies the source of the copy. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

- ST16:
  - [**file:**]{ **/flash** | **/pcmcia1** | **/pcmcia2** }[**/***directory*]**/***file_name*
  - **tftp://**{ *host*[*:port#*] }[**/***directory*]**/***file_name*
  - **[ftp: | sftp:]//**[*username*[*:password*]**@**]{ *host* } [*:port#*][**/***directory*]**/***file_name*
- ASR 5000:
  - [**file:**]{ **/flash** | **/pcmcia1** | **/hd** }[**/***directory*]**/***file_name*
  - **tftp://**{ *host*[*:port#*] }[**/***directory*]**/***file_name*
  - **[ftp: | sftp:]//**[*username*[*:password*]**@**]{ *host* } [*:port#*][**/***directory*]**/***file_name*

directory is the directory name.
filename is the actual file of interest.

Important: Configuration files should be named with a .cfg extension.

username is the user to be authenticated.
password is the password to use for authentication.
host is the IP address or host name of the server.

Important: *hostname* can **only** be used if the **networkconfig** parameter is configured for DHCP and the DHCP server returns a valid nameserver.

port# is the logical port number that the communication protocol is to use.

-redundant

This keyword directs the system to save the CLI configuration file to the local device, defined by the url variable, and then automatically copy that same file to the like device on the standby processing card, if available.

Important: This keyword will only work for local devices that are located on both the active and standby processing cards. For example, if you save the file to the /pcmcia1 device on the active processing card, that same type of device (card in Slot 1 of the standby processing card) must be available. Otherwise, a failure message is displayed. If saving the file to an external network (non-local) device, the system disregards this keyword.

Important: This keyword does not synchronize the local file system. If you have added, modified, or deleted other files or directories to or from a local device for the active processing card, then you must synchronize the local file system on both SMC cards.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Important: Caution should be exercised when using the **-noconfirm** option as this may cause the accidental over-write of data if the URL refers to an existing file.

showsecrets

This keyword causes the CLI configuration file to be saved with all passwords in plain text, rather than their default encrypted format.

verbose

Indicates the output should provide as much information as possible. If this option is not specified then the output will be the standard level which is the concise mode.

Usage

Backup the current configuration as part of periodic maintenance activities in case of emergencies.

Important: The saving of a configuration does not save the boot options as configured via the global configuration mode **boot** commands.

Example

The following saves the configuration data to the local file */flash/pub/juneconfig.cfg* with no confirmation from the user:

```
save configuration /flash/pub/juneconfig.cfg -noconfirm
```

The following saves the configuration data to remote hoist *remoteABC* as */pub/juneconfig.cfg*:

```
save configuration tftp://remoteABC/pub/juneconfig.cfg
```

save logs

Saves the current log file to a local or remote location.

Product

All

Privilege

Security Administrator, Administrator

Syntax

save logs { url } [active] [inactive] [callid *call_id* **] [event-verbosity** *evt_verboseness* **] [facility** *facility* **] [level** *severity_level* **] [pdu-data** *pdu_format* **] [pdu-verbosity** *pdu_verboseness* **] [since** *from_date_time* **[until** *to_date_time* **]] [| { grep** *grep_options* **| more }]**

url

Specifies the location to store the log file(s). *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:
Specifies the source of the copy. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

- ST16:
  - **[file:**]{ **/flash** | **/pcmcia1** | **/pcmcia2** }[**/***directory*]**/***file_name*
  - **tftp://**{ *host*[*:port#*] }[**/***directory*]**/***file_name*
  - **[ftp: | sftp:]//**[*username*[*:password*]**@**]{ *host* } [*:port#*][**/***directory*]**/***file_name*
- ST16:
  - **[file:**]{ **/flash** | **/pcmcia1** | **/hd** }[**/***directory*]**/***file_name*
  - **tftp://**{ *host*[*:port#*] }[**/***directory*]**/***file_name*
  - **[ftp: | sftp:]//**[*username*[*:password*]**@**]{ *host* } [*:port#*][**/***directory*]**/***file_name*

Important: Use of the SMC hard drive is not supported in this release.

directory is the directory name.
filename is the actual file of interest.
username is the user to be authenticated.
password is the password to use for authentication.
host is the IP address or host name of the server.

Important: *hostname* can **only** be used if the **networkconfig** parameter is configured for DHCP and the DHCP server returns a valid nameserver.

port# is the logical port number that the communication protocol is to use.

active

Indicates output is to display data from active logs.

inactive

Indicates output is to display data from inactive logs.

callid call_id

Specifies a call ID for which log information is to be displayed. call_id must be specified as a 4-byte hexadecimal number.

event-verbosity evt_verboseness

Specifies the level of verboseness to use in displaying of event data as one of:

- min - displays minimal information about the event. Information includes event name, facility, event ID, severity level, date, and time.
- concise - displays detailed information about the event, but does not provide the event source within the system.
- full - displays detailed information about event, including source information, identifying where within the system the event was generated.

facility*facility*

Specifies the facility to modify the filtering of logged information for as one of:

- **a10:** A10 interface facility
- **a11:** A11 interface facility
- **a11mgr:** A11 Manager facility
- **aaa-client:** AAA client facility
- **aaamgr:** AAA manager logging facility
- **aaaproxy:** AAA Proxy facility
- **acl-log:** Access Control List logging facility
- **acsctrl:** Active Charging Service (ACS) Controller facility
- **acsmgr:** Active Charging Service (ACS) Manager facility
- **alarmctrl:** Alarm Controller facility
- **all:** All facilities
- **asf:** Voice Application Server Framework logging facility
- **asfprt:** ASF Protocol Task (SIP) logging facility
- **asngwmgr:** ASN Gateway Manager facility
- **asnpcmgr:** ASN Paging/Location-Registry Manager facility
- **bgp:** Border Gateway Protocol (BGP) facility
- **cli:** CLI logging facility
- **cscf:** IMS/MMD CSCF
- **cscfmgr:** SIP CSCF Manager facility
- **csp:** Card Slot Port controller facility

- **css:** Content Service Selection (CSS) facility
- **css-sig:** Content Service Selection (CSS) RADIUS Signaling facility
- **dcardctrl:** IPSEC Daughtercard Controller logging facility (not used at this time)
- **dcardmgr:** IPSEC Daughtercard Manager logging facility (Not used at this time)
- **dhcp:** DHCP facility (GGSN product only)
- **dhost:** Distributed Host logging facility
- **diameter:** Diameter endpoint logging facility
- **diameter-acct:** Diameter Accounting
- **diameter-auth:** Diameter Authentication
- **diameter-ecs:** ACS Diameter signaling facility
- **diameter-svc:** Diameter Service
- **diamproxy:** DiamProxy logging facility
- **dpath:** IPSEC Data Path facility
- **drvctrl:** Driver Controller facility
- **evlog:** Event log facility
- **famgr:** Foreign Agent manager logging facility
- **firewall:** Firewall logging facility
- **gss-gcdr:** GTPP Storage Server GCDR facility
- **gtpc:** GTP-C protocol logging facility (GGSN product only)
- **gtpcmgr:** GTP-C protocol Manager logging facility (GGSN product only)
- **gtpp:** GTP-PRIME protocol logging facility (GGSN product only)
- **gtpu:** GTP-U protocol logging facility (GGSN product only)
- h248prt: H.248 Protocol logging facility
- **hamgr:** Home Agent manager logging facility
- **hat:** High Availability Task (HAT) process facility
- **ims-authorizatn:** IMS Authorization Service facility
- **ip-arp:** IP Address Resolution Protocol facility
- **ip-interface:** IP interface facility
- **ip-route:** IP route facility

- stat: Statistics logging facility
- **system:** System logging facility
- **tacacsplus:** TACACS+ Protocol logging facility
- **threshold:** threshold logging facility
- **udr:** User detail record facility (used with the Charging Service)
- **user-data:** User data logging facility
- **user-l3tunnel:** User layer-3 tunnel logging facility
- **vpn:** Virtual Private Network logging facility
- **wimax-data:** WiMAX DATA
- **wimax-r6:** WiMAX R6

---

level *severity_level*

Specifies the level of information to be logged, severity_level, from the following list which is ordered from highest to lowest:

- critical - display critical events
- error - display error events and all events with a higher severity level
- warning - display warning events and all events with a higher severity level
- unusual - display unusual events and all events with a higher severity level
- info - display info events and all events with a higher severity level
- trace - display trace events and all events with a higher severity level
- debug - display all events

---

pdu-data *pdu_format*

Specifies output format for the display of packet data units as one of:

- none - output is in raw format (unformatted).
- hex - output being displayed in hexadecimal format.
- hex-ascii - output being displayed in hexadecimal and ASCII similar to a main-frame dump.

---

pdu-verbosity pdu_verboseness

Specifies the level of verboseness to use in displaying of packet data units as a value from 1 to 5 where 5 is the most detailed.

---

since from_date_time [until to_date_time]

Default: no limit.
since from_date_time: indicates only the log information which has been collected more recently than from_date_time is to be displayed.
until to_date_time: indicates no log information more recent than to_date_time is to be displayed. until defaults to current time when omitted.
from_date_time and to_date_time must be formatted as YYYY:MM:DD:HH:mm or YYYY:MM:DD:HH:mm:ss. Where YYYY is a 4-digit year, MM is a 2-digit month in the range 01 through 12, DD is a 2-digit day in the range 01 through 31, HH is a 2-digit hour in the range 00 through 23, mm is a 2-digit minute in the range 00 through 59, and ss is a 2 digit second in the range 00 through 59.
to_date_time must be a time which is more recent than from_date_time.

The use of the until keyword allows for a time range of log information while only using the since keyword will display all information up to the current time.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in *Command Line Interface Reference*.

Usage

Backup the current log file as part of periodic maintenance activities.

Example

The following saves the log to the local file /flash/pub/junelogs.logs with no confirmation from the user:

```
save logs /flash/pub/junelogs.logs -noconfirm
```

The following saves the configuration data to remote host remoteABC as /pub/junelogs.logs:

```
save logs tftp://remoteABC/pub/junelogs.logs
```

session trace subscriber

This command enable disables the subscriber session trace functionality based on a specified subscriber device or ID on one or all instance of session on a specified EPS network elements.

Product

MME, P-GW, S-GW

Privilege

Operator

Syntax

session trace subscriber network-element {mme | pgw | sgw} {imei *id* **} { imsi** *id* **} { interface { all |** *interface* **} } trace-ref** *id* **collection-entity** *ip_address*

no session trace subscriber [network-element { mme | pgw | sgw }] [trace-ref *id* **]**

no

Disables the entire session trace or for a specific network element and/or trace reference.

network-element { mme | pgw | sgw }

Identifies the network element that, in turn, identifies the interfaces where the session trace is to occur. Specific interfaces can be specified using the interface keyword described below.
mme: Specifies that the session trace is to occur on one or all interfaces on the MME.
pgw: Specifies that the session trace is to occur on one or all interfaces on the P-GW.
sgw: Specifies that the session trace is to occur on one or all interfaces on the S-GW.

imei *id*

Specifies the International Mobile Equipment Identification number of the subscribers UE. *id* must be the 8 digit TAC (Type Allocation Code) and 6 digit serial number. Only the first 14 digits of the IMEI/IMEISV are used to find the equipment ID.

imsi *id*

Specifies the International Mobile Subscriber Identification (IMSI). *id* must be the 3 digit MCC (Mobile Country Code), 2 or 3 digit MNC (Mobile Network Code), and the MSIN (Mobile Subscriber Identification Number). The total should not exceed 15 digits.

interface { all | *interface* **}**

Specifies the interfaces where the session trace application will collect data.
all: Specifies that all interfaces associated with the selected network element
interface: Specifies the interface type where the session trace application will collect trace data. The following interfaces are applicable for the network element type:

- MME:
  - **s1mme**: Specifies that the interface where the trace will be performed is the S1-MME interface between the MME and the eNodeB.

- **s3**: Specifies that the interface where the trace will be performed is the S3 interface between the MME and an SGSN.
- **s6a**: Specifies that the interface where the trace will be performed is the S6a interface between the MME and the HSS.
- **s10**: Specifies that the interface where the trace will be performed is the S10 interface between the MME and another MME.
- **s11**: Specifies that the interface where the trace will be performed is the S11 interface between the MME and the S-GW.

- P-GW:
  - **gx**: Specifies that the interface where the trace will be performed is the Gx interface between the P-GW and the PCRF.
  - **s2a**: Specifies that the interface where the trace will be performed is the S2a interface between the P-GW and the HSGW.
  - **s2b**: Specifies that the interface where the trace will be performed is the S2b interface between the P-GW and an ePDG.
  - **s2c**: Specifies that the interface where the trace will be performed is the S2c interface between the P-GW and a trusted, non-3GPP access device.
  - **s5**: Specifies that the interface where the trace will be performed is the S5 interface between the P-GW and the S-GW.
  - **s6b**: Specifies that the interface where the trace will be performed is the S6b interface between the P-GW and the 3GPP AAA server.
  - **s8b**: Specifies that the interface where the trace will be performed is the S8b interface between the P-GW and the S-GW.
  - **sgi**: Specifies that the interface where the trace will be performed is the SGi interface between the P-GW and the PDN.
- S-GW:
  - **gxc**: Specifies that the interface where the trace will be performed is the Gxc interface between the S-GW and the PCRF.
  - **s11**: Specifies that the interface where the trace will be performed is the S11 interface between the S-GW and the MME.
  - **s4**: Specifies that the interface where the trace will be performed is the S4 interface between the S-GW and an SGSN.
  - **s5**: Specifies that the interface where the trace will be performed is the S5 interface between the S-GW and the P-GW.
  - **s8b**: Specifies that the interface where the trace will be performed is the S8b interface between the S-GW and the P-GW.

trace-ref *id*

Specifies the trace reference for the trace being initiated. *id* must be the MCC (3 digits), followed by the MNC (3 digits), then the trace ID number (3 byte octet string).

collection-entity *ip_address*

Specifies the IP address of the collection entity where session trace data is pushed. *ip_address* must be a valid IPv4 address and is specified in dotted decimal notation.

Usage

Use this command to initiate a session trace for a specified subscriber device or ID on one or all interfaces on a specified network element.

Important: Session trace configuration is performed in the Global Configuration Mode using the **session trace** command. Refer to the Global Configration Mode Commands chapter in this reference for more information.

Example

The following command initiates a session trace on a P-GW S5 interface for a subscriber with an IMSI of *322233123456789* and sets the trace reference as *322233987654* and the collection entity IP address as *1.2.3.4*:

```
session trace subscriber network-element pgw imsi 322233123456789
interface s5 trace-ref 322233987654 collection-entity 1.2.3.4
```

The following command initiates a session trace on an MME S6a interface for a subscriber with an IMSI of *322233123456789* and sets the trace reference as *322233987654* and the collection entity IP address as *1.2.3.4*:

```
session trace subscriber network-element mme imsi 322233123456789
interface s6a trace-ref 322233987654 collection-entity 1.2.3.4
```

setup

Enters the system setup wizard which guides the user through a series of questions regarding the system basic configuration options such as initial context-level administrative users, host name, etc.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
setup
```

Usage

The setup wizard provides a user friendly interface for initial system configuration.

Important: If the configuration script generated by the setup wizard is applied when an existing configuration is in use the options which are common to both are updated and all remaining options are left unchanged.

Example

```
setup
```

sgsn clear-detached-subscriptions

Clear subscription data belonging to a subscriber who has already detached.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sgsn clear-detached-subscriptions imsi *imsi*

imsi *imsi*

Specifies the international mobile subscriber identity (IMSI) of the subscriber session identifying the subscription data to be cleared.

imsi : Enter 1 to 15 digits.

Usage

This command can be issued on either a 2G or 3G SGSN to clear subscription data (including subscription information, and information for P-TMSI allocated, received authorization vectors, and NGAF flag values). This command is only effective if the subscriber has already detached.

After the data is purged, the SGSN sends an appropriate message to the HLR.

Related Commands:

- To clear subscription data for subscribers that are currently attached, refer to the **admin-disconnect-behavior clear-subscription** commands described in the chapters for *GPRS Service Configuration Mode* or the *SGSN Service Configuration Mode*.

Example

sgsn clear-detached-subscriptions imsi *040501414199978*

sgsn imsimgr

Enter commands to initiate an audit to enable managing the SGSN's IMSI manager's (IMSIMgr) IMSI table .

Important: These commands are used primarily for troubleshooting purposes and are intended for the use of specially trained service representatives.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sgsn imsimgr { add-record *imsi* **sessmgr instance** *sessmgr#* **| audit-with sessmgr { all | instance** *sessmgr#* **} | remove-record** *imsi* **}**

add-record *imsi*

Adds a record for an IMSI to the IMSI manager's table and associates a specific session manager (SessMgr) with the IMSI.
imsi : Enter up to 15 digits. An IMSI consists of the 3-digit MCC (mobile country code) + the 2- or 3-digit MNC (mobile network code) + the MSIN (mobile station identification number) for the remaining 10 or 9 digits (depending on the length of the MNC).

sessmgr instance *sessmgr#*

Identifies a specific Session Manager (SessMgr) associated with the IMSI.
sessmgr# : Enter up to 4 digits, 0 to 4095.

audit-with sessmgr { all | instance *sessmgr#* **}**

Initiate an IMSI audit with a specific Session Manager (SessMgr) or with all SessMgrs.
sessmgr# : Enter up to 4 digits, 0 to 4095.

remove-record *imsi*

Delete a specific IMSI from the IMSI table.
imsi : Enter up to 15 digits. An IMSI consists of the 3-digit MCC (mobile country code) + the 2- or 3-digit MNC (mobile network code) + the MSIN (mobile station identification number) for the remaining 10 or 9 digits (depending on the length of the MNC).

Usage

Use this command to manage the IMSIMgr's IMSI table, and to initiate an audit of one or more SessMgrs with the IMSIMgr so that the IMSI table has the correct IMSI-SessMgr association. After this audit, any IMSI in the IMSIMGR which is not found in any Sessmgr is deleted and similarly any missing entries at the IMSIMgr are created.

Example

Delete IMSI 044133255524211 from the audit table:

```
sgsn imsimgr remove-record 044133255524211
```

sgsn offload

This command instructs the SGSN to begin the offloading procedure and actually starts and stops the offloading of subscribers which is part of the SGSN's Gb (2G) or Iu (3G) Flex load redistribution functionality.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
sgsn offload [ gprs-service srvc_name | sgsn-service srvc_name } srvc_name {
activating | connecting } [ nri-value | stop | t3312-timeout seconds ]
```

gprs-service *srvc_name*

A unique string of 1 to 63 alphanumeric characters that identifies a specific GPRS service that has already been defined for the 2G SGSN configuration.

sgsn-service *srvc_name*

A unique string of 1 to 63 alphanumeric characters that identifies a specific SGSN service that has already been defined for the 3G SGSN configuration.

activating

Instructs the SGSN to off load any subscribers sending an 'activate request' message.

connecting

Instructs the SGSN to off load any subscribers sending either an 'attach request' or a 'RAU request' message.

nri-value *nri-value*

Instructs the SGSN to check the P-TMSI and use the SGSN matching the configured NRI value to off load subscribers.
nri-value: Must be an integer from 1 to 63 to identify a specific SGSN in a pool. Use of 0 (zero) value is not recommended.

stop

Instructs the SGSN to stop offloading subscribers from the pool area.

t3312-timeout *seconds*

Configures the timer for sending period RAUs to the MS. Default is 4 seconds.
seconds: Must be an integer from 2 to 60.

Usage

Use this command to configured the offloading of subscribers which is a part of the SGSN's load redistribution operation. This command can be used anytime an SGSN is to be taken out of service.

Example

The following command instructs the SGSN to notify all MS to detach and reattach.

```
sgsn offload gprs-service srvc_name activating nri-value nri_value
```

sgsn op

These commands instruct the SGSN to begin specific operations or functions.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sgsn op { convert | nse { fr | ip | sgsn-invoke-trace } | show | ss7-rd *ss7-rd_id* **{ destination | link | linkset | peer } }**

---

convert point-code *pt_code* **variant** *variant*

This command accesses a built-in conversion tool to convert SS7 point codes, according to identified variants, from dotted-decimal format to decimal format and *visa versa* .
point-code *pt_code:* Enter an SS7 point code in either dotted-decimal format or decimal format.
variant *variant:* Identify the appropriate variant for the point code:

- **ansi**
- **itu**
- **ttc**

---

nse { fr *operation* **| ip** *operation* **| sgsn-invoke-trace nse-id** *nse_id* **}**

The **nse** command enables the operator to perform a range of live control functions (e.g, reset, block, unblock) for various types of virtual connections based on the signalling type of the NSE:
fr : Identifies a Frame Relay NSE.
ip : Identifies an IP NSE.
operation: Identifies the operation to be performed for the NSE connection (if available for the selected signalling type) :

- **block nse-id** *nse_id*- Blocks signal flow through all network service virtual connections (NSVC) for the specified NSE:
  - *nse_id :* Enter an integer from 0 to 65535.
- **bvc-flc-limit rate** *rate* **bvc-id** *bvc_id* **nse-id** *nse_id*- SGSN initiates flow control at the defined percentage rate to limit the flow through the BSSGP virtual connection (BVC) for the specified NSE and optionally for a specified BVC.
  - *rate :* Enter an integer from 0 to 100.
  - *bvc_id :* Enter an integer from 0 to 65000.
  - *nse_id :* Enter an integer from 0 to 65535.
- **bvc-reset bvc-id** *bvc_id* **nse-id** *nse_id* - SGSN initiates a BVC-Reset on the specified BVC and NSE:
  - *bvc_id :* Enter an integer from 0 to 65000.
  - *nse_id :* Enter an integer from 0 to 65535.
- **nsvc** *nsvc_id* **{ block | enable | disable | unblock }***nse_id*- SGSN initiates NS-Block or NS-Unblock for the specified NSVC of the specified NSE:

- *nsvc_id :* Enter an integer from 0 to 65535.
- *nse_id :* Enter an integer from 0 to 65535.

- **reset nse-id** *nse_id* - SGSN initiates NS-Reset for all NSVC configured in the NSE.
  - *nse_id :* Enter an integer from 0 to 65535.
- **unblock nse-id** *nse_id* - SGSN initiates NS-Unblock for all NSVC configured for the specified NSE.
  - *nse_id :* Enter an integer from 0 to 65535.

sgsn-invoke-trace nse-id *nse_id* **record-type** *record_type* **trace-reference** *reference* **[mobile-id type** *id_type* **| trace-transaction-id** *trace_id***]** :

Important: Thiscommand can be used for troubleshooting/debugging purposes and is primarily intended for the use of specially trained service representatives.

Instructs the SGSN (1) to send the BSSGP message SGSN-INVOKE-TRACE to the BSC to initiate a BSC trace of a particular MS and (2) to define the type and triggering of the trace.

- *nse_id :* Identify the peer NSE, enter an integer from 0 to 65535.
- *record_type :* Select the type of trace to be performed:
  - **basic**
  - **handover**
  - **no-bss-trace**
  - **radio**
- **trace-reference** *reference :* Enter the trace reference ID - an integer from 0 to 65535.
- **mobile-id type** *id_type :* Select the appropriate mobile ID type for the MS that is to be traced:
  - **imei value** *value* - Specifies the mobile ID type as the unique International Mobile Equipment Identity.

    value : Enter the 15-digit IMEI value.
  - **imeisv value** *value* - Specifies the mobile ID type as the unique International Mobile Equipment Identity - with the two-digit software version number.

    value : Enter the 16-digit IMEISV value.
  - **imsi value** *value* - Specifies the mobile ID type as a network unique International Mobile Subscriber Identity.

    value : Enter the 15-digit IMSI value.
- **trace-transaction-id** *trace_id :* Enter the trace transaction ID - an integer from 0 to 65535.

show plmn-list smgr-inst *sessmgr#*

SGSN displays the configured PLMN list for the specified session manager (SessMgr):
sessmgr# : Enter up to 4 digits, 0 to 4095.

ss7-rd *ss7-rd_id* **{ destination | link | linkset | peer }**

The **ss7-rd** commands assist with troubleshooting connections between the SGSN and the peer server.

ss7-rd_id : Enter a value between 1 and 12 that identifying the configured SS7 routing domain.

- **destination audit asp-instance** *asp_id* **peer-server-id** *peer_id* **psp-instance-id** *psp_id*

  Initiate destination audit (DAUD) messages for all point codes reachable via the identified peer-server, which is in restricted/unavailable/congested state due to DRST/DUNA/SCON messages respectively from the far end.

  - *asp_id :* Enter the relevant ASP configuration ID, an integer between 1 and 4.
  - *peer_id :* Enter the relevant peer server configuration ID, an integer between 1 and 144.
  - *psp_id :* Enter the relevant PSP configuration ID, an integer between 1 and 4

- **link** *procedure* **linkset-id** *linkset_id* **link-id** *link_id*

  Initiates MTP3 network link management procedures for the specified link:

  - **activate** -- activates the deactivated link.
  - **deactivate** -- deactivates specified link.
  - **deactivate-l2-only** -- deactivates the link only at the MTP3 layer.
  - **inhibit** -- inhibits the link only if it does *not* make any desination unreachable.
  - **uninhibit** -- uninhibits the inhibited link.
  - *linkset_id :* Enter an integer between 1 and 144.
  - *link_id :* Enter an integer between 1 and 16.

- **linkset-id** *procedure* **linkset-id** *linkset_id*

  Initiates MTP3 network link management procedures for all the links in the specified linkset:

  - **activate** -- activates the deactivated linkset.
  - **deactivate** -- deactivates the linkset.
  - **deactivate-l2-only** -- deactivates the linkset only at MTP3 layer.
  - *linkset_id :* Enter an integer between 1 and 144.

- **peer** *message* **asp-instance** *asp_id* **peer-server-id** *peer_id* **psp-instance-id** *psp_id* :

  Initiates one of the following SCTP/M3UA management messages from the identified link:

  - **abort** - Sends an SCTP Abort message which aborts the SCTP association ungracefully.
  - **activate** - Sends an M3UA ASP Active message to activate the link.
  - **down** - Sends an M3UA ASP Down message to bring down the M3UA link.
  - **establish** - Sends an SCTP INIT message to start the SCTP association establishment.
  - **inactivate** - Sends an M3UA ASP Inactive message to deactivate the link.
  - **inhibit** - Inhibits the M3UA link locally when the operator wants to lockout the link.
  - **terminate** - Sends SCTP Shutdown message which closes the SCTP association gracefully.
  - **un-inhibit** - Uninhibits the M3UA link.
  - **up** - Sends an M3UA ASP UP message to bring up the M3UA link.
  - *asp_id :* Enter the relevant ASP configuration ID, an integer between 1 and 4.
  - *peer_id :* Enter the relevant peer server configuration ID, an integer between 1 and 144.
  - *psp_id :* Enter the relevant PSP configuration ID, an integer between 1 and 4

Usage

In most cases, an operator will block/unblock/reset from the BSC-side. The **nse** commands cause the SGSN to initiate actions, usually for one of the following reasons:

- to resolve issues on the BSC-side,
- as part of an upgrade to the BSC,
- as part of link expansion,
- to resolve NSVC/BVC status mismatches observed between the SGSN and BSC.

The **sgsn-invoke-trace** command initiates the trace procedure where the BSC begins a trace record on a specified MS.

Example

Instruct the SGSN to initiate an NS-Block for all NSVC associated with Frame Relay NSE ID 2422:

```
sgsn op nse fr unblock nse-id 2422
```

Activate linkset 1 configured in SS7 routing domain 1:

```
sgsn op ss7-rd 1 linkset activate linkset-id 1
```

shutdown

Terminates all processes within the chassis.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
shutdown [ -noconfirm ]
```

-noconfirm

Execute the command without any additional prompts or confirmation from the user.

Usage

The system performs a hardware reset and reloads the highest priority boot image and configuration file specified in the boot.sys file. Refer to the **boot system priority** command in the Global Configuration Mode for additional information on configuring boot images, configuration files and priorities.

Important: To avoid the abrupt termination of subscriber sessions, it is recommended that a new call policy be configured and executed prior to invoking the **shutdown** command. This sets busy-out conditions for the system and allows active sessions to terminate gracefully. Refer to the **newcall** command in the Exec Mode for additional information.

Caution: Issuing this command causes the system to become unavailable for session processing until the reboot process is complete.

Example

The following command performs a hardware reset on the system:

```
shutdown
```

sleep

Pauses the CLI interface.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

sleep *seconds*

seconds

Specifies the number of seconds to pause. The number of seconds must be a value in the range from 1 through 3600.

Usage

Sleep is a command delay which is only useful when creating command line interface scripts such as predefined configuration files/scripts.

Example

The following will cause the CLI to pause for *30* seconds.

sleep *30*

srp initiate-switchover

This command changes the device status on the primary and backup HA or GGSN systems configured for Interchassis Session Recovery support.

Product

HA, GGSN PDIF

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
srp initiate-switchover [ post-processing-timeout | reset-route-modifier |
timeout seconds ] [ -noconfirm ]
```

post-processing-timeout

Specifies the timeout value in seconds to initiate the post-switchover process. The value must be an integer from 0 through 3600.

reset-route-modifier

During a switchover, reset the route-modifier to the initial value.

timeout *seconds*

Default: 300
Specifies the number of seconds before a forced switchover occurs. seconds must be a value in the range from 0 through 65535.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

This command executes a forced switchover from active to inactive. The command must be executed on the active system and switches the active system to the inactive state and the inactive system to an active state.

Example

The following initiates a switchover in *30* seconds.

```
srp initiate-switchover timeout 30
```

srp reset-auth-probe-fail

This command resets the auth probe monitor failure information.

Product

HA, GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
srp reset-auth-probe-fail
```

Usage

This command resets the auth probe monitor failure information to 0.

srp terminate-post-process

This command forcibly terminates the post-switchover of primary and backup HA or GGSN systems configured for Interchassis Session Recovery (ICSR) support.

Product

HA, GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
srp terminate-post-process [ -noconfirm ]
```

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to force the termination of post-switchover process.

Example

```
srp terminate-post-process
```

srp validate-configuration

Initiates a configuration validation check from the ACTIVE chassis.

Product

HA, GGSN PDIF

Privilege

Security Administrator, Administrator

Syntax

```
srp validate-configuration
```

Usage

Validates the configuration for an active chassis.

ssh

Connects to a remote host using a secure interface.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

ssh { *host_name* | *host_ip_address* } [port *port_num*] [user *user_name*]

host_name | host_ip_address

Identifies the remote node to attempt to connect to.
host_name: specifies the remote node using the node's logical host name which must be resolved via DNS lookup.
host_ip_address: specifies the remote node using the node's assigned IP address specified using the standard IPv4 dotted decimal notation.

port *port_num*

Specifies a specific port to connect to where *port_num* must be a value in the range 1025 through 10000.

user *user_name*

Specifies a user name to attempt to connect as.

Usage

SSH connects to a remote network element using a secure interface.

Example

The following connects to remote host *remoteABC* as user *user1*.

ssh *remoteABC* **user** *user1*

The following connects to remote host *1.2.3.4* without any default user.

ssh *1.2.3.4*

The following connects to remote host *1.2.3.4* via port *2047* without any default user.

ssh *1.2.3.4* **port** *2047*

start crypto security-association

Initiates IKE negotiations.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

start crypto security-association *cryptomap*

cryptomap

This is the name of the crypto map policy to use when starting the IKE negotiations. *cryptomap* must be the name of an existing crypto map entered as an alpha and/or numeric string of from 1 to 127 characters.

Usage

Use this command to start IKE negotiations for IPSEC.

Example

The following command starts the IKE negotiations using the parameters set in the crypto map named *crytpomap1*:

start crypto security-association *cryptomap1*

Chapter 89
Exec Mode (T-Z)

This section includes the commands **telnet** through **upgrade url-blacklisting database**.

telnet

Connects to a remote host using the terminal-remote host protocol.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

telnet { *host_name* | *host_ip_address* } [port *port_num*]

host_name | *host_ip_address*

Identifies the remote node to attempt to connect to.
host_name: specifies the remote node using the node's logical host name which must be resolved via DNS lookup.
host_ip_address: specifies the remote node using the node's assigned IP address specified using the standard IPv4 dotted decimal notation.

port *port_num*

Specifies a specific port to connect to where *port_num* must be a value in the range 1025 through 10000.

Usage

Telnet to a remote node for maintenance activities and/or troubleshooting when unable to do so directly.

Important: **telnet** is not a secure method of connecting between two hosts. **ssh** should be used whenever possible for security reasons.

Example

The following connects to remote host *remoteABC*.

```
telnet remoteABC
```

The following connects to remote host *1.2.3.4* port *2047*.

```
telnet 1.2.3.4 port 2047
```

terminal

Sets the number of rows or columns for output.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

terminal { length *lines* **| width** *characters* **}**

length *lines* **| width** *characters*

length *lines*: sets the terminal length in number of *lines* (rows) of text from 5 to 4294967295 lines or the special value of 0 (zero). The value 0 sets the terminal length to infinity.
width *characters*: sets the terminal width in number of *characters* from 5 to 512 characters.

Usage

Set the length to 0 (infinite) when collecting the output of a command line interface session which is part of a scripted interface.

Example

The following sets the length then width in two commands.

```
terminal length 66
terminal width 160
```

The following command sets the number of rows of the terminal to infinity.

```
terminal length 0
```

test alarm

Tests the alarm capabilities of the chassis.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
test alarm { audible | central-office { critical | major | minor } }
```

audible | central-office { critical | major | minor }

audible: indicates that the internal alarm on the system management card is to be tested for 10 seconds. The alarm status is returned to its prior state, i.e., if the audible alarm was enabled prior to the test, the alarm will again be enabled following the test.
central-office { **critical** | **major** | **minor** }: indicates the central office alarms are to be tested for the specified CO alarm.

Usage

Test the alarm capabilities of the chassis as periodic maintenance to verify the hardware for generation of the internal audible alarms is functional.

Example

```
test alarm audible

test alarm central-office critical

test alarm central-office major

test alarm central-office minor
```

timestamps

Enables/disables the generation of a timestamp in response to each command entered. The timestamp does not appear in any logs as it is a CLI output only. This command affects the current CLI session only. Use the **timestamps** command in the Global Configuration Mode to change the behavior for all future CLI sessions.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
[ no ] timestamps
```

no

Disables generation of timestamp output for each command entered. When omitted, the output of a timestamp for each entered command is enabled.

Usage

Enable timestamps when logging a CLI session on a remote terminal such that each command will have a line of text indicating the time when the command was entered.

traceroute

Collects information on the route data will take to a specified host.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Important: Inspector privileges are granted for all variables except **count and port**. To initiate a traceroute count or to target a specific port for a traceroute, you must have a minimum privilege level of Operator.

Syntax

traceroute { *host_name* | *host_ip_address* } [**count** *packets*] [**df**] [**maxttl** *max_ttl*] [**minttl** *min_ttl*] [**port** *port_num*] [**size** *octet_count*] [**src** { *src_host_name* | *src_host_ip_address* }] [**timeout** *seconds*] [| { **grep** *grep_options* | **more** }]

host_name | host_ip_address

Identifies the remote node to trace the route to.
host_name: specifies the remote node using the node's logical host name which must be resolved via DNS lookup.
host_ip_address: specifies the remote node using the node's assigned IP address specified using the standard IPv4 dotted decimal notation.

count *packets*

Default: 3
Specifies the number of UDP probe packets to send.

df

Indicates the packets for the tracing of the route should not be fragmented. If a packet would require fragmenting then it is dropped and the result is the ICMP response "Unreachable, Needs Fragmentation" is received.

maxttl *max_ttl*

Default: 30
Specifies the maximum time to live, in seconds, for the route tracing packets. *max_ttl* must be specified as a value in the range of 1 through 255. It is an error if *max_ttl* is less than *min_ttl* whether *min_ttl* is specified or defaulted.
The time to live (TTL) is the number of hops through the network, i.e., it is not a measure of time.

minttl *min_ttl*

Default: 1

Specifies the minimum time to live, in seconds, for the route tracing packets. *min_ttl* must be specified as a value in the range of 1 through 255. It is an error if *min_ttl* is greater than *max_ttl* whether *max_ttl* is specified or defaulted.
The time to live (TTL) is the number of hops through the network, i.e., it is not a measure of time.

port *port_num*

Default: 33434
Specifies a specific port to connect to where *port_num* must be a value in the range 1 through 65535.

size *octet_count*

Default: 40
Specifies the number of bytes each packet. *octet_count* must be a value in the range 40 through 32768.

src { *src_host_name* **|** *src_host_ip_address* **}**

Default: originating system's IP address
Specifies an IP address to use in the packets as the source node.
src_host_name: specifies the remote node using the node's logical host name which must be resolved via DNS lookup.
src_host_ip_address: specifies the remote node using the node's assigned IP address specified using the standard IPv4 dotted decimal notation.

timeout *seconds*

Default: 5
Specifies the maximum time to wait for a response from each route tracing packet. *seconds* must be a value in the range 2 through 100.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series-series Command Line Interface Reference.

Usage

Trace an IP route when troubleshooting network problems where certain nodes are having significant packet delays or packet loss. This can also be used to identify bottlenecks in the routing of data within the network.

Example

The following traces the route to remote host *remoteABC* and sends the output to the more command.

```
traceroute remoteABC | more
```

The following command traces the route to remote host *1.2.3.4*'s port *2047* waiting a maximum of *2* seconds for responses.

```
traceroute 1.2.3.4 port  2047 timeout 2
```

update active-charging

This command updates specified active charging option(s) for the matching sessions.

Product

ACS, FW, NAT

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

update active-charging { switch-to-fw-and-nat-policy *fw_nat_policy* **| switch-to-rulebase** *rulebase* **} { all | callid** *call_id* **| fw-and-nat-policy** *fw_nat_policy* **| imsi** *imsi* **| ip-address** *ipv4_address* **| msid** *msid* **| rulebase** *rulebase* **| username** *user_name* **} [-noconfirm] [| { grep** *grep_options* **| more }]**

switch-to-fw-and-nat-policy

Switch to the specified Firewall-and-NAT policy.
fw_nat_policy must be the name of a Firewall-and-NAT policy, and must be a string of 1 through 63 characters in length.

switch-to-rulebase

Switch to the specified rulebase.
rulebase must be the name of a rulebase, and must be a string from 1 through 63 characters in length.

all

Updates rulebase for all subscribers.

callid *call_id*

Specific Call identification number.
call_id must be an eight-digit HEX number.

fw-and-nat-policy *fw_nat_policy*

Specific Firewall-and-NAT policy.
fw_nat_policy must be a string from 1 through 63 characters in length.

imsi *imsi*

Specific International Mobile Subscriber Identification (IMSI).
imsi must be 3 digits of MCC (Mobile Country Code), 2 or 3 digits of MNC (Mobile Network Code), and the rest with MSIN (Mobile Subscriber Identification Number). The total should not exceed 15 digits. For example, 123-45-678910234 can be entered as 12345678910234.

ip-address *ipv4_address*

Specific IPv4 IP address.
ipv4_address must be IPv4 address in dotted decimal notation.

msid *msid*

Updates rulebase for a specific MSID.
msid must be a string of 1 through 24 characters in length.

rulebase *rulebase*

Updates rulebase for sessions matching the specified rulebase.
rulebase must be a string from 1 through 63 characters in length.

username *user_name*

Updates rulebase for a specific user.
user_name must be a sequence of characters and/or wildcard characters ('$' and '*')> - string of 1 through 127 characters in length.

-noconfirm

Specifies that the command is to execute without any additional prompt and confirmation from the user.

| { grep *grep_options* **| more }**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

Use this command to change specified active charging option(s) for the matching sessions.

Example

The following command changes the rulebase for sessions using the rulebase named *standard* to use the rulebase named *super*:

```
update active-charging switch-to-rulebase super rulebase standard
```

update cscf

This command will cause a NOTIFY to be triggered from S-CSCF with contact event as “shortened” and indicating the expiry timer value for each contact as “reauthentication-time” provided from CLI. The subscriber is supposed to send a fresh REGISTER message within “reauthentication-time”, which will be challenged by S-CSCF in order to accomplish reauthentication. If reauthentication does not occur/fails, the subscriber will be cleared after “reauthentication-time”.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

```
update cscf subscriber { all | username user_name } cscf-service service_name
reauthentication-time seconds [ verbose ]
```

subscriber { all | username *user_name* }

Updates cscf subscriber data.
all: Updates data for all subscribers within a specified S-CSCF service.
username *user_name*: Name of specific user within current context. can be between 1 and 127 alpha and/or numeric characters and is case sensitive.

cscf-service *service_name*

Specific configured S-CSCF service. *service_name* can be between 1 and 63 alpha and/or numeric characters and is case sensitive.

reauthentication-time *seconds*

Specify the time within which subscriber is expected to reauthenticate. *seconds* must be an integer from 1 to 86400 seconds.

verbose

Show detailed information.

Usage

This command is only applicable for an S-CSCF service.

Important: reauthentication-time should be greater than the current expiry time of the contact so that S-CSCF will initiate the NOTIFY message.

Example

The following command sets the reauthentication time for all CSCF subscribers in the *scscf1* S-CSCF service to *500* seconds:

```
update cscf subscriber all cscf-service scscf1 reauthentication-time 500
```

update firewall policy

This command is obsolete.

update ip

When you update an IP Access list, this command forces the new version of the access list to be applied to any subscriber sessions that are currently using that list.

Product

PDSN, GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

update ip access-list *list_name* **subscribers [** *command_keyword* **] [** *filter_keywords* **] [| { grep** *grep_options* **| more }]**

list_name

This is the name of the IP Access list that you want to apply to the subscriber.

[*command_keyword* **] [** *filter_keywords* **]**

These are the same command keywords and filter keywords available for the **show subscribers** command.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Use this command to force existing subscriber sessions that are already using a specific IP Access list to have that IP Access list reapplied. This is useful when you edit an IP Access list and want to make sure that even existing subscriber sessions have the new changes applied.

Example

To apply the IP Access list named ACLlist1 to all existing subscribers that are already using that IP Access list, enter the following command:

update ip access-list *ACLlist1* **subscribers all**

update qos policy map

Updates QoS profile information based on specific subscriber policy maps.

Product

All

Privilege

Security Administrator, Administrator

Syntax

update qos policy-map *map_name* **use-granted-profile-id** *id1* **[** *id2* **] [** *id3* **] subscribers [** *command_keyword* **] [** *filter_keywords* **] [-noconfirm] [verbose] [match-requested-profile-id] [| { grep** *grep_options* **| more }]**

map_name

Specifies the name of the policy map. *map_name* can be from 1 to 15 alpha and/or numeric characters in length.

use-granted-profile-id *id1* **[** *id2* **] [** *id3* **]**

Specifies the profile IDs to update. Up to 3 different profile IDs can be specified.
Each profile ID is specified as a hexadecimal value from 0x0 and 0xFFFF.

subscribers [*command_keyword* **] [** *filter_keywords* **]**

These are the same command keywords and filter keywords available for the **show subscribers** command.

[-noconfirm]

Updates matching subscribers without prompting for confirmation.

[verbose]

Displays details for the profile updates.

[match-requested-profile-id]

Causes the system to send session-updates only with profile-ids matching the profile-ids in the requested list.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Use this command to update subscriber session profile IDs based on the specified criteria.

Example

The following command updates profile IDs *0x3E* and *0x4C* for all subscriber sessions and sends session-updates with the IDs:

```
update qos policy-map test use-granted-profile-id 0x3E 0x4C subscribers
all match-requested-profile-id
```

update qos tft

Updates the subscribers TFT associated with the flow ID and direction.

Product

All

Privilege

Security Administrator, Administrator

Syntax

update qos tft flow-id *flow-id* **flow-dir { forward | reverse } use-granted-profile-id** *id1*[*id2*] [*id3*] **subscribers [** *command_keyword* **] [** *filter_keywords* **] [-noconfirm] [verbose] [match-requested-profile-id] [| { grep** *grep_options* **| more }**

flow-id *flow-id*

When *flow-id* is specified, the session update will be sent only when the flow ID matches the flow-id and flow-direction.
The *flow-id* must be specified as a value in the range of 1 through 255.

flow-dir {forward | reverse}

The direction of the tft flow.

subscribers [*command_keyword* **] [** *filter_keywords* **]**

These are the same command keywords and filter keywords available for the **show subscribers** command.

Usage

Supports QoS updates based on subscriber TFTs.

Example

```
update qos tft flow-id 0 flow-dir reverse use-granted-profile-id 0x0
subscribers all -noconfirm
```

upgrade

This command installs major software releases to the system.

Product

All

Privilege

Security Administrator, Administrator

Syntax

upgrade { online | patch } *image_url* **config** *cfg_url* **[-noconfirm]**

online

Perform a software upgrade from one release version to another. The online upgrade is only available for software release 3.5 and higher.

patch

Install an interim, or patch, software release.

Important: Software Patch Upgrades are not supported in this release.

image_url

Specifies the location of a image file to use for system startup. The URL may refer to a local or a remote file. The URL must be formatted according to one of the following formats:

- ST16:
  - [**file:**]{ **/flash** | **/pcmcia1** | **/pcmcia2** }[*/directory*]*/file_name*
  - **[tftp:]//**{ *host*[*:port#*] }[*/directory*]*/file_name*
- ASR 5000:
  - [**file:**]{ **/flash** | **/pcmcia1** | **/hd** }[*/directory*]*/file_name*
  - **[http: | tftp:]//**{ *host*[*:port#*] }[*/directory*]*/file_name*

directory is the directory name.
filename is the actual file of interest.
host is the IP address or host name of the server.
port# is the logical port number that the communication protocol is to use.

Important: A file for use on an ST16 uses the convention xxxxx.st16.bin where xxxxx is the software build information.

Important: A file intended for use on an ASR 5000 uses the convention xxxxx.ASR5000.bin, where xxxxx is the software build information.

Important: When using the TFTP, it is advisable to use a server that supports large blocks, per RFC 2348. This can be implemented by using the "block size option" to ensure that the TFTP service does not restrict the file size of the transfer to 32MB.

config *config_path*

Specifies the location of a configuration file to use for system startup. This must be formatted according to the following format:

- ST16:
  - [**file:**]{ **/flash** | **/pcmcia1** | **/pcmcia2** }[*/path*]*/filename*
- ASR 5000:
  - [**file:**]{ **/flash** | **/pcmcia1** | **/hd** }[*/path*]*/filename*

Where *path* is the directory structure to the file of interest, and *filename* is the name of the configuration file. This file typically has a **.cfg** extension.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use the **upgrade online** command to perform a software upgrade when upgrading from one software release version to another, providing that both versions support this feature. For example, you can use this method to upgrade from release version 3.5 (any build number) to version 4.0 (any build number), but you cannot use this method to upgrade from release version 3.0 to version 3.5 since version 3.0 does not support the feature.

Important: Software Patch Upgrades are not supported in this release.

Important: This command is not supported on all platforms.

Example

The following command performs a major software release upgrade from an older version to a newer version. In this example the new software image file is in a subdirectory on a tftp server, and the configuration file is in a subdirectory on the local flash.tftp://host[/path]/filename

```
upgrade online tftp://imageserver/images/image.bin config
/flash/configurations/localconfig.cfg
```

upgrade content-filtering

This command upgrades the Static Rating Database (SRDB) for Category-based Content Filtering application.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

```
upgrade content-filtering category { database | rater-pkg }
```

upgrade content-filtering category database

This command triggers upgrade of the Category-based Content Filtering Static Rating Database (SRDB).

upgrade content-filtering category rater-pkg

This command triggers manual upgrade of the Dynamic Content-Filtering Rater Package (*rater.pkg* file). The *rater.pkg* file contains the models and feature counters that are used to return the dynamic content rating. The upgrade will trigger distribution of the *rater.pkg* to all the SRDBs.

Important: This command is customer specific. For more information, please contact your local sales representative.

Usage

Use this command to load the Static Rating Database (SRDB) in to memory for Category-based Content Filtering application, and/or to load the *rater.pkg* file.
If the default directory of /cf does not exist on the flash, it will create the same. It also locates the recent full database and loads it into memory. This command also clears the old and excess incremental databases.

Important: This command is not supported on all platforms.

Example

The following command upgrades the SRDB for the Category-based Content Filtering application:

```
upgrade content-filtering category database
```

upgrade url-blacklisting database

This command upgrade the URL Blacklisting database.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

```
upgrade url-blacklisting database [ -noconfirm ]
```

-noconfirm

Specifies that the command must execute without any additional prompt and confirmation from the user.

Usage

Use this command to upgrade and load URL Blacklisting database whenever required.

Example

```
upgrade url-blacklisting database
```

Chapter 90
Exec Mode Show Commands (A-C)

This section includes the commands **show** through **show css service**.

show aaa

Use this command to view AAA statistics for the current context.

Product

PDSN, GGSN, SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show aaa { group { all | name *aaa_group_name* **} | local counters } [| { grep** *grep_options* **| more }]**

group { all | name *aaa_group_name* **}**

Displays AAA information.

- **all**: If the exec context is local, information for all the default AAA groups, and the AAA groups configured in all the contexts are displayed. If the exec context is not local, information for only the context-specific AAA groups are displayed.
- **name** *aaa_group_name*: Displays information of the specified AAA group.

  aaa_group_name must be the name of a AAA group, and must be an alpha and/or numeric string of 0 through 64 characters in length.

local counters

Displays information for current context.

grep *grep_options* **| more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

This command is used to view accounting and authentication statistics for the current context.

Example

The following command displays AAA statistics for the current context:

```
show aaa local counters
```

The following command displays AAA statistics for the AAA group *aaa_group1*:

```
show aaa group name aaa_group1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging analyzer statistics

This command displays statistic information for protocol analyzers.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging analyzer statistics [ name protocol [ verbose ] ] [ | {
grep grep_options | more } ]
```

name *protocol*

Displays detailed information for the specified protocol analyzer.
protocol must be an available analyzer name, and must be one of the following:

- **dns**
- **file-transfer**
- **ftp**
- **http**
- **icmp**
- **icmpv6**
- **imap**
- **ip**
- **ipv6**
- **mms**
- **p2p**
- **pop3**
- **rtcp**
- **rtp**
- **rtsp**
- **sdp**
- **secure-http**
- **sip**
- **smtp**
- **tcp**
- **udp**
- **wsp**
- **wtp**

verbose

Indicates the output should provide as much information as possible. If this option is not specified then the output is the standard level which is the concise mode.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display statistic information for active charging protocol analyzers.

Example

The following command displays detailed statistic information for all P2P protocol analyzers:

```
show active-charging analyzer statistics name p2p verbose
```

The following command displays detailed statistic information for all TCP protocol analyzers:

```
show active-charging analyzer statistics name tcp verbose
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging bandwidth-policy

This command displays information on bandwidth policies configured in a service.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging bandwidth-policy { all | name bandwidth_policy_name } [ | {
grep grep_options | more } ]
```

all

Displays information for all bandwidth policies configured in the service.

name *bandwidth_policy_name*

Displays detailed information for the specified bandwidth policy.
bandwidth_policy_name must be the name of a bandwidth policy, and must be an alpha and/or numeric string of 1 through 63 characters in length.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view information on bandwidth policies configured in a service.

Example

The following command displays detailed information for the bandwidth policy named *standard*:

```
show active-charging bandwidth-policy name standard
```

show active-charging charging-action

This command displays information for charging actions configured in the ACS service.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging charging-action { { { all | name charging_action_name } [
service name acs_service_name ] } | statistics [ name charging_action_name ] } [
| { grep grep_options | more } ]
```

all

Displays information for each configured charging action.

name *charging_action_name*

Displays detailed information for the specified charging action.
charging_action_name must be the name of a charging action, and must be an alpha and/or numeric string of 1 through 63 characters in length.

statistics

Displays statistical information for all configured charging actions.

service name *acs_service_name*

Displays information for all or a specific charging action in the specified ACS service.
acs_service_name must be the name of an ACS service, and must be an alpha and/or numeric string of 1 through 15 characters in length.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display information for charging actions configured in a service.

Example

The following command displays a detailed information for all charging actions:

```
show active-charging charging-action all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging content-filtering category policy-id

This command displays Content Filtering category policy definitions.

Important: This command is not available on StarOS 8.0 and earlier.

Product

CF

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging content-filtering category policy-id { all | id policy_id }
[ | { grep grep_options | more } ]
```

all

Displays definitions of all Content Filtering category policies.

id *policy_id*

Displays definitions of a specific Content Filtering category policy.
policy_id must be a CF policy ID, and must be an integer from 1 through 4294967295.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view Content Filtering category definitions for a specific/all Policy IDs.

Example

The following command displays Content Filtering category definitions for policy ID 3:

```
show active-charging content-filtering category policy-id id 3
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging content-filtering category statistics

This command displays category-based content filtering statistics.

Product

CF

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show active-charging content-filtering category statistics [rulebase { name *rulebase_name* **| all }] [verbose] [| { grep** *grep_options* **| more }]**

rulebase { name *rulebase_name* **| all }**

Displays category-based content filtering statistics, either for all or for a specific rulebase.

- **name** *rulebase_name*: Specifies the rulebase.

  rulebase_name must be the name of an existing rulebase, and must be an alpha and/or numeric string of 1 through 63 characters in length.

- **all**: Displays category-based content filtering statistics for each rulebase in the ACS service.

verbose

Specifies that the output should provide as much information as possible. If this option is not specified then the output is the standard level, which is the concise mode.

grep *grep_options* **| more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view category-based content filtering statistics for a specific rulebase, or cumulative statistics for all rulebases in the ACS service.

Example

The following command displays category-based content filtering statistics for the rulebase named *consumer*:

```
show active-charging content-filtering category statistics rulebase name
consumer
```

The following command displays cumulative category-based content filtering statistics for all rulebases in verbose mode:

```
show active-charging content-filtering category statistics verbose
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging content-filtering server-group

This command displays information for Content Filtering Server Group (CFSG) configured in the service.

Product

CF

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging content-filtering server-group [ name cfsg_name |
statistics [ name cfsg_name [ acsmgr instance instance [ priority priority ] ] |
verbose ] [ | { grep grep_options | more } ]
```

name *cfsg_name*

Specifies name of the CFSG.
cfsg_name must be the name of a CFSG, and must be an alpha and/or numeric string of 1 through 63 characters in length.

acsmgr instance*instance*

Specifies the manager instance.
instance must be an integer from 1 through 65535.

priority *priority*

Specifies priority of the server for which statistics has to be displayed.
priority must be an integer from 1 through 65535.

verbose

Specifies that the output display all available statistics of each ICAP server connection at each instance. If this option is not specified then the output is at the standard level, which is the concise mode.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view CFSG information/statistics.
show active-charging content-filtering server-group name *cfsg_name*: The output of this command displays detailed information for the specified CFSG.
show active-charging content-filtering server-group statistics name *cfsg_name*: The output of this command displays cumulative statistics for the specified CFSG. This will include all the instances and all the servers configured in the CFSG.

show active-charging content-filtering server-group statistics name *cfsg_name* **acsmgr instance** *instance*: The output of this command displays the cumulative statistics of all the ICAP server connections on the specified manager instance.
show active-charging content-filtering server-group statistics name *cfsg_name* **acsmgr instance** *instance* **priority** *priority*: The output of this command displays the statistics for the specified ICAP server connection on the specified manager instance.
show active-charging content-filtering server-group statistics verbose: The output of this command displays statistics of each ICAP server connection at each instance.

Example
The following command displays information for the CFSG named *test12*:

```
show active-charging content-filtering server-group name test12
```

The following command displays detailed information for all CFSGs:

```
show active-charging content-filtering server-group statistics verbose
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging credit-control

This command displays statistics for Diameter/RADIUS Prepaid Credit Control Service in the ACS service.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show active-charging credit-control { statistics [all | group *group_name* **] | session-states [rulebase** *rulebase_name* **] [content-id** *content_id* **] } [| { grep** *grep_options* **| more }]**

---

statistics [all | group *group_name* **]**

Displays prepaid credit control statistics.

- **all**: Displays all available statistics.
- **group** *group_name*: Displays statistics for the specified credit control group.

  group_name must be the name of a credit control group, and must be an alpha and/or numeric string of 1 through 63 characters in length.

---

session-states [rulebase *rulebase_name* **] [content-id** *content_id* **]**

Displays prepaid CCA session status based on rulebase and/or content ID.

- **rulebase** *rulebase_name*: Displays the CCA session state counts for the specified rulebase.

  rulebase_name must be the name of a rulebase configured for credit control service, and must be an alpha and/or numeric string of 1 through 63 characters in length.

- **content-id** *content_id*: Displays CCA session state counts for the specified content ID.

  content_id must be the content ID of a credit control service, and must be an integer from 1 through 65535.

---

grep *grep_options* **| more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view statistics for Diameter/RADIUS prepaid credit control service in the ACS service.

Example

The following command shows ACS statistics of configured Diameter or RADIUS Credit Control Application:

```
show active-charging credit-control statistics
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging edr-format

This command displays information about EDR formats configured in the ACS service.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging edr-format [ statistics ] [ all | name edr_format_name ] [
| { grep grep_options | more } ]
```

all

Displays information for all EDR formats.

statistics

Displays statistics for all or the specified EDR format.
If neither **all** nor **name** is specified, summarized statistics over all EDR formats is displayed.

name *edr_format_name*

Displays information for the specified EDR format.
edr_format_name must be the name of an existing EDR format, and must be an alpha and/or numeric string of 1 through 63 characters in length.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display information for EDR format(s) in the ACS service.

Example

The following command displays all configured EDR formats in the ACS service.

```
show active-charging edr-format all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging edr-udr-file

This command displays CDR flow control information. This command also displays the EDR and UDR file related information.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging edr-udr-file { flow-control-counters [ verbose ] |
statistics } [ | { grep grep_options | more } ]
```

flow-control-counters [verbose]

Displays the counters for dropped EDR/UDR records. These counters are for when CDRMOD uses flow control to stop ACS/Session Managers from sending the records.
verbose displays detailed information.

statistics

Displays EDR and UDR file statistics.

grep *grep_options* **| more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view CDR flow control information.

Example

The following command displays EDR and UDR files statistics:

```
show active-charging edr-udr-file statistics
```

The following command displays CDR flow control information:

```
show active-charging edr-udr-file flow-control-counters
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging file-space-usage

This command displays the file space used by CDR/EDR files.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show active-charging file-space-usage [| { grep *grep_options* **| more }]**

grep *grep_options* **| more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view CDR/EDR file space usage information. The context in which this command is used is not relevant.

show active-charging firewall statistics

This command displays Active Charging Stateful Firewall statistics.

Product

FW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show active-charging firewall statistics [callid *call_id* **| domain-name** *domain_name* **| nat-realm** *nat_realm* **| protocol { icmp | ip | other | tcp | udp } | username** *user_name* **] [acsmgr instance** *instance_id* **] [verbose] [| { grep** *grep_options* **| more }]**

---

acsmgr instance *instance_id*

Specifies the ACS/Session Manager instance ID.
instance_id must be an integer from 1 through 65535.

---

callid *call_id*

Specifies the call identification number.
call_id must be an eight-digit HEX number.

---

domain-name *domain_name*

Specifies the domain name.
domain_name must be a string of 1 through 127 characters in length.

---

nat-realm *nat_realm*

Specifies the NAT realm name.
nat_realm must be an alpha and/or numeric string of 1 through 31 characters in length.

---

protocol { icmp | ip | other | tcp | udp }

Specifies the protocol:

- **icmp**
- **ip**
- **other**: Protocols other than TCP, UDP, and ICMP
- **tcp**
- **udp**

---

username *user_name*

Specifies the user name.
user_name must be a string of 1 through 127 characters in length.

verbose

Specifies that the output displays all available information. If this option is not specified then the output is the standard level, which is the concise mode.

grep *grep_options* **| more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view Stateful Firewall statistics. If you are in the local context, statistics for all contexts are displayed. Otherwise, only statistics of your current context are displayed.

Example

The following command displays Stateful Firewall statistics:

```
show active-charging firewall statistics
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging firewall track-list

This command displays the list of servers being tracked for involvement in any Denial-of-Service (DOS) attacks.

Product

FW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging firewall track-list attacking-servers [ | { grep
grep_options | more } ]
```

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view details of servers being tracked for involvement in any DOS attack.

Example

The following command displays the list of servers being tracked for involvement in any DOS attacks:

```
show active-charging firewall track-list attacking-servers
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging flows

This command displays information for active charging flows.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging flows { all | [ connected-time [ < | > | greater-than |
less-than ] seconds ] [ flow-id flow_id ] [ full ] [ idle-time [ < | > |
greater-than | less-than ] seconds ] [ ip-address [ server | subscriber ] [ < |
> | IPv4 | greater-than | less-than ] address ] [ nat { not-required | required
[ nat-ip nat_ip_address ] } ] [ port-number [ server | subscriber ] [ < | > |
IPv4 | greater-than | less-than ] number ] [ rx-bytes [ < | > | greater-than |
less-than ] number ] [ rx-packets [ < | > | greater-than | less-than ] number ]
[ session-id session_id ] [ summary ] [ trans-proto { icmp | tcp | udp } ] [ tx-
bytes [ < | > | greater-than | less-than ] number ] [ tx-packets [ < | > |
greater-than | less-than ] number ] [ type flow_type ] } [ | { grep grep_options
| more } ] ]
```

all

Displays information for all active charging flows.

connected-time [< | > | greater-than | less-than] *seconds*

Displays information for flows filtered by connected time period.

- **<** *seconds*: Displays flows that have been connected less than the specified number of seconds.
- **>** *seconds*: Displays flows that have been connected more than the specified number of seconds.
- **greater-than** *seconds*: Displays flows that have been connected more than the specified number of seconds.
- **less-than** *seconds*: Displays flows that have been connected less than the specified number of seconds.

seconds must be an integer from 0 through 4294967295.

flow-id *flow_id*

Displays information for specified active charging flow ID.

full

Displays all available information for the specified flows.

idle-time [< | > | greater-than | less-than] *seconds*

Displays information for flows filtered by idle time period.

- **<** *seconds*: Displays flows that have been idle less than the specified number of seconds.
- **>** *seconds*: Displays flows that have been idle more than the specified number of seconds.

- **greater-than** *seconds*: Displays flows that have been idle more than the specified number of seconds.
- **less-than** *seconds*: Displays flows that have been idle less than the specified number of seconds.

seconds must be an integer from 0 through 4294967295.

---

ip-address [server | subscriber] [< | > | IPv4 | greater-than | less-than] *address*

Displays information for flows filtered by IPv4 IP address.

- **server**: Specifies the IP address for a specific server.
- **subscriber**: Specifies subscriber details for this **ip-address**. *address* is an IPv4 IP address in the **x.x.x.x** format.
- **<** *address*: Specifies an IPv4 IP address that is lesser than *address*.
- **>** *address*: Specifies an IPv4 IP address that is greater than *address*.
- **greater-than** *address*: Specifies an IPv4 IP address that is greater than *address*.
- **less-than** *address*: Specifies an IPv4 IP address that is lesser than *address*.

address must be an IPv4 address in decimal notation.

---

nat { not-required | required [nat-ip *nat_ip_address* **[nat-port** *nat_port* **]] }**

Important: The **nat** keyword and options are only available in StarOS 8.3 and later releases.

Displays information for flows filtered by Network Address Translation (NAT) required or not required setting.

- **not-required**: Sessions with NAT processing not required.
- **required**: Sessions with NAT processing required.
- **nat-ip** *nat_ip_address*: Sessions using specified NAT IP address. *nat_ip_address* must be an IPv4 address in dotted decimal format.
- **nat-port** *nat_port*: Sessions using specified NAT IP address and NAT port number. *nat_port* must be an integer from 0 through 65535.

---

port-number [server | subscriber] [< | > | IPv4 | greater-than | less-than] *number*

Displays information on flows filtered by port number.

- **server**: Specifies the port-number for a specific server.
- **subscriber**: Specifies subscriber details for this **port-number**. *number* must be an integer from 0 through 65535.
- **<** *number*: Specifies a port number that is less than the specified *port-number*.
- **>** *number*: Specifies a port number that is greater than the specified *port-number*.
- **greater-than** *number*: Specifies a port number that is greater than the specified *port-number*.
- **less-than** *number*: Specifies a port number that is less than the specified *port-number*.

rx-bytes [< | > | greater-than | less-than] *number*

Displays information on flows filtered by the number of bytes received in the flow.

- **<** *number*: Specifies the number of bytes that is less than the specified *rx-bytes*.
- **>** *number*: Specifies number of bytes that is greater than the specified *rx-bytes*.
- **greater-than** *number*: Specifies number of bytes that is greater than the specified *rx-bytes*.
- **less-than** *number*: Specifies number of bytes that is less than the specified *rx-bytes*.

number must be an integer from 0 through 18446744073709551615.

rx-packets [< | > | greater-than | less-than] *number*

Displays information on flows filtered by the number of packets received in the flow.

- **greater-than** *number*: Specifies the number of packets that is greater than the specified *rx-packets*.
- **less-than** *number*: Specifies the number of packets that is less than the specified *rx-packets*.

number must be an integer from 0 through 18446744073709551615.

session-id *session_id*

Displays detailed information for specific active charging session ID.

summary

Displays summary information for defined sessions, based on defined parameters.

trans-proto { icmp | tcp | udp }

Displays information on flows filtered by the transport protocol.

- **icmp**: ICMP protocol type flow
- **tcp**: TCP protocol type flow
- **udp**: User Datagram Protocol (UDP) flows

tx-bytes [< | > | greater-than | less-than] *number*

Displays information on flows filtered by the number of bytes received in the flow.

- **<** *number*: Specifies the number of bytes that is less than the specified *tx-bytes*.
- **>** *number*: Specifies number of bytes that is greater than the specified *tx-bytes*.
- **greater-than** *number*: Specifies number of bytes that is greater than the specified *tx-bytes*.
- **less-than** *number*: Specifies number of bytes that is less than the specified *tx-bytes*.

number must be an integer from 0 through 18446744073709551615.

tx-packets [< | > | greater-than | less-than] *number*

Displays information on flows filtered by the number of packets received in the flow.

- **greater-than** *number*: Specifies the number of packets that is greater than the specified *tx-packets*.
- **less-than** *number*: Specifies the number of packets that is less than the specified *tx-packets*.

number must be an integer from 0 through 18446744073709551615.

type *flow_type*

Displays information on flows filtered by flow type of application protocol.
flow_type must be one of the following:

- **dns**
- **ftp**
- **http**
- **icmp**
- **icmpv6**
- **imap**
- **ip**
- **ipv6**
- **mms**
- **p2p**: P2P protocol type flows including one or more of the following applications:
  - **applejuice**
  - **ares**
  - **bittorrent**
  - **ddlink**
  - **directconnect**
  - **edonkey**
  - **fasttrack**
  - **feidian**
  - **filetopia**
  - **fring**
  - **gadu_gadu**
  - **gnutella**
  - **gtalk**
  - **halflife2**
  - **hamachivpn**
  - **imesh**
  - **iskoot**
  - **irc**
  - **jabber**
  - **manolito**
  - **msn**
  - **mute**
  - **oovoo**
  - **orb**

- oscar
- pando
- popo
- pplive
- ppstream
- qq
- qqlive
- skinny
- skype
- slingbox
- sopcast
- soulseek
- steam

- xbox
- yahoo
- zattoo

- pop3
- rtcp
- rtp
- rtsp
- secure-http
- sip
- smtp
- tcp
- udp
- **unknown**: Unknown type of protocol type flow not listed here.
- wsp-connection-less
- wsp-connection-oriented

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display charging flow type information.

Example

The following command displays a detailed flow information for a session ID of *test*:

```
show active-charging flows session-id test
```

The following command displays a detailed flow information for a P2P type session:

```
show active-charging flows full type p2p
```

The following command displays a detailed information for a P2P type flow:

```
show active-charging flows type p2p
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging fw-and-nat policy

This command displays Firewall-and-NAT Policy information.

Important: This command is only available in StarOS 8.1, and in StarOS 9.0 and later. For more information on this command please contact your local service representative.

Product

ACS, FW, NAT

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging fw-and-nat policy { { { all | name fw_nat_policy_name } [
service name acs_service_name ] } | { statistics { all | name fw_nat_policy_name
} } } [ | { grep grep_options | more } ]
```

all

Displays information for all Firewall-and-NAT policies configured, optionally all in a specified service.

name *fw_nat_policy_name*

Displays detailed information for the specified Firewall-and-NAT policy.
fw_nat_policy_name must be the name of the Firewall-and-NAT policy, and must be an alpha and/or numeric string of 1 through 63 characters in length.

service name *acs_service_name*

Displays information for all or the specified Firewall-and-NAT policy in the specified ACS service.
acs_service_name must be the name of the ACS service, and must be an alpha and/or numeric string of 1 through 15 characters in length.

statistics

Displays statistics for the all/specified Firewall-and-NAT policy.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view Firewall-and-NAT Policy information.

Example

The following command displays detailed information for the Firewall-and-NAT policy named *standard*:

show active-charging fw-and-nat policy name *standard*

show active-charging group-of-prefixed-urls

This command displays information on group of prefixed URLs configured in an ACS service.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging group-of-prefixed-urls { all | name prefixed_url_group } [
service name acs_service_name ] [ | { grep grep_options | more } ]
```

all

Displays information for all group of prefixed URLs configured in an ACS service.

name *prefixed_url_group*

Displays detailed information for the specified group of prefixed URLs.
prefixed_url_group must be the name of a group of prefixed URLs, and must be an alpha and/or numeric string of 1 through 63 characters in length.

service name *acs_service_name*

Displays information for all or the specified group of prefixed URLs in the specified ACS service.
acs_service_name must be the name of the ACS service, and must be an alpha and/or numeric string of 1 through 15 characters in length.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter

Usage

Use this command to view information on group of prefixed URLs configured in the ACS service.

Example

The following command displays for the group of prefixed URLs named *test123*:

```
show active-charging group-of-prefixed-urls name test123
```

show active-charging group-of-ruledefs

This command displays information on group of ruledefs configured in an ACS service.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show active-charging group-of-ruledefs { { all | name *group_of_ruledefs* **} [service name** *acs_service_name* **] | statistics name** *group_of_ruledefs* **} [| { grep** *grep_options* **| more }]**

all

Displays information for all groups of ruledefs configured, optionally all in a specified ACS service.

name *group_of_ruledefs*

Displays detailed information for the specified group of ruledefs.
group_of_ruledefs must be the name of a group of ruledefs, and must be an alpha and/or numeric string of 1 through 63 characters in length.

service name *acs_service_name*

Displays information for all or the specified group of ruledefs within the specified ACS service.
acs_service_name must be the name of the ACS service, and must be an alpha and/or numeric string of 1 through 15 characters in length.

statistics name *group_of_ruledefs*

Displays statistics for the specified group of ruledefs.
group_of_ruledefs must be the name of a group of ruledefs, and must be an alpha and/or numeric string of 1 through 63 characters in length.

grep *grep_options* **| more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view information on group of ruledefs configured in a ACS service.

Example

The following command displays information on all groups of ruledefs configured:

```
show active-charging group-of-ruledefs all
```

show active-charging nat statistics

This command displays NAT realm statistics.

Product

NAT

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show active-charging nat statistics [nat-realm *nat_realm* **] [| { grep** *grep_options* **| more }]**

show active-charging nat statistics

This command when issued in the local context displays statistics for all NAT realms in all contexts. When issued in a specific context, this command displays statistics for all NAT realms in that context.

show active-charging nat statistics nat-realm *nat_realm*

This command when issued in the local context displays statistics for the specified NAT realm in all contexts. When issued in a specific context, this command displays statistics for the specified NAT realm in that context.

nat-realm *nat_realm*

nat_realm must be an alpha and/or numeric string of 1 through 31 characters in length.

grep *grep_options* **| more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view NAT realm statistics.

Example

The following command when issued in the local context, displays NAT realm statistics for NAT realms named *test135* in all contexts:

show active-charging nat statistics nat-realm *test135*

show active-charging p2p-dynamic-rules

This command displays P2P Dynamic signature file information.

Product

P2P

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show active-charging p2p-dynamic-rules [verbose] [acsmgr instance *instance_id* **] [| { grep** *grep_options* **| more }]**

acsmgr instance *instance_id*

Specifies the ACS/Session Manager instance ID.
instance_id must be an integer from 1 through 65535.

verbose

Displays P2P Dynamic rule statistics in detail.

grep *grep_options* **| more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view P2P Dynamic signature file statistics/information.

Example

The following command displays P2P Dynamic rule information:

show active-charging p2p-dynamic-rules

show active-charging packet-filter

This command displays information on packet filters configured in an ACS service.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging packet-filter { all | name packet_filter_name } [ service
name acs_service_name ] [ | { grep grep_options | more } ]
```

all

Displays information for all packet filters configured, optionally all configured in an ACS service.

name *packet_filter_name*

Displays detailed information for the specified packet filter.
packet_filter_name must be the name of a packet filter, and must be an alpha and/or numeric string of 1 through 63 characters in length.

service name *acs_service_name*

Displays information for all or the specified packet filter in the specified ACS service.
acs_service_name must be the name of the ACS service, and must be an alpha and/or numeric string of 1 through 15 characters in length.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view information on packet filters configured in an ACS service.

Example

The following command displays information for the packet filter *filter12*:

```
show active-charging packet-filter name filter12
```

show active-charging rulebase

This command shows information for rulebases.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging rulebase { { { all | name rulebase_name } [ service name
acs_service_name ] } | statistics [ name rulebase_name ] } | [ | { grep
grep_options | more } ]
```

all

Displays details of all rulebases configured in the system.

name *rulebase_name*

Displays details of the specified rulebase.
rulebase_name must be the name of a rulebase, and must be an alpha and/or numeric string of 1 through 63 characters in length.

service name *acs_service_name*

Displays details of all or the specified rulebase configured in the specified ACS service.
acs_service_name must be the name of the ACS service, and must be an alpha an/or numeric string of 1 through 15 characters in length.

statistics

Displays statistical information for all or the specified rulebase.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view various statistics for a specific charging rulebase.

Example

The following command displays active charging rulebase statistics.

```
show active-charging rulebase statistics
```

The following command displays configurations and statistics for a rulebase named *rulebase_1*.

show active-charging rulebase name *rulebase_1*

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging ruledef

This command displays information for rule definitions (ruledefs) configured in the ACS service.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging ruledef { all | charging | firewall | name ruledef_name |
post-processing | routing | statistics [ all { charging | firewall [ wide ] |
post-processing } | name ruledef_name [ wide ] ] } [ | { grep grep_options |
more } ]
```

all

Displays information for all ruledefs configured in the ACS service.

charging

Displays information for all Charging ruledefs configured in the ACS service.

firewall

Displays information for all Firewall ruledefs configured in the ACS service.

name *ruledef_name*

Displays detailed information for the specified ruledef.
ruledef_name must be the name of an existing ruledef, and must be an alpha and/or numeric string of 1 through 63 characters in length.

post-processing

Important: This keyword is only available in StarOS 8.3 and later.

Displays information for all post-processing ruledefs configured in the ACS service.

routing

Displays information for all Routing ruledefs configured in the ACS service.

service *service_name*

This keyword is obsolete.

statistics [all { charging | firewall [wide] | post-processing } | name *ruledef_name* **[wide]]**

Displays statistical information for all/specified ruledefs configured in the ACS service. If none of the optional arguments are supplied, statistics totaled for all ruledefs will be displayed.

- **all**: Displays statistics for all ruledefs of the specified type configured in the ACS service.
- **charging**: Displays statistics for all Charging ruledefs configured in the service.
- **firewall**: Displays statistics for all Firewall ruledefs configured in the service.
- **post-processing**: Displays statistics for all Post-processing ruledefs configured in the service.

> ***Important:*** The **post-processing** keyword is only available in StarOS 8.3 and later.

- **name** *ruledef_name*: Displays statistics for the specified ruledef.

  ruledef_name must be the name of a ruledef, and must be an alpha and/or numeric string of 1 through 63 characters in length.
- **wide**: Displays all available information in a single wide line.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view information for ruledefs configured in the ACS service.

Example

The following command displays ACS ruledef statistics.

```
show active-charging ruledef statistics
```

> ***Important:*** Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging service

This command displays ACS service details.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show active-charging service { all | name *acs_service_name* **} [| { grep** *grep_options* **| more }]**

all

Displays information for all configured ACS services.

name *acs_service_name*

Displays detailed information for the specified ACS service.
acs_service_name must be the name of an ACS service, and must be an alpha and/or numeric string of 1 through 15 characters in length.

grep *grep_options* **| more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view ACS service details.

Example

The following command displays details for the ACS service named *test1*.

show active-charging service name *test1*

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging sessions

This command displays statistics for ACS sessions.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show active-charging sessions [full [wide] | summary | display-dynamic-charging-rules | dynamic-charging] { [all] | [*filter_keyword*] + } [| { grep *grep_options* | more }]

full [wide]

Displays all available information for the specified session.
Optionally all available information can be displayed in a single wide line.

summary

Displays summary information for defined sessions based on defined parameters.

display-dynamic-charging-rules

Displays information for the dynamic-charging rules configured per session under Gx/Ty interface support.

dynamic-charging

Displays information for dynamic charging sessions.

filter_keyword

The following keywords are filters that modify or filter the output of the Command Keywords. Not all filters are available for all command keywords. Multiple filter keywords can be entered on a command line.
When multiple filter keywords are specified, the output conforms to all of the filter keywords specifications. For example, if you enter the following command:
show active-charging sessions full active-charging-service *acs_1*
Counters for active charging sessions active in ACS service *acs_1* with full details is displayed. Information for all other services is not displayed.

acsmgr instance *instance*

Displays session information for a specific ACS/Session Manager instance.

active-charging-service *acs_service_name*

Displays session information for the specified ACS service.
acs_service_name must be the name of an ACS service, and must be an alpha and/or numeric string of 1 through 15 characters in length.

all

Displays session information for all active charging sessions.

callid

Specifies the call identification number.

display-dynamic-charging-rules

Displays dynamic charging rules configured.

dynamic-charging

Displays session information for all dynamic charging sessions.

firewall { not-required | required }

Displays session information for sessions with Firewall Processing required or not required, as specified.

fw-and-nat policy *fw_nat_policy_name*

Displays information for the specified Firewall-and-NAT Policy.
fw_nat_policy_name specifies the Firewall-and-NAT policy name, and must be an alpha and/or numeric string of 1 through 63 characters in length.

imsi

Specifies the International Mobile Subscriber Identity (IMSI) of the subscriber session.

ip-address

Specifies the IP address for the specific charging service.

msid

Displays active charging session information for a specific subscriber's Mobile Station Identification (MSID) number.

nat { not-required | required [nat-realm *nat_realm* **] }**

Displays session information for sessions with NAT required or not required, as specified.
nat-realm *nat_realm* specifies a NAT realm name. *nat_realm* must be an alpha and/or numeric string of 1 through 63 characters in length.

rulebase

Displays information for a rulebase that is configured in an active charging session.

rx-data

Displays the bytes received in the session.

session-id

Displays detailed session information for a specific session identification.

tx-data

Displays the bytes sent in the session.

type

Displays session information for specified DNS application type(s).

- **dns**
- **ftp**
- **http**
- **icmp**
- **icmpv6**
- **imap**
- **ip**
- **ipv6**
- **mms**
- **p2p**: Displays session information for a P2P application type:
  - **applejuice**
  - **ares**
  - **bittorrent**
  - **ddlink**
  - **directconnect**
  - **edonkey**
  - **fasttrack**
  - **feidian**
  - **filetopia**
  - **fring**
  - **gadu_gadu**
  - **gnutella**
  - **gtalk**
  - **halflife2**
  - **hamachivpn**
  - **imesh**
  - **irc**
  - **iskoot**
  - **jabber**
  - **manolito**
  - **msn**
  - **mute**
  - **oovoo**

- orb
- oscar
- pando
- popo
- pplive
- ppstream
- qq
- qqlive
- skinny
- skype
- slingbox
- sopcast
- soulseek
- steam
- tvants
- tvuplayer
- uusee
- vpnx
- vtun
- winmx
- winny
- wofwarcraft
- xbox
- yahoo
- zattoo

- pop3
- rtcp
- rtp
- rtsp
- secure-http
- sip
- smtp
- tcp
- udp
- unknown
- wsp-connection-less
- wsp-connection-oriented

username

Displays session information for a specific user name.

dynamic-charging

Displays the all sessions having received at least one Gx message from Session Manager/IMS Authorization.

grep *grep_options* **| more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display the configuration information for an active charging session.

Example

The following command displays full information of an active charging session.

```
show active-charging sessions full all
```

The following command displays an active charging session summary.

```
show active-charging sessions summary
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging subsystem

This command shows service and configuration counters for the ACS service.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging subsystem { all | facility acsmgr { all | instance
instance_value } } [ rulebase name rulebase_name ] | [ | { grep grep_options |
more } ]
```

all

Displays ACS subsystem information.

facility acsmgr [all | instance *instance_value* **]**

Displays logged events for all ACS/Session Managers or for a specific instance.
instance_value must be an integer from 1 through 65535.

rulebase name *rulebase_name*

Displays rulebase statistics for the specified rulebase.
rulebase_name must be the name of a rulebase, and must be an alpha and/or numeric string of 1 through 63 characters in length.

grep *grep_options* **| more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view ACS/Session Manager information.

Example

The following command displays ACS subsystem information:

```
show active-charging subsystem all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging tcp-proxy statistics

This command displays ACS TCP Proxy statistics.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show active-charging tcp-proxy statistics [rulebase *rulebase_name* **] [verbose]**

rulebase *rulebase_name*

Displays TCP Proxy statistics for the specified rulebase.
rulebase_name must be the name of a rulebase, and must be an alpha and/or numeric string of 1 through 63 characters in length.

verbose

Displays detailed TCP proxy statistics.

grep *grep_options* **| more**

Specifies that the output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view TCP Proxy statistics.

Example

The following command displays detailed TCP proxy statistics for the rulebase named *test14*:

show active-charging tcp-proxy statistics rulebase *test14* **verbose**

show active-charging timedef

This command displays the details of timeslots configured in specified time definition(s).

Important: This command is only available in StarOS 8.1 and in StarOS 9.0 and later.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging timedef { all | name timedef_name } [ service name
acs_service_name ] [ | { grep grep_options | more } ]
```

all

Displays information for all timedefs configured in the service.

name *timedef_name*

Displays detailed information for the specified timedef.
timedef_name must be the name of a timedef, and must be an alpha and/or numeric string of 1 through 63 characters in length.

service name *acs_service_name*

Displays information for all or a specific timedef configured in the specified ACS service.
acs_service_name must be the name of the ACS service, and must be an alpha and/or numeric string of 1 through 15 characters in length.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view details of timeslots configured in specified timedef(s) that have been configured for the Time-of-Day Activation/Deactivation of Rules feature.

Example

The following command displays timeslot details of all timedefs configured in the ACS service:

```
show active-charging timedef all
```

show active-charging udr-format

This command displays information about UDR formats configured in an ACS service.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show active-charging udr-format { all | name *udr_fromat_name* **} [| { grep** *grep_options* **| more }]**

all

Displays information for all UDR formats.

name *udr_fromat_name*

Displays information for the specified UDR format.
udr_format_name must be the name of an existing UDR format, and must be an alpha and/or numeric string of 1 through 63 characters in length.

grep *grep_options* **| more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display information for UDR format(s) in an ACS service.

Example

The following command displays all configured UDR formats in an ACS service.

```
show active-charging udr-format all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging url-blacklisting statistics

This command displays URL Blacklisting statistics.

Product

CF

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show active-charging url-blacklisting statistics [rulebase { all | name *rulebase_name* **}] [verbose] [| { grep** *grep_options* **| more }]**

rulebase { all | name *rulebase_name* **}**

Displays URL Blacklisting statistics for all or a specific rulebase.

- **all**: Displays URL Blacklisting statistics for all configured rulebases.
- **name** *rulebase_name*: Displays URL Blacklisting statistics for the specified rulebase.

  rulebase_name must be the name of a rulebase, and must be an alpha and/or numeric string of 1 through 63 characters in length.

verbose

Displays detailed URL Blacklisting statistics.

grep *grep_options* **| more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view URL Blacklisting hits and misses statistics.

Example

The following command displays cumulative URL Blacklisting statistics:

```
show active-charging url-blacklisting statistics
```

The following command displays URL Blacklisting statistics for the rulebase *rulebase_1*:

```
show active-charging url-blacklisting statistics rulebase name rulebase_1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging xheader-format

This command displays x-header format configurations.

Important: This is a customer-specific command. Please contact your local sales representative for more information.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show active-charging xheader-format { all | name *xheader_format* **} [| { grep** *grep_options* **| more }]**

all

Displays information for all x-header formats configured.

name *xheader_format*

Displays information for the specified x-header format.
xheader_format must be the name of an x-header format, and must be an alpha and/or numeric string of 1 through 63 characters in length.

grep *grep_options* **| more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view details of x-header formats configured in an ACS service.

Example

The following command displays information for the x-header format named *test12*:

show active-charging xheader-format *test12*

show administrators

Displays information regarding all CLI users currently connected to the system.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show administrators [session id] [| { grep *grep_options* **| more }]**

session id

Indicates the output is to contain additional information about the CLI user session including the assigned session ID.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

This command displays a list of administrative users that have command line interface sessions active.

Example

show administratorsshow administrators session id

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show alarm

Displays alarm information.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show alarm { all | audible | central-office | facility | outstanding [all | chassis | port *slot/port* **| slot** *slot* **] [verbose] | statistics } [| { grep** *grep_options* **| more }]**

---

all

Displays the state of all alarms in one screen.

---

audible

Displays the state of the internal audible alarm buzzer on the SPC/SMC.

---

central-office

Displays the state of the CO Alarm relays on the SPIO.

---

facility

Displays the state of the facility (audible and CO) alarms.

---

outstanding [all | chassis | port *slot/port* **| slot** *slot* **] [verbose]**

Displays information on currently outstanding alarms.

- **all**: Displays all alarm information.
- **chassis**: Displays chassis/power/fan alarms.
- **port** *slot/port*: Shows the alarm information for the specified port.
- **slot** *slot*: Shows the alarm information for the card in the specified slot.
- **verbose**: Displays more verbose output, including the internal alarm ID

---

statistics

Displays basic statistics on the alarming subsystem, including the current number of outstanding alarms of different severities and a cumulative total of alarms generated.

---

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command Output* section of the *Command Line Interface Overview* chapter.

Usage

View alarms to verify system status or to periodically check the general health of the system.

Important: This command is not supported on all platforms.

Example

The following command displays all alarms that are currently outstanding:

```
show alarm outstanding all
```

The following command displays more detailed information on all alarms that are currently outstanding:

```
show alarm outstanding all verbose
```

The following command displays alarm statistics:

```
show alarm statistics
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show apn

Displays configuration information for either a specific or all configured APNs.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show apn { all | name *apn_name* **] [| { grep** *grep_options* **| more }]**

all

Displays information on all APNs configured on the system.

name *apn_name*

Displays information for a specific APN.
apn_name is the name of the APN and can be from 1 to 62 alpha and/or numeric characters and is case sensitive.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more** options, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

This command is used to verify the configuration of one or all APNs for monitoring or troubleshooting purposes. The output is a concise listing of APN parameter settings.
If this command is executed from within the local context with the all keyword, information for all APNs configured on the system will be displayed.

Example

The following command displays configuration information for all APNs:

```
show apn all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show apn counter ip-allocation

This command displays the IP allocation method information/statistics counters on per APN basis for all currently active calls.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show apn counter ip-allocation [all | name apn_name ] [ | { grep grep_options |
more } ]
```

all

Displays statistics for all APNs.

name *apn_name*

Displays statistics for a specific APN.
apn_name is the name of the preconfigured APN and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

{ grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

This command is used to display the IP allocation counters on per APN basis for all currently active calls. Output of this command gives the user clear idea of how many sessions in each APN are using a particular type of ip-allocation method.
If this command is issued from within the local context, the statistics displayed will be cumulative for all APNs configured on the system regardless of context. If no APN name is specified and the command is executed from a context with multiple APNs configured, the output will be cumulative for all APNs in the context.

Example

The following command displays statistics for all APN on a system:

```
show apn counter ip-allocation all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show apn statistics

Displays APN statistics for either a specific or all configured APNs.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show apn statistics [all | name *apn_name* **] [| { grep** *grep_options* **| more }]**

all

Displays statistics for all APNs.

name *apn_name*

Displays statistics for a specific APN.
apn_name is the name of the APN and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

This command is used to view statistics for one or all APNs within a context for monitoring or troubleshooting purposes.
If this command is issued from within the local context, the statistics displayed will be cumulative for all APNs configured on the system regardless of context. If no APN name is specified and the command is executed from a context with multiple APNs configured, the output will be cumulative for all APNs in the context.

Example

The following command displays statistics for an APN named *isp2*:

show apn statistics name *isp2*

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show asngw-service

This command displays information about selected Access Service Network Gateway (ASN GW) calls/services.

Product

ASN GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show asngw-service { all | name *service_name* **| session | statistics } [bs-status [address** *ip_address* **| filter { all | icmp-monitored | no-calls | summary | up]] [| { grep** *grep_options* **| more }]**

---

all

Displays information for all configured ASN GW services.

---

name *service_name*

Displays information only for the specified ASN GW service.
service_name must be the name of an existing ASN GW service in the current context. The service name must be an alpha and/or numeric string of 1 through 63 characters in length.

---

session

Displays information about configured ASNGW sessions. See the **show asngw-service session** command

---

statistics

Total of collected information for specific protocol since last restart or clear command.

---

bs-status { address *ip_address* **| filter { all | icmp-monitored | no-calls | summary | up } }**

Displays the ASN BS status based on IP address and various filters.
address *ip_address* specifies the IP address of ASN base station whose status is requested.
ip_address must be an IPv4 or IPv6 IP address of ASN BS.
filter { all | icmp-monitored | no-calls | summary | up }: Filters the requested BS's status on the basis of following criteria:

- **all**: Displays the status of all ASN BS.
- **icmp-monitored**: Displays the status of ASN BS which are monitored through ICMP ping messages.
- **no-calls**: Displays the status of ASN BS which has no active calls.
- **summary**: Displays the summary of status of requested ASN BSs.
- **up**: Displays the of status of ASN BSs which are in active state.

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view information for selected configured ASN GW services.

Example

The following command displays available information for all active ASN GW services.

```
show asngw-service all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show asngw-service session

This command displays statistics for specific Access Service Network Gateway sessions.

Product

ASN GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show asngw-service session [all | anchor-only [full] | callid *call_id* **| counters | full | ip-address** *ipv4_address* **| msid** *msid_number* **| non-anchor-only [full] | peer-address** *ipv4_address* **| summary | username** *user_name* **] [| { grep** *grep_options* **| more }]**

all

Displays all related information for all active ASN GW service sessions.

anchor-only

Displays all available information for all active ASN GW service sessions on an anchor ASN GW only.

callid *call_id*

Displays available information for the specific call identification number.
call_id must be an eight-digit HEX number.

full

Displays all available information for the associated display or filter keyword.

ip-address *ipv4_address*

IP address of the subscriber.
ipv4_address must be an IPv4 address, in dotted decimal notation.

msid *msid_number*

Displays available information for the specific mobile station identification number.
msid_number must be an MSID number.

non-anchor-only

Displays all available information for all active ASN GW service sessions on a non-anchor ASN GW only.

peer-address *ipv4_address*

Address of specific IP peer.
ipv4_address must be an IPv4 address, in dotted decimal notation.

summary

Displays summary of available information for associated display or filter keyword (previous keyword).

username *user_name*

Name of specific user within current context. Displays available information for the specific user name. *user_name* must be followed by an user name.
The user name can an alpha and/or numeric string of 1 through 127 characters in length.

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view configuration information for an ASN GW session.

Example

The following command displays all available ASN GW sessions.

```
show asngw-service session all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show asngw-service session counters

This command displays statistics for specific Access Service Network Gateway sessions.

Product

ASN GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show asngw-service session counters [[function-type { auth-relay | context-transfer | data-path | handoff | im-operation | ms-state-change | paging | qos }] | [anchor-only | callid *call_id* **| ip-address** *ipv4_address* **| msid** *msid_number* **| non-anchor-only | peer-address** *ipv4_address* **| username** *user_name* **] [r4-only | r6-only | verbose]] [| { grep** *grep_options* **| more }]**

anchor-only

Displays all available information for all active anchor sessions in an ASN GW service.

callid *call_id*

Displays available information for the specific call identification number.
call_id must be an eight-digit HEX number.

function-type { auth-relay | context-transfer | data-path | handoff | im-operation | ms-state-change | paging | qos }

Displays the counters for specific type of functions in an ASN GW session.
auth-relay: Displays information about authentication relay messages.
context-transfer: Displays information about context-transfer messages.
data-path: Displays information about data-path registration messages.
handoff: Displays information about hand-off messages.
im-operations: Displays information about idle mode state operation messages.
ms-state-change: Displays information about MS state change messages.
paging: Displays information about paging messages.
qos: Displays information about RR messages.

ip-address *ipv4_address*

IP address of the subscriber.
ipv4_address must be an IPv4 address, in dotted decimal notation.

msid *msid_number*

Displays available information for the specific mobile station identification number.
msid_number must be an MSID number.

non-anchor-only

Displays all available information for all active non-anchor sessions in an ASN GW service.

peer-address *ipv4_address*

Address of specific IP peer.
ipv4_address must be an IPv4 address, in dotted decimal notation.

r6-only

Displays all available counters for R6 interface in an ASN GW session.

r4-only

Displays all available counters for R4 interface in an ASN GW session.

username *user_name*

Displays available session information for the specific WiMAX user in ASN GW service session.
user_name must be followed by an user name.
The user name can an alpha and/or numeric string of 1 through 127 characters in length.

verbose

Indicates the output should provide as much information as possible. If this option is not specified then the output will be the standard level which is the concise mode.

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view the counters of an ASN GW session.

Example

The following command displays the counters for data path type function.

```
show asngw-service session counters function-type data-path
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show asngw-service statistics

Displays statistics for all ASN GW sessions.

Product

ASN GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show asngw-service statistics { [function-type { auth-relay | context-transfer | data-path | handoff | im-operations | ms-state-change | paging | qos} [r4-only | r6-only]] | name *service_name* **| r4-only | r6-only | verbose | peer-address** *ipv4_address* **[verbose] } [| { grep** *grep_options* **| more }]**

---

function-type

Displays information about selected function type on R4 or R6 interface.

---

function-type { auth-relay | context-transfer | data-path | handoff | im-operations | ms-state-change | paging | qos} [r4-only | r6-only]

Displays the counters for specific type of functions in an ASN GW session.
auth-relay: Displays information about authentication relay messages.
context-transfer: Displays information about context-transfer messages.
data-path: Displays information about data-path registration messages.
handoff: Displays information about hand-off messages.
im-operations: Displays information about idle mode state operation messages.
ms-state-change: Displays information about MS state change messages.
paging: Displays information about paging messages.
qos: Displays information about RR messages.
r4-only: Displays information about selected function on R4 interface.
r6-only: Displays information about selected function on R6 interface.

---

name *service_name*

Displays specific service.
service_name must be a service name.
The service name can be one to 63 alpha and/or numeric characters long.

---

r4-only

Displays statistics of R4 interface in ASN GW services.

---

r6-only

Displays statistics of R6 interface in ASN GW services.

---

peer-address *ipv4_address*

Address of specific IP Peer.
ipv4_address must be an IPv4 address, in dotted decimal notation.

verbose

Indicates the output should provide as much information as possible. If this option is not specified then the output will be the standard level which is the concise mode.

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display ASN GW statistics.

Example

The following command displays information about selected MS-State-Change function.

```
show asngw-service statistics function-type ms-state-change
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show asnpc-service

This command displays information about selected Access Service Network Paging Controller and Location Registry (ASN PC/LR) services.

Product

ASN GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show asnpc-service { all | id | name *service_name* **| session | statistics } [| { grep** *grep_options* **| more }]**

all

Displays information for all configured ASN PC services.

paging-group

Displays all the configured paging-groups and associated paging nodes, and the offset count. For a specific paging group, enter the paging group id number.

name *service_name*

Displays information only for the specified ASN PC service.
service_name must be the name of an existing ASN PC service in the current context. The service name must be an alpha and/or numeric string of 1 through 63 characters in length.

session

Displays information about configured ASN PC sessions.

statistics

Total of collected information for specific protocol since last restart or clear command.

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view information for selected configured ASN PC services.

Example

The following command displays available information for all active ASN PC services.

```
show asnpc-service all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show asnpc-service session

This command displays statistics for specific ASN PC service sessions.

Product

ASN GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show asnpc-service session [all | callid *call_id* **| counters | full | msid** *msid_number* **| peer-address** *ipv4_address* **| summary] [| { grep** *grep_options* **| more }]**

all

Displays all related information for all active ASN PC service sessions.

callid *call_id*

Displays available information for the specific call identification number.
call_id must be an eight-digit HEX number.

full

Displays all available information for the associated display or filter keyword.

msid *msid_number*

Displays available information for the specific mobile station identification number.
msid_number must be an MSID number.

peer-address *ipv4_address*

Address of specific peer.
ipv4_address must be an IPv4 address, in dotted decimal notation.

summary

Displays summary of available information for associated display or filter keyword (previous keyword).

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view configuration information for an ASN PC session.

Example

The following command displays all available ASN PC session counters in verbose mode.

```
show asnpc-service session all
```

The following command displays full ASN PC session counters in verbose mode.

```
show asnpc-service session full
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show asnpc-service session counters

This command displays session counters for ASN PC service sessions.

Product

ASN GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show asngw-service session counters [all | callid *call_id* **| msid** *msid_number* **| peer-address** *ipv4_address* **| verbose]] [| { grep** *grep_options* **| more }]**

all

Displays all available counters for all ASN PC service sessions.

callid *call_id*

Displays available information for the specific call identification number.
call_id must be an eight-digit HEX number.

msid *msid_number*

Displays available information for the specific mobile station identification number.
msid_number must be an MSID number.

peer-address *ipv4_address*

Address of specific IP peer.
ipv4_address must be an IPv4 address, in dotted decimal notation.

verbose

Indicates the output should provide as much information as possible. If this option is not specified then the output will be the standard level which is the concise mode.

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view the counters of an ASN PC session.

Example

The following command displays the counters for ASN PC service sessions in verbose mode.

```
show asnpc-service session counters verbose
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show asnpc-service session counters verbose

This command displays session counters for ASN PC service sessions in complete detail.

Product

ASN GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show asngw-service session counters verbose [function-type { context-transfer | im-operations | ms-state-change | paging }] [all | callid *call_id* **| msid** *msid_number* **| peer-address** *ipv4_address* **]] [| { grep** *grep_options* **| more }]**

all

Displays all available counters for all ASN PC service sessions in verbose mode.

callid *call_id*

Displays available information for the specific call identification number in verbose mode.
call_id must be an eight-digit HEX number.

function-type { context-transfer | im-operations | ms-state-change | paging }

Displays the counters for specific type of functions in an ASN GW session.
context-transfer: Displays information about context-transfer messages.
im-operations: Displays information about idle mode state operation messages.
ms-state-change: Displays information about MS state change messages.
paging: Displays information about paging messages.

msid *msid_number*

Displays available information for the specific mobile station identification number in verbose mode.
msid_number must be an MSID number.

peer-address *ipv4_address*

Address of specific IP peer.
ipv4_address must be an IPv4 address, in dotted decimal notation.

r4-only

Displays statistics of R4 interface in ASN PC services in verbose mode.

r6-only

Displays statistics of R6 interface in ASN PC services in verbose mode.

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view the counters of an ASN PC session in verbose mode.

Example

The following command displays the counters for data path type function.

```
show asnpc-service session counters verbose
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show asnpc-service statistics

Displays statistics for all ASN PC service sessions.

Product

ASN GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show asngw-service statistics [name *service_name* **| peer-address** *ipv4_address* **| verbose] [| { grep** *grep_options* **| more }]**

name *service_name*

Displays specific service.
service_name must be a service name.
The service name can be one to 63 alpha and/or numeric characters long.

peer-address *ipv4_address*

Address of specific IP Peer.
ipv4_address must be an IPv4 address, in dotted decimal notation.

verbose

Indicates the output should provide as much information as possible. If this option is not specified then the output will be the standard level which is the concise mode.

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display ASN PC statistics.

Example

The following command displays information about ASN PC service in verbose mode.

```
show asnpc-service statistics verbose
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show asnpc-service statistics verbose

Displays statistics for all ASN PC service in verbose mode.

Product

ASN GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show asnpc-service statistics verbose [function-type { context-transfer | im-operations | ms-state-change | paging }] | all | r4-only | r6-only] [| { grep *grep_options* **| more }]**

function-type { context-transfer | ms-state-change | paging }

Displays the statistics for specific type of functions in an ASN PC service in verbose mode.
context-transfer: Displays information about context-transfer messages.
im-operations: Displays information about idle mode state operation messages.
ms-state-change: Displays information about MS state change messages.
paging: Displays information about paging messages.

all

Displays statistics of all ASN PC services in verbose mode.

r4-only

Displays statistics of R4 interface in ASN PC services.

r6-only

Displays statistics of R6 interface in ASN PC services.

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display ASN PC service statistics in verbose mode.

Example

The following command displays information about selected MS-State-Change function.

```
show asnpc-service statistics verbose function-type ms-state-change
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show banner

Displays the configured banner message for the current context.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show banner { all | charging-service | motd | lawful-intercept | pre-login } [| { grep *grep_options* **| more }]**

all

Displays all banners configured for a service in a system including enhanced charging service.

charging-service

Displays banner message configured for a enhanced charging service in current context.

motd

Display the banner message that is configured for the current context.

lawful-intercept

Display the banner message that is configured for users that have Lawful Intercept privileges.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Show the configured banner to verify the message of the day contents for possible change

Example

show banner

show bcmcs counters

Displays BCMCS-specific counters and statistics.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show bcmcs counters { all | callid *call_id* **| flow-id** *flow_id* **}**

all

Displays BCMCS-specific counters and statistics for all multicast sessions.

callid *call_id*

Displays BCMCS-specific counters and statistics for a specific call ID.

flow_id *flow_id*

Displays BCMCS-specific counters and statistics for a specific BCMCS flow, defined by a flow ID.

Usage

Use this command to view BCMCS-specific statistics. You may narrow the results of the command output by specifying a specific call ID or flow ID.

Example

show bcmcs counters all

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show bcmcs statistics

Displays BCMCS-specific statistics for the current PDSN-service.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show bcmcs statistics [pdsn-service *service_name* **]**

pdsn-service *service_name*

Defines a specific PDSN service from which to gather BCMCS-specific statistics.

Usage

Shows several sets of BCMCS-specific statistics, and may be configured to show statistics only for a certain PDSN service.

Example

show bcmcs statistics pdsn-service *service_name*

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show boot

Displays information on the current boot image in use.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show boot [initial-config | { grep *grep_options* **| more }]**

initial-config

Identifies the OS image, configuration file, and boot priority used during the initial start up of the system.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Show the boot information in preparing for maintenance activities by verifying current boot data. The boot image in use may not be the same as the boot image stored on the SPC/SMC due to upgrades and pending reboots. **show boot initial-config** displays the actual boot image and configuration file loaded during boot. This may or may not be the highest priority image and makes this command useful when comparing the loaded image to the priority list.

Important: This command is not supported on all platforms.

Example

The following command displays the boot system configuration priority list:

```
show boot
```

The following command displays the initial configuration after a system boot:

```
show boot initial-config
```

show bssap+ statistics

Displays statistics for base station system application part plus in a Gs service sessions.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show bssap+ statistics [ gs-service gs_svc_name ] [ vlr { name vlr_ name | isdn-
number E164_ISDN_Num } ] [ verbose ] [ | { grep grep_options | more } ]
```

gs-service *gs_svc_name*

Specifies the name of a specific Gs service to filter the BSSAP+ information.
gs_svc_name is the name of a configured Gs service for which BSSAP+ is applied and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

vlr { name *vlr_name* **| isdn-number** *E164_ISDN_Num* **}**

Specifies the name of the VLR or SS7 address in E.164 ISDN format to filter the BSSAP+ information.
name vlr_*name* is name of the VLR must be an alpha and/or numeric string of 1 to 63 characters.
E164_VLR_num is an ISDN number for VLR per E.164 number plan and must be an numerical string of 1 to 15 digits.

verbose

Indicates the output should provide as much information as possible. If this option is not specified then the output will be the standard level which is the concise mode.

| {grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display the statistics of BSSAP+ application on a system.

Example

The following command displays information about BSSAP+ in a Gs service named *gssvc1*.

```
show bssap+ statistics gs-service gssvc1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show bulkstats

Displays the information on bulk statistics.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show bulkstats [[data] | [schemas] | [variables [apn | asngw | asnpc | bcmcs | card | closedrp | common | context | cscf | dcca | dpca | ecs | egtpc | fa | gprs | gtpc | gtpp | ha imsa | ippool | ipsg | lac | lma | mag | mipv6ha | mme | nat-realm | pdg | pdif | pgw | phsgw | phspc | port | ppp | radius | rp | sccp | sgsn | sgtp | sgw | ss7link | ss7rd | system | vpn] [obsolete]] [| { grep *grep_options* | more }]]

data

Displays collected bulk statistical data.

schema

Displays the configuration of the statistics to be collected on a per-schema basis.

show bulkstats [[data] | [schemas] | [variables [apn | asngw | asnpc | bcmcs | card | closedrp | common | context | cscf | dcca | dpca | ecs | egtpc | fa | gprs | gtpc | gtpp | ha imsa | ippool | ipsg | lac | lma | mag | mipv6ha | mme | nat-realm | pdg | pdif | pgw | phsgw | phspc | port | ppp | radius | rp | sccp | sgsn | sgtp | sgw | ss7link | ss7rd | system | vpn] [obsolete]] [| { grep *grep_options* | more }]]

Displays all valid bulkstat schema statistics, or only the statistics for the specified schema.
If the **obsolete** keyword is used, obsolete (but still available) schema variables are displayed. An asterisk (*) is displayed next to schema variables that have been obsoleted.
For information on available schemas, refer to the *Bulk Statistics Configuration Mode Commands* chapter.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For information on usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

This command is used to display information on bulk statistics supported by the system.
The **variable** keyword can be used to list statistics supported by the system either for all schemas, or for an individual schema.
The **schema** keyword can be used to display the configuration of bulkstatistic settings including the schema.
The **data** keyword can be used to display bulkstatistic data collected up to that point.

Example

The following command displays the bulk statistics data:

```
show bulkstats data
```

The following command displays the bulk statistics schema configuration:

```
show bulkstats data schemas
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show card

Displays card information based upon the filtering options specified.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show card { diag [*card_num* **] | hardware [** *card_num* **] | info [** *card_num* **] | mappings | table [all] } [| { grep** *grep_options* **| more }]**

diag [*card_num* **] | hardware [** *card_num* **] | info [** *card_num* **] | mappings | table [all]**

Specifies what card information is to be displayed.
diag [*card_num* **]**: indicates diagnostic information is to be displayed for all cards or the card specified by *card_num*. *card_num* must be a value in the range 1 through 48.
hardware [*card_num* **]**: indicates information on the installed hardware is to be displayed for all cards or the card specified by *card_num*. *card_num* must be a value in the range 1 through 48.
info [*card_num* **]**: indicates detailed information is to be displayed for all cards or the card specified by *card_num*. *card_num* must be a value in the range 1 to 48.
mappings: indicates the front installed to rear installed card mapping is to be displayed.
table [all]: indicates information for each card in front and RCC slots is to be displayed. The **all** keyword indicates all 48 slots are to be displayed.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

View the card information to verify card installations for front and rear as well as for checking basic or detailed card information.

Example

The following command displays the diagnostic information for a card in slot *8*:

```
show card diag 8
```

The following command displays the detailed information for a card in slot *8*:

```
show card info 8
```

The following command displays the card mappings for the chassis:

```
show card mappings
```

The following command displays the card table:

```
show card mappings
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show cli

Displays current CLI users and associated session information.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show cli { session | history } [| { grep *grep_options* **| more }]**

session

Displays information about the current CLI session.

history

Displays CLI command history for this CLI session.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Show current command line interface sessions when there is some unexpected output from a chassis and a check of current CLI users may reveal other activities in progress.

Example

show cli

show clock

Displays the current system data and time.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show clock [universal] [| { grep *grep_options* **| more }]**

universal

Displays the date and time in universal coordinated time (UTC).

grep *grep_options* **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command Output* section of the *Command Line Interface Overview* chapter.

Usage

Check the current time of a chassis to compare with network wide time or for logging purposes if network accounting and/or event records appear to have inconsistent timestamps.

Important: This command is not supported on all platforms.

Example

The following displays the system time in local time and UTC, respectively.

```
show clock

show clock universal
```

show configuration

Displays current configuration information for the card, context, port, or target configuration file as specified.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

show configuration [card *card_num* **| context** *name* **[radius group [all | name** *group* **]] | port** *slot/port* **| srp] [showsecrets] [url** *url* **] [verbose] [| { grep** *grep_options* **| more }]**

---

card *card_num* **| context** *name* **[radius group [all | name** *group* **]] | port** *slot/port*

Specifies the type of configuration information to be displayed.
card *card_num*: specifies a specific card for which configuration information is to be displayed. *card_num* must be a value in the range 1 through 48.
context *name*: specifies a specific context for which configuration information is to be displayed.
radius group [all | name *group*: specifies a specific or all RADIUS server group/s configured in a specific context for which configuration information is to be displayed.
port *slot/port*: specifies a specific port for which configuration information is to be displayed.

---

srp

Shows the Service Redundancy Protocol configuration.

---

showsecrets

Show encrypted/unencrytpted secret keys saved in the configuration. If this keyword is not specified, secret keys are not displayed.

---

url *url*

Default: configuration which is currently in use.
This keyword is not available to users with Operator level permissions. Specifies the location of the configuration data to use for information display. The *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:
Specifies the source of the copy. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

- ST16:
  - **[file:]{ /flash | /pcmcia1 | /pcmcia2 }[/** *directory* **]/***file_name*
  - **tftp://{** *host***[** *:port#* **] }[** */directory* **]/***file_name*
  - **[http: | ftp: | sftp:]//[** *username***[** *:password* **]@] {** *host* **}[** *:port#* **][** */directory* **]/***file_name*
- ASR 5000:

- **[file:]{ /flash | /pcmcia1 | /hd }[/***directory* **]/***file_name*
- **tftp://{** *host***[** *:port#* **] }[/***directory* **]/***file_name*
- **[http: | ftp: | sftp:]//[** *username***[** *:password* **]@] {** *host* **}[** *:port#* **][/***directory* **]/***file_name*

directory is the directory name.
filename is the actual file of interest.

Important: Configuration files should be named with a .cfg extension.

username is the user to be authenticated.
password is the password to use for authentication.
host is the IP address or host name of the server.
port# is the logical port number that the communication protocol is to use.

verbose

Indicates the output should provide as much information as possible. If this option is not specified then the output will be the standard level which is the concise mode.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

View the current configuration to review recent changes.

Important: This command is not supported on all platforms.

Example

The following command displays the local in use port configuration information for port *24/1* in verbose mode.

```
show configuration port 24/1 verbose
```

The following command displays the card configuration for card 17 on host *remoteABC* stored in the configuration file in */pub/config.cfg*.

```
show configuration card 17
```

The following command displays the configuration of all RADIUS server groups configured in context *local*

```
show configuration context local radius group all
```

The following command shows the configuration for a context named PDIF.

```
show configuration context pdif
```

show configuration errors

Displays current configuration errors and warning information for the target configuration file as specified for a service.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

show configuration errors [section { aaa-config | active-charging | apn | asngw-service | asnpc-service | closed-rp-service | cscf-service | diameter | fa-service | ggsn-service | gprs-service | gs-service | ha-service | hsgw-service | imssh-service | imsue-service | ipms | ipsg-service | iups-service | lac-service | lns-service | map-service | mme-service | pdif-service | pdsn-service | phsgw-service | policy-grp-config | sccp-network | sgsn-op-policy | sgsn-service | sgtp-service | subscriber-config }] [verbose] [| { grep *grep_options* | more }]

section { aaa-config | active-charging | apn | asngw-service | asnpc-service | closed-rp-service | cscf-service | diameter | fa-service | ggsn-service | gprs-service | ha-service | hsgw-service | imssh-service | imsue-service | ipms | ipsg-service | iups-service | lac-service | lns-service | map-service | mme-service | pdif-service | pdsn-service | phsgw-service | policy-grp-config | sccp-network | sgsn-op-policy | sgsn-service | sgtp-service | subscriber-config }

Specifies the services and section to display and validate configuration.
aaa-config: Displays configuration errors/warnings for the AAA service(s) configured on the system.
active-charging: Displays configuration errors/warnings for the Enhanced Charging Service(s) and the Personal Stateful Firewall service(s) configured on the system.
apn: Displays configuration errors/warnings for the APN configuration(s) on the system.
asngw-service: Displays configuration errors/warnings for the Access Service Network Gateway (ASN-GW) Service configured in a specific context for which configuration errors/warnings is to be displayed.
asnpc-service: Displays configuration errors/warnings for the ASN Paging Controller and Location Registry (ASN PC-LR) Service(s) configured on the system.
closed-rp-service: Displays configuration errors/warnings for the closed RP service(s) configured on the system.
cscf-service: Displays configuration errors/warnings for the Call Session Control Function (CSCF) service(s) configured on the system.
diameter: Displays configuration errors/warnings for the Diameter configuration(s) on the system.
fa-service: Displays configuration errors/warnings for the Foreign Agent (FA) service(s) configured on the system.
ggsn-service: Displays configuration errors/warnings for the GGSN service(s) configured on the system.
gprs-service: Displays configuration errors/warnings for the GPRS service(s) configured on the system.
gs-service: Displays configuration errors/warnings for the GS service(s) configured on the system.
ha-service: Displays configuration errors/warnings for the Home Agent (HA) service(s) configured on the system.
hsgw-service: Displays configuration errors/warnings for the HSGW service(s) configured on the system.

imssh-service: Displays configuration errors/warnings for the IMS Sh (IMSSh) service(s) configured on the system.
imsue-service: Displays configuration errors/warnings for the IMS UE service(s) configured on the system.
ipms: Displays configuration errors/warnings for the IPMS service(s) configured on the system.
ipsg-service: Displays configuration errors/warnings for the IP Security Gateway (IPSG) service(s) configured on the system.
iups-service: Displays configuration errors/warnings for the IuPS service(s) configured on the system.
lac-service: Displays configuration errors/warnings for the Layer 2 Tunneling Protocol (L2TP) Access Concentrator (LAC) service(s) configured on the system.
lns-service: Displays configuration errors/warnings for the L2TP Network Server (LNS) service(s) configured on the system.
map-service: Displays configuration errors/warnings for the MAP service(s) configured on the system.
mme-service: Specifies the configuration errors for MME service configured in a specific context for which configuration errors/warnings is to be displayed.
pdif-service: Displays configuration errors/warnings for the PDIF service(s) configured on the system.
pdsn-service: Displays configuration errors/warnings for the PDSN service(s) configured on the system.
phsgw-service: Displays configuration errors/warnings for the PHS Gateway service(s) configured on the system.
policy-grp-config: Displays configuration errors/warnings for the Policy Group configuration(s) on the system.
sccp-network: Displays configuration errors/warnings for the SCCP network configuration(s) on the system.
sgsn-op-policy: Displays configuration errors/warnings for the SGSN operator policy configuration(s) on the system.
sgsn-service: Displays configuration errors/warnings for the SGSN service(s) configured on the system.
sgtp-service: Displays configuration errors/warnings for the SGTP service(s) configured on the system.
subscriber-config: Displays configuration errors/warnings for the subscriber configuration(s) on the system.

verbose

Indicates the output should provide as much information as possible. If this option is not specified then the output will be the standard level which is the concise mode.

grep *grep_options* **|** **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For more information on the usage of **grep** and **more**, refer *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view the current configuration errors and warning to review recent changes.

Example

The following command displays configuration errors and warnings for all services configured in a context/system:

```
show configuration errors verbose | more
```

The following command displays configuration errors and warnings for Enhanced Charging service and Personal Stateful Firewall service configured in a context:

```
show configuration errors section active-charging verbose
```

show congestion-control

Displays information pertaining to congestion control functionality on the system

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show congestion-control { configuration | statistics { a11mgr | asngwmgr |
asnpcmgr | egtpinmgr | gtpcmgr | hamgr | l2tpmgr } [ all | instance
task_instance ] } [ | { grep grep_options | more } ]
```

configuration

Displays congestion control configuration information including threshold parameters and policy settings for the configured services.

statistics

Displays congestion control statistics for one of the following services:
a11mgr: Specifies that statistics are displayed for PDSN services.
asngwmgr: Specifies that statistics are displayed for ASN GW services.
asnpcmgr: Specifies that statistics are displayed for ASN PC-LR services.
egtpinmgr: Specifies that statistics are displayed for EGTP ingress demuxmgr.
gtpcmgr: Specifies that statistics are displayed for GGSN services.
hamgr: Specifies that statistics are displayed for HA services.
l2tpmgr: Specifies that statistics are displayed for L2TP managers.
all: Select this keyword to display statistics based on the current state of all instances of the specified task.
instance *task_instance*: Specifies that statistics are to be displayed for a specific software task instance. *task_instance* can be configured to any integer value from 1 to 128.

Important: The inst column of the **show task table** command output can be used to determine the instance of a particular task.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

This command displays congestion control configuration information or statistics for a particular service type. When the all keyword is used, the system compares the current state of all instances of the specified task. The state is based on whether or not any congestion control thresholds have been exceeded. If one or more

instances are experiencing congestion, the state is displayed as “Applied”, and the various thresholds that have been crossed are indicated.

Example

The following command displays congestion control statistics for a PDSN service using an **a11mgr** task with an instance of *2*:

```
show congestion-control statistics a11mgr instance 2
```

The following command displays congestion control statistics for an ASN GW service using an **asngwmgr** task with an instance of *2*:

```
show congestion-control statistics asngwmgr instance 2
```

The following command displays congestion control statistics for an ASN PC-LR service using an **asnpcmgr** task with an instance of *2*:

```
show congestion-control statistics asnpcmgr instance 2
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show content-filtering category database

This command displays details of the specified category based content filtering database for content filtering application configured in a system/service.

Product

CF

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show content-filtering category database [active | all | facility srdbmgr { all | instance *instance_value* **} | url** *url_string* **] [verbose] [| { grep** *grep_options* **| more }]**

active

Displays the information about all active databases, for example databases in memory.
This is the default setting for category database information.

all

Displays the information about all active databases, for example, databases in memory and all saved databases on a system.

facility

Displays logged events for a specific facility.

srdbmgr { all | instance *instance_value* **}**

Displays logged events for all static rating database managers or for all or for a specific instance.

- **all**: Displays the logged events for all SRDB Manager instances.
- **instance** *instance_value*: Displays events logged for a specific SRDB Manager instance. *instance_value* must be an integer from 1 through 8.

url *url_string*

Displays the information of the specific database located at the given URL.
url_string specifies the name/location of category database to retrieve information, and must be an alpha and/or numeric string of 1 through 512 characters in length.

verbose

This option enables the detailed mode for additional information display for specific database.

grep *grep_options* **| more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display information of database for category based content filtering application in a service.

Example

The following command displays a detailed information for all active databases in memory.

```
show content-filtering category database active all
```

The following command displays the CF database status of all running SRDB manager.

```
show content-filtering category database facility srdbmgr all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show content-filtering category policy-id

This command displays Content Filtering category policy definitions.

Important: In StarOS 8.1 and later releases this command is replaced by the show active-charging content-filtering category policy-id command.

Product

CF

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show content-filtering category policy-id { all | id *cf_policy_id* **} [| { grep** *grep_options* **| more }]**

all

Displays definitions of all Content Filtering category policies.

id *cf_policy_id*

Displays definitions of a specific Content Filtering category policy.
cf_policy_id must be a preconfigured category policy ID, and must be an integer from 1 through 4294967295.

grep *grep_options* **| more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view Content-Filtering Category definitions for a specific/all Policy IDs.

Example

The following command displays Content Filtering category definitions for policy ID 3:

show content-filtering category policy-id id *3*

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show content-filtering category statistics

This command displays statistics for the Category-based Content Filtering application configured in a system/service.

Product

CF

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show content-filtering category statistics [ facility srdbmgr { all | instance
instance_value } ] [ | { grep grep_options | more } ]
```

facility

Displays logged events for a specific facility.

srdbmgr { all | instance *instance_value* }

Displays logged events for all Static Rating Database (SRDB) Manager instances or for the specified instance.

- **all**: Displays events logged for all SRDB Manager instances.
- **instance** *instance_value*: Displays events logged for a specific SRDB Manager instance.

  instance_value must be an integer from 1 through 8.

grep *grep_options* **| more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view the statistics of Category Based Content Filtering application in a service. This command's output also indicates capability of the system to perform Content Filtering and Dynamic Content Filtering if configured.

Important: Content filtering cannot be performed if less than two PACs/PSCs are activated. Dynamic Content Filtering cannot be performed if less than three PACs/PSCs are activated.

Example

The following command displays the detailed statistics of configured category based content filtering application:

```
show content-filtering category statistics
```

The following command displays the detailed statistics of configured category based content filtering application based on running SRDB Manager *instance1*.

show content-filtering category statistics facility srdbmgr instance *instance1*

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show content-filtering category url

This command displays the information about the categories of the database at the specific URL configured for category based content filtering application in a system/service.

Product

CF

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show content-filtering category url url_string [ policy-id cf_policy_id |
rulebase rulebase_name ] [ verbose ] [ | { grep grep_options | more } ]
```

url *url_string*

Displays the category information of the specific URL.
url_string specifies the URL, and must be an alpha and/or numeric string of 1 through 512 characters in length.

policy-id *cf_policy_id*

Displays the category information of specific URL configured with specified content filtering category policy ID.
cf_policy_id must be a category policy ID configured in the ACS Configuration Mode, and must be an integer from 0 through 65535.

rulebase *rulebase_name*

This option displays the category information of specific URL configured in ACS Configuration Mode for Category-based content filtering in specific rulebase.
rulebase_name must be the name of an existing rulebase, and must be an alpha and/or numeric string of 1 through 15 characters in length.

verbose

This option enables the detailed mode for additional information display for specific database.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display information of a database URL for category based content filtering application in a service.

Example

The following command displays a detailed information for all active databases in memory.

```
show content-filtering category url verbose /cf_server/cf/optcmd.bin
verbose
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show content-filtering server-group

This command displays information for content Filtering Server Group (CFSG) configured in the service.

Product

CF

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show content-filtering server-group [name *cfsg_name* **| statistics] | [| { grep** *grep_options* **| more }]**

name *cfsg_name*

Displays information for the specified CFSG.
cfsg_name must be the name of a CFSG, and must be an alpha and/or numeric string of 1 through 63 characters in length.

statistics

Displays statistical information for all configured CFSGs.

grep *grep_options* **| more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display information for Content Filtering Server Group configured in a service.

Example

The following command displays a detailed information for all charging actions:

```
show content-filtering server-group statistics
```

The following command displays a details of a specific charging action:

```
show content-filtering server-group name test123
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show context

Displays information on currently configured contexts.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show context [all | name *context_name* **] [| { grep** *grep_options* **| more }]**

all | name *context_name*

all: Display information for all currently configured contexts.
name *context_name*: Display information for the context specified as *context_name* only.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

View configured contexts when the context of interest needs to be looked up. This may be useful in verifying configuration or in troubleshooting the system.

Example

The following command displays information for the configured context named *sampleContext*:

```
show context name sampleContext
```

The following command displays information for all contexts:

```
show context all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show cpu

Displays information on system CPUs.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show cpu { info [card *card_num* **[cpu** *cpu_num* **]] [graphs] [verbose] | table } [| { grep** *grep_options* **| more }]**

info [card *card_num* **[cpu** *cpu_num* **]] [graphs] [verbose]**

Specifies information for an entire card or a specific CPU is to be displayed.
card *card_num*: Specifies the card to display associated information. *card_num* must be a value in the range 1 through 48 and must refer to an installed card.
cpu *cpu_num*: Optionally selects a specific CPU on the card of interest to display specific information. *cpu_num* must be a value in the range 0 through 3 and must refer to an installed CPU.
graphs: In addition to textual CPU information display CPU utilization information in graphs.
verbose: Output is to display all information available.

table

Display, in tabular format, all cards and CPUs.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

View CPU statistics to aid in diagnosing service problems for the case of overload conditions.

Important: This command is not supported on all platforms.

Example

The following command displays the CPU information in tabular format for all CPUs on all installed cards:

```
show cpu table
```

The following command displays CPU information for card *8* in verbose mode:

```
show cpu info card 8 verbose
```

The following command displays information for CPU *0* on card *1*:

```
show cpu info card 1 cpu 0
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show crash

Displays summary of crashes or information on a specific crash.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show crash { list | number *crash_num* **} [| { grep** *grep_options* **| more }]**

list | number *crash_num*

list: Indicates a list of recent crash data is to be displayed.
number *crash_num*: Indicates the information for the crash specified by *crash_num* is to be displayed. The crash number must be an existing crash which would be displayed using the **list** keyword.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

VIew the crash list to determine frequency of crashes or if crashes occur at some specific time of day. This may also be used to view information on a specific crash to aid in troubleshooting.

Example

The following displays the list of recent crashes.

```
show crash list
```

The following command will display the crash information for crash number *11*.

```
show crash number 11
```

show credit-control sessions

This command displays credit control sessions information.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show credit-control session [all | callid | full | mdn | nai | summary] [| { grep *grep_options* **| more }]**

session [all | callid | full | mdn | nai | summary]

Displays the credit control session status based on the following keywords:
all: Displays all available information for Credit Control sessions
callid: Displays the Credit Control SessionCall ID
full: Displays All available information for the associated display or the filter keyword
mdn: Displays the Credit Control MDN
nai: Displays the Credit Control NI
summary: Displays the summary of Credit Control session information

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
Please refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter for details on the usage of **grep** and **more**.

Usage

Use this command to show active credit control application for service sessions.

Example

The following command shows the configured Credit Control application sessions:

```
show credit-control sessions
```

show credit-control statistics

This command displays credit control statistics.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show credit-control statistics cc-service *name*

cc-service

Specifies the Credit Control Service name.
name must be an existing Credit Control Service, and must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to show active credit control statistics.

Example

The following command shows the configured credit control statistics for a service named *service1*:

show credit-control statistics cc-service *service1*

show crypto group

Displays information pertaining to configured crypto groups.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show crypto group [name *group_name* **| summary]**

name *group_name*

Displays information for a specific crypto group.
group_name is the name of the group for which to display information.

summary

Displays state and statistical information for configured crypto groups in this context.

Usage

Use this command to display information and statistics pertaining to one or all configured crypto groups within the current context.
If the **summary** keyword is not used, detailed information is displayed.

The following command displays detailed information for a crypto group called *group1*:

show crypto group name *group1*

show crypto ikev1

Displays pre-shared key information for peer security gateways configured within the context.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show crypto ikev1 { keys | policy [ preference ] | security-associations [
summary ] }
```

keys

Specifies the IKE pre-shared key information based on the peer security gateway.

policy [*preference*]

Specifies the IKE policy priority for which configuration information will be displayed.
The priority can be configured to any integer value from 1 to 100.
If no preference is specified, information will be displayed for all configured policies.

security-associations [summary]

Specifies that established IPSec SA information should be displayed.

Usage

Use this command to:

- Display pre-shared key information. This information can be used to verify configuration and/or for troubleshooting.
- Verify the configuration of IKE policies within the context.
- Display established IPSec SA information. This information can be used for troubleshooting.

Example

The following command lists the pre-shared keys received from peer security gateways as part of the Diffie-Hellman exchange:

```
show crypto ikev1 keys
```

The following command displays information for an IKE policy with a preference of 1:

```
show crypto ikev1 policy 1
```

The following command displays the currently established SAs:

```
show crypto ikev1 security-associations summary
```

show crypto ikev2-ikesa security-associations summary

Summary view of ikev2-ikesa SAs

Product

PDIF

Privilege

Administrator, Security Administrator

Syntax

```
show crypto ikev2-ikesa security-associations summary
```

Usage

Shows a summary of the of the SAs configured for a crypto template. It shows the total configured SA lifetime in seconds and the number of seconds left on the timer.

Example

Use this command to create the SA summary:

```
show crypto ikev2-ikesa security-associations summary
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show crypto ipsec

Displays IPSec security associations (SAs) configured within or facilitated by the context and can optionally display statistics for them.

Product

PDSN, GGSN, PDIF, SCM

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show crypto ipsec security-associations map-type { ipsec-3gpp-cscf-subscriber | ipsec-dynamic | ipsec-ikev1 | ipsec-l2tp | ipsec-manual | ipsec-mobile-ip } | summary [distribution | ipsecmgr *ipsec_mgr_id* **| map-type** *map_type* **] | tag** *map_name*

---

map-type { ipsec-dynamic | ipsec-ikev1 | ipsec-l2tp | ipsec-manual | ipsec-mobile-ip }

Specifies that information for all crypto maps of a specific type configured within the context will be displayed. The following types can be specified:

- **ipsec-3gpp-cscf-subscriber**: P-CSCF Subscriber IPSec Tunnel
- **ipsec-dynamic**: Dynamic IPSec Tunnel
- **ipsec-ikev1**: IKEv1 IPSec Tunnel
- **ipsec-ikev2-subscriber**: IKEv2 Subscriber Tunnel
- **ipsec-l2tp**: L2TP IPSec Tunnel
- **ipsec-manual**: Manual (Static) IPSec Tunnel
- **ipsec-mobile-ip**: Mobile IP IPSec Tunnel

---

summary [distribution | ipsecmgr *ipsec_mgr_id* **| map-type** *map_type* **| template-map** *map_name* **]**

Specifies that only security association summary information should be displayed.
distribution: Show IPSec Manager SA distribution information.
ipsecmgr *ipsec_mgr_id*: Show summary SA information for the specified IPSec manager instance ID. must be an integer from 1 through 200.
map-type *map_type*: Show summary SA information for the specified type of crypto map.The following types can be specified:

- **ipsec-3gpp-cscf-subscriber**: P-CSCF Subscriber IPSec Tunnel
- **ipsec-dynamic**: Dynamic IPSec Tunnel
- **ipsec-ikev1**: IKEv1 IPSec Tunnel
- **ipsec-l2tp**: L2TP IPSec Tunnel
- **ipsec-manual**: Manual (Static) IPSec Tunnel
- **ipsec-mobile-ip**: Mobile IP IPSec Tunnel

tag *map_name*

Specifies that SAs should be displayed for the specified crypto map.
map_name is the name of the crypto map configured in the context and can be from 1 to 127 alpha and/or numeric characters and is case sensitive.

Usage

Use this command to display IPSec SA information and statistics. This information can be used for performance monitoring and/or troubleshooting.
The displayed information categorizes control signal and data statistics. Data statistics are further categorized according to the encapsulation method, either GRE or IP-in-IP.

Example

The following command displays summary SA statistics for all IPSec managers.

```
show crypto ipsec security-associations summary
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show crypto ipsec transform-set

Displays IPsec transform set configuration information.

Product

PDG/TTG

PDIF

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show crypto ipsec transform-set [*transform_name* **]**

transform_name

Specifies the name of a particular IPsec transform set for which to display information.
transform_name is the name of the IPsec transform set and can be from 1 to 127 alpha and/or numeric characters and is case sensitive.

Usage

Use this command to verify the configuration of IPsec transform sets within the context.
If no keyword is specified, information will be displayed for all IPsec transform sets configured within the context.

Important: This command is used in PDIF Release 8.3 only.

Example

The following command displays information for an IPsec transform set named test1:

show crypto ipsec transform-set *test1*

show crypto isakmp keys

Displays pre-shared key information for peer security gateways configured within the context.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show crypto isakmp keys
```

Usage

Use this command to display pre-shared key information based on the peer security gateway. This information can be used to verify configuration and/or for troubleshooting.

Example

The following command lists the pre-shared keys received from peer security gateways as part of the Diffie-Hellman exchange:

```
show crypto isakmp keys
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show crypto isakmp policy

Displays ISAKMP policy configuration information.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show crypto isakmp policy [*preference* **]**

preference

Specifies the ISAKMP policy priority for which configuration information will be displayed. The priority can be configured to any integer value from 1 to 100.

Usage

Use this command to verify the configuration of ISAKMP policies within the context.
If no *preference* is specified, information will be displayed for all configured policies.

Example

The following command displays information for an ISAKMP policy with a preference of 1:

show crypto isakmp policy *1*

show crypto isakmp security-associations

Displays currently established IKE security associations (SAs) facilitated by the context.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show crypto isakmp security-associations [ cookies ]
```

cookies

Specifies that cookies should be displayed.

Usage

Use this command to display established IPSec SA information. This information can be used for troubleshooting.

Example

The following command displays the currently established SAs:

```
show crypto isakmp security-associations
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show crypto managers

Shows statistics per IPSec Manager.

Product

PDSN, GGSN, PDIF, SCM

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show crypto managers [context *context_id* **| crypto-map** *map_name* **| instance** *instance_num* **| summary [distribution | ike-stats | ipsec-3gpp-cscf-stats | ikev2-stats [demux-stats] | ipsec-sa-stats | npu-stats]]**

context *context_id*

Show IPSec manager statistics for the context with the specified context identifier number.
must be an integer from 1 through 64.

crypto-map *map_name*

Show IPSec Managers for a specific crypto map.
map_name must be the name of an existing crypto map.

instance *instance_num*

Show statistics for the specified IPSec manager instance.
instance_num must be an integer from 1 through 284.

summary [distribution | ike-stats | ipsec-3gpp-cscf-stats | ikev2-stats [demux-stats] | ipsec-sa-stats | npu-stats]

Shows stats per service IP address for each manager.
distribution: Shows a summary list of IPsec manager distribution.
ike-stats: Shows a summary list of IPSec IKE statistics. for each IPsec manager.
ipsec-3gpp-cscf-stats - Displays CSCF IPSec Statistics on each IPsec Manager.
ikev2-stats: Displays IKEv2 Statistics on each IPsec Manager.

- **demux-stats**: Displays session demux statistics on each IPsec Manager.

ipsec-sa-stats: Shows a summary list of IPsec Security Association statistics for each IPsec Manager.
npu-stats: Displays NPU statistics on each IPsec Manager.

Usage

Use this command to view statistics relating to IPSec managers.

Example

The following command displays summary information for all IPSec managers:

```
show crypto managers summary
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show crypto map

Displays crypto map configuration information.

Product

PDIF, PDSN, GGSN, SCM

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show crypto map [map-type [ipsec-3gpp-cscf-subscriber | ipsec-dynamic | ipsec-ikev1 | ipsec-ikev2-subscriber | ipsec-l2tp | ipsec-manual | ipsec-mobile-ip] | tag *map_name* **| summary]**

map-type [ipsec-3gpp-cscf-subscriber | ipsec-dynamic | ipsec-ikev1 | ipsec-ikev2-subscriber | ipsec-l2tp | ipsec-manual | ipsec-mobile-ip]

Specifies that information for all crypto maps of a specific type configured within the context will be displayed. The following types can be specified:

- **ipsec-3gpp-cscf-subscriber**: P-CSCF subscriber IPSec Tunnel
- **ipsec-dynamic**: Dynamic IPSec Tunnel
- **ipsec-ikev1**: IKEv1 IPSec Tunnel
- **ipsec-ikev2-subscriber**: IKEv2 Subscriber Tunnel
- **ipsec-l2tp**: L2TP IPSec Tunnel
- **ipsec-manual**: Manual (Static) IPSec Tunnel
- **ipsec-mobile-ip**: Mobile IP IPSec Tunnel

tag *map_name*

Specifies the name of a crypto map for which to display configuration information.
map_name is the name of the crypto map configured in the context and can be from 1 to 127 alpha and/or numeric characters and is case sensitive.

summary

Displays summary information for all crypto maps configured in the context.

Usage

Use this command to verify the configuration of crypto maps within the context.
If no keyword is specified, information will be displayed for all maps configured within the context regardless of type.

Example

The following command displays configuration information for a dynamic crypto map named *test_map3*:

show crypto map tag *test_map3*

show crypto statistics

Displays IPSec statistics.

Product

PDSN, GGSN, PDG/TTG, PDIF, SCM

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show crypto statistics ikev1 | ikev2 [service-ip-address *ip-address* **] [service-name** *name* **] | ipsec-3gpp-cscf [service-ip-address** *ip-address* **] [service-name** *name* **]**

ikev1

Displays global ikev1 statistics for this context.

ikev2 [service-ip-address *ip-address* **] [service-name** *name* **]**

Displays global ikev2 statistics for this context.
service-ip-address *ip-address*: Specified PDIF service ip address.
service-name *name*: Specified PDIF service name.

ipsec-3gpp-cscf [service-ip-address *ip-address* **] [service-name** *name* **]**

Displays global CSCF IPSec SA statistics for this context.
service-ip-address *ip-address*: Specified CSCF service IP address.
service-name *name*: Specified CSCF service name.

Usage

Use this command to display statistics for IPSec tunnels facilitated by the context. This information can be used for performance monitoring and/or troubleshooting

Example

The following command displays cumulative IPSec statistics for the current context:

```
show crypto statistics
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show crypto transform-set

Displays transform set configuration information.

Product

PDIF, PDSN, GGSN, SCM

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show crypto transform-set [*transform_name* **]**

transform_name

Specifies the name of a particular transform set for which to display information.
transform_name is the name of the transform set and can be from 1 to 127 alpha and/or numeric characters and is case sensitive.

Usage

Use this command to verify the configuration of transform sets within the context.
If no keyword is specified, information will be displayed for all transform sets configured within the context.

Important: This command is used in PDIF Release 8.1. In PDIF Release 8.3, the syntax of this command is changed to **show crypto ipsec transform-set**.

Example

The following command displays information for a transform set named test1:

show crypto transform-set *test1*

show cscf nat

Displays the mapping created for each of the media streams present in an established dialog.

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator

Syntax

show cscf nat media mapping { all | aor *aor* **} [| { grep** *grep_options* **| more }]**

media mapping { all | aor *aor* **}**

all: Displays the UE/Network origins and destinations, including their IP addresses/port numbers and associated contexts.
aor *aor*: Displays information for a specific AoR. *aor* must be an existing AoR and be from 1 to 79 alpha and/or numeric characters.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
Refer to *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter for details on the usage of **grep** and **more**.

Usage

Use this command to display the status of configured Network Address Translation (NAT) support.

Example

The following command displays the status of the mapping created for each of the media streams present on this system:

```
show cscf nat media mapping all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show cscf peer-servers

Displays name, IP address, and status of configured peer servers visible to the system.

Product

SCM

Privilege

Security Administrator, Administrator, Operator

Syntax

```
show cscf peer-servers { all | full | name service_name [ server-name
server_name ] } [ | { grep grep_options | more } ]
```

`all | full | name` *`service_name`* `[ server-name` *`server_name`* `]`

`all`: Displays the peer server list names and the servers within those lists including their IP addresses/port numbers and domain names.
`full`: Displays additional details regarding the peer servers within the configured lists on the system.
`name` *`service_name`* `[ server-name` *`server_name`* `]`: Displays the same information as the full keyword output, but for a specific peer server list or specific server.
`service_name/server_name` must be an existing peer server list or server and be from 1 through 80 alpha and/or numeric characters.

`grep` *`grep_options`* `| more`

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
Refer to *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter for details on the usage of **`grep`** and **`more`**.

Usage

Use this command to display the status of configured peer servers.

Example

The following command displays the status of a peer server named *`icscf3`* that is a member of peer server list *`cscf-main`*:

```
show cscf peer-servers name cscf-main server-name icscf3
```

The following command displays the status of all peer servers in configured peer server groups in this context:

```
show cscf peer-servers full
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show cscf service

Displays configuration and/or statistic information for CSCF services on this system.

Product

SCM

Privilege

Security Administrator, Administrator, Operator

Syntax

show cscf service { all [counters] | diameter policy-control statistics service-name *service_name* **[vpn-name** *name* **] | grey-list name** *name* **| li-packet-cable statistics service-name** *service_name* **| statistics name** *service_name* **[all | calls | ip-security | message | package-name { message-summary | presence | reg | winfo } | registrations | sigcomp | tcp] | subscription name** *service_name* **} [| { grep** *grep_options* **| more }]**

---

all [counters]

Displays configuration information for all CSCF services configured on this system.
counters: Displays statistics with the configuration information for all CSCF services configured on the system.

---

diameter policy-control statistics service-name *service_name* **[vpn-name** *name* **]**

policy-control: Displays Diameter (DPECA) statistics on the CSCF Rx interface with the configuration information.
service-name *service_name*: Specifies the name of a CSCF service for which the statistics will be displayed. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.
vpn-name *name*: Specifies the name of a context in which all statistics for all services will be displayed. *name* must be an existing context and be from 1 to 79 alpha and/or numeric characters.

---

grey-list name *name*

Displays the list of run-time grey-listed users and their remaining barred period for the specified CSCF service.
name must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

---

li-packet-cable statistics service-name *service_name*

Displays Lawful Intercept statistics for a specific CSCF service configured on this system. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

---

statistics name *service_name* **[all | calls | ip-security | message | package-name { message-summary | presence | reg | winfo } | registrations | sigcomp | tcp | vpn-name** *name* **]**

Displays service statistics for a specific CSCF service configured on this system. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.
all: Displays all CSCF service statistics.

calls: Displays session statistics related to CSCF calls.
ip-security: Displays session statistics related to CSCF IPSec.
message: Displays session statistics for the SIP method MESSAGE.
package-name: Displays session statistics for the associated event package.

- **message-summary**: Displays session statistics for the "message-summary" event package.
- **presence**: Displays session statistics for the "presence" event package.
- **reg**: Displays session statistics for the "reg" event package.
- **winfo**: Displays session statistics for the "watcher-info" event package.

registrations: Displays session statistics related to CSCF registrations, re-registrations, and de-registrations.
sigcomp: Displays session statistics related to CSCF sigcomp.
tcp: Displays session statistics related to CSCF TCP.

Important: This keyword must be followed by another statistics-related keyword.

subscription name *service_name*

Displays service level subscription information for a specific service. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display configuration information and/or statistics for any or all CSCF services on this system.

Example

The following command displays service statistics for the CSCF service named *cscf1*:

```
show cscf service statistics name cscf1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show cscf sessions

Displays statistics for CSCF sessions on this system.

Product

SCM

Privilege

Security Administrator, Administrator, Operator

Syntax

show cscf sessions { counters { calls { duration | first-response-time | invite-processing-time | post-answer-delay | post-dial-delay | service *service_name* **| session-release-delay | session-setup-delay } service** *service_name* **| subscription { duration | service** *service_name* **| setup-time } service** *service_name* **} | duration | full [callleg-id** *id* **| from-aor** *aor* **| service** *service_name* **| session-id** *id* **| to-aor** *aor* **] [media-type** *type* **] | summary [from-aor** *aor* **| service** *service_name* **| session-id** *id* **| to-aor** *aor* **] } [| { grep** *grep_options* **| more }]**

counters { calls { duration | first-response-time | invite-processing-time | post-answer-delay | post-dial-delay | service *service_name* **| session-release-delay | session-setup-delay } service** *service_name* **| subscription { duration | service** *service_name* **| setup-time } service** *service_name* **}**

Displays counters for all CSCF sessions matching the filter criteria.
calls: Counters associated with calls in CSCF service.

- **duration**: Displays the call duration time.
- **first-response-time**: Displays the time interval for the first response received for INVITE.
- **invite-processing-time**: Displays the INVITE message processing time in CSCF.
- **post-answer-delay**: Displays the time interval for post answer delay.
- **post-dial-delay**: Displays the time interval for the ringing or success response for INVITE.
- **service** *service_name*: Displays specific service. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

> ***Important:*** This keyword may be used alone with the **counters** keyword or following any other counters-specific keyword.

- **session-release-delay**: Displays the time interval for releasing the call.
- **session-setup-delay**: Displays the time interval for session setup.

subscription: Counters associated with subscriptions in CSCF service.

- **duration**: Displays the SIP Subscription duration time.
- **service** *service_name*: Displays specific service. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

Important: This keyword may be used alone with the **subscription** keyword or following any other subscription-specific keyword.

- **setup-time**: Displays the SIP Subscription setup time.

duration

Displays the call duration for all CSCF sessions.

full [callleg-id *id* **| from-aor** *aor* **| service** *service_name* **| session-id** *id* **| to-aor** *aor* **] [media-type** *type* **]**

Displays all the session information for the active CSCF sessions matching the filter criteria.
callleg-id *id*: Specifies a call leg from which session statistics are to be displayed. *id* must be an existing call-leg ID and be from 1 to 63 alpha and/or numeric characters.
from-aor *aor*: Specifies that session statistics are to be displayed for sessions originating from this specific AoR. *aor* must be an existing AoR and be from 1 to 79 alpha and/or numeric characters.
service *service_name*: Specifies that session statistics are to be displayed for sessions using this CSCF service. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.
session-id *id*: Specifies that session statistics are to be displayed for sessions with this ID. *id* must be an existing session ID and be from 1 to 63 alpha and/or numeric characters.
to-aor *aor*: Specifies that session statistics are to be displayed for sessions sent to this specific AoR. *aor* must be an existing AoR and be from 1 to 79 alpha and/or numeric characters.
media-type *type*: Displays information about specific media type, if any. *type* must be an existing media type and be from 1 to 9 alpha and/or numeric characters.

summary [from-aor *aor* **| service** *service_name* **| session-id** *id* **| to-aor** *aor* **]**

Displays session summary information for sessions matching the filter criteria.
from-aor *aor*: Specifies that session statistics are to be displayed for sessions originating from this specific AoR. *aor* must be an existing AoR and be from 1 to 79 alpha and/or numeric characters.
service *service_name*: Specifies that session statistics are to be displayed for sessions using this CSCF service. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.
session-id *id*: Specifies that session statistics are to be displayed for sessions with this ID. *id* must be an existing session ID and be from 1 to 63 alpha and/or numeric characters.
to-aor *aor*: Specifies that session statistics are to be displayed for sessions sent to this specific AoR. *aor* must be an existing AoR and be from 1 to 79 alpha and/or numeric characters.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
Refer to *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter for details on the usage of **grep** and **more**.

Usage

Use this command to display session information for any or all CSCF sessions.

Example

The following command displays the output for CSCF session duration:

```
show cscf sessions duration
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show cscf sip

Displays SIP statistics for a specific CSCF service configured on this system.

Product

SCM

Privilege

Security Administrator, Administrator, Operator

Syntax

show cscf sip statistics name *service_name* **[interface { domain name** *domain_name* **| ip address** *ip_address* **} | vpn-name** *name* **] [| { grep** *grep_options* **| more }]**

statistics name *service_name*

Specifies the name of the CSCF service. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

[interface { domain name *domain_name* **| ip address** *ip_address* **}**

SIP statistics will be displayed for this interface.
domain name *domain_name*: Specifies the domain associated with the CSCF service. *domain_name* must be an existing domain and be from 1 to 64 alpha and/or numeric characters.
ip address *ip_address*: Specifies the destination or source ip address associated with the CSCF service.

vpn-name *name*

Specifies the name of the context in which the service is configured. *name* must be an existing context and be from 1 to 79 alpha and/or numeric characters.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
Refer to *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter for details on the usage of **grep** and **more**.

Usage

Use this command to display SIP statistics for a specific CSCF service.

Important: This command displays counters for SIP statistics for a specified CSCF service. Counters are incriminated when SIP messages are sent (Tx) or received (Rx). SIP Request, Response, and Error counters are maintained at various levels in the SIP stack. These values are dependent on the packet flow. For example, if packets are dropped at an initial stage of parsing and error detection, the counters may not increment. All 2xx Response counters for individual requests are maintain outside the SIP layer and will not track re-transmissions and erroneous packets that are dropped. All other counters do keep track of re-transmissions.

Example

The following command displays SIP statistics for the CSCF service named *cscf1*:

```
show cscf sip statistics name cscf1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show cscf tcp

Displays TCP connection information for a specific CSCF service configured on this system.

Product

SCM

Privilege

Security Administrator, Administrator, Operator

Syntax

show cscf tcp connections service *service_name* **[facility { cscfmgr | sessmgr }] [full] [remote-ip** *ip_address* **] [remote-port** *port_number* **] [| { grep** *grep_options* **| more }]**

connections service *service_name*

service *service_name*: Specifies the name of the CSCF service.
service_name must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

facility { cscfmgr | sessmgr }

Facility type for which connection details have to be retrieved.
cscfmgr: Facility type cscfmgr.
sessmgr: Facility type sessmgr.

full

Displays detailed information related to each connection.

remote-ip *ip_address*

Remote IP address to match the connection. *ip_address* is expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

remote-port *port_number*

Remote port to match the connection.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
Refer to *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter for details on the usage of **grep** and **more**.

Usage

Use this command to display TCP connection information for a specific CSCF service.

Important: More than one optional keyword may be used per command.

Example

The following command displays TCP connections for the CSCF service named *cscf1*:

```
show cscf tcp connections service cscf1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show css delivery-sequence

This is a restricted command. In StarOS 9.0 and later, this command is obsoleted.

show css server

This is a restricted command. In StarOS 9.0 and later, this command is obsoleted.

show css service

This is a restricted command. In StarOS 9.0 and later, this command is obsoleted.

Chapter 91
Exec Mode Show Commands (D-G)

This section includes the commands **show dhcp** through **show gtpu-service**.

show dhcp

Displays counter information pertaining to DHCP functionality based on specific criteria.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show dhcp [counters | full | summary] [all | apn *apn_name* **| callid** *id* **| chaddr** *mac_address* **| dhcp-service** *svc_name* **| imsi** *imsi* **| user-address** *address* **| msid** *msid* **| server** *server_address* **| username** *name* **]**

counters

Displays DHCP counter information.

full

Displays all available information pertaining to the criteria specified.

summary

Displays a summary of the DHCP statistics.

all

Displays counter information for each active PDP context.

apn *apn_name*

Displays information based on a specific APN name.
apn_name is the name of the APN and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

callid *id*

Displays information for a specific call identification number.
id must be specified as a 4-byte hexadecimal number.

chaddr *mac_address*

Displays information for a specific mobile node.
mac_address must be MAC address of mobile node.

dhcp-service *svc_name*

Displays information for a specific DHCP service.
svc_name is the name of the DHCP service and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

imsi *imsi*

Displays information for a specific International Mobile Subscriber Identity (IMSI).
imsi is an integer value from 1 to 15 characters.

user-address *address*

Displays information for a specific DHCP-assigned user IP address.
address is the IP address expressed in dotted-decimal notation.

msid *msid*

Displays information for a specific Mobile Subscriber Identity (MSID).
msid must be from 1 to 15 digits.

server *server_address*

Displays information for a specific DHCP server.
server_address is the IP address of the server expressed in dotted-decimal notation.

username *name*

Displays information for a specific subscriber.
name can be from 1 to 127 alpha and/or numeric characters (including wildcards ('$' and '*')) and is case sensitive.

Usage

Counters pertaining to DHCP functionality can be displayed as cumulative values or for specific APNs, PDP contexts, servers, or DHCP services.

Example

The following command displays DHCP counter information for a DHCP service called DHCP-Gi:

```
show dhcp dhcp-service DHCP-Gi
```

The following command displays DHCP counter information for a DHCP Call Id 01ca11a2:

```
show dhcp call-id 01ca11a2
```

The following command displays DHCP information for the specified mobile node:

```
show dhcp chaddr 00:05:47:00:37:44
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show dhcp statistics

Displays DHCP statistics for the specified servers.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show dhcp statistics [dhcp-service *svc_name* **| server** *ip_address* **]**

dhcp-service *svc_name*

Displays statistics for a specific DHCP service.
svc_name is the name of the desired DHCP service and can be from 1 to 63 alpha and/or numeric characters in length and is case sensitive.

server *ip_address*

Displays statistics for a specific DHCP server.
ip_address is the IP address of the desired server and must be entered in dotted decimal notation.

Usage

Statistics for a single DHCP service or DHCP server can be viewed using the **dhcp-service** or **server** keywords respectively.
Cumulative statistics for all DHCP services and servers within a context can be viewed by executing the command with no keywords from within the context in which they're configured.
If this command is issued from within the local context, the statistics displayed will be cumulative for all dhcp servers configured on the system regardless of context.

Example

The following command allows you to view statistics for all configured DHCP servers within the context:

```
show dhcp statistics
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show dhcp-service

Displays configuration information for either a specific, or for all DHCP servers configured.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show dhcp-service { all | name *svc_name* **}**

all

Displays information for all configured DHCP services.

name *svc_name*

Displays information for a specific DHCP service.
svc_name is the name of the service and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

Usage

This command is used to verify the configuration of one or all DHCP services for monitoring or troubleshooting purposes. he output is a concise listing of DHCP service parameter settings.
If this command is executed from within the local context with the all keyword, information for all DHCP services configured on the system will be displayed.

Example

The following command displays configuration information for a DHCP service called dhcp1:

show dhcp-service name *dhcp1*

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show dhcp status

Displays configuration information for either a specific, or for all DHCP service and servers configured.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show dhcp status [dhcp-service *svc_name* **] [server** *ip_addr* **]**

all

Displays information for all configured DHCP services.

dhcp-service *svc_name*

Displays information for a specific DHCP service.
svc_name is the name of the service and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

server *ip_address*

Displays status for a specific DHCP server.
ip_address is the IP address of the desired server and must be entered in dotted decimal notation.

Usage

This command is used to show/verify the status or configuration of one or all DHCP services along with count of cumulative leased addresses and addresses leased at that time for monitoring or troubleshooting purposes. The output is a concise listing of DHCP service parameter settings.
If this command is executed from within the local context with the all keyword, information for all DHCP services configured on the system will be displayed.

Example

The following command displays status of a DHCP service called ggsn_dhcp1:

show dhcp status dhcp-service *ggsn_dhcp1*

State shown in display is consolidated across session managers, i.e. for each session manager, DHCP server have a timestamp value associated with its state.
For a DHCP server, its timestamp value is compared for each session manager and the state associated with the latest value is shown.

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show diameter aaa-statistics

This command displays Diameter AAA statistics.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show diameter aaa-statistics [all | group *group_name* **[server** *server_name* **] | server** *server_name* **] [| { grep** *grep_options* **| more }]**

all

Displays all available Diameter server statistics.

group *group_name* **[server** *server_name* **]**

Displays all Diameter server statistics within the specified AAA group.
group_name must be the name of a AAA group, and must be a string of 1 through 64 characters in length.
server_name must be the name of a Diameter server, and must be a string of 1 through 64 characters in length.

server *server_name*

Displays Diameter server statistics for the specified server.
server_name must be the name of the Diameter server, and must be a string of 1 through 64 characters in length.

| { grep *grep_options* **| more }**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to view Diameter AAA statistics.

Example

The following command displays all available Diameter server statistics:

```
show diameter aaa-statistics all
```

show diameter accounting servers aaa-group

This command displays Diameter accounting server information for a AAA group.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show diameter accounting servers [aaa-group *group_name* **] [| { grep** *grep_options* **| more }]**

group_name

group_name must be the name of a AAA group, and must be a string of 0 through 64 characters in length.

| { grep *grep_options* **| more }**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to view Diameter accounting server information for a AAA group.

Example

The following command displays Diameter accounting server information for a AAA group named *group12*:

show diameter accounting servers aaa-group *group12*

show diameter authentication servers aaa-group

This command displays Diameter Authentication server information for a specified AAA group.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show diameter authentication servers [aaa-group *group_name* **]**

group_name

group_name must be the name of a AAA group, and must be a string of 0 through 64 characters in length.

Usage

Use this command to view Diameter authentication server information for a AAA group.

Example

The following command displays Diameter authentication server information for a AAA group named *group12*:

show diameter authentication servers aaa-group *group12*

show diameter endpoint

This command has been deprecated, and is replaced by the show diameter endpoints command.

show diameter endpoints

This command displays the status of Diameter client endpoint(s).

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show diameter endpoints { all | endpoint endpoint_name } [ | { grep grep_options
| more } ]
```

all

Displays status of all Diameter client endpoints.

endpoint *endpoint_name*

Displays status of the specified Diameter client endpoint.
endpoint_name must be the name of a Diameter endpoint, and must be a string of 1 through 63 characters in length.

| { grep *grep_options* **| more }**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to view the status of Diameter client endpoints.
If you are in the local context, then all contexts are searched for the specified endpoint(s). Specify **all** to see all endpoints; otherwise, just the named endpoint will be displayed. If no argument is provided, a summary of all endpoints is displayed.
Default value: N/A

Example

The following command displays status of all Diameter client endpoints.

```
show diameter endpoints all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show diameter message-queue

This command displays Diameter message queue statistics.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show diameter message-queue counters { inbound | outbound } [endpoint *endpoint_name* **[peer-host** *peer_id* **[peer-realm** *realm_id* **]] | session-id** *session_id* **] [| { grep** *grep_options* **| more }]**

counters { inbound | outbound }

Specifies the message counters:
inbound: Specifies Diameter inbound messages
outbound: Specifies Diameter outbound messages

endpoint *endpoint_name*

Specifies the Diameter endpoint.
endpoint_name must be a string of 1 through 63 characters in length.

peer-host *peer_id*

Specifies the Diameter peer host.
peer_id must be a string of 1 through 63 characters in length.

peer-realm *realm_id*

Specifies the Diameter peer realm.
realm_id must be a string of 1 through 127 characters in length.

session-id *session_id*

Specifies the session ID.
session_id must be a string of 1 through 127 characters in length.

| { grep *grep_options* **| more }**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to view the count of the messages in the Diameter message queue for specific counter type, session ID, or endpoint, peer host, and peer realm.

Example

The following command displays message queue statistics for outbound messages specific to the Diameter endpoint named *asr5k.testnetwork.com*.

```
show diameter message-queue counters outbound endpoint
asr5k.testnetwork.com
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show diameter peers

This command displays Diameter peer information.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show diameter peers [ full | summary ] [ all | [ endpoint endpoint_name ] [
peer-host peer_id ] [ peer-realm realm_id ]+ ] [ | { grep grep_options | more }
]
```

full

Displays full details of all or specified Diameter peers.

summary

Displays summary details of all or specified Diameter peer(s).

all

Displays details of all Diameter peers.

endpoint *endpoint_name*

Displays details of the specified Diameter endpoint.
endpoint_name must be the origin endpoint value, and must be a string of 1 through 255 characters in length.

peer-host *peer_id*

Displays details of the specified Diameter peer host.
peer_id must be the peer host value, and must be a string of 1 through to 63 characters in length.

peer-realm *realm_id*

Displays details of the specified Diameter peer realm.
realm_id must be the Diameter peer realm ID, and must be a string of 1 through 127 characters in length.

| { grep *grep_options* **| more }**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to view the details of Diameter peers.

If you are in the local context, then all contexts are searched for the specified peer(s).
This is similar to the **show subscribers** CLI command and supports multiple filter options specified at the same time.
If filter options are specified (e.g., **all**, **endpoint**, etc.), the default is for one line of output to be displayed per peer. Use **full** to get detailed information per peer, or **summary** to get summarized information about all matching peers.
If no filter options are specified, a summary output for all peers is displayed. Use the **full** option to get detailed information about every peer.
Default value: N/A

Example
The following command details of the Diameter endpoint named *endpoint12*:

```
show diameter peers endpoint endpoint12
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show diameter route status

This command displays Diameter route health status information.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show diameter route status [ endpoint endpoint_name | full [ endpoint
endpoint_name ] ] [ host host_name | peer peer_id ] [ | { grep grep_options |
more } ]
```

full

Displays information of which Diameter clients are using which peer/host combinations.

endpoint *endpoint_name*

Displays detailed information of the specified Diameter client endpoint.
endpoint_name must be the name of a Diameter endpoint, and must be a string of 1 through 63 characters in length.

host *host_name*

Displays information for the specified Diameter host.
host_name must be the name of a Diameter host, and must be a string of 1 through 63 characters in length.

peer *peer_id*

Displays information for the specified Diameter peer.
peer_id must be the name of a Diameter peer host, and must be a string of 1 through 63 characters in length.

| { grep *grep_options* **| more }**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to view the Diameter route health status.
If you are in the local context, then the route information used by Diameter endpoints in all ST16 contexts will be used in the display.
The route status displays status of peer/host combinations. Refer to the **route-failure** CLI command in Diameter Endpoint Configuration mode. When no options are specified, the display will give one line per peer/host combination, indicating how many Diameter clients are using each combination, and for how many clients the combination is available or failed. Specify **full** to see which Diameter clients are using which

peer/host combinations. Specify **host** or **peer** to see just combinations with the named host or peer.
Specify **endpoint** to see detailed information about the named Diameter client.
Default value: N/A

Example

The following command displays route health status details of the Diameter client endpoint named *endpoint12*:

```
show diameter route status endpoint endpoint12
```

show diameter route table

This command displays the Diameter routing table.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show diameter route table [wide] [endpoint *endpoint_name* **] [| { grep** *grep_options* **| more }]**

wide

Displays the route table information in wide-format.

endpoint *endpoint_name*

Displays the Diameter routing table for the specified endpoint.
endpoint_name must be the name of a Diameter endpoint, and must be a string of 1 through 63 characters in length.

| { grep *grep_options* **| more }**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to view the status of Diameter client endpoints.
If you are in the local context, then the route information used by Diameter endpoints in all chassis contexts will be used in the display.
The route table displays all static and dynamic routes. Refer to the route-entry CLI command in Diameter Endpoint Configuration Mode.
Default value: N/A

Example

The following command displays status of the Diameter client endpoint named *endpoint12*.

show diameter route table endpoint *endpoint12*

show diameter statistics

This command displays Diameter peer statistics.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show diameter statistics [[proxy] endpoint *endpoint_name* **[peer-host** *peer_id* **[peer-realm** *realm_id* **]]] [| { grep** *grep_options* **| more }]**

endpoint *endpoint_name*

Displays statistics for the specified DIameter endpoint.
endpoint_name must be the name of a Diameter endpoint, and must be an alpha and/or numeric string of 1 through 63 characters in length.

peer-host *peer_id*

Displays statistics for the specified Diameter host peer.
peer_id must be an alpha and/or numeric string of 1 through 255 characters in length.

peer-realm *realm_id*

Displays statistics for the specified Diameter peer realm.
realm_id must be an alpha and/or numeric string of 1 through 127 characters in length.

proxy

Displays proxy related statistics.

| { grep *grep_options* **| more }**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to view Diameter statistics for the specified endpoint or proxy.

Example

The following command displays Diameter peer statistics for the endpoint named *endpoint12*:

show diameter statistics endpoint *endpoint12*

show dns-client

Displays DNS cache and/or statistics for a specified DNS client.

Product

P-CSCF, SIP Proxy, SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show dns-client { cache client *name* **[query-name** *name* **| query-type { A | SRV }] | statistics client** *name* **} [| { grep** *grep_options* **| more }]**

cache client *name* **[query-name** *name* **| query-type { A | SRV }]**

Specifies that the cache for the defined DNS client is to be displayed.
name: Defines the name of the DNS client whose cache is to be displayed. *name* must be an existing DNS client and be from 1 to 255 alpha and/or numeric characters in length.
query-name *name*: Filters DNS results based on the domain name. *name* must be from 1 to 255 characters in length. *name* is the domain name used to perform the DNS query. *name* is different from the actual domain name which is resolved. For example, to resolve the SIP server for *service.com*, the query name is *_sip._udp.service.com* and the query type is **SRV**.
query-type:

- **A**: Filters DNS results based on domain IP address records (A records).
- **SRV**: Filters DNS results based on service host records (SRV records).

statistics client *name*

Specifies that statistics for the defined DNS client are to be cleared.
name: Defines the name of the DNS client whose statistics are to be displayed. *name* must be an existing DNS client and be from 1 to 255 alpha and/or numeric characters in length.

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified.
A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Cisco ASR 5000 Series Command Line Interface Reference*.

Usage

Use this command to display DNS cache and/or statistics for a specified DNS client.

Example

The following command displays statistics for a DNS client named *domain1.com*:

show dns-client statistics client *domain1.com*

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show dynamic-policy statistics

Displays policy control and charging (PCC) statistics from the interface communicating with the PCRF (Gx(x)).

Product

HSGW, PDSN, S-GW

Privilege

Inspector

Syntax

show dynamic-policy statistics { hsgw-service *name* **| pdsn-service** *name* **| sgw-service** *name* **}**

hsgw-service *name*

Displays policy control and charging statistics from the Gxa interface communicating with the PCRF. *name* must be an existing HSGW service name and be from 1 to 63 alpha and/or numeric characters.

pdsn-service *name*

Displays policy control and charging statistics from the Gx interface communicating with the PCRF. *name* must be an existing PDSN service name and be from 1 to 63 alpha and/or numeric characters.

sgw-service *name*

Displays policy control and charging statistics from the Gxc interface communicating with the PCRF. *name* must be an existing S-GW service name and be from 1 to 63 alpha and/or numeric characters.

Usage

Use this command to display PCC statistics for the specified service and its Gx interface communicating with the PCRF.

Example

The following command displays PCC statistics for a PDSN service named *cdma4*:

show dynamic-policy statistics pdsn-service *cdma4*

show egtpc peers

Displays information about eGTP-C peers.

Product

MME, P-GW, S-GW

Privilege

Inspector

Syntax

show egtpc peers [address *ip_address* **| egtp-service** *name* **[address** *ip_address* **] | interface { mme [address** *ip_address* **] | pgw-ingress [address** *ip_address* **] | sgw-egress [address** *ip_address* **] | sgw-ingress [address** *ip_address* **] }] [| { grep** *grep_options* **| more }]**

---

address *ip_address*

Displays information about a specific eGTP-C peer based on the IP address of the peer. *ip_address* must be an existing eGTP-C peer and be expressed in IPv4 dotted decimal notation.

---

egtp-service *name* **[address** *ip_address* **]**

Displays information about eGTP-C peers associated with a specific service. *name* must be an existing egtp-service and be from 1 to 63 alpha and/or numeric characters.
address *ip_address*: Additionally, the results can be filtered based on the IP address associated with the service. *ip_address* must be an existing eGTP-C peer and be expressed in IPv4 dotted decimal notation.

---

interface { mme [address *ip_address* **] | pgw-ingress [address** *ip_address* **] | sgw-egress [address** *ip_address* **] | sgw-ingress [address** *ip_address* **] }**

Displays information about eGTP-C peers associated with the service interface configured on this system.
mme [address *ip_address* **]**: Displays information about eGTP-C MME peers associated with the service interface configured on this system. Additionally, the results can be filtered based on the IP address associated with the MME peer. *ip_address* must be an existing MME peer and be expressed in IPv4 dotted decimal notation.
pgw-ingress [address *ip_address* **]**: Displays information about eGTP-C P-GW ingress peers associated with the service interface configured on this system. Additionally, the results can be filtered based on the IP address associated with the P-GW ingress peer. *ip_address* must be an existing P-GW ingress peer and be expressed in IPv4 dotted decimal notation.
sgw-egress [address *ip_address* **]**: Displays information about eGTP-C S-GW egress peers associated with the service interface configured on this system. Additionally, the results can be filtered based on the IP address associated with the S-GW egress peer. *ip_address* must be an existing S-GW egress peer and be expressed in IPv4 dotted decimal notation.
sgw-ingress [address *ip_address* **]**: Displays information about eGTP-C S-GW ingress peers associated with the service interface configured on this system. Additionally, the results can be filtered based on the IP address associated with the S-GW ingress peer. *ip_address* must be an existing S-GW ingress peer and be expressed in IPv4 dotted decimal notation.

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified.
A command to send output to must be specified.
For details on using the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display information about eGTP-C peers associated with the service interface configured on this system. The output contains the following information about the peer:

- Status of the peer
- Echo status
- Restart counter status
- Peer restart counter knowledge
- Service ID
- Peer IP address
- Current sessions
- Maximum sessions

Important: The primary command, **show egtpc peers**, when entered without additional keywords, displays information for all peers associated with the service operating on this system.

Example

The following command returns an output for an eGTP-C S-GW egress peers associated with the service interface configured on this system with an IP address of 1.2.3.4:

show egtpc peers interface sgw-egress address *1.2.3.4*

The following command returns an output for an eGTP-C MME peer associated with the service interface configured on this system with an IP address of 1.2.3.4:

show egtpc peers interface mme address *1.2.3.4*

show egtp-service

Displays configuration information for evolved GPRS Tunneling Protocol (eGTP) services on this system.

Product

MME, P-GW, S-GW

Privilege

Inspector

Syntax

show egtp-service { all | name *service_name* **} [| { grep** *grep_options* **| more }]**

all

Displays configuration information for all eGTP services configured on this system.

name *service_name*

Displays configuration information for a specific eGTP service configured on this system.
service_name must be an existing eGTP service, and be from 1 to 63 alpha and/or numeric characters in length.

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified.
A command to send output to must be specified.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Reference Guide*.

Usage

Use this command to view configuration information for eGTP services on this system.

Example

The following command displays service statistics for the eGTP service named *egtp1*:

show egtp-service name *egtp1*

show egtpc sessions

Displays eGTP-C session information.

Product

MME, P-GW, S-GW

Privilege

Inspector

Syntax

show egtpc sessions [egtp-service *name* **| interface { mme | pgw-ingress | sgw-egress | sgw-ingress }] [| { grep** *grep_options* **| more }]**

---

egtp-service *name*

Displays information about eGTP-C sessions associated with a specific service. *name* must be an existing egtp-service and be from 1 to 63 alpha and/or numeric characters.

---

interface { mme | pgw-ingress | sgw-egress | sgw-ingress }

Displays information about eGTP-C sessions associated with the service interface configured on this system.
mme: Displays information about eGTP-C sessions associated with the MME interface configured on this system.
pgw-ingress: Displays information about eGTP-C sessions associated with the P-GW ingress interface configured on this system.
sgw-egress: Displays information about eGTP-C sessions associated with the S-GW egress interface configured on this system.
sgw-ingress: Displays information about eGTP-C sessions associated with the S-GW ingress interface configured on this system.

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified.
A command to send output to must be specified.
For details on using the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display session information for a specific eGTP service or for sessions associated with an interface type configured on this system.

Example

The following command displays eGTP-C session information for sessions associated with all P-GW ingress interfaces configured on this system:

```
show egtpc sessions interface pgw-ingress
```

The following command displays eGTP-C session information for sessions associated with all MME interfaces configured on this system:

show egtpc sessions interface mme

show egtpc statistics

Displays evolved GPRS Tunneling Protocol Control (eGTP-C) plane statistics for a specific service name or interface type.

Product

MME, P-GW, S-GW

Privilege

Inspector

Syntax

show egtpc statistics [egtp-service *name* **| interface { mme | pgw-ingress | sgw-egress | sgw-ingess } | mme-address** *ip_address* **| pgw-address** *ip_address* **| sgw-address** *ip_address* **] [verbose] [| { grep** *grep_options* **| more }]**

---

egtp-service *name*

Displays statistics for a specific eGTP service configured on this system.
service_name must be an existing eGTP service, and be from 1 to 63 alpha and/or numeric characters in length.

---

interface { mme | pgw-ingress | sgw-egress | sgw-ingess }

mme: Displays eGTP-C statistics for all MME interfaces.
pgw-ingress: Displays eGTP-C statistics for all eGTP P-GW ingress interfaces.
sgw-egress: Displays eGTP-C statistics for all eGTP S-GW egress interfaces.
sgw-ingress: Displays eGTP-C statistics for all eGTP S-GW ingress interfaces.

---

mme-address *ip_address*

Displays eGTP-C statistics for a specific MME IP address. *ip_address* must be an existing MME IP address and be expressed in dotted decimal notation.

---

pgw-address *ip_address*

Displays eGTP-C statistics for a specific P-GW IP address. *ip_address* must be an existing MME IP address and be expressed in dotted decimal notation.

---

sgw-address *ip_address*

Displays eGTP-C statistics for a specific S-GW IP address. *ip_address* must be an existing MME IP address and be expressed in dotted decimal notation.

---

verbose

Displays the maximum amount of detail available for this commands output. If this option is not specified, the output is truncated to a more concise level.

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified.
A command to send output to must be specified.

For details on using the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display evolved GPRS Tunneling Protocol Control (eGTPC) plane statistics for a specific service name or interface type.

Example

The following command displays eGTPC statistics for interfaces configured as S-GW ingress interfaces:

```
show egtpc statistics interface sgw-ingess
```

The following command displays eGTP-C session information for sessions associated with all MME interfaces configured on this system:

```
show egtpc sessions interface mme
```

show external-inline-servers

This command is obsolete.

show fa-service

Displays information on configured foreign agent services.

Product

PDSN, GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show fa-service { all | name *fa_name* **} [| { grep** *grep_options* **| more }]**

all | name *fa_name*

all: indicates information on all foreign agent services is to be displayed.
name *fa_name*: indicates only the information for the FA service specified as *fa_name* is to be displayed.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Cisco ASR 5000 Series Command Line Interface Reference*.

Usage

Display foreign agent service configuration information.

Example

The following commands display information on the FA service *sampleService* and all services, respectively.

```
show fa-service name sampleService

show fa-service all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show fans

Displays the current control status, speed, and temperature for the upper and lower fans.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show fans [| { grep *grep_options* **| more }]**

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Cisco ASR 500 Series Command Line Interface Reference*.

Usage

View the fan information to verify system hardware status as necessary.

Example

The following command displays information regarding the cooling fans in the system:

```
show fans
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show file

Displays the contents of the file specified. The contents are paginated as if it were normal ASCII output.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show file url *url* **[| { grep** *grep_options* **| more }]**

url *url*

Specifies the location of a file to display. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

- ST16:
  - **[file:]{ /flash | /pcmcia1 | /pcmcia2 }[/***directory* **]/***file_name*
  - **tftp://{** *host***[** *:port#* **] }[/***directory* **]/***file_name*
  - **[http: | ftp: | sftp:]//[** *username***[** *:password* **]@] {** *host* **}[** *:port#* **][/***directory* **]/***file_name*
- ASR 5000:
  - **[file:]{ /flash | /pcmcia1 | /hd }[/***directory* **]/***file_name*
  - **tftp://{** *host***[** *:port#* **] }[/***directory* **]/***file_name*
  - **[http: | ftp: | sftp:]//[** *username***[** *:password* **]@] {** *host* **}[** *:port#* **][/***directory* **]/***file_name*

Important: Use of the SMC hard drive is not supported in this release.

directory is the directory name.
filename is the actual file of interest.
username is the user to be authenticated.
password is the password to use for authentication.
host is the IP address or host name of the server.
port# is the logical port number that the communication protocol is to use.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Cisco ASR 500 Series Command Line Interface Reference*.

Usage

Display the contents of files to view such information as log data, trace information, etc.

Example

The following will display the contents of the local file */pub/log.txt*.

```
show file //pcmcia1/pub/log.txt
```

The following command will display the contents of the file */pub/log.txt* on remote host *remoteABC*.

```
show file ftp://remoteABC/pub/log.txt
```

show firewall flows

This command is obsolete.

show firewall ruledef

This command is obsolete.

show firewall statistics

This command is obsolete.

show freeze-ptmsi imsi

Displays the P-TMSI (packet-temporary mobile subscriber identify) corresponding to the IMSI (international mobile subscriber identity) that has entered a frozen state after the purge timeout timer expires.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show freeze-ptmsi imsi *imsi_num*

imsi *imsi_num*

Specifies the IMSI that has been frozen. The first three digits are the MCC (mobile country code). The next two or three digits are the MNC (mobile network code). The remaining digits are the MSIN (mobile station identification number).
imsi_num: Enter a sequence of up to 15 digits.

Usage

This command enables the operator to know whether a frozen IMSI has an associated P-TMSI.

Example

The following command displays the P-TMSI corresponding to a frozen IMSI:

show freeze-ptmsi imsi *262090426000194*

show ggsn-service

Displays configuration information for GGSN services on the system.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show ggsn-service { all | name *ggsn_svc_name* **} [| { grep** *grep_options* **| more }]**

all

Displays information for all GGSN services configured with the given context.

name *ggsn_svc_name*

Specifies the name of a specific GGSN service for which to display information.
ggsn_svc_name is the name of a configured GGSN service and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For more information on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Reference.

Usage

This command is used to verify the configuration of one or all GGSN services for monitoring or troubleshooting purposes. The output is a concise listing of GGSN service parameter settings.
If this command is executed from within the local context with the all keyword, information for all GGSN services configured on the system will be displayed.

Example

The following command displays configuration information for a GGSN service called *ggsn1*:

show ggsn-service name *ggsn1*

show ggsn-service sgsn-table

This new command is the only way to list all SGSNs by IP address and show the current number of subscribers to each SGSN.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show ggsn-service sgsn-table
```

Usage

While there are existing commands to show SGSN subscriber information, this new command is the only way to list all SGSNs by IP address and show the current number of subscribers to each SGSN.

Example

The following command will bring up a table showing the current active/inactive status, IP address, reboots/restarts and SGSN users.

```
show ggsn-service sgsn-table
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show global-title-translation

Displays configuration information for the global title translation (GTT).

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show global-title-translation { address-map *name* **| association** *name* **}**

address-map *name*

Displays GTT database. *name* must be a unique identification comprised of 1 to 63 alphanumeric characters.

association *name*

Displays GTT association list.
name: Enter a unique identification comprised of 1 to 63 alphanumeric characters.

Usage

This command displays the configuration for the GTT.

Example

The following command displays the address map called *gtt-ad1*.

show global-title-translation address-map *gtt-ad1*

show gmm-sm statistics

This command displays statistics for the GPRS Mobility Management and Session Management (GMM/SM) configuration of the system's SGSN service. GMM/SM supports mobility to allow the SGSN to know the location of a Mobile Station (MS) at any time and to activate, modify and deactivate the PDP sessions required by the MS for user data transfer.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show gmm-sm statistics [gmm-only | sm-only] [gprs-service *srvc_name* **[nsei** *nse_id* **| routing-area mcc** *mcc_id* **mnc** *mnc_id* **lac** *lac_id* **rac** *rac_id* **]] | [sgsn-service** *srvc_name* **[rnc mcc mcc** *mcc_id* **mnc** *mnc_id* **rnc-id** *rnc_id* **| routing areamcc** *mcc_id* **mnc** *mnc_id* **lac** *lac_id* **rac** *rac_id* **]] [verbose] [| { grep** *grep_options* **| more }]**

gmm-only

Enter this keyword to display only GPRS mobility management (GMM) information for other specified keyword parameters for the current context.

sm-only

Enter this keyword to display only session management (SM) information for other specified keyword parameters for the current context.

gprs-service *srvc_name*

Enter this keyword to display the statistics for the specified GPRS service. The display request can be narrowed by adding additional keywords.
srvc_name must be an alphanumeric string of 1 to 63 alphanumeric characters.

nsei

Enter this keyword to display the GMM/SM session statistics for the identified network service entity (NSEI).

sgsn-service *srvc_name*

Enter this keyword to display the statistics for the specified SGSN service. The display request can be narrowed by adding additional keywords.
srvc_name must be an alphanumeric string of 1 to 63 alphanumeric characters.

rnc

Enter this keyword to fine-tune the display of the GMM/SM session statistics just for the specified (rnc-id) radio network controller (RNC).

rnc-id *rnc_id*

Enter this keyword to identify the specific RNC.

rnc_id must be an integer from 0 through 4095.

routing-area mcc *mcc_id* **mnc** *mnc_id* **lac** *lac_id* **rac** *rac_id*

Enter the **routing-area** keyword to fine-tune the display of the GMM/SM session statistics for a specified routing area (RA) identified by the MCC, MNC, LAC and RAC.

mcc *mcc_id*

Enter this keyword to specify the mobile country code (MCC) as part of the identification of the RNC or RA. *mcc_id* must be an integer from 100 through 999.

mnc *mnc_id*

Enter this keyword to specify the mobile network code (MNC) as part of the identification of the RNC or RA. *mnc_id* must be an integer from 00 through 999.

lac *lac_id*

Enter this keyword to specify the location area code (LAC) as part of the identification of the RNC or RA. *lac_id* must be an integer from 1 through 65535.

rac *rac_id*

Enter this keyword to specify the routing area code (RAC) as part of the identification of the RNC or RA. *rac_id* must be an integer from 1 through 255.

verbose

This keyword displays all possible statistics for specified command or keyword.

grep *grep_options* **|** **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For more information on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Reference.

Usage

Use this command to display usage statistics for the GMM/SM session configurations for SGSN services, including a BSC's attaches, activations, and throughput.

Example

The following command displays GMM/SM statistics for a specific routing area defined for the GPRS service:

```
show gmm-sm statistics gprs-service gprs1 routing-area mcc 123 mcc 131
lac 24 rac 11
```

The following command displays all possible information for GMM/SM statistics:

```
show gmm-sm statistics verbose
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show gprsns

Displays the statistics or status for the 2G GPRS NS layer (link level).

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show gprsns { statistics { msg-stats { consolidated nse *nse_id* **} | nse** *nse_id* **} | sns-msg-stats } | status { nsvc-status-all nse** *nse_id* **| nsvc-status-consolidated nse** *nse_id* **| nsvc-status-per-bvci bvci** *bvc_id* **nse** *nse_id* **} }**

---

statistics

Display statistics for GPRS NS layer.

---

msg-stats

Display tx and rx message statistics (except for SNS messages) in the statistics output.

---

consolidated nse *nse_id*

nse_id: Enter an integer from 0 to 65535.

---

nse *nse_id*

Display statistics for a specific NSE.
nse_id: Enter an integer from 0 to 65535.

---

sns-msg-stats

Display SNS message statistics in the statistics output.

---

status

---

nsvc-status-all

Display statistics for all NSVC in the specified NSE.

---

nsvc-status-consolidated nse *nse_id*

---

nsvc-status-per-bvci bvci *bvc_id* **nse** *nse_id*

bvc_id: Enter an integer from 0 to 65535.
nse_id: Enter an integer from 0 to 65535.

grep *stats_type*

stats_type:

- **--ignore-case** - ignore case of letters, unless there is a capital letter
- **--invert-match** - display non matching text
- **--line-number** - display line numbers
- **-i** - ignore case of letters, unless there is a capital letter
- **-n** - display line numbers
- **-v** - display non matching text

Usage

This command is used to display the statistics and status of the NSVC.
If this command is executed from within the context that the NSE and NSVC are configured, then the display .....???????

Example

Use the following command to display status of all NSVC for NSE 1422:

show gprsns status nsvc-status-all nse *1422*

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show gprs-service

Displays the statistics of GPRS service(s) configured in a given context on the system.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show gprs-service { all | name gprs_srvc_name } [ | { grep grep_options | more }
]
```

all

Displays information for all GPRS services configured with the given context.

name *gprs_srvc_name*

Specifies the name of a specific GRPS service for which information is to be displayed.
gprs_srvc_name is the name of a configured GPRS service and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For more information on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Reference.

Usage

This command is used to verify the configuration of one or all GPRS services for monitoring or troubleshooting purposes. The output is a concise listing of GPRS service parameter settings.
If this command is executed from within the local context with the all keyword, information for all GPRS services configured on the system will be displayed.

Example

The following command displays configuration information for all GPRS services configured in this context:

```
show gprs-service all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show gs-service

Displays configuration information and statistics for Gs service configured on system.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show gs-service { all | name *svc_name* **} [| { grep** *grep_options* **| more }]**

all

Displays information for all Gs services configured with in the given context.

name *svc_name*

Specifies the name of a specific Gs service for which to display information.
svc_name is the name of a configured Gs service and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For more information on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Reference.

Usage

This command is used to verify the configuration of one or all Gs services for monitoring or troubleshooting purposes.
If this command is executed from within the local context with the all keyword, information for all Gs services configured on the system will be displayed.

Example

The following command displays configuration information for all Gs services configured on a system:

```
show gs-service all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show gtpc

Displays GTPv0, GTPv1-C, GTPv1-U information with filtering options.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show gtpc [full | counters | summary] { all | apn *apn_name* **| imsi***imsi_value* **[nsapi** *nsapi_value* **] | callid** *callid* **| sgsn-address** *ip_address* **| ggsn-service** *ggsn_name* **| user-address** *ip_address* **| username** *username* **}**

[full | counters | summary]

Specifies the level of information to be displayed. The following levels can be used:

- **full**: Indicates detailed information is to be displayed.
- **counters**: Indicates the output is to include the statistic counters.
- **summary**: Indicates only summary information is to be displayed.

{ all | apn *apn_name* **| imsi** *imsi_value* **[nsapi** *nsapi_value* **] | callid** *callid* **| sgsn-address** *ip_address* **| ggsn-service** *ggsn_name* **| user-address** *ip_address* **| username** *username* **}**

Specifies the filter criteria used when displaying GTP information. The following filters can be used:

- **all**: Specifies that all available information is to be displayed.
- **apn** *apn_name*: Specifies that GTP information for a particular APN will be displayed. *apn_name* can be from 1 to 63 alpha and/or numeric characters and is case sensitive.
- **imsi** *imsi_value* **[nsapi** *nsapi_value* **]**: Specifies that GTP information will be displayed for a particular International Mobile Subscriber Identity (IMSI). *imsi_value* is an integer value from 1 to 15 characters. Optionally, the IMSI could be further filtered by specifying a particular PDP context using the Network Service Access Point Identifier (NSAPI). *nsapi_value* is an integer value from 5 to 15.
- **callid** *callid*: Specifies that GTP information will be displayed for a particular call identification number. *callid* must be specified as a 4-byte hexadecimal number.
- **sgsn-address** *ip_address*: Specifies that GTP information for a particular SGSN will be displayed. *ip_address* is the address of the SGSN in dotted decimal notation.
- **ggsn-service** *ggsn_name:* Specifies that GTP information for a particular GGSN service will be displayed. *ggsn_name* can be from 1 to 63 alpha and/or numeric characters and is case sensitive.
- **user-address** *ip_address:* Specifies that GTP information for a particular user address will be displayed. *ip_address* is the address of the user's PDP context in dotted decimal notation.
- **username** *username:* Specifies that GTP information for a particular username will be displayed. *username* can be from 1 to 127 alpha and/or numeric characters (including wildcards ('$' and '*')) and is case sensitive.

Usage

This command displays statistics for every GTP message type based on the filter criteria. This information is useful for system monitoring or troubleshooting.

Example

The following command displays GTPC counters for a GGSN service named *ggsn1*:

```
show gtpc counters ggsn-service ggsn1
```

The following command displays GTPC full information:

```
show gtpc full
```

The following command displays GTPC summary information for a specific call identification number of *05f62f34*:

```
show gtpc summary callid 05f62f34
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show gtpc statistics

Display GTPv0, GTPv1-C, GTPv1-U statistics with filtering options.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show gtpc statistics [apn-name *apn_name* **] [custom1| custom2] [sgsn-address** *address* **] [ggsn-service** *svc_name* **] [verbose]**

apn-name *apn_name*

Specifies that GTP statistics for a particular APN will be displayed.
apn_name can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

custom1

Displays the statistics of GTP-C messages for preservation mode and free of charge service.
This keyword is customer-specific license enabled and used for Preservation-Mode and Free-of-Charge Service which are enabled under customer-specific license. For more information on this support, contact your local representative.

custom2

Displays the statistics of GTP-C messages for overcharging protection on loss of radio coverage for a GGSN service.
This keyword is feature-specific license enabled and used for subscriber overcharging protection on loss of radio coverage at the GGSN service. For more information on this support, contact your local representative.

sgsn-address *address*

Specifies that GTP statistics for a particular SGSN will be displayed.
address is the address of the SGSN in dotted decimal notation.

ggsn-service *svc_name*

Specifies that GTP statistics for a particular GGSN service will be displayed.
ggsn_name can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

verbose

Specifies that detailed statistics will be displayed.

Usage

The information displayed by this command consists of session statistics such as the number of currently active sessions categorized by PDP context type, and statistics for every GTP message type. The statistics are cumulative.

If the verbose keyword is used, additional information will be displayed such as statistics for every type of error code.

Example
The following command displays verbose GTP statistics:

```
show gtpc statistics verbose
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show gtpp accounting

Displays information on the GPRS Tunneling Protocol Prime (GTPP).

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show gtpp accounting servers
```

Usage

This command is used to view the status of GTPP accounting servers configured within a context for monitoring or troubleshooting purposes.
If this command is issued from within the local context, a information for all GTPP accounting servers configured on the system is displayed regardless of context.

Example

The following command displays the status of and information on configured GTPP accounting servers:

```
show gtpp accounting servers
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show gtpp counters

Displays GTPP counters for configured charging gateway functions (CGFs) within the given context.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show gtpp counters { all | cgf-address cgf_address }
```

all

Displays counters for all CGFs configured within the context.

cgf-address *cgf_address*

Displays counters for a specific CGF.
cgf_address is the IP address of the CGF expressed in dotted decimal notation.

Usage

Counters for a single CGF can be viewed using the **cgf-address** keyword. Counters for all CGFs in the context can be viewed by entering the command with the **all** keyword.
If this command is issued from within the local context and no CGF-address is specified, the counters displayed will be cumulative for all CGFs configured on the system regardless of context.

Example

The following command displays counters for all CGF:

```
show gtpp counters all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show gtpp group

Displays information pertaining to the configured GTPP storage server group.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show gtpp group [name *gtpp_group_name* **| all]] [| { grep** *grep_options* **| more }]**

name *gtpp_group_name*

Displays information and CDR statistics of the GTPP server group named *gtpp_group_name*. *gtpp_group_name* is name of the configured/default GTPP storage server group.

all

Displays statistics of all configured GTPP storage server group including default group.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For more information on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Reference.

Usage

Use this command to display the CDR statistics on the basis of GTPP server groups. It shows the information for all or specific GTPP server group configured in the context from which this command is issued.

Example

The following command displays the status of the GTPP server group backup server configured in a context called *GTPP_Group1*:

show gtpp group name *GTPP_Group1*

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show gtpp statistics

Displays GTPP statistics for configured CGFs within the context.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show gtpp statistics [ cgf-address cgf_address ]
```

cgf-address *cgf_address*

Specifies the IP address of a specific CGF for which to display statistics and is express in dotted decimal notation.

Usage

Statistics for a single CGF can be viewed by specifying its IP address. Statistics for all CGFs in the context can be viewed by **not** specifying an IP address.
If this command is issued from within the local context, the statistics displayed will be cumulative for all CGFs configured on the system regardless of context.

Example

The following command displays statistics for a CGF with an IP address of *192.168.1.14*:

```
show gtpp statistics cgf-address 192.168.1.14
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show gtpp storage-server

Displays information pertaining to the configured GTPP storage server.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show gtpp storage-server [counters { all | group name *name* **} | group name** *name* **| local file { counters { all | group name** *name* **} | statistics [group name** *name* **] } | status [verbose] | streaming { counters { all | group name** *name* **} | statistics [group name** *name* **] }] [| { grep** *grep_options* **| more }]**

counters

Displays counters for the external GTPP storage server.

group name *name*

Displays GTPP backup server information for the specified group.

local file

Displays statistics and counters for the local storage-server. This is the hard disk if hard disk support has been enabled with the **gtpp storage-server mode** command in the GTPP Group Configuration Mode.

statistics

Displays statistics for the GTPP storage server.

status [verbose]

Displays status of the GTPP storage server. **verbose** enables the detailed view.

streaming

Displays the status of CDRs backup on HDD while 'streaming' mode is enabled.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Cisco ASR 500 Series Command Line Interface Reference*.

Usage

Executing this command with no keywords displays status information for the GTPP backup server configured in the context from which this command is issued.

Example

The following command displays the GTPP CDR file statistics stored on the local SMC hard disk.

```
show gtpp storage-server local file counters all
```

The following command displays the status of the GTPP backup server configured in a context called ggsn1:

```
show gtpp storage-server
```

The following command displays statistics for the GTPP backup server configured in a context called ggsn1:

```
show gtpp storage-server statistics
```

The following command displays gtpp storage server counters:

```
show gtpp storage-server counters
```

The following command displays gtpp storage server status:

```
show gtpp storage-server status
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show gtpu statistics

Displays GPRS Tunneling Protocol user plane (GTP-U) statistics and counters on this system.

Product

P-GW, S-GW

Privilege

Inspector

Syntax

show gtpu statistics [gtpumgr-instance *number* **] [gtpu-service** *name* **| peer-address** *ip_address* **]**

gtpumgr-instance *number*

Displays configuration information for a specific GTP-U manager instance.
number must be an existing instance and be an integer value from 1 to 4294967295.

gtpu-service *name*

Displays GTP-U statistics and counters for a specific GTP-U service configured on this system.
name must be an existing GTP-U service, and be from 1 to 63 alpha and/or numeric characters in length.

peer-address *ip_address*

Displays GTP-U statistics and counters for a specific peer IP address.
ip_address must be an existing peer IPv4 or IPv6 address and be specified in dotted decimal notation (for IPv4) or colon-separated notation (for IPv6).

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified.
A command to send output to must be specified.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Reference Guide*.

Usage

Use this command to view statistics and counters for GTP-U traffic on this system.

Example

The following command displays statistics for the GTP-U service named *egtp1*:

show egtpu statistics gtpu-service *egtp1*

show gtpu-service

Displays configuration information for GPRS Tunneling Protocol user plane (GTP-U) services on this system.

Product

P-GW, S-GW

Privilege

Inspector

Syntax

show gtpu-service { all | name *service_name* **} [| { grep** *grep_options* **| more }]**

all

Displays configuration information for all GTP-U services configured on this system.

name *service_name*

Displays configuration information for a specific GTP-U service configured on this system.
service_name must be an existing GTP-U service, and be from 1 to 63 alpha and/or numeric characters in length.

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified.
A command to send output to must be specified.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Reference Guide*.

Usage

Use this command to view configuration information for GTP-U services on this system.

Example

The following command displays service statistics for the GTP-U service named *egtp1*:

show egtp-service name *egtp1*

Chapter 92
Exec Modes Show Commands (H-L)

This section includes the commands **`show ha-service`** through **`show logs`**.

show ha-service

Displays information on configured home agent services.

Product

HA

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show ha-service { all | name *ha_name* **} [| { grep** *grep_options* **| more }]**

all | name *ha_name*

all: indicates information on all home agent services is to be displayed.
name *ha_name*: indicates only the information for the HA service specified as *ha_name* is to be displayed.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Display home agent service configuration information.

Example

The following commands displays information on the HA service *sampleService* and all services, respectively.

```
show ha-service name sampleService
```

```
show ha-service all
```

show hardware

Displays information on the system hardware.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show hardware { card [ card_num ] | inventory | version [ board | diags | fans]
} [ | { grep grep_options | more } ]
```

card [*card_num* **]**

Provide the hardware information for all cards or the card specified by *card_num*. *card_num* must be a value in the range 1 through 48 and must refer to an installed card.

inventory

Display the hardware information for all slots in tabular format.

version [board | diags | fans]

Display the CPU information for all application cards and fan controller version for the upper and lower fan trays.
board: Only include the CPLD and FPGA version information.
diags: Only include the CFE diagnostics version information.
fans: Show the fan controller versions for the upper and lower fan trays.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Show the hardware information to verify part lists and hardware component versions with reserve stock

Example

The following displays the hardware information for a card installed in slot *1*.

```
show hardware card 1
```

The following command displays the hardware inventory for the entire chassis.

```
show hardware inventory
```

The following command results in the display of the CPU version for all application cards displaying only the CPLD and FPGA information.

```
show hardware version board
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show hd raid

Shows the output of the RAID established on the ASR 5000 SMCs.

Product

All

Privilege

Security Administrator, Administrator, Administrator, Operator

Syntax

```
show hd raid [ verbose ]
```

Example

```
show hd raid verbose
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show hd-storage-policy

Displays ACR counter and statistic information.

Product

HSGW, P-GW, S-GW

Privilege

Inspector

Syntax

show hd-storage-policy { all | counters [all] [name *name* **] [verbose] | name** *name* **| statistics [all] [name** *name* **] [verbose] }**

all

Specifies that ACR information for all HD storage policies configured on the system is to be displayed.

counters [all] [name *name* **] [verbose]**

Specifies that ACR counter information for HD storage policies configured on the system is to be displayed.

name *name*

Specifies that ACR information for an HD storage policy with the specified name is to be displayed.

statistics [all] [name *name* **] [verbose]**

Specifies that ACR statistic information for HD storage policies configured on the system is to be displayed.

verbose

Displays HD storage statitics based on instance.

Usage

Use this command to display ACR counter and statistic information.

Example

The following command displays ACR statistic information for an HD storage policy named *pgwsgw*:

show hd-storage-policy statistics name *pgwsgw*

show hnbgw counters

This command displays the session counter information for Home-NodeB Gateway (HNB-GW) services and HNBs connected on this system.

Product

HNB-GW

Privilege

Inspector

Syntax

show hnbgw counters [hnbgw-service *service_name* **| hnbid** *hnb_identifier* **] [| { grep** *grep_options* **| more }]**

hnbgw-service *service_name*

This keyword is used to filter the counter display based on the HNB-GW service name *service_name* configured and running on this system.
service_name must be an existing HNB-GW service, and be from 1 to 63 alpha and/or numeric characters in length.

hnbid *hnb_identifier*

This keyword is used to filter the counter display based on Home-NodeB *hnb_identifier* which is connected to this system with HNB-GW service and in active or dormant state.
hnb_identifier must be an identifier for HNB from 1 to 255 alpha and/or numeric characters in length.

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified.
A command to send output to must be specified.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section in *Command Line Interface Overview* chapter of the *Command Line Interface Reference*.

Usage

Use this command to view the session counter information for HNB-GW services configured and HNBs connected on this system.

Example

The following command displays the counters for the HNB-GW service named *hnbgw1*:

show hnbgw counter hnbgw-service *hnbgw1*

show hnbgw statistics hnbgw-service

This command displays the session statistics for Home-NodeB Gateway (HNB-GW) services configured and running on this system.

Product

HNB-GW

Privilege

Inspector

Syntax

show hnbgw statistics hnbgw-service *service_name* **[hnbap-only | ranap-only | rua -only | sccp-only | sctp-only] [verbose] [| { grep** *grep_options* **| more }]**

hnbgw-service *service_name*

This keyword is used to filter the session statistics display based on the HNB-GW service name *service_name* configured and running on this system.
service_name must be an existing HNB-GW service, and be from 1 to 63 alpha and/or numeric characters in length.

hnbap-only

This keyword is used to filter the session statistics display limited to Home NodeB Application Part (HNBAP) traffic only for selected HNB-GW service which is configured and running on this system.

ranap-only

This keyword is used to filter the session statistics display limited to Radio Access Network Application Protocol (RANAP) traffic only for selected HNB-GW service which is configured and running on this system.

rua-only

This keyword is used to filter the session statistics display limited to RANAP User Adaptation (RUA) traffic only for selected HNB-GW service which is configured and running on this system.

sccp-only

This keyword is used to filter the session statistics display limited to Signaling Connection Control Part (SCCP) traffic only for selected HNB-GW service which is configured and running on this system.

sctp-only

This keyword is used to filter the session statistics display limited to Stream Control Transmission Protocol (SCTP) traffic only for selected HNB-GW service which is configured and running on this system.

verbose

This keyword is used to display the detailed statistics for all sessions on HNB-GW services or for selected filter and named HNB-GW service which is configured and running on this system.

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified.
A command to send output to must be specified.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section in *Command Line Interface Overview* chapter of the *Command Line Interface Reference*.

Usage

Use this command to view the session statistics for overall session or in selected part of user session for HNB-GW services configured and running on this system.

Example

The following command displays the session statistics for HNBAP part of session details for the HNB-GW service named *hnbgw1*:

```
show hnbgw statistics hnbgw-service hnbgw1 hnbap-only
```

The following command displays the session statistics for RANAP part of session with maximum details for the HNB-GW service named *hnbgw1*:

```
show hnbgw statistics hnbgw-service hnbgw1 ranap-only verbose
```

show hnbgw statistics hnbid

This command displays the session statistics for Home-NodeB (HNB) connected to an HNB-GW service on this system.

Product

HNB-GW

Privilege

Inspector

Syntax

```
show hnbgw statistics hnbid hnb_identifier [ hnbap-only | ranap-only | rua -
only] [ verbose] [ | { grep grep_options | more } ]
```

hnbid *hnb_identifier*

This keyword is used to filter the session statistics display based on Home-NodeB *hnb_identifier* which is connected to this system through an HNB-GW service.
hnb_identifier must be an identifier for HNB from 1 to 255 alpha and/or numeric characters in length.

hnbap-only

This keyword is used to filter the session statistics display limited to Home NodeB Application Part (HNBAP) traffic only for selected HNB which is connected to this system through HNB-GW service.

ranap-only

This keyword is used to filter the session statistics display limited to Radio Access Network Application Protocol (RANAP) traffic only for selected HNB which is connected to this system through HNB-GW service.

rua-only

This keyword is used to filter the session statistics display limited to RANAP User Adaptation (RUA) traffic only for selected HNB which is connected to this system through HNB-GW service.

verbose

This keyword is used to display the detailed statistics for all HNB sessions or for selected filter and HNB which is connected to this system through HNB-GW service.

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified.
A command to send output to must be specified.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section in *Command Line Interface Overview* chapter of the *Command Line Interface Reference*.

Usage

Use this command to view the session statistics for overall session or in selected part of user session for selected HNB which is connected to this system through HNB-GW service..

Example

The following command displays the session statistics for HNBAP part of session details for the HNB having *hnb112234* as identifier on this system:

```
show hnbgw statistics hnbid hnb112234 hnbap-only
```

The following command displays the detailed session statistics for RANAP part of session details for the HNB having *hnb112234* as identifier on this system:

```
show hnbgw statistics hnbid hnb112234 ranap-only verbose
```

show hnbgw-service

This command displays the configuration details for configured HNB-GW service(s) on this system.

Product

HNB-GW

Privilege

Inspector

Syntax

show hnbgw-service { all | hnbgw-service *service_name* **}**

all

This keyword is used to display the configuration and other default parameters for all HNB-GW service configured on this system.

hnbgw-service *service_name*

This keyword displays the configuration and default parameters for specific HNB-GW service name *service_name* which is configured and running on this system.
service_name must be an existing HNB-GW service, and be from 1 to 63 alpha and/or numeric characters in length.

Usage

Use this command to view the configuration and service parameters set for all or any specific HNB-GW service(s) on this system.

Example

The following command displays the configured and default paramters for all HNB-GW services configured on this system:

```
show hnbgw-service all
```

show hsgw-service

Displays configuration information for HRPD Serving Gateway (HSGW) services on this system.

Product

HSGW

Privilege

Inspector

Syntax

show hsgw-service { all | name *service_name* **} [| { grep** *grep_options* **| more }]**

all

Displays configuration information for all HSGW services configured on this system.

name *service_name*

Displays configuration information for a specific HSGW service configured on this system.
service_name must be an existing HSGW service, and be from 1 to 63 alpha and/or numeric characters in length.

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified.
A command to send output to must be specified.
For details on the usage of the **grep** and **more** commands, refer to the Regulating a Command's Output section of Chapter 1 of the Command Line Interface Reference Guide.

Usage

Use this command to view configuration information for HSGW services on this system.

Example

The following command displays service statistics for the HSGW service named *hsgw1*:

show hsgw-service name *hsgw1*

show ims-authorization policy-control

Displays information and statistics specific to the policy control in IP Multimedia Subsystem (IMS) authorization service.

Product

SCM, GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show ims-authorization policy-control statistics [ service ims_auth_svc_name |
server { ip-address ip_address [ port port_value ] | name server_name } ] [ | {
grep grep_options | more } ]
```

statistics

Displays the total collected statistics of all policy control parameters of IMS authorization service sessions since the last system restart or clear command.

service *ims_auth_svc_name*

Displays the total collected statistics of all IMS authorization sessions processed by a specific IMS authorization service since the last system restart or clear command. *ims_auth_svc_name* must be an existing IMS authorization service name.

server { ip-address *ip_address* **[port** *port_value* **] | name** *server_name* **}**

Displays the server-level message statistics and the server IP address.
Specify the PCRF server IP address or server name.

grep *grep_options* **| more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

Use this command to display information and statistics about policy control configuration in existing IMS authorization services.

Example

The following command displays the existing IMS authorization service name *ims_auth_gx1* on the system:

```
show ims-authorization policy-control statistics service ims_auth_gx1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show ims-authorization policy-gate

Displays information of installed Policy Gates for specific subscriber in IP Multimedia Subsytem (IMS) authorization service.

Product

SCM, GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show ims-authorization policy-gate { { status [summary | full] [{ imsi *imsi_value* **[nsapi** *nsapi_value* **] } | callid** *call_id* **| { ims-auth-service** *ims_auth_svc* **} [rulename** *rule_name* **] } | { counters [all | { imsi** *imsi_value* **[nsapi** *nsapi_value* **] } | { rulename** *rule_name***} | { callid** *call_id* **}] } [| { grep** *grep_options* **| more }]]**

status [summary | full]

This option displays the status of the installed policy gates and their flow definitions along with the run-time status in an IMS authorization service based on the specified criteria.
summary: limits the display to a summary on status of the installed policy gates and their flow definitions along with the run-time status in an IMS authorization service based.
full: displays the full information on status of the installed policy gates and their flow definitions along with the run-time status in an IMS authorization service based.

counters all

This option displays the counters/statistics of the installed policy gates and their flow definitions along with the run-time status in an IMS authorization service based on the specified criteria.
all displays the all counters of the installed gates and their flow definitions along with the run-time status in an IMS authorization service based.

imsi *imsi_value [* **nsapi** *nsapi_value]*

This option displays all of the counters/status of the installed policy gates and their flow definitions along with the run-time status in an IMS authorization service based on the specified International Mobile Subscriber Identity (IMSI) named *imsi_value*.
nsapi *nsapi_value* specifies Network Service Access Point Identifier (NSAPI) named *nsapi_value* to limit the display to a single PDP context of the subscriber.

callid *call_id*

This option displays all of the counters/status of the installed policy gates and their flow definitions along with the run-time status in an IMS authorization service based on the specified call identifier named *call_id*.

ims-auth-service *ims_auth_svc*

This option displays status of the installed policy gates and their flow definitions along with the run-time status in an IMS authorization service named *ims_auth_svc*.

rulename *rule_name*

This option displays all of the counters/status of the installed policy gates and their flow definitions along with the run-time status in an IMS authorization service based on the specific dynamic charging rule named *rule_name*.

grep *grep_options* **|** **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
Please refer to the *Regulating a Command's Output* section of the *Command Line Interface Reference* for details on the usage of **grep** and **more**.

Usage

Use this command to display information/statistics/counters about all of the installed policy gates and their flow definitions along with the run-time status with specified criteria and filters in existing IMS authorization services.

Example

The following command displays the full status of the installed policy gates in an existing IMS authorization service on the system:

```
show ims-authorization policy-gate status full
```

The following command displays the all counters of the installed policy gates in an existing IMS authorization service on the system:

```
show ims-authorization policy-gate counters all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show ims-authorization servers

Displays information and statistics specific to the authorization servers used for IP Multimedia Subsytem (IMS) authorization service.

Product

SCM, GGSN

Privilege

Security Administrator, Administrator

Syntax

show ims-authorization servers [ims-auth-service *ims_auth_svc_name* **[| { grep** *grep_options* **| more }]]**

server [ims-auth-service *ims_auth_svc_name* **]**

Displays the information and statistics of all authorization servers configured for IMS authorization service in a system.
ims-auth-service *ims_auth_svc_name*: Displays the configured authorization servers for IMS authorization for an IMS authorization service named *ms_auth_svc_name*.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
Please refer to the *Regulating a Command's Output* section of the *Command Line Interface Reference* for details on the usage of **grep** and **more**.

Usage

Use this command to display information and statistics about IMS authorization servers configured on a system or IMS authorization service.

Example

The following command displays the information and statistics of the authorization servers in IMS authorization service named *ims_auth_gx1*:

show ims-authorization servers ims-auth-service *ims_auth_gx1*

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show ims-authorization service

Displays information, configuration, and statistics of all/specific IP Multimedia Subsytem (IMS) authorization service.

Product

SCM, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
show ims-authorization service { { all [ verbose ] | name ims_auth_svc_name |
summary ] } | { statistics [ all | name ims_auth_svc_name ] [ verbose ] } [ | {
grep grep_options | more } ]
```

all [verbose]

Displays information and configuration of all configured IMs authorization services with a single line of information for each IMS authorization service.
verbose: Displays all information and configuration data of every IMS authorization services configured on system.

name *ims_auth_svc_name* **]**

Displays the information, statistics, and configuration data of an IMS authorization service named *ms_auth_svc_name*.

summary

Displays summarized information and configuration data of all IMS authorization services configured in a system.

statistics [all | name *ims_auth_svc_name* **] [verbose]**

Displays the IMS Authorization service statistics including following information:

- Initial authorization procedures
- Re-authorization procedures initiated by us
- Re-authorization procedures initiated by servers
- Various failure statistics

If no criteria specified summarized statistics of all IMS Authorization services are displayed

- **all**: displays individual statistics for every IMS authorization service configured on system.
- name *ims_auth_svc_name*: Displays the statistics of the IMS authorization service named *ims_auth_svc_name*
- verbose: displays the detailed statistics of a configured IMS authorization service.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

Please refer to the Regulating a *Regulating a Command's Output* section of the *Command Line Interface Reference* for details on the usage of **grep** and **more**.

Usage

Use this command to display the IMS Authorization service status, counters and configuration. The status includes the state of a server table switchover. Statistics option is used for various processes and procedure status.

Example

The following command displays the information and configuration data of the IMS authorization service named *ims_auth_gx1*:

```
show ims-authorization service name ims_auth_gx1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show ims-authorization sessions

Displays information, configuration, and statistics of sessions active in IP Multimedia Subsystem (IMS) authorization service.

Product

SCM, GGSN

Privilege

Security Administrator, Administrator

Syntax

show ims-authorization session [full | summary] | [all | [ims-auth-service *ims_auth_svc_name* **| imsi** *imsi_value* **[nsapi** *nsapi_value* **] | apn** *apn_name* **| ip-address** *ip_address* **| callid** *call_id* **] [| { grep** *grep_options* **| more }]**

full

Displays complete information and configuration data of all sessions in IMS authorization services configured in a system.

summary

Displays summarized information and configuration data of all sessions in IMS authorization services configured in a system.

all

Displays information and configuration of all sessions running in IMS authorization services with a single line of information for each IMS authorization session.

ims-auth-service *ims_auth_svc_name* **]**

Displays the information, statistics, and configuration data of sessions in an IMS authorization service named *ms_auth_svc_name*.

imsi *imsi_value [* **nsapi** *nsapi_value]*

This option displays all of the counters/status of the running services in an IMS authorization service based on the specified International Mobile Subscriber Identity (IMSI) named *imsi_value*.
nsapi *nsapi_value* specifies Network Service Access Point Identifier (NSAPI) named *nsapi_value* to limit the display to a single PDP context of the subscriber.

apn *apn_name*

This option displays all of the counters/status of the running services in IMS authorization service based on the access point name (APN) named *apn_name*.

ip-address *ip_address*

This option displays all of the counters/status of the running services in IMS authorization service based on the host IP address having IP address value as *ip_address*.

callid *call_id*

This option displays all of the counters/status of the running services in IMS authorization service based on the specified call identifier named *call_id*.

summary

Displays summarized information and configuration data of all IMS authorization services configured in a system.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
Please refer to the Regulating a *Regulating a Command's Output* section of the *Command Line Interface Reference* for details on the usage of **grep** and **more**.

Usage

Use this command to display the sessions running under IMS Authorization service on a system with different filter criteria.

Example

The following command displays the information and statistical data of a session in IMS authorization service:

```
show ims-authorization sessions full
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show ip

Displays information for the IP-based interfaces' access group and access list information along with address resolve protocol information for the current context.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show ip { access-group [*statistics*] **| access-list [** *list_name* **] | arp [** *arp_ip_address* **] | [summary] | statistics]] | localhosts [** *host_name* **] | prefix-list [detail [** *list_name* **] | name** *list_name* **| summary [** *list_name* **]] | rip | route [** *route_ip_address* **[** *route_gw_address* **]] | static-route** *sroute_ip_address* **[** *sroute_gw_address* **] | vrf** *vrf-name***} [| { grep** *grep_options* **| more }]**

access-group [*statistics* **]**

Displays all configured access groups in the current context along with the priority values.
statistics: Displays all configured access groups along with packet and byte counters for each ACL rule hit for the current context. In addition, it shows the priority values.

access-list [*list_name* **]**

Indicates the output is to display the information for all access control lists or the list specified as *list_name*.

arp [*arp_ip_address* **]**

Displays the address resolution protocol table or the ARP information associated with the IP address specified as *arp_ip_address*. *arp_ip_address* must be specified using the standard IPv4 dotted decimal notation.

Important: When the VPN Manager restarts, it removes all interfaces from the kernel and thus the kernel removes all ARP entries. When this happens, the NPU still holds all of the ARP entries so that there is no traffic disruption. When this happens, from a user point of view, **show ip arp** is broken since this command gathers information from the Kernel and not the NPU.

localhosts [*host_name* **]**

Displays all the local host information or only for the host specified as *host_name*.

prefix-list [detail [*list_name* **] | name** *list_name* **| summary [** *list_name* **]]**

This keyword list information on configured IP prefix lists. With no keyword supplied, a list of all prefix lists and their entries is displayed.

detail [*list_name* **]**: Lists detailed information for all prefix lists and their entries. If a list name is specified only the details for the specified prefix list are displayed. *list_name* must be a string of from 1 through 79 alpha and/or numeric characters.
name *list_nam*: Lists the entries for a specified prefix list. *list_name* must be a string of from 1 through 79 alpha and/or numeric characters.
summary [*list_name* **]**: Lists summary information for all prefix lists and their entries. If a list name is specified only the summary for the specified prefix list are displayed. *list_name* must be a string of from 1 through 79 alpha and/or numeric characters.

rip

Displays general RIP routing process information. (RIP is not supported at this time.)

route [*route_ip_address* **[** *route_gw_address* **]]**

Indicates the route information to the address specified by *route_ip_address* is to be displayed. The route gateway address may be specified as needed to identify the route. *route_ip_address* and *route_gw_address* must be specified using the standard IPv4 dotted decimal notation.

static-route *sroute_ip_address* **[** *sroute_gw_address* **]**

Displays the static route information for the address specified by *sroute_ip_address* is to be displayed. The static route gateway address may also be specified to identify the route. *sroute_ip_address* and *sroute_gw_address* must be specified using the standard IPv4 dotted decimal notation.

vrf *vrf_name*

Displays the routing information of the VRF. *vrf_name is* a name used to identify a VRF.

grep *grep_options* **|** **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Show the IP information to verify and/or troubleshooting communication difficulties between to a remote host/node.

Example

The following command displays the ACL for the list named *sampleACL*.

```
show ip access-list sampleACL
```

The following command will output the static route information to remote host *1.2.3.4*.

```
show ip static-route 1.2.3.4
```

show ip as-path-access-list

Displays the contents of a BGP router AS path access list in the current context.

Product

HA

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show ip as-path-access-list *list_name*

list_name

The name of an existing AS path access list configured in the current context. must be an alpha and or numeric string from 1 through 79 characters in length.

Usage

Use this command to display the configured entries for the specified BGP router AS path access list in the current context.

Example

The following command displays the contents of an AS path access list named *ASlist1*:

show ip as-path-access-list *ASlist1*

show ip bgp

Disp[lays BGP information for the current context.

Product

HA

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show ip bgp [*ip_address/mask* **|** **debugging** **|** **filter-list** *list_name* **|** **neighbors [** *ip_adrress* **]** **|** **route-map** *map_name* **|** **vpnv4 { all [** **network** **|** **neighbors** **|** **summary** **]** **|** **vrf vrf-name [** **network** **]** **|** **route-distinguisher [** **network** **|** **neighbors** **|** **summary** **]** **}** **[** **|** **{** **grep grep_options** **|** **more** **}** **]**

ip_address/mask

Specify the IP address and netmask bits for the network for which information should be displayed. *ip_address* is an IPv4 address in dotted-decimal notation and *mask* is the number of subnet bits, representing a subnet mask in shorthand. These must be entered in the dotted-decimal notation/subnet bits format (1.1.1.1/24).

debugging

Display debug flags that are enabled.

filter-list *list_name*

Display routes that match the specified filter list.

neighbors [*ip_address*]

Display information for all neighbors or a specified neighbor. i*p_address* is an IPv4 address in dotted-decimal notation

route-map *map_name*

Display routes that match the specified route-map.

vpnv4 { all [network | neighbors | summary] | vrf vrf-name [network] | route-distinguisher [network | neighbors | summary] }

Display all VPNv4 routing data, routing data for a VRF, or a route-distinguisher.

- **all**: displays all VPN routing information. If this is specified, the information displayed is gathered from all the VRF's known to BGP and displayed. It could contain the list of neighbors, the list of networks, or a particular network
- **network**: displays the network for which information in the BGP routing table.
- **neighbors**: shows neighbor information for the all the vrfs including the default vrf or for the VRF with a matching RD value.
- **summary**: shows summary information of neighbors for all the vrfs including the default vrf or for the VRF with a matching RD value.

- **vrf vrf name**: name used to identify a VRF. Information is only gathered from the corresponding VRF. If there is no such VRF, an error is reported.
- **network**: displays the network for which information in the BGP routing table.
- **route-distinguisher**: If specified along with the RD value, the information displayed is gathered from the corresponding VRF whose RD value is the same as the specified value. If there is no VRF associated with such an RD, an error is reported.
- **network**:displays the network for which information in the BGP routing table.
- **neighbors**:shows neighbor information for the all the vrfs including the default vrf or for the VRF with a matching RD value.
- **summary**:shows summary information of neighbors for all the vrfs including the default vrf or for the VRF with a matching RD value.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command display to BGP information for the current context.

Example

The following command displays information for all BGP neighbors:

```
show ip bgp neighbors
```

show ip interface

This command displays the statistical and configuration information for the IP-based interfaces including VRF table for specific context.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show ip interface [vrf *vrf-name* **] [name** *intfc_name* **[statistics] [tunnel [gre-keepalive]] [summary] [| { grep** *grep_options* **| more }]**

vrf *vrf_name*

Displays the routing information of the VRF. *vrf_name is* a name used to identify a VRF.

name *intfc_name*

Indicates the name of the interface for which information has to be displayed. If no interface name is specified then information for all IP interfaces is displayed.
ntfc_name is name of the configured IP interface.

tunnel [gre-keepalive]

This keyword will filter the IP interface information for tunnel type of interfaces.
It is applicable for GRE/IP-in-IP type of tunnel interfaces only.
gre-keepalive: This optional keyword displays the GRE keepalive information for GRE tunnel configured with this IP interface.

statistics

Displays the session statistics of all ingress and egress packets processed through this IP interface.

summary

Displays summarized information about requested IP interface/s.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to display the summarized of detailed configuration and statistical information for configured IP interface. This information can be used to verify and/or troubleshooting communication difficulties between to a remote host/node.

Example

The following command displays the interface information, including statistics, for the IP interface *sampleInterface*.

```
show ip interface sampleInterface statistics
```

The following command displays the GRE keepalive information for an IP interface named *IP_gre1*.

```
show ip interface IP_gre1 tunnel gre-keepalive
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show ip ospf

This command displays OSPF routing information.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show ip ospf [border-routers | database [verbose] [ls-id *ip_addr* **] [adv-router** *ip_addr* **] [ls-type { router | network | summary | asbr-summary | external | nssa |** *integer* **}] | debugging | interface | neighbor [details] | route | virtual-links]**

border-routers

Displays all known area border routers (ABRs) and Autonomous System border routers (ASBRs) for OSPF.

database [verbose] [ls-id *ip_addr* **] [adv-router** *ip_addr* **] [ls-type { router | network | summary | asbr-summary | external | nssa |** *integer* **}]**

Displays a summary of the database information for OSPF.
verbose: Display detailed OSPF database information.
ls-id *ip_addr*: Display OSPF database information for the LSAs with the specified LSID.
adv-router *ip_addr*: Display OSPF database information for the advertising router with the specified LSID.
ls-type { router | network | summary | asbr-summary | external | nssa | *LSA_Numerical_Type* **}]**: Display OSPF database information for the specified LSA type.

debugging

Lists which debugging parameters are enabled.

interface

Displays interface information for OSPF.

neighbor [details]

Displays summary information about all known OSPF neighbors.
details: Displays detailed information about all known OSPF neighbors.

route [summary]

Displays the OSPF routing table.
summary: Displays the number of intra-area, inter-area, external-1 and external-2 routes.

virtual-links

Displays the OSPF virtual links.

Usage

Use this command to display OSPF information.

Example

To display general OSPF information, enter the following command;

```
show ip ospf
```

show ip policy-forward

Displays information for IP packet redirecting policy for HA.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show ip policy-forward
```

Usage

Use this command to see all the settings for IP packet redirection configuration from existing HA to new HA during upgrade.

Important: It is a customer specific command.

Example

The following command displays forward policy configuration for an HA:

```
show ip policy-forward
```

show ip pool

This command displays statistics specific to IP pools.

Product

PDSN, GGSN, HA, ASN-GW, A-BG

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show ip pool [address {pool-name *pool_name* **| group-name** *group_name* **} { used | free | hold | release } [limit** *limit* **] | group-name** *group_name* **| groups | hold-timer { imsi** *imsi* **| msid** *msid* **| username** *username* **[imsi** *imsi* **| msid** *msid* **] } | overlap | pool-name** *pool_name* **| private | public | resource | static | summary | verbose | wide]**

---

address { pool-name *pool_name* **| group-name** *group_name* **} { used | free | hold | release} [limit** *limit* **]**

Displays IP pool addresses for the specified IP pool or pool group that are currently in the specified state.
pool-name *pool_name*: Show IP addresses from the IP pool with the specified name. *pool_name* must be the name of an existing IP pool.
group-name *group_name*: Show IP addresses from the IP pool group with the specified name. *group_name* must be the name of an existing IP pool group.
used: Display the IP addresses that are in a used state.
free: Display the IP addresses that are in a free state.
hold: Display the IP addresses that are in a hold state.
release: Display the IP addresses that ar4e in a release state.
limit *limit*: The maximum number of address to display. *limit* must be an integer from 1 through 524287.

---

group-name *group_name*

Show information about the IP pool group with the specified name. *group_name* must be the name of an existing IP pool group.

---

groups

List information about all IP pool groups.

---

hold-timer {imsi *imsi* **| msid** *msid* **| username** *username* **[imsi** *imsi* **| msid** *msid***]}**

Displays hold timer address information for the specified IMSI, MSID, or username.
imsi *imsi:* The IMSI for which to display hold-timer information. *imsi* must be a valid IMSI (International Mobile Subscriber Identity) ID which is a 15 character field that identifies the subscriber's home country and carrier.
msid *msid*: The MSID for which to display hold-timer information. *msid* must be a mobile subscriber ID from 7 through 16 digits.
username *username*: The username for which to display hold-timer information. *username* must be an alpha and or numeric string of from 1 through 127 characters.

Important: Active users cannot be displayed. If an active ID or username is entered, the following error message appears: Failure: No address matching the specified information was found! Please confirm that the options used match the network architecture/deployment,i.e. IMSI/MSID only, Username only, or IMSI/MSID plus Username. Please note that this command does not apply for addresses in the used state.

overlap

List information on overlapping IP pools

pool-name *pool_name*

Show information about the specified IP pool. *pool_name* must be the name of an existing IP pool.

private

Show information about IP pools marked private.

public

Show information about IP pools marked public.

resource

Show information about resource IP pools.

static

Show information about static IP pools.

summary

Show a summary of all IP pool information.

verbose

Show detailed information about all IP pools.

wide

Show detailed information formatted to more than 80 columns.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to display statistics pertaining to IP Pools in the current context.

Example

The following command displays IP address information for an IP Pool named *pool1*:

```
show ip pool address pool-name pool
```

To display a summary list for all IP pools in the current context, enter the following command:

```
show ip pool summary
```

The following command displays IP pool information for all IP pools configured in the current context:

```
show ip pool verbose
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show ip ipsp

Displays the names of IP pools that are enabled for the IP pool sharing protocol (IPSP) and lists the disposition of addresses in the pools.

Product

PDSN, HA, ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
showipipsp [ summary ]
```

summary

Only show the disposition of the addresses in the participating IP pools. Do not show the names of the participating IP pools.

Usage

Use this command to list the names of IP pools that are participating in the IPSP and list the disposition of IP addresses in those pools.

Important: For information on configuring and using IPSP refer to the System Administration and Configuration Guide.

Example

To list information on al IPSP participating pools and address disposition, enter the following command:

```
show ip ipsp
```

show ipms status

Displays the status of IPMS client service with information related to system and call events. It also displays the status of IPMS servers configured.

Product

IPMS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax **show ipms status [summary | all | server address** *ip_address* **]**

summary

Displays the summary of all configured IPMS client and IPMS servers.

all

Displays information for all configured IPMS client and IPMS servers.

server address *ip_address*

Displays status for a specific IPMS server.
ip_address is the IP address of the desired IPMS server and must be entered in IPv4 dotted decimal notation.

Usage

This command is used to show/verify the status or configuration of one or all IPMS server along with system and call event information.

Example

The following command displays status of an IPMS server with IP address *1.2.3.4*:

show ipms status server address *1.2.3.4*

show ipsg

Displays information and statistics specific to the IP Services Gateway service.

Product

IPSG

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show ipsg { service { all [counters] | name *name* **} | sessions { all | callid** *num* **| counters {** *criteria* **} | full {** *criteria* **} | ip-address** *address* **| msid** *num* **| peer-address** *address* **| summary {** *criteria* **} | username** *name* **} | statistics [name** *name* **| peer-address** *address* **] } [| { grep** *grep_options* **| more }]**

---

service { all [counters] | name *name* **}**

Displays information about the configured IPSG service.
all [counters]: Displays information about all of the configured IPSG services on the system.
name *name*: Displays information about a specific IPSG service on the system. *name* must be an existing IPSG service name.

---

sessions { all | callid *num* **| counters {** *criteria* **} | full {** *criteria* **} | imsi** *num* **| ip-address** *address* **| msid** *num* **| peer-address** *address* **| summary { criteria } | username** *name* **}**

all: Displays session information including call ID, NAI, and home address for all current IPSG sessions. This is the default behavior for the **sessions** keyword.
callid *num*: Displays session information for a current IPSG session based on the call ID. *num* must be an existing IPSG service session call ID.
counters { *criteria* }: Displays session counters for sessions matching the criteria. (See *criteria* below.)
full { *criteria* }: Displays all available session information for sessions matching the criteria. (See *criteria* below.)
ip-address *address*:
msid *num*: Displays session information for a current IPSG session based on the MSID. *num* must be an existing IPSG service session MSID.
peer-address *address*: Displays session information for a current IPSG session based on the IP address of the device sending the RADIUS accounting messages. *address* must be an existing IPSG service session IP address for the device sending the RADIUS accounting messages.
summary { *criteria* }: Displays a summary of available session information for sessions matching the criteria. (See *criteria* below.)
username *name*: Displays session information for a specific IPSG session based on the username of the subscriber. *name* must be an existing IPSG service session subscriber username.
criteria:
all: Displays session information for all exisitng IPSG service sessions.
callid *num*: Displays session information for a specific IPSG session based on the call ID. *num* must be an existing IPSG service session call ID.
ip-address *address*: Displays session information for a specific IPSG session based on the IP address of the subscriber. *address* must be an existing IPSG service session subscriber IP address.

msid *num*: Displays session information for a specific IPSG session based on the MSID. *num* must be an existing IPSG service session MSID.
peer-address *address*: Displays session information for a current IPSG session based on the IP address of the device sending the RADIUS accounting messages. *address* must be an existing IPSG service session IP address for the device sending the RADIUS accounting messages.
username *name*: Displays session information for a specific IPSG session based on the username of the subscriber. *name* must be an existing IPSG service session subscriber username.

statistics [name *name* **| peer-address** *address* **]**

Displays the total collected statistics of all IPSG sessions since the last system restart or clear command.
name *name*: Displays the total collected statisitcs of all IPSG sessions processed by a specific service since the last system restart or clear command. *name* must be an existing IPSG service name.
peer-address *address*: Displays the total collected statistics of all IPSG sessions associated with a specific IP address of the device responsable for sending the RADIUS accounting messages. Displayed statistics are from the last system restart or clear command.

grep *grep_options* **| more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

Use this command to display information and statistics about existing IPSG services.

Example

The following command displays the existing IPSG services on the system:
show ipsg service all
The following command displays all the existing IPSG service sessions on the system:

```
show ipsg session all
```

The following command displays the cumulative IPSG session statistics on the system:

```
show ipsg statistics
```

The following command displays the cumulative IPSG session statistics on the system for an IPSG service named *ipsg1*:

```
show ipsg statistics name ipsg1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show ipv6

Displays the statistics for each rule in an IPv6 access control group.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show ipv6 access-group

show ipv6 { access-group [*statistics* **] | access-list [** *list_name* **] | interface [summary | name** *interface_name* **[statistics] | neighbors | route** *route_ip_address* **}**

access-group [*statistics* **]**

Displays all configured access groups in the current context along with the priority values.
statistics: Displays all configured access groups along with packet and byte counters for each IPv6 ACL rule hit for the current context. In addition, it shows the priority values.

access-list [*list_name* **]**

Indicates the output is to display the information for all access control lists or the list specified as *list_name*.

interface [summary | name *interface_name* **[statistics]**

This command displays information about IPv6 interfaces. If no interface name is specified then information for IPv6 interfaces is displayed.
summary: Displays a summary of the interface information.
name *interface_name*: Displays information for the IPv6 interface specified. Must be followed by an *interface_name*.
statistics: Includes the number on inbound and outbout IP packets statistics that were registered by the kernel in the information displayed.

neighbors

Displays the neighbor discovery table for this context.

route *route_ip_address*

Indicates the route information to the address specified by *route_ip_address* is to be displayed. The route gateway address may be specified as needed to identify the route. *route_ip_address* using colon (:) separated notation.

Usage

Show the IPv6 information to verify and/or troubleshoot communication difficulties between to a remote host/node.

Example

The following command displays the ACL for the list named *sampleACL*.

```
show ipv6 access-list samplev6ACL
```

The following command displays the interface information, including statistics, for the IPv6 interface *samplev6Interface*.

```
show ipv6 interface samplev6Interface statistics
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show ipv6 pool

Displays information for ipv6 pools.

Product

PDSN, GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show ipv6 pools [name *ipv6 pool name* **| group-name** *name* **| { grep** *grep_options* **| more }]**

name *ipv6 name*

Displays information for a specified ipv6 pool.

group-name *name*

Displays information for a specified IPv6 pools group.
name is the name of the group of IPv6 pool and must be a string having 1 to 79 alpha and/or numeric characters.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to see all the ipv6 pools.

Example

The following command displays ipv6 pool information:

show ipv6 pools

show iups-service

This command displays information for Iu-PS services in the current context.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show iups-service { all | name *srvc_name* **} [rnc { all | mcc** *mcc_num* **mnc** *mnc_num* **| rnc_id }]**

all

Show information for all IuPS services.

name *srvc_name*

srvc_name: must be a string of 1 to 63 alphanumeric characters that identifies a specific existing IuPS service.

rnc all

Displays information for all configured RNCs.

rnc mcc *mcc_num* **mnc** *mnc_num*

Displays information for a specific RNC.

- *mcc_num:* The Mobile Country Code (MCC) of the RNC. Must be a 3 digit integer from 200 through 999.
- *mnc_num:* The Mobile Network Code (MNC) of the RNC. Must be a 2 or 3 digit integer from 00 through 999.

rnc *rnc_id*

rnc_id: The identification number of the RNC configuration instance. Must be an integer from 0 to 4095.

Usage

Use this command to display information for a specific Iu-PS service or for all Iu-PS services configured within the context. It is also possible, but not required, to fine-tune the display to only provide information for a specific RNC.
Iu-PS services control the interface between the SGSN and the RNCs in the UMTS Radio Access Network (UTRAN). Iu-PS services include the control plane and the data plane between these nodes.

Example

The following command displays information for a single Iu-PS service named *iups-svc-1*:

show iups-service name *iups-svc-1*

The next command displays information for all Iu-PS services configured in the current context:

```
show iups-service all
```

This command displays information for a specific RNC for a specific Iu-PS services:

```
show iups-service name iups-svc-1 rnc 123
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show l2tp sessions

Displays information for L2TP tunnels.

Product

LNS, PDSN, GGSN, HA

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show l2tp sessions [full | summary | counters] [all | callid *id* **| username** *name* **| msid** *ms_id* **| lac-service** *service_name* **| lns-service** *service_name* **peer-address [** *operator* **]** *peer_address* **]**

full

Shows all available information for the specified sessions.

summary

Shows a summary of available information for the specified sessions.

counters

Shows counters for the specified L2TP sessions.

all

Shows all current sessions.

callid *id*

Show session information for the specified call id. The output of the command **show l2tp tunnels** contains a field labeled Callid Hint which lists the call id information to use with this command. This is an 8-Byte Hexadecimal number.

username *name*

Shows session information for the specified subscriber. *username* has a string length of 1 to 127 characters. Wildcard characters $ and * are allowed.

msid *ms_id*

Shows session information for the mobile user identified by *ms_id*. *ms_id* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI. Wildcard characters $ and * are allowed.

lac-service *service_name*

Shows all L2TP sessions in the specified LAC service.

lns-service *service_name*

Shows all L2TP sessions in the specified LNS service.

peer-address [*operator* **]** *peer_address*

Shows all L2TP sessions to the destination (peer LNS) at the specified IP address. The *peer_address* must be specified using the standard IPv4 dotted decimal notation.
In conjunction with **sessions** keyword, indicates a range of peers is to be displayed.
peer-address [*operator*] *peer_address* must be specified using the standard IPv4 dotted decimal notation.
operator implies how to logically specify a range of peer-address and it must be one of the following:

- **<**: IP address less than to specified *peer_address*
- **>**: IP address less than to specified *peer_address*
- **greater-than**: IP address less than to specified *peer_address*
- **less-than**: IP address less than to specified *peer_address*

Usage

Use this command to show information for sessions in the current context.

Important: If this command is executed from within the local context, cumulative session information is displayed for all contexts.

Example

The following command displays cumulative statistics for all sessions processed within the current context:

```
show l2tp sessions
```

The following command displays all information pertaining to the L2TP session of a subscriber named *isp1vpnuser1*:

```
show l2tp session full username isp1vpnuser1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show l2tp statistics

Displays statistics for all L2TP tunnels and sessions.

Product

LNS, PDSN, GGSN, HA

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show l2tp statistics [lac-service *service_name* **| lns-service** *service_name* **| peer-address** *peer_ip_address* **]**

lac-service *service_name*

Shows L2TP statistics for all tunnels and sessions in the specified LAC service.

lns-service *service_name*

Shows L2TP statistics for all tunnels and sessions in the specified LNS service.

peer-address *peer_address*

Shows L2TP statistics for all tunnels and sessions to the destination (peer LNS) at the specified IP address. The *peer_address* must be specified using the standard IPv4 dotted decimal notation.

Usage

Use this command to display statistics for L2TP services.

Example

The following command displays statistics for a specific LAC service named *vpn1*:

show l2tp statistics lac-service *vpn1*

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show l2tp tunnels

Displays information for L2TP tunnels.

Product

LNS, PDSN, GGSN, HA

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show l2tp tunnels [full | summary | counters] [all | callid *id* **| username** *name* **| msid** *ms_id* **| lac-service** *service_name* **| lns-service** *service_name* **| peer-address [** *operator* **]** *peer_address* **]**

full

Shows all available information for the specified tunnels.

summary

Shows a summary of available information for the specified tunnels.

counters

Shows counters for the specified L2TP tunnels.

all

Shows all current tunnels.

callid *id*

Show tunnel information for the specified call id. The output of the command **show l2tp tunnels** contains a field labeled Callid Hint which lists the call id information to use with this command. This is an 8-Byte Hexadecimal number.

username *name*

Shows tunnel information for the specified subscriber. *username* has a string length of 1 to 127 characters. Wildcard characters $ and * are allowed.

msid *ms_id*

Shows tunnel information for the mobile user identified by *ms_id*. *ms_id* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI. Wildcard characters $ and * are allowed.

lac-service *service_name*

Shows all L2TP tunnels in the specified LAC service.

lns-service *service_name*

Shows all L2TP tunnels in the specified LNS service.

peer-address [*operator* **]** *peer_address*

Shows all L2TP tunnels to the destination (peer LNS) at the specified IP address. The *peer_address* must be specified using the standard IPv4 dotted decimal notation.
In conjunction with **tunnels** keyword, indicates a range of peers is to be displayed.
peer-address [*operator*] *peer_address* must be specified using the standard IPv4 dotted decimal notation.
operator implies how to logically specify a range of peer-address and it must be one of the following:

- **<**: IP address less than to specified *peer_address*
- **>**: IP address less than to specified *peer_address*
- **greater-than**: IP address less than to specified *peer_address*
- **less-than**: IP address less than to specified *peer_address*

Usage

Use this command to show information for tunnels in the current context.

Example

The following command displays all of the tunnels currently being facilitated by LAC services within the current context:

```
show l2tp tunnels all
```

The following command displays information pertaining to the L2TP tunnel(s) established for a LAC-service named vpn1:

```
show l2tp tunnels full lac-service vpn1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show lawful-intercept

Displays information on sessions that are currently being lawfully intercepted.

Product

PDSN, HA, GGSN, ASN-GW, SGSN

Privilege

Security Administrator, Administrator, Operator, or Inspector that have li-administrator privileges.

Syntax

show lawful-intercept [full] { [all] [imsi *imsi_value* **] [intercept-id** *li_id* **] [ip-addr** *intercept_ip_addr* **] [msid** *ms_id***] [username** *subscriber_name* **] | statistics }**

full

Display full detailed information.

all

Display information for all lawful intercepts.

imsi *imsi_value*

Specifies the International Mobile Subscriber Identity (IMSI) of the intercepted subscriber session.
imsi_value is an integer value from 1 to 15 characters.

ipaddr *intercept_ip_addr*

Specifies the IP address of the intercepted subscriber session.
intercept_ip_addr must be specified using dotted decimal notation.

msid *ms_id*

Specifies the mobile subscriber identification number of the intercepted subscriber session.
ms_id must be from 7 to 16 digits specified as an IMSI, MIN, or RMI.

username *subscriber_name*

Specifies the username of the intercepted subscriber.
subscriber_name refers to a previously configured user.

statistics

Display summary statistical information for all Lawful Intercept sessions.

Usage

Use this command to display lawful intercept statistics.

Important: You must log in to the system through a Secure Shell (SSH) using a system account that has li-administrator privileges to use this command. For details on using the Lawful Intercept capability of the system, refer to System Administration and Configuration Guide.

Example

To show detailed information for a lawfully intercepted session with the MSID 0000100048, enter the following command

```
show lawful-intercept full msid 0000100048
```

show lac-service

Displays the information for all LAC services or for a particular LAC service.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show lac-service { all | name *service_name* **} [| { grep** *grep_options* **| more }]**

all

Display information for all LAC services.

name *service_name*

Display information only for the LAC service specified by *service_name*.
service_name is up to a 60 character name given to the service when it was originally configured.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to list information for LAC services configured on this system.

Example

The following commands display information for all LAC services and the LAC service named *lac1*, respectively.

show lac-service allshow lac-service name *lac1*

show leds

Displays the current status of the LEDs for a specific card or all cards.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show leds { all | *card_num* } [| { grep *grep_options* | more }]

all | *card_num*

all: indicates the LED status for all cards is to be displayed.
card_num: indicates the LED status for the card specified by *card_num* is to be displayed.

grep *grep_options* | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Display the status of the LEDs as a part of an automated periodic script which checks the LEDs of the chassis.

Important: This command is not supported on all platforms.

Example

The following commands display the LED status for all cards and only card *8*, respectively.

```
show leds all
```

Important: Refer to the descriptions for Card LEDs and System LEDs in **show card info** command in the Counters and Statistics Reference for information on the LED color codes.

show license information

Displays the installed license information as well as maximum number of sessions.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show license information { *key_name* | full } | { key } [| { grep *grep_options* | more }]

***key_name* | full**

key_name: the output displays the information for the key specified as *key_name*.
full: the output displays the full features and quantities without any hardware limits in place.

key:

indicates the output is to display the installed keys in encrypted format.

grep *grep_options* | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Show the license information to verify the proper keys have been installed. This command is also helpful in troubleshooting user system access due to the maximum number of sessions being reached.

Example

The following displays the encrypted installed key and the information for *sampleKey* respectively.

show license information *sampleKey*

show linecard table

Displays information on the rear-installed interface cards.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show linecard table [| { grep *grep_options* **| more }]**

table

Displays information on all linecard slots in tabular format.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Show the line card information to verify hardware inventories and installed components.

Important: This command is not supported on all platforms.

Example

```
show linecard table
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show lma-service

Displays statistic and counter information for Local Mobility Anchor (LMA) services on this system.

Product

P-GW

Privilege

Inspector

Syntax

show lma-service all

show lma-service name *service_name*

show lma-service session [all | callid *id* **| counters | full | ipv6-address { <** *address* **| >** *address* **|** *address* **| greater-than** *address* **[less-than** *address* **] | less-than** *address* **[greater-than** *address* **] } | summary | username** *name* **]**

show lma-service statistics [lma-service *name* **] } [| { grep** *grep_options* **| more }]**

---

all

Displays information about all configured LMA services on this system.

---

name *service_name*

Displays configuration information for a specific LMA service configured on this system.
service_name must be an existing LMA service, and be from 1 to 63 alpha and/or numeric characters in length.

---

session [all | callid *id* **| counters | full | ipv6-address { <** *address* **| >** *address* **|** *address* **| greater-than** *address* **[less-than** *address* **] | less-than** *address* **[greater-than** *address* **] } | summary | username** *name* **]**

Displays session information filtered by the following parameters:
all: Displays all active LMA sessions using LMA services on the system.
callid *id*: Displays available session information for the specific call identification number. *id* must be an eight-digit HEX number.
counters: Displays session counters for active LMA sessions using LMA services on the system. This keyword can also be filtered by the following:

- **all**
- **callid**
- **ipv6-address**
- **username**

Refer to the keyword descriptions in this command for information regarding these filters.
full: Displays additional session information for active LMA sessions using LMA services on the system. This keyword includes the information in the output of the 'all' keyword plus additional information. This keyword can also be filtered by the following:

- **all**

- **callid**
- **ipv6-address**
- **username**

Refer to the keyword descriptions in this command for information regarding these filters.

ipv6-address:

- **<** *address* and **less-than** *adress*: Displays summary information for a group of IPv6 addresses that are less than the specified IPv6 address using one of these keywords. A range can be specified by including an address with the **greater-than** option. *address* must be specified in colon separated notation.
- **>** *address* and **greater-than** *address*: Displays summary information for a group of IPv6 addresses that are greater than the specified IPv6 address using one of these keywords. A range can be specified by including an address with the **less-than** option. *address* must be specified in colon separated notation.
- *address*: Displays summary information for a specific IPv6 address using an LMA service on this system. *address* must be specified in colon separated notation.

summary: Displays the number of LMA sessions currently active for LMA services configured on the system.

username *name*: Displays available session information for a specific user in a service session. *name* must be followed by an existing user name and must be from 1 to 127 alpha and/or numeric characters.

statistics [lma-service *name* **]**

lma-service *name*: Displays LMA service statistics for a specific LMA service. *name* must be an existing LMA srvice and be from 1 to 63 alpha and/or numeric characters.

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified.

A command to send output to must be specified.

For details on the usage of the **grep** and **more** commands, refer to the Regulating a Command's Output section of Chapter 1 of the Command Line Interface Reference Guide.

Usage

Use this command to view configuration information for LMA services on this system.

Example

The following command displays service statistics for the LMA service named *lma1*:

show lma-service name *lma1*

show lns-service

Displays the information for all LNS services or for a particular LNS service.

Product

PDSN, HA, GGSN, LNS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show lns-service { all | name *service_name* **} [| { grep** *grep_options* **| more }]**

all

Display information for all LNS services.

name *service_name*

Display information only for the LNS service specified by *service_name*.
service_name is up to a 60 character name given to the service when it was originally configured.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to list information for LNS services configured on this system.

Example

The following commands display information for all LNS services and the LNS service named *lns1*, respectively.

```
show lns-service all
```

```
show lns-service name lns1
```

show local-user

Displays information pertaining to local-user accounts.

Product

All

Privilege

Security Administrator

Syntax

show local-user [[username *name* **] [inactive** *filter* **] [verbose | wide] | statistics [verbose]]**

---

username *name*

Specifies the name of a specific local-user administrative account for which to display information. *name* can be from 3 to 16 alpha and/or numeric characters in length and is case sensitive.

---

inactive *filter*

Specifies a filter for displaying inactive local-user accounts. *filter* can be one of the following:

- **<** *days* **:** Displays accounts that have been inactive less than the specified number of days.
- **>** *days* **:** Displays accounts that have been inactive more than the specified number of days.
- **greater-than** *days* **:** Displays accounts that have been inactive more than the specified number of days.
- **less-than** *days* **:** Displays accounts that have been inactive less than the specified number of days.

days can be configured to any integer value from 1 to 365.

[verbose | wide]

Default: **wide**

Specifies how the information is to be displayed as one of the following options:

- **verbose** : The data is displayed in list format. Additional information is provided beyond what is displayed when the **wide** option is used.
- **wide** : The data is displayed in tabular format.

---

statistics [verbose]

Displays local-user statistics.

Using the **verbose** keyword displays additional statistics.

Usage

Use this command to display information and statistics on local-user administrative accounts.

Example

The following command displays detailed information on local-user administrative accounts that have been inactive for more than 10 days:

show local-user inactive greater-than *10* **verbose**

The following command displays detailed information for a local-user account named *Test*:

show local-user username *Test* **verbose**

The following command displays detailed local-user account statistics:

show local-user statistics verbose

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show logging

Displays the defined logging filters for the current context.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show logging [active | verbose] [| { grep *grep_options* **| more }]**

active | verbose

Default: all facilities are shown in concise form.
active: indicates only the active CLI logging filter information is to be displayed.
verbose: indicates the output should provide as much information as possible.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

View log filters to trouble shoot disk utilization issues.

Example

```
show logging
```

```
show logging active
```

```
show logging verbose
```

```
show logging active verbose
```

show logs

Displays active and inactive logs filtered by the options specified.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show logs [active] [inactive] [callid *call_id* **] [event-verbosity** *evt_verboseness*] **[facility** *facility* **] [level** *severity_level* **] [pdu-data** *pdu_format* **] [pdu-verbosity** *pdu_verboseness* **] [proclet** *facility* **] [since** *from_date_time* **[until** *to_date_time* **]] [| { grep** *grep_options* **| more }]**

active

Indicates output is to display data from active logs.

inactive

Indicates output is to display data from inactive logs.

callid *call_id*

Specifies a call ID for which log information is to be displayed. *call_id* must be specified as a 4-byte hexadecimal number.

event-verbosity *evt_verboseness*

Specifies the level of verboseness to use in displaying of event data as one of:

- min - displays minimal information about the event. Information includes event name, facility, event ID, severity level, date, and time.
- concise - displays detailed information about the event, but does not provide the event source within the system.
- full - displays detailed information about event, including source information, identifying where within the system the event was generated.

facility *facility*

Specifies the facility to modify the filtering of logged information for as one of:

- **a10:** A10 interface facility
- **a11:** A11 interface facility
- **a11mgr:** A11 Manager facility
- **aaa-client:** AAA client facility
- **aaamgr:** AAA manager logging facility
- **aaaproxy:** AAA Proxy facility
- **acl-log:** Access Control List logging facility

- **acsctrl:** Active Charging Service (ACS) Controller facility
- **acsmgr:** Active Charging Service (ACS) Manager facility
- **alarmctrl:** Alarm Controller facility
- **all:** All facilities
- **asf:** Voice Application Server Framework logging facility
- **asfprt:** ASF Protocol Task (SIP) logging facility
- **asngwmgr:** ASN Gateway Manager facility
- **asnpcmgr:** ASN Paging Controller/Location-Registry Manager facility
- **bgp:** Border Gateway Protocol (BGP) facility
- **cli:** CLI logging facility
- **cscf:** IMS/MMD CSCF
- **cscfmgr:** SIP CSCF Manager facility
- **csp:** Card Slot Port controller facility
- **css:** Content Service Selection (CSS) facility
- **css-sig:** Content Service Selection (CSS) RADIUS Signaling facility
- **dcardctrl:** IPSEC Daughtercard Controller logging facility (not used at this time)
- **dcardmgr:** IPSEC Daughtercard Manager logging facility (Not used at this time)
- **dhcp:** DHCP facility (GGSN product only)
- **dhost:** Distributed Host logging facility
- **diameter:** Diameter endpoint logging facility
- **diameter-acct:** Diameter Accounting
- **diameter-auth:** Diameter Authentication
- **diameter-ecs:** ACS Diameter signaling facility
- **diameter-svc:** Diameter Service
- **diamproxy:** DiamProxy logging facility
- **dpath:** IPSEC Data Path facility
- **drvctrl:** Driver Controller facility
- **egtpc**: eGTP-C logging facility
- **egtpmgr**: eGTP manager logging facility
- **evlog:** Event log facility
- **famgr:** Foreign Agent manager logging facility
- **firewall:** Firewall logging facility
- **gss-gcdr:** GTPP Storage Server GCDR facility
- **gtpc:** GTP-C protocol logging facility (GGSN product only)
- **gtpcmgr:** GTP-C protocol Manager logging facility (GGSN product only)
- **gtpp:** GTP-PRIME protocol logging facility (GGSN product only)
- **gtpu:** GTP-U protocol logging facility (GGSN product only)

- **h248prt**: H.248 Protocol logging facility
- **hamgr:** Home Agent manager logging facility
- **hat:** High Availability Task (HAT) process facility
- **ims-authorizatn:** IMS Authorization Service facility
- **ip-arp:** IP Address Resolution Protocol facility
- **ip-interface:** IP interface facility
- **ip-route:** IP route facility
- **ipsec:** IP Security logging facility
- **ipsgmgr:** IP Services Gateway facility
- **ipsp:** IP Pool Sharing Protocol logging facility
- **l2tp-control:** L2TP control logging facility
- **l2tp-data:** L2TP data logging facility
- **l2tpdemux:** L2TP Demux Manager logging facility
- **l2tpmgr:** L2TP Manager logging facility
- **li:** Lawful intercept facility (Logs are visible only to system accounts with li-administrator privileges.)
- **magmgr**: Mobile Access Gateway manager logging facility
- **mme-app**: Mobility Management Entity Application logging facility
- **mmedemux**: Mobility Management Entity Demux Manager logging facility
- **mme-hss**: Mobility Management Entity logging facility
- **mme-misc**: Mobility Management Entity Miscellaneous logging facility
- **mobile-ip**: Mobile IP processes
- **mobile-ip-data**: Mobile IP data facility
- **mobile-ipv6**: Mobile IPv6 logging facility
- **multicast-proxy**: Multicast Proxy logging facility
- **nas**: Network Access Signaling logging facility
- **netwstrg:** Network Storage facility
- **npuctrl:** Network Processor Unit Control facility
- **npumgr:** Network Processor Unit Manager facility
- **nsctrl:** Charging Service Controller facility (supported in conjunction with ECSv1)
- **nsmgr:** Charging Service Manager facility
- **nsproc:** Charging Service process facility
- **orbs:** Object Request Broker System logging facility
- **ospf:** OSPF logging facility
- **pgw**: PDN Gateway logging facility
- **ppp**: PPP link and packet facilities
- **radius-acct**: RADIUS accounting logging facility
- **radius-auth**: RADIUS authentication logging facility

- **radius-coa**: RADIUS change of authorization and radius disconnect
- **rct**: Recovery Control Task logging facility
- **rdt**: Redirect Task logging facility
- **resmgr**: Resource Manager logging facility
- **rip**: RIP logging facility (RIP is not supported at this time.)
- **rohc**: RObust Header Compression facility
- **rsvp**: Reservation Protocol logging facility
- **sct**: Shared Configuration Task logging facility
- **sessctrl**: Session Controller logging facility
- **sessmgr**: Session Manager logging facility
- **sft**: Switch Fabric Task logging facility
- **sgw**: Serving Gateway logging facility
- **sipcdprt:** Sip Call Distributor facility
- **sitmain:** System Initialization Task main logging facility
- **snmp:** SNMP logging facility
- **srdb:** Static Rating Database
- **srp:** Service Redundancy Protocol (SRP) logging facility
- **ssh-ipsec:** SSH IP Security logging facility **stat:** Statistics logging facility
- **stat:** Statistics logging facility
- **system:** System logging facility
- **tacacsplus:** TACACS+ Protocol logging facility
- **threshold:** threshold logging facility
- **udr:** User detail record facility (used with the Charging Service)
- **user-data:** User data logging facility
- **user-l3tunnel:** User layer-3 tunnel logging facility
- **vpn:** Virtual Private Network logging facility
- **wimax-data:** WiMAX DATA
- **wimax-r6:** WiMAX R6

---

level *severity_level*

level *severity_level*: specifies the level of information to be logged, *severity_level*, from the following list which is ordered from highest to lowest:

- critical - display critical events
- error - display error events and all events with a higher severity level
- warning - display warning events and all events with a higher severity level
- unusual - display unusual events and all events with a higher severity level
- info - display info events and all events with a higher severity level
- trace - display trace events and all events with a higher severity level

- debug - display all events

pdu-data *pdu_format*

Specifies output format for the display of packet data units as one of:

- none - output is in raw format (unformatted).
- hex - output being displayed in hexadecimal format.
- hex-ascii - output being displayed in hexadecimal and ASCII similar to a main-frame dump.

pdu-verbosity *pdu_verboseness*

Specifies the level of verboseness to use in displaying of packet data units as a value from 1 to 5 where 5 is the most detailed.

proclet *facility*

Shows the logs from a specific proclet facility. The available facilities are the same as those listed earlier.

since *from_date_time* **[until** *to_date_time* **]**

Default: no limit.
since *from_date_time*: indicates only the log information which has been collected more recently than *from_date_time* is to be displayed.
until *to_date_time*: indicates no log information more recent than *to_date_time* is to be displayed. **until** defaults to current time when omitted.
from_date_time and *to_date_time* must be formatted as YYYY:MM:DD:HH:mm or YYYY:MM:DD:HH:mm:ss. Where YYYY is a 4-digit year, MM is a 2-digit month in the range 01 through 12, DD is a 2-digit day in the range 01 through 31, HH is a 2-digit hour in the range 00 through 23, mm is a 2-digit minute in the range 00 through 59, and ss is a 2 digit second in the range 00 through 59.
to_date_time must be a time which is more recent than *from_date_time*.
The use of the **until** keyword allows for a time range of log information while only using the **since** keyword will display all information up to the current time.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

View log files for general maintenance or troubleshooting system issues.

Example

The following commands display log information for the *a11mgr* facility starting with February 20th, 2003 at midnight where both are equivalent.

```
show logs facility a11mgr since 2003:02:20:00:00
```

```
show logs facility a11mgr since 2003:02:20:00:00:00
```

The following command displays the log information for call ID *FE881D32* only in active logs.

show logs active callid *FE881D32*

Chapter 93
Exec Mode Show Commands (M-P)

This section includes the commands **`show m3ua statistics`** through **`show profile-id-qci-mapping`**.

show mag-service

Displays statistic and counter information for Mobile Access Gateway (MAG) services on this system.

Product

HSGW, S-GW

Privilege

Inspector

Syntax

show mag-service { all | name *service_name* **| session [all | callid** *id* **| counters | full | msid** *id* **| summary | username** *name* **] | statistics [name** *service_name* **] } [| { grep** *grep_options* **| more }]**

---

all

Displays information for all configured MAG services on this system.

---

name *service_name*

Displays configuration information for a specific MAG service configured on this system.
service_name must be an existing MAG service, and be from 1 to 63 alpha and/or numeric characters in length.

---

session [all | callid *id* **| counters | full | msid** *id* **| summary | username** *name* **]**

all: Displays all active MAG sessions using MAG services on the system.
callid *id*: Displays available session information for the specific call identification number. *id* must be an eight-digit HEX number.
counters: Displays counters for all MAG services on the system.This keyword can also be filtered by the following:

- **all**
- **callid**
- **msid**
- **username**

Refer to the keyword descriptions in this command for information regarding these filters.
full: Displays additional session information for all active MAG sessions using MAG services on the system. This keyword includes the information in the output of the 'all' keyword plus additional information. This keyword can also be filtered by the following:

- **all**
- **callid**
- **msid**
- **username**

Refer to the keyword descriptions in this command for information regarding these filters.
msid *id*: Displays available information for a specific mobile station identification number or group of numbers based on wildcard entry. *id* must be a valid MSID number and can be a sequence of characters

and/or wildcard characters ('$' and/or '*'). The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as wildcard enclose them in single quotes (‘). For example: ‘$’.
summary: Displays the number of MAG sessions currently active for MAG services configured on the system.
username *name*: Displays available session information for a specific user in a service session. *name* must be followed by an existing user name and must be from 1 to 127 alpha and/or numeric characters.

statistics [name *service_name* **]**

name *service_name*: Displays MAG service statistics for a specific MAG service. *service_name* must be an existing MAG service and be from 1 to 63 alpha and/or numeric characters.

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified.
A command to send output to must be specified.
For details on the usage of the **grep** and **more** commands, refer to the Regulating a Command’s Output section of Chapter 1 of the Command Line Interface Reference Guide.

Usage

Use this command to view configuration information for MAG services on this system.

Example

The following command displays service statistics for the MAG service named *mag1*:

```
show mag-service name mag1
```

show map-service

Displays information configured for the Mobile Application Part (MAP) services, including MAP service features and operational configuration. Also includes some related configuration information for the HLR and EIR configuration parameters.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show map-service [all | name *srvc_name* **]**

name *srvc_name*

srvc_name: must be a string of 1 to 63 alphanumeric characters that identifies a specific existing MAP service.

Usage

Use this command to display all MAP service or the statistics for a particular MAP service.

Example

The following command displays configuration information for the MAP service named *map-svc-1*:

show map-service name *map-srvc-1*

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show map statistics

Displays Mobile Application Part (MAP) statistics.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show map statistics [name *srvc_name* **]**

name *srvc_name*

srvc_name: must be a string of 1 to 63 alphanumeric characters that identifies a specific existing MAP service.

Usage

Use this command to display all MAP statistics or the statistics for a particular MAP service.

Example

The following command displays statistics for the MAP service named *map-svc-1*:

show map statistics name *map-svc-1*

The following command displays combined statistics for all MAP services in the current context:

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show maximum-temperatures

Shows the maximum temperature reached by each card since the last temperature timestamp reset.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show maximum-temperatures [verbose] [| { grep *grep_options* **| more }]**

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

verbose

Indicates that the output is to contain detailed information.

Usage

Verify the maximum temperature reached by components in the chassis since the indicated timestamp.

Important: This command is not supported on all platforms.

Example

```
show maximum-temperatures

show maximum-tempteratures verbose
```

show mbms bearer-service

Displays configuration information for bearer service configured for multimedia broadcast and multicast facility on this system.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show mbms bearer-service [all | apn *apn_name* **mcast-addr** *ip_address* **| service-type { broadcast | multicast } | full | instance** *instance_id* **| summary] + [| { grep** *grep_options* **| more }]**

all

Displays information on all bearer services configured on the system.

apn *apn_name* **mcast-addr** *ip_address*

Displays bearer service information of MBMS for a specific APN *apn_name* bind to given BM-SC (Broadcast Multicast - Service Center) server address *ip_address*.
apn_name is the name of the APN and can be from 1 to 62 alpha and/or numeric characters and is case sensitive.
ip_address is the IP address of the BM-SC server in IPv4 dotted decimal notation bind to the APN.

service-type { broadcast | multicast }

Displays information for a specific type of service for MBMS.
broadcast: Specifies the MBMS service type as broadcast only.
multicast: Specifies the MBMS service type as multicast only.

full

Displays full information for specific or all instances of bearer service in MBMS feature on system.

instance *instance_id*

Displays session information filtered for specific instances of bearer service in MBMS feature on system.
instance_id is the indicator for bearer service running for MBMS session and it must be an integer from 1 through 64.

summary

Displays summary information for specific or all instances of bearer service in MBMS feature on system.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more** options, refer to the Regulating a Command's Output section of the Command Line Interface Reference.

Usage

Use this command to verify the configuration of one or all bearer services and active instances of bearer services under MBMS feature. It is also useful for monitoring or troubleshooting purposes.
If this command is executed from within the local context with the all keyword, information for all bearer service instances running under MBMS feature configured on the system will be displayed.

Example

The following command displays configuration information for all bearer service instances running on system:

```
show mbms bearer-service full all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show mipfa

Displays the foreign agent information for the mobile IP calls specified.

Product

PDSN, GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show mipfa { [[counters | full | summary] { all | callid *call_id* **| msid** *ms_id* **| peer-address [** *operator* **]** *peer_address* **| reverse-tunnel { on | off } | username** *user_name* **} | statistics [fa-service** *fa_name* **| peer-address [** *peer_address* **| greater-than** *peer_address* **| less-than** *peer_address* **| >** *peer_address* **| <** *peer_address* **] }] | peers fa-service** *service_name* **[current-sessions { { > | greater-than }** *sessions* **[<** *sessions* **] | { < | less-than }** *sessions* **[>** *sessions* **] |** *sessions* **}] [peer-address** *address* **] } [| { grep** *grep_options* **| more }]**

counters | full | summary

Default: concise output.
counters: indicates the output is to include the statistic counters.
full: indicates detailed information is to be displayed.
summary: indicates only summary information is to be displayed.
These options are not available in conjunction with the **statistics** keyword.

all | callid call_id | msid *ms_id* **| peer-address** *peer_ip_address* **| reverse-tunnel { on | off } | username** *user_name*

all: indicates all available information is to be displayed.
callid *call_id*: indicates the information only for calls with Id *call_id* are to be displayed. *call_id* must be specified as a 4-byte hexadecimal number.
msid *ms_id*: specifies a mobile subscriber ID only for which information is to be displayed. *ms_id* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI and /or characters $ and * for wildcard filter.
show mipha msid *01234567$$*
will show any subscriber with a MSID that match the upper 8 digits of MSID supplied, i.e. 01234567 and any 2 digits at remaining 2 places.
peer-address *peer_ip_address*: specifies the peer IP address for which MIP call information is to be displayed. *peer_ip_address* must be specified using the standard IPv4 dotted decimal notation.
reverse-tunnel { **on** | **off** }: specifies either the on or off reverse IP tunnels information is to be displayed.
username *user_name*: specifies a user only for which MIP call information is to be displayed where the user is specified as *user_name*.
user_name must be a sequence of character and /or wildcard characters $ and * for wildcard matching with a string length of 1 to 127 characters.

statistics [fa-service *fa_name* **| peer-address [peer_address | greater-than** *peer_address* **| less-than** *peer_address* **| >** *peer_address* **| <** *peer_address* **]**

Indicates the statistics information is to be displayed for foreign agent service specified as *fa_name* or for the peer specified by the address *peer_address*.
fa-service *fa_name* : indicates the statistic information for the peer specified is to be displayed. *fa_name* must be from 1 to 63 alpha and/or numeric characters.
peer-address *peer_address* :indicates the statistic information for the peer specified is to be displayed. *peer_address* must be specified using the standard IPv4 dotted decimal notation.
greater-than *peer_address*: Specifies the range of IPv4 addresses greater than *peer_address*.
less-than *peer_address*: Specifies the range of IPv4 addresses less than *peer_address*.
> *peer_address*: Specifies the range of IPv4 addresses greater than *peer_address*.
< *peer_address*: Specifies the range of IPv4 addresses less than *peer_address*.

peer-address [*operator* **]** *peer_address*

In conjunction with **mipfa [summary] peer-address** keyword, indicates a range of peers is to be displayed.
peer-address [*operator* **]** *peer_address* must be specified using the standard IPv4 dotted decimal notation.
operator implies how to logically specify a range of peer-address and it must be one of the following:

- **<**: IP address less than to specified *peer_address*
- **>**: IP address less than to specified *peer_address*
- **greater-than**: IP address less than to specified *peer_address*
- **less-than**: IP address less than to specified *peer_address*

peers fa-service *service_name* **[current-sessions { { >** | **greater-than }** *sessions* **[<** *sessions* **]** | **{ <** | **less-than }** *sessions* **[>** *sessions* **]** | *sessions* **}] [peer-address** *address* **]**

Displays peer servers for the specified FA service.
fa-service *service_name*: Specifies the name of the FA service from which the associated peer servers are to be dispalyed. *service_name* must be an existing FA service and be from 1 to 63 alpha and/or numeric characters in length.
current-sessions: Displays only peer servers with current sessions meeting the following criteria:

- **>** | greater-than *sessions*: Displays only peer servers currently running sessions higher than the value entered in this parameter. *sessions* must be an integer from 1 to 3000000. **Note**: the keyword "**greater-than**" and the "**>**" symbol are interchangeable in this instance of the command.
- **<** *sessions*: Displays only peer servers that are currently running sessions higher than the **greater-than** peramter but less than the value entered in this parameter. *sessions* must be an integer from 1 to 3000000.
- **<** | less-than *sessions*: Displays only peer servers currently running sessions lower than the value entered in this parameter. *sessions* must be an integer from 1 to 3000000. **Note**: the keyword "**less-than**" and the "**<**" symbol are interchangeable in this instance of the command.
- **>** *sessions*: Displays only peer servers that are currently running sessions lower than the **less-than** peramter but more than the value entered in this parameter. *sessions* must be an integer from 1 to 3000000.
- *sessions*: Displays only peer servers currently running sessions that are equal to the value entered in this parameter. *sessions* must be an integer from 1 to 3000000.

peer-address *address*: Displays only peer servers matching the IP address entered in this parameter. *address* must be specified using IPv4 dotted decimal notation and can be followed by the netmask of the address.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

View MIP foreign agent information to support troubleshooting subscriber issues by viewing call information and filtering on the subscriber information using various methods.

Example

The following displays the call information for all mobile IP FA calls and statistics for *fa1*, respectively:

```
show mipfa all
```

The following command displays the statistics for the foreign agent service *fa1*:

```
show mipfa statistics fa-service fa1
```

The following commands displays call information for user *user6@aaa* in full detail and in summary:

```
show mipfa full username user6@aaa
```

```
show mipfa summary username user1
```

The following displays MIP FA call information for calls from mobile subscriber *4412345678* and peer address *1.2.3.4*, respectively:

```
show mipfa msid 4412345678
```

```
show mipfa peer-address 1.2.3.4
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show mipha

Displays the home agent information for the mobile IP calls specified.

Product

HA

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show mipha { [[counters | full | summary] { all | callid *call_id* **| imsi** *imsi_num* **| ip-address** *ip_addr* **| msid** *msid_num* **| peer-address [** *operator* **]** *peer_address* **| reverse-tunnel { on | off } | username** *user_name* **} | statistics [ha-service** *ha_name* **| peer-address** *peer_address* **] }] | peers ha-service** *service_name* **[current-sessions { { > | greater-than }** *sessions* **[<** *sessions* **] | { < | less-than }** *sessions* **[>** *sessions* **] |** *sessions* **}] [peer-address** *address* **] } [| { grep** *grep_options* **| more }]**

---

counters | full | summary

Default: concise output.
counters: indicates the output is to include the statistic counters.
full: indicates detailed information is to be displayed.
summary: indicates only summary information is to be displayed.
These options are not available in conjunction with the **statistics** keyword.

---

msid *msid_num*

Displays the subscriber with supplied MSID on HA.
msid *msid_num*: specifies a mobile subscriber ID only for which information is to be displayed. *ms_id* must be from 7 to 16 digits hexadecimal digit specified as an IMSI, MIN, or RMI and /or characters $ and * for wildcard filter.
In case of **enforce imsi-min equivalence** is enabled on the chasis and MIN or IMSI numbers supplied, this keyword/ filter will show subscribers with a corresponding MSID (MIN or IMSI) whose lower 10 digits matches to lower 10 digits of the supplied MSID.
show mipha msid *ABCD0123456789* or
show mipha msid *0123456789*
will show any subscriber with a MSID that match the lower 10 digits of MSID supplied, i.e. 0123456789.
show mipha msid *01234567$$*
will show any subscriber with a MSID that match the upper 8 digits of MSID supplied, i.e. 01234567 and any 2 digits at remaining 2 places.

---

all | callid *call_id* **| imsi** *imsi_num* **| ip-address** *ip_addr* **| msid** *msid_num* **| peer-address [** *operator* **]** *peer_address* **| reverse-tunnel { on | off } | username** *user_name*

all: indicates all available information is to be displayed.
callid *call_id*: indicates the information only for calls with Id *call_id* are to be displayed. *call_id* must be specified as a 4-byte hexadecimal number.

imsi *imsi_num*: Specifies an international mobile subscriber ID only for which information is to be displayed. The IMSI (International Mobile Subscriber Identity) ID is a 15 character field which identifies the subscriber's home country and carrier.
ip-address *ip_addr*: Show statistics for a call that has the specified IP address assigned. *ip_addr* must be an IPv4 address specified in decimal notation.
msid *msid_num*: Specifies a mobile subscriber ID only for which information is to be displayed. *ms_id* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI.
peer-address *peer_address*: indicates the statistic information for the peer specified is to be displayed. **peer-address** *peer_address* must be specified using the standard IPv4 dotted decimal notation.
reverse-tunnel { **on** | **off** }: specifies either the on or off reverse IP tunnels information is to be displayed.
username *user_name*: specifies a user only for which MIP call information is to be displayed where the user is specified as *user_name*.
user_name must be a sequence of character and /or wildcard characters $ and * for wildcard matching with a string length of 1 to 127 characters.

---

peer-address [*operator* **]** *peer_address*

In conjunction with **mipha [summary] peer-address** keyword, indicates a range of peers is to be displayed.
peer_address must be specified using the standard IPv4 dotted decimal notation.
operator implies how to logically specify a range of peer-address and it must be one of the following:

- **<**: IP address less than to specified *peer_address*
- **>**: IP address less than to specified *peer_address*
- **greater-than**: IP address less than to specified *peer_address*
- **less-than**: IP address less than to specified *peer_address*

---

statistics [ha-service *ha_name* **| peer-address** *peer_address* **]**

Indicates the statistics information is to be displayed for home agent service specified as *ha_name* or for the peer specified by the address *peer_address*.
ha-service *ha_name*: indicates the statistic information for the peer specified is to be displayed. *ha_name* must be from 1 to 63 alpha and/or numeric characters.
peer-address *peer_address*: indicates the statistic information for the peer specified is to be displayed. **peer-address** *peer_address* must be specified using the standard IPv4 dotted decimal notation.

---

peers ha-service *service_name* **[current-sessions { { > | greater-than }** *sessions* **[<** *sessions* **] | { < | less-than }** *sessions* **[>** *sessions* **] |** *sessions* **}] [peer-address** *address* **]**

Displays peer servers for the specified HA service.
ha-service *service_name*: Specifies the name of the HA service from which the associated peer servers are to be dispalyed. *service_name* must be an existing HA service and be from 1 to 63 alpha and/or numeric characters in length.
current-sessions: Displays only peer servers with current sessions meeting the following criteria:

- > | greater-than *sessions*: Displays only peer servers currently running sessions higher than the value entered in this parameter. *sessions* must be an integer from 1 to 3000000. **Note**: the keyword "**greater-than**" and the "**>**" symbol are interchangeable in this instance of the command.

- **<** *sessions*: Displays only peer servers that are currently running sessions higher than the **greater-than** peramter but less than the value entered in this parameter. *sessions* must be an integer from 1 to 3000000.
- < | less-than *sessions*: Displays only peer servers currently running sessions lower than the value entered in this parameter. *sessions* must be an integer from 1 to 3000000. **Note**: the keyword "**less-than**" and the "**<**" symbol are interchangeable in this instance of the command.
- > *sessions*: Displays only peer servers that are currently running sessions lower than the **less-than** peramter but more than the value entered in this parameter. *sessions* must be an integer from 1 to 3000000.
- *sessions*: Displays only peer servers currently running sessions that are equal to the value entered in this parameter. *sessions* must be an integer from 1 to 3000000.

peer-address *address*: Displays only peer servers matching the IP address entered in this parameter. *address* must be specified using IPv4 dotted decimal notation and can be followed by the netmask of the address.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

View MIP home agent information to support troubleshooting subscriber issues by viewing call information and filtering on the subscriber information using various methods.

Example

The following displays the call information for all mobile IP HA calls and statistics for *ha1*, respectively:

show mipha allshow mipha statistics ha-service *ha1*

The following commands displays call information for user *isp1user1* in full detail and in summary:

show mipha full username *isp1user1***show mipha summary username** *user1*

The following displays MIP HA call information for calls from mobile subscribers with reverse tunneling *off* and peer address *1.2.3.4*, respectively:

show mipha reverse-tunnel *off*

show mipha peer-address *1.2.3.4*

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show mipv6ha

Displays MIPv6 Home Agent-based information about selected Mobile IP calls.

Product

PDSN, HA

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show mipv6ha [all | callid *callid* **| counters** *filter* **| full** *filter* **| ipv6-address** *ip_addr*| **statistics mipv6ha-service** *mipv6ha-service_name* **| summary** *filter* **| username** *user_name* **]**

all

Displays all information for mipv6ha calls.

callid *call_id*

Specifies the Call Identification number.
call_id must be an eight-digit HEX number.

counters [all | callid | ipv6-address | username]

Displays the counters associated with the HA-based MIPv6 service. The following filters are available:

- **all**
- **callid:**
- **ipv6-address**
- **username**

full [all | callid | ipv6-address | username]

Displays all available information for the associated display or filter keyword.
The following filters are available:

- **all**
- **callid:**
- **ipv6-address**
- **username**

ipv6-address *ip_addr*

Displays information for subscribers connected via the packet control function with a specific or range of IP address ipv6_address. The address must be specified using the IPv6 colon notation.

- <: Filters output so that only information less than the specified IPv6 address value is displayed.
- >: Filters output so that only information greater than the specified IPv6 address value is displayed.
- less-than:Filters output so that only information less than the specified IPv6 address value is displayed.

- greater-than:Filters output so that only information greater than the specified IPv6 address value is displayed.

statistics [mipv6ha-service *mipv6ha-service_name* **]**

Total of collected information for specific protocol since last restart or clear command.
This can be filtered according to a specified **mipv6ha-service**.

summary [all | callid | ipv6-address | username]

Displays summary information for defined sessions, based on defined parameters.
The following filters are available:

- **all**
- **callid:**
- **ipv6-address**
- **username**

username *user_name*

Displays session information for a specific username.

Usage

View MIPv6 home agent information to support troubleshooting subscriber issues by viewing call information and filtering on the subscriber information using various methods.

Example

The following displays the call information for all mobile IP HA calls and statistics for *ha1*, respectively:

```
show mipv6ha all
```

The following command displays call information for user *mipv6hauser1* in full detail and in summary:

```
show mipv6ha full username mipv6hauser1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show mme-hss service

Displays configuration and setup information of MME-HSS service(s) running on a peer or local system.

Product

MME

Privilege

Inspector

Syntax

```
show mme-hss service { all | name svc_name } [ verbose ] [ | { grep grep_options | more } ]
```

all

Displays configuration/setup information for all MME-HSS services configured on this system.

name *service_name*

Displays configuration/setup information for a specific MME-HSS service configured on this system. *service_name* must be an existing MME-HSS service, and be from 1 to 63 alpha and/or numeric characters in length.

verbose

This keyword displays the comprehensive information of specific or set of arguments.

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified.
A command to send output to must be specified.
For details on the usage of the **grep** and **more** commands, refer to the Regulating a Command's Output section in CLI Overview chapter of the Command Line Interface Reference.

Usage

Use this command to view configuration/setup information for MME-HSS services on this system.
This command also displays the configured actions for failure handling on various type of messages.

Example

The following command displays service statistics for all MME-HSS services configured on the system:

```
show mme-hss service all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show mme-hss session

Displays session information of MME-HSS service(s) running on a peer or local system.

Product

MME

Privilege

Inspector

Syntax

show mme-hss session [summary | full] [all | call-id *call_identifier* **| mdn** *mdn_string* **| nai** *nai_string* **] [verbose] [| { grep** *grep_options* **| more }]**

summary

This keyword displays the summarized output of this command.

full

This keyword displays detailed output of this command.

all

This keyword displays information of all MME-HSS sessions running on this system.

call-id *call_identifier*

Displays summarized or detailed statistics of MME-HSS sessions running and filtered on the basis of the call identifier with an MME-HSS service configured on this system.
call_identifier must an existing call identity in eight character Hex digit format running on an MME service on system.

mdn *mdn_string*

Displays summarized or detailed statistics of MME-HSS sessions running and filtered on the basis of mobile directory Number (MDN) with an MME-HSS service configured on this system.
mdn_string must be an alpha and/or numeric string of 1 to100 characters in length.

nai *nai_string*

Displays summarized or detailed statistics of MME-HSS sessions running and filtered on the basis of Network Access Identifier(NAI) with an MME service configured on this system.
nai_string must be an alpha and/or numeric string of 1 to128 characters in length.

verbose

This keyword displays the comprehensive information of specific or set of arguments.

| { grep *grep_options* **| more }**

This argument searches the output of the root command and selects the lines matching one or more patterns/options. The types of patterns are controlled by the options specified with *grep_options*.

For details on the usage of the **grep** and **more** commands, refer to the Regulating a Command's Output section in CLI Overview chapter of the Command Line Interface Reference.

Usage

Use this command to view detialed or summarized session statistics of MME-HSS sessions running on MME-HSS services on a system. This command also provides the various filter criteria to display the session statistics.

Example

The following command displays information of all MME-HSS sessions of MME-HSS services running on a system:

```
show mme-hss session all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

The following command displays summarized session information of all MME-HSS sessions running on a system:

```
show mme-hss session summary all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show mme-service

Displays configuration information for Mobility Management Entity (MME) services on this system.

Product

MME

Privilege

Inspector

Syntax

```
show mme-service { all | name svc_name } [ verbose ] [ | { grep grep_options |
more } ]
```

all

Displays configuration information for all MME services configured on this system.

name *service_name*

Displays configuration information for a specific MME service configured on this system.
service_name must be an existing MME service, and be from 1 to 63 alpha and/or numeric characters in length.

verbose

This keyword displays the comprehensive information of specific or set of arguments.

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified.
A command to send output to must be specified.
For details on the usage of the **grep** and **more** commands, refer to the Regulating a Command's Output section in CLI Overview chapter of the Command Line Interface Reference.

Usage

Use this command to view configuration information for MME services on this system.

Example

The following command displays service statistics for the MME service named *mme1*:

```
show mme-service name mme1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show mme-service db statistics

This command displays the MME database statistics for MME sessions for all or specific session instances on this system.

Product

MME

Privilege

Inspector

Syntax

show mme-service db statistics [instance *smgr_instance* **] [verbose] [| { grep** *grep_options* **| more }]**

instance *smgr_instance*

This keyword specifies that MME database statistics are to be displayed for a specific instance of session manager running for MME service.
smgr_instance must be specified as an instance ID in the range 0 through 4294967295. If instance is not specified summary statistics are displayed.

verbose

This keyword displays the comprehensive information of specific or set of arguments.

| { grep *grep_options* **| more }**

This argument searches the output of the root command and selects the lines matching one or more patterns/options. The types of patterns are controlled by the options specified with *grep_options*.
For details on the usage of the **grep** and **more** commands, refer to the Regulating a Command's Output section in CLI Overview chapter of the Command Line Interface Reference.

Usage

Use this command to view database statistics for all or a particular instance of session manager for MME services on this system.

Example

The following command displays the summary database statistics for the MME service on a system:

```
show mme-service db statistics
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show mme-service db record

This command displays the MME database records of MME sessions grouped in session instances on this system filtered with IMSI or GUTI as criteria.

Product

MME

Privilege

Inspector

Syntax

```
show mme-service db record { all | imsi imsi_identifier | callid call_id | guti
plmn plmn_id group-id mme_grp_id code mme_code m-tmsi mtmsi_value } [ verbose ]
[ | { grep grep_options | more } ]
```

all

This keyword specifies the criteria to display all database records of a session instance used for MME service.

imsi *imsi_identifier*

This keyword specifies the filter criteria as International Mobile Subscriber Identity (IMSI) *imsi_identifier* to display the database records of a session instance.
imsi_identifier is a 15 character IMSI field which identifies the subscriber's home country and carrier. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘). For example; ‘$’.

callid *call_id*

This keyword specifies the filter criteria as call id *call_id* to display the database records of a session instance.
call_id must be specified as an 8-byte hexadecimal number.

guti plmn *plmn_id* **group-id** *mme_grp_id* **code** *mme_code* **m-tmsi** *mtmsi_value*

This set of keyword specifies the filter criteria as Globally Unique Temporary Identifier (GUTI) to display the database records for an MME service.
The GUTI is constructed from the GUMMEI and the M-TMSI where GUMMEI is constructed from PLMN (MMC and MNC) *plmn_id* and MME Identifier is constructed from an MME Group ID (MMEGI) *mme_grp_id* and an MME Code (MMEC) *mme_code*.
Within the MME, the mobile is identified by the M-TMSI *mtmsi_value*.
A GUTI has; 1) unique identity for MME which allocated the GUTI; and 2) the unique identity of the UE within the MME that allocated the GUTI.
Within the MME, the mobile is identified by the M-TMSI. The Globally Unique MME Identifier (GUMMEI) is constructed from public land mobile network id (PLMN) which constructed with MCC and MNC. The MME Identifier (MMEI) is constructed from an MME Group ID (MMEGI) and an MME Code (MMEC). In other words The GUTI is constructed from the GUMMEI and the M-TMSI.

verbose

This keyword displays the comprehensive information of specific or set of arguments.

| { grep *grep_options* **| more }**

This argument searches the output of the root command and selects the lines matching one or more patterns/options. The types of patterns are controlled by the options specified with *grep_options*. For details on the usage of the **grep** and **more** commands, refer to the Regulating a Command's Output section in CLI Overview chapter of the Command Line Interface Reference.

Usage

Use this command to view database records for all or a particular instance of session manager for MME services on this system with IMSI or GUTI as a filter criteria.

Example

The following command displays the summary database records of a session instance for a subscriber having IMSI as *123455432112345* in the MME service:

show mme-service db record imsi *123455432112345*

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show mme-service enodeb-association

Displays configuration information of associated eNodeB with an MME services on system.

Product

MME

Privilege

Inspector

Syntax

show mme-service enodeb-association [summary | full] [all | mme-service-name *mme_svc_name* **| peer-address** *peer_ip_address* **| peer-id** *peer_identifier* **] [verbose] [| { grep** *grep_options* **| more }]**

summary

This keyword displays the summarized output of this command.

full

This keyword displays detailed output of this command.

all

This keyword displays information of all eNodeBs associated with MME services on this system.

mme-service-name *mme_svc_name*

Displays summarized or detailed configuration information of eNodeBs associated with specific MME service *mme_svc_name* configured on this system.
mme_svc_name must be an existing MME service on system.

peer-address *peer_ip_address*

Displays summarized or detailed configuration information of eNodeBs associated with specific MME peer address *peer_ip_address* configured with an MME service on this system.
peer_ip_address must be a configured peer MME IP address in IPv4/IPv6 notation with an existing MME service on system.

peer-id *peer_identifier*

Displays summarized or detailed configuration information of eNodeBs associated with specific MME peer id *peer_identifier* configured with an MME service on this system.
peer_identifier must be a configured peer MME Id between 1 through 4294967295 with an existing MME service on system.

verbose

This keyword displays the comprehensive information of specific or set of arguments.

| { grep *grep_options* **| more }**

This argument searches the output of the root command and selects the lines matching one or more patterns/options. The types of patterns are controlled by the options specified with *grep_options*. For details on the usage of the **grep** and **more** commands, refer to the Regulating a Command's Output section in CLI Overview chapter of the Command Line Interface Reference.

Usage

Use this command to view configuration information of eNodeBs associated with an MME services on this system.

Example

The following command displays detailed service statistics of associated eNodeBs with MME service named *mme1*:

show mme-service enodeb-association full mme-service-name *mme1*

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show mme-service session

Displays session information of MME service(s) running on a peer or local system.

Product

MME

Privilege

Inspector

Syntax

show mme-service session [summary | full | counters] [all | s1-peer *s1_peer_ip_address* **| s11-peer** *s11_peer_ip_address* **| call-id** *call_identifier* **| pdn-address** *pdn_ip_address* **] [verbose] [| { grep** *grep_options* **| more }]**

summary

This keyword displays the summarized output of this command.

full

This keyword displays detailed output of this command.

counters

This keyword displays all counters related events and messages for an MME session running on a system.

all

This keyword displays information of all MME sessions running on this system.

s1-peer *s1_peer_ip_address*

Displays summarized or detailed configuration information of MME session running and filtered on the basis of IP address of a peer connected through S1 interface with an MME service configured on this system.
s1_peer_ip_address must be a configured IP address of a peer on S1 interface in IPv4/IPv6 notation with an existing MME service on system.

s11-peer *s11_peer_ip_address*

Displays summarized or detailed configuration information of MME session running and filtered on the basis of IP address of a peer connected through S11 interface with an MME service configured on this system.
s11_peer_ip_address must be a configured IP address of a peer on S11 interface in IPv4/IPv6 notation with an existing MME service on system.

call-id *call_identifier*

Displays summarized or detailed configuration information of MME session running and filtered on the basis of the identifier of MME calls with an MME service configured on this system.
call_identifier must an existing call identity in eight character Hex digit format running on an MME service on system.

pdn-address *pdn_ip_address*

Displays summarized or detailed configuration information of MME session running and filtered on the basis of IP address of connected PDN(s) with an MME service configured on this system.
s11_peer_ip_address must be a configured IP address of a peer on S11 interface in IPv4/IPv6 notation with an existing MME service on system.

verbose

This keyword displays the comprehensive information of specific or set of arguments.

| { grep *grep_options* **| more }**

This argument searches the output of the root command and selects the lines matching one or more patterns/options. The types of patterns are controlled by the options specified with *grep_options*.
For details on the usage of the **grep** and **more** commands, refer to the Regulating a Command's Output section in CLI Overview chapter of the Command Line Interface Reference.

Usage

Use this command to view session information of MME session in an MME services on this system.

Example

The following command displays detailed session statistics of an MME service running on a system:

```
show mme-service session full
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

The following command displays detailed session counters of an MME service running on a system:

```
show mme-service session counters
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show mme-service statistics

This command displays the service statistics of an MME service specified by various criteria.

Product

All

Privilege

Security Administrator, Administrator

Syntax

show mme-service statistics [sctp [mme-service *mme_svc_name* **] | s1ap [mme-service** *mme_svc_name* **| peer-id** *peer_identifier* **] | [emm-only | esm-only] [mme-service** *mme_svc_name* **| peer-id** *peer_identifier* **] [verbose] [| { grep** *grep_options* **| more }]**

emm-only

This keyword sets the filter criteria as MME service name or peer MME identifier to display all EPS mobility management (EMM) related statistics.

esm-only

This keyword sets the filter criteria as MME service name or peer MME identifier to display all EPS session management (ESM) related statistics.

s1ap

This keyword sets the filter criteria as MME service name of peer MME identifier to display all S1-AP statistics.

sctp

This keyword sets the filter criteria as MME service name of peer MME identifier to display all SCTP statistics.

mme-service *mme_svc_name*

This keyword sets the filter criteria as MME service name to display all type of statistics of an MME service; i.e. EMM, ESM, SCTP, S1-AP, and SCTP.

peer-id *peer_identifier*

This keyword sets the filter criteria as identifier of MME peer to display all service statistics of an MME service; i.e. EMM, ESM, SCTP, S1-AP, and SCTP.

verbose

This keyword displays the comprehensive information of specific or set of arguments.

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified.
A command to send output to must be specified.

For details on the usage of the **grep** and **more** commands, refer to the Regulating a Command's Output section in CLI Overview chapter of the Command Line Interface Reference.

Usage

This command is used to display the statistical information of an MME service based on various filter criteria as local MME service or peer MME related to EMM, ESM, SCTP, S1-AP, and SCTP.

Example

The following command displays the service session statistics of all MME service on a system related to all; i.e. EMM, ESM, SCTP, S1-AP, and SCTP:

```
show mme-service statistics
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

The following command displays the service session statistics of all MME services on a system related to S1-AP:

```
show mme-service statistics s1ap
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

The following command displays the service session statistics of all MME services on a system related to EMM only:

```
show mme-service statistics emm-only
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show multicast-sessions

Shows information for multicast sessions defined by the specified keywords. Keywords described under Command Keywords below are base commands that display distinctive different types of data. Keywords described under Filter Keywords are filters that modify or filter the output of the base commands. Not all filter keywords are available for all command keywords commands. Each command keyword lists the filter keywords that it accepts.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show multicast-sessions [*command_keyword* **] [** *filter_keywords* **] [| { grep** *grep_options* **| more }**

command_keyword

The following keywords are base commands that each have a distinct display output. Only one Command Keyword can entered on the command line.

debug-info { callid *id* **| flowid** *id* **}**

Displays internal call troubleshooting information for multicast sessions defined by the specified keywords.
callid *id:* Displays subscriber information for the call specified by *id*. The call ID must be specified as an 8-byte hexadecimal number.
flowid *id:* Displays information for a specifc BCMCS flow, defined by *id.* The flow ID must be a hexidecimal number.

full

Displays all available multicast session information. The following filter keywords are valid for this command:
active, all, callid, card-num, dormant, flowid, flowid-type, mcast-address, pcf, pdsn-service, grep, more

summary

Only displays a summary of multicast session information. The following commands are valid for this command:
active, all, callid, card-num, dormant, flowid, flowid-type, mcast-address, pcf, pdsn-service, grep, more

filter_keywords

The following keywords are filters that modify or filter the output of the Command Keywords. Not all filters are available for all Command Keywords. Multiple Filter Keywords can be entered on a command line. When multiple Filter Keywords are specified, the output conforms to all of the Filter Keywords specifications.

active

Only display information for multicast sessions that are currently active.

all

If no keywords are specified before **all**, information for all multicast sessions is displayed. If keywords are specified before **all**, all information is displayed with no further options being allowed.

callid *id*

Displays multicast session information for the call specified by *id*. The call must be specified as an 8-byte hexadecimal number.

card-num *card_num*

The slot number of the processing card by which the subscriber session is processed. *card_num* is a slot number from 1 through 7 or 10 through 16.

dormant

Shows information for subscriber sessions that are dormant (not transmitting or receiving data).

flowid *id*

Displays information for a specific BCMCS flow, defined by *id*. The flow ID must be a hexadecimal number.

flowid-type [flow | program]

Displays information for multicast sessions according to the type of flow.
flow: Shows all multicast sessions for the flow ID type "flow".
program: Shows all multicast sessions for the flow ID type "program".

mcast-address *ipv4_address*

Show multicast sessions for a specific multicast address. Must be followed by the IP address of an interface, using dotted decimal notation.

pcf *ipv4_address*

Displays information for multicast sessions connected via the packet control function, defined by *ipv4_address*. The address must be specified using the standard IPv4 dotted decimal notation.

pdsn-service *svc_name*

Displays information for multicast session connected to the packet data service *svc_name*. The packet data service must have been previously configured.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
Please refer to the Regulating a Command's Output of Command Line Interface Reference for details on the usage of **grep** and **more**.

Usage

Use this command to view information about multicast sessions.

The output of this command may be considered for part of a periodic system auditing program by verifying active and dormant sessions.

Example
The following command displays the all broadcast-multicast sessions active in a context/system:

```
show multicast-sessions all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show network-requested-pdp-context

Displays information for the specified network-requested PDP context.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show network-requested-pdp-context imsi *imsi_value*

imsi *imsi_value*

Specifies that information will be displayed for a particular International Mobile Subscriber Identity (IMSI). *imsi_value* is an integer value from 1 to 15 characters.

Usage

USe this command to display information pertaining to network-requested PDP contexts.

Example

The following command displays network-requested PDP context information for a subscriber with an IMSI of *123456789*:

show network-requested-pdp-context imsi *123456789*

show network-service-entity

Displays information regarding the network service entities (NSEs) in the network.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show network-service-entity { consolidated-status | fr-config [ peer-nsei nsei]
| ip-config [ nsvl { all | instance value } }
```

consolidated-status

Displays NSVC status information for all network service entities in the network. This keyword is particularly useful for troubleshooting.

fr-config [peer-nsei *nsei*]

Displays network service configurations for NSEs using Frame Relay configurations.
peer-nsei *nsei* including this optional keyword limits the display to a specific peer NSE identified with an integer of 0 to 65535.

ip-config [nsvl { all | instance *value* }

Displays network service configurations for NSEs using IP configurations.
Including the **nsvl** keyword limits the display to all or a single (instance 0 to 3) network service virtual link.

Usage

Use this command to display NSE information pertaining to the NSVCs of the NSEs in the networks or NSEs configured for Frame Relay or IP.

Example

The following command displays the status of all the NSVCs for all the NSEs in the network.

```
show network-service-entity consolidated-status
```

show nw-reachability server

Show the configuration for the network reachability servers for the current context.

Product

HA

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show nw-reachability server { all | name server_name }
```

all

Show configuration information for all network reachability servers in the current context.

name *server_name*

Show configuration information for the network reachability server with the specified name. *server_name* is the name of a previously configured reachability server and must be a string from 1 through 15 characters in length.

Usage

Use this command to display configuration information on network reachability servers configured in the current context.

Example

The following command displays information on all network reachability servers in the current context:

```
show nw-reachability server all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show ntp

Displays the network timing protocol associations and status.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show ntp { associations | status } [address *ip_address* **] [| { grep** *grep_options* **| more }]**

associations

associations: displays the current NTP server associations and related statistics.

status

status: displays the client permeates configured and the synchronization status.

address *ip_address*

address *ip_address*: the IP address of a specific NTP server/client in the current context. *ip_address* must be specified using the standard IPv4 dotted decimal notation.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

View network timing protocol information to troubleshooting system clock issues by displaying the associations and status of the local NTP client.

Example

The following displays the NTP associations and status, respectively.

```
show ntp associationsshow ntp status
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show orbem

Displays the ORB element manager information and statistics for the current context.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show orbem { client { id *client_name* **| table } | event-notif-service filters | session { id** *session_name* **| table } | status } [| { grep** *grep_options* **| more }**
]

client { id *client_name* **| table }**

Indicates client information is to be displayed. The keyword **table** is used to output to the display information on all configured clients. The keyword **id** is used to specify a specific client for which information is to be displayed specified as *client_name*.
client_name must refer to an existing client which is found using the **table** keyword option.

event-notif-service filters

Displays information pertaining to filters configured for the ORB Notification Service.

session { id *session_name* **| table }**

Indicates session information is to be displayed. The keyword **table** is used to output to the display information on all configured clients. The keyword **id** is used to specify a specific session for which information is to be displayed specified as *session_name*.
session_name must refer to an existing session which is found using the **table** keyword option.

status

Indicates the ORB element manage server status information is to be displayed.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Display current sessions when ORBEM system response may appear sluggish. This command is also useful in periodic verification of the server status.

Example

The following commands will display the information for all clients.

show orbem client table

The following commands display the information for the *clientName* and *sessionID*, respectively:

show orbem client id *clientName*

show orbem session id *sessionId*

The following command displays the ORBEM server status:

show orbem status

The following command displays the information for all sessions:

show orbem session table

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show patch-progress

This command displays the status of the on-going software patch installation.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show patch-progress
```

Usage

Use this command to show the status of an on-going software patch installation.

Important: Software Patch Upgrades are not supported in this release.

show pdg-service

Displays configuration information about PDIF services configured on the system.

Product

PDG/TTG

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show pdg-service { all | name *service_name* **}**

all

Displays information for all configured PDG services.

name *service_name*

Displays information for the specified PDG service only.
service_name must be the name of an existing PDG service in the current context and from 1 to 63 alpha and/or numeric characters.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Use this command to display information for PDG services.

Example

The following command displays available information for all active PDG services:

```
show pdg-service all
```

show pdg-service statistics

Displays statistics for the PDG/TTG since the last restart or clear command. The output includes the number of each type of protocol message. For example, the output includes the various types of EAP messages.

Product

PDG/TTG

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show pdg-service statistics [name *service_name* **| peer-address** *ipv4_address* **]**

name *service_name*

Displays statistics for the specified PDG service.
service_name must from 1 to 63 alpha and/or numeric characters.

peer-address *ipv4_address*

Displays statistics for a specific subscriber with the specified WLAN IPv4 address.
ipv4_address must be entered in standard IPv4 dotted decimal notation.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Use this command to display PDG service statistics.

Example

The following command displays statistics for all active PDG services:

```
show pdg-service statistics
```

show pdif-service

Displays configuration information about PDIF services configured on the system.

Product

PDIF

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show pdif service { all [counters] | name *name* **[counters] | statistics [name** *name* **| peer-address** *address* **] } [| { grep***grep_options* **| more }]**

all [counters]

Displays configuration information and statistic counters for all PDIF services in the system.

name *name* **[counters]**

Displays configuration information and statistic counters for a specified PDIF service in the system. *name* must be from 1 to 63 alpha and/or numeric characters and an existing PDIF service.

statistics [name *name* **| peer-address** *address* **]**

name *name*: Displays service statistics for a specific PDIF service. *name* must be from 1 to 63 alpha and/or numeric characters and an existing PDIF service.
peer-address *address*: Displays service statistics for a specifid peer server. *address* must be specified in IP v4 dotted decimal notation.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Use this command to display configuration information and statistics about PDIF services on the system.

Example

The following example displays configuration information about a PDIF service named *pdif23*:

show pdif service name *pdif23*

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show pdsn-service

Displays information on configured packet data services for the current context.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show pdsn-service { all | name *pdsn_name* **} [pcf-status [address** *ip_address* **| filter [all | icmp-monitored | no-calls | summary | up]]] [| { grep** *grep_options* **| more }]**

all | name *pdsn_name*

all: indicates information is to be displayed for all configured packet data services.
name *pdsn_name*: indicates information only for the PDSN service specified is displayed. *pdsn_name* must be the name of an existing PDSN service in the current context and must be from 1 to 79 alpha and/or numeric characters.

pcf-status [address *ip_address* **| filter [all | icmp-monitored | no-calls | summary | up]]**

pcf-status: This keyword by itself lists summary information for all PCFs.
address *ip_address:* Only list information for the PCF with the specified IP address. *ip_address* must be specified in IP v4 dotted decimal notation.
filter: Filter the output so only the specified information is displayed. If filter is specified with no keywords summary information for all PCFs is displayed.

- **all**: Show information for all the PCFs
- **icmp-monitored**: Show information only for PCFs which are ICMP monitored
- **no-calls**: Show information only for PCFs which have no active sessions
- **summary**: Show only a summary of the status of the PCFs
- **up**: Show information only for PCFs which are alive

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Show the PDSN service information for standard system monitoring or troubleshooting.

Example

The following will display the information for the sampleService and for all configured services, respectively:

show pdsn-service all

show pdsn-service name *sampleService*

show pgw-service

Displays configuration information for PDN Gateway (P-GW) services on this system.

Product

P-GW

Privilege

Inspector

Syntax

show pgw-service { all | name *service_name* **| statistics { all | name** *service_name* **} } [| { grep** *grep_options* **| more }]**

all

Displays configuration information for all P-GW services configured on this system.

name *service_name*

Displays configuration information for a specific P-GW service configured on this system.
service_name must be an existing P-GW service, and be from 1 to 63 alpha and/or numeric characters in length.

statistics { all | name *service_name* **}**

Displays P-GW service statistics.
all: Displays statistics for all P-GW services on the system.
name *service_name*: Displays statistics for a specific P-GW service. *name* must be an existing P-GW srvice and be from 1 to 63 alpha and/or numeric characters.

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified.
A command to send the output to must be specified.
For details on the usage of the **grep** and **more** commands, refer to the Regulating a Command's Output section of Chapter 1 of the Command Line Interface Reference Guide.

Usage

Use this command to view configuration information for P-GW services on this system.

Example

The following command displays service statistics for the P-GW service named *pgw1*:

show pgw-service name *pgw1*

show port

Displays information such as statistics and information on configured ports.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show port { datalink counters [*slot/port* **] | info {** *slot/port* **} [vlan** *vlan_id* **] | npu counters [** *slot/port* **[tagged | untagged | vlan** *tag_id* **]] | table | utilization table } [| { grep** *grep_options* **| more }]**

---

datalink counters *slot/port*

Display the information for all data links or only the one specified by *slot/port*. *slot/port* must refer to a previously configured port.

---

info { *slot/port* **} [vlan** *vlan_id* **]**

Display detailed information for all ports within the chassis or only the one specified by *slot/port*. *slot/port* must refer to a previously configured port.
vlan *vlan_id*: Display detailed information about all VLANs in the port/slot. If the optional *vlan_id* is not specified, it will show port information for all VLANs in slot/port.

---

npu counters [*slot/port* **[tagged | untagged | vlan** *tag_id* **]] | bound | unbound]**

Display the information for network processing unit ports. The information for all ports is output or only the one specified by *slot/port*. *slot/port* must refer to a previously configured port.
tagged: Display stats for all tagged packets.
untagged: Display statistics for all untagged packets.
vlan *tag_id*: Display NPU counters for a specified VLAN. *tag_id* must be the VLAN tag ID of a previously configured VLAN.
bound: Displays individual and cumulative npu port counters for the bound ports within the current context. If the command is invoked the local context all of the bound ports for all contexts and cumulative counter values for all contexts is displayed.
unbound: Displays individual and cumulative npu port counters for all unbound ports within system.

---

table

Display information on all physical ports on rear-installed interface cards.

---

utilization table

Show average port utilization in Mbps. The output is a table that lists the current utilization average, a 5 minute average, and a 15 minute average, for all enabled ports.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Display port information for troubleshooting of network communications by viewing statistics and configuration information for physical ports.

Example

The following displays detailed information for port 1 in slot 17:

```
show port info 17/1show port table
```

The following displays information for the data link port 33/1:

```
show port datalink counters 33/1
```

```
show port npu counters 33/1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show power

Displays information about installed cards with power supplied.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show power [all | chassis | *card_num* **] [| { grep** *grep_options* **| more }]**

all | chassis | *card_num* **]**

Default: chassis
all: indicates power information for all cards is to be displayed.
chassis: indicates the chassis power source(s) are to be displayed.
card_num: specifies a specific card for which power information is to be displayed. *card_num* must be a value in the range 1 through 48.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

View power source information to quickly check the power for all cards within a chassis.

Important: On some platforms, only **show power** is supported with no other keywords or variables.

Example

The following displays power supply status for the chassis.

```
show power
```

The following command displays the power status for all slots

```
show power all
```

show ppp

Displays the point-to-point protocol information, detailed or summarized, for one or all connections by the use of filtering options.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show ppp { [counters | full | summary] { all | callid *call_id* **| imsi** *id* **| msid** *ms_id* **| username** *user_name* **} | statistics [pcf-address [** *pcf_ip_addr* **| all] | pdsn-service** *pdsn_name* **] } [| { grep** *grep_options* **| more }]**

---

counters | full | summary

Provides an optional modifier to the output for the level and type of information.
counters: indicates the point-to-point protocol statistics are to be displayed.
full: indicates all available information is to be displayed.
summary: indicates only a summary of available information is to be displayed.

---

all | callid *call_id* **| imsi** *imsi_id* **| msid** *ms_id* **| username** *user_name* **}]**

all: indicates all available information is to be displayed.
callid *call_id*: indicates the PPP information only for the call specified by *call_id* is to be displayed. *call_id* must be specified as a 4-byte hexadecimal number.
imsi *id*: specifies that PPP information only for the subscriber with the specified id be displayed. The IMSI (International Mobile Subscriber Identity) *id* is a 15 character field which identifies the subscriber's home country and carrier.
msid *ms_id*: specifies a mobile subscriber ID only for which information is to be displayed. *ms_id* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI.
username *user_name*: specifies a user only for which PPP information is to be displayed where the user is specified as *user_name*.

---

statistics [pcf-address [*pcf_ip_addr* **| all] | pdsn-service** *pdsn_name* **]**

Statistics for all packet data services is displayed.
pcf-address [*pcf_ip_addr* **| all**] : Display statistics only for the time the session is connected to the specified PCF (Packet Control Function) or for all PCFs. pcf_ip_addr must be specified using the standard IPv4 dotted decimal notation.
pdsn-service *pdsn_name*: Display statistics only for the service specified by *pdsn_name*. *pdsn_name* must be from 1 to 63 alpha and/or numeric characters.

---

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

View the Point-to-Point Protocol information to support troubleshooting subscriber connections by viewing information for point-to-point connections for a specific subscriber.

Example

The following displays the PPP summary for all connections.

```
show ppp summary all
```

The following outputs the point-to-point detailed information for the user *user1*.

```
show ppp full username user1
```

The following command displays the standard information for the call with ID *FF0E11CD*.

```
show ppp callid ff0e11cd
```

The following command displays the PPP statistics for *pdsn1*.

```
show ppp statistics pdsn-service pdsn1
```

The following command provides summarized information for the PPP statistics.

```
show ppp
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show prepaid 3gpp2

This command displays prepaid accounting information for all services or only the service specified.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show prepaid 3gpp2 statistics { all | { ggsn-service | ha-service | lns-service | pdsn-service } { all | name *service_name* **} } | per-service-summary } [| { grep** *grep_options* **| more }]**

all

This keyword displays prepaid statistics for all services.

ggsn-service

Display statistics for GGSN service(s).

ha-service

Display statistics for HA service(s).

lns-service

Display statistics for LNS service(s).

pdsn-service

Display statistics for PDSN service(s).

{ all | name *service_name* **}**

all: Display statistics for all services of the specified type.
name *service_name*: Display statistics for the service named *service_name* of the specified service type.

per-service-summary

Displays prepaid statistics per service summary for all services.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Displays Pre-paid statistics for a particular named service or for all services.

Example
To display statistics for a PDSN service name *PDSN1*, enter the following command:

```
show prepaid 3gpp2 statistics pdsn-service name PDSN1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show prepaid wimax

This command displays prepaid WiMAX accounting information for all services or only the service specified.

Product

ASN GW

Privilege

Inspector

Syntax

show prepaid wimax statistics { all | asngw-service { all | name *service_name* **} | ha-service { all | name** *service_name* **} | per-service-summary } [| { grep** *grep_options* **| more }]**

all

This keyword displays prepaid statistics for all services.

asngw-service

Displays prepaid statistics for ASN GW service(s).

ha-service

Displays prepaid accounting statistics for HA service(s).

{ all | name *service_name* **}**

all: Display statistics for all services of the specified type.
name *service_name*: Display statistics for the service named *service_name* of the specified service type.

per-service-summary

Displays prepaid statistics per service summary for all services.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Use this command to display prepaid WiMAX accounting statistics for named service or for all services.

Example

The following command displays prepaid WiMAX accounting statistics for an ASN GW service name *asn1*:

show prepaid wimax statistics asngw-service name *asn1*

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show profile-id-qci-mapping

Displays QCI-RAN mapping tables configured on this system.

Product

HSGW

Privilege

Inspector

Syntax

show profile-id-qci-mapping table { all | name *table_name* **} [| { grep** *grep_options* **| more }]**

all

Displays information for all QCI-RAN mapping tables configured on this system.

name *table_name*

Displays information for a QCI-RAN mapping tables configured for a specific QCI-RAN table on this system.
table_name must be an existing QCI-RAN table, and be from 1 to 63 alpha and/or numeric characters in length.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Use this command to display the contents of a specific QCI-RAN mapping table or all mapping tables configured on this system.

Example

The following command displays the contents of a QCI-RAN mapping table named *table1*:

show profile-id-qci-mapping table name *table1*

Chapter 94
Exec Mode Show Commands (Q-S)

This section includes the commands **qci-qos-mapping** through **show system uptime**.

show qci-qos-mapping

Displays QCI-QoS mapping tables configured on this system.

Product

HSGW, P-GW, S-GW

Privilege

Inspector

Syntax

```
show qci-qos-mapping table { all | name table_name } [ | { grep grep_options |
more } ]
```

all

Displays information for all QCI-QoS mapping tables configured on this system.

name *table_name*

Displays information for a QCI-QoS mapping tables configured for a specific QCI-QoS table on this system. *table_name* must be an existing QCI-QoS table, and be from 1 to 63 alpha and/or numeric characters in length.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to display the contents of a specific QCI-QoS mapping table or all mapping tables configured on this system.

Example

The following command displays the contents of a QCI-QoS mapping table named *table1*:

```
show qci-qos-mapping table name table1
```

show qos npu inter-subscriber traffic

Displays configuration information pertaining to NPU QoS priority queue bandwidth allocation and sharing.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show inter-subscriber traffic { bandwidth | bandwidth-sharing }
```

bandwidth

Displays NPU QoS priority queue bandwidth allocation configuration information.

bandwidth-sharing

Displays NPU QoS priority queue bandwidth sharing configuration information.

Usage

Use this command to verify configuration information and for troubleshooting.
When the bandwidth keyword is used, the output is a table showing the configuration status, the priority queue, and the bandwidth allocation per DSCP.
When the bandwidth-sharing keyword is used, the output of is a table displaying the bandwidth sharing configuration per processing card slot/CP number.
For additional information on the NPU QoS functionality, refer to the System Administration and Configuration Guide.

Important: This functionality is not supported for use with the PDSN at this time.

show qos npu stats

Displays NPU Qos statistics per priority queue for a particular processing card:

Product

GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show qos npu stats inter-subscriber traffic slot *slot_num*

slot *slot_num*

Specifies the chassis slot number in which the processing card for which to display statistics is installed. *slot_num* is an integer from 1 to 48 that represents the slot in which a processing card is installed. Processing cards can be installed in slots 1 through 8, and/or 10 through 16.

Usage

This command displays packet and byte counts per NPU QoS priority queue on a per-processing card basis. For additional information on the NPU QoS functionality, refer to the System Administration and Configuration Guide.

Important: This functionality is not supported for use with the PDSN at this time.

Example

The following command displays NPU QoS priority queue statistics for a processing card installed in chassis slot number 4:

show qos npu stats inter-subscriber traffic *slot 4*

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show radius

Displays and statistic information for accounting and/or authentication.

Product

PDSN, HA, GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show radius { accounting servers | authentication servers } [detail] [admin-status { enabled | disabled }] [| { grep *grep_options* **| more }] [radius group** *group_name* **[detail] [| { grep** *grep_options* **| more }]]**

accounting servers

Lists information for configured accounting servers and their current state.

authentication servers

Lists information for configured authentication servers and their current state.

[detail]

Displays historical state information for configured servers of the specified type

admin-status { enabled | disabled }

Displays information for accounting and/or authentication servers with an administrative status of “enabled” or ”disabled”.

radius group *group_name*

Displays the authentication/authorization RADIUS server group information for server group *group_name* with in current context.
group_name will be a string of size 1 to 63 character and specifies the name of server group configured in specific context for authentication/accounting.

grep *grep_options* **| more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Display the RADIUS server information as part of periodic monitoring of the health of the system.

Example

The following displays the information on configured accounting servers:

show radius accounting server

The following command displays detailed information for RADIUS accounting servers:

show radius accounting servers detail

The following command displays detailed information for RADIUS server group *star1* used for authentication:

show radius authentication servers radius group *star1* **detail**

The following command displays detailed information for RADIUS server group *star1* used for accounting:

show radius accounting servers radius group *star1* **detail**

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show radius charging servers

This command displays the RADIUS authentication and accounting servers or server group that are configured for use by charging services.

Product

PDSN, HA, GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show radius charging servers [radius group *group_name* **] [| { grep** *grep_options* **| more }]**

radius group *group_name* **all**

Displays all RADIUS counter information for the specified server group configured for use by charging services.
group_name specifies the name of server group configured in specific context for authentication/accounting, and must be a string of 1 through 63 characters in length.

grep *grep_options* **| more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to display information about RADIUS servers or server group configured for use by Charging Services.

Example

The following command displays RADIUS servers configured for Charging Services:

```
show radius charging servers
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show radius client

DIsplays information about the RADIUS client configured on the system.

Product

PDSN, HA, GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show radius client status [| { grep *grep_options* **| more }]**

status

Displays a status summary for the RADIUS client.

| { grep *grep_options* **| more }**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

The configuration of the RADIUS protocol on the system enables RADIUS client functionality.
This command is used to view information pertaining to the status of the client.

Example

The following command displays detailed information pertaining to the system's RADIUS client:

```
show radius client status
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show radius counters

Displays RADIUS server and statistic information for accounting and/or authentication.

Product

PDSN, HA, GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show radius counters { all | radius group group_name all | server ip_address [
port number ] | summary [ all-contexts [ verbose ] ] } [ | { grep grep_options |
more } ]
```

counters { all | server *ip_address* **[port** *number* **] }**

counters { all | server *ip_address* **[port** *number* **] }**: indicates the statistics for either **all** servers or the server specified by *ip_address* is to be displayed. The statistics for a specific port of the server may also be specified as *number*. *ip_address* must be specified using the standard IPv4 dotted decimal notation. *number* must be a value from 0 through 65535.

radius group *group_name* **all**

Displays all RADIUS counter information for the specified server group within current context. *group_name* specifies name of the server group configured in specific context for authentication/accounting, and must be a string of 1 through 63 characters in length.

summary [all-contexts [verbose]]

Displays a summary of RADIUS statistics for all the RADIUS servers configured in specific context. all-contexts: Specifies that a summary of RADIUS statistics for all RADIUS servers configured in all contexts should be displayed. If **verbose** is also specified the information is dispayed in more detail.

grep *grep_options* **| more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Display the RADIUS server information as part of periodic monitoring of the health of the system.

Example

The following command displays detailed information pertaining to the RADIUS server group *star1* with in current context:

```
show radius counters radius group star1 all
```

The following displays the statistics for the server with IP address *1.2.3.4*, then just port *7777*, followed by **all** services.

show radius counters server *1.2.3.4*

show radius counters server *1.2.3.4* **port** *7777*

show radius counters all

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show resources

Displays the resource information by CPU or session.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show resources { cpu | session } [| { grep *grep_options* **| more }]**

cpu | session

cpu: indicates the resource information is to be displayed by CPU.
session: indicates the resource information is to be displayed by session.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

View resource utilization as part of troubleshooting systems which appear sluggish or are having excessive connection timeouts or other connection issues.

Example

The following display the resource information by CPU and session, respectively.

```
show resources cpu
```

```
show resources session
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show rohc counters

This command displays ROHC counters for all active calls.

Product

PDSN, HSGW,

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show rohc counters [all | callid *call_id* **| imsi** *imsi_num* **| ip-address** *ip_addr* **| msid** *msid_num* **| username** *user_name* **] [| { grep** *grep_options* **| more }]**

all

indicates all information is to be displayed.

callid *call_id*

call_id indicates the information only for calls with Id *call_id* are to be displayed. *call_id* must be specified as a 4-byte hexadecimal number.

imsi *imsi_num*

imsi_num: Specifies an international mobile subscriber ID only for which information is to be displayed. The IMSI (International Mobile Subscriber Identity) ID is an up to 15-character field which identifies the subscriber's home country and carrier: 3 digits of Mobile Country Code (MCC), 2 or 3 digits of Mobile Network Code (MNC), followed by the Mobile Subscriber Identification Number MSIN. Example: 123-45-678910234. May also be entered as 12345678910234.

ip-address *ip_addr*

ip_addr: Specifies a mobile subscriber IP address only for which information is to be displayed. *ip_addr* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

msid *msid_num*

msid_num specifies a mobile subscriber ID only for which information is to be displayed. *msid_num* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI.

username *user_name*

user_name: specifies a user only for which R-P information is to be displayed where the user is specified as user_name.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to display ROHC counters for all active calls.

Example

The following command displays ROHC counters for all active calls:

```
show rohc counters all
```

show rohc statistics

This command displays statistics and counters for ROHC IP header compression.

Product

PDSN, HSGW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show rohc statistics [ pdsn-service < service name >  | hsgw-service
hsgwsvc_name ] [ | { grep grep_options | more } ]
```

pdsn-service *pdsnsvc_name*

Display ROHC statistics and counters for the specified PDSN service.

hsgw-service *hsgwsvc_name*

Display ROHC statistics and counters for the specified HSGW service.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to display ROHC statistics for all services or for a specific PDSN or HSGW.

Example

The following command displays ROHC statistics for the PDSN service named pdsn1:

```
show rohc statistics pdsn-service pdsn1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show route-map

This command displays entries for all route maps for the current context.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show route-map [name *route-map name* **| | { grep** *grep_options* **| more }]**

name *route-map name*

Displays information for a specified route-map. The name is a string of 1 to 79 characters.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to see the rules configured in all route-maps for the current context.

Example

The following command displays the route-map information;

```
show route-map
```

Refer to the match and set command descriptions in Route-map Configuration Mode Commands for explanations of the various entries listed.

show rp

Displays the R-P interface statistics using the filtering options specified.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show rp [ counters | full | summary ] { all | callid call_id | msid ms_id |
peer-address peer_ip_address | username user_name } [ | { grep grep_options |
more } ]
```

counters | full | summary

Provides an optional modifier to the output for the level and type of information.
counters: indicates the R-P protocol statistics are to be displayed.
full: indicates all available information is to be displayed.
summary: indicates only a summary of available information is to be displayed.
These options are not available in conjunction with the keywords **statistics** or **service-option statistics**.

all | callid *call_id* **| msid** *ms_id* **| peer-address** *peer_ip_address* **| username** *user_name*

all: indicates all R-P information is to be displayed.
callid *call_id*: indicates the information only for calls with Id *call_id* are to be displayed. *call_id* must be specified as a 4-byte hexadecimal number.
msid *ms_id*: specifies a mobile subscriber ID only for which information is to be displayed. *ms_id* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI.
peer-address *peer_ip_address*: specifies the peer IP address, of the PCF, for which R-P information is to be displayed. *peer_ip_address* must be specified using the standard IPv4 dotted decimal notation.
username *user_name*: specifies a user only for which R-P information is to be displayed where the user is specified as *user_name*.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

View the R-P interface statistics for the current context.

Example

The following displays the summary for all connections.

show rp summary all

The following outputs the R-P interface detailed information for the user *user1*.

show rp full username *isp1user1*

The following command displays the standard information for the call with ID *FF0E11CD*.

show rp callid *ff0e11cd*

The following displays the statistics summary for the R-P facility.

show rp

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show rp service-option

Displays the R-P service option statistics using the filtering options specified.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show rp service-option statistics [number *svc_option_num* **|** **pdsn-service** *pdsn_name* **] [| { grep** *grep_options* **| more }]**

number *svc_option_num* **|** **pdsn-service** *pdsn_name*

Default: display statistics for all service options numbers and associated packet data services.
number *svc_option_num*: specifies the service option number for which collected statistics are to be displayed.
pdsn-service *pdsn_name*: specifies the packet data service for which the collected statistics are to be displayed.

grep *grep_options* **|** **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

View the R-P service option statistics for the current context.

Example

The following displays the statistics for all service options.

```
show rp service-option statistics
```

The following displays the statistics for service option *5*.

```
show rp service-option statistics number 5
```

The following command displays the statistics for all service options in collected for the packet data service *sampleService*.

```
show rp service-option statistics pdsn-service sampleService
```

show rp statistics

Displays the R-P protocol statistics using the filtering options specified.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show rp statistics [pdsn-service *pdsn_name* **| peer-address [** *peer_address* **| all]] [| { grep** *grep_options* **| more }] [verbose]**

pdsn-service *pdsn_name* **| peer-address** *peer_address*

Default: all R-P protocol statistics are to be displayed.
pdsn-service *pdsn_name* : indicates the statistic information for the service specified is to be displayed. *pdsn_name* must be from 1 to 63 alpha and/or numeric characters.
peer-address [*peer_address* | **all**] :indicates the statistic information for the peer specified or all peers is to be displayed. *peer_address* must be specified using the standard IPv4 dotted decimal notation.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

verbose

Displays more detailed statistics.

Usage

View the R-P statistics for the current context.

Example

The following displays all collected R-P statistics.

```
show rp statistics
```

The following displays the R-P statistics associated with the peer address *1.2.3.4*.

```
show rp statistics peer-address 1.2.3.4
```

The following command displays the R-P statistics for the packet data service *PCFnet*.

```
show rp statistics pdsn-service PCFnet
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show rsvp counters

Displays the rsvp counters using the filtering options specified.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show rsvp counters [all | callid *call_id* **| msid** *ms_id* **| username** *user_name* **]**

all | callid *call_id* **| msid** *ms_id* **| username** *user_name*

all: indicates all rsvp information is to be displayed.
callid *call_id*: indicates the information only for calls with Id *call_id* are to be displayed. *call_id* must be specified as a 4-byte hexadecimal number.
msid *ms_id*: specifies a mobile subscriber ID only for which information is to be displayed. *ms_id* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI.
username *user_name*: specifies a user only for which rsvp information is to be displayed where the user is specified as *user_name*.

Usage

View the rsvp counters for the current context.

Example

The following displays all collected rsvp counters.

```
show rsvp counters all
```

show rsvp statistics

Displays the rsvp statistics using the filtering options specified.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show rsvp counters [pdsn-service *service* **| sessmgr instance** *instance* **]**

pdsn-service *service* **| sessmgr instance** *instance*

pdsn-service *service*: indicates the statistic information for the service specified is to be displayed. pdsn_name must be from 1 to 63 alpha and/or numeric characters.
sessmgr instance *instance*: indicates the session manager instances.

Usage

View the rsvp statistics for the current context.

Example

The following displays collected rsvp statistics for a *sampleService*.

show rsvp statistics pdsn-service *sampleService*

show requirement pac daughtercard

Displays the system-level status indicating whether or not the encryption daughtercard (EDC) is required on PACs within chassis.

Product

PDSN, GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show requirement pac daughtercard
```

Usage

This command displays whether or not the EDC is required on PACs within the chassis.

Important: This command is not supported on all platforms

Example

`show requirement pac daughtercard`

When EDC requirement is enabled, the output of this command matches this example:

`[local]chicago# show requirement pac daughtercardThe encryption daughtercard is required for all PACs[local]chicago#`

When EDC requirement is disabled, the output of this command matches this example:

```
[local]chicago# show requirement pac daughtercardThe encryption daughtercard is
not required for all PACs[local]chicago#
```

show sccp-network

This command displays SS7 Signaling Connection Control Part (SCCP) network configuration and status information.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show sccp-network { *ntwk_index* | all } [status [all | dpc]]

ntwk_index

Display configuration and status information for the SSCP network configuration with the specified network index.
ntwk_index must be an integer from 1 through 12.

all

Display all available configuration and status information for all SSCP networks.

status all

Display all status information for specified SCCP networks.

status dpc

Display status information for the device in the SCCP network identified by the destination point-code.

Usage

Use this command to display global SCCP statistics or to display SCCP statistics for a specified service or network.

Example

The following command displays global SCCP statistics:

```
show sccp-network all
```

The following command displays information for an SCCP network configuration with the network index of *1*:

```
show sccp-network 1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show sccp statistics

This command displays SS7 Signaling Connection Control Part (SCCP) statistics for services that use the SCCP protocol.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show sccp statistics [iups-service *iups_srvc_name* **| map-service** *map_srvc_name* **| sccp-network** *ntwk_index* **]**

iups-service *iups_srvc_name*

Display SCCP protocol statistics for the specified IU-PS service in the current context.*iups_name* must be the name of a configured Iu-PS service and must be an alphanumeric string of from 1 through 63 characters.

map-service *map_srvc_name*

Display SCCP protocol statistics for the specified MAP service in the current context. must be the name of a configured MAP service and must be an alphanumeric string of from 1 through 63 characters.

sccp-network *ntwk_index*

Display SCCP protocol statistics for the SSCP network configuration with the specified network index. *ntwk_index* must be an integer from 1 through 12.

Usage

Use this command to display global SCCP statistics or to display SCCP statistics for a specified service or network.

Example

The following command displays global SCCP statistics:

```
show sccp statistics
```

The following command displays SCCP statistics for the IuPS service named *iups-serv1*:

```
show sccp statistics iups-service iups-serv1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show session counters historical

Displays historical information for session-related counters based on data collected in bulk statistics.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show session counters historical { all | arrived | callops | connected |
disconnected | failed | handoff | rejected | renewal } [ all-intervals | recent-
intervals ] [ cumulative | incremental ] [ graph | table ]
```

all

Displays data for all counters either as a single, wide table or as multiple graphs.

arrived

Displays only data for “total calls arrived” counters. This is based on the “sess-ttlarrived” statistic in the system schema.

callops

Displays data for all call operations. This is a calculated value based on the following formula:
(arrived + rejected + disconnected + failed + handoffs + renewals)

connected

Displays only data for “total calls connected” counters. This is based on the “sess-ttlconnected” statistic in the system schema.

disconnected

Displays only data for “total calls disconnected” counters. This is based on the “sess-ttldisconn” statistic in the system schema.

failed

Displays only data for “total calls failed” counters. This is based on the “sess-ttlfailed” statistic in the system schema.

handoff

Displays only data for “total handoffs” counters. This is based on the “sess-ttlhandoff” statistic in the system schema.

rejected

Displays only data for “total calls rejected” counters. This is based on the “sess-ttlrejected” statistic in the system schema.

renewal

Displays only data for "total renewal" counters. This is based on the "sess-ttlrenewal" statistic in the system schema.

all-intervals

Displays all available historical information from all samples. This this filter is used by default.

recent-intervals

Displays historical information for only recent samples.

cumulative

Displays total data for all samples up to and including the last one. In this view, values increase over time.

incremental

Displays data changes for each specific sample. The data for each sample is the amount of change since the previous sample. This filter is used by default.

graph

Displays data in graphical form.

table

Displays data in tabular form. This is the default view.

Usage

This command provides the ability to track key session-related statistic information over time. This information can be used as part of system performance monitoring and capacity planning.

Important: The information provided in the output of this command requires that bulk statistics funtionality be enabled on the system. Refer to the System Administration and Configuration Guide for more information on configuring/enabling bulk statistics support.

The output of this command displays historical data collected at various sample intervals. The interval length is 15 minutes and is not user-configurable. Up to 192 samples (2 days worth of data) are maintained.

Important: Data collection is "best-effort" over these intervals. Data is preserved on system management card switchovers. As with all counters, certain session failures can cause inaccuracies with counters, including counters which appear to go backwards.

Each sample is identified by a timestamp that displays the approximate time the data was gathered. It is in the format YYYY:MM:DD:HH:MM:SS.
Data acquired during the sample may be marked with an "S" appended to the end of the timestamp or to the counter value. The "S" indicates that the data is suspect (potentially bad). Occurrences of this result from events like changes to the real time clock, which can cause an interval to be an atypical length. Instances of suspect data should be rare. Additionally, there may be occasions in which a sample may be marked as

"invalid". "invalid" identifies bad data, a situation that could result from the polling hasn't run long enough, or because of an unexpected error retrieving data.
Since baseline values must be obtained prior to collecting interval samples, the first interval of data will not be available until up to 2x the interval period.

Example
The following command displays cumulative total calls arrived information for the most recent intervals and displays the output in graphical format:

```
show session counters historical arrived recent-intervals cummulative
graph
```

The following command displays historical data for all counters for all intervals and displays the output in tabular format:

```
show session counters historical all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show session counters pcf-summary

Displays the PCF summary which include the number of calls, call types, and Tx/Rx packets/octets statistics.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show session counters pcf-summary [ call-types | data | wf1 [ pcf pcf_address |
[ | { grep grep_options | more } ] ] ]
```

call-types

Displays the number of calls and the types of calls.

data

Displays the number of successful calls and Tx/Rx packets/octets statistics.

pcf *pcf_address*

Displays the given PCF summary for a particular address.

wf1

Displays the PCF summary in a single very wide line.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
Please refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference* for details on the usage of **grep** and **more**.

Usage

Use this command to display a summary of all PCFs.

Example

```
show session counters pcf-summary
```

show session disconnect-reasons

Displays a list of the reasons for call disconnects and the number of calls disconnected for each reason.

Product

All

Privilege

Security Administrator, Administrator, Inspector, Operator

Syntax

```
show session disconnect-reasons [ gprs-only | sgsn-only | mme-only | verbose ] [
| { grep grep_options | more } ] ]
```

gprs-only

Only supported on the SGSN.
This keyword limits the display to session disconnect reasons for the SGSN's 2G MM and PDP context disconnects.

sgsn-only

Only supported on the SGSN.
This keyword limits the display to session disconnect reasons for the SGSN's 3G MM and PDP context disconnects.

mme-only

This keyword filters to the list of the session disconnect reasons for MME call disconnects.

verbose

List all disconnect reasons even if the values are zero (0).

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference* .

Usage

Use this command to display a list of the reasons why calls were disconnected.

Example

To view session disconnect statistics, enter the following command:

```
show session disconnect-reasons
```

To view a list of the disconnect reasons with verbose output, enter the following command:

```
show session disconnect-reasons verbose
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show session duration

Displays session duration information for the current context filtered by the options specified.

Product

All

Privilege

Security Administrator, Administrator, Inspector, Operator

Syntax

show session duration [*session_filter* **] [| { grep** *grep_options* **| more }]**

session_filter

Indicates name of the sessions/services/AGWs whose session duration information is to be filtered and displayed. This consist of following:

- **asn-peer-address** *ip_address*: Indicates that only the session information for the ASN GW peer whose IP address is specified by *ip_address* is to be displayed. *ip_address* must be specified using the standard IPv4 dotted decimal notation.
- **asngw-service** *service_name*: Indicates that only the session information for the ASN GW service whose name is specified by *service_name* is to be displayed.
- **asnpc-peer-address** *ip_address*: Indicates that only the session information for the ASN PC peer whose IP address is specified by *ip_address* is to be displayed. *ip_address* must be specified using the standard IPv4 dotted decimal notation.
- **asnpc-service** *service_name*: Indicates that only the session information for the ASN PC service whose name is specified by *service_name* is to be displayed.
- **apn** *apn_name*: Indicates that only session information for the specified APN will be displayed. *apn_name* specifies the name of a configured APN that can be from 1 to 63 alpha and/or numeric characters and is case sensitive.
- **cscf-service** *service_name*:Indicates that only session information for the specified CSCF service will be displayed. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

Important: CSCF SIP calls under progress only. Registrations will not be considered a call.

- **dhcp-server** *dhcp_address*: Indicates that only session information for the specified DHCP server will be displayed. *dhcp_address* is the name of the DHCP server and must be expressed in dotted decimal notation.
- **fa** *fa_address*: Indicates only the session information for the foreign agent whose IP address is specified by *fa_address* is to be displayed. *fa_address* must be specified using the standard IPv4 dotted decimal notation.
- **fa-service** *fa_name*: Indicates only the session information for the foreign agent service specified by *fa_name* is to have information displayed.
- **ggsn-service** *ggsn_name*: Indicates that only session information for the specified GGSN service will be displayed. *ggsn_name* specifies the name of a configured GGSN service that can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

- **gprs-only**: Limits the display to the session information for the SGSN's 2G MM and PDP contexts.
- **ha** *ha_address*: Indicates only the session information for the home agent whose IP address is specified by *ha_address* is to be displayed. *ha_address* must be specified using the standard IPv4 dotted decimal notation.
- **ha-service** *ha_name*: Indicates only the session information for the home agent service specified by *ha_name* is to be displayed.
- **hsgw-service** *service_name*: Indicates only the session information for the HSGW service specified by the *service_name* is to be displayed. *service_name* must be an existing HSGW service and be from 1 to 63 alpha and/or numeric characters.
- **lma-service** *service_name*: Indicates only the session information for the LMA service specified by the *service_name* is to be displayed. *service_name* must be an existing {MA service and be from 1 to 63 alpha and/or numeric characters.
- **mme-service** *service_name*: Indicates only the session information for the MME service specified by the *service_name* is to be displayed. *service_name* must be an existing MME service and be from 1 to 63 alpha and/or numeric characters.
- **mag-service** *service_name*: Indicates only the session information for the MAG service specified by the *service_name* is to be displayed. *service_name* must be an existing MAG service and be from 1 to 63 alpha and/or numeric characters.
- **pcf** *pcf_address*: Indicates only the session information for the packet control function with IP address *pcf_address* is to be displayed. *pcf_address* must be specified using the standard IPv4 dotted decimal notation.
- **pdsn-service** *pdsn_name*: Indicates only the session information for the packet data service specified by *pdsn_name* is to have information displayed.

Important: If no PCF address or PDSN service is specified the session information for all sessions is displayed.

- **sgsn-address** *sgsn-address*: Indicates that only session information for the specified SGSN will be displayed. *sgsn_address* is the IP address of the SGSN and must be expressed in dotted decimal notation.
- **sgsn-only**: Limits the display to the session information for the SGSN's 3G MM and PDP contexts.
- **sgw-service** *service_name*: Indicates only the session information for the S-GW service specified by the *service_name* is to be displayed. *service_name* must be an existing S-GW service and be from 1 to 63 alpha and/or numeric characters.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

View the session information to troubleshooting subscriber problems and for general monitoring for orphaned sessions.

Example

The following commands display the duration information for the session connected to the packet control function with address *1.2.3.4*, packet data service *sampleService*, and for all sessions, respectively.

```
show session duration pcf 1.2.3.4

show session duration pdsn-service sampleService

show session duration
```

show session progress

Displays session progress information for the current context filtered by the options specified.

Product

All

Privilege

Security Administrator, Administrator, Inspector, Operator

Syntax

show session progress [asn-peer-address *ip_address* **| asngw-service** *service_name* **| asnpc-service** *service_name* **| asnpc-peer-address** *ip_address* **| apn** *apn_name* **| cscf-service** *service_name* **| dhcp-server** *dhcp_address* **| fa** *fa_address* **| fa-service** *fa_name* **| ggsn-service** *ggsn_name* **| ha** *ha_adress* **| ha-service** *ha_name* **| hsgw-servie** *service_name* **| lma-service** *service_name* **| mag-service** *service_name* **| mme-address** *mme_address* **| pcf {** *pcf_address* **| all }** **| pdsn-service** *pdsn_name* **| pdsnclosedrp-service | pgw-address** *ip_address* **| sgsn-address** *sgsn_address* **| sgw-service** *service_name* **] [| { grep** *grep_options* **| more }]**

progress [asn-peer-address *ip_address* **| asngw-service** *service_name* **| asnpc-service** *service_name* **| asnpc-peer-address** *ip_address* **| apn** *apn_name* **| cscf-service** *service_name* **| dhcp-server** *dhcp_address* **| fa** *fa_address* **| fa-service** *fa_name* **| ggsn-service** *ggsn_name* **| ha** *ha_adress* **| ha-service** *ha_name* **| hsgw-servie** *service_name* **| lma-service** *service_name* **| mag-service** *service_name* **| mme-address** *mme_address* **| pcf {** *pcf_address* **| all }** **| pdsn-service** *pdsn_name* **| pdsnclosedrp-service | pgw-address** *ip_address* **| sgsn-address** *sgsn_address* **| sgw-service** *service_name* **]**

progress: indicates session progress information is to be displayed.

- **asn-peer-address** *ip_address*: Indicates that only the session information for the ASN GW peer whose IP address specified by *ip_address* is to be displayed. *ip_address* must be specified using the standard IPv4 dotted decimal notation.
- **asngw-service** *service_name*: Indicates that only the session information for the ASN GW service whose name is specified by *service_name* is to be displayed.
- **asnpc-service** *service_name*: Indicates that only the session information for the ASN PC service whose name is specified by *service_name* is to be displayed.
- **asnpc-peer-address** *ip_address*: Indicates that only the session information for the ASN PC peer whose IP address specified by *ip_address* is to be displayed. *ip_address* must be specified using the standard IPv4 dotted decimal notation.
- **apn** *apn_name***:** Indicates that only session information for the specified APN will be displayed. *apn_name* specifies the name of a configured APN that can be from 1 to 63 alpha and/or numeric characters and is case sensitive.
- **cscf-service** *service_name***:** Indicates that only session information for the specified CSCF service will be displayed. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

Important: CSCF SIP calls under progress only. Registrations will not be considered a call.

- **dhcp-server** *dhcp_address*: Indicates that only session information for the specified DHCP server will be displayed. *dhcp_address* is the name of the DHCP server and must be expressed in dotted decimal notation.
- **fa** *fa_address*: indicates only the session information for the foreign agent whose IP address is specified by *fa_address* is to be displayed. *fa_address* must be specified using the standard IPv4 dotted decimal notation.
- **fa-service** *fa_name*: indicates only the session information for the foreign agent service specified by *fa_name* is to have information displayed.
- **ggsn-service** *ggsn_name*: Indicates that only session information for the specified GGSN service will be displayed. *ggsn_name* specifies the name of a configured GGSN service that can be from 1 to 63 alpha and/or numeric characters and is case sensitive.
- **ha** *ha_adress*: indicates only the session information for the home agent whose IP address is specified by *ha_address* is to be displayed. *ha_address* must be specified using the standard IPv4 dotted decimal notation.
- **ha-service** *ha_name*: indicates only the session information for the home agent service specified by *ha_name* is to have information displayed.
- **hsgw-service** *service_name*: Indicates only the session progress information for the HSGW service specified by the *service_name* is to be displayed. *service_name* must be an existing HSGW service and be from 1 to 63 alpha and/or numeric characters.
- **lma-service** *service_name*: Indicates only the session progress information for the LMA service specified by the *service_name* is to be displayed. *service_name* must be an existing {MA service and be from 1 to 63 alpha and/or numeric characters.
- **mag-service** *service_name*: Indicates only the session progress information for the MAG service specified by the *service_name* is to be displayed. *service_name* must be an existing MAG service and be from 1 to 63 alpha and/or numeric characters.
- **mme-address** *mme_address*: indicates only the session information for the foreign agent whose IP address is specified by *mme_address* is to be displayed. *mme_address* must be specified using the standard IPv4 dotted decimal notation.
- **pcf** *pcf_address*: Indicates only the session information for the packet control function with IP address *pcf_address* is to be displayed. *pcf_address* must be specified using the standard IPv4 dotted decimal notation.
- **pcf all**: indicates the session information for the packet control function for all pcf addresses.
- **pdsn-service** *pdsn_name*: indicates only the session information for the packet data service specified by *pdsn_name* is to have information displayed.

Important: If no PCF address or PDSN service is specified the session information for all sessions is displayed.

- **pgw-address** *ip_address*: Indicates only session progress information for the P-GW with an IP address specified by *ip_address* is to be displayed. *ip_address* must be specified using the standard IPv4 dotted decimal notation.
- **sgsn-address** *sgsn-address*: Indicates that only session information for the specified SGSN will be displayed. *sgsn_address* is the IP address of the SGSN and must be expressed in dotted decimal notation.

- **sgw-service** *service_name*: Indicates only the session progress information for the S-GW service specified by the *service_name* is to be displayed. *service_name* must be an existing S-GW service and be from 1 to 63 alpha and/or numeric characters.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

View the session information to troubleshooting subscriber problems and for general monitoring for orphaned sessions.

Example

The following commands display the status information for the session connected to the packet control function with address *1.2.3.4*, packet data service *sampleService*, and for all sessions, respectively.

```
show session progress pcf 1.2.3.4

show session progress pdsn-service sampleService

show session progress
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show session recovery status

Displays session recovery status information for the current context filtered by the options specified.

Product

All

Privilege

Security Administrator, Administrator, Inspector, Operator

Syntax

show session recovery status [verbose] [| { grep *grep_options* **| more }]**

recovery status

Displays the current status of the system's ability to recover from a hardware or software fault that requires the recovery of home agent-based Mobile IP session(s).

verbose

Includes per-CPU Session Recovery status.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

View the session information for troubleshooting subscriber problems and for general monitoring for orphaned sessions.

Example

To display the session recovery status information, enter the following command:

```
show session recovery status
```

Adding the optional verbose keyword to this command provides more details.

```
show session recovery status verbose
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show session setuptime

Displays session setup time information for all sessions or sessions associated with the specified AGW/node.

Product

All

Privilege

Operator

Syntax

show session setuptime [mme-only | pcf *pcf_address* **|gprs-only | sgsn-address** *sgsn_address*| **sgsn-only] [| { grep** *grep_options* **| more }]**

[mme-only | pcf pcf_address | gprs-only | sgsn-address *sgsn_address* **| sgsn-only]**

Displays the call setup times aggregated into basic ranges of time.

- **mme-only**: Filters and displays the call setup information for MME calls only.
- **pcf** *pcf_address*: displays call setup data for the packet control function whose IP address is specified as *pcf_address*. *pcf_address* must be specified using the standard IPv4 dotted decimal notation. The call setup times for all PCFs is displayed when no specified PCF is specified.
- **gprs-only**: Displays 2G call setup data for the for the SGSN for the MM and PDP contexts.
- **sgsn-address** *sgsn_address***:** Displays call setup times for the specified SGSN. *sgsn_address* is the IP address of the SGSN and must be expressed in dotted decimal notation. This keyword is used by the GGSN.
- **sgsn-only**: Displays 3G call setup data for the for the SGSN for the MM and PDP contexts.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

View the session information to troubleshooting subscriber problems and for general monitoring for orphaned sessions.
When no keywords are specified, the information shown is cumulative for all sessions that have been facilitated by the system.

Example

The following command shows setup time statistics for all sessions from the PCF at IP address 192.168.10.3:

show session setuptime pcf *192.168.10.3*

show session subsystem

Displays session information for system subsystems. If no keywords are specified, information for all subsystems is displayed.

Product

All

Privilege

Security Administrator, Administrator, Inspector, Operator

Syntax

```
show session subsystem [ full | facility facility [ all | instance id ] ] [
verbose ] [ | { grep grep_options | more }]
```

`[ full | facility facility [ all | instance id ] ]`

- **`full`**: Indicates that a full statistics summary of all subsystems is to be displayed.
- **`facility`** *`facility`*: Specifies the facility for which subsystem statistics is to be displayed where *`facility`* is specified as one of:
  - **a11mgr**: A11 Manager
  - **aaamgr**: Accounting and Authentication Manager
  - **aaaproxy**: AAA Proxy Manager
  - **asngwmgr**: ASN Gateway Manager
  - **asnpcmgr**: ASN Paging/Location-Registry Manager
  - **cscfmgr**: SIP CSCF Manager
  - **dgmbmgr**: Diameter Gmb Application Manager
  - **diamproxy**: Diameter Proxy Application Manager
  - **egtpegmgr**: EGTP Egress Demux Manager
  - **egtpinmgr**: EGTP Ingress Demux Manager
  - **famgr**: Foreign Agent Manager
  - **gtpumgr**: GTPUMGR Demux Manager
  - **gtpcmgr**: GTPC Manager
  - **hamgr:** Home Agent Manager
  - **hnbmgr**: HNBGW HNB Manager
  - **imsimgr**: SGSN IMSI Manager
  - **ipsgmgr:** IP Services Gateway Manager
  - **l2tpdemux:** L2TP Demux Manager
  - **l2tpmgr:** L2TP Manager
  - **linkmgr**: SGSN/SS7 Master Manager
  - **magmgr**: Mobile Access Gateway Manager

- **megadiammgr:** Mega Diameter Manager
- **mmedemux**: MME Demux Manager logging facility
- **mmemgr**: MME Manager logging facility
- **mmgr**: SGSN/SS7 Master Manager
- **phsgwmgr**: PHS Gateway Manager
- **phspcmgr**: PHS Paging Controller Manager
- **sessmgr:** Session Manager
- **sgtpcmgr**: SGSN GTPC Manager

- **all | instance** *id*: the keyword **all** indicates all instances of the specified facility are to be displayed whereas the keyword **instance** specifies a specific instance for which information is to be displayed where *id* must be specified as an instance ID in the range 0 through 4294967295. If all or instance is not specified summary statistics are displayed.

verbose

Displays everything the show session subsystem command output displays with the exception that the Setup Time statistics are reported in 100 ms increments from <100 ms up to 9600 ms.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
Please refer to the Regulating the Command Output section in the Command Line Interface Reference for details on the usage of **grep** and **more**.

Usage

View the session information to troubleshooting subscriber problems and for general monitoring for orphaned sessions.
If this command is entered with no keywords, the information displayed is cumulative for all sessions facilitated by the system.

Example

The following commands display the statistics information summarized for all sessions, then for the *famgr* facility (all sessions), and finally only for the session with ID *127589* for the *hamgr* subsystem.

```
show session subsystem full

show session subsystem facility a11mgr all

show session subsystem facility aaamgr all

show session subsystem facility asngwmgr all

show session subsystem facility famgr all

show session subsystem facility hamgr all

show session subsystem facility sessmgr all
```

```
show session subsystem facility aaaproxy all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show session trace

Displays status and statistics for the session trace application.

Product

MME, P-GW, S-GW

Privilege

Inspector

Syntax

show session trace { statistics | subscriber network-element { mme | pgw | sgw } trace-ref *value* **| tce-address** *ip_address* **tce-index** *num* **| tce-summary | trace-summary } [| { grep** *grep_options* **| more }]**

statistics

Displays summary statistics of the session trace subsystem.

subscriber network-element { mme | pgw | sgw } trace-ref *value*

Displays status and statistics of a specified session trace using the network element type and the trace reference. *value* must be a valid trace reference 12 characters in length.

tce-address *ip_address* **tce-index** *num*

Displays status and statistics of a specified Trace Collection Entity (TCE) connection. *ip_address* must be a valid existing collection entity IPv4 address and is specified in dotted decimal notation.

tce-summary

Displays a summary of all active TCE connections.

trace-summary

Displays a summary of all active session traces.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
Please refer to the Regulating the Command Output section in this reference for details on the usage of **grep** and **more**.

Usage

Use this command to display status and statistics for the session trace application.

Example

The following command displays status and statistics for a subscriber session trace on a P-GW with a trace reference of *32223398765*:

show session trace subscriber network-element pgw trace-ref *32223398765*

The following command displays status and statistics for a subscriber session trace on an MME with a trace reference of *32221234567*:

show session trace subscriber network-element pgw trace-ref *32223398765*

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show sgsn-operator-policy

Displays configuration information for the SGSN features bundled into the SGSN Operator Policy and includes operational configuration for features such as GPRS Attach, GPRS RAU Inter, and PTMSI-Realloc Service Request (Signalling).

Product

SGSN

Privilege

Security Administrator, Administrator, Inspector, Operator

Syntax

show sgsn-operator-policy (all | full | name *op-pol-name* **} +**

all

Displays information for all configured SGSN operator policies.

full

Display all details of the configuration for the specified SGSN Operator Policy.

name *op-pol-name*

Identifies a specific operator policy. *op-pol-name* must be a combination of 1 to 64 alphanumeric characters.

Usage

This command can be used to display all of the operator policies that have been configured or all of the configuration information for a specific operator policy.

Example

The following command displays information for all configured SGSN operator policies:

show sgsn-operator-policy all

show sgsn-service

This command displays information about the configured SGSN services in the current context.

Product

SGSN

Privilege

Security Administrator, Administrator, Inspector, Operator

Syntax

show sgsn-servie { all | name *srvc_name* **}**

all

Displays information for all SGSN services in the current context.

name *srvc_name*

Displays information for the specified SGSN service in the current context. *srvc_name* must be the name of a configured SGSN service and must be an alphanumeric string from 1 to 63 characters in length.

Usage

Use this command to display information for SGSN services.

Example

The following command displays information for all SGSN services in the current context:

```
show sgsn-service all
```

The following command displays information for an SGSN service in the current context that is named sgsn1:

```
show sgsn-service name sgsn1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show sgsn sessmgr

This command displays session manager (SessMGR) statistics specific to the SGSN service.

Product

SGSN

Privilege

Security Administrator, Administrator, Inspector, Operator

Syntax

show sgsn sessmgr { all | instance *smgr_inst* **}**

all

Displays all SessMGR statistics specific to the system's SGSN services.

instance *smgr_inst*

Displays the statistics for a specific session manager instance of the SGSN service.
smgr_inst must be an integer between 1 and 10000000.

Usage

Use this command to display information for SGSN services.

Example

The following command displays SGSN SessMGR statistics for all SGSN services on the system:

```
show sgsn sessmgr all
```

show sgtp-service

This command displays information about the configured SGTP services in the current context, including GTP-C and GTP-U operational configuration.

Product

SGSN

PDG/TTG

Privilege

Security Administrator, Administrator, Inspector, Operator

Syntax

show sgtp-service { all | ggsn-table | sgsn-table | name *srvc_name* **}**

all

Displays configuration information for all of the SGTP services defined for the current context.

ggsn-table

Displays GGSN information configured for the SGTP service in the current context.

sgsn-table

Displays SGSN information configured for the SGTP service in the current context.

name *srvc_name*

Displays information for the specified SGTP service in the current context. *srvc_name* must be the name of a configured SGTP service and must be an alphanumeric string from 1 to 63 characters in length.

Usage

Use this command to display information for SGSN services.

Example

The following command displays information for all SGTP services in the current context:

```
show sgtp-service all
```

The following command displays the GGSN information in SGTP services in the current context:

```
show sgtp-service ggsn-table
```

The following command displays the SGSN information in SGTP services in the current context:

```
show sgtp-service sgsn-table
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show sgtpc statistics

This command displays all statistics, for SGTPC interface parameters, collected since the last restart or last use of a clear command.

Product

SGSN

PDG/TTG

Privilege

Security Administrator, Administrator, Inspector, Operator

Syntax

show sgtpc statistics [all | gsn-address *ipv4_address* **| sgtp-service** *sgtp_srvc_name* **] [verbose]**

all

Displays configuration information for all of the SGTP services defined for the current context.

gsn-address *ipv4_address*

ipv4_address Displays statistics for a specific SGSN identified by the SGSN's IPv4 address. specified in dotted decimal notation.
Note this must be an existing and active interface.

sgtp-service *sgtp_srvc_name*

Displays statistics for the specified SGTP service in the current context.
sgtp_srvc_name must be the name of a previously configured and active SGTP service and must be an alphanumeric string from 1 to 63 characters in length.

verbose

Causes the system to displays more detailed level of statistics.

Usage

Use this command to display information for SGSN services.

Example

The following command displays statistics for the SGTP service named *sgtp1*:

show sgtpc statistics sgtp-service *sgtp1*

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show sgtpu statistics

This command displays all transmission and reception statistics, for pre-defined and active GTP-U interfaces, collected since the last restart or last use of a clear command.

Product

SGSN

PDG/TTG

Privilege

Security Administrator, Administrator, Inspector, Operator

Syntax

show sgtpu statistics [ggsn-address *ipv4_address* **| iups-service** *iups_srvc_name* **| rnc-address** *ipv4_address* **| sgtp-service** *sgtp_srvc_name* **| gprs-service** *gprs_srvc_name* **nsei** *nse_id* **]**

ggsn-address *ipv4_address*

ipv4_address Displays statistics for a specific GGSN identified by the GGSN's IPv4 address. specified in dotted decimal notation.

iups-service *iups_srvc_name*

Displays statistics for the specified IuPS service in the current context.
iups_srvc_name must be the name of a previously configured and active IuPS service and must be an alphanumeric string from 1 to 63 characters in length.

rnc-address *ipv4_address*

ipv4_address Displays statistics for a specific RNC identified by the RNC's IPv4 address. specified in dotted decimal notation.

sgtp-service *sgtp_srvc_name*

Displays statistics for the specified SGTP service in the current context.
sgtp_srvc_name must be the name of a previously configured and active SGTP service and must be an alphanumeric string from 1 to 63 characters in length.

gprs-service *gprs_srvc_name* **nsei** *nse_id*

Displays the statistics for a specific NSEI-based GTPU statistics associated with the specified GPRS service in the current context.
gprs_srvc_name must be the name of a previously configured and active GPRS service and must be an alphanumeric string from 1 to 63 characters in length.
nse_id must be an integer from 0 to 65535.

Usage

Use this command to display information for SGSN services.

Example

The following command displays GPTP-U statistics for the traffic between an SGSN and a connected RNC.

```
show sgtpu statistics rnc-address 123.1.2.3
```

show sgw-service

Displays configuration information and/or service statistics for Serving Gateway (S-GW) services on this system.

Product

S-GW

Privilege

Inspector

Syntax

```
show sgw-service { all | name service_name | statistics { all | name
service_name } } [ | { grep grep_options | more } ]
```

all

Displays configuration information for all S-GW services configured on this system.

name *service_name*

Displays configuration information for a specific S-GW service configured on this system.
service_name must be an existing S-GW service, and be from 1 to 63 alpha and/or numeric characters in length.

statistics { all | name *service_name* **}**

Displays statistics for all S-GW services on this system or for a specified service. *service_name* must be an existing S-GW service and be from 1 to 63 alpha and/or numerics characters.

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified.
A command to send output to must be specified.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to view configuration information and/or service statistics for S-GW services on this system.

Example

The following command displays service statistics for the S-GW service named *sgw1*:

```
show sgw-service statistics name sgw1
```

show snmp

Displays information on the Simple Network Management Protocol servers and interfaces.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show snmp { accesses | communities | contexts | notifies | server | transports | trap [history | statistics { verbose } { wide }] | views } [| { grep *grep_options* **| more }]**

---

accesses

Displays SNMP server usage statistics.

---

communities

Displays SNMP community strings.

---

contexts

Displays SNMP information per context.

---

notifies

Displays SNMP event trap and notification statistics.

---

server

Displays SNMP server configuration information.

---

transports

Displays trap destination configuration information.

---

trap [history | statistics { verbose } { wide }]

history: displays SNMP event trap history. **trap history** shows up to 5000 time-stamped trap records stored in a buffer. The buffer may be cleared by entering the **clear snmp history** command.
statistics: displays SNMP event trap and notification statistics.
verbose: displays rows for every defined trap, even if never generated.
wide: shows trap statistics data in excess of 80 columns.

---

views

Displays SNMP views.

---

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Display SNMP information as part of system verification and troubleshooting.

Example

The following commands display the usage statistics, community string information, event trap and notification data, server information, and trap destination configuration, respectively.

```
show snmp communities

show snmp transport

show snmp server

show snmp accesses

show snmp notifies

show snmp trap history
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show srp

Displays the Service Redundancy Protocol information.

Product

HA, PDSN GGSN PDIF

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show srp { call-loss statistics | checkpoint statistics [ verbose ] | info |
statistics } | [ grep grep_options | more ]
```

call-loss statistics

Displays history of lost calls during switchover.

checkpoint statistics [verbose]

Displays check pointing statistics on session redundancy data (session mangers, current call recovery records, etc.).
verbose: Displays cumulative information for all session managers in tabular output.

info

Displays Service Redundancy Protocol information (context, chassis state, peer, connection state, etc.).

statistics

Displays Service Redundancy Protocol statistics (hello messages sent, configuration validation, resource messages, switchovers, etc.).

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

The output of this command may be considered as part of a periodic system auditing program by verifying the Service Redundancy Protocol performance. For more information, refer to the Interchassis Session Recovery chapter of the Administration and Configuration Guide and the Service Redundancy Protocol Configuration Mode chapter of the Command Line Reference.

Example

The following command shows Service Redundancy Protocol information:
show srp call-loss statistics

```
show srp info
show srp checkpoint statistics
show srp statistics
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show srp monitor

Displays the Service Redundancy Protocol monitor information.

Product

HA, GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show srp monitor [all | authentication-probe | bgp | [grep *grep_options* **| more]]**

all

Displays monitor information for all types (authentication-probe and bgp).

authentication-probe

Displays authentication probe monitor information.

bgp

Displays BGP monitor statistics.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

The output of this command may be considered as part of a periodic system auditing program by verifying the Service Redundancy Protocol performance. For more information, refer to the Interchassis Session Recovery chapter of the Administration and Configuration Guide and the Service Redundancy Protocol Configuration Mode chapter of the Command Line Reference.

Example

The following command shows Service Redundancy Protocol monitor information:

```
show srp monitor
```

show ss7-routing-domain

This command displays the configuration information for the defined SS7 routing domains. As SS7 routing domains conglomerate a large number of operational parameters, this command enables you to narrow your displays to specific protocol parameters on a specific link.

Product

SGSN

Privilege

Security Administrator, Administrator, Inspector, Operator

Syntax

show ss7-routing-domain { all | *ss7rd_id* { m3ua | mtp2 | mtp3 | qsaal | routes [adjacent] | sctp asp { all | instance *asp_id* } | sscf } }

show ss7-routing-domain *ss7rd_id* m3ua { statistics { gen | peer-server { all | id *peer-server_id* peer-server-process { all | instance *psp_instance* } } } | status { address-translation-table | destination-point-code { all | *ss7_dpc* } | gen | peer-server *peer-server_id* [peer-server-process instance *psp_id* | verbose] }

show ss7-routing-domain 1 sscf { statistics linkset { all | id *linkset_id* link { all | id *link_id* } } | status linkset { all | id *linkset_id* link { all | id *link_id* [verbose] } } }

ss7-routing-domain { all | *ss7rd_id* }

Specifies whether the display will output information for all SS7 routing domains or only for a specifically identified SS7 routing domain.
ss7rd_id must be an integer value from 1 through 12.

m3ua

Provides access to statistics or status information for the SS7 MTP3 User Adaptation Layer (M3UA) the specified SS7 routing domain.

mtp2

Provides access to statistics or status information the SS7 Message Transfer Part-2 (MTP2) for the specified SS7 routing domain.

mtp3

Provides access to statistics or status information the SS7 Message Transfer Part-3 (MTP3) for the specified SS7 routing domain.

qsaal

Provides access to statistics or status information for the Service Specific Connection-Oriented Protocol (SSCOP) sub-layer of the Quasi Signaling Application Adaptation Layer (QSAAL) for the specified SS7 routing domain.

routes [adjacent]

Displays the destination point code (DPC) routing table.
adjacent - If this keyword is used with the routes keyword, then it provides access to the statistics and status information for configured adjacent point codes.

sctp asp { all | instance *asp_id* **}**

Provides access to the status or statistics of Stream Control Transmission Protocol (SCTP) application server processes (ASP) in the specified SS7 routing domain for all or a specified SCTP ASP instance.

- **all**: This keyword displays the information for all SCTP application server process instances for specific SS7 routing domain.
- **instance** *asp_id* : Specified the specific SCTP application server process instance where *instance_id* must be an integer value from 1 through 4.

sscf

Provides access to the statistics or status information for the Service Specific Coordination Function (SSCF (q.2140)) for the specified SS7 routing domain.

peer-server [all | id *peer-server_id* **]**

This keyword filters the information for the specific protocol in SS7 routing domain for all or specific peer server id.

- **all**: This keyword displays the information for all peer servers for specific protocol.
- **id** *peer-server_id* : Specified the specific linkset identifier where *peer-server_id* must be an integer value from 1 through 49.

peer-server-process [all | instance *instance_id* **]**

This keyword filters the information for the specific protocol in SS7 routing domain for all or specific instance of peer-server process.

- **all**: This keyword displays the information for all peer server process instances for specific protocol.
- **instance** *instance_id* : Specified the specific peer server process instance where *instance_id* must be an integer value from 1 through 4.

destination-point-code [all | *dest_point_code***]**

This keyword filters the information for the specific protocol in SS7 routing domain for all or specific destination point code.

- **all**: This keyword displays the information for all destination point codes in SS7 routing domain.
- *dest_point_code*: Specified the specific destination point code in SS7 routing domain.

gen

This keyword displays the general information for the specific protocol for the specified SS7 routing domain.

verbose

This keyword enables the display of maximum information for a protocol statistics/status.

linkset [all | id *linkset_id*]

This keyword filters the information for the specific protocol in SS7 routing domain for all or specific link set.

- **all**: This keyword displays the information for all linksets for specific protocol.
- **id** *linkset_id*: Specified the specific linkset identifier where *linkset_id* must be an integer value from 1 through 49.

link [all | id *link_id*]

This keyword filters the information for the specific protocol in SS7 routing domain for all or specific link set.

- **all**: This keyword displays the information for all links for specific protocol.
- **id** *link_id*: Specified the specific linkset identifier where *link_id* must be an integer value from 1 through 16.

Usage

Use this command to display the SS7 routing domain and different layer protocol information for SGSN service.

Example

Following command displays the information/statistics of all SCTP application server processes of peer server id 17 and peer server process instance 1 in SS7 routing domain 12:

```
show ss7-routing-domain 12 sctp asp all status peer-server id 17 peer-server-process instance 1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show ssh key

Displays the secure shell public key information.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show ssh key [type { v1-rsa | v2-rsa | v2-dsa }] [| { grep *grep_options* **| more }]**

[type { v1-rsa | v2-rsa | v2-dsa }]

Specifies the type of SSH key information to display. If type is not specified, information for all types is displayed.
v1-rsa: SSH v1 RSA host key only
v2-rsa: SSH v2 DSA host key only
v2-dsa: SSH v2 RSA host key only

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Show the secure shell key information for all types to verify installed keys.

Example

The following command shows information for all SSH V1 and SSH V2 keys:

```
show ssh key
```

The following command shows information for only SSH V2 RSA host keys:

```
show ssh key type v2-rsa
```

show subscribers

Shows information for subscriber sessions defined by the specified keywords. Keywords described under Command Keywords below are base commands that display distinctive type of data. Keywords described under Filter Keywords are filters that modify or filter the output of the base commands. Not all filter keywords are available for all command keywords commands. Each command keyword lists the filter keywords that it accepts.

Product

All

Privilege

Security Administrator, Administrator, Inspector, Operator

Syntax

show subscribers [*command_keyword* **] [** *filter_keywords* **] [| { grep** *grep_options* **| more }]**

Command Keywords

The following keywords are base commands that each have a distinct display output. Only one Command Keyword can entered on the command line.

aaa-configuration

Shows AAA configuration information for subscriber sessions defined by the specified filter keywords. The following filter keywords are valid with this command:
active, all, apn, callid, card-num, configured-idle-timeout, connected-time, dhcp-server, dormant, **fa**, **fa-service, ggsn-service**, ha, ha-service, idle-time, imsi, ip-address, ip-pool, lac, lac-service, lns, lns-service, long-duration-time-left, msid, network-requested, network-type, pcf, pdsn-service, **plmn-type, rx-data**, **session-time-left, sgsn-address**, **sgsn-service, tx-data, username, verbose, grep, more**

access-flows { accounting | dynamic | pre-provisioned | static }

Shows the ip-flows for the subscribers defined by the specified filter keywords.
accounting: Use this keyword to display the accounting type of access flows for a subscriber.
dynamic: Use this keyword to display the dynamic type of access flows for a subscriber.
pre-provisioned: Use this keyword to display the pre-provisioned type of access flows for a WiMAX subscriber.
static: Use this keyword to display the static type of access flows for a subscriber.
The following filter keywords are valid with this command:

```
active, active-charging-service, all, asngw-service, asnpc-
service, asn-peer-address, apn, callid, card-num, ccoa-only,
configured-idle-timeout, connected-time, dhcp-server, dormant, fa,
fa-service, flow-type, ggsn-service, gsm-traffic-class, ha, ha-
ipsec-only, ha-service, idle-time, imsi, ip-address, ip-pool,
ipv6-address, ipv6-prefix, l3-tunnel-local-address, l3-tunnel-
remote-address, lac, lac-service, lns, lns-service, long-duration-
time-left, mip-udp-tunnel-only, msid, msiddn, network-requested,
network-type, pcf, pdsn-service, plmn-type, rulebase, rx-data,
```

session-time-left, sgsn-address, sgsn-service, tx-data, username, verbose, grep, more

activity

Display subscribers link activity percentage. When no Filter Keywords are specified, the output is a summary of all subscriber activity. When Filter Keywords are specified, the link activity percentage is displayed as graphs in which one is displayed using a high sampling rate, a 10 second interval between samples, and a low sampling rate, a 15 minute interval between samples
The following filter keywords are valid with this command:

active, all, asngw-service, asnpc-service, asn-peer-address, apn, callid, card-num, configured-idle-timeout, connected-time, dhcp-server, dormant, fa, fa-service, ggsn-service, ha, ha-service, idle-time, imsi, ip-address, ip-pool, lac, lac-service, lns, lns-service, long-duration-time-left, msid, network-requested, pcf, pdsn-service, plmn-type, rx-data, session-time-left, sgsn-address, sgsn-service, tx-data, username, grep, more

asn-peer-address *ip_address*

Displays information for subscribers on an ASN GW trusted peer.
ip_address is the IPv4 address of the ASN GW peer server in dotted decimal notation.
The following filter keywords are valid with this command:

all, counters all, asngw-service, full, summary, grep, more

asngw-service *service_name*

Displays counters for subscribers accessing the ASN GW service.
service_name must be an existing service and be from 1 to 63 alpha and/or numeric characters in length.
The following filter keywords are valid with this command:

all, counters all, full, summary, grep, more

asnpc-service *service_name*

Displays counters for subscribers accessing the ASN Paging Controller and Location Registry service.
service_name must be an existing ASN PC service and be from 1 to 63 alpha and/or numeric characters in length.
The following filter keywords are valid with this command:

all, counters all, full, summary, grep, more

bearer-establishment { direct-tunnel | normal | pending }

Selects Bearer Establishment type defined by the specified filter keywords.
direct-tunnel: Select subscribers having direct tunnel establshed with the RNC.
normal: Select subscribers having bearer established with SGSN.
pending: Select subscribers for whom bearer is not fully established.

configuration

Display current configuration for all subscribers or a specified subscriber. The following filter keywords are valid with this command:

all, username, grep, more

counters

Show the counters associated with the subscriber. The following filter keywords are valid with this command: active, all, asngw-service, asnpc-service, asn-peer-address, apn, callid, card-num, configured-idle-timeout, connected-time, dhcp-server, dormant, fa, fa-service, ggsn-service, ha, ha-service, idle-time, imsi, ip-address, ip-pool, lac, lac-service, lns, lns-service, long-duration-time-left, msid, network-requested, network-type, pcf, pdsn-service, plmn-type, rx-data, session-time-left, sgsn-address, sgsn-service, tx-data, username, grep, more

cscf-only

Displays information for CSCF subscribers only.
The following filter keywords are valid with this command:

```
aaa-configuration, access-flows, active, activity, all, bearer-
establishment, callid, card-num, configured-idle-timeout,
connected-time, counters, cscf-service, data-rate, dormant, fa,
full, gtp-version, ha, idle-time, ims-auth-service, imsi, ip-
address, ip-alloc-method, ip-pool ipv6-address, ipv6-prefix, l3-
tunnel-local-addr, l3-tunnel-remote-addr, long-duration-time-left,
mipv6ha-service, msid, network-type, policy, rx-data, session-
time-left, smgr-instance, subscription, summary, tft, tx-data,
username, wf1
```

cscf-service *service_name*

Displays information for subscribers accessing the specified CSCF service.
service_name must be an existing service and be from 1 to 63 alpha and/or numeric characters in length.
The following filter keywords are valid with this command:

```
bearer-establishment, callid, card-num, configured-idle-timeout,
connected-time, cscf-service, fa, gtp-version, ha, idle-time, ims-
auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-
address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr,
long-duration-time-left, mipv6ha-service, msid, network-type, rx-
data, session-time-left, smgr-instance, subscription, tx-data,
username
```

css-delivery-sequence

Important: This is a restricted keyword. In StarOS 9.0 and later, this keyword is obsoleted.

css-service *csssvc_name*

Important: This is a restricted keyword. In StarOS 9.0 and later, this keyword is obsoleted.

data-rate [summary | full] [verbose | graph { high | low }] [high | low]

Indicates how to display subscriber throughput data.

Important: This keyword is best used for individual subscriber output.

summary: Combine statistics for the matching subscriber and show a summary in text form.
full: Display a separate output for each matching subscriber separately in tabular form.
verbose: Display cumulative information for all matching subscribers in tabular output.
graph { **high** | **low** }: Display the throughput data as a graph using either a high sampling rate of every 30 seconds or a low sampling rate of every 15minutes. The graph contains data points over the last 24 hours, if available. The command displays a graph each for the transmit and receive peak, average, and sustained throughput for a total of six graphs.
high: Display the raw data collected for the throughput analysis using a high sampling rate (smaller interval). The data displayed uses a sampling interval of 30 seconds and includes the data collected over the last 24 hours, if available.
low: Display the raw data collected for the throughput analysis using a low sampling rate (larger interval). The data displayed uses a sampling interval of 15 minutes and includes the data collected over the last 24 hours, if available.
The following filter keywords are valid with this command:

```
active, all, asngw-service, asnpc-service, asn-peer-address, apn,
callid, card-num, configured-idle-timeout, connected-time, dhcp-
server, dormant, fa, fa-service, ggsn-service, ha, ha-service,
hsgw-only, hsgw-service, idle-time, imsi, ip-address, ip-pool,
lac, lac-service, lma-service, lns, lns-service, long-duration-
time-left, mag-service, mme-address, mme-service, msid, network-
requested, pcf, pdsn-service, plmn-type, rx-data, session-time-
left, sgsn-address, sgsn-service, tx-data, username, grep, more
```

debug-info { callid *id* **| msid** *id* **| username** *name* **}**

Displays internal call troubleshooting information for subscriber sessions defined by the specified keywords.
callid *id*: Displays subscriber information for the call specified by *id*. The call ID must be specified as an 8-byte hexadecimal number.
msid *id*: Displays information for the mobile user identified by *id*. *id* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘). For example; ‘$’.
username *name*: Displays information for connections for the subscriber identified by *name*. The user must have ben previously configured. *name* must be a sequence of characters and/or wildcard characters ('$' and '*') from 1 to 127 characters in length. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as wildcard enclose them in single quotes (‘). For example; ‘$’.

full

Shows all available subscriber information. The following filter keywords are valid with this command: active, all, asngw-service, asnpc-service, asn-peer-address, apn, callid, card-num, configured-idle-timeout, connected-time, dhcp-server, dormant, fa, fa-service, ggsn-service, ha, ha-service, idle-time, imsi, ip-address, ip-pool, lac, lac-service, lns, lns-service, long-duration-time-left, msid, network-requested, network-type, pcf, pdsn-service, plmn-type, rx-data, session-time-left, sgsn-address, sgsn-service, tx-data, username, grep, more

ggsn-only

Displays only GGSN-specific subscriber context information.

gprs-only

Displays only 2G SGSN subscribers/contexts. The following filter keywords are valid with this command: aaa-configuration, active, active-charging-service, activity, all, apn, callid, card-num, configured-idle-timeout, connected-time, counters, data-rate, full, ggsn-address, gprs-service, gsm-traffic-class, idle-time, imsi, msid, msisdn, partial, plmn-type, rx-data, session-time-left, summary, tx-data, grep, and more.

gtp-version { 0 | 1 }

Displays the specific GTP version number. Must be followed by one of the supported GTP versions (0 or 1). The following filter keywords are valid with this command:
active-charging-service, apn,bearer-establishment, callid, dhcp-server, fa, fa-service, ggsn-service, gprs-service, gsm-traffic-class, msid, msisdn, plmn-type, sgsn-address, sgsn-service, smgr-instance, tx-data, username, grep, more.

hsgw-only

Displays HSGW subscriber session information.
The following filters/keywords are valid with this command:

```
all, full, summary
```

hsgw-service *svc_name*: Displays subscriber information based on the HSGW service name. *svc_name* must be an existing HSGW service and be from 1 to 63 alpha and/or numeric characters.

hsgw-service *svc_name*

Displays subscriber information based on the HSGW service name. *svc_name* must be an existing HSGW service and be from 1 to 63 alpha and/or numeric characters.

ip-alloc-method {aaa-assigned | dhcp [relay-agent | proxy-client] | dynamic-pool | l2tp-lns-assigned | mip-ha-assigned | ms-provided-static | not-ms-provided-static | static pool }

Displays the specific IP Allocation Method. Must be followed by one of the IP Allocation Methods:
aaa-assigned: Selects subscribers whose IP Addresses were assigned by AAA.
dhcp: Selects subscribers whose IP Addresses were assigned by DHCP.

- **relay-agent**: Selects subscribers whose IP Addresses were assigned by the DHCP Relay Agent
- **proxy-client**: Selects subscribers whose IP Addresses were assigned by the DHCP Proxy Client

dynamic-pool: Selects subscribers whose IP Addresses were assigned from a dynamic IP address pool.
l2tp-lns-assigned: Selects subscribers whose IP Addresses were assigned by the Layer 2 Tunneling Protocol Network Server.
mip-ha-assigned: Selects subscribers whose IP Addresses were assigned by the Mobile IP Home Agent.
ms-provided-static: Selects subscribers whose IP Addresses were provided by the Mobile Station.
not-ms-provided-static: Selects subscribers whose IP Addresses were not provided by the Mobile Station.
static-pool: Selects subscribers whose IP Addresses were assigned from a static IP address pool.

ipsg-only

Displays IPSG subscriber session information.

lma-service *svc_name*

Displays subscriber information based on the LMA service name. *svc_name* must be an existing LMA service and be from 1 to 63 alpha and/or numeric characters.

mag-only

Displays MAG subscriber session information.
The following filters/keywords are valid with this command:

```
all, full, summary
```

mag-service *svc_name*: Displays subscriber information based on the MAG service name. *svc_name* must be an existing MAG service and be from 1 to 63 alpha and/or numeric characters.

mag-service *svc_name*

Displays subscriber information based on the MAG service name. *svc_name* must be an existing MAG service and be from 1 to 63 alpha and/or numeric characters.

mme-address

Displays subscriber information based on the MME IP address. *ip_address* must be an existing MME IP address and be entered in IPv4 dotted decimal notation.

mme-only

Displays MME subscriber session information.
The following filter keywords are valid with this command:

```
all, full, summary
```

mme-service *svc_name*: Displays subscriber information based on the MME service name. *svc_name* must be an existing MME service and be from 1 to 63 alpha and/or numeric characters.
mme-address *ip_address*: Displays subscriber information based on the MMM IP address. *ip_address* must be an existing MME IP address and be entered in IPv4 dotted decimal notation.

pdg-only

Displays a summary of PDG subscriber statistics.

pdg-service *name*

Displays statistics for users associated with a specific PDG service name.

pdif-only

Displays a summary of PDIF subscriber statistics.

pdif-service *name*

Displays connection statistics for users associated with a specific pdif-service name.

pgw-only

Displays P-GW subscriber session information.
The following filters/keywords are valid with this command:

```
all, full, summary
```

pgw-service *svc_name*: Displays subscriber information based on the P-GW service name. *svc_name* must be an existing P-GW service and be from 1 to 63 alpha and/or numeric characters.
sgw-address *ip_address*: Displays subscriber information based on the S-GW IP address. *ip_address* must be an existing S-GW IP address and be entered in IPv4 dotted decimal notation.

---

qci *number*

Displays subscriber session information based on the QCI value assigned to the subscriber. *number* must be an integer value from 0 to 9.

---

s1u-state { active | idle | idle-active }

Displays session information based on the subscriber's S1-U state. The S1-U interface is the interface from the eNodeB to the S-GW.
active: Displays session information for subscribers with an S1-U state set to active.
idle: Displays session information for subscribers with an S1-U state set to idle.
idle-active: Displays session information for subscribers with an S1-U state set to idle-active.

---

s5-proto { gtp | pmip }

Displays subscriber session information based on the S5 interface protocol used. Choose either GPRS Tunneling Protocol (GTP) or Proxy Mobile IP (PMIP).

---

sgsn-only

Displays only 3G SGSN-specific subscriber context information. The following filters are valid with this command:
aaa-configuration, active, active-charging-service, activity, all, apn, callid, card-num, configured-idle-timeout, connected-time, counters, data-rate, full, ggsn-address, gsm-traffic-class, idle-time, imsi, msid, msisdn, partial qos [requested | netogitated] , plmn-type, rnc, rx-data, session-time-left, summary, tx-data, grep, and more.

---

sgw-only

Displays S-GW subscriber session information.
The following filters/keywords are valid with this command:

```
all, full, summary
```

sgw-service *svc_name*: Displays subscriber information based on the S-GW service name. *svc_name* must be an existing S-GW service and be from 1 to 63 alpha and/or numeric characters.
pgw-address *ip_address*: Displays subscriber information based on the P-GW IP address. *ip_address* must be an existing P-GW IP address and be entered in IPv4 dotted decimal notation.

---

sgw-service *svc_name*

Displays subscriber information based on the S-GW service name. *svc_name* must be an existing S-GW service and be from 1 to 63 alpha and/or numeric characters.

---

subscription { aor *address* **| callid** *id* **| full }**

Displays subscription information for defined subscribers, based on defined parameters.
aor *address*: Clear session(s) by Address of Record.
callid *id*: Specific Call Identification Number.

full: Displays all available information.

---

summary

Only display a summary of the subscriber information. The following filter keywords are valid with this command:
active, activity, all, asngw-service, asnpc-service, asn-peer-address, apn, callid, card-num, configured-idle-timeout, connected-time, dhcp-server, dormant, enodeb-address, fa, fa-service, ggsn-service, ha, ha-service, idle-time, imsi ip-address, ip-pool, lac, lac-service, lns, lns-service, long-duration-time-left, msid, network-requested pcf, pdsn-service, plmn-type, rx-data, session-time-left, sgsn-address, tx-data, username, grep, more

---

tft

Displays the current Traffic Flow Template (TFT) associated with the subscriber session.

---

tx-data

Bytes transmitted by the subscriber.

---

wf1

Displays subscriber information in wide format number 1. Wide format number 1 includes the following information for each listed subscriber session:

- Access Type
- Access Technology
- Call State
- Link Status
- Network Type
- Call ID
- MSID
- Username
- IP Address
- Time-Idle
- Access Peer Address
- Service Address
- Network Peer Address
- Connect Time

---

filter_keywords

The following keywords are filters that modify or filter the output of the Command Keywords. Not all filters are available for all Command Keywords. Multiple Filter Keywords can be entered on a command line. When multiple Filter Keywords are specified, the output conforms to all of the Filter Keywords specifications.
For example; if you enter the following command:
show subscribers counters ip-pool pool1 card-num 1

Counters for all subscriber sessions that were assigned an IP address from the IP pool named pool1 and also are being processed by the processing card in slot 1 is displayed. Information for all other subscribers is not displayed.

active

Only display information for those subscribers who currently have active sessions.

active-charging-service *acs_service*

Displays information for subscribers under active charging service processing.
acs_service must be a string of 1 through 15 characters in length.

all

If no keywords are specified before **all**, information for all subscribers is displayed. If keywords are specified before **all**, all information is displayed with no further options being allowed.

apn *name*

Displays subscribers currently facilitated by the Access Point Name (APN) template called *name* configured on the system. This command is for GGSN only.

asngw-only

Displays counters for subscribers accessing the ASN GW service only.

asnpc-only

Displays counters for subscribers accessing the ASN Paging Controller and Location Registry service only.

callid *id*

Displays subscriber information for the call specified by *id*. The call ID must be specified as an 8-byte hexadecimal number.

card-num *card_num*

The slot number of the processing card by which the subscriber session is processed. *pac_num* is a slot number from 1 through 7 or 10 through 16.

ccoa-only

Displays the subscribers that registered a MIP colocated COA directly with the HA.
This option is only valid when MIPHA session license is enabled.

configured-idle-timeout [< | > | greater-than | less-than] *value*

Shows the idle timeout that is configured for the specified subscriber. A value of 0 (zero) indicates that the subscribers idle timeout is disabled.
<: Filters output so that only information less than the specified value is displayed.
>: Filters output so that only information greater than the specified value is displayed.
greater-than: Filters output so that only information greater than the specified value is displayed.
less-than: Filters output so that only information less than the specified value is displayed.
value: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 4294967295.

connected-time [< | > | greater-than | less-than] *value*

Shows how long the subscriber has been connected. **<**: Filters output so that only information less than the specified value is displayed.
<: Filters output so that only information less than the specified value is displayed.
>: Filters output so that only information greater than the specified value is displayed.
greater-than: Filters output so that only information greater than the specified value is displayed.
less-than: Filters output so that only information less than the specified value is displayed.
value: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 4294967295.

cscf-only

Displays information for CSCF subscribers only.

cscf-service *service_name*

Displays information for subscribers accessing the specified CSCF service.
service_name must be an existing service and be from 1 to 63 alpha and/or numeric characters in length.

dhcp-server *address*

Displays subscribers currently accessing the system that have been provided an IP address by the DHCP server specified by *address*. This command is for GGSN only.

dormant

Shows information for subscriber sessions that are dormant (not transmitting or receiving data).

enodeb-address *IPv4_ddress*

Displays information for EPS subscribers connected to the eNodeB specified by *IPv4_address*. The address must be specified using the standard IPv4 dotted decimal notation.

fa *address*

Displays information for subscribers connected to the foreign agent specified by *address*. The address must be specified using the standard IPv4 dotted decimal notation.

fa-only

Only display FA-specific context information.

fa-service *name*

Displays information for subscribers connected to the foreign agent service specified by *name*. The foreign agent service name must have been previously defined.

firewall { not-required | required }

Displays information for the specified subscribers:
not-required: Subscribers for whom firewall processing is not required.
required: Subscribers for whom firewall processing is required.

firewall-policy *fw_policy_name*

This keyword is obsolete.

fw-and-nat policy *fw_nat_policy*

Important: This option is customer-specific and is only available in StarOS 8.1.

Displays information for subscribers using the specified Firewall-and-NAT policy.
fw_nat_policy specifies the Firewall-and-NAT policy name, and must be an alpha and/or numeric string of 1 through 15 characters in length.

ggsn-address *ip_address*

Displays information for subscribers connected to the GGSN with specific IP address specified by *ip_address*. The GGSN IP address *ip_address* must have been previously defined.
ip_address: must use dotted decimal notation.
This keyword is for SGSN only.

ggsn-preservation-mode

Displays information for subscribers connected to the GGSN service with preservation mode enabled. This filter keyword is for GGSN only.

ggsn-service *name*

Displays information for subscribers connected to the GGSN service specified by *name*. The GGSN service *name* must have been previously defined. This keyword is for GGSN only.

gsm-traffic-class { background | conversational | interactive | streaming }

Displays information for subscriber traffic that matches the specified 3GPP traffic class.

- **background**: 3GPP QoS background class.
- **conversational**: 3GPP QoS conversational class.
- **interactive**: 3GPP QoS interactive class. Must be followed by a traffic priority.
- **streaming**: 3GPP QoS streaming class.

ha *address*

Displays information for subscribers connected to the home agent specified by *address*. The address must be specified using the standard IPv4 dotted decimal notation.

ha-ipsec-only

Only display information for subscriber sessions that are using IP-Security.

ha-only

Only display HA-specific context information.

ha-service *name*

Displays information for subscribers connected to the home agent service specified by *name*. The home agent service *name* must have been previously defined.

idle-time [< | > | greater-than | less-than] *value*

Displays how long the subscriber session has been idle or display subscriber sessions that meet the idle time criteria specified.
<: Filters output so that only information less than the specified value is displayed.
>: Filters output so that only information greater than the specified value is displayed.
greater-than: Filters output so that only information greater than the specified value is displayed.
less-than: Filters output so that only information less than the specified value is displayed.
value: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 4294967295.

ims-auth-service *service_name*

Displays information for subscribers with specified IMS Authorization Service. *service_name* must have been previously defined.

imsi *id*

Shows the subscriber with the specified id. The IMSI (International Mobile Subscriber Identity) ID is a 15 character field which identifies the subscriber's home country and carrier. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘). For example; ‘$’.

ip-address [< | > | greater-than | less-than] *address*

Displays information for subscribers connected to the specified *address*.
<: Filters output so that only information for subscribers with an IP address lower than the specified address is displayed.
>: Filters output so that only information for subscribers with an IP address higher than the specified address is displayed.
greater-than: Filters output so that only information for subscribers with an IP address higher than the specified address is displayed.
less-than: Filters output so that only information for subscribers with an IP address lower than the specified address is displayed.
address: The address must be specified using the standard IPv4 dotted decimal notation. Used in conjunction with <, >, greater-than, less-than. If the ip address is specified without a qualifier then only subscribers with the specified IP address have their information displayed.

ip-pool *name*

Displays information for subscribers assigned addresses from the IP address pool *name*. *name* must be the name of an existing IP pool or IP pool group.
IP pool *name* will be either ipv4 or ipv6 according to call line setup for specified pool *name*.

ipv6-address *address*

Displays information for subscribers connected to the specified *address*.

ipv6-prefix *prefix*

Displays information for subscribers connected to the specified address and *prefix*.

lac *address*

Displays information for calls to the peer LAC (L2TP access concentrator) specified by *address*.

lac-only

Show L2TP LAC specific information only.

lac-service *name* **[local-tunnel-id id | remote-tunnel-id** *id* **]**

Displays information for calls associated with the LAC service named *name*. This is a string of 1 to 63 characters.
local-tunnel-id *id* : Specifies a specific local tunnel from which to clear calls. id must be in the range of 1 to 65535.
remote-tunnel-id *id* : Specifies a specific remote tunnel from which to clear calls. id must be in the range of 1 to 65535.

l3-tunnel-local-addr *ip_address*

Specific layer 3 tunneling interface specified by *ip_address*. The address must be specified using the standard IPv4 dotted decimal notation.

l3-tunnel-remote-addr *ip_address*

Specific layer 3 tunneling peer specified by *ip_address*. The address must be specified using the standard IPv4 dotted decimal notation.

lns *address*

Displays information for calls to the peer LNS (L2TP network server) specified by *address*.

lns-only

Show L2TP LNS specific information only.

lns-service *name* **[local-tunnel-id** *id* **| remote-tunnel-id** *id* **]**

Displays information for calls associated with the LNS service named *name*. This is a string of 1 to 63 characters.
local-tunnel-id *id* : Specifies a specific local tunnel from which to clear calls. id must be in the range of 1 to 65535.
remote-tunnel-id *id* : Specifies a specific remote tunnel from which to clear calls. id must be in the range of 1 to 65535.

long-duration-time-left [< | > | greater-than | less-than] *value*

Shows how much time is left for the maximum duration of a specified subscriber session.
<: Filters output so that only information less than the specified value is displayed.
>: Filters output so that only information greater than the specified value is displayed.
greater-than: Filters output so that only information greater than the specified value is displayed.
less-than: Filters output so that only information less than the specified value is displayed.

value: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 4294967295.

mip-udp-tunnel-only

Displays the subscribers that negotiated MIP-UDP tunneling with the HA.
This option is only valid when MIP NAT Traversal license is enabled.

mipv6ha-only

Shows MIPV6HA-specific context information for the session.

mipv6ha-service *service_name*

Displays specific configured MIPV6 Home Agent service. *service_name* must have been previously defined.

msid *id*

Displays information for the mobile user identified by *id*. *id* must be from 7 to 16 hexadecimal digits specified as an IMSI, MIN, or RMI. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘). For example: ‘$’.
In case of **enforce imsi-min equivalence** is enabled on the chasis and MIN or IMSI numbers supplied, this filter will show subscribers with a corresponding MSID (MIN or IMSI) whose lower 10 digits matches to lower 10 digits of the supplied MSID.
show subscribers msid *ABCD0123456789* or
show subscribers msid *0123456789*
will show any subscriber with a MSID that match the lower 10 digits of MSID supplid, i.e. 0123456789.

msisdn *msisdn*

Displays information for the mobile user identified by the Mobile Subscriber ISDN Number (MSISDN). *msisdn* must be 7 to 16 digits; specified as an IMSI, MIN, or RMI.

nat { not-required | required [nat-ip *nat_ip_address* **| nat-realm** *nat_realm* **] }**

Displays information for the specified subscribers.
not-required: Subscribers for whom Network Address Translation (NAT) processing is not required.
required: Subscribers for whom NAT processing is required.

Important: The **nat-ip** keyword is only available in StarOS 8.3 and later.

nat-ip *nat_ip_address*: Subscribers for whom NAT processing is enabled and are using the specified NAT IP address. *nat_ip_address* specifies the NAT IP address and must be a standard IPv4 address.
nat-realm *nat_realm*: Subscribers for whom NAT processing is enabled and are using the specified NAT realm. *nat_realm* specifies the NAT realm name and must be a string from 1 through 63 characters in length.

network-requested

Display information for currently active subscribers whose sessions were initiated by the GGSN network requested create PDP context procedure.

network-type { gre | ipip | ipsec | ipv4 | ipv6 | l2tp | mobile-ip | proxy-mobile-ip }

Displays network type information for the subscriber session. The following network types can be selected:

- **gre** : Generic Routing Encapsulation (GRE) per RFC 2784
- **ipip** : IP-in-IP encapsulation per RFC 2003
- **ipsec** : IPSec
- **ipv4**: Internet Protocol version 4 (IPv4)
- **ipv6**: Internet Protocol version 6 (IPv6)
- **l2tp**: Layer 2 Tunneling Protocol encryption per RFC 2661
- **mobile-ip** : Mobile IP
- **proxy-mobile-ip** : Proxy Mobile IP

nsapi *nsap_id*

Displays session information for the mobile user identified by network service access point identifier (NSAPI) between MS and SGSN. NSAPI is also used as part of the Tunnel Identifier between GPRS Support Nodes (GSNs). The user identity IMSI and the application identifier (NSAPI) are integrated into the Tunnel Identifier (GTPv0) (TID) or Tunnel Endpoint Identifier (GTPv1) (TEID) that uniquely identifies the subscriber's sublink between the GSNs (SGSN and GGSN). The NSAPI is an integer value within the PDP context header.
nsap_id must be an integer value from 5 through 15.

partial qos { negotiated | requested }

This filter is specific to the SGSN.
Is limits the display of information to requested or negotiated QoS information for the subscriber.
This filter can be used in combination with further defining filters: active, active-charging-service, all, apn, callid, card-num, configured-idle-timeout, connected-time, ggsn-address, gprs-service, gsm-traffic-class, idle-time, imsi, msid, msisdn, negotiated, plmn-type, requested, rx-data, session-time-left, tx-data

pcf [< | > | less-than | greater-than] *ipv4_address* **[[< | > | less-than | greater-than]** *ipv4_address* **]**

Displays information for subscribers connected via the packet control function with a specific or range of IP address *ipv4_ddress*. The address must be specified using the standard IPv4 dotted decimal notation.

- **<**: Filters output so that only information less than the specified IPv4 address value is displayed.
- **>**: Filters output so that only information greater than the specified IPv4 address value is displayed.
- **less-than**:Filters output so that only information less than the specified IPv4 address value is displayed.
- **greater-than**:Filters output so that only information greater than the specified IPv4 address value is displayed.

Note: It is possible to define a limited range of IP addresses by using the less-than and greater-than options to define minimum and maximum values.

pdsn-only

Show PDSN specific information only.

pdsn-service *name*

Displays information for subscribers connected to the packet data service *name*. The packet data service must have been previously configured.

plmn-type

Displays subscriber type (HOME, VISITING, or ROAMING).
This keyword is for the GGSN or the SGSN only.

policy

Displays the current policies associated with the subscriber session.

rnc id *rnc_id* **mcc** *mcc_num* **mnc** *mnc_num*

Displays information for subscribers connected to the SGSN via a specific RNC (radio network controller) identified by the RNC ID, the MCC (mobile country code), and the MNC (mobile network code).
This keyword is for SGSN only.

rx-data [< | > | greater-than | less-than] *value*

The number of bytes received by the specified subscriber.
<: Filters output so that only information less than the specified value is displayed.
>: Filters output so that only information greater than the specified value is displayed.
greater-than: Filters output so that only information greater than the specified value is displayed.
less-than: Filters output so that only information less than the specified value is displayed.
value: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 18446744073709551615.

session-time-left [< | > | greater-than | less-than] *value*

How much session time is left for the specified subscriber.
<: Filters output so that only information less than the specified value is displayed.
>: Filters output so that only information greater than the specified value is displayed.
greater-than: Filters output so that only information greater than the specified value is displayed.
less-than: Filters output so that only information less than the specified value is displayed.
value: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 4294967295.

smgr-instance *number*

Specific sessmgr instance. *number* must be in the range of 1 to 4294967295.

sgsn-address *address*

Shows information for subscribers whose PDP contexts are currently being facilitated by the SGSN specified by address. This command is for GGSN only.

sgsn-service *srvc_name*

Shows subscriber information for a specified 3G SGSN service.
srvc_name must be a string of 1 to 63 alphanumeric characters that identifies a configured SGSN service.
This command is for SGSN only.

tx-data [< | > | greater-than | less-than] *value*

The number of bytes transmitted by the specified subscriber.
<: Filters output so that only information less than the specified value is displayed.
>: Filters output so that only information greater than the specified value is displayed.
greater-than: Filters output so that only information greater than the specified value is displayed.
less-than: Filters output so that only information less than the specified value is displayed.
value: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 18446744073709551615.

username *name*

Displays information for connections for the subscriber identified by *name*. The user must have been previously configured. *name* must be a sequence of characters and/or wildcard characters ('$' and '*') from 1 to 127 characters in length. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘). For example; ‘$’.

verbose

Display detailed information.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to view information about subscriber sessions.
The output of this command may be considered for part of a periodic system auditing program by verifying active and dormant subscribers.
The Command Keywords may be used standalone to display detailed information or you may use one or more of the various Filter Keywords to reduce the amount of information displayed.

Caution: Executing this command may negatively impact performance if multiple instances are executed while the system is under heavy load and simultaneously facilitating multiple CLI sessions.

Example

The following command displays information for all subscriber sessions:

```
show subscribers all
```

The following command displays information for all ggsn-only subscriber sessions:

```
show subscribers ggsn-only all
```

The following command displays information for all subscriber sessions in wide format 1:

```
show subscribers wf1 all
```

```
show subscribers aaa-configuration
```

```
show subscribers counters username isp1user1
```

The following command displays information for subscriber in GGSN service:

```
show subscribers ggsn-only allshow subscribers ggsn-only full
```

The following command displays information for all subscriber with SGSN session having partial QoS requests:

```
show subscribers sgsn-only partial qos requested
```

The following command displays information for all subscriber with MME session connected to MME service having IP address as *1.1.1.1*:

show subscribers mme-only mme-address *1.1.1.1*

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show super-charger

Lists subscribers with valid super charger configuration.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show super-charger { imsi imsi | all }
```

imsi

Defines a specific subscriber's international mobile subscriber identity (IMSI) number.
imsi - up to 15 digits This number includes the MCC (mobile country code), the MNC (mobile network code) and the MSIN (mobile station identification number),

all

Instructs the SGSN to display super charger subscription information for all subscribers.

Usage

Use this command to determine if a single subscriber, identified by the IMSI, has a super charger configuration. Also, this command can display the list of all subscribers with a super charger configuration. If a subscriber has super charger as part of the configuraiton, then subscriber data is backed up (using the IMSI Manager) after the subscriber detaches and the purge timer expires.

Example

The following command displays the super charger configuration information for the subscriber identified by the IMSI 90121882144672.

```
show super-charger imsi 90121882144672
```

show support details

This command outputs a comprehensive list of system information that is useful for troubleshooting purposes. In most cases, the output of this command is requested by the technical support team.

Product

All

Privilege

All

Syntax

show support details [to file *url* **]**

to file *url*

Specifies the location where a tar file with the support detail information should be created. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

- ST16:
  - **[file:] { /flash | /pcmcia1 | /pcmcia2 } [/***directory* **] /***file_name*
  - **tftp://{** *host*[*:port#* **] } [/***directory* **] /***file_name*
  - **[ftp: | sftp:] // [** *username*[*:password* **] @] {** *host* **} [** *:port#* **] [/***directory* **] /***file_name*
- ASR 5000:
  - **[file:] { /flash | /pcmcia1 | /hd } [/***directory* **] /***file_name*
  - **tftp:// {** *host* **[** *:port#* **] } [/***directory* **] /***file_name*
  - **[ftp: | sftp:] // [** *username*[*:password* **] @] {** *host* **} [** *:port#* **] [/***directory* **] /***file_name*

directory is the directory name.
filename is the actual file of interest.
username is the user to be authenticated.
password is the password to use for authentication.
host is the IP address or host name of the server.
port# is the logical port number that the communication protocol is to use.
If the filename is not specified with a .tar extension, it is automatically appended to the filename when the file is created and a message is generated.
The content of the tar file is a follows:

- **support_summary** - An ASCII text file that contains the support detail information.
- **information.minicores.tar** - A tar file that contains any minicore files found on the system. Minicore files contain memory core dumps that are captured during some events. These core dumps provide specific memory locations and other information about the event. This information is useful to the technical support team in identifying specifically where an event occurred and its probably cause.

Usage

Use this command to obtain extensive system information for use in troubleshooting. This command does the work of over 30 separate commands, which saves time and ensures that all of the information needed is collected and displayed in the same order every time. The output of the following commands is included:

- show version verbose
- show config
- show context
- show ip pool
- show ip interface
- show ip route
- show boot
- show boot initial-config
- show system uptime
- show license information
- show card hardware
- show card info
- show card diag
- show card table all
- show port table all
- show port info
- show port npu counters
- show port datalink counters
- show fans
- show hardware version fans
- show power chassis
- show alarm audible
- show alarm central-office
- show alarm outstanding
- show alarm statistics
- show asngw-service statistics
- show asnpc-service statistics
- show content-filtering category database
- show cpu table
- show cpu info verbose
- show resources
- show task table
- show task resources
- show task resources max
- show crash list

- show snmp trap history
- show logs level error
- show logs level error inactive
- show ppp statistics
- show session disconnect-reasons
- show apn statistics all
- show pdsn-service all
- show ha-service all
- show dhcp-service all
- show ggsn-service all
- show lac-service all
- show lns-service all
- mme-hss-service
- mme-service
- show session progress
- show rp statistics
- show mipfa statistics
- show mipha statistics
- show srp info
- show srp checkpoint statistics
- show srp checkpoint statistics verbose
- show gtpc statistics verbose
- show gtpp accounting servers
- show gtpp statistics verbose
- show gtpp storage-server
- show session recovery status verbose
- show clock all
- show radius counters all
- show ntp associations all
- show charging-service all (if the Enhanced Charging Service license is installed)
- show qos npu inter-subscriber traffic bandwidth-sharing
- timestamps
- no timestamps

In addition to the information provided by the above commands, the show support details command includes information that is not otherwise accessible to users but that is helpful in the swift resolution of issues.

Example

The following command displays the system information on your console.

show support details

The following command displays the information on your console and also writes it to the local device (pcmcia1 in this case) and includes the mini core dumps, using the filename *r-p_problem.tar*:

show support details to file /pcmcia1/*r-p_problem.tar*

The following command displays the information on your console and also writes it to an FTP server (named host), placing the file in the dir directory and includes the mini core dumps, using the filename *re_problem.tar*:

show support details to file *ftp://host/dir/re_problem.tar*

show system uptime

Shows the system the amount of time the system has been operational since the down time (maintenance or otherwise).

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show system uptime [| { grep *grep_options* **| more }]**

uptime

Indicates only the system up time is to be displayed.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Display the system up time to check for the possibility of anomalous behavior related to longer up times.

Example

The following commands display the system basic information and up time only, respectively.

```
show system uptime
```

Chapter 95
Exec Mode Show Commands (T-Z)

This section includes the commands **`show task`** through **`show version`**.

show task

Displays information about system tasks.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show task { info | resources | table } [card *card_num* **] [facility** *facility* **{ all | instance id }] [process** *process_name* **all] [max] [| { grep** *grep_options* **| more }]**

{ info | resources | table }

Specifies type of information to be displayed and scope of tasks to include in output.
info: Display detailed task information.
resources: Display resource allocation and usage information for all tasks.
table: Display identification information in tabular format for all tasks.

card *card_num*

Default: all powered on cards.
Specifies a single card for which task information is to be displayed where *card_num* must be from 1 to 48.

facility *facility* **{ all | instance id }**

Default: all facilities.
Specifies the list of facilities for which task information may be displayed. A specific instance of the facility may be displayed as specified by id or all instances may be displayed. The value of id must be in the range of 0 through 100000. *facility* must be one of:

- **a11mgr**: A11 Interface Manager facility
- **aaamgr**: AAA Manager Facility
- **aaaproxy**: AAA Proxy manager Facility
- **acsctrl**: Active Charging Service (ACS) Controller Facility
- **acsmgr**: Active Charging Service (ACS) Manager Facility
- **asngwmgr**: ASN Gateway Manager
- **asnpcrmg**r: ASN Paging/Location-Registry (ASN-PC) Manager
- **bgp**: Border Gateway Protocol (BGP) Facility
- **bulkstat**: Bulk Statistics Manager Facility
- **cdrmod**: Charging Detail Record Module
- **cli**: Command Line Interface Facility
- **cscfmgr**: SIP CSCF Manager
- **cspctrl**: Card Slot Port controller Facility

- **cssctrl**: Content Service Steering Controller
- **dcardctrl**: IPSEC Daughtercard Controller Logging Facility
- **dcardmgr**: IPSEC Daughtercard Manager Logging Facility
- **dhmgr**: Distributed Host Manager
- **drvctrl**: Driver Controller Facility
- **egtpegmgr**: EGTP Egress Demux Manager
- **egtpinmgr**: EGTP Ingress Demux Manager
- **evlogd**: Event Log Daemon Facility
- **famgr**: Foreign Agent Manager Facility
- **gtpcmr**: GTP-C Protocol Logging facility (GGSN product only)
- **h248prt**: H.248 Protocol Task
- **hamgr**: Home Agent Manager Facility
- **hatcpu**: High Availability Task CPU Facility
- **hatsystem**: High Availability Task Facility
- **ipsecctrl**: IP Security Controller Facility
- **ipsecmgr**: IP Security Manager Facility
- **ipsgmgr**: IP Services Gateway Facility
- **l2tpdemux**: L2TP Demultiplexor (LNS) Facility
- **l2tpmgr**: L2TP Manager Facility
- **magmgr**: Mobile Access Gateway Manager
- **megadiammgr**: MegaDiameter Manager
- **mmedemux**: MME Demux Manager logging facility
- **mmemgr**: MME Manager logging facility
- **mmgr**: SGSN/SS7 Master Manager
- **mptest**: Migration Performance Test on Packet Accelerator Card
- **netwstrg**: Network Storage Manager
- **npuctrl**: Network Processor Unit control Facility
- **npumgr**: Network Processor Unit Manager Facility
- **nputst**: Network Processor Unit Tester
- **nsctrl**: Charging Service Controller
- **nsmgr**: Charging Service Process Manager
- **orbns**: Object Request Broker Notification Server Facility
- **orbs**: Object Request Broker System Facility
- **ospf**: Open Shortest Path First Facility
- **rct**: Recovery Control Task Facility
- **rdt**: Redirect Task Facility
- **rip**: Routing Information Protocol Facility

- **rmctrl**: Resource Manager Controller Facility
- **rmmgr**: Resource Manager Facility
- **sct**: Shared Configuration Task Facility
- **sessctrl**: Session Controller Facility
- **sessmgr**: Session Manager Facility
- **sft**: Switch Fabric Monitoring Task
- **sipcdprt**: Sip Call Distributor Task
- **sitmain**: System Initialization Task Main Facility
- **sitparent**: Card based system initialization facility that applies to Packet Accelerator Cards and Switch Processor Cards

Important: **sitparent** replaces the facilities **sitpac, sitspc** and **sittac**.

- **snmp**: SNMP Protocol Facility
- **srdb**: Static Rating Database
- **threshold**: Threshold Server Facility
- **vpnctrl**: Virtual Private Network Controller Facility
- **vpnmgr**: VPN Manager Facility
- **zebos**: ZEBOS™ OSPF Message Facility

`all`: Display information for all instances of the specified facility.
`instance` *`id`*: Display information for the specified instance of the specified facility only. id must be an integer from 0 through 10000000.

`process` *`process_name`* **`all`**

Display information for all instances of the specified process. must be one of the following process names:

- **ftpd:** File Transfer Protocol Daemon
- **inetd:** Internet Super-server Daemon
- **nsproc:** NetSpira Packet Processor
- **ntpd:** Network Time Protocol Daemon
- **orbnsd:** Object Request Broker Notification Server
- **ping:** Ping
- **pvmd-wrapper:** NetSpira Messenger Daemon
- **pvmgs:** NetSpira Messenger Daemon
- **rlogin:** Remote Login
- **sftp-server:** Secure File Transfer Protocol Server
- **sitreap:** System Initialization Task Cleanup Process
- **sn_resolve:** DNS Resolver Process
- **ssh:** Secure Shell
- **sshd:** Secure Shell Daemon

- **telnet:** Telnet
- **telnetd:** Telnet Daemon
- **tftpd:** Trivial File Transfer Protocol Daemon
- **traceroute:** Traceroute

max

Default: current usage levels are displayed.
Displayed the maximum usage levels for tasks as opposed to the current usage levels.
The keyword **max** is valid only in conjunction with the **resources** keyword.

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Display task information as part of system troubleshooting unexpected behavior.

Important: This command is not supported on all platforms.

Example

The following commands provide some examples of the combinations of options that may be used to display task information.

```
show task info facility hatspc all

show task info facility hatspc instance 456

show task resources facility zebos all

show task table facility ospf

show task table card 8 facility cli all

show task resources facility rip all max
```

show temperature

Displays the current temperature on all installed application and line cards. Also displays the temperature of upper and lower fan trays. Temperature readings are acquired from sensors located on theses components.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show temperature [verbose] [| { grep *grep_options* **| more }]**

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

verbose

Indicates that the output is to contain detailed information.

Usage

Verify current temperature of components in chassis.

Example

show temperature

show tempterature verbose

show terminal

Displays the current terminal settings for number of lines in length and number of characters in width.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show terminal [| { grep *grep_options* **| more }]**

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Verify current terminal settings in case the output displayed appears to have line breaks/wraps in unexpected places.

Example

```
show terminal
```

show threshold

Displays thresholding information for the system.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show threshold [ default ]
```

[default]

Used to display the system's thresholding default values.

Usage

Use this command to display information on threshold value configuration and activity.

Example

The following command displays configuration information pertaining to threshold values configured on the system:

```
show threshold
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show timing

Displays the information configured to define a transmit timing source other than the system clock. The display includes related information (such as port status, timing source priority, timing alarms, etc.) for all of the ports configured for either BITS or line timing.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show timing
```

Usage

Use this command to determine which line cards are recovering receive timing clocks.

Important: This command is not supported on all platforms.

Example

The following command displays timing configuration and status information for the timing-configured ports.

```
show timing
```

show upgrade

Displays the status of an on-going on-line software upgrade.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show upgrade
```

Usage

Use this command to show the status of an on-going on-line software upgrade.

Important: This command is not supported on all platforms.

show url-blacklisting database

This command displays URL Blacklisting static database configurations.

Product

CF

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show url-blacklisting database [all | url *url* **| facility acsmgr { all | instance** *instance* **}] [| { grep** *grep_options* **| more }]**

all

Displays configurations of all URL Blacklisting databases present in the default or override directory.

facility acsmgr { all | instance *instance* **}**

Displays configurations of URL Blacklisting database configuration per facility/ACSMgr instance.
all: Displays URL Blacklisting database configuration of all ACSMgrs.
instance *instance*: Displays URL Blacklisting database configuration of the specified instance.
instance must be instance number of the database, and must be an integer from 1 through 10000000.

url *url*

Displays configurations of the URL Blacklisting database specified in the URL.
url must be the database's URL, and must be a string of 1 through 512 characters in length.

grep *grep_options* **| more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

Use this command to view configurations associated with in-memory and on-flash Blacklisting database. The **show url-blacklisting database** command displays the active database that is loaded, and is the one set by either the default or override CLI commands.

Example

The following command displays configurations of all the databases present in default or override directory, indicating one as ACTIVE and rest as NOT LOADED:

```
show url-blacklisting database all
```

The following command displays configurations of the */flash/bl/optblk.bin* database:

show url-blacklisting database url */flash/bl/optblk.bin*

The following command displays database configuration for the ACSMgr instance *1*:

show url-blacklisting database facility acsmgr instance *1*

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show version

Displays the version information for the current system image or for a remote image.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show version [*url* **] [all | verbose] [| { grep** *grep_options* **| more }]**

---

url

Specifies the location of a configuration file to display version information for. The *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

- ST16:
  - **[file:] { /flash | /pcmcia1 | /pcmcia2 } [/***directory* **] /***file_name*
  - **tftp://{** *host* **[** *:port#* **] } [/***directory* **] /***file_name*
  - **[http: | ftp: | sftp:] // [** *username* **[** *:password* **] @] {** *host* **} [** *:port#* **] [/***directory* **] /***file_name*
- ASR 5000:
  - **[file:] { /flash | /pcmcia1 | /hd } [/***directory* **] /***file_name*
  - **tftp:// {** *host* **[** *:port#* **] } [/***directory* **] /***file_name*
  - **[http: | ftp: | sftp:] // [** *username* **[** *:password* **] @] {** *host* **} [** *:port#* **] [/***directory* **] /***file_name*

directory is the directory name.
filename is the actual file of interest.
username is the user to be authenticated.
password is the password to use for authentication.
host is the IP address or host name of the server.
port# is the logical port number that the communication protocol is to use.

---

all | verbose

all: indicates all image information is to be displayed.
verbose: indicates the output is to contain detailed information.
The **verbose** keyword may not be used in conjunction with a URL specification.

---

grep *grep_options* **| more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Display the version information to verify the image versions loaded in preparation for maintenance, upgrades, etc.

Important: This command is not supported on all platforms.

Example

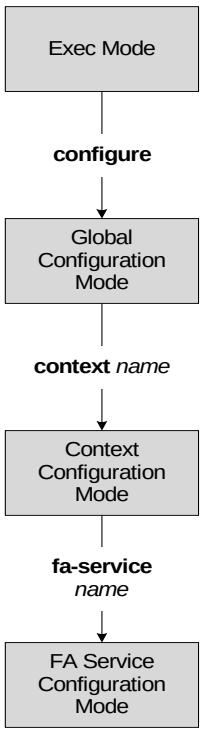
The following commands display the version information with the basic level of output and the detailed level, respectively.

```
show version

show version verbose
```

Chapter 96
FA Service Configuration Mode Commands

The Foreign Agent Service Configuration Mode is used to create and manage the Foreign Agent (FA) services associated with the current context.



advertise

Configures agent advertisement parameters within the FA service.

Product

PDSN, GGSN, ASN GW

Privilege

Security Administrator, Administrator

Syntax

advertise {adv-delay *seconds* |**adv-lifetime** *time* | **adv-interval** { *seconds* | **msec** *num* } | **num-adv-sent** *number* | **prefix-length-extn** | **reg-lifetime** *reg_time* }

no advertise{ **prefix-length-extn** | **reg-lifetime** }

[default] advertise adv-delay

no advertise prefix-length-extn

Disables prefix-length-extn

no advertise reg-lifetime

Specifies that there is no limit to the registration lifetime that the FA service will allow in any Registration Request message from the mobile node.

default advertise adv-delay

Sets the initial delay for the unsolicited advertisement to default value of 1000 ms.

advertise adv-delay *seconds*

Default: 1000
This command sets the initial delay for the unsolicited advertisement.
seconds is the advertisement delay in milliseconds and must be an integer from 10 through 5000.

Important: This command is available for WiMAX CMIP calls only.

adv-lifetime *time*

Default: 9000
Specifies the FA agent advertisement lifetime.
The agent advertisement lifetime is the amount of time that an FA agent advertisement remains valid in the absence of further advertisements.
time is measured in seconds and can be configured to any integer value between 1 and 65535.

adv-interval { *seconds* | msec *num* }

Default: 5 seconds
Specifies the amount of time between agent advertisements.
seconds is the time in seconds and can can be any integer value from 1 through1800.

msec *num*: Configures agent advertisement Interval in milliseconds. can be any integer from 100 through 1800000.

num-adv-sent *number*

Default: 5
Specifies the number of unanswered agent advertisements that the FA service sends upon PPP establishment before it will reject the session.
number can be any integer value between 1 and 65535.

prefix-length-extn

Default: Disabled
When this is enabled, the FA includes the FA-service address in the Router Address field of the Agent Advertisement and appends a Prefix Length Extension in Agent Advertisements with a prefix length of 32.

reg-lifetime *reg_time*

Default: 600
Specifies the longest registration lifetime that the FA service will allow in any Registration Request message from the mobile node.
reg_time is measured in seconds and can be configured to any integer value between 1 and 65534.

Usage

Use to tailor FA advertisements to meet your network needs and/or conditions.

Example

The following command configures the FA advertisement interval at 10 seconds, the advertise lifetime to 20000 seconds, and the maximum number of unanswered advertisements that will be sent to 3.

```
advertise adv-interval 10 adv-lifetime 20000 num-adv-sent 3
```

authentication aaa

This configuration enables/disables the authentication parameters for the FA service to override dynamic keys from AAA with static keys to support MIP registration with HA which do not support dynamic keys.

Product

FA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

[no | default] authentication aaa-distributed-mip-keys override

no

Disable the override of dynamic keys from AAA.

default

By default the override behavior is disabled and system uses dynamic keys from AAA after successful EAP authentication. When no EAP authentication happens system uses static keys by default.

Usage

Specify how the system will perform authentication of registration request messages. By default dynamic MN-HA and FA-HA keys from AAA after successful EAP authentication used by PMIP client in WiMAX calls for MIP registration with HA. This configuration in FA service overrides the dynamic keys from AAA with static keys to support MIP registration with HA which do not support dynamic keys.

Example

The following command configures the FA service to override use of AAA MIP keys and force the use of statically configured FA-HA SPI/key for WiMAX calls.

```
authentication aaa-distributed-mip-keys override
```

authentication mn-aaa

Specifies how the system handles authentication for mobile node re-registrations.

Product

PDSN, ASN GW, GGS

Privilege

Security Administrator, Administrator

Syntax

```
authentication mn-aaa { always | ignore-after-handoff | init-reg | init-reg-except-handoff | renew-and-dereg-noauth | renew-reg-noauth } [ optimize-retries ]
```

always

Specifies that the FA service performs authentication each time a mobile node registers. This is the default setting.

ignore-after-handoff

MN-AAA authentication is not done at the FA, for a handoff Access Gateway (AGW).

init-reg

MN-AAA and MN-FAC extensions are required only in initialization RRQ.

init-reg-except-handoff

MN-AAA and MN-FAC extensions are not required in initialization RRQ after inter-Access Gateway (AGW) handoff.

renew-and-dereg-noauth

Specifies that the FA service does not perform authentication for mobile node re-registration or deregistration authorization requests. Initial registration is handled normally.

renew-reg-noauth

Specifies that the FA service does not perform authentication for mobile node re-registrations. Initial registration and de-registration are handled normally.

optimize-retries

Optimizes the number of Authentication retries sent to the AAA server.
When an authentication request is pending for a MIP call at the AGW, if a retry RRQ is received from the mobile node, the AGW discards the old RRQ and keeps the most recent RRQ. Subsequently when the authentication succeeds, the AGW forwards the most recent RRQ to the HA. If the authentication fails, the AGW replies to the MN using the most recent RRQ.

Usage

Use this command to determine how the FA service handles mobile node re-registrations.
The system is shipped from the factory with the mobile AAA authentication set to always.

Example
The following command configures the configures the FA service to perform mobile node authentication for every re-registration:

```
authentication mn-aaa always
```

The following command specifies that the FA service does not perform authentication for mobile node re-registrations:

```
authentication mn-aaa renew-reg-noauth
```

authentication mn-ha

Configures whether the FA service looks for MN-HA auth extension in the RRP.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

authentication mn-ha { **allow-noauth** | **always** }

allow-noauth

Allows a reply that does not contain the auth extension.

always

A reply should always contain the auth extension to be accepted.
This is the default setting.

Usage

Use this command to determine whether or not the the FA service requires the MN-HA auth extension in the RRP.
The system is shipped from the factory with this set to always.

Example

The following command configures the FA service to require a reply to contain the authentication extension to be accepted.:

```
authentication mn-ha always
```

bind

Binds the FA service to a logical IP interface serving as the Pi interface and specifies the maximum number of subscribers that can access this service over the interface.

Product

PDSN, ASN GW, GGSN PDIF

Privilege

Security Administrator, Administrator

Syntax

bind address *address* [**max-subscribers** *count*]

no bind address

address

Specifies the IP address (address) of the interface configured as the Pi interface. address is specified in dotted decimal notation.

max-subscribers *max#*

Default: 500000
Specifies the maximum number of subscribers that can access this service on this interface.
count can be configured to any integer value between 0 and 500000.

Important: The maximum number of subscribers supported is dependant on the license key installed and the number of active PACs/PSCs installed in the system. A fully loaded system with 13 active PACs/PSCs can support 500,000 total subscribers. Refer to the license key command for additional information.

Usage

Associate or tie the FA service to a specific logical IP address. The logical IP address or interface takes on the characteristics of an Pi interface. Only one interface can be bound to a service. The interface should be configured prior to issuing this command.
This command also sets a limit as to the number of simultaneous subscribers sessions that can be facilitated by the service/interface at any given time.
When configuring the **max-subscribers** option, be sure to consider the following:

- The total number of interfaces you will configure for use as Pi interfaces
- The maximum number of subscriber sessions that all of these interfaces may handle during peak busy hours
- The average bandwidth for each of the sessions
- The type of physical port (10/100Base-T or 1000Base-Tx) that these interfaces will be bound to

Taking these factors into account and distributing your subscriber session across all available interfaces will allow you to configure your interfaces to optimally handle sessions without degraded performance.
Use the **no bind address** command to delete a previously configured binding.

Example

The following command would bind the logical IP interface with the address of 192.168.3.1 to the FA service and specifies that a maximum of 600 simultaneous subscriber sessions can be facilitated by the interface/service at any given time.

```
bind address 192.168.3.1 max-subscribers 600
```

The following command disables a binding that was previously configured:

```
no bind address
```

challenge-window

Defines the number of recently sent challenge values that are considered valid by the FA.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

challenge-window *number*

number

Default: 2
The number of recently sent challenge values that are considered valid. *number* must be an integer from 1 through 5.

Usage

Use this command to set the number of recently sent challenge values that are considered valid by the FA.

Example

Set the challenge window to 3:

```
challenge-window 3
```

default subscriber

Specifies the name of a subscriber profile configured within the same context as the FA service from which to base the handling of all other subscriber sessions handled by the FA service.

Product

PDSN, ASN GW, GGSN PDIF

Privilege

Security Administrator, Administrator

Syntax

default subscriber *profile_name*

no default subscriber *profile_name*

profile_name

Specifies the name of the configured subscriber profile. *profile_name* can be between 1 and 63 alpha and/or number characters and is case sensitive.

Usage

Each subscriber profile specifies "rules" such as permissions, PPP settings, and timeout values.
By default, the FA service will use the information configured for the subscriber named default within the same context. This command allows for multiple FA services within the same context to apply different "rules" to sessions they process. Each set of rules can be configured under a different subscriber name which is pointed to by this command.
Use the **no default subscriber** *profile_name* command to delete the configured default subscriber.

Example

To configure the FA service to apply the rules configured for a subscriber named user1 to every other subscriber session it processes, enter the following command:

default subscriber *user1*

dynamic-ha-assignment

This command configures various dynamic HA assignment parameters.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] dynamic-ha-assignment [ aaa-override mn-supplied-ha-addr |
allow-failover ]
```

default

Feature is disabled by default.

no

Removes the feature and returns it to the default setting of disabled.

aaa-override mn-supplied-ha-addr

Enables the system to override the mobile node supplied HA IP address with the AAA provided HA address.

allow-failover

Enables/disables a failover retry for dynamic HA assignment from the AAA server.

Usage

Use this command to override the mobile node supplied HA IP address with the AAA supplied HA address. Use this command to enable or disable the failover feature that allows the system to receive and use a newer HA address from the AAA server in cases where the original HA address is not responding.
A AAA server may assign different HA addresses each time a retransmitted MIP RRQ is authenticated during the MIP session setup. When this configuration is enabled, if the FA gets a new HA address from AAA during setup, it discards the previous HA address and start using the new address. This allows the FA session to connect to an available HA during setup.

Example

The following command enables the failover feature that allows the system to receive and use a newer HA address from the AAA server:

```
dynamic-ha-assignment allow-failover
```

dynamic-mip-key-update

When enabled, the FA service processes MIP_Key_Update_Request from the AAA server and allows dynamic MIP key updates (DMUs).

Default: Disabled

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

dynamic-mip-key-update

no dynamic-mip-key-update

no

The FA service rejects MIP_Key_Update_Request from the AAA server, not allowing dynamic MIP key updating to occur and terminates the call.

Usage

Use this command to enable or disable the DMU feature in the FA service.

Example

To enable DMU and allow dynamic updates of MIP keys, enter the following command:

dynamic-mip-key-update

encapsulation allow gre

Enables or disables the use of generic routing encapsulation (GRE) when establishing a MIP session. When enabled, if requested by a Mobile Node (MN), the FA requests the HA to use GRE encapsulation when establishing the MIP session. When disabled, the FA does not set the GRE bit in Agent Advertisements to the MN.

Default: GRE is enabled.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

encapsulation allow gre

no encapsulation allow gre

Usage

Use to disable or re-enable the use of GRE encapsulation for MIP sessions.

Example

To disable GRE encapsulation for MIP sessions, enter the following command;

no encapsulation allow gre

To re-enable GRE encapsulation for MIP sessions, enter the following command;

encapsulation allow gre

end

Exits the FA service configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the FA service configuration mode and returns to the context configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the context configuration mode.

fa-ha-spi

Configures the security parameter index (SPI) between the FA service and the HA.

Product

PDSN, ASN GW, GGSN PDIF

Privilege

Security Administrator, Administrator

Syntax

fa-ha-spi remote-address { *ha_ip_address* | *ip_addr_mask_combo* } **spi-number** *number* { **encrypted secret** *enc_secret* | *secret* } [**description string** | **hash-algorithm** { **hmac-md5** | **md5** | **rfc2002-md5** } | **monitor-ha** | **replay-protection** { **timestamp** | **nonce** } | **timestamp-tolerance** *tolerance* **]**

no fa-ha-spi remote-address { *ha_ip_address* | *ip_addr_mask_combo* } **spi-number** *number*

remote-address { *ha_ip_address* | *ip_addr_mask_combo* }

ha_ip_address :Specifies the IP address of the HA in IP v4 dotted decimal notation.
ip_addr_mask_combo: Specifies the IP address of the HA and specifies the IP address network mask bits. *ip_addr_mask_combo* must be specified using the form 'IP Address/Mask Bits' where the IP address is specified using the standard IPv4 dotted decimal notation and the mask bits are a numeric value which is the number of bits in the subnet mask.

spi-number *number*

Specifies the SPI (number) which indicates a security context between the FA and the HA in accordance with RFC 2002.
number can be configured to any integer value between 256 and 4294967295.

encrypted secret *enc_secret* | **secret** *secret*

Configures the shared-secret between the FA service and the HA. The secret can be either encrypted or non-encrypted.

- **encrypted secret** enc_secret **:** Specifies the encrypted shared key (enc_secret) between the FA service and the HA. enc_secret must be between 1 and 254 alpha and/or numeric characters and is case sensitive.

Important: The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **secret** keyword is the encrypted version of the plain text secret key. Only the encrypted secret key is saved as part of the configuration file.

- **secret** secret **:** Specifies the shared key (secret) between the FA service and the HA. secret must be between 1 and 127 alpha and/or numeric characters and is case sensitive.

description *string*

This is a description for the SPI. *string* must be an alpha and or numeric string of from 1 through 31 characters.

hash-algorithm { hmac-md5 | md5 | rfc2002-md5 }

Default: hmac-md5
Specifies the hash-algorithm used between the FA service and the HA.

- **hmac-md5 :** Configures the hash-algorithm to implement HMAC-MD5 per RFC 2002bis.
- **md5 :** Configures the hash-algorithm to implement MD5 per RFC 1321.
- **rfc2002-md5 :** Configures the hash-algorithm to implement keyed-MD5 per RFC 2002.

monitor-ha

Default: disabled
Enables the HA monitor feature for this HA address.
To set the behavior of the HA monitor feature, refer to the **ha-monitor** command in this chapter. To disable this command (if enabled) for this HA address, re-enter the entire **fa-ha-spi** command without the **monitor-ha** keyword.

replay-protection { timestamp | nonce }

Default: timestamp
Specifies the replay-protection scheme that should be implemented by the FA service for this SPI.

- **nonce:** Configures replay protection to be implemented using NONCE per RFC 2002.
- **timestamp:** Configures replay protection to be implemented using timestamps per RFC 2002.

Important: This keyword should only be used in conjunction with Proxy Mobile IP support.

timestamp-tolerance *tolerance*

Default: 60
Specifies the allowable difference (tolerance) in timestamps that is acceptable. If the difference is exceeded, then the session will be rejected. If this is set to 0, then time stamp tolerance checking is disabled at the receiving end.
tolerance is measured in seconds and can be configured to any integer value between 0 and 65535.

Important: This keyword should only be used in conjunction with Proxy Mobile IP support.

+

More than one of the above keywords can be entered within a single command.

Usage

An SPI is a security mechanism configured and shared by the FA service and the HA. Please refer to RFC 2002 for additional information.
Though it is possible for FAs and HAs to communicate without SPIs being configured, the use of them is recommended for security purposes. It is also recommended that a “default” SPI with a remote address of 0.0.0.0/0 be configured on both the HA and FA to prevent hackers from spoofing addresses.

Important: The SPI configuration on the HA must match the SPI configuration for the FA service on the system in order for the two devices to communicate properly.

A maximum of 2048 SPIs can be configured per FA service.
Use the **no** version of this command to delete a previously configured SPI.

Example
The following command configures the FA service to use an SPI of 512 when communicating with an HA with the IP address 192.168.0.2. The key that would be shared between the HA and the FA service is q397F65. When communicating with this HA, the FA service will also be configured to use the rfc2002-md5 hash-algorithm.

```
fa-ha-spi remote-address 192.168.0.2 spi-number 512 secret q397F65 hash-
algorithm rfc2002-md5
```

The following command deletes the configured SPI of 400 for an HA with an IP address of 172.100.3.200:

```
no fa-ha-spi remote-address 172.100.3.200 spi-number 400
```

gre

Configures Generic Routing Encapsulation (GRE) parameters.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

gre { checksum | checksum-verify | reorder-timeout *timeout* **| sequence-mode { none | reorder } | sequence-numbers }**

no gre { checksum | checksum-verify | sequence-numbers }

no

Disables the specified functionality.

checksum

Default: disabled
Enables the introduction of the checksum field in outgoing GRE packets.

checksum-verify

Default: disabled
Enables verification of the GRE checksum (if present) in incoming GRE packets.

reorder-timeout *timeout*

Default: 100
Configures maximum number of milliseconds to wait before processing reordered out-of-sequence GRE packets. *timeout* must be an integer from 0 through 5000.

sequence-mode { none | reorder }

Default: none
Configures how incoming out-of-sequence GRE packets should be handled.
none: Disables reordering of incoming out-of-sequence GRE packets.
reorder: Enables reordering of incoming out-of-sequence GRE packets.

sequence-numbers

Default: Disabled.
Enables insertion or removal of GRE sequence numbers in GRE packets.

Usage

Use this command to configure how the FA service handles GRE packets.

Example

To set maximum number of milliseconds to wait before processing reordered out-of-sequence GRE packets to 500 milliseconds, enter the following command:

```
gre reorder-timeout 500
```

To enable the reordering of incoming out of sequence GRE packets, enter the following command:

```
gre sequence-mode reorder
```

ha-monitor

Configures the behavior of the HA monitor feature.

Product

PDSN, ASN GW, FA, HA

Privilege

Security Administrator, Administrator

Syntax

[default] ha-monitor [interval *sec*| **max-inactivity-time** *sec* | **num-retry** *num* **]**

[no] ha-monitor

default

Restores the system default setting(s) for the command/keyword(s). This command is disabled by default.

no

Disables the HA monitoring feature for this FA service.

interval *sec*

Default: 30
Configures the time interval before the next monitoring request message is sent to the HA.
sec must be a numeric value between 1 and 36000.

max-inactivity-time *sec*

Default: 60
Specifies the maximum amount of time the system will wait without receiving MIP control traffic from a HA before the HA monitoring mechanism is triggered.
sec must be a numeric value between 30 and 600.

num-retry *num*

Default: 5
Configures the number of time the system will attempt to send HA monitor requests before determining the HA is down and a trap is initiated.
num must be a numeric value between 0 and 10.

Usage

Use this command to set parameters for the HA monitor feature. This feature allows the AGW/FA to monitor HAs with which it has MIP sessions. The monitoring feature is triggered when the AGW/FA does not receive any MIP traffic from a HA for a configured amount of time (**max-inactivity-time**). The AGW/FA starts sending special MIP RRQ monitor messages and waits for RRP monitor message responses from the HA. The RRQ monitor messages are addressed to the HA service address. The source address of the monitor-request messages is the FA service's IP address.
The actions taken during monitoring are comprised of the following:

- If no monitor response is received during the interval time (**interval**), the AGW retransmits the monitor message a configured number of times (**num-retry**).
- If no response is received after retransmitting for the number configured in **num-retry**, the HA is considered down. The AGW/FA sends a trap (HAUnreachable) to the management station. Monitoring of this HA is stopped until a MIP control message is received from the particular HA and when the AGW/FA sends a trap (HAreachable) to the management station and starts monitoring the HA again.
- When an HA receives the RRQ from an FA, it verifies the message and identifies it as a monitor message based on a special reserved NAI (in the message) and a Monitor HA CVSE in the RRQ. The HA responds with an RRP with Reply code 0x00 (accepted) and includes the Monitor HA CVSE. When the FA receives the RRP from the HA, it updates the activity for the peer HA to maintain the "up" state.

Important: This command only sets the behavior of the HA monitor feature. To enable the HA monitor feature for each HA address, refer to the **fa-ha-spi** command in this chapter. Up to 256 HAs can be monitored per system.

Example

The following commands set the HA monitor message interval to 45 seconds, the HA inactivity time to 60 seconds, and the number of HA monitor retries to 6:

```
ha-monitor interval 45ha-monitor max-inactivity-time 60
```

ha-monitor num-retry *6*

idle-timeout-mode

Controls whether Mobile IP data and control packets or only Mobile IP data resets the session idle timer.

Product

PDSN, ASN GW, GGSN PDIF

Privilege

Security Administrator, Administrator

Syntax

```
idle-timeout-mode {aggressive | normal}
```

aggressive

Only Mobile IP data resets the session idle timer.

normal

Both Mobile IP data and control packets reset the session idle timer.

Usage

Use this command to control how the session idle timer is reset.

Example

The following command specifies that only Mobile IP data can reset the session idle timer:

```
idle-timeout-mode aggressive
```

ignore-mip-key-data

When this is enabled, if DMU is not enabled and the MN sends a MIP_Key_Data CVSE, the FA ignores the MIP_Key_Data extension and the call is continued like a regular MIP call.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
ignore-mip-key-data

no ignore-mip-key-data
```

no

Disable ignoring of MIP key data.

Usage

When DMU is not enabled, use this command to ignore MIP key data sent by the MN and allow the call to continue normally.

Example

To enable the FA to ignore MIP key data sent by the MN, enter the following command:

```
ignore-mip-key-data
```

ignore-stale-challenge

Enables the system to accept RRQs with previously used challenges. This feature is disabled by default.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
ignore-stale-challenge

no ignore-stale-challenge
```

no

Disable this feature. If an RRQ is received with a previously used challenge and there are RRQs pending on the same session, accept the RRQ if it has a new Identification in the retransmitted RRQ. All other RRQs received with previously used challenge are rejected with the Stale Challenge (106) error code.

Usage

Use this command to allow the FA to accept stale challenges regardless of the ID field or if other RRQs are pending.

Example

To enable this functionality in the FA service, enter the following command;

```
ignore-stale-challenge
```

To disable this functionality, enter the following command;

```
no ignore-stale-challenge
```

ip local-port

Configures the local User Datagram Protocol (UDP) port for the Pi interfaces' IP socket on which to listen for Mobile IP Registration messages.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

ip local-port *port#*

port#

Specifies the UDP port number.
port# can be any integer value between 1 and 65535.

Usage

Specify the UDP port that should be used for communications between the FA service and the HA.
The system is shipped from the factory with the local port set to 434.

Example

The following command specifies a UDP port of 3950 for the FA service to use to communicate with the HA on the Pi interface:

```
ip local-port 3950
```

isakmp

Configures support for IPSec within the FA-service.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

isakmp {peer-ha *ha_address* **{crypto map** *map_name* **[[encrypted] secret** *secret* **]} | default { crypto map** *map_name* **[[encrypted] secret***secret***]}}**

no isakmp { peer-ha *peer_ip_address* **| default }**

---

no

Deletes the reference to the crypto map for the specified HA or deletes the reference for the default crypto map.

---

peer-ha ha_address { crypto map map_name [[encrypted] secret *preshared_***secret] }**

Configures a crypto map for a peer HA.

- ha_address **:** The IP address of the HA with which the FA service will establish an IPSec SA. The address must be expressed in dotted decimal format.
- **crypto map** map_name **:** The name of a crypto map configured in the same context that defines the IPSec tunnel properties. *map_name* is the name of the crypto map and can be from 1 to 127 alpha and/or numeric characters.
- **encrypted :** This keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **secret** keyword is the encrypted version of the plain text secret key. Only the encrypted secret key is saved as part of the configuration file.
- **secret** secret **:** The pre-shared secret that will be used during the IKE negotiation. *preshared_secret* is the secret and can be from 1 to 127 alpha and/or numeric characters.

---

default { crypto map map_name [[encrypted] secret secret] }

Specifies the default crypto map to use when there is no matching crypto map configured for an HA address.

- **crypto map** map_name **:** The name of a crypto map configured in the same context that defines the IPSec tunnel properties. *map_name* is the name of the crypto map and can be from 1 to 127 alpha and/or numeric characters.
- **encrypted :** This keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **secret** keyword is the encrypted version of the plain text secret key. Only the encrypted secret key is saved as part of the configuration file.
- **secret** secret **:** The pre-shared secret that will be used during the IKE negotiation. *preshared_secret* is the secret and can be from 1 to 127 alpha and/or numeric characters.

Usage

Use this command to configure the FA-service's per-HA IPSec parameters. These dictate how the FA service is to establish an IPSec SA with the specified HA.

Important: For maximum security, it is recommended that the above command be executed for every possible HA that the FA service communicates with.

A default crypto map can also be configured using the default keyword. The default crypto map is used in the event that the AAA server returns an HA address that is not configured as an isakmp peer-ha.

Important: For maximum security, the default crypto map should be configured in addition to peer-ha crypto maps instead of being used to provide IPSec SAs to all HAs.

Note that once an IPSec tunnel is established between the FA and HA for a particular subscriber, all new Mobile IP sessions using the same FA and HA are passed over the tunnel regardless of whether or not IPSec is supported for the new subscriber sessions. Data for existing Mobile IP sessions is unaffected.

Example

The following command creates a reference for an HA with the IP address 1.2.3.4 to a crypto map named map1:

```
isakmp peer-ha 1.2.3.4 crypto map map1
```

The following command deletes the crypto map reference for the HA with the IP address 1.2.3.4.

```
no isakmp peer-ha 1.2.3.4
```

limit-reg-lifetime

Enable the current default behavior of limiting the MIP lifetime to be smaller than the Idle, Absolute, or Long Duration timeouts. When disabled, this command allows a MIP lifetime that is longer than the Idle, Absolute or Long Duration timeouts.

Product

PDSN, ASN GW, GGSN PDIF

Privilege

Security Administrator, Administrator

Syntax

```
[no | default] limit-reg-lifetime
```

no

Allows a MIP lifetime that is longer than the Idle, Absolute or Long Duration timeouts.

default

Enable the default behavior of limiting the MIP lifetime to be smaller than the Idle, Absolute, or Long Duration timeouts.

Usage

Use the no keyword with this command to allow a MIP lifetime that is longer than the Idle, Absolute or Long Duration timeouts.
Use the base command or the keyword to reset the FA service to the default behavior of limiting the MIP lifetime to be smaller than the Idle, Absolute, or Long Duration timeouts.

Example

Configure the FA service to allow a MIP lifetime that is longer than the Idle, Absolute or Long Duration timeouts by entering the following command:

no limit-reg-lifetime

Configure the FA service to the default behavior of limiting the MIP lifetime to be smaller than the Idle, Absolute, or Long Duration timeouts by entering either of the following commands:

```
default limit-reg-lifetimelimit-reg-lifetime
```

max-challenge-len

For mobile subscribers, the FA generates a random number and sends it to the mobile node as part of the mobile authentication extension (Mobile-Foreign Authentication extension) as described in RFC 3012. This command sets the maximum length of the FA challenge in bytes.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

max-challenge-len *length*

length

Default: 16
The maximum length, in bytes, of the FA challenge. This value must be an integer in from 4 to 32.

Usage

Change the maximum allowed length of the randomly generated FA challenge its default of 16.

Example

Use the following command to change the maximum length of the FA challenge to 18 bytes:

```
max-challenge-len 18
```

mn-aaa-removal-indication

Enables the FA to remove the MN-FAC and MN-AAA extensions from RRQs. This is disabled by default.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
mn-aaa-removal-indication

no mn-aaa-removal-indication
```

no

Disable the removal of the MN-FAC and MN-AAA extensions from RRQs.

Usage

Enable this feature if there is no need to authenticate the subscriber at HA using MN-AAA extension.

Example

The following command enables the FA service to remove MN-FAC and MN-AAA extensions from RRQs:

```
mn-aaa-removal-indication
```

multiple-reg

Specifies the number of simultaneous Mobile IP sessions that will be supported for over a single PPP session.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

multiple-reg *number*

number

number can be configured to any integer value between 1 and 3.

Usage

Use to support multiple registrations per subscriber.
The system is shipped from the factory with the multiple simultaneous MIP sessions set to 1.

Important: The system will only support multiple Mobile IP sessions per subscriber if the subscriber's mobile node has a static IP address. The system will only allow a single Mobile IP session for mobile nodes that receive a dynamically assigned IP address. In addition, because only a single Mobile IP or proxy-Mobile IP session is supported for IP PDP contexts, this parameter must remain at its default configuration.

Example

The following command configures the number of supported simultaneous registrations for subscribers using this FA service to 3.

```
multiple-reg 3
```

optimize tunnel-reassembly

Configures FA to HA optimization for tunnel reassembly.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
optimize tunnel-reassembly

no optimize tunnel-reassembly
```

Usage

Enabling this functionality fragments large packets prior to encapsulation for easier processing. Tunnel reassembly optimization is disabled by default.

Important: Cisco Systems strongly recommends that you do not use this command without first consulting Cisco Systems Technical Support. This command applies to very specific scenarios where packet reassembly is not supported at the far end of the tunnel. There are cases where the destination network may either discard the data, or be unable to reassemble the packets.

Important: This functionality works best when the FA service is communicating with an HA service running in a system. However, an FA service running in the system communicating with an HA from a different manufacturer will operate correctly even if this parameter is enabled.

Use the no version of this command to disable tunnel optimization if it was previously enabled.

Example

The following command enables tunnel reassembly optimization:

```
optimize tunnel-reassembly
```

private-address allow-no-reverse-tunnel

This command enables the FA to allow calls with private addresses and no reverse tunneling.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

private-address allow-no-reverse-tunnel

no private-address allow-no-reverse-tunnel

no

Disables the functionality. This is the default setting.

Usage

Use this command to let the FA allow sessions with private addresses that do not have the reverse tunnel bit set.

Example

To enable sessions with private addresses and no reverse tunneling, enter the following command:

```
private-address allow-no-reverse-tunnel
```

proxy-mip

Configures parameters pertaining to Proxy Mobile IP support.

Product

PDSN, ASN GW, GGSN PDIF

Privilege

Security Administrator, Administrator

Syntax

proxy-mip { allow | ha-failover [max-attempts *max_attempts* **| num-attempts-before-switching** *num_attempts* **| timeout seconds]| max-retransmissions number | renew-percent-time** *renew-time* **| retransmission-timeout** *time* **}**

```
no proxy-mip {allow | ha-failover }
```

```
default proxy-mip {allow | ha-failover | max-retransmissions | renew-percent-time | retransmission-timeout}
```

no

Disables FA service support for Proxy Mobile IP or HA failover for Proxy Mobile IP.

default

Restores the specified option to the default setting as described below.

allow

Default: Disabled
Enables FA service support for Proxy Mobile IP.

ha-failover [max-attempts *max_attempts* **| num-attempts-before-switching** *num_attempts* **| timeout** *seconds* **]**

Default: Disabled
Enables HA failover for the Proxy Mobile IP feature.

- **max-attempts** *max_attempts* - Configures the maximum number of retransmissions of Proxy MIP control messages. *max_attempts* must be an integer from 1 through 10. Default is 4
- **num-attempts-before-switching** *num_attempts* - Configures the total number of RRQ attempts (including retransmissions) before failing over to the alternate HA. *num_attempts* must be an integer from 1 through 5. Default is 2.
- **timeout** *seconds* - Configures the retransmission timeout, in seconds, of Proxy MIP control messages when failover happens. *seconds* must be an integer from 1 through 50. Default is 2

max-retransmissions *number*

Default: 5
Configures the maximum number re-try attempts that the FA service is allowed to make when sending Proxy Mobile IP Registration Requests to the HA.

number is the maximum number of retries and can be configured to any integer value from 1 to 4294967295.

renew-percent-time *renew-time*

Default: 75
Configures the amount of time that must pass prior to the FA sending a Proxy Mobile IP Registration Renewal Request.
renew-time is entered as a percentage of the advertisement registration lifetime configured for the FA service. (Refer to the **advertise** command in this chapter). The time can be configured to any integer value from 1 to 100.
The following equation can be used to calculate *renew-time*:
renew-time = (duration / lifetime) * 100
duration = The desired amount of time that can pass prior to the FA sending a Proxy Mobile IP Registration Renewal Request
lifetime = The advertisement registration lifetime configured for the FA service.
duration £ lifetime

retransmission-timeout *time*

Default: 3
Configure the maximum amount of time allowed by the FA for a response from the HA before re-sending a Proxy Mobile IP Registration Request message.
time is measured in seconds and can be configured to any integer value from 1 to 100.

Usage

The proxy-mip command and its keywords configure the FA services support for Proxy Mobile Mobile IP. When enabled though the session license and feature use key, the system supports Proxy Mobile IP to provide a mobility solution for subscribers with mobile nodes (MNs) capable of supporting only Simple IP.
In addition to the parameters configured via this command, the HA-FA SPI(s) must also be modified to support Proxy Mobile IP. Refer to the fa-ha-spi command for more information.

Example

The following command configures the FA service to wait up to 5 seconds for an HA to respond prior to re-sending an a Mobile IP Registration Request message:

```
proxy-mip retransmission-timeout 5
```

If the advertisement registration lifetime configured for the FA service is 900 seconds and you want the system to send a Proxy Mobile IP Registration Renewal Request message after 500 seconds, then the following command must be executed:

```
proxy-mip renew-percent-time 50
```

Note that 50 = (450 / 900) 100.

reg-timeout

Configures the FA registration reply timeout.

Product

PDSN, ASN GW, GGSN PDIF

Privilege

Security Administrator, Administrator

Syntax

reg-timeout *time*

time

Default: 45
time is measured in seconds and can be configured to any integer between 1 and 65535.

Usage

Configure the amount of time that the FA service will wait for a Registration Reply from an HA before the call is rejected with a reply code of 78H (registration Timeout).

Example

The following command configures a registration timeout of 10.

```
reg-timeout 10
```

reverse-tunnel

Enables the use of reverse tunneling for a Mobile IP sessions when requested by the mobile node.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
reverse-tunnel

no reverse-tunnel
```

no

Indicates the reverse tunnel option is to be disabled. When omitted, the reverse tunnel option is enabled.

Usage

Reverse tunneling involves tunneling datagrams originated by the mobile node to the HA via the FA service. When an MN arrives at a foreign network, it listens for agent advertisements and selects an FA that supports reverse tunnels. The MN requests this service when it registers through the selected FA. At this time, the MN may also specify a delivery technique such as Direct or the Encapsulating Delivery Style.
The advantages of using reverse-tunneling:

- All datagrams from the mobile node seem to originate from its home network
- The FA can keep track of the HA that the mobile node is registered to and tunnel all datagrams from the mobile node to its HA

Use the **no** option of this command to disable reverse tunneling. If reverse tunneling is disabled, and the mobile node does not request it, then triangular routing is used.
The system is shipped from the factory with the reverse tunnel enabled.

Important: If reverse tunneling is disabled on the system and a mobile node requests it, the call will be rejected with a reply code of 74H (reverse-tunneling unavailable).

Example

The following command disables reverse-tunneling support for the FA service:

```
no reverse-tunnel
```

revocation

Enables the MIP revocation feature and configures revocation parameters.

Product

PDSN, ASN GW, GGSN PDIF

Privilege

Security Administrator, Administrator

Syntax

revocation { enable | max-retransmission *number* **| negotiate-i-bit | retransmission-timeout** *secs* **| trigger internal-failure }**

no revocation enable | trigger internal-failure | negotiate-i-bit

no revocation { enable | negotiate-i-bit | trigger internal-failure }

Completely disables registration revocation on the FA.
Disables sending revocation messages to the HA when a session is affected by an internal task failure.

enable

Enables the MIP registration revocation feature on the FA. When enabled, if revocation is negotiated with an HA, and a MIP binding is terminated, the FA can send a Revocation message to the HA. This feature is disabled by default.

max-retransmission *number*

Default: 3
The maximum number of retransmissions of a Revocation message before the revocation fails. *number* must be an integer from 0 through 10.

negotiate-i-bit

Default: disabled
Enables the FA to negotiate the i-bit via PRQ/RRP messages and processes the i-bit revocation messages.

retransmission-timeout *secs*

Default: 3
The number of seconds to wait for a Revocation Acknowledgement from the HA before retransmitting the Revocation message. *secs* must be an integer from 1 through 10.

trigger internal-failure

Default: disabled
Enable sending a revocation message to the HA for all sessions that are affected by an internal task failure.

Usage

Use this command to enable or disable the MIP revocation feature on the FA or to change settings for this feature. Both the HA and the FA must have Registration Revocation enabled and FA/HA authorization must be in use for Registration Revocation to be negotiated successfully.

Example

The following command enables Registration Revocation on the FA:

```
revocation enable
```

The following command sets the maximum number of retries for a Revocation message to 6:

```
revocation max-retransmission 6
```

The following command sets the timeout between retransmissions to 10:

```
revocation retransmission-timeout 10
```

threshold reg-reply-error

Set an alarm or alert based on the number of registration reply errors per FA service.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

threshold reg-reply-error *high_thresh* **[clear** *low_thresh* **]**

no threshold reg-reply-error

no

Deletes the alert or alarm.

high_thresh

Default: 0
The high threshold number of registration reply errors that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100000.

Important: You must enter a value between 1 and 100000 to trigger an alert/alarm.

clear *low_thresh*

Default:0
The low threshold number of registration reply errors that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 100000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Important: You must enter a value between 1 and 100000 to trigger an alert/alarm.

Usage

Use this command to set an alert or an alarm when the number of registration reply errors is equal to or greater than a specified number of calls per second.
Alerts or alarms are triggered for the number of registration reply errors on the following rules:

- **Enter condition:** Actual number of registration reply errors > High Threshold
- **Clear condition:** Actual number of registration reply errors £ Low Threshold

Example

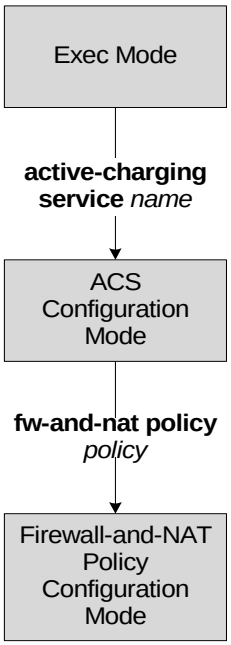
The following command configures a registration reply error threshold of 1000 and a low threshold of 500 for a system using the Alarm thresholding model:

```
threshold reg-reply-error 1000 clear 500
```

Chapter 97
Firewall-and-NAT Policy Configuration Mode Commands

The Firewall-and-NAT Policy Configuration Mode enables configuring Firewall-and-NAT policies.

Important: This configuration mode is only available in StarOS 8.1, StarOS 9.0 and later releases. This configuration mode must be used to configure Policy-based Stateful Firewall and NAT features.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

access-rule

This command creates and configures an access rule.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

access-rule { no-ruledef-matches { downlink | uplink } action { deny [charging-action *charging_action* **] | permit [bypass-nat | nat-realm** *nat_realm* **] } | priority** *priority* **{ [dynamic-only | static-and-dynamic] access-ruledef** *ruledef_name* **{ deny [charging-action** *charging_action* **] | permit [[bypass-nat | nat-realm** *nat_realm* **] trigger open-port { port_number | range** *start_port* **to** *end_port* **} direction { both | reverse | same }] } } }**

default access-rule no-ruledef-matches { downlink | uplink } action

no access-rule priority *priority*

default

Configures the default setting.
Default: Uplink direction: **permit**; Downlink direction: **deny**

no

Removes the access rule specified by the priority.

no-ruledef-matches

Configures action on packets with no ruledef match.

downlink

Specifies to act on downlink packets with no ruledef match.

uplink

Specifies to act on uplink packets with no ruledef match.

action

Specifies action to take on downlink/uplink packets with no ruledef match.

deny

Specifies to deny packets.

permit

Specifies to permit packets and allow the creation of data flows.

charging-action *charging_action*

Specifies the charging action. Optionally, for deny action a charging action can be configured. If a packet matches the deny rule, action is taken as configured in the charging action. If a charging action is specified, the content-ID and billing-action configured in the charging action are used. Also, the flow may be terminated (instead of just discarding the packet), if so configured in the specified charging action.
charging_action must be an alpha and/or numeric string of 1 through 63 characters in length.

bypass-nat

Important: In StarOS 9.0 and later, this keyword is NAT license dependent.

Specifies to bypass NAT.

nat-realm *nat_realm*

Important: In StarOS 9.0 and later, this keyword is NAT license dependent.

Specifies the NAT realm to be used to perform NAT on subscriber packets matching the access ruledef. If the NAT realm is not specified, NAT will be bypassed. That is, NAT will not be performed on subscriber packets that are matching a ruledef with no NAT realm name configured in it.
nat_realm must be an alpha and/or numeric string of 1 through 31 characters in length.

priority *priority*

Specifies priority of an access ruledef in the Firewall-and-NAT policy.
priority must be an integer from 1 through 65535, and must be unique for each access ruledef in the Firewall-and-NAT policy.

[dynamic-only | static-and-dynamic] access-ruledef *ruledef_name*

Specifies the access ruledef name. Optionally, the ruledef type can also be specified.

- **dynamic-only**: Dynamic Ruledef—Predefined ruledef that can be enabled/disabled by the policy server, and is disabled by default.
- **static-and-dynamic**: Static and Dynamic Ruledef—Predefined ruledef that can be enabled/disabled by the policy server, and is enabled by default.
- **access-ruledef** *ruledef_name*: Specifies the access ruledef name. *ruledef_name* must be an alpha and/or numeric string of 1 through 63 characters in length.

trigger open-port { *port_number* | range *start_port* to *end_port* }
direction { both | reverse | same }

Important: In StarOS 9.0 and later, this keyword is Stateful Firewall license dependent.

Optionally a port trigger can be specified to be used for this rule to limit the range of auxiliary data connections (a single or range of port numbers) for protocols having control and data connections (like FTP). The trigger port will be the destination port of an association which matches a rule.

- *port_number*: Specifies the auxiliary port number to open for traffic, and must be an integer from 1 through 65535.

- **range** *start_port* **to** *end_port*: Specifies the range of port numbers to open for subscriber traffic.
  - *start_port* must be an integer from 1 through 65535.
  - *end_port* must be an integer from 1 through 65535, and must be greater than *start_port*.
- **direction { both | reverse | same }**: Specifies the direction from which the auxiliary connection is initiated. This direction can be same as the direction of control connection, or the reverse of the control connection direction, or in both directions.
  - *both*: Provides the trigger to open port for traffic in either direction of the control connection.
  - *reverse*: Provides the trigger to open port for traffic in the reverse direction of the control connection (from where the connection is initiated).
  - *same*: Provides the trigger to open port for traffic in the same direction of the control connection (from where the connection is initiated).

Usage

Use this command to add access ruledefs to the Firewall-and-NAT policy and configure the priority and actions for rule matching.
The policy specifies the rules to be applied on calls. The ruledefs in the policy have priorities, based on which priority matching is done.
For Stateful Firewall, the port trigger configuration is optional, and can be configured only if a rule action is permit. When a rule is matched and the rule action is permit, if the trigger is configured, the appropriate check is made. The trigger port will be the destination port of an association that matches the rule. Multiple triggers can be defined for the same port number to permit multiple auxiliary ports for subscriber traffic.
When a rule is matched and if the rule action is deny, the action taken depends on what is configured in the specified charging action. If the flow exists, flow statistics are updated and action is taken as configured in the charging action:

- If the billing action is configured as EDR enabled, EDR is generated.
- If the content ID is configured, UDR information is updated.
- If the flow action is configured as “terminate-flow”, the flow is terminated instead of just discarding the packet.

If the billing action, content ID, and flow action are not configured, no action is taken on the dropped packets.

Important: For Stateful Firewall, only the terminate-flow action is applicable if configured in the specified charging action.

Allowing/dropping of packets is determined in the following sequence:

- Check is done to see if the packet matches any pinholes. If yes, no rule matching is done and the packet is allowed.
- Access ruledef matching is done. If a rule matches, the packet is allowed or dropped as per the **access-rule priority** configuration.
- If no access ruledef matches, the packet is allowed or dropped as per the **access-rule no-ruledef-matches** configuration.

For a packet dropped due to access ruledef match or no match (first packet of a flow), the charging action applied is the one configured in the **access-rule priority** or the **access-rule no-ruledef-matches** command respectively.

For action on packets dropped due to any error condition after data session is created, the charging action must be configured in the **flow any-error charging-action** command in the ACS Rulebase Configuration Mode.
The GGSN can dynamically activate/deactivate dynamic ruledefs for a subscriber based on the rule name received from a policy server. At rule match, if a rule in the policy is a dynamic rule, and if the rule is enabled for the particular subscriber, rule matching is done for the rule. If the rule is disabled for the particular subscriber, rule matching is not done for the rule.

Example
For Stateful Firewall, the following command assigns a priority of *10* to the access ruledef *test_rule*, adds it to the policy, and permits port trigger to be used for the rule to open ports in the range of *1000* to *2000* in either direction of the control connection:

```
access-rule priority 1 access-ruledef test_rule permit trigger open-port
range 1000 to 2000 direction both
```

end

This command returns the CLI prompt to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec mode.

exit

This command exits the current configuration mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

firewall dos-protection

This command configures Stateful Firewall protection for subscribers from Denial-of-Service (DoS) attacks.

Important: In StarOS 8.0, this configuration is available in the ACS Configuration Mode. In StarOS 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the ACS Rulebase Configuration Mode. In StarOS 8.3, this configuration is available in the ACS Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] firewall dos-protection { all | flooding { icmp | tcp-syn | udp } | ftp-bounce | ip-unaligned-timestamp | mime-flood | port-scan | source-router | tcp-window-containment | teardrop | winnuke }

default firewall dos-protection
```

no

Disables Stateful Firewall protection for subscribers against the specified DoS attack(s).

default

Disables Stateful Firewall protection for subscribers against all DoS attacks.

all

Enables Stateful Firewall protection for subscribers against all DoS attacks supported by the Stateful Firewall service.

flooding { icmp | tcp-syn | udp }

Enables protection against the specified flooding attack:

- **icmp**: Enables protection against ICMP Flood attack
- **tcp-syn**: Enables protection against TCP Syn Flood attack
- **udp**: Enables protection against UDP Flood attack

ftp-bounce

Enables protection against FTP Bounce attacks.

ip-unaligned-timestamp

Enables protection against IP Unaligned Timestamp attacks.

mime-flood

Enables protection against HTTP Multiple Internet Mail Extension (MIME) header flooding attacks.

port-scan

Enables protection against Port Scan attacks.

tcp-window-containment

Enables protection against TCP sequence number out-of-range attacks.

source-router

Enables protection against IP Source Route IP Option attacks.

teardrop

Enables protection against Teardrop attacks.

winnuke

Enables protection against WIN-NUKE attacks.

Usage

Use this command to enable Stateful Firewall protection from different types of DoS attacks. This command can be used multiple times for different DoS attacks.

Important: DoS attacks are detected only in the downlink direction.

Example

The following command enables protection from all supported DoS attacks:

```
firewall dos-protection all
```

firewall flooding

This command configures Stateful Firewall protection from Packet Flooding attacks.

Important: In StarOS 8.0, this configuration is available in the ACS Configuration Mode. In StarOS 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the ACS Rulebase Configuration Mode. In StarOS 8.3, this configuration is available in the ACS Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall flooding { protocol { icmp | tcp-syn | udp } packet limit packets } |
sampling-interval interval }

default firewall flooding { protocol { icmp | tcp-syn | udp } packet limit } |
sampling-interval }
```

default

Configures the default setting for the specified configuration.

protocol { icmp | tcp-syn | udp }

Specifies the transport protocol:

- **icmp**: Configuration for ICMP protocol.
- **tcp-syn**: Configuration for TCP-SYN packet limit.
- **udp**: Configuration for UDP protocol.

packet limit *packets*

Specifies the maximum number of specified packets a subscriber can receive during a sampling interval.
packets must be an integer from 1 through 4294967295.
Default: 1000 packets per sampling interval for all protocols.

sampling-interval *interval*

Specifies the flooding sampling interval, in seconds.
interval must be an integer from 1 through 60.
Default: 1 second
The maximum sampling-interval configurable is 60 seconds.

Usage

Use this command to configure the maximum number of ICMP, TCP-SYN, / UDP packets allowed to prevent the packet flooding attacks to the host.

Example

The following command ensures a subscriber will not receive more that 1000 ICMP packets per sampling interval:

```
firewall flooding protocol icmp packet limit 1000
```

The following command ensures a subscriber will not receive more than 1000 UDP packets per sampling interval on different 5-tuples. That is, if an attacker is sending lot of UDP packets on different ports or using different spoofed IPs, those packets will be limited to 1000 packets per sampling interval. This way only "suspected" malicious packets are limited and not "legitimate" packets.

```
firewall flooding protocol udp packet limit 1000
```

The following command ensures a subscriber will not receive more than 1000 TCP-Syn packets per sampling interval:

```
firewall flooding protocol tcp-syn packet limit 1000
```

The following command specifies a flooding sampling interval of 1 second:

```
firewall flooding sampling-interval 1
```

firewall icmp-checksum-error

This command configures Stateful Firewall action on packets with ICMP Checksum errors.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall icmp-checksum-error { drop | permit }

default firewall icmp-checksum-error
```

default

Configures the default setting.
Default: **drop**

drop

Specifies to drop packets with ICMP Checksum errors.

permit

Specifies to permit packets with ICMP Checksum errors.

Usage

Use this command to configure Stateful Firewall action on packets with ICMP Checksum errors. This CLI also applies to ICMP packets with Inner IP Checksum error.
For NAT-only calls, packets with ICMP errors are dropped, and other packets are allowed.

Example

The following command configures Stateful Firewall to drop packets with ICMP Checksum errors:

```
firewall icmp-checksum-error drop
```

firewall icmp-destination-unreachable-message-threshold

This command configures a threshold on the number of ICMP error messages sent by the subscriber for a particular data flow.

Important: In StarOS 8.0, this configuration is available in the ACS Configuration Mode. In StarOS 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the ACS Rulebase Configuration Mode. In StarOS 8.3, this configuration is available in the ACS Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall icmp-destination-unreachable-message-threshold *messages* **then-block-server**

{ default | no } firewall icmp-destination-unreachable-message-threshold

default

Configures the default setting.
Default: No limit

no

Removes the previous configuration.

messages

Specifies the threshold on the number of ICMP error messages sent by the subscriber for a particular data flow. *messages* must be an integer from 1 through 100.

Usage

Use this command to configure a threshold on the number of ICMP error messages sent by the subscriber for a particular data flow. After the threshold is reached, it is assumed that the server is not reacting properly to the error messages, and further downlink traffic to the subscriber on the unwanted flow is blocked.
Some servers that run QChat ignore the ICMP error messages (Destination Port Unreachable and Host Unreachable) from the mobiles. So the mobiles continue to receive unwanted UDP traffic from the QChat servers, and their batteries get exhausted quickly.

Example

The following command configures a threshold of 10 ICMP error messages:

firewall icmp-destination-unreachable-message-threshold *10* **then-block-server**

firewall icmp-fsm

This command enables/disables Stateful Firewall's ICMP Finite State Machine (FSM).

Product

FW

Privilege

Security Administrator, Administrator

Syntax

`[ default | no ] firewall icmp-fsm`

`default`

Configures the default setting.
Default: Enabled. Same as **`firewall icmp-fsm`**.

`no`

Disables Stateful Firewall ICMP FSM checks.

Usage

Use this command to enable/disable Stateful Firewall ICMP FSM checks. When Stateful Firewall and ICMP FSM are enabled, ICMP reply messages for which there is no saved ICMP request message are discarded. ICMP error messages (i.e., messages containing an embedded message) for which there is no saved flow for the embedded message are discarded.

Example

The following command disables Stateful Firewall's ICMP FSM checks:

```
no firewall icmp-fsm
```

firewall ip-reassembly-failure

This command configures Stateful Firewall action on packets involved in IP Reassembly Failure scenarios.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall ip-reassembly-failure { drop | permit }

default firewall ip-reassembly-failure
```

default

Configures the default setting.
Default: **permit**

drop

Specifies to drop packets involved in IP reassembly failure scenarios.

permit

Specifies to permit packets involved in IP reassembly failure scenarios.

Usage

Use this command to configure Stateful Firewall action on packets involved in IP reassembly failure scenarios such as missing fragments, overlapping offset, etc.
For NAT-only calls, packets involved in IP reassembly failure scenarios are dropped.

Example

The following command specifies to drop packets involved in IP reassembly failure scenarios:

```
firewall ip-reassembly-failure drop
```

firewall malformed-packets

This command configures Stateful Firewall action on malformed packets.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall malformed-packets { drop | permit }

default firewall malformed-packets
```

default

Configures the default setting.
Default: **permit**

drop

Specifies to drop malformed packets.

permit

Specifies to permit malformed packets.

Usage

Use this command to configure Stateful Firewall action on malformed packets.
For NAT-only calls, malformed packets are always permitted.

Example

The following command specifies Stateful Firewall to drop malformed packets:

```
firewall malformed-packets drop
```

firewall max-ip-packet-size

This command configures the maximum IP packet size (after IP reassembly) allowed over Stateful Firewall.

Important: In StarOS 8.0, this configuration is available in the ACS Configuration Mode. In StarOS 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the ACS Rulebase Configuration Mode. In StarOS 8.3, this configuration is available in the ACS Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall max-ip-packet-size packet_size protocol { icmp | non-icmp }

default firewall max-ip-packet-size protocol { icmp | non-icmp }
```

default

Configures the default setting.
Default: 65535 bytes (for both ICMP and non-ICMP)

packet_size

Specifies the maximum packet size allowed.
packet_size must be an integer from 30000 through 65535.

protocol { icmp | non-icmp }

Specifies the transport protocol:

- **icmp**: Configuration for ICMP protocol.
- **non-icmp**: Configuration for protocols other than ICMP.

Usage

Use this command to configure the maximum IP packet size allowed for ICMP and non-ICMP packets to prevent packet flooding attacks to the host. Packets exceeding the configured size will be dropped for “Jolt” and “Ping-Of-Death” attacks.

Example

The following command allows a maximum packet size of *60000* for ICMP protocol:

```
firewall max-ip-packet-size 60000 protocol icmp
```

firewall mime-flood

This command configures Stateful Firewall protection from MIME Flood attacks.

Important: In StarOS 8.0, this configuration is available in the ACS Configuration Mode. In StarOS 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the ACS Rulebase Configuration Mode. In StarOS 8.3, this configuration is available in the ACS Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall mime-flood { http-headers-limit *max_limit* **| max-http-header-field-size** *max_size* **}**

default firewall mime-flood { http-headers-limit | max-http-header-field-size }

default

Configures the default setting for the specified parameter.

http-headers-limit *max_limit*

Specifies the maximum number of headers allowed in an HTTP packet. If the number of HTTP headers in a page received is more than the specified limit, the request will be denied.
max_limit must be an integer from 1 through 256.
Default: 16

max-http-header-field-size *max_size*

Specifies the maximum header field size allowed in the HTTP header, in bytes. If the size of HTTP header in the received page is more than the specified number of bytes, the request will be denied.
max_size must be an integer from 1 through 8192.
Default: 4096 bytes

Usage

Use this command to configure the maximum number of headers allowed in an HTTP packet, and the maximum header field size allowed in the HTTP header to prevent MIME flooding attacks.
This command is only effective if Stateful Firewall DoS protection for MIME flood attacks has been enabled using the **firewall dos-protection mime-flood** command, and the **route** command has been configured to send HTTP packets to the HTTP analyzer.

Example

The following command sets the maximum number of headers allowed in an HTTP packet to *100*:

firewall mime-flood http-headers-limit *100*

The following command sets the maximum header field size allowed in the HTTP header to *1000* bytes:

firewall mime-flood max-http-header-field-size *1000*

firewall policy

This command enables/disables Stateful Firewall support in a Firewall-and-NAT policy.

Important: In StarOS 8.0, this configuration is available in the ACS Configuration Mode. In StarOS 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the ACS Rulebase Configuration Mode. In StarOS 8.3, this configuration is available in the ACS Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall policy firewall-required

no firewall policy
```

no

Disables Stateful Firewall support in the Firewall-and-NAT policy.

firewall-required

Enables Stateful Firewall support in the Firewall-and-NAT policy.

Usage

Use this command to enable/disable Stateful Firewall support for all subscribers using a Firewall-and-NAT policy.

Example

The following command enables Stateful Firewall support in a Firewall-and-NAT policy:

```
firewall policy firewall-required
```

The following command disables Stateful Firewall support in a Firewall-and-NAT policy:

```
no firewall policy
```

firewall tcp-checksum-error

This command configures Stateful Firewall action on packets with TCP Checksum error.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall tcp-checksum-error { drop | permit }

default firewall tcp-checksum-error
```

default

Configures the default setting.
Default: **drop**

drop

Specifies to drop packets with TCP Checksum errors.

permit

Specifies to permit packets with TCP Checksum errors.

Usage

Use this command to configure Stateful Firewall action on packets with TCP Checksum error.
For NAT-only calls, packets with TCP Checksum errors are permitted.

Example

The following command specifies Stateful Firewall to drop packets with TCP Checksum errors:

```
firewall tcp-checksum-error drop
```

firewall tcp-first-packet-non-syn

This command configures Stateful Firewall action on TCP flows starting with a non-SYN packet.

Important: In StarOS 9.0, this command is deprecated. This configuration is available as the **`firewall tcp-fsm [ first-packet-non-syn { drop | permit | send-reset } ]`** command.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

`firewall tcp-first-packet-non-syn { drop | reset }`

`default firewall tcp-first-packet-non-syn`

`default`

Configures the default setting.
Default: **`drop`**

`drop`

Specifies to drop the non-SYN packet.

`reset`

Specifies to send reset.

Usage

Use this command to configure Stateful Firewall action on TCP flows starting with a non-SYN packet.

Example

For flows starting with a non-SYN packet, the following command specifies Stateful Firewall to drop the non-SYN packet:

`firewall tcp-first-packet-non-syn drop`

firewall tcp-fsm

This command enables/disables Stateful Firewall's TCP Finite State Machine (FSM).

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall tcp-fsm [ first-packet-non-syn { drop | permit | send-reset } ]
{ default | no } firewall tcp-fsm
```

default

Configures the default setting.
Default: **firewall tcp-fsm first-packet-non-syn drop**

no

Disables Stateful Firewall's TCP FSM.

first-packet-non-syn { drop | permit | send-reset }

Specifies Stateful Firewall action on TCP flows starting with a non-SYN packet:

- **drop**: Specifies to drop the packet.
- **permit**: Specifies to permit the packet.
- **send-reset**: Specifies to drop the packet and send TCP RST.

Default: **drop**

Usage

Use this command to enable/disable Stateful Firewall's TCP FSM checks. When Stateful Firewall and TCP FSM are enabled, state of the TCP session is checked to decide whether to forward TCP packets.

Example

The following command enables TCP FSM, and configures action to take on TCP flows starting with a non-SYN packet to drop the packet:

```
firewall tcp-fsm first-packet-non-syn drop
```

firewall tcp-idle-timeout-action

This command configures action on TCP idle timeout expiry.

Important: In StarOS 9.0 and later this command is also available to NAT.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

```
firewall tcp-idle-timeout-action { drop | reset }

{ default | no } firewall tcp-idle-timeout-action
```

default

Configures the default setting.
Default: **reset**

no

Configures the TCP idle timeout expiry action to reset.

drop | reset

Specifies the action to take on TCP idle timeout expiry.
drop: Drops the session.
reset: Sends TCP RST. When configured to reset, the session is dropped, and the system can avoid packets arriving for the idle flow from getting dropped.

Usage

Use this command to configure action to take on TCP idle timeout expiry.

Example

The following command configures action to take on TCP idle timeout expiry to drop:

```
firewall tcp-idle-timeout-action drop
```

firewall tcp-options-error

This command configures Stateful Firewall action on packets with TCP Option errors.

Product

FW

Privileges

Security Administrator, Administrator

Syntax

```
firewall tcp-options-error { drop | permit }

default firewall tcp-options-error
```

default

Configures the default setting.
Default: **permit**

drop

Specifies to drop packets with TCP Option errors.

permit

Specifies to permit packets with TCP Option errors.

Usage

Use this command to configure Stateful Firewall action on packets with TCP Option errors.

Example

The following command configures Stateful Firewall to drop packets with TCP Option errors:

```
firewall tcp-options-error drop
```

firewall tcp-reset-message-threshold

This command configures a threshold on the number of TCP reset messages sent by the subscriber for a particular data flow. After this threshold is reached, further downlink traffic to the subscriber on the unwanted flow is blocked.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall tcp-reset-message-threshold messages then-block-server

{ default | no } firewall tcp-reset-message-threshold
```

default

Configures the default setting.
Default: Disabled

no

Disables the configuration.

messages

Specifies the threshold on the number of TCP reset messages sent by the subscriber for a particular data flow. *messages* must be an integer from 1 through 100.

Usage

Use this command to configure a threshold on the number of TCP reset messages (TCP RST+ACK) sent by the subscriber for a particular data flow. After the threshold is reached, assuming the server is not reacting properly to the reset messages further downlink traffic to the subscriber on the unwanted flow is blocked. This configuration enables QCHAT noise suppression for TCP.

Example

The following command sets the threshold on the number of TCP reset messages to *10*:

```
firewall tcp-reset-message-threshold 10 then-block-server
```

firewall tcp-syn-flood-intercept

This command configures TCP SYN intercept parameters for protection against TCP SYN flooding attacks.

Important: In StarOS 8.0, this configuration is available in the ACS Configuration Mode. In StarOS 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the ACS Rulebase Configuration Mode. In StarOS 8.3, this configuration is available in the ACS Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall tcp-syn-flood-intercept { mode { none | watch [ aggressive ] } | watch-timeout intercept_watch_timeout }

default firewall tcp-syn-flood-intercept { mode | watch-timeout }
```

default

Configures the default settings for SYN Flood DoS protection.

mode { none | watch [aggressive] }

Specifies the TCP SYN flood intercept mode:

- **none**: Disables the TCP SYN Flood Intercept feature.
- **watch**: Configures TCP SYN flood intercept feature in watch mode. The Stateful Firewall passively watches to see if TCP connections become established within a configurable interval. If connections are not established within the timeout period, the Stateful Firewall clears the half-open connections by sending RST to TCP client and server. The default watch-timeout for connection establishment is 30 seconds.
- **aggressive**: Configures TCP SYN flood Intercept or Watch feature for aggressive behavior. Each new connection request causes the oldest incomplete connection to be deleted. When operating in watch mode, the watch timeout is reduced by half. If the watch-timeout is 30 seconds, under aggressive conditions it becomes 15 seconds. When operating in intercept mode, the retransmit timeout is reduced by half (i.e. if the timeout is 60 seconds, it is reduced to 30 seconds). Thus the amount of time waiting for connections to be established is reduced by half (i.e. it is reduced to 150 seconds from 300 seconds under aggressive conditions).

Default: **none**

watch-timeout *intercept_watch_timeout*

Specifies the TCP intercept watch timeout, in seconds.
intercept_watch_timeout must be an integer from 5 through 30.
Default: 30

Usage

This TCP intercept functionality provides protection against TCP SYN Flooding attacks. This command enables and configures TCP intercept parameters to prevent TCP SYN flooding attacks by intercepting and validating TCP connection requests for DoS protection mechanism configured with the **dos-protection** command

The system captures TCP SYN requests and responds with TCP SYN-ACKs. If a connection initiator completes the handshake with a TCP ACK, the TCP connection request is considered as valid by system and system forwards the initial TCP SYN to the valid target which triggers the target to send a TCP SYN-ACK. Now system intercepts with TCP SYN-ACK and sends the TCP ACK to complete the TCP handshake. Any TCP packet received before the handshake completion will be discarded.

Example

The following command sets the intercept watch timeout setting to *15* seconds:

```
firewall tcp-syn-flood-intercept watch-timeout 15
```

firewall tcp-syn-with-ecn-cwr

This command configures Stateful Firewall action on TCP SYN packets with either ECN or CWR flag set.

Product

FW

Privileges

Security Administrator, Administrator

Syntax

```
firewall tcp-syn-with-ecn-cwr { drop | permit }

default firewall tcp-syn-with-ecn-cwr
```

default

Configures the default setting.
Default: **permit**

drop

Specifies to drop TCP SYN packets with either ECN or CWR flag set.

permit

Specifies to permit TCP SYN packets with either ECN or CWR flag set.

Usage

Use this command to configure Stateful Firewall action on receiving a TCP SYN packet with either ECN or CWR flag set.

Example

The following command configures Stateful Firewall to drop TCP SYN packets with ECN / CWR flag set:

```
firewall tcp-syn-with-ecn-cwr drop
```

firewall udp-checksum-error

This command configures Stateful Firewall action on packets with UDP Checksum error.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall udp-checksum-error { drop | permit }

default firewall udp-checksum-error
```

default

Configures the default setting.
Default: **drop**

drop

Specifies to drop packets with UDP Checksum error.

permit

Specifies to permit packets with UDP Checksum error.

Usage

Use this command to configure Stateful Firewall action on packets with UDP Checksum error.
For NAT-only calls, packets with UDP Checksum error are permitted.

Example

The following command specifies to drop packets with UDP Checksum error:

```
firewall udp-checksum-error drop
```

firewall validate-ip-options

This command enables / disables the Stateful Firewall validation of IP options for errors.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] firewall validate-ip-options
```

default

Configures the default setting.
Default: Disabled. Same as **no firewall validate-ip-options**

no

Disables validation of IP options.

Usage

Use this command to enable / disable Stateful Firewall validation of IP options. When enabled, Stateful Firewall will drop packets with IP option errors.
For NAT calls, validation of IP Options is disabled.

Example

The following command enables validation of IP options:

```
firewall validate-ip-options
```

nat binding-record

This command configures the generation of NAT Binding Records.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

nat binding-record edr-format *edr_format* **[port-chunk-allocation] [port-chunk-release]**

{ default | no } nat binding-record

default

Configures the default setting.
Default: **port-chunk-release**

no

Disables generating NAT Binding Records.

edr-format *edr_format*

Specifies the EDR format name.
edr_format must be an alpha and/or numeric string of 1 through 63 characters in length.

port-chunk-allocation

Specifies generating NAT Binding Records when a port-chunk is allocated.

port-chunk-release

Specifies generating NAT Binding Record when a port-chunk is released.

Usage

Use this command to configure the generation of NAT Binding Records.

Example

The following command configures an EDR format named *test123* and specifies generating NAT Binding Records when a port chunk is allocated:

nat binding-record edr-format *test123* **port-chunk-allocation**

nat policy

This command enables/disables Network Address Translation (NAT) support in a Firewall-and-NAT policy.

Important: In StarOS 8.3, this configuration is available in the ACS Rulebase Configuration Mode.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

nat policy nat-required [default-nat-realm *nat_realm_name* **]**

no nat policy

no

Disables NAT support in the Firewall-and-NAT policy.

nat-required

Enables NAT support in the Firewall-and-NAT policy.

default-nat-realm *nat_realm_name*

Specifies the default NAT realm for the Firewall-and-NAT policy.
nat_realm_name must be the name of an existing NAT realm, and must be an alpha and/or numeric string of 1 through 31 characters in length.

Usage

Use this command to enable/disable NAT support for all subscribers using a Firewall-and-NAT policy.
In StarOS 8.1, to enable NAT support for a subscriber, Stateful Firewall must also be enabled for that subscriber. See the **firewall policy** CLI command.
Once NAT is enabled for a subscriber, the NAT IP address to be used is chosen from the NAT realms specified in the rules. See the **access-rule** CLI command.
You can enable/disable NAT at any time, however the changed NAT status will not be applied to active calls. The new NAT status will only be applied to new calls.

Example

The following command enables NAT support in a Firewall-and-NAT policy:

```
nat policy nat-required
```

The following command disables NAT support in a Firewall-and-NAT policy:

```
no nat policy
```

nat private-ip-flow-timeout

This command configures the Private IP NPU flow timeout setting.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

nat private-ip-flow-timeout *timeout*

{ default | no } nat private-ip-flow-timeout

default

Configures the default setting.
Default: 180 seconds

no

Disables the Private IP NPU flow timeout configuration.
When disabled, the flow is installed at call setup and will be removed only when the subscriber disconnects.

timeout

Specifies the Private IP NPU flow timeout period in seconds.
timeout must be an integer from 180 through 86400.

Usage

Use this command to configure the Private IP NPU flow timeout setting.
For NAT-enabled calls, by default, the downlink private IP NPU flow will not be installed at call setup for a subscriber session. The flow will only be installed on demand. When there is no traffic on the private flow, the private IP flow will be removed after the configurable timeout period.

Example

The following command configures the Private IP NPU flow timeout setting to *36000* seconds:

nat private-ip-flow-timeout *36000*

nat suppress-aaa-update

This command suppresses sending NAT Bind Update (NBU) to the AAA server when PPP disconnect happens.

Important: This command is customer-specific. For more information please contact your local service representative.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

```
nat suppress-aaa-update call-termination

default nat suppress-aaa-update
```

default

Configures the default setting.
Default: No suppression of AAA updates.

Usage

Use this command to suppress sending of NBU to the AAA server when PPP disconnect happens, as these NBUs would be cleared at the AAA after receiving the accounting-stop. This enables to minimize the number of messages between the chassis and AAA server. When not configured, NBU are sent to the AAA server whenever a port chunk is allocated, de-allocated, or the call is cleared (PPP disconnect).

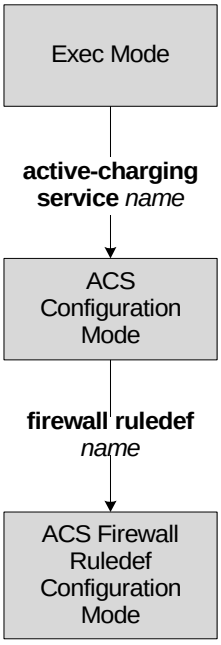
Example

The following command suppresses the sending of NBU to the AAA server:

```
nat suppress-aaa-update call-termination
```

Chapter 98
Firewall Ruledef Configuration Mode Commands

The Firewall Ruledef Configuration Mode is used to configure and manage Access/Stateful Firewall rule definitions.



bearer 3gpp apn

This command configures an access/firewall ruledef to analyze user traffic based on APN bearer.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

[no] bearer 3gpp apn [case-sensitive] *operator value*

no

Removes previously configured bearer ruledef.

case-sensitive

This keyword makes the rule case sensitive.
By default, ruledefs are not case sensitive.
Default: Disabled

operator

Specifies how to logically match the APN name.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

value

The APN name to match in bearer flow.
value must be an alpha and/or numeric string of 1 through 62 characters in length, and can include punctuation characters.

Usage

Use this command to specify an access/firewall ruledef to analyze user traffic based on APN name.

Example

The following command creates an access/firewall ruledef for analyzing user traffic for an APN named *apn12*:

bearer 3gpp apn = *apn12*

bearer 3gpp imsi

This command configures an access/firewall ruledef to analyze user traffic based on International Mobile Station Identification (IMSI) number in bearer flow.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] bearer 3gpp imsi { *operator msid* | { !range | range } imsi-pool *imsi_pool* }

no

Removes previously configured bearer ruledef.

operator

Specifies how to logically match the MSID.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

msid

Specifies the Mobile Station Identifier.

{ !range | range } imsi-pool *imsi_pool*

{ !range | range }: Specifies the range criteria:

- **!range**: Not in the range of
- **range**: In the range of

imsi-pool *imsi_pool*: Specifies the IMSI pool name. *imsi_pool* must be a string of 1 through 63 characters in length.

Usage

Use this command to specify an access/firewall ruledef to analyze user traffic based on IMSI number of mobile station.

Example

The following command creates an access/firewall ruledef to analyze user traffic for the IMSI number *9198838330912*:

bearer 3gpp imsi = *9198838330912*

bearer username

This command configures an access/firewall ruledef to analyze user traffic based on user name of the bearer flow.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] bearer username [case-sensitive] *operator value*

no

Removes previously configured bearer ruledef.

case-sensitive

This keyword makes the rule case sensitive.
By default, ruledefs are not case sensitive.
Default: Disabled

operator

Specifies how to logically match the MSID.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

value

Specifies the user name.
value must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage

Use this command to specify a access/firewall ruledef to analyze user traffic based on user name of the bearer flow.

Example

The following command creates an access/firewall ruledef for analyzing user traffic for the user name *user12*:

bearer username = *user12*

create-log-record

This command enables/disables Firewall ruledef logging.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] create-log-record
```

no

Disables Firewall ruledef logging.

Usage

Use this command to enable/disable Firewall ruledef logging.

Example

The following command enables Firewall ruledef logging:

```
create-log-record
```

The following command disables Firewall ruledef logging:

```
no create-log-record
```

end

This command exits the current configuration mode, and returns to the Executive mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to change to the Executive mode.

exit

This command exits the current configuration mode, and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to returns to the parent configuration mode.

icmp any-match

This command configures an access/firewall ruledef to match any ICMP traffic for the user.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] icmp any-match *operator condition*

no

Removes previously configured ICMP any-match ruledef.

operator

Specifies how to logically match the analyzed state.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to be matched for the user traffic.
condition must be one of the following:

- **FALSE**: Specified condition is FALSE.
- **TRUE**: Specified condition is TRUE.

Usage

Use this command to specify an access/firewall ruledef to match any ICMP traffic of the user.

Example

The following command creates an access/firewall ruledef to match any non-ICMP traffic of the user:

icmp any-match = *FALSE*

icmp code

This command configures an access/firewall ruledef to analyze user traffic based on ICMP code.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] icmp code *operator code*

no

Removes previously configured ICMP code ruledef.

operator

Specifies how to logically match the ICMP code.
operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

code

Specifies the ICMP code.
code must be an integer from 0 through 255.

Usage

Use this command to define an access/firewall ruledef to analyze user traffic based on the ICMP code.

Example

The following command creates an access/firewall ruledef for analyzing user traffic using the ICMP code as *23*:

icmp code = *23*

icmp type

This command configures an access/firewall ruledef to analyze user traffic based on ICMP type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] icmp type *operator type*

no

Removes previously configured ICMP type ruledef.

operator

Specifies how to logically match the ICMP type.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

type

Specifies the ICMP type.
type must be an integer from 0 through 255.
For example, 0 for ECHO Reply, 3 for Dest. Unreachable, and 5 for Redirect.

Usage

Use this command to define an access/firewall ruledef to analyze user traffic based on the ICMP type.

Example

The following command creates an access/firewall ruledef for analyzing user traffic using an ICMP type as *123*:

icmp type = *123*

ip any-match

This command configures an access/firewall ruledef to match any IP traffic for the user.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip any-match *operator condition*

no

Removes previously configured IP any-match ruledef.

operator

Specifies how to logically match the analyzed state.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to be matched for the user traffic.
condition must be one of the following:

- **FALSE**: Specified condition is FALSE.
- **TRUE**: Specified condition is TRUE.

Usage

Use this command to specify an access/firewall ruledef to match any IP traffic of the user.

Example

The following command creates an access/firewall ruledef to match any non-IP traffic of the user:

ip any-match = *FALSE*

ip downlink

This command configures an access/firewall ruledef to analyze user traffic based on IP packet flow in downlink direction (to subscriber).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip downlink *operator condition*

no

Removes previously configured IP ruledef.

operator

Specifies how to logically match the packet flow direction.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **TRUE**: Analyzed
- **FALSE**: Not analyzed

Usage

Use this command to define an access/firewall ruledef to analyze user traffic based on the IP packet flow direction as downlink.

Example

The following command creates firewall ruledef for analyzing user traffic using an IP packet direction to downlink (to subscriber):

ip downlink = *TRUE*

ip dst-address

This command configures an access/firewall ruledef to analyze user traffic based on IP destination address.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip dst-address { *operator* **{** *ip_address* **|** *ip_address/mask* **} | { !range | range } host-pool** *host_pool* **}**

no

Removes previously configured IP destination address ruledef.

operator **{** *ip_address* **|** *ip_address/mask* **}**

operator specifies how to logically match the IP destination address.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

ip_address: Specifies the IP address of destination node for outgoing traffic in IPv4 or IPv6 standard notation. *ip_address* must be the IP address in dotted decimal notation for IPv4, or in colon notation for IPv6.
ip_address/mask: Specifies the IP address of destination node for outgoing traffic in IPv4 or IPv6 standard notation with subnet mask bit. *ip_address/mask* must be the IP address in dotted decimal notation for IPv4, or in colon notation for IPv6 with subnet mask bit. The mask bit is a numeric value which is the number of bits in the subnet mask.

{ !range | range } host-pool *host_pool* **}**

!range | range: Specifies the range criteria:

- **!range**: Not in the range of
- **range**: In the range of

host-pool *host_pool*: Specifies the host pool name. *host_pool* must be a string of 1 through 63 characters in length.

Usage

Use this command to specify an access/firewall ruledef to analyze user traffic based on the IP destination address.

Example

The following command creates IP ruledef for analyzing user traffic using an IP destination address of *1.1.1.1*:

ip dst-address = *1.1.1.1*

ip protocol

This command configures an access/firewall ruledef to analyze user traffic based on the protocol being transported by IP packets.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] ip protocol { { `*`operator`*` { `*`protocol`*` | `*`protocol_assignment`*` } } | { `*`operator protocol_assignment`*` } }`

---

no

Removes previously configured IP protocol address ruledef.

`operator` **{** *`protocol`* **|** *`protocol_assignment`* **}**

`operator`: Specifies how to logically match the IP protocol.
`operator` must be one of the following:

- **!=**: Does not equal
- **=**: Equals

`protocol`: Specifies the protocol by name.
`protocol` must be one of the following:

- ah
- esp
- gre
- icmp
- tcp
- udp

`protocol_assignment`: Specifies the protocol by assignment number. *`protocol_assignment`* must be an integer from 0 through 255 (e.g., 1 for ICMP, 6 for TCP, and 17 for UDP).

`operator protocol_assignment`

`operator`: Specifies how to logically match the IP protocol.
`operator` must be one of the following:

- **<=**: Less than or equals
- **>=**: Greater than or equals

`protocol_assignment`: Specifies the protocol by assignment number.
`protocol_assignment` must be an integer from 0 through 255 (e.g., 1 for ICMP, 6 for TCP, and 17 for UDP).

Usage

Use this command to specify an access/firewall ruledef to analyze user traffic based on the IP protocol.

Example

The following command creates IP ruledef for analyzing user traffic using a protocol assignment of *1*:

```
ip protocol = 1
```

ip src-address

This command configures an access/firewall ruledef to analyze user traffic based on IP source address.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip src-address { *operator* **{** *ip_address* **|** *ip_address/mask* **} | { !range | range } host-pool** *host_pool* **}**

---

no

Removes previously configured IP destination address ruledef.

---

operator **{** *ip_address* **|** *ip_address/mask* **}**

operator: Specifies how to logically match the IP source address.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

ip_address: Specifies the IP address of source node for incoming traffic in IPv4 or IPv6 standard notation. *ip_address* must be the IP address in dotted decimal notation for IPv4, or in colon notation for IPv6.
ip_address/mask: Specifies the IP address of source node for incoming traffic in IPv4 or IPv6 standard notation with subnet mask bit. *ip_address/mask* must be the IP address in dotted decimal notation for IPv4, or in colon notation for IPv6 with subnet mask bit. The mask bit is a numeric value which is the number of bits in the subnet mask.

{ !range | range } host-pool *host_pool*

!range | range: Specifies the range criteria:

- **!range**: Not in the range of
- **range**: In the range of

host-pool *host_pool*: Specifies the host pool name. *host_pool* must be a string of 1 through 63 characters in length.

Usage

Use this command to specify an access/firewall ruledef to analyze user traffic based on the IP source address.

Example

The following command creates IP ruledef for analyzing user traffic using an IP source address of *1.1.1.1*:

```
ip src-address = 1.1.1.1
```

ip uplink

This command configures an access/firewall ruledef to analyze user traffic based on IP packet flow in uplink direction (from subscriber).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip uplink *operator condition*

no

Removes previously configured IP uplink match ruledef.

operator

Specifies how to logically match the IP packet flow direction.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **TRUE**: Not analyzed
- **FALSE**: Analyzed

Usage

Use this command to define an access/firewall ruledef to analyze user traffic based on the IP packet flow direction as uplink.

Example

The following command creates firewall ruledef for analyzing user traffic using an IP packet direction to uplink (from subscriber):

ip uplink = *TRUE*

tcp any-match

This command configures an access/firewall ruledef to match any TCP traffic for the user.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp any-match *operator condition*

no

Removes previously configured TCP any-match ruledef.

operator

Specifies how to logically match the analyzed state.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to be matched for the user traffic.
condition must be one of the following:

- **FALSE**: Specified condition is FALSE.
- **TRUE**: Specified condition is TRUE.

Usage

Use this command to specify an access/firewall ruledef to match any TCP traffic of the user.

Example

The following command creates an access/firewall ruledef to match any non-TCP traffic of the user:

tcp any-match = *FALSE*

tcp dst-port

This command configures an access/firewall ruledef to analyze user traffic based on destination TCP port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp dst-port { *operator port_number* **|** **{ !range | range } {** *start_range* **to** *end_range* **|** **port-map** *port_map* **} }**

---

no

Removes the previously configured destination TCP port ruledef.

---

operator

Specifies how to logically match the port number.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

---

port_number

Specifies the port number to match.
port_number must be an integer from 1 to 65535.

---

range | !range

Specifies the range criteria:

- **!range**: Not in the range
- **range**: In the range

---

start_range **to** *end_range*

Specifies the starting and ending port numbers for the range of destination TCP ports.
start_range must be an integer from 1 through 65535.
end_range must be an integer from 1 through 65535, and must be greater than *start_range*.

---

port-map *port_map*

Specifies name of the port-map for the port range.
port_map must be a string of 1 through 63 characters in length.

Usage

Use this command to specify an access/firewall ruledef to analyze user traffic based on destination TCP port.

Example

The following command creates an access/firewall ruledef for analyzing user traffic matching destination port for TCP as *10*:

```
tcp dst-port = 10
```

tcp either-port

This command configures an access/firewall ruledef to analyze user traffic based on either (destination or source) TCP ports.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp either-port { *operator port_number* **|** **{ !range | range } {** *start_range* **to** *end_range* **|** **port-map** *port_map* **} }**

---

no

Removes previously configured TCP either-port (destination or source) ruledef.

---

operator

Specifies how to logically match the port number.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

---

port_number

Specifies the port number to match.
port_number must be an integer from 1 through 65535.

---

range | !range

Specifies the range criteria:

- **!range**: Not in the range
- **range**: In the range

---

start_range **to** *end_range*

Specifies the starting and ending port numbers for the port range.
start_range must be an integer from 1 through 65535.
end_range must be an integer from 1 through 65535, and must be greater than *start_range*.

---

port-map *port_map*

Specifies name of the port-map for the port range.
port_map must be a string of 1 through 63 characters in length.

Usage

Use this command to specify an access/firewall ruledef to analyze user traffic based on either TCP port.

Example

The following command creates an access/firewall ruledef for analyzing user traffic matching destination or source port for TCP as *10*:

```
tcp either-port = 10
```

tcp src-port

This command configures an access/firewall ruledef to analyze user traffic based on source TCP port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tcp src-port { *operator port_number* **|** **{ !range | range } {** *start_range* **to** *end_range* **|** **port-map** *port_map* **} }**

no

Removes previously configured source TCP port ruledef.

operator

Specifies how to logically match the port number.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

port_number

Specifies the port number to match.
port_number must be an integer from 1 to 65535.

range | !range

Specifies the range criteria:

- **!range**: Not in the range
- **range**: In the range

start_range **to** *end_range*

Specifies the starting and ending port numbers for the port range.
start_range must be an integer from 1 through 65535.
end_range must be an integer from 1 through 65535, and must be greater than *start_range*.

port-map *port_map*

Specifies name of the port-map for the port range.
port_map must be a string of 1 through 63 characters in length.

Usage

Use this command to specify an access/firewall ruledef to analyze user traffic based on source TCP port.

Example

The following command creates an access/firewall ruledef for analyzing user traffic matching source port for TCP as *10*:

```
tcp src-port = 10
```

udp any-match

This command configures an access/firewall ruledef to match any UDP traffic for the user.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] udp any-match *operator condition*

no

Removes previously configured UDP any-match ruledef.

operator

Specifies how to logically match the analyzed state.
operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition to be matched for the user traffic.
condition must be one of the following:

- **FALSE**: Specified condition is FALSE.
- **TRUE**: Specified condition is TRUE.

Usage

Use this command to specify an access/firewall ruledef to match any UDP traffic of the user.

Example

The following command creates an access/firewall ruledef to match any UDP traffic of the user:

udp any-match = *TRUE*

udp dst-port

This command configures an access/firewall ruledef to analyze user traffic based on destination UDP port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] udp dst-port { *operator port_number* **|** **{ !range | range } {** *start_range* **to** *end_range* **|** **port-map** *port_map* **} }**

no

Removes previously configured destination UDP ports ruledef.

operator

Specifies how to logically match the port number.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

port_number

Specifies the port number to match.
port_number must be an integer from 1 through 65535.

!range | range

Specifies the range criteria.

- **!range**: Not in the range
- **range**: In the range

start_range **to** *end_range*

Specifies the starting and ending port numbers for the port range.
start_range must be an integer from 1 through 65535.
end_range must be an integer from 1 through 65535, and must be greater than *start_range*.

port-map *port_map*

Specifies name of the port-map for the port range.
port_map must be a string of 1 through 63 characters in length.

Usage

Use this command to specify an access/firewall ruledef to analyze user traffic based on destination UDP port.

Example

The following command creates an access/firewall ruledef for analyzing user traffic matching destination port for UDP as *10*:

```
udp dst-port = 10
```

udp either-port

This command configures an access/firewall ruledef to analyze user traffic based on either (destination or source) UDP port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] udp either-port { *operator port_number* **|** **{ !range | range } {** *start_range* **to** *end_range* **|** **port-map** *port_map* **} }**

---

no

Removes previously configured either-port (destination or source) UDP ruledef.

---

operator

Specifies how to logically match the port number.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

---

port_number

Specifies the port number to match.
port_number must be an integer from 1 through 65535.

!range | range

Specifies the range criteria.

- **!range**: Not in the range
- **range**: In the range

---

start_range **to** *end_range*

Specifies the starting and ending port numbers for the port range.
start_range must be an integer from 1 through 65535.
end_range must be an integer from 1 through 65535, and must be greater than *start_range*.

---

port-map *port_map*

Specifies name of the port-map for the port range.
port_map must be a string of 1 through 63 characters in length.

Usage

Use this command to specify an access/firewall ruledef to analyze user traffic based on either UDP port.

Example

The following command creates an access/firewall ruledef for analyzing user traffic matching destination or source port for UDP as *10*:

```
udp either-port = 10
```

udp src-port

This command configures an access/firewall ruledef to analyze user traffic based on source UDP port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] udp src-port { *operator port_number* **| { !range | range } {** *start_range* **to** *end_range* **| port-map** *port_map* **} }**

no

Removes previously configured source UDP port ruledef.

operator

Specifies how to logically match the port number.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

port_number

Specifies the port number to match.
port_number must be an integer from 1 through 65535.

!range | range

Specifies the range criteria.

- **!range**: Not in the range
- **range**: In the range

start_range **to** *end_range*

Specifies the starting and ending port numbers for the port range.
start_range must be an integer from 1 through 65535.
end_range must be an integer from 1 through 65535, and must be greater than *start_range*.

port-map *port_map*

Specifies name of the port-map for the port range.
port_map must be a string of 1 through 63 characters in length.

Usage

Use this command to specify an access/firewall ruledef to analyze user traffic based on source UDP port.

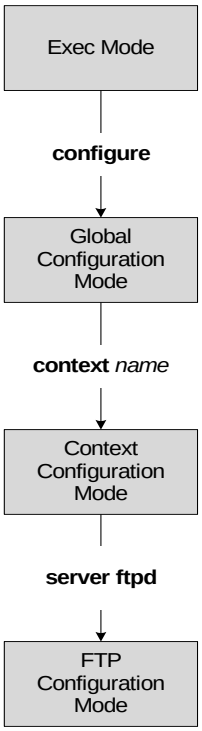
Example

The following command creates an access/firewall ruledef for analyzing user traffic matching source port for UDP as *10*:

```
udp src-port = 10
```

Chapter 99
FTP Configuration Mode Commands

The FTP Configuration Mode is used to manage the FTP server options for the current context.



end

Exits the FTP server configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the FTP server configuration mode and returns to the context configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the context configuration mode.

max servers

Configures the maximum number of FTP servers that can be started within any 60 second interval. If this limit is reached, the system waits two minutes before trying to start any more servers.

Product

All

Privilege

Security Administrator, Administrator

Syntax

max servers *count*

count

Default: 40
Specifies the maximum number of servers that can be spawned in any 60 second interval. count must be a value in the range from 1 to 100.

Usage

Set the number of servers to tune the system response as a heavily loaded system may need more servers to support the incoming requests.
The converse would be true as well in that a system can benefit by reducing the number of servers such that FTP services do not cause excessive system impact to other services.

Example

max servers *50*

timeout

Configures the client idle timeout before an FTP session is automatically closed.

Product

All

Privilege

Security Administrator, Administrator

Syntax

timeout *seconds*

seconds

Default: 900
Specifies the number of seconds of inactivity before an FTP session is automatically closed. *seconds* must be in the range from 10 through 86400.

Usage

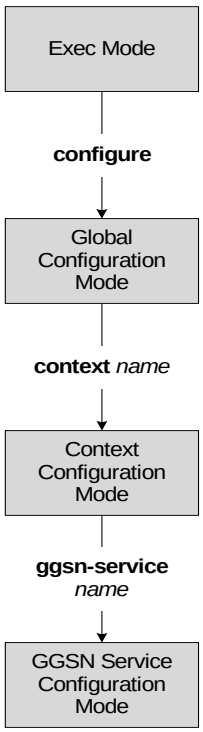
Adjust the session timeout to fine tune the system. FTP session resources can be released sooner to support additional requests by adjusting the timeout to a smaller value.

Example

timeout *300*

Chapter 100
GGSN Service Configuration Mode Commands

The Gateway GPRS Support Node (GGSN) Configuration Mode is used to create and manage GGSN services within for the current context.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

accounting

Configures the name of the context configured on the system that processes accounting for PDP contexts handled by this GGSN service.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

accounting context *context_name*

no accounting context

no

Removes a previously configured accounting context.

context_name

Specifies the name of the context to be used for accounting. The name must be between 1 and 79 alpha and/or numeric characters and is case sensitive.

Usage

By default, the system attempts to use the same context as the one in which the GGSN service is configured for accounting purposes. This command can be used to either change the system's default behavior, or allow GPRS Tunneling Protocol Prime (GTPP) accounting to a charging gateway (CG).
By default when GTPP accounting is used, accounting records will be sent to the accounting servers configured in whichever context the GGSN service is configured. This command may be used to override that default.

Example

The following command configures the GGSN service's accounting context to be plmn1:

accounting context *plmn1*

associate gtpu-service

This command associates a previously configured GTP-U service to bind the GGSN service with a peer. A GTP-U service must be configured in Context Configuration mode before using this configuration.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

associate gtpu-service *svc_name*

no associate gtpu-service

no

Removes the associated GTP-U service from this GGSN service configuration.

svc_name

Identifies the name of the GTP-U service preconfigured in Context configuration mode to associate with a GGSN service.
The *svc_name* must be an alphanumerical string from 1 through 63 characters.

Usage

Use this command to configure GTP-U data plan between GGSN service and peer node. The serivce defined for GTP-U can be configured in Context configuration mode.

Example

Following command associates GTP-U service named *gtpu-hnb1* with specific GGSN service.

associate gtpu-service *gtpu-hnb1*

bind

Binds the GGSN service to a logical IP interface serving as the Gn interface. Specifies the maximum number of subscribers that can access this service over the interface.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

bind address *address* **[max-total-pdp-contexts** *max_total* **| max-ppp-pdp-contexts** *max_ppp*]

no bind address*address*

no

Removes a previously configured binding for the GGSN service.

address

Specifies the IP address (address) of the interface configured as the Gn interface. address is specified in dotted decimal notation.

max-total-pdp-contexts *max_total*

Default: 1,500,000
Specifies the maximum number of PDP contexts (both IP and PPP) that can access this service on this interface.
count can be configured to any integer value between 0 and 1,500,000 on ST16.
count can be configured to any integer value between 4,000,000 on ASR 5000.

Important: The maximum number of subscriber contexts supported is dependant on the session capacity license installed and the number of active PACs/PSCs installed in the system. A fully loaded ST16 system with 13 active PACs can support 1,500,000 and an ASR 5000 with 13 active PSCs can support 4,000,000 total IP and PPP PDP contexts. Note that each PPP PDP context is treated as two IP PDP contexts. Refer to the **license key** command for additional information.

max-ppp-pdp-contexts *max_ppp*

Default: 750,000
Specifies the maximum number of PPP PDP contexts that can access this service on this interface.
count can be configured to any integer value between 0 and 1,500,000 on ST16.
count can be configured to any integer value between 0 and 2,500,000 on ASR 5000.

Important: The maximum number of subscriber contexts supported is dependant on the session capacity license installed and the number of active PACs installed in the system. A fully loaded ST16 system with 13 active PACs can support 1,500,000 PPP PDP contexts. Refer to the **license key** command for additional information.

Important: The maximum number of subscriber contexts supported is dependant on the session capacity license installed and the number of active processing cards installed in the system. A fully loaded ASR 5000 with 13 active processing cards can support 2,500,000 total PPP PDP contexts. Refer to the **license key** command for additional information.

Usage

Used to associate or tie the GGSN service to a specific logical IP address. The logical IP address or interface takes on the characteristics of a Gn interface. Only one interface can be bound to a service. The interface should be configured prior to issuing this command.

This command also sets a "soft" limit as to the number of simultaneous subscriber contexts that can be facilitated by the service/interface at any given time. Soft limits are based on measurements gathered at regular short intervals (several times per minute) as opposed to measurements taken in real-time. Therefore the sampled measurement may not match the actual number of PDP contexts currently being processed. Every PDP context request received is compared against the result of the last sample. If the sample is less than the soft limit configured, the request will be processed. If it is more, the request will be rejected.

When configuring the **`max-total-pdp-contexts`** or **`max-ppp-pdp-contexts`** options, be sure to consider the following:

- Each PPP PDP context is treated as two IP PDP contexts due to the additional CPU and memory resources required
- The total number of interfaces that you configure for use as Gn interfaces
- The maximum number of subscriber PDP contexts that all of the interfaces may handle during peak busy hours
- The average bandwidth for each of the PDP contexts
- The type of physical port (10/100Base-T or 1000Base-Tx) to which these interfaces are bound

Taking these factors into account and distributing your subscriber contexts across all available interfaces allows you to configure your interfaces to optimally handle PDP contexts without degraded performance.

Example

The following command would bind the logical IP interface with the address of 192.168.3.1 to the GGSN service and specifies that a maximum of 600 simultaneous subscriber sessions can be facilitated by the interface/service at any given time:

```
bind address 192.168.3.1 max-subscribers 600
```

The following command disables a binding that was previously configured:

```
no bind address
```

cc behavior

Configures the 3GPP behavior bits associated with the GGSN's charging characteristics (CC).

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

cc behavior no-records *nr_value* **}**

no-records *nr_value*

Default: 0 (disabled)
Specifies the behavior bit upon which the GGSN ceases sending accounting records to a server.
nr_value can be configured to any integer value between 1 and 12 corresponding to the 12 behavior bits B1 through B12.

Usage

3GPP standards after 3GPP R98 included 12 behavior bits as part of GGSN charging characteristics. Like the charging characteristics profile index, the behavior bits are sent by the SGSN to the GGSN in the Create PDP Context request message.
This command configures the behavior bits for each of the conditions described.

Example

The following command configures a behavior bit of 10 for no-records:

cc behavior no-records *10*

cc profile

Configures the charging characteristic (CC) profile index properties.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

cc profile *index* **[buckets** *number* **| interval** *time* **[downlink** *down_octets* **uplink** *up_octets* **| total** *total_octets* **] | prepaid {prohibited | use-rulebase-configuration } | server address context | sgsns** *num_changes* **| tariff time1** *mins hours* **[time2** *mins hours* **[time3** *mins hours* **[time4** *mins hours* **[time5** *mins hours* **[time6** *mins hours* **]]]] | volume {downlink** *vol_down_octets* uplink *vol_up_octets* **| total** *total_octets***}]**

no cc profile *index* **{buckets | interval | prepaid | server address | sgsns | tariff | volume }**

default cc profile *index* **[buckets | interval | prepaid | server address | sgsns | tariff | volume]**

no

Removes a previously configured profile index.

default

Returns the specified cc profile to the original default system settings.

index

Configures a profile index for the parameter to be specified. index can be configured to any integer value from 0 to 15.

Important: 3GPP standards suggest that profile index values of 1, 2, 4, and 8 be used for hot billing, flat rate billing, prepaid billing and normal billing, respectively. A single charging characteristics profile can contain multiple behavior settings.

buckets *number*

Default: 4
Specifies the number of statistics container changes due to QoS changes or tariff time that can occur before an accounting record should be closed.
number can be configured to any integer value from 1 through 4.

interval *time* **[downlink** *down_octets* **uplink** *up_octets* **| total** *total_octets* **]**

Specifies the normal time duration that must elapse before closing an accounting record provided that any or all of the following conditions occur:

- Downlink traffic volume is reached within the time interval
- Uplink traffic volume is reached within the time interval
- Total traffic volume (up and downlink) is reached within the time interval

time is measured in seconds and can be configured to any integer value from 60 to 40,000,000.
down_octets is the downlink traffic volume measured in octets and can be configured to any integer value from 0 to 1,000,000.
up_octets is the uplink traffic volume measured in octets and can be configured to any integer value from 0 to 1,000,000.
total_octets is the total traffic volume measured in octets and can be configured to any integer value from 0 to 1,000,000.

prepaid {prohibited | use-rulebase-configuration }

This command enables or disables prepaid for the specified profile index.
Default: N/A
prohibited: Disable prepaid for the specified profile index.
use-rulebase-configuration: Use the prepaid configuration in the rulebase.

sgsns *num_changes*

Default: 4
Specifies the number of SGSN changes (i.e., inter-SGSN switchovers) resulting in a new RAI (Routing Area Identity) that can occur before closing an accounting record.
num_changes can be configured to any integer value from 1 to 15.

tariff time1 *mins hours* **time2** *mins hours* **time3** *mins hours* **time4** *mins hours* **time5** *mins hours* **time6** *mins hours*

Specifies time-of-day time values to close the current statistics container (but not necessarily the accounting record). Six different tariff times may be specified. If less than six times are required, the same time can be specified multiple times.

Important: The system assumes that the billing system uses the day/date to determine if the statistics container represents an actual tariff period.

For each of the different tariff times, the following parameters must be configured:

- *mins*: The minutes of the hour, an integer value from 0 to 59.
- *hours*: The hour of the day, an integer value from 0 to 23.

volume {downlink *vol_down_octets* **uplink** *vol_up_octets* **| total** *total_octets* **}**

Specifies the downlink, uplink, and total volumes that must be met before closing an accounting record.
vol_down_octets is measured in octets and can be configured to any integer value from 100,000 to 4,000,000,000.
vol_up_octets is measured in octets and can be configured to any integer value from 100,000 to 4,000,000,000.

total_octets is the total traffic volume (up and downlink) measured in octets and can be configured to any integer value from 100,000 to 4,000,000,000.

Usage

Charging characteristics consist of a profile index and behavior settings. This command configures profile indexes for the GGSN's charging characteristics. The GGSN supports up to 16 profile indexes.
This command works in conjunction with the cc-sgsn command located in the APN configuration mode that dictates which CCs should be used for subscriber PDP contexts.

Example

The following command configures a profile index of 10 for tariff times of 7:00 AM and 7:30 PM:

```
cc profile 10 tariff time1 0 7 time2 30 19 time3 0 7 time4 30 19
```

default

Sets/restores the default value assigned for the specified parameter.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
default {cc {behavior | profile index } | echo-interval | gtpu echo-interval |
gtpu reorder {context | sequence-numbers | timeout } | guard-interval | ip
{local-port gtpc-v1 | qos-dscp } | max-retransmissions | plmn {unlisted-sgsn } |
setup-timeout | timeout }
```

`cc {behavior | profile index }`

Restores the GGSN's charging characteristics parameters to the following default settings:

- **behavior**: Restores all behavior parameters to their default values of 0 (disabled).
- **profile:** For the specified index, the following defaults are applied:
  - buckets: 4
  - interval: Disabled
  - volume: Disabled
  - sgsns: 4
  - tariff-time: Disabled

`echo-interval`

Restores the GTP echo-interval parameter to its default setting of 60.

`gtpu echo-interval`

Restores the GTPU echo-interval parameter to its default setting of 60.

`gtpu reorder {context | sequence-numbers | timeout }`

Restores the gtpu reordering parameters to the following default settings:

- gtpu reorder context: Disabled
- gtpu reorder sequence-numbers: Disabled
- gtpu reorder timeout: 100 milliseconds

`gtpu udp-checksum insert`

Restores the GGSN gtpu udp-checksum parameter to its default setting of enabled.

`guard-interval`

Restores the GGSN guard-interval parameter to its default setting of 100.

ip {local-port gtpc-v1 | qos-dscp }

Restores the GGSN ip parameters to the following default setting:

- **local-port gtpc-v1**: 2123
- **qos-dscp**: conversational ef streaming af11 interactive af21 background be

max-retransmissions

Restores the GGSN max-retransmissions parameter to its default setting of 4.

plmn {unlisted-sgsn }

Restores the GGSN plmn unlisted-ggsn parameter to its default setting of reject.

setup-timeout

Restores the GGSN setup-timeout parameter to its default setting of 60.

timeout

Restores the GGSN timeout parameter to its default setting of 5.

Usage

After the system has been modified from its default values, this command is used to set/restore specific parameters to their default values.

Example

The following command restores the GGSN service's guard interval parameter to its default setting:

```
default guard-interval
```

dns-client

This command defines the context name where a DNS client is configured. This comamnd will associates an existing DNS client configuration with GGSN to perform DNS query for P-CSCF, if P-CSCF query request in AAA message is received from Diameter node.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
dns-client context dns_ctxt_name

[no] dns-client context
```

no

Removes the association of DNS context which was configured to perform DSN query in this GGSN service.

dns_ctxt_name

Specifies the name of the context in which a DNS client configuration is present. Typically this should be the same where this GGSN servie is configured.
dns_ctxt_name is a context name and must be alpha and/or numeric string of 1 through 79 characters.

Usage

Use this command to associate a DNS client configuration to perform DNS query used for the resolution of P-CSCF query received in AAA message from Diameter peer, on the basis of DNS client parameters configured in a context.
A DNS client configuration must be present in the same context as GGSN service before enabling this command to perform DNS query for P-CSCF.

Important: This command is a license-enabled feature.

Example

The following command associates a DNS client configuration to perform DNS query for P-CSCF with this GGSN service which is configured in same context as GGSN service:

```
default dns-client context
```

echo-interval

Configures the rate at which GPRS Tunneling Protocol (GTP) v1-C Echo packets are sent from the GGSN service to the SGSN.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

echo-interval *time_interval*

no echo-interval

no

Disables the sending of GTPv1-C Echo packets.

time_interval

Default: 60
Specifies the frequency at which the GGSN service sends GTPv1-C Echo packets to the SGSN(s) it is configured to communicate with.
time_interval is measured in seconds and can be configured to any integer value between 60 and 3600.

Usage

Use this command to adjust the rate at which the GGSN sends these packets. GTPv1-C Echo packets are used to detect whether SGSNs that the GGSN service is communicating with, has become unresponsive or has rebooted.
The system initiates this protocol for each of the following scenarios:

- Upon system boot
- Upon the configuration of a new SGSN on the system using the **sgsn address** command as described in this chapter
- Upon the execution of the path failure detection policy as described in **path-failure** command of this chapter

The echo-interval command is used in conjunction with the **max-retransmissions** and **retransmission-timeout** commands as described in this chapter.
In addition to receiving an echo response for this echo protocol, if GGSN receives a Node Alive Request message or a Echo Request message from a presumed dead SGSN, it will immediately assume the SGSN is active again.
If the GGSN discovers that an SGSN has become unresponsive, it will terminate all PDP contexts that had been established with the SGSN.

Example

The following command configures the GGSN service to send GTP Echo packets every 120 seconds:

echo-interval *120*

end

Exits the GGSN service configuration mode and returns to the Administrator-Exec mode prompt.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Administrator-Exec mode.

exit

Exits the GGSN service configuration mode and returns to the context configuration mode.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Returns to the context configuration mode.

gtpc nsapi-in-create-pdp-response

This command configures the exclusion/inclusion of optional information element (IE) Network Service Access Point Identifier (NSAPI) in “Create PDP Context Response” messages in GTP-C.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[default | no] gtpc nsapi-in-create-pdp-response
```

default

Sets the default mode for GTP-C messages; i.e. to not to include NSAPI IE in “Create PDP Context Response” messages.

no

Removes the preconfigured mode for GTP-C messages; in other words sets the mode for GTP-C message to not to include NSAPI IE in “Create PDP Context Response” messages. By default it is disabled.

Usage

Use this command to configure the mode for the GTP-C messages to exclude or include the NSAPI IE in “Create PDP Context Response” message received from SGSN.

Example

The following command configures the GGSN service to include the optional IE of NSAPI in “Create PDP Context Response” message:

```
gtpc nsapi-in-create-pdp-response
```

gtpc private-extension

This command configures the customer specific private extension in GTP-C messages.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpc private-extension {{{focs | odb} access-list acl_name in disconnect-on-
violation }| ggsn-preservation-mode | insk | loss-of-radio-coverage | none}

default gtpc private-extension

no gtpc private-extension [focs | insk | preservation-mode | loss-of-radio-
coverage]
```

default

Sets the default mode for GTP-C messages. By default it is disabled.

no

Disables the configured private extensions for GTP-C messages.

{focs | odb} access-list *acl_name* **in disconnect-on-violation**

These keywords configures the Free-Of-Charge-Service and Operator Determined Barring fo all packet oriented services as defined by operators.
focs: This keyword enables/disables Free of Charging Services for the subscriber who has no credit, and also takes the access-list *acl_name* to be applied for FOCS.
odb: This keyword enables/disables "all packet oriented service barred" for the subscriber, and also takes the access-list *acl_name* to be applied for ODB.
acl_name is the name of configured access control list for this service.

Important: These are the customer-specific keywords and need customer-specific license to use them.

insk

This keyword is for the Intelligent-Network-Service-Key defined by vendors. This private extension can be present in Create PDP Context request messages.
A radius dictionary can be configured to send that value in accounting messages.

Important: This is a customer specific-keyword and needs customer-specific license to use this feature.

ggsn-preservation-mode

This keyword is the customer specific option and used to indicate the presence of such a private extension in Update PDP Context requests. It indicates whether the subscriber is active or has become idle, and RAN resources might have been released. It also indicates the "type" of desired preservation mode behavior. System support two different types of behavior. When **ggsn-preservation-mode** is configured, different generation of accounting records occur based on the "type" of mode. To enable the different generation of accounting records, the trigger for preservation mode must be configured for RADIUS or GTPP command for that accounting protocol. If that trigger is not configured, there will be no change in the generation of accounting records.

Important: This is a customer-specific keyword and needs customer-specific license to use this feature.

loss-of-radio-coverage

These keywords enables the protection for overcharging to a subscriber due to loss of radio coverage (LORC) in a GGSN service. It also enables the system to understand the private extension in GTP-C message for LORC in Update PDP Context message from SGSN.

Important: This is a license enabled keyword and need feature-specific license to use it.

none

Removes the private extensions from record which are from GTP-C messages received from the SGSN.

Usage

Use this command to configure the private extensions to record from the GTP-C messages received from SGSN. It also configures the customer specific features; i.e. preservation mode for GGSN service.
Overcharging protection for LORC is a solution which provides the ability to configure mobile carriers to maximize their network solutions and balancing the requirements to accurately bill their customer.
Consider scenario where a mobile is streaming or downloading very large files from external sources and the mobile goes out of radio coverage. If this download is happening on Background/Interactive traffic class then the GGSN is unaware of such loss of connectivity as SGSN does not perform the Update PDP Context procedure to set QoS to 0kbps (this is done when traffic class is either Streaming or Conversational only). The GGSN continues to forward the downlink packets to SGSN. In the loss of radio coverage, the SGSN will do paging request and find out that the mobile is not responding; SGSN will then drops the packets. In such cases, the G-CDR will have increased counts but S-CDR will not. This means that when operators charge the subscribers based on G-CDR the subscribers may be overcharged. This feature is implemented to avoid the overcharging in such cases.
This implementation is based on Cisco-specific private extension to GTP messages and/or any co-relation of G-CDRs and S-CDRs. It also does not modify any RANAP messages.

Important: This is a license enabled command and needs feature-specific license/s to use this command.

Important: Some of the keywords a customer-specific feature and need customer-specific license/s to use them.

Example

The following command configures the GGSN service to record the private extension for intelligent network service key as defined by operator:

```
gtpc private-extension insk
```

gtpc ran-procedure-ready-delay

This command configures the GGSN to enable the RAN Procedure Ready feature for the particular GGSN service and specify the timeout period for RAN procedure timer in GGSN which is started on arrival of every secondary Create PDP Context request.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gtpc ran-procedure-ready-delay [timeout *dur*]

[default | no] gtpc ran-procedure-ready-delay

default

Sets the default mode of RAN Procedure Ready feature for the particular GGSN service. By default it is disabled.

no

This keyword is used to disable RAN Procedure Ready feature for the particular GGSN service. By default it is disabled.

timeout *dur*

Default: 10
Specifies the timeout duration in seconds for RAN procedure timer in GGSN which is started on arrival of every secondary "Create PDP Context Request" message.
This is an optional keyword. If no timeout period is specified then default value of 10 seconds will be assigned to timeout period.
dur must be an integer between 1 through 40.

Usage

Use this command to enable the RAN Procedure Ready feature for the particular GGSN service and to specify the timeout period for RAN procedure timer in GGSN which is started on arrival of every secondary "Create PDP Context Request" message.
Once a "Create PDP Context Request" is received by GGSN from SGSN, a timer will be started at GGSN and GGSN will wait till the Radio Access Bearer setup is completed and "Update PDP Context Request" is sent by SGSN. If any downlink data is received before arrival of "Update PDP Context Request" or before timer expire, that downlink packets will be queued or buffered. Currently buffer limit of sub-system is 1024 packets.
To support this feature each sub-session uses a common flag 'ran procedure ready state', whenever a "Create PDP Context Request" is received for secondary PDP context and sub-session is allocated, this flag will be set to TRUE by default. This common flag is checked while sending downlink traffic, if this flag is FALSE then GGSN permit flow of downlink data but, if it is TRUE, GGSN will queue the downlink packets.
In case if the buffer becomes full (total buffer limit is of 1024 packets) then, all the newly coming packets will be dropped.

If “Update PDP Context Request” is received by GGSN with RAN Procedure flag set or if timer expires the ‘ran-procedure ready state’ flag in sub-session will be reset and hence GGSN will start sending queued packets in ‘first-in first-out’ manner and buffering will be disabled for further downlink traffic.
This feature supports following scenarios when RAB setup timer starts at the GGSN:

- If GGSN receives the “Update PDP Context Request” before timer expires, with RAN Procedure Ready bit TRUE (1), then GGSN will stop the timer, send all the queued/buffered packets in ‘first-in first-out’ manner and change the ‘ran procedure ready state’ to FALSE and disables buffering of further downlink data.
- If GGSN receives the “Update PDP Context Request” before timer expires, with RAN Procedure Ready bit FALSE (0), then GGSN will process the “Update PDP Context Request” as usual, but will not disable the buffering of downlink data and wait for other “Update PDP Context Request” to come with RAN procedure ready flag set or wait for timer to expire.
- If GGSN do not receive the “Update PDP Context Request” with RAN Procedure Ready bit TRUE (1) before timer expire, the timer will be fired and GGSN starts sending all the queued packet and will change the ‘ran procedure ready state’ to FALSE and disables buffering of further downlink data (assuming that the corresponding SGSN does not support this feature).
- If timer has expired and GGSN received an “Update PDP Context Request” for secondary PDP context with or without RAN Procedure Ready bit set , the UPC will be processed as usual without making any changes for buffering the packets.

Important: This feature make no effect on Enhanced Charging Service or DPI as the buffering of downlink data is done before sending it to ACSMgr.

Important: During SGSN handoff scenario all packets will be processed in a normal way and the downlink packets buffered till the timer expires.

Example
The following command configures the GGSN service to enable the RAN Procedure Ready feature and specify the timeout period as 20 seconds for RAN procedure timer in GGSN:

```
gtpc ran-procedure-ready-delay timeout 20
```

gtpu echo-interval

Configures the rate at which GPRS Tunneling Protocol (GTP) v1-U Echo packets are sent from the GGSN service to the SGSN.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gtpu echo-interval *time_interval*

no gtpu echo-interval

no

Disables the sending of GTPv1-U Echo packets.

time_interval

Default: 60
Specifies the frequency at which the GGSN service sends GTPv1-C Echo packets to the SGSN(s) it is configured to communicate with.
time_interval is measured in seconds and can be configured to any integer value between 60 and 3600.

Usage

GTPv1-C Echo packets are used to detect whether SGSNs that the GGSN service is communicating with, has become unresponsive or has rebooted. Use this command to adjust the rate at which the GGSN sends these packets.
If the GGSN discovers that an SGSN has become unresponsive, it will terminate all PDP contexts that had been established with the SGSN.

Example

The following command configures the GGSN service to send GTPv1-U Echo packets every 120 seconds:

gtpu echo-interval *120*

gtpu reorder

Configures packet data reordering for the GGSN service.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpu reorder {context {ppp } | sequence-numbers {ipv4 | ppp | ipv4-ppp | ppp-ipv4 } | timeout time }

no gtpu reorder {context | sequence-numbers {ipv4 | ppp | ipv4-ppp | ppp-ipv4 } }
```

no

Disables the re-ordering of GTPU packets.

context {ppp }

Default: Disabled
Enables the GGSN service to re-order PPP data packets based on the sequence numbers inserted by the SGSN.

sequence-numbers {ipv4 | ppp | ipv4-ppp | ppp-ipv4 }

Default: Disabled
Enables the GGSN service to insert sequence numbers into the data packets that it sends to the SGSN. The insertion of sequence numbers can be controlled for specific PDP context types. The following PDP context types can be specified:

- **ipv4** : Enables re-ordering for IP PDP context types
- **ppp** : Enables re-ordering for PPP PDP context types
- **ipv4-ppp** : Enables re-ordering for both IP and PDP context types
- **ppp-ipv4**: The same as ipv4-ppp, enables re-ordering for both IP and PDP context types

Important: If packet re-ordering is enabled using the **gtpu reorder context** command, sequence numbers are automatically be added regardless of this command.

timeout *time*

Default: 100 milliseconds
If re-ordering is enabled, this option specifies the amount of time that the GGSN should wait prior to sending re-sequenced data packets stored in queue.
time is measured in milliseconds and can be configured to any integer value between 0 and 5000. A timeout of "0" indicates that only packets arriving in sequence are processed and the accepted sequence number is updated for each in-sequence packet. Packets are not queued. Packets arriving with seq number less than the accepted sequence number are discarded.

Usage

Use this command to control data packet re-ordering between the GGSN and SGSN.
If re-ordering is enabled for the GGSN service, the GGSN informs the SGSN to also reorder the data packets from the GGSN. The GGSN informs the SGSN in the create PDP context response. The GGSN and SGSN optionally insert sequence numbers into the data packets that they send.

Example

The following command specifies that the GGSN service re-sequences data packets received from the SGSN for PPP PDP context types:

```
gtpu reorder context ppp
```

The following command specifies that the GGSN service inserts sequence numbers for both IP and PPP PDP context types into data packets it is sending to the SGSN for PPP PDP context types:

```
gtpu reorder sequence-numbers ppp-ipv4
```

gtpu udp-checksum insert

This command enables/disables the insertion of UDP checksum in outgoing UDP data packets. By default checksum insertion is enabled.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[no | default] gtpu udp-checksum insert
```

no

Disables insertion of UDP checksum in outgoing UDP data packets.

default

Enables the insertion of UDP checksum in outgoing UDP data packets.

Usage

Use this command to enable or disable the system to insert UDP checksum in outgoing UDP data packets.

Example

The following command specifies that the GGSN service will insert the UDP checksum into outgoing UDP data packets:

```
gtpu udp-checksum insert
```

guard-interval

Configures the time period after which a redundant PDP context request received from an SGSN is treated as a new request rather than a re-send of a previous request.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

guard-interval *guard_time*

no guard-interval

no

Disables the guard-interval function for the GGSN service.

guard_time

Default: 100
Specifies the amount of time that must pass before a GGSN service treats a redundant PDP context request as a new request instead of a re-send of a previous request.
guard_time is measured in seconds and can be configured to any integer value between 10 and 3600.

Usage

The guard interval is used to protect against replay attacks. Without a guard interval configured, information from a valid PDP context request could be used to gain un-authorized network access.
If the GGSN service receives a PDP context request in which the International Mobile Subscriber Identity (IMSI), the Network Service Access Point Identifier (NSAPI), the end user IP address, and the GTP sequence number are identical to those received in a previous request, the GGSN treats the new request as a re-send of the original. Therefore, information from a valid PDP context request could be collected and re-sent at a later time by an un-authorized user to gain network access.
Configuring a guard interval limits the amount of time that the information contained within a PDP context request remains valid.

Example

The following command configures the GGSN service with a guard interval of 60 seconds:

```
guard-interval 60
```

ip local-port

Configures the local User Datagram Protocol (UDP) port for the Gn interfaces' GTPC socket for GTPv1.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
ip local-port gtpc-v1 port#
```

gtpc-v1 *port#*

Default: 2123
Specifies the UDP port number for GTPv1 GTPC sockets.
port# can be configured to any integer value between 1 and 65535.

Usage

By default, the GGSN service attempts to use GTPv1 when communicating with SGSNs. This parameter configures the UDP port over which the GTP control (GTPC) sockets are sent.
If an SGSN only supports GTPv0, the GGSN service automatically switches to GTPv0 when communicating with this SGSN. In the scenario, the GGSN service communicates with the SGSN on UDP port 3386 and does not have a GTPC socket.

Important: The UDP port setting on the SGSN must match the local-port setting for the GGSN service on the system in order for the two devices to communicate.

Example

The following command configures the GGSN service to use UDP port 2500 for exchanging GTPC sockets with SGSNs when using GTPv1:

```
ip local port 2500
```

ip qos-dscp

Configures the quality of service (QOS) differentiated service code point (DSCP) used when sending data packets over the Gn interface.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

ip qos-dscp {{allocation-retention-priority | background | conversational | interactive *traffic_priority* **| streaming } {** *dscp***}}+**

no ip qos-dscp [allocation-retention-priority | background | conversational | interactive *traffic_priority* | streaming] +

allocation-retention-priority

Specifies the DSCP for interactive class if the allocation priority is present in the QOS profile.
allocation-retention-priority can be the integers 1, 2, or 3.
DSCP values use the following matrix to map based on traffic handling priority and Alloc/Retention priority if the allocation priority is present in the QOS profile.
The following table shows the DSCP value matrix for *allocation-retention-priority*.

Table 20. Default DSCP Value Matrix

Allocation Priority	1	2	3
Traffic Handling Priority			
1	ef	ef	ef
2	af21	af21	af21
3	af21	af21	af21

background

Specifies the QOS for traffic patterns in which the data transfer is not time-critical (for example email exchange). This traffic pattern requires the lowest QOS.

conversational

Specifies the QOS for traffic patterns in which there is an constant flow of packets in each direction, upstream and downstream. This traffic pattern requires the highest QOS.

interactive

Specifies the QOS for traffic patterns in which there is an intermittent flow of packets in each direction, upstream and downstream. This traffic pattern requires a higher QOS than the background pattern, but not as high as that for the streaming pattern.
traffic_priority is the 3GPP traffic handling priority and can be the integers 1,2 or 3.

streaming

Specifies the QOS for traffic patterns in which there is a constant flow of data in one direction, either upstream or downstream. This traffic pattern requires a higher QOS than the interactive pattern, but not as high as that for the conversational pattern.

dscp

Default:
- background: be
- interactive:
- Traffic Priority 1: ef
- Traffic Priority 1: af21
- Traffic Priority 1: af21
- streaming: af11
- conversational: ef

Specifies the DSCP for the specified traffic pattern. *dscp* can be configured to any one of the following:

• **af11:** Assured Forwarding 11 per-hop-behavior (PHB)	• **af32:** Assured Forwarding 32 PHB
• **af12:** Assured Forwarding 12 PHB	• **af33:** Assured Forwarding 33 PHB
• **af13:** Assured Forwarding 13 PHB	• **af41:** Assured Forwarding 41 PHB
• **af21:** Assured Forwarding 21 PHB	• **af42:** Assured Forwarding 42 PHB
• **af22:** Assured Forwarding 22 PHB	• **af43:** Assured Forwarding 43 PHB
• **af23:** Assured Forwarding 23 PHB	• **be:** Best effort forwarding PHB
• **af31:** Assured Forwarding 31 PHB	• **ef:** Expedited forwarding PHB

+

More than one of the above keywords can be entered within a single command.

Usage

DSCP levels can be assigned to specific traffic patterns in order to ensure that data packets are delivered according to the precedence with which they're tagged. The diffserv markings are applied to the outer IP header of every GTP data packet. The diffserv marking of the inner IP header is not modified.

The four traffic patterns have the following order of precedence: background (lowest), interactive, streaming, and conversational (highest). Data packets falling under the category of each of the traffic patterns are tagged with a DSCP that further indicate their precedence as shown in the following tables :

Table 21. Class structure for assured forwarding (af) levels

Drop Precedence	Class			
	Class 1	Class 2	Class 3	Class 4
Low	af11	af21	af31	af41
Medium	af12	af22	af32	af41
High	af13	af23	af33	af43

Table 22. DSCP Precedence

Precedence (low to high)	DSCP
0	Best Effort (be)
1	Class 1
2	Class 2
3	Class 3
4	Class 4
5	Express Forwarding (ef)

The DSCP level can be configured for multiple traffic patterns within a single instance of this command. The no ip qos command can be issued to remove a QOS setting and return it to it's default setting.

Example

The following command configures the DSCP level for the streaming traffic pattern to be **ef**:

```
ip qos streaming ef
```

The following command configures the DSCP levels for the conversational, streaming, interactive and background traffic patterns to be ef, ef, af22, and af41, respectively:

```
ip qos-dscp conversational ef streaming ef interactive af22 background
af41
```

max-retransmissions

Configures the maximum number of times that GTP control packets are retransmitted to an SGSN before it marks it unreachable.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

max-retransmissions *max_number*

max_number

Default: 4
Indicates the maximum number of times that GTP control packets are retransmitted.
max_number can be configured to any integer value between 0 and 15.

Usage

This command is used in conjunction with the **timeout** command to control the retransmission of GTP control packets when no response is received from an SGSN. It is equivalent to the N3-REQUESTS parameter discussed in 3GPP TS 29.060.
If no response is received from the SGSN prior to the expiration of the timeout value, the GTP control packets are re-sent by the GGSN. This process occurs as many times as allowed by the configuration of this command.
If the max-retransmissions value is exceeded, the GGSN records a “Path Failure” for that SGSN and releases all PDP contexts associated with it.

Example

The following command configures the maximum number of retransmissions to 8:

```
max-retransmissions 8
```

mbms policy

This command enables/disables the MBMS user service support for Multicast and/or Broadcast mode. It also specifies the policy for MBMS user service mode.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
mbms policy multicst broadcast

[no | default] mbms policy
```

no

Removes/disables the configured MBMS support for Multicast and/or Broadcast mode in this GGSN service.

default

Restores the default mode of MBMS support in this GGSN service.

multicst broadcast

Enables the MBMS support and configures the policy for multicast and broadcast of user service.

Usage

Use this command to enable/disable the MBMS user service support for Multicast and/or Broadcast mode. It also specifies the policy for MBMS user service mode.

Example

The following command enables the MBMS support in this GGSN service:

```
mbms policy multicast broadcast
```

path-failure

Determines the GTP path-failure behavior on echo/non-echo messages.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
path-failure detection-policy gtp {echo [non-echo] | non-echo [echo] }

[no | default] path-failure detection-policy
```

no

No defined detection policy means path-failures are not detected.

default

Use the default command to set the path-failure detection-policy to gtp in echo mode.

detection-policy gtp {echo [non-echo] | non-echo [echo] }

Detection-policy is the policy to be used when path-failure is in the default active state. GTP messages are either gtp(u) (user) or gtp(c) (control) type, and the gtp keyword takes either echo or non-echo as message type.
echo: gtp(u) or gtp(c) message.
non-echo: a message type other than gtp(u) or gtp(c).

Usage

Under current circumstances, a GGSN shuts down the GTP tunnel if the associated SGSN does not respond to multiple retries of an echo or non-echo message from the GGSN. In this way, a single call failure could be responsible for the loss of all active calls in the tunnel.
This is also an issue when echo is disabled, or when there is very little traffic on the SGSN and the GGSN is configured with large echo intervals.
This behavior adversely impacts the user experience because the customer has to reconnect every time this happens with their SGSN.

Example

The following example detects path failures when the SGSN fails to respond to multiple echo message retries:

```
path-failure detection-policy gtp echo
```

The following example turns off path-failure detection. On timeout of gtp(c) message retries, the particular context will be purged:

```
no path-failure detection-policy
```

plmn id

Configures the GGSN's public land mobile network (PLMN) identifiers. Up to five PLMN IDs can be configured for each GGSN service.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

plmn id mcc *mcc_number* **mnc** *mnc_number* **[primary]**

no plmn id mcc *mcc_number* **mnc** *mnc_number*

no

Removes a previously configured PLMN identifier for the GGSN service.

mcc *mcc_number*

Specifies the mobile country code (MCC) portion of the PLMN's identifier.
mcc_number is the PLMN MCC identifier and can be configured to any integer value between 100 and 999.

mnc *mnc_number*

Specifies the mobile network code (MNC) portion of the PLMN's identifier.
mnc_number is the PLMN MNC identifier and can be configured to any 2 or 3 digit integer value between 00 and 999.

primary

When multiple PLMN IDs are configured the **primary** keyword can be used to designate one of the PLMN IDs to be used for the AAA attribute (3GPP-GGSN-MCC-MNC).

Usage

The PLMN identifier is used to aid the GGSN service in the determination of whether or not a mobile station is visiting, roaming, or home. Multiple GGSN services can be configured with the same PLMN identifier. Up to five PLMN IDs can be configured for each GGSN Service.

Example

The following command configures the PLMN identifier with an MCC of 462 and MNC of 2:

plmn id mcc *462* **mnc** *02*

plmn unlisted-sgsn

Configures the GGSN's policy for handling communications from SGSNs that it is not configured to communicate with.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[default] plmn unlisted-sgsn {foreign [disable-gtpc-echo] [reject-foreign-
subscriber] | home [disable-gtpc-echo] | reject}
```

default

Resets configured parameters to their default settings.

foreign

Default: Disabled
Specifies that the GGSN service accepts messages from SGSNs that are not configured within the service using the sgsn command.
This keyword also dictates that unlisted SGSNs are treated as if they belong to a foreign PLMN. Therefore PDP contexts originating from them are treated as visiting or roaming.

disable-gtpc-echo

Default: Send GTPC Echo messages to unlisted SGSNs.
When this keyword is specified, GTPC echo messages are not sent to unlisted SGSNs.

reject-foreign-subscriber

Default: Disabled
Specifies that incoming calls from foreign subscribers are rejected.

home

Default: Disabled
Specifies that the GGSN service accepts messages from SGSNs that are not configured within the service using the sgsn command.
This keyword also dictates that unlisted SGSNs are treated as if they belong to the GGSN service's home PLMN.

reject

Default: Enabled
Specifies that the GGSN service rejects messages from SGSNs that are not configured within the service using the sgsn command.
When the GGSN service rejects the message(s), it returns a cause code of No Resources 199 (C7H, No resources available).

Usage

This command works in conjunction with the **sgsn** command that configures the GGSN service to communicate with specific SGSNs. Any messages received from SGSNs not configured in that list are subject to the rules dictated by the **unlisted-sgsn** policy.

Example

The following command configures the GGSN service to accept messages from unlisted SGSNs and treat the SGSN as if it is on the GGSN's home network:

```
plmn unlisted-sgsn accept home
```

policy

Specifies the reject code to be used in the "Create PDP Context" response message when a RADIUS server timeouts.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
policy {accounting-server-timeout use-reject-code {system-failure | no-resources
} | authentication-server-timeout use-reject-code {system-failure | user-
authentication-failure } }

default policy {authentication-server-timeout | accounting-server-timeout }
```

default

Restores the specified parameter to its default setting.

accounting-server-timeout use-reject-code {system-failure | no-resources }

Default: **no-resources**
Specifies the reject code used by the GGSN if communication with an accounting server times out. The possible reject codes are:

- system-failure (204 (CCH))
- no-resources (199 (C7H))

authentication-server-timeout use-reject-code {system-failure | user-authentication-failure }

Default: user-authentication-failure
Specifies the reject code used by the GGSN if communication with an authentication server times out. The possible reject codes are:

- system-failure (204 (CCH))
- user-authentication-failure (209 (D1H))

Usage

This command is used to configure the cause code used by the GGSN if communication with either a RADIUS authentication or accounting server times out.
When this parameter is used in conjunction with Radius accounting servers, the response is only set if a flag is configured in the APN Delay GTP Response, only after getting a response to the Accounting Start.

Example

The following command configures the GGSN response to a RADIUS authentication server timeout to be system-failure:

```
policy authentication-server-timeout use-reject-code system-failure
```

retransmission-timeout

Configures the timeout period in between retransmissions of GTP control packets. This timeout configuration is not applicable on Echo Request retransmission.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

retransmission-timeout *retransmit_time*

retransmit_time

Default: 5
Specifies the amount of time that must pass without an SGSN response before the GGSN service retransmits GTP control packets.
retransmit_time is measured in seconds and can be configured to any integer value between 1 and 20.

Usage

This command is used in conjunction with the **max-retransmissions** command to control the retransmission of GTP control packets when no response is received from an SGSN.
If no response is received from the SGSN prior to the expiration of the timeout value, the GTP control packets are re-sent by the GGSN. This process occurs as many times as allowed by the configuration of the max-retransmissions command.
If the max-retransmissions value is exceeded within the retransmission-timeout period, the GGSN records a "Path Failure" for that SGSN and releases all PDP contexts associated with it.

Important: This retransmission timeout configuration in not applicable for Echo Requests message retransmission. Echo are sent/retransmitted every echo interval, which can be configured separately.

Example

The following command configures a timeout value of 20 seconds:

retransmission-timeout *20*

setup-timeout

Configures the maximum amount of time the GGSN service allows for the setting up of PDP contexts.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

setup-timeout *setup_time*

setup-time

Default: 60
Specifies the maximum amount of time the GGSN service allows for the setting up of PDP contexts. *setup_time* is measured in seconds and can be configured to any integer value between 1 and 6000.

Usage

Use this command to limit the amount of time allowed for setting up PDP contexts. If the PDP context is not setup within the configured time frame, the GGSN service rejects the PDP context with a cause code of 199 (C7H, No resources available).

Example

The following command allows a maximum of 120 seconds for the setting up of PDP contexts:

setup-timeout *120*

sgsn address

Configures the SGSNs that this GGSN service is allowed to communicate with.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

sgsn address {{*ip_address* **[subnetmask** *netmask* **]} | *ip_address*/*netmask*} [plmn-foreign [reject-foreign-subscriber] |mcc** *mcc_code* **mnc** *mnc_code* **[reject-foreign-subscriber]] [rat-type {GAN | GERAN | HSPA | UTRAN | WLAN }] [description** *description* **] [disable-gtpc-echo]**

no sgsn {address *ip_address* **[subnetmask** *netmask* **] }**

no

Removes a specific SGSN from the list or all configured SGSNs.

address

Configures the IP address of the SGSN.
ip_address must be expressed in dotted decimal notation.

subnetmask

Configures the subnet mask of the SGSN.
netmask must be expressed in dotted decimal notation.

disable-gtpc-echo

Default: Send GTPC Echo messages to unlisted SGSNs.
When this keyword is specified, GTPC echo messages are not sent to unlisted SGSNs.

plmn-foreign

Indicates whether or not the SGSN belongs to a foreign public land mobile network (PLMN).

reject-foreign-subscriber

Default: Disabled
Specifies that incoming calls from foreign subscribers are rejected.

mcc *mcc_code*

Specifies the mobile country code (MCC) portion of the PLMN's identifier.
mcc_code is the PLMN MCC identifier and can be configured to any integer value between 100 and 999.

mnc *mnc_code*

Specifies the mobile network code (MNC) portion of the PLMN's identifier.

mnc_code is the PLMN MNC identifier and can be configured to any 2 or 3 digit integer value between 00 and 999.

rat-type {GAN | GERAN | HSPA | UTRAN | WLAN }

This keyword configures the type of radio access technology.
GAN: Specifies the Generic Access Network type of RAT.
GERAN: Specifies the GSM EDGE Radio Access Network type of RAT.
HSPA: Specifies the Hight Speed Packet Access type of RAT.
UTRAN: Specifies the UMTS Terrestrial Radio Access Network type of RAT.
WLAN: Specifies the Wireless Local Access Network type of RAT.

description *description*

Add description field to the SGSN entry in GGSN service.
description is a string of 1 to 63 alpha and/or numeric characters.

Usage

Use this command to configure a list of SGSNs that the GGSN service is to communicate with. This command can be entered multiple times to configure multiple SGSNs.

Important: The GGSN only communicates with the SGSNs configured using this command unless a plmn-policy is enabled to allow communication with unconfigured SGSNs. PLMN policies are configured using the **plmn unlisted-sgsn** command.

Example

The following command configures the GGSN to communicate with an SGSN on a foreign PLMN with an IP address of 192.168.1.100 and subnet mask of 255.255.255.0:

sgsn address *192.168.1.100* **subnetmask** *255.255.255.0* **plmn-foreign**

sgsn define-multiple-address-group

This keyword defines an SGSN Multiple Address Group and enters SGSN Multiple Address Group Configuration mode. Whenever there is a change in the control address in a GTPC UPC message, it is treated as an inter-SGSN handoff because an SGSN is usually identified uniquely by a single IP-address. This command supports a multiple address group feature which allows you to specify a set of addresses that specify a single SGSN. When a UPC handoff is received from any address in the group, it is treated as an intra-SGSN handoff.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

[no] sgsn define-multiple-address-group *grp_name*

no

Removes a specific SGSN Multiple Address Group from the list GGSN service configuration.

grp_name

Specifies the name of an SGSN multiple address group to create or configure.
must be an alphanumeric string from 1 through 63 characters in length.

Usage

Use this command to create or configure an SGSN Multiple Address Group that the GGSN service is to communicate with. This command can be entered multiple times to configure multiple SGSN Multiple Address Groups.

Example

The following command creates an SGSN Multiple Address Group named sgsngrp1 enters *SGSN Multiple Address Group Configuration* mode:

```
sgsn define-multiple-address-group sgsngrp1
```

sgsn multiple-address-group

Configures the SGSN multiple address groups that this GGSN service is allowed to communicate with.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

sgsn multiple-address-group *grp_name* **[disable-gtpc-echo] [mcc** *mcc_code* **mnc** *mnc_code* **[reject-foreign-subscriber]] [plmn-foreign [reject-foreign-subscriber] [rat-type {GAN | GERAN | HSPA | UTRAN | WLAN }] [description** *description* **]**

no sgsn multiple-address-group *grp_name*

no

Removes a specific SGSN multiple address group from the list of configured SGSN multiple address groups.

grp_name

Specifies the name of a configured SGSN multiple address group to use.

disable-gtpc-echo

Default: Send GTPC Echo messages to unlisted SGSNs.
When this keyword is specified, GTPC echo messages are not sent to unlisted SGSNs.

plmn-foreign

Indicates whether or not the SGSN multiple address group belongs to a foreign public land mobile network (PLMN).

reject-foreign-subscriber

Default: Disabled
Specifies that incoming calls from foreign subscribers are rejected.

mcc *mcc_code*

Specifies the mobile country code (MCC) portion of the PLMN's identifier.
mcc_code is the PLMN MCC identifier and can be configured to any integer value between 100 and 999.

mnc *mnc_code*

Specifies the mobile network code (MNC) portion of the PLMN's identifier.
mnc_code is the PLMN MNC identifier and can be configured to any 2 or 3 digit integer value between 00 and 999.

rat-type {GAN | GERAN | HSPA | UTRAN | WLAN }

This keyword configures the type of radio access technology.

GAN: Specifies the Generic Access Network type of RAT.
GERAN: Specifies the GSM EDGE Radio Access Network type of RAT.
HSPA: Specifies the Hight Speed Packet Access type of RAT.
UTRAN: Specifies the UMTS Terrestrial Radio Access Network type of RAT.
WLAN: Specifies the Wireless Local Access Network type of RAT.

description *description*

Add a description field to the SGSN multiple address group entry in the GGSN service configuration. *description* must be a string of 1 through 63 alphanumeric characters.

Usage

Use this command to configure a list of SGSN multiple address groups that the GGSN service is to communicate with. This command can be entered multiple times to configure multiple SGSN multiple address groups.

Important: The GGSN only communicates with the SGSN multiple address groups configured using this command unless a plmn-policy is enabled to allow communication with unconfigured SGSNs. PLMN policies are configured using the **plmn unlisted-sgsn** command.

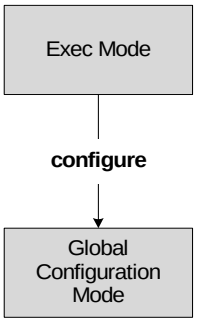
Example

The following command configures the GGSN to communicate with an SGSN with multiple address that is defined by an SGSN multiple address group named sgsngrp1 that is on a foreign PLMN:

```
sgsn multiple-address-group sgsngrp1 plmn-foreign
```

Chapter 101
Global Configuration Mode Commands

The Global Configuration Mode is used to configure basic system-wide parameters.



aaa accounting-overload-protection

This command configures Overload Protection Policy for accounting requests.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
aaa accounting-overload-protection prioritize-gtpp

{ default | no } aaa accounting-overload-protection
```

default

Configures the default setting.
Default: no priority assigned

no

Disables the Overload Protection configuration.

prioritize-gtpp

Specifies to give higher priority to GTPP requests among the other outstanding requests. So while purging the lower priority requests will be selected first.

Usage

Use this command to configure Overload Protection Policy for accounting requests.

Example

The following command prioritizes GTPP requests among the other outstanding requests:

```
aaa accounting-overload-protection prioritize-gtpp
```

aaa default-domain

Configure global accounting and authentication default domain for subscriber and context-level administrative user sessions.

Product

All

Privilege

Security Administrator, Administrator

Syntax

aaa default-domain { administrator | subscriber } *domain_name*

no aaa default-domain { administrator | subscriber } [*domain_name* **]**

no

Removes all or only the specified configured domain.

administrator | subscriber

administrator: Configures the default domain for context-level administrative users.
subscriber: Configures the default domain for subscribers.

domain_name

Specifies the context which is to be set as the default. *domain_name* must be from 1 to 79 alpha and/or numeric characters with no spaces.

Usage

This command configures the default domain which is used when accounting and authentication services are required for context-level administrative user and subscriber sessions whose user name does not include a domain.

Example

The following commands configure the default domains for context-level administrative users and subscribers, respectively:

aaa default-domain administrator *sampleAdministratorDomain*

aaa default-domain subscriber *sampleSubscriberDomain*

The following command removes the *sampleSubscriberDomain* domain:

no aaa default-domain subscriber *sampleSubscriberDomain*

aaa domain-matching ignore-case

This command disables case sensitivity when performing domain matching. When this command is enabled, the system disregard case when matching domains.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] aaa domain-matching ignore-case
```

```
default aaa domain-matching
```

default

Configures ignore-case as the domain matching method.

no

Specifies that the system consider case when domain matching.

Usage

Use this command to configure the system to ignore case when matching domains.

Example

The following command configures the system to ignore case when matching domains:

```
aaa domain-matching ignore-case
```

aaa domain-matching imsi-prefix

This command enables domain lookup for session based on the IMSI prefix length. Default: Disabled

Important: This command is only available in Release 8.3 and later.

Product

All

Privilege

Security Administrator, Administrator

Syntax

aaa domain-matching imsi-prefix prefix-length *prefix_length*

no aaa domain-matching imsi-prefix

no

Specifies the system must not consider imsi-prefix domain matching method.

prefix-length

Specifies the IMSI length to be matched with the domain.
prefix_length must be an integer from 1 through 15.

Usage

Use this command to configure the IMSI-prefix method of domain matching. This command enables domain lookup for the session based on the IMSI prefix length. If there is a domain configured with the matching IMSI prefix, the associated configuration is used.
This feature does not support partial matches.

Example

The following command configures the IMSI prefix method for domain matching setting the prefix length to *10*.

aaa domain-matching imsi-prefix prefix-length *10*

aaa large-configuration

This command enables/disables the system to accept a large number of RADIUS configurations to be defined and stored.

Important: For this command to take affect, after entering the command the configuration must be saved and reloaded.

When aaa large-configuration is disabled, the following restrictions are in place:

- Only one (1) NAS IP address can be defined per context with the **`radius attribute`** command.
- The RADIUS attribute **nas-ip-address** can only be configured if the RADIUS group is **default**.
- Only 320 RADIUS servers can be configured system-wide.
- Only 64 RADIUS groups can be configured system-wide.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
aaa large-configuration

no aaa large-configuration
```

`no`

Disables AAA large configuration support.

Usage

When aaa large-configuration is enabled, the system provides the ability to configure multiple NAS IP addresses in a single context to used with different radius groups. As well, the command allows support for up to 1600 RADIUS server configurations and for a PDSN a maximum of 400 or for a GGSN a maximum of 800 RADIUS server group configurations system-wide.

Example

To enable the definition of a large number of RADIUS configurations, enter the following commands in the following order:
In APN Configuration mode, enter:

```
default aaa group
```

In Global Configuration mode, enter:

```
aaa large-configuration
```

In Exec mode, use the **save configuration** command and then the **reload** command.

aaa last-resort

Configure global accounting and authentication last resort domain for subscriber and context-level administrative user sessions.

Product

All

Privilege

Security Administrator, Administrator

Syntax

aaa last-resort context { administrator | subscriber } *context_name*

no aaa last-resort context { administrator | subscriber } [*context_name* **]**

no

Removes all or only the specified previously configured authentication last resort domain name.

administrator | subscriber

administrator: Configures the last resort domain for context-level administrative.
subscriber: Configures the last resort domain for the subscribers.

context_name

Specifies the context which is to be set as the last resort. *context_name* must be from 1 to 79 alpha and/or numeric characters with no spaces.

Usage

Set the last resort context which is used when there is no applicable default domain (context) and there is no domain provided with the subscriber's or context-level administrative user's name for use in the AAA functions.

Example

The following commands configure the last resort domains for context-level administrative user and subscribers, respectively:

aaa last-resort administrator *sampleAdministratorDomain*

aaa last-resort subscriber *sampleSubscriberDomain*

The following command removes the previously configured domain called *sampleAdministratorDomain*:

no aaa last-resort administrator *sampleAdministratorDomain*

aaa username-format

Configure global accounting and authentication user name formats for AAA functions. Up to six formats may be configured.

Product

All

Privilege

Security Administrator, Administrator

Syntax

aaa username-format { domain | username } *separator*

no aaa username-format { domain | username } *separator*

no

Removes the specified user name format from the configuration.

domain | username

Default: username @
domain: indicates the left side of the string from the separator character is a domain name and the right side is the user name.
username: indicates the left side of the string from the separator character is a user name and the right side is the domain name.

Important: The user name string is always searched from right to left for the first occurrence of the separator character.

separator

Specifies the character to use for delimiting the domain from the user name for global AAA functions as one of: @, %, -, \, #, or /. Note: to specify a slash)'\') as the separator it is necessary to enter a double slash ('\\') on the command line.

Usage

Define the formats for user name delimiting if certain domains or groups of users are to be authenticated based upon their user name versus domain name.

Example

aaa username-format domain *@*

aaa username-format username *%*

no aaa username-format username *%*

active-charging service

This command creates/selects an Active Charging Service.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

active-charging service *acs_service_name* **[-noconfirm]**

no active-charging service *acs_service_name*

no

Removes the specified Active Charging Service.

acs_service_name

Creates/selects the specified ACS Service, and changes to the ACS Configuration Mode wherein the ACS service can be configured.
acs_service_name must be the name of an ACS service, and must be an alpha and/or numeric string of 1 through 15 characters in length.

-noconfirm

Specifies that the command must execute without any additional prompt and confirmation from the user.

Usage

Use this command to create/select an ACS service in the system.
Use this command after enabling ACS using the **require active-charging** command. This command allows administrative users to configure the ACS functionality.

Example

The following command creates an ACS service named *test*:

active-charging service *test*

alarm

Enables/disables alarming options for the switch processor card internal alarms and the central-office external alarms. To verify the state of the alarms, refer to the **show alarm** command.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
alarm { audible | central-office  }

no alarm { audible | central-office  }
```

no

Disables the option specified.

audible | central-office

audible: indicates the internal audible alarm on the switch processor cards are to be enabled.
central-office: indicates the central office alarms are to be enabled.

Usage

Disable CO and audible alarms when an existing device provides such capability.

Example

The following commands enable the SPC/SMC internal alarm and disable the central office alarms, respectively.

```
alarm audible

no alarm central-office
```

arp

Configures a system-wide time interval for performing Address Resolution Protocol (ARP) refresh.

Product

All

Privilege

Security Administrator, Administrator

Syntax

arp base-reachable-time *time*

default arp base-reachable-time

default

Restores the parameter to its default setting.

time

Default: 30
Specifies the ARP refresh interval (in seconds). The range is 30 to 86400 seconds.

Usage

Use this command to configure a system-wide ARP refresh interval. Once a neighbor is found, the entry is considered valid for at least a random value between the *time*/2 and the *time**1.5.

Example

The following command configures an ARP refresh interval of 1 hour:

arp base-reachable-time *3600*

autoconfirm

This command disables or enables confirmation for certain commands. This command affects all future CLI sessions.

Important: To change the behavior for the current CLI session only, use the **autoconfirm** command in the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
autoconfirm

no autoconfirm
```

Usage

When autoconfirm is enabled, certain commands ask you to answer yes or no to confirm that you want to execute the command. When autoconfirm is disabled the confirmation questions never appear. Disabling autoconfirm disables command confirmation for all future CLI sessions.
By default **autoconfirm** is enabled.

Example

The following command enables command confirmation for all future CLI sessions;

```
autoconfirm
```

The following command disables command confirmation for all future CLI sessions;

```
no autoconfirm
```

autoless

This command is obsolete. It is included in the CLI for backward compatibility with older configuration files. When executed, this command issues a warning and performs no function.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
autoless

no autoless
```

banner

Configures the CLI banner which is displayed upon the initialization of a CLI session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

banner { charging-service | lawful-intercept | motd | pre-login } *string*

no banner { charging-service | lawful-intercept | motd | pre-login }

no

Removes the banner message by setting it to be string of zero length.

charging-service

Specifies the Active Charging Service banner message. That banner is displayed upon the initialization of an SSH CLI session with ACS-admin privileges (whenever anyone with the CLI privilege bit for ACS logs in.

lawful-intercept

Configures the CLI banner message of the day which is displayed upon the initialization of an SSH CLI session with li-admin privileges.

motd

Configures the CLI banner message of the day which is displayed upon the initialization of any CLI session.

pre-login

Configures the CLI banner displayed before a CLI user logs in.

Important: This banner is displayed only for serial port and telnet log ins. It is not supported in ssh and, therefore, will not be displayed before ssh log ins.

string

Specifies the banner or message to be displayed at session initialization. *string* may be from 0 to 2048 characters and must be enclosed in double quotation marks if the banner or message is to include spaces.

Usage

Set the message of the day banner when an important system wide message is needed. For example, in preparation for removing a chassis from service, set the banner 1 or more days in advance to notify administrative users of the pending maintenance.

Example

banner motd *"Have a nice day."*

banner motd *No_News_Today*

no banner motd

boot delay

Configures the delay period, in seconds, before attempting to boot the system from a software image file residing on an external network server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

boot delay *time*

no boot delay

no

Deletes the setting for the boot delay. The boot process executes immediately.

time

Specifies the amount of time (in seconds) to delay prior to requesting the software image from the external network server. The range is 1 to 300 seconds.

Usage

Useful when booting from the network when connection delays may cause timeouts. Such as when the Spanning Tree Protocol is used on network equipment.

Important: The settings for this command are stored immediately in the boot.sys file. No changes are made to the system configuration file.

Example

The following sets the boot delay to *10* seconds:

boot delay *10*

boot interface

Configures the Switch Processor I/O card network interfaces for obtaining a system software image during the system boot process.

Product

All

Privilege

Security Administrator, Administrator

Syntax

boot interface { spio-eth1 | spio-eth2 } [medium { auto | speed *medium_speed* **duplex** *medium_duplex* **} [media** *medium_media* **]]**

no boot interface

---

no

Removes the boot interface configuration from the boot.sys file. Only files from the local file system can be loaded.

---

spio-eth1 | spio-eth2

Specifies the network interface to be configured where **spio-eth1** is the primary interface on the SPIO (slot 24 interface 1 or slot 25 interface 1) and **spio-eth2** is the secondary interface on the SPIO (slot 24 interface 2 or slot 25 interface 2). The interfaces refer to either the RJ-45 interfaces for speeds of 10, 100, or 1000 megabit per second (Mbps) or the SFP interface for the optical gigabit (1000 Mbps) interface.

---

medium { auto | speed *medium_speed* **duplex** *medium_duplex* **}**

Default: auto
auto: configures the interface to auto-negotiate the interface speed. and duplex.
speed *medium_speed* **duplex** *medium_duplex*: specifies the speed to use at all times where *medium_speed* must be one of:

- 10
- 100
- 1000

The keyword **duplex** is used to set the communication mode of the interface where *medium_duplex* must be one of:

- full
- half

---

media *medium_media*

Default: rj45
Optionally sets the physical interface where *medium_media* must be either rj45 or sfp.

Usage

Modify the boot interface settings to ensure the system is able to obtain a software image from an external network server.

Important: The settings for this command are stored immediately in the boot.sys file. No changes are made to the system configuration file.

Example

The following configures the primary interface to auto-negotiate the speed.

```
boot interface spio-eth1 medium auto
```

The following command configures the secondary interface to a fixed gigabit speed at full duplex using RJ45 connectors for the physical interface.

```
boot interface spio-eth2 medium speed 1000 duplex full media rj45
```

The following restores the defaults for the boot interface.

```
no boot interface
```

boot nameserver

Configures the IP address of the DNS (Domain Name Service) server to use when looking up hostnames in URLs for network booting.

Product

All

Privilege

Security Administrator, Administrator

Syntax

boot nameserver *ip_address*

no boot nameserver

ip_address

IPv4 address of the DNS server the system uses to lookup hostnames in URLs for a software image from the network during the system boot process.

no

Removes the network boot nameserver information from the boot.sys file.

Usage

Use this command to identify the DNS server to use to lookup hostnames in a software image URL.

Important: The settings for this command are stored immediately in the boot.sys file. No changes are made to the system configuration file.

Example

The following configures the system to communicate with a DNS nameserver with the IP address of 1.2.3.4:

```
boot nameserver 1.2.3.4
```

boot networkconfig

Configures the networking parameters for the Switch Processor I/O card network interfaces to use when obtaining a software image from an external network server during the system boot process.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
boot networkconfig { dhcp | { { dhcp-static-fallback | static } ip address
spio24 ip_address [ spio25 ip_address ] netmask ip_mask [ gateway gw_address ] }
}

no boot networkconfig
```

no

Removes the network configuration information from the boot.sys file.

dhcp

Indicates that a Dynamic Host Control Protocol (DHCP) server is used for communicating with the external network server.

dhcp-static-fallback | static

dhcp-static-fallback: provides static IP address fallback network option when a DHCP server is unavailable.
static: specifies a fixed network IP address for the external network server that hosts the software image.

spio24 *ip_address* **[spio25** *ip_address* **] netmask** *ip_mask* **[gateway** *gw_address* **]**

spio24 *ip_address* [**spio25** *ip_address*]: the IP address to use for the SPIO in slot 24 and optionally the SPIO in slot 25 for network booting. *ip_address* must be specified using the standard IPv4 dotted-decimal notation.
netmask *ip_mask*: the network mask to use in conjunction with the IP address(es) specified for network booting. *ip_mask* must be specified using the standard IPv4 dotted-decimal notation.
gateway *gw_address*: the IP address of a network gateway to use in conjunction with the IP address(es) specified for network booting. *gw_address* must be specified using the standard IPv4 dotted-decimal notation.

Important: If *gw_address* is not specified, then the network server must be on the same LAN as the system. Since both SPIOs must be in the same network, the netmask and gateway settings are shared.

Usage

Configure the network parameters for the ports on the SPIO cards to use to communicate with an external network server that hosts software images.

Important: The settings for this command are stored immediately in the boot.sys file. No changes are made to the system configuration file.

Important: When configuring static addresses both SPIOs must have different IP addresses. Neither address can be the same as the local context IP address.

Example

The following configures the system to communicate with the external network server via DHCP with a fallback to IP address *1.2.3.4*, respectively.

```
boot networkconfig dhcp-static-fallback ip address spio24 192.168.100.10
netmask 255.255.255.0
```

The following command configures the system to communicate with an external network server using the fixed (static) IP address *1.2.3.4* with a network mask of *255.255.255.0*.

```
boot networkconfig static ip address spio24 192.168.100.10 netmask
255.255.255.0
```

The following restores the system default for the network boot configuration options.

```
no boot networkconfig
```

boot system priority

Specifies the priority of a boot stack entry to use when the system first initializes or restarts. Up to 10 boot system priorities (entries in the boot.sys file located on the /flash device in the SPC/SMC) can be configured.

Product

All

Privilege

Security Administrator, Administrator

Syntax

boot system priority *number* **image** *image_url* **config** *config_path*

no boot system priority *number*

no

Remove a boot stack entry at the priority specified from the boot stack when it is no longer used.

priority *number*

Specifies the priority for the file group (consisting of an image (.bin) and its corresponding configuration (.cfg) file) specified in the boot stack. The value must be in the range from 1 through 100 where a priority of 1 is the highest. Up to 10 boot system priorities (boot stack entries) can be configured.

Important: When performing a software upgrade it is important that the new file group have the highest priority (lowest value) configured.

Important: It is suggested that an "N-1" priority numbering methodology, where "N" is the first priority in the current boot stack be employed to ensure that higher priority numbers remain open.

image *image_url*

Specifies the location of a image file to use for system startup. The URL may refer to a local or a remote file. The URL must be formatted according to one of the following formats:

- ST16:
- [**file:**]{ **/flash** | **/pcmcia1** | **/pcmcia2** }[**/***directory*]**/***filename*
- [**tftp:**]**//***host*[**:***port*][**/***directory*]**/***filename*
- ASR 5000:
- [**file:**]{ **/flash** | **/pcmcia1** | **/hd** }[**/***directory*]**/***filename*
- [**http:** | **tftp:**]**//***host*[**:***port*][**/***directory*]**/***filename*

Important: Use of the SMC hard drive is not supported in this release.

directory is the directory name.
filename is the actual file of interest.

host is the IP address or host name of the server.
port# is the logical port number that the communication protocol is to use.

Important: A file intended for use on an ST16 uses the convention xxxxx.st16.bin where xxxxx is the software build information.

Important: A file intended for use on an ASR 5000 uses the convention xxxxx.asr5000.bin, where xxxxx is the software build information.

Important: When using the TFTP, it is advisable to use a server that supports large blocks, per RFC 2348. This can be implemented by using the "block size option" to ensure that the TFTP service does not restrict the file size of the transfer to 32MB.

config *config_path*

Specifies the location of a configuration file to use for system startup. This must be formatted according to the following format:

- ST16:
- [**file:**]{ **/flash** | **/pcmcia1** | **/pcmcia2** }[**/***path*]**/***filename*
- ASR 5000:
- [**file:**]{ **/flash** | **/pcmcia1** | **/hd** }[**/***path*]**/***filename*

Important: Use of the SMC hard drive is not supported in this release.

Where *path* is the directory structure to the file of interest, and *filename* is the name of the configuration file. This file typically has a **.cfg** extension.

Usage

This command is useful in prioritizing boot stack entries in the boot.sys file, typically located on the /flash device of the Active SPC/SMC, for automatic recovery in case of a failure of a primary boot file group.

Important: The configuration file must reside on the SPC's/SMC's local filesystem, stored on one of its local devices (/flash, /pcmcia1, /pcmcia2, /hd). Attempts to load the configuration file from an external network server will result in a failure to load that image and configuration file group, causing the system to load the image and configuration file group with the next highest priority in the boot stack.

Important: Configuration changes do not take effect until the system is reloaded.

Important: The settings for this command are stored immediately in the boot.sys file. No changes are made to the system configuration file.

Example

The following commands set up two locations to obtain a boot file group from.

boot system priority 1 image tftp:*//remoteABC/pub/2003jan.bin config /flash/pub/data/2003feb.cfg*

boot system priority 2 image /flash*/pub/data/2002jun.bin config /pcmcia1/pub/data/2003feb.cfg*

The following removes the current priority **1** boot entry from the boot.sys file.

no boot system priority *1*

bulkstats

Enables the collection of bulk statistics by the system and/or enters the bulk statistic configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

bulkstats { collection | historical | mode }

no bulkstats collection

no

Disables the collection of bulk statistics.

collection

Enables the statistics collection process. Collects a period snapshot of data, i.e. “here is what the value is right now”.

historical collection

Enables the system to collect historical bulk statistics.
If enabled, the system keeps track of some things which require the storing of more data, such as “the highest value that’s been seen over the last 24 hours”.

mode

Enters the bulk statistics configuration mode. The resulting command-line prompt will look similar to:

```
[<context-name>]asr5000(config-bulkstats)#
```

Usage

The Bulk Statistics Configuration Code consists of commands for configuring bulk statistic properties, such as the period of collection. Bulk Statistics configuration mode commands are defined in the “Bulk Statistics Configuration Mode Commands” chapter.
The system can be configured to collect bulk statistics and send them to a collection server (called a receiver). Bulk statistics are statistics that are collected in a group or schema, for example, system stats, port stats, radius stats.
Once bulk statistics receiver, schema, and collection properties are configured, this **bulkstats** command is used to enable or disable the collection of the data.
To collect a sample that will provide an average, for example, an average of CPU counters, the “historical” features must be enabled with the **bulkstats historical collection** command.
Since bulk statistics are collected at regular, user-defined intervals, the **bulkstats force** command in the Exec Mode can be used to manually initiate the collection of statistics at any time.

Example

```
bulkstats collection

bulkstats mode

no bulkstats collection
```

ca-certificate

Configures and selects an X.509 CA root certificate to enable a security gateway to perform certificate-based peer (client) authentication. The system supports a maximum of 16 certificates and 16 CA root certificates. A maximum of four CA root certificates can be bound to a crypto template.

Product

Privilege

Administrator, Security Administrator, Operator

Syntax

[no] ca-certificate name *name* **pem { data** *pemdata* **| url** *url* **}**

no

Removes the named CA certificate.

name

Names the CA certificate.

pem data *pemdata* **|** *url*

The PEM-formatted data can be specified (**data pemdata**) or the information can be read from a file via url **url**). When read via a file, note that **show configuration** will not contain the url reference, but will instead output the data via **data pemdata**, such that the configuration file is self-contained.

Usage

In addition to the X.509 certificate-based gateway authentication method and the PSK (Pre-Shared Key) and EAP-AKA (Extensible Authentication Protocol - Authentication and Key Agreement) peer (client) authentication methods, the FNG supports X.509 certificate-based peer authentication.
The FNG checks the network policy on whether a FAP is authorized to provide service. If the network policy states that all FAPs that pass device authentication are authorized to provide service, no further authorization check may be required. If the network policy requires that each FAP be individually authorized for service (in the case where the FEID is associated with a valid subscription), the FNG sends a RADIUS Access-Request message to the AAA server. If the AAA server sends a RADIUS Access-Accept message, the FNG proceeds with device authentication. Otherwise, the FNG terminates the IPSec tunnel setup by sending an IKEv2 Notification message indicating authentication failure.
The operator/administrator is responsible for configuring the certificates through the CLI. The FNG will generate an SNMP notification when the certificate is within 30 days of expiration, and then once a day.

Example

Use the following command to remove a certificate named *fap1*:

no ca-certificate data *fap1*

card

Enters the card configuration mode for the card specified.

Product

All

Privilege

Security Administrator, Administrator

Syntax

card *number*

number

Specifies the number of the card for which the card configuration mode is to be entered. *number* must be a value in the range 1 through 48.

Usage

Enter the configuration mode for a specific card when changes a required.

Important: This command is not supported on all platforms.

Example

card *8*

card-standby-priority

Configures the redundancy priorities for the Packet Accelerator Card (PAC) or Packet Services Cards (PSC or PSC2) by specifying the slot number search order for a standby card when needed. Not available for the XT2 platform.

Product

All

Privilege

Security Administrator, Administrator

Syntax

card-standby-priority *slot_num* **[** *slot_num* **] [** *slot_num* **] ...**

slot_num

Specifies the slot of the card for the order of the standby cards. *slot_num* must be in the range from 1 through 16 excluding slots 8 and 9. *slot_num* may be repeated as many times as necessary to indicate the complete search order.

Usage

Set the standby order of the redundant cards when multiple standby cards are available. Questionable hardware should be placed lower in the priority list.

Important: This command replaces the **pac-standby-priority** command.

Important: This command is not supported on all platforms.

Example

The following command configures the redundancy priority to use the standby cards in slots 16, 14, and 12 in that order:

card-standby-priority *16 14 12*

cdr-multi-mode

This command enables multiple instances of CDRMOD.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ default ] cdr-multi-mode
```

default

Configures the default setting.

Usage

Use this command to enable multiple instances of CDRMOD.

certificate

Configures and selects an X.509 Trusted Author certificate.

Product

ECS

PDG/TTG

PDIF

Privilege

Administrator, Security Administrator, Operator

Syntax

[no] certificate name *name* **pem { data** *pemdata* **| url** *url* **}**

no

Removes the named certificate.

name

Names the certificate.

pem data *pemdata* **|** *url*

The PEM-formatted data can be specified (**data pemdata)** or the information can be read from a file via url **url**). When read via a file, note that **show configuration** will not contain the URL reference, but will instead output the data via **data pemdata**, such that the configuration file is self-contained.

Usage

A certificate authority or certification authority (CA) is an entity which issues digital certificates for use by other parties. It is an example of a trusted third party. CAs are characteristic of many public key infrastructure (PKI) schemes.
If CERT information is configured, PDIF will include the CERT payload in the first IKE_AUTH Response during the first authentication. PDIF stores its own certificate for use in the first AUTH calculation. MS will not have its own certificate from CA. Still it will be capable of accepting a certificate from PDIF and verify AUTH.
The operator/administrator is responsible for configuring the certificates through the CLI. PDIF will generate an SNMP notification when the certificate is within 30 days of expiration, and then once a day.

Example

Use the following command to remove a certificate named *box1*:

no certificate data *box1*

cli

Configures global CLI parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

cli { access { monitor-protocol | monitor-subscriber } { administrator | operator } } | login-failure-delay *number* **| max-sessions** *number* **| operator clear-subscriber-one-only | trap config-mode }**

no cli { max-sessions | login-failure-delay *number* **| operator clear-subscriber-one-only | trap config-mode }**

default cli { access { monitor-protocol | monitor-subscriber } | max-sessions | login-failure-delay *number* **| operator clear-subscriber-one-only | trap config-mode }**

no

Removes the limit on the number of allowed simultaneous CLI sessions on the system. or removes the limit of how many subscribers an Operator can clear.

default

Resets the keywords to their default values.

access { monitor-protocol | monitor-subscriber } { operator | administrator }

Sets access privileges on the **monitor protocol** and **monitor subscriber** commands:
monitor-protocol: Selects privileges for the **monitor protocol** command.
monitor-subscriber: Selects privileges for the **monitor subscriber** command.
operator: Sets the privileges for the selected command to allow use by users with operator privileges.
administrator: Restricts use of the selected command to administrators only.

login-failure-delay *number*

This is the time to wait before a login failure is returned and another login may be attempted. Default is five seconds.

max-sessions *number*

Sets the number of allowed simultaneous CLI sessions on the system. If this value is set to a number below the current number of open CLI sessions, the open sessions will continue until closed. *number* must be from 2 through 100.

Caution: Use caution when setting this command. Limiting simultaneous CLI sessions prevents authorized users from accessing the system if the maximum number allowed has been reached. The system already limits CLI sessions based on available resources. Additional limitation could have adverse effects.

`operator clear-subscriber-one-only`

Restricts Operator to clearing only one subscriber session at a time.

`trap config-mode`

Enables sending an SNMP notification (trap) when a CLI user enters the configuration mode.

Usage

Control the number of simultaneous CLI sessions on the system at any given time.

Important: The maximum number of multiple CLI session support is based on the amount of available memory. The Resource Manager, however, reserves enough resources so that a minimum of six CLI sessions are assured for ST16s. One of the CLI sessions is reserved for use exclusively by a CLI session on an SPIO console interface. Additional CLI sessions beyond the pre-reserved set are permitted if sufficient SPC resources are available. If the Resource Manager is unable to reserve resources for a CLI session beyond those that are pre-reserved, administrative users are prompted as to whether or not the system should attempt to create the new CLI session even without reserved resources.

Important: The maximum number of multiple CLI session support is based on the amount of available memory. The Resource Manager, however, reserves enough resources so that a minimum of 15 CLI sessions are assured for ASR 5000s. One of the CLI sessions is reserved for use exclusively by a CLI session on an SPIO console interface. Additional CLI sessions beyond the pre-reserved set are permitted if sufficient SMC resources are available. If the Resource Manager is unable to reserve resources for a CLI session beyond those that are pre-reserved, administrative users are prompted as to whether or not the system should attempt to create the new CLI session even without reserved resources.

Example

The following command sets the number of allowed simultaneous CLI sessions to 5.

```
cli max-sessions 5
```

The following command sets the command **`monitor protocol`** to administrator-only

```
cli access monitor-protocol administrator
```

clock

Configures system clock timezone and what local time zone to use.

Product

All

Privilege

Security Administrator, Administrator

Syntax

clock timezone *tz* **[local]**

no clock timezone

no

Resets the system timezone to the system default UTC.

tz

Specifies the system time zone to use as one of:

- america-buenos-aires (GMT-3:00; Buenos Aires)
- america-caracas (GMT-4:00) Caracas
- america-guatemala (GMT-6:00; Guatemala, Guatemala)
- america-la_paz (GMT-4:00; La Paz)
- america-lima (GMT-5:00; Lima, Peru)
- america-puerto-rico (GMT-4:00; Puerto Rico)
- america-sao-paulo (GMT -3:00; Brazil)
- america-tijuana (GMT-8:00; Tijuana)
- asia-baghdad (GMT+3:00; Baghdad, Russia Zone 2, Kuwait, Nairobi, Riyadh, Moscow, Tehran)
- asia-bangkok (GMT+7:00; Bangkok)
- asia-calcutta (GMT+5:30; Calcutta, Mumbai, New Delhi)
- asia-dhaka (GMT+6:00; Dhaka)
- asia-hong-kong (GMT+8:00; Hong_Kong)
- asia-irkutsk (GMT+9:30; Irkutsk)
- asia-kabul (GMT+4:30; Kabul)
- asia-karachi (GMT+5:00; Karachi)
- asia-katmandu (GMT+5:45; Kathmandu)

- australia-darwin (GMT+9:30) Northern Territory - Alice Springs, Darwin, Uluru
- australia-adelaide (GMT+9:30) Southern Territory - Adelaide
- australia-melbourne (GMT+10:00) Victoria - Ballarat, Melbourne
- australia-sydney (GMT+10:00) New South Wales - Newcastle, Sydney, Wollongong
- australia-hobart (GMT+10:00) Tasmania - Hobart, Launceston
- australia-brisbane (GMT+10:00) Queensland - Brisbane, Cairns, Toowoomba, Townsville
- australia-lordhowe (GMT+10:30) Lord Howe Island
- canada-newfoundland (GMT-3:30; Newfoundland)
- canada-saskatchewan (GMT-6:00; Saskatchewan)
- europe-central (GMT+1:00; Paris, Berlin, Amsterdam, Brussels, Vienna, Madrid, Rome, Bern, Stockholm, Oslo)
- europe-dublin (GMT+0:00) Dublin, Ireland
- europe-eastern (GMT+2:00; Russia Zone 1, Athens, Helsinki, Istanbul, Jerusalem, Harare)
- newzealand-auckland (GMT +12:00; Auckland, Willington)
- newzealand-chatham (GMT +12:45; Chatham)
- nuku (GMT-13:00; Nuku'alofa)
- pacific-fiji (GMT+12:00; Wellington, Fiji, Marshall Islands)
- pacific-guam (GMT+10:00; Brisbane, Cairns, Sydney, Guam)
- pacific-kwajalein (GMT-12:00; Kwajalein)
- pacific-norfolk - (GMT+11:30) Norfolk Island
- pacific-samoa (GMT-11:00; Samoa)
- us-alaska (GMT-9:00; Alaska)
- us-arizona (GMT-7:00; Arizona)
- us-central (GMT-6:00; Chicago, Mexico City, Saint Louis)
- us-eastern (GMT-5:00; Bogota, Lima, New York City)
- us-hawaii (GMT-10:00; Hawaii)
- us-indiana (GMT-6:00; Indiana)
- us-mountain (GMT-7:00; Cheyenne, Denver, Las Vegas)
- us-pacific (GMT-8:00) San Francisco, LA, Seattle
- utc (GMT; Universal Time Coordinated: London, Dublin, Edinburgh, Lisbon, Reykjavik, Casablanca)

local

Indicates the timezone specified by *tz* is to be considered the local time zone for local time display and conversion.

Usage

Clock and timezone management is necessary for proper accounting records. The chassis may be set to display a different local time than that of the system clock which allows accounting records to use the system time but to display the proper local time for users.

Example

clock timezone *utc*

clock timezone *us-indiana* **local**

no clock timezone

congestion-control

Enables/disables congestion control support on the system.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
congestion-control policy

default congestion-control

no congestion-control
```

default

Sets the congestion control to its default value.

no

Disables congestion-control functionality. This is the default setting.

Usage

Congestion control on the system is used to monitor the system for conditions that could potentially degrade performance when the system is under heavy load. Typically, these conditions are temporary (i.e high CPU or memory utilization) and are quickly resolved. However, continuous or large numbers of these conditions within a specific time interval may impact the system's ability to service subscriber sessions. The purpose of congestion control is to aid in the identification of such conditions and invoke policies for addressing the situation.

Congestion control operation is based on the configuration of the following:

- **Congestion condition thresholds:** Thresholds dictate the conditions for which congestion control is to be enabled and establish limits for defining the state of the system (congested or clear). These thresholds function in a similar fashion to the operation thresholds that can be configured for the system (as described in later in this chapter). The primary difference is that when these thresholds are reached, not only is an SNMP trap generated (starCongestion), but a service congestion policy is invoked as well.

A threshold tolerance is configured to dictate the percentage under the configured threshold that must be reached in order for the condition to be considered "cleared". An SNMP trap (starCongestionClear) is then triggered.

- **Service congestion policies:** Congestion policies are configurable for each service (PDSN, GGSN, or HA). These policies dictate how services respond should the system detect that a congestion condition threshold has been crossed.

Because congestion control functionality on the system is disabled by default, this command should be executed once congestion-control thresholds and policies have been configured. (Refer to the **congestion-control policy** and **congestion-control threshold** commands for more information.)

congestion-control overload-disconnect

This command enables and disables the policy for disconnecting passive calls (chassis-wide) during an overload situation. It also configures and fine-tunes the overload-disconnect congestion control policy for an entire chassis.

To verify the congestion-control configuration use **show congestion-control configuration** from the Exec mode.

To set overload-disconnect policies for individual subscribers., see **overload-disconnect** in Subscriber Configuration Mode Commands.

Product

All

Privilege

Security Administrator, Administrator

Syntax

congestion-control overload-disconnect [iterations-per-stage *integer* **| percent** *percentage_value* **| threshold { license-utilization** *percentage_value* **| max-sessions-per-service-utilization** *percentage_value* **| tolerance** *number* **}]**

default congestion-control overload-disconnect [iterations-per-stage | percent | threshold { license-utilization | max-sessions-per-service-utilization | tolerance }]

no congestion-control overload-disconnect

iterations-per-stage *integer*

An integer between 2 and 8. This value defines the number of calls to be disconnected during the defined number of seconds. The default value for this keyword is 8.

percent *percentage_value*

An integer between 1 and 100 specifies the percentage of calls to be disconnected, in stages, during an overload situation. The default value is 5.

threshold

license-utilization: An integer value between 1 and 100 that specifies the license-utilization percentage threshold for overload situations. If candidates are available, passive calls are disconnected when this threshold is exceeded. The default value is 80.
max-sessions-per-service-utilization: An integer value between 1 and 100 that specifies a percentage of the maximum sessions per service. If candidates are available, passive calls are disconnected when this threshold is exceeded. The default value is 80.
tolerance: An integer between 1 and 25 that specifies the percentage of calls the system disconnects below the values set for the other two thresholds. In either case, a Clear Traps message is sent after the number of calls goes below the corresponding threshold value. The tolerance default value is 10.

default

When ‘default’ and one of the keywords is added to the command, then the policy remains in its current state and the value for the specified keyword is reset to its default value.

When ‘default’ and the command are entered without keywords, then the overload-disconnect policy for congestion control is disabled.

no congestion-control overload-disconnect

Disables the overload-disconnect policy for congestion control.

Usage

Use this command to set the policy for call disconnects when the chassis experiences call overload.

Example

The following command sets an overload-disconnect policy for the chassis in which 5 calls would be disconnected very 5 seconds during an overload situation.

```
congestion-control overload-disconnect interations-per-stage 5
```

Both of the following commands disable the overload-disconnect policy without changing the policy configuration.

```
default congestion-control overload-disconnect
```

or

```
no congestion-control overload-disconnect
```

To instruct the system to stop call disconnects when the number of calls goes down 85% of the total allowed calls for that service, enter both of the following commands to set the max-sessions-per-service-utilization value to 90% and the tolerance value to 5%:

```
congestion-control overload-disconnect threshold max-sessions-per-
service-utilization 90

congestion-control overload-disconnect threshold tolerance 5
```

congestion-control policy

Configures congestion control policies.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
default congestion-control policy {asngw-service| asnpc-service | ggsn-service
| ha-service | lns-service | mipv6ha-service | pdsn-service | pdg-service |
pdif-service | pdsnclosedrp-service | sgsn-service }
```

default congestion-control policy *service*

Sets the congestion policy action for the selected service to its default value.

asngw-service

Sets the congestion policy action for the ASN GW service.

asnpc-service

Sets the congestion policy action for the ASN PC-LR service.

cscf-service

Sets the congestion policy action for the CSCF service.

ggsn-service

Sets the congestion policy action for the GGSN service.

ha-service

Sets the congestion policy action for the HA service.

lma-service

Sets the congestion control policy action for the LMA service

lns-service

Sets the congestion policy action for the LNS service.

mipv6ha-service

Sets the congestion policy action for the MIPv6-HA service.

mme-service

Sets the congestion control policy for action to take when subscriber sessions exceeds the defined threshold limit.

For MME type of session/calls **redirect** action is not supported.

pdg-service

Sets the congestion policy action for the PDG service.

pdif-service

Sets the congestion policy action for the PDIF service.

pdsn-service

Sets the congestion policy action for the PDSN service.

sgsn-service

Sets the congestion policy action for the SGSN service.

action { drop | none | redirect | reject }

Defines what policy action is taken:

- **drop**: Specifies that the system is to drop incoming packets containing new session requests. (PDSN, GGSN, ASN GW, LMA, MME, and ASN PC and HA only)
- **none**: Specifies that the system is take no action. This is the default for PDIF-service.
- **redirect**: Specifies that the system is to redirect new session requests to an alternate device. (PDSN and HA only)

Important: If this option is used, the IP address of the alternate device must be configured using the **policy overload redirect** command that is part of the service configuration. Note that this option can not be used in conjunction with GGSN and MME services.

- **reject**: Specifies that the system processes new session request messages and responds with a reject message. (For PDSN and HA, the reply code is 130, “insufficient resources”. For the GGSN, the reply code is 199, “no resources available”.)

Usage

Congestion policies can be configured for each service. When congestion control functionality is enabled, these policies dictate how services respond should the system detect that a congestion condition threshold has been crossed.

Example

The following command configures a congestion control policy of reject for PDSN services:

```
congestion-control policy pdsn-service action reject
```

The following command configures a congestion control policy of reject for MME services:

```
congestion-control policy mme-service action reject
```

congestion-control threshold

Configures the congestion control threshold values that are to be monitored.

Product

All

Privilege

Security Administrator, Administrator

Syntax

congestion-control threshold { license-utilization *percent* **| max-sessions-per-service-utilization** *percent* **| message-queue-utilization** *percent* **| message-queue-wait-time** *time* **| port-rx-utilization** *percent* **| port-specific {***slot/port* **| all } [tx-utilization** *percent* **] [rx-utilization** *percent***] | port-tx-utilization** *percent* **| service-control-cpu-utilization** *percent* **| system-cpu-utilization** *percent* **| system-memory-utilization** *percent* **| tolerance** *percent* **}**

default congestion-control threshold { license-utilization | max-sessions-per-service-utilization | message-queue-utilization | message-queue-wait-time | port-rx-utilization | port-specific | tx-utilization | rx-utilization | port-tx-utilization | service-control-cpu-utilization | system-cpu-utilization | system-memory-utilization | tolerance }

no congestion-control threshold port-specific { *slot/port* **| all }**

no congestion-control threshold port-specific { *slot/port* **| all } [rx-utilization** *percent* **] [tx-utilization** *percent* **]**

no congestion-control threshold { message-queue-utilization | message-queue-wait-time | port-rx-utilization *percent* **| port-tx-utilization percent | service-control-cpu-utilization | system-cpu-utilization | system-memory-utilization }**

---

default congestion-control threshold *keyword*

Sets the threshold keyword to its default value.

---

no congestion-control threshold port-specific { *slot/port* **| all }**

This command disables port specific threshold monitoring on the specified port or on all ports.
slot/port: Specifies the port for which port specific threshold monitoring is being configured. The slot and port must refer to an installed card and port.
all: Set port specific threshold monitoring for all ports on all cards.

---

license-utilization *percent*

Default: 100
The percent utilization of licensed session capacity as measured in 10 second intervals.
percent can be configured to any integer value from 0 to 100.

---

max-sessions-per-service-utilization *percent*

Default: 80

The percent utilization of the maximum sessions allowed per service as measured in real-time. This threshold is based on the maximum number of sessions or PDP contexts configured for the a particular service. (Refer to the bind command for the PDSN, GGSN, SGSN, or HA services.)
percent can be configured to any integer value from 0 to 100.

message-queue-utilization *percent*

Default: 80
The percent utilization of the Demux Manager software task's message queue as measured in 10 second intervals. The queue is capable of storing a maximum of 10000 messages.
percent can be configured to any integer value from 0 to 100.

message-queue-wait-time *time*

Default: 5
The maximum time (in seconds) messages can be held in queue as measured by packet time stamps.
time is measured in seconds and can be configured to any integer value from 1 to 30.

Important: In the event that this threshold is crossed, an SNMP trap is not triggered. In addition, the service congestion policy invocation resulting from the crossing of this threshold is enforced only for the packet that triggered the action.

[no] port-rx-utilization *percent*

Default: 80
The average percent utilization of port resources for all ports by received data as measured in 5 minute intervals.
percent can be configured to any integer value from 0 to 100.

[no] port-specific {*slot/port* **| all} [rx-utilization** *percent***] [tx-utilization** *percent***]**

Default: Disabled
Sets port-specific thresholds. If you set port-specific thresholds, when any individual port-specific threshold is reached, congestion control is applied system-wide.
slot/port: Specifies the port for which port-specific threshold monitoring is being configured. The slot and port must refer to an installed card and port.
all: Set port specific threshold monitoring for all ports on all cards.
rx-utilization *percent*: Default 80%. The average percent utilization of port resources for the specified port by received data as measured in 5 minute intervals. percent must an integer from 0 through 100.
tx-utilization *percent*: Default 80%. The average percent utilization of port resources for the specified port by transmitted data as measured in 5 minute intervals. percent must be an integer from 0 through 100.

[no] port-tx-utilization *percent*

Default: 80
The average percent utilization of port resources for all ports by transmitted data as measured in 5 minute intervals.
percent can be configured to any integer value from 0 to 100.

service-control-cpu-utilization *percent*

Default: 80
The average percent utilization of CPUs on which a Demux Manager software task instance is running as measured in 10 second intervals.
percent can be configured to any integer value from 0 to 100.

system-cpu-utilization *percent*

Default: 80
The average percent utilization for all PAC/PSC/PSC2 CPUs available to the system as measured in 10 second intervals.
percent can be configured to any integer value from 0 to 100.
This threshold setting can be disabled with **no congestion-control threshold system-cpu-utilization** command. In case later you want to enable the same threshold setting **congestion-control threshold system-cpu-utilization** command will enable the CPU utilization threshold to preconfigured level.

system-memory-utilization *percent*

Default: 80
The average percent utilization of all CPU memory available to the system as measured in 10 second intervals.
percent can be configured to any integer value from 0 to 100.

tolerance *percent*

Default: 10
The percentage under a configured threshold that dictates the point at which the condition is cleared.
percent is an integer value from 0 to 100.

Usage

Thresholds dictate the conditions for which congestion control is to be enabled and establish limits for defining the state of the system (congested or clear). These thresholds function in a similar fashion to the operation thresholds that can be configured for the system (as described in later in this chapter). The primary difference is that when these thresholds are reached, not only is an SNMP trap generated (starCongestion), but a service congestion policy is invoked as well.
The tolerance parameter establishes the threshold at which the condition is cleared. An SNMP trap (starCongestionClear) is generated for the clear condition, as well.

Example
The following command configures a system CPU utilization threshold of 75%.

```
congestion-control threshold system-cpu-utilization 75
```

This setting will remain in configuration unless you specify another threshold value in place of 75. This threshold setting can be disabled with **no congestion-control threshold system-cpu-utilization** command but can not be removed from configuration. Later if you want to enable the previously configured threshold value of *75* percent you only need to enter **congestion-control threshold system-cpu-utilization** command without specifying any threshold value and it will enable the CPU utilization threshold to preconfigured level of *75* percent.

For example, **no congestion-control threshold system-cpu-utilization** will disable the configured threshold setting and **congestion-control threshold system-cpu-utilization** will again enable the threshold setting of 75%.
The following command configures a threshold tolerance of 5%:

```
congestion-control threshold tolerance 5
```

In the above examples, the starCongestion trap gets triggered if the system CPU utilization goes above 75% and the starCongestionClear trap gets triggered if it reaches or goes below 70%.

content-filtering category database directory

This command configures the base directory to be used for storing all content-rating databases that are required for Category-based Content Filtering application.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

content-filtering category database directory path *directory_path*

default content-filtering category database directory path

default

Specifies the default base directory and directory path for Category-based Content Filtering application.

directory_path

Default: /pcmcia1/cf
Specifies the base directory and its path to store all of the full or incremental content rating databases for the Category-based Content Filtering application.
directory_path must be an alpha and/or numeric string of 1 through 255 characters in length.

Usage

Use this command to specify the directory and its path to download all full or incremental category-rating databases to be used for the Category-based Content Filtering application.
Merging of incremental database can be done as part of the database upgrade process preformed with **upgrade content-filtering category database** command in the Executive Mode.

Example

The following command configures the */flash/cf_temp/DB* as base directory to download all full and incremental content-rating databases for content filtering application.

content-filtering category database directory path */flash/cf_temp/DB*

content-filtering category database max-versions

This command configures the number of full content-rating databases to maintain/archive in the base directory for category-based content filtering application.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

content-filtering category database max-versions *num_archive*

default content-filtering category database max-versions

default

Sets the default number of full databases for specified directory path/location.

num_archive

Default: 2
Specifies the maximum number of database to be archived or maintained in the specific location.
num_archive must be an integer between 1 and 3.

Usage

Use this command to set the number of full content-rating database to be maintained in the specified directory path with the base file name specified using the **content-filtering database override file** command. Note that the specified directory path is the location specified using the **content-filtering category database directory path** command.

Example

The following command configures the system to maintain *3* full content-rating databases for category-based content filtering application.

content-filtering category database max-versions *3*

content-filtering category database override

This command specifies the name of a file to be used by the category-rating database load process for category-based content filtering application.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

content-filtering category database override file *file_name.extension*

default content-filtering category database override file

default

Sets the default content rating database file name; i.e. optcmd.bin.

file *file_name.extension*

Specifies the header of the file in the database directory path location to determine the newest full database. *file_name* must be an alpha and/or numeric string of up to 10 characters with an extension of 3 character after a period (.) as *extension*.

Usage

Use this command to configure the category-rating database file name to determine the newest version of full database. A process called "**LOAD_DATABASE**" invokes during the system startup or the database upgrade process by **upgrade content-filtering category database** command in Executive Mode. This process examines the header of each of the files in the database folder specified by **content-filtering category directory path** command in this mode.
Note that by default system examines the header of those files only which begins with the string "OPTCMDB" and having extension ".bin".

Example

The following command configures the system to examine the header of files that begins with *CF_sta.DB* only for content filtering application.

content-filtering category database override file *CF_sta.DB*

context

Enters the context configuration mode or is used to add or remove a specified context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

context *name* **[-noconfirm]**

no context *name*

no

Removes the specified context from the configuration.

name

Specifies the name of a context to enter, add, or remove. When creating a new context, the context name must be unique, it may not be the same as any existing context or any domain specified within any context.

Important: *When creating a new context, the context name specified* must not conflict with the name of any existing context or domain names.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Configure contexts or remove obsolete contexts.

Important: A maximum of 64 contexts may be created.

Example

context *sampleContext*
no context *sampleContext*

crash enable

Enables/disables the copying of crash data to a specified location.

Product

All

Privilege

Security Administrator, Administrator

Syntax

crash enable [encrypted] url *crash_url* **[filename-pattern** *pattern* **] [restrict** *mbyte* **]**

no crash enable

---

no

Removes the specified context from the configuration.

Important: System crash information is generated and stored in the crash list even when the **no** keyword is specified. The information maintained in the crash lists is minimal crash information when the **no** keyword has been specified.

---

encrypted

The URL specified is in an encrypted format for security reasons.

---

filename-pattern *pattern*

The **filename-pattern** is a string containing any or all of the following variables:

- *%hostname%* - The system hostname.
- *%ip%* - A SPIO IP address
- *%cpu%* - CPU number
- *%card%* - Card number
- *%time%* - POSIX timestamp in hexadecimal notation
- *%filename%* - Alias for *crash-%card%-%cpu%-%time-core%*
- *%%* - A single *%* sign

If no pattern is specified the result is the same as the pattern *filename*.
Use '/' characters in the filename pattern part to store crashes in per-system subdirectories.

---

url *crash_url*

Specifies the location to store crash files. *crash_url* may refer to a local or a remote file. *crash_url* must be entered using one of the following formats:

- ST16:
- **[file:]{/flash|/pcmcia1|/pcmcia2}[/***directory***]/**
- **tftp://{***host***[:***port#***]}[/***directory***]/**

- **[ftp:|sftp:]//[***username***[:***password***]@] {***host***}[:***port#***][/***directory***]/**
- ASR 5000:
- **[file:]{/flash|/pcmcia1|/hd}[/***directory***]/**
- **tftp://{***host***[:***port#***]}[/***directory***]/**
- **[ftp:|sftp:]//[***username***[:***password***]@] {***host***}[:***port#***][/***directory***]/**

Important: Use of the SMC hard drive is not supported in this release.

directory is the directory name.
filename is the actual file of interest.
username is the user to be authenticated.
password is the password to use for authentication.
host is the IP address or host name of the server.
port# is the logical port number that the communication protocol is to use.

restrict *mbyte*

Default: 128
Specifies a maximum amount of memory to use for storing crash files where mbyte is in megabytes and must be in the range from 1 through 128 megabytes.
The **restrict** keyword is only applicable to local URLs.

Usage

Enable crashes if there are systems that are not stable and the crash information will be useful for trouble shooting. The remote storage of the crash file reduces the memory utilized on the chassis.

Example

crash enable *ftp://remoteABC/pub/crash.dmp*

crash enable */flash/pub/data/crash.dmp* **restrict** *64*

no crash enable

css acsmgr-selection-attempts

This is a restricted command. In Release 9.0 and later, this command is obsoleted.

css delivery-sequence

This is a restricted command. In Release 9.0 and later, this command is obsoleted.

css service

This is a restricted command. In Release 9.0 and later, this command is obsoleted.

default

Restores the system default values for the specified parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

default { aaa { domain-matching | username-format }| autoconfirm | banner [lawful-intercept | motd | pre-login] | boot [delay | interface | nameserver | networkconfig] | card-standby-priority | cli max-sessions | congestion-control | logging { display | filter runtime } | operational-mode | pac-standby-priority | qos npu inter-subscriber traffic { bandwidth | priority [assigned-to dscp { af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 | af43 | be | ef }] } | require session recovery | snmp { engine-id | notif-threshold } | system hostname | task { facility sessmgr start | resource cpu-memory-low } | threshold { *value* } | timestamps | upgrade limit [time] [usage] }

---

aaa { domain-matching | username-format }

domain-matching - Resets the system to consider case when matching domains.
username-format - Resets the username format to the default of username @

---

autoconfirm

Restores the autoconfirm behavior to its default of disabled.

---

banner

lawful-intercept - Restores the system default message of the day for SSH CLI sessions.
motd - Restores the system default message of the day banner.
pre-login - Restores the CLI log in banner to the system default.

---

boot [delay | interface | nameserver | networkconfig]

interface | networkconfig - Restores the default boot interface and network configuration options. The keywords **interface** and **networkconfig** are used to restore the default option settings for the interface and network configuration options, respectively.
Defaulting the network configuration boot option removes the network boot option from the boot.sys file. It does not remove the network config options from the configuration file which is managed separately from the boot.sys file.
delay - Removes the boot delay setting (if any). The default for boot delay is “no boot delay”.
nameserver - Removes the nameserver IP address.

---

card-standby-priority

Resets the standby priority of the Packet Accelerator Cards and Packet Services Cards.

cli max-sessions

Restores the default value of this command to **no cli max-sessions** which removes the limit on the number of allowed simultaneous CLI sessions on the system.

congestion-control

Restores the system's congestion-control functionality to its default setting of disabled.

logging {display | filter runtime}

display: sets the default level of detail to display for trace log information to the system default.
filter runtime: resets the filtering of logged information to log in real time.

operational-mode

Sets the operational mode of the chassis to the system default.

pac-standby-priority

This parameter has been replaced by the **card-standby-priority** keyword.

qos npu inter-subscriber traffic {bandwidth | priority [assigned-to dscp { af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 | af43 | be | ef }] }

Restores the following NPU QoS parameters to their default values:

- **bandwidth** :
- gold : 10%
- silver : 20%
- bronze: 30%
- best-effort: 40%
- **priority** : All DSCP values are mapped to the best-effort priority queue but are not configured.

require session recovery

Resets the session recovery feature to its default setting of disabled.

snmp { engine-id | notif-threshold | system hostname | timestamps }

engine-id: restores the SNMP engine ID to the system default.
notif-threshold: restores the SNMP notification threshold to the system default.

task { facility sessmgr start | resource cpu-memory-low }

facility sessmgr start: Restores the default session manager start policy.
resource cpu-memory-low: Resets the system so that when a CPU runs very low on memory (below 12MB) the most over limit task is killed.

system hostname

Sets the system host name for SNMP use to the system default value.

threshold { *value* }

Restores thresholding values to their default setting. The possible values are:

- **10sec-cpu-utilization**: CPU utilization using a 10 sec average.
- **aaa-acct-failure**: AAA accounting failure threshold settings
- **aaa-acct-failure-rate**: AAA accounting failure rate threshold settings
- **aaa-auth-failure**: AAA authentication failure threshold settings
- **aaa-auth-failure-rate**: AAA authentication failure rate threshold settings
- **aaa-retry-rate**: AAA retry rate threshold settings
- **call-reject-no-resource**: Calls rejected due to no resources threshold settings
- **call-setup**: Calls setup threshold settings
- **call-setup-failure**: Call setup failure threshold settings
- **cpu-available-memory**: CPU available memory threshold settings
- **cpu-load**: PAC/PSC/PSC2 CPU load using a 5 minute average measurement
- **cpu-memory-usage**: Percentage of total CPU memory usage
- **cpu-session-throughput**: CPU session throughput threshold settings
- **cpu-utilization**: CPU utilization threshold settings
- **license**: Session license threshold settings
- **model**: Thresholding model settings
- **monitoring**: Threshold monitoring configuration settings
- **packets-filtered-dropped**: Filtered/dropped packet threshold settings
- **packets-forwarded-to-cpu**: Forwarded packet threshold settings
- pdif-current-sessions: Threshold monitoring for all current PDIF sessions.
- pdif-current-active-sessions: Threshold monitoring for only the currently-active PDIF sessions.
- **per-service-ggsn-sessions**: The number of GGSN sessions per GGSN service
- **per-service-gprs-sessions**: The number of GPRS sessions per GPRS service
- **per-service-gprs-pdp-sessions**: The number of PDP contexts per GPRS service
- **per-service-ha-sessions**: The number of HA sessions per HA service
- **per-service-lns-sessions**: The number of LNS sessions per LNS service
- **per-service-pdsn-sessions**: The number of PDSN sessions per PDSN service
- **per-service-sgsn-sessions**: The number of SGSN sessions per SGSN service
- **per-service-sgsn-pdp-sessions**: The number of PDP contexts per SGSN service
- **poll**: Threshold polling interval configuration settings
- **total**: Total subscriber threshold settings
- **total-ggsn-sessions**: Total GGSN sessions for all GGSN services in the system
- **total-gprs-sessions**: Total GPRS sessions per for all GPRS services in the system
- **total-gprs-pdp-sessions**: Total PDP contexts for all GPRS services in the system
- **total-ha-sessions**: Total HA sessions for all HA services in the system

- **total-lns-sessions**: Total LNS sessions for all LNS services in the system
- **total-pdsn-sessions**: Total PDSN sessions for all PDSN services in the system
- **total-sgsn-sessions**: Total SGSN sessions per for all SGSN services in the system
- **total-sgsn-pdp-sessions**: Total PDP contexts for all SGSN services in the system

timestamps

Resets the inclusion of timestamps in command.

upgrade limit [time] [usage]

Sets upgrade limit values to the defaults. If the optional keywords are not specified all values are reset to their defaults.
time: Resets the maximum time a session may exist during a software upgrade to the default of 120.
usage: Resets the minimum number of sessions before closing the sessions during a software upgrade to the system default of 100.

Usage

Restore system defaults to aid in trouble shooting or just prior to modifying additional configuration options.

Example

```
default banner motd
default boot
default logging display
default system hostname
default upgrade limit time
```

diameter-proxy ram-disk-limit

This command configures the amount of extra RAM disk space in MB to be allocated to Diamproxy task when local storage (hard disk) is enabled.

Product

SGW, PGW, HSGW

Privilege

Security Administrator, Administrator

Syntax

diameter-proxy ram-disk-limit mb *space_mb*

default diameter-proxy ram-disk-limit mb

default

Configures the default setting.
Default: 32 MB

mb space_mb

Specifies the storage space in MB.
space_mb must be an integer from 10 through 256.

Usage

Specifies the additional storage space to be allocated to Diamproxy for file write, in MB. The specified memory in MB is added to the existing memory allocated to Diamproxy only if HDD storage is enabled. By default, 32 MB is additionally allocated.

Example

The following command specifies that 100 MB of additional storage space be allocated tot he Diamproxy task:

diameter-proxy ram-disk-limit mb *100*

end

Exits the Global Configuration Mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec Mode.

enforce imsi-min equivalence

Enables the PDSN/HA to treat IMSI and MIN as the same for identifying the PDSN/HA session.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
enforce imsi-min equivalence

[ no | default ] enforce imsi-min equivalence
```

`[ no | default ]`

Disables the PDSN/HA from treating IMSI and MIN as the same for identifying the PDSN/HA session.
Default: Disabled.

Usage

Generally on an HA, the IMSI and MIN are treated as different and hence the RRQs with 1x and DO PDSNs are processed as different sessions. You can use this feature to treat the IMSI and MIN with the matching lower 10-digit as the same for identifying a session. The 10-digit MIN and the 15-digit IMSI are treated as equivalent for the purpose of matching sessions if the lower 10 digits are the same. Any handoff from 1x to DO or vice-versa is treated as the same session if the NAI and HoA also match. If the NAI and/or HoA do not match, then the duplicate IMSI session detect and terminate feature is applicable.
Generally on a PDSN, the IMSI and MIN are treated as different and hence RP messages from 1x and DO PDSNs are processed as different sessions. You can use this feature to treat the IMSI and MIN with the matching lower 10-digit as the same for identifying a session. The 10-digit MIN and the 15-digit IMSI are treated as equivalent for the purpose of matching PDSN sessions if the lower 10 digits are the same. Any handoff from 1x to DO or vice-versa is treated as the same session.

Example

To monitor or clear subscriber session information filtered by on IMSI/MIN refer to the **`show subscribers msid`** command.

Important: This command must be executed at startup only and will not take effect when reconfigured without rebooting.

Example

The following command enables the treatment of the IMSI and MIN as the same for identifying the session:

```
enforce imsi-min equivalence
```

Either of the following commands disables the treatment of the IMSI and MIN as the same for identifying sessions:

```
no enforce imsi-min equivalence

default enforce imsi-min equivalence
```

exit

Exits the Global Configuration Mode, and returns the CLI session to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to change to the parent configuration mode. This command has the same effect as the **end** command as the Global Configuration Mode's parent mode is the Exec Mode.

gtpp compression-process

This command configures the maximum number of child compression processes that AAA proxy can have. This command is only applicable to the ASR 5000 platform.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp compression-process *max_number*

default gtpp compression-process

default

Restores the system to the default settings for the number of child compression processes allowed.

max_number

Specifies the maximum number of child processes. The default is 1
max_number: Must be an integer from 1 to 4.

Usage

This command configures the maximum number of child compression processes that AAA proxy can have only if hard disk storage is enabled.

Example

gtpp compression-process *3*

gtpp ram-disk-limit

This command configures additional storage space to be allocated for writing files. This command is only applicable to the ASR 5000 platform.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp ram-disk-limit mb *mega_bytes*

default gtpp ram-disk-limit

default

Restores the system to the default settings of 32 MB of storage.

mb *mega_bytes*

Specifies the number of megabytes of storage allocated for files.
mega_bytes: Must be an integer from 10 to 256. The default is 32 MB.

Usage

The memory specified with this command would be added to the existing memory allocated to the AAA proxy only if hard disk storage is enabled.

Example

gtpp ram-disk-limit mb *256*

gtpp single-source

Configures the system to reserve a CPU for performing a proxy function for accounting.

Product

GGSN, SGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
gtpp single-source [ centralized-lrsn-creation | private-extensions ]

no gtpp single-source
```

centralized-lrsn-creation

Defines the LRSN generation at proxy. The AAA proxy will generate the LRSN for all CDR types generated by either the GGSN or the SGSN.
Default: disabled

private-extensions

It is an optional keyword, enables the proprietary use of customer-specific GTPP extensions.
If **private-extensions** is not configured, all customer specific private extensions related to GTPP message transfer with CGF and recovery through GSS are disabled.

Important: In order for the customer-specific extensions to work properly, the **gtpp max-pdu-size** command in the Context Configuration Mode should be set to 65400 and the **gtpp server** command's **max** value should be set to "1".

no

Disables GTPP single-sourcing. This is the default setting.

Caution: Entering this command while PDP contexts are in process could cause the loss of pending CDRs. The configuration must be saved and the chassis reloaded for this option to take effect.

Usage

When GTPP single-sourcing is enabled, the system's AAA proxy function generates requests to the accounting server using a single UDP source port number, instead of having each AAA Manager generate independent requests with unique UDP source port numbers. This is accomplished by the AAA Managers forwarding their GTPP PDUs to the AAA Proxy function that runs on a reserved PAC/PSC/PSC2 CPU. Since a PAC/PSC/PSC2 CPU is being reserved, fewer Session Managers and AAA Managers will be started on that PAC/PSC.

Caution: This command must be entered prior to the configuration of other services. Specifying it later may return an error due to a lack of CPU availability.

Example

The following command enables GTPP single-sourcing with the use of private GTPP extensions:

```
gtpp single-source private-extensions
```

The following command disables GTPP single-sourcing:

```
no gtpp single-source
```

global-title-translation address-map

Creates an instance of a Global Title Translation (GTT) address-map, a database, for global titles (ISDN-type address) used for SCCP routing. Upon creating the instance, the system enters global title translation address-map configuration mode. For the commands to configuration the database, go to the Global Title Translation Address-Map Configuration Mode chapter in this guide.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

global-title-translation address-map *name*

no global-title-translation address-map *name*

no

Removes the specified GTT address-map database from the SCCP portion of the configuration.

name

This value uniquely identifies a specific instance of a GTT address-map.
name: must be a string of 1 to 63 alphanumeric characters.

Usage

Create a GTT address-map with a unique identifier and enter the GTT address-map configuration mode.

Example

global-title-translation address-map *gtt-map1*

global-title-translation association

Creates an instance of a Global Title Translation (GTT) association which defines the rules for handling global title translation. Upon creating the instance, the system enters global title translation association configuration mode. For the commands to configure the rules, go to the Global Title Translation Association Configuration Mode chapter in this guide.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

global-title-translation association *name*

no global-title-translation association *name*

no

Removes the specified instance of a GTT association from the SCCP portion of the configuration.

name

This value uniquely identifies a specific instance of a GTT association.
name: must be a string of 1 to 63 alphanumeric characters.

Usage

Create a GTT association with a unique identifier and enter the GTT association configuration mode.

Example

global-title-translation association *gtt-assoc1*

hd raid

Provides access to a local RIAD hard drive configuration mode in order to manage parameters supporting local storage of records.

Product

All

Privilege

Security Administrator, Administrator

Syntax

hd raid

raid

Provides access to the HD RAID configuration mode in order to manage the RAID on the ASR 5000 SMC hard drive.

Usage

Enters the HD RAID configuration mode.
Entering this command results in the following prompt:

```
[context_name]hostname(config-hd-raid)#
```

HD RAID Configuration Mode commands are defined in the HD RAID Configuration Mode Commands chapter.

Example

The following command opens the hd-raid mode:

hd raid

hd storage-policy

Provides access to the local hard drive configuration mode in order to manage parameters supporting local storage of records.

Product

GGSN, SGSN, HSGW, P-GW, S-GW

Privilege

Administrator

Syntax

hd storage-policy *name*

no hd storage-policy *name*

no

Removes a configured HD storage policy from the system.

storage-policy *name*

Specifies a name for an HD storage policy and enters the HD Storage Policy Configuration Mode. *name* must be from 1 to 63 alpha and/or numeric characters.

Usage

Creates a new policy or specifies an existing policy and enters the HD Storage Policy Configuration Mode. Entering this command results in the following prompt:
[*context_name*]*hostname*(config-hd-storage-policy)#
HD Storage Policy Configuration Mode commands are defined in the HD Storage Policy Configuration Mode Commands chapter.

Example

The following command creates an HD storage policy named *policy3* and enters the HD Storage Policy Configuration Mode:

hd storage-policy *policy3*

high-availability

Configures PAC/PSC/PSC2 task failure detection speed.

Product

PDSN, GGSN, ASN GW

Privilege

Security Administrator, Administrator

Syntax

```
high-availability fault-detection speed { agressive | normal }

default high-availability fault-detection speed
```

{ agressive | normal }

Default: **normal**

- **aggressive**: Initiates PAC/PSC failover without performing additional checks.
- **normal**: Initiates PAC/PSC failover after additional checks are performed.

Usage

Use this command to increase the fault detection speed for faster switchovers after a PAC/PSC/PSC2 task failure.

Setting fault detection speed to aggressive will trigger PAC/PSC/PSC2 failover as soon as possible if a potential failure is detected. Aggressive mode will reduce the duration of subscriber outages caused by a failed PAC/PSC/PSC2 if session recovery is enabled.

Aggressive mode also bypasses most information gathering steps and logs that can be used to determine the root cause of the failure.

In normal mode, additional checks are performed before triggering a PAC/PSC/PSC2 failover to ensure the card has actually failed. In aggressive mode these checks are bypassed so that session recovery can start as soon as possible. These additional checks reduce the likelihood of a false positive failure.

Example

The following command sets the fault detection speed for PAC/PSC/PSC2/tasks to **aggressive**:

```
high-availability fault-detection speed agressive
```

license

Configures the session license key.

Product

All

Privilege

Security Administrator, Administrator

Syntax

license key *key_value* **[-force] session-limit**

no license key *key_value* **[-force] session-limit**

no

Removes the license key(s) installed.

key *key_value*

Installs the license key specified by *key_value*. *key_value* is provided by Cisco Systems operations staff.

session-limit

Use this keyword to suppress fail-over calls from being rejected if the licensed threshold is crossed.

Important: This is a customer-specific command that is available for HA, PDSN, EHA, and PDIF. Please contact your local sales representative for more information.

-force

Sets the license key even if resources are not available. The system supports the dynamic resizing of demultiplexor software tasks based on the licensed session capacity and feature type. When installing a license, the system automatically attempts to resize currently functioning tasks. Warning messages are displayed if there is an issue. Though it's use is not recommended, the -force keyword can be used to suppress these warning messages.

Caution: Use of this option is not recommended.

Usage

Install or update system session keys when necessary due to expiration and/or capacity needs.

Example

license key *sampleKeyValue*

```
no license key
```

line

Enters the terminal display line configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
line
```

Usage

Change the terminal display configuration based upon the users own terminal characteristics.

local-user allow-aaa-authentication

Enables/disables the use of administrative accounts other than local-user administrative accounts.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
local-user allow-aaa-authentication

no local-user allow-aaa-authentication

default local-user allow-aaa-authentication
```

no

Disables administrative user accounts other than local-user accounts.

default

Returns this parameter to its default setting of enabled.

Usage

Local-user administrative accounts are separate from other administrative user accounts configured at the context level (Security Administrator, Administrator, Operator, and Inspector).
Context-level administrative users rely on the system's AAA subsystems for validating user names and passwords during login. This is true for both administrative user accounts configured locally through a configuration file or on an external RADIUS server.
Since the T1.276-2003 password security mechanisms are supported only for local-user administrative accounts and not for the AAA-based administrative accounts, this command provides a mechanism for disabling AAA-based administrative accounts.
By default, AAA-based administrative accounts are allowed.

Example

The following command forces the system to authenticate local-user accounts based only on the information in the security account file on its CompactFlash:

```
no local-user allow-aaa-authentication
```

local-user lockout-time

Configures the lockout period for local-user administrative accounts.

Product

All

Privilege

Security Administrator, Administrator

Syntax

local-user lockout-time *time*

default local-user lockout-time

default

Restores the parameter to its default setting.

time

Default: 60
The amount of time that must elapse before a previously locked-out local-user account can attempt to login again. *time* is measured in minutes and can be configured to any integer value between 1 and 10080.

Usage

Local-user administrative accounts can become locked for reasons such as exceeding the configured maximum number of login failures.
Once an account is locked, this parameter specifies the lockout duration. Once the amount of time configured by this parameter has elapsed, the local-user can once again attempt to login.

Example

The following command configures a lockout time of 120 minutes (2 hours):

local-user lockout-time *120*

local-user max-failed-logins

Configures the maximum number of failed login attempts a local-user can have before their account is locked out.

Product

All

Privilege

Security Administrator, Administrator

Syntax

local-user max-failed-logins *number*

no local-user max-failed-logins

default local-user max-failed-logins

no

Disables this functionality.

default

Restores this parameter to its default setting.

number

Default: 5
Specifies the maximum number of times a local-user could experience a login failure before their account is locked out. number can be configured to any integer value between 2 and 100.

Usage

This command configures the maximum number of failed login attempts a local-user can have before their account is locked out. For example if, this parameter is configured to "3" then after the third failed login attempt, the account would be locked.

Important: Local-user accounts can be configured to either enforce or reject a lockout due to the maximum number of failed login being reached. Refer to the **local-user username** command for more information.

Refer to the **local-user lockout-time** command for more information.

Example

The following command configures a maximum of three login attempts:

local-user max-failed-logins *3*

local-user password

Configures local-user administrative account password properties.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
local-user password { [ complexity { ansi-t1.276-2003 | none } ] [ history
length number [ duration days ] ] [ max-age days ] [ min-change-char number ] [
min-change-interval days ] [ min-length number ] }

no local-user password { [ history ] [ max-age ] [ min-change-interval ] }

default local-user password { [ complexity ] [ history ] [ max-age ] [ min-
change-char ] [ min-change-interval ] [ min-length ] }
```

no

Disables the specified parameter.

default

Restores the specified parameter to its default setting.

[complexity { ansi-t1.276-2003 | none }]

Default: ansi-t1.276-2003
Specifies the password strength as one of the following:

- **ansi-t1.276-2003:** If this option is selected, then the following rules are enforced:
- Passwords may not contain the username or the reverse of the username
- Passwords may contain no more than 3 of the same characters used consecutively
- Passwords must contain at least three of the following:
- upper case alpha character
- lower case alpha character
- numeric character
- special character
- **none:** No additional password checks are performed.

[history length *number* **[duration** *days* **]]**

Default: length is 5
Specifies the number of previous password entries kept in the history list maintained by the system. A password can not be reused if it is one of the entries kept in the history list unless the time it was last used was more than the number of days specified by the **duration** keyword.
If the duration keyword is not used, the only check performed by the system is that it is not in the history list.

number is the number of entries for each account stored in the history list and can be configured to any integer value from 1 to 100. *days* is the number of days during which a password can not be reused and can be configured to any integer value between 1 and 365.

[max-age *days* **]**

Default: 90
Specifies the maximum age for a password. Users logging in with a password older than the specified limit are locked out. Once the lockout period expires, at their next login attempt, they are prompted to change their password before accessing the CLI.

Important: Local-user accounts can be configured to either enforce or reject a lockout due to a password's maximum age being reached. Refer to the **local-user username** command for more information.

days is the number of days that passwords remain valid and can be configured to any integer value from 1 to 365.

[min-change-char *number* **]**

Default: 2
Specifies the minimum number of characters that must be changed (in comparison to the current password) when a user changes their password.

Important: Changes in password length are counted as "character" changes. For example: changing a password from "password" to "passwo" is a 2-character change, changing a password from "password" to "password2" is a 1-character change, and changing a password from "password" to "apassword" is a 9-character change.

number is the number of characters and can be configured to any integer value between 0 and 16.

[min-change-interval *days* **]**

Default: 1
Specifies the frequency that passwords can be changed (other than first login).
days is the minimum number of days that must pass before a user can change their password. It can be configured to any integer value from 1 to 365.

Important: If the **no local-user password min-change-interval** command is used, users may change their password as often as desired which could allow them to circumvent the password history function.

[min-length *number* **]**

Default: 8
Specifies the minimum length allowed for user-defined password.
number is the minimum number of alpha and/or numeric characters that the password must contain and can be configured to any integer value between 3 and 32.

Usage

This command is used to set the property requirements for user-defined passwords and system behavior in relation to those passwords.

Information pertaining to user passwords, login failures, and password history are stored on the SPC's/SMC's CompactFlash and in the software's Shared Configuration Task (SCT).
The system uses the information in SCT for runtime operations such as determining password ages and determining if new passwords meet the criteria specified by this command.

Example
The following command configures a minimum password length requirement of 6 characters:

```
local-user password min-length 6
```

The following command configures the system to store the 4 most recently used passwords per user-account in the history list:

```
local-user password history length 4
```

local-user username

Adds/removes local-user administrative accounts.

Product

All

Privilege

Security Administrator, Administrator

Syntax

local-user username *name* **[authorization-level { administrator | inspector | operator | security-admin }] [ecs | noecs] [ftp | noftp] [timeout-min-absolute** *time* **] [timeoute-min-idle** *time* **] [no-lockout-login-failure] [no-lockout-password-aging] password** *password*

no local-user username *name*

---

no

Removes a previously configured user.

---

name

Specifies the name of the user. The name must be from 3 to 16 alpha and/or numeric characters in length and is case sensitive.

[authorization-level { administrator | inspector | operator | security-admin }]

Default: Operator

Configures the authorization level for the user as one of the following:

- **administrator:** Administrator users have read-write privileges and can execute any command throughout the CLI except for a few security functions allowed only in the administrator mode. Administrators can configure or modify the system and are able to execute all system commands, including those available to the operator and inspector user. This level corresponds to the both the System Administrator and Application Administrator levels in the T1.276-2003.
- **inspector:** Inspector users are limited to a small number of read-only Exec Modecommands.The bulk of these are “show” commands giving the inspector the ability to view a variety of statistics and conditions. The Inspector cannot execute show configuration commands and do not have the privilege to enter the Config Mode.
- **operator:** Operator users have read-only privileges to a larger subset of the Exec Mode commands as depicted in the following figure. Operator users can execute all commands that are part of the inspector mode, plus some system monitoring, statistic, and fault management functions. Operators do not have the ability to enter the Config Mode.
- **security-admin:** Security Administrator users have read-write privileges and can execute any command throughout the CLI. Security Administrators can execute all system commands, including those available to the administrator, operator, and inspector users. This level corresponds to both the System Security Administrator and Application Security Administrator levels in T1.276-2003.

[ecs | noecs]

Default: ecs
Specifies whether or not the user has access to configuration parameters pertaining to the Active Charging Service.

- **ecs**: The user has access.
- **noecs**: The user does not have access.

[ftp | noftp]

Default: ftp
Specifies whether or not the user is allowed to access the system via the File Transfer Protocol (FTP) and/or the Secure File Transfer Protocol (SFTP).

- **ftp**: The user has access.
- **noftp**: The user does not have access.

[timeout-min-absolute *time* **]**

Default: 0
Specifics the maximum session time for this user. *time* is measured in minutes and can be configured to any integer value between 0 and 525600. A value of "0" indicates no limit.

Important: This limit applies only to the user's CLI sessions.

[timeout-min-idle *time* **]**

Default: 0
Specifics the maximum idle time for this user. *time* is measured in minutes and can be configured to any integer value between 0 and 525600. A value of "0" indicates no limit.

Important: This limit applies only to the user's CLI sessions.

[no-lockout-login-failure]

Default: Disabled
Specifies that this user will never be locked out due to login attempt failures.

[no-lockout-password-aging]

Default: Disabled
Specifies that this user will never be locked out due to the age of their password.

password *password*

Specifies the initial password for this user. *password* must from 6 to 32 alpha and or numeric characters in length in length and is case sensitive.

Important: The user is requested to change their password upon their first login.

Usage

The ability to configure administrative local-users is provided in support of the login security mechanisms specified in ANSI T1.276-2003.
Like administrative users configured at the context level, local-users can be assigned one of 4 security levels:

Local-User Level User	Context Level User
Security Administrator	Administrator
Administrator	Config-Administrator
Operator	Operator
Inspector	Inspector

Local-user configuration support is handled differently from that provided for administrative users configured at the context level.
Context-level administrative users rely on the system's AAA subsystems for validating user names and passwords during login. This is true for both administrative user accounts configured locally through a configuration file or on an external RADIUS server. Passwords for these user types are assigned once and are accessible in the configuration file.
Local-user account information (passwords, password history, lockout states, etc.) is maintained in non-volatile memory on the CompactFlash module and in the software's Shared Configuration Task (SCT). This information is maintained in a separate file--not in configuration files used by the system. As such, the configured local-user accounts are not visible with the rest of the system configuration.
Local-user and context-level administrative accounts can be used in parallel.

Example
The following command configures a security-administrator level local-user administrative account for a user named *User672* that has FTP privileges, a temporary password of *abc123*, and that does not lockout due to either login attempt failures or password aging:

```
local-user username User672 authorization-level security-admin ftp no-
lockout-login-failure no-lockout-password-aging password abc123
```

The following command deletes a previously configured local-user administrative account called admin32:

```
no local-user username admin32
```

logging console

Enables the output of logged events to be displayed on the console terminal.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
logging console

no logging console
```

no

Disables the output of events to the console port.

Usage

Log console output to allow for offline review during system monitoring and/or trouble shooting.

logging disable

Enables/disables the logging of the specified event ID or range of IDs.

Product

All

Privilege

Security Administrator, Administrator

Syntax

logging disable eventid *id* **[to** *to_id* **]**

no logging disable eventid *id* **[to** *to_id* **]**

no

Indicates the event IDs specified are to be enabled for logging.

eventid *id*

Specifies the event for which no logging is to occur. *id* must be a value in the range 1 through 100000.

to *to_id*

Specifies the end ID of the events when a range of event ID is to be disabled from being logged. *to_id* must be a value in the range 1 through 100000. The *to_id* must be equal to or larger than the *id* specified.

Usage

Disable common events which may occur with a normal frequency are not of interest in monitoring the system for troubles.

Example

The following commands disables the logging of event ID 4580 and the range of events from 4500 through 4599, respectively.

logging disable eventid *4580*

logging disable eventid *4500* **to** *4599*

The following enables the subset of disabled event IDs:

no logging disable eventid *4500* **to** *4549*

logging display

Configures the level of detail for information to be logged.

Product

All

Privilege

Security Administrator, Administrator

Syntax

logging display event-verbosity *evt_level* **] [pdu-data** *format* **] [pdu-verbosity** *pdu_level* **]**

event-verbosity *evt_level*

Specifies the level of verboseness to use in logging of events as one of:

- min
- concise
- full

pdu-data *format*

Specifies output format for packet data units when logged as one of:

- none
- hex
- hex-ascii

Where none results in the output in raw format, hex results in the output being displayed in hexadecimal format, and hex-ascii results in the output being displayed in hexadecimal and ASCII similar to a main-frame dump.

pdu-verbosity *pdu_level*

Specifies the level of verboseness to use in logging of packet data units as a value from 1 to 5 where 5 is the most detailed.

Usage

Tune the level of information to be logged so as to avoid flooding a log file with information which is not useful or critical.

Example

The following sets the logging display for events to the maximum.

```
logging display event-verbosity full
```

The following command sets the logging display level of detail for packet data units to level 3 and sets the output format to the main-frame style hex-ascii:

logging display pdu-data *hex-ascii* **pdu-verbosity** *3*

logging filter

Configures the logging of events to be done in real time for the specified facility.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
logging filter runtime facility facility level report_level [ critical-info |
no-critical-info ]
```

facility *facility*

Specifies the facility to modify the filtering of logged information for as one of:

- **a10:** A10 interface facility
- **a11:** A11 interface facility
- **a11mgr:** A11 Manager facility
- **aaa-client:** AAA client facility
- **aaamgr:** AAA manager logging facility
- **aaaproxy:** AAA Proxy facility
- **acl-log:** Access Control List logging facility
- **acsctrl:** Active Charging Service (ACS) Controller facility
- **acsmgr:** Active Charging Service (ACS) Manager facility
- **alarmctrl:** Alarm Controller facility
- **all:** All facilities
- **asf:** Voice Application Server Framework logging facility
- **asfprt:** ASF Protocol Task (SIP) logging facility
- **asngwmgr:** ASN Gateway Manager facility
- **asnlrmgr:** ASN Paging/Location-Registry Manager facility
- **bgp:** Border Gateway Protocol (BGP) facility
- **bssap+:** Base Station Sub-system Application Part+ logging facility
- **bssgp:** Base Station Sub-system GPRS Protocol logging facility
- **cap:** Camel Application Part logging facility
- **chatconf:** Voice Chat/Conference logging facility
- **cli:** CLI logging facility
- **credit-control:** Credit Control facility
- **cscf:** IMS/MMD CSCF
- **cscfmgr:** SIP CSCF Manager facility

- **csp:** Card Slot Port controller facility
- **css:** Content Service Selection (CSS) facility
- **css-sig:** Content Service Selection (CSS) RADIUS Signaling facility
- **dcardctrl:** IPSEC Daughter card Controller logging facility (not used at this time)
- **dcardmgr:** IPSEC Daughter card Manager logging facility (Not used at this time)
- **demuxmgr:** Demux Manager API facility
- **dgmbmgr:** Diameter Gmb Application Manager logging facility
- **dhcpv6:** DHCPV6
- **dhcp:** DHCP facility (GGSN product only)
- **dhost:** Distributed Host logging facility
- **diameter:** Diameter endpoint logging facility
- **diameter-acct:** Diameter Accounting
- **diameter-auth:** Diameter Authentication
- **diameter-ecs:** ECS Diameter signaling facility
- **diameter-svc:** Diameter Service
- **diamproxy:** DiamProxy logging facility
- **dpath:** IPSEC Data Path facility
- **drvctrl:** Driver Controller facility
- **ds3mgr:** DS3 Manager logging facility
- **eap-ipsec:** EAP
- **ecs-css:** ACSMGR <-> Session Manager Signalling Interface Logging facility
- **evlog:** Event log facility
- **famgr:** Foreign Agent manager logging facility
- **firewall**: Inline per-subscriber Stateful Firewall facility
- **gmm:** GMM Protocol logging facility
- **gprs-ns:** GPRS-NS Protocol logging facility
- **gss-gcdr:** GTPP Storage Server GCDR facility
- **gtpc:** GTP-C protocol logging facility (GGSN product only)
- **gtpcmgr:** GTP-C protocol Manager logging facility (GGSN product only)
- **gtpp:** GTP-PRIME protocol logging facility (GGSN product only)
- **gtpu:** GTP-U protocol logging facility (GGSN product only)
- **h248prt**: H.248 Protocol logging facility
- **hamgr:** Home Agent manager logging facility
- **hat:** High Availability Task (HAT) process facility
- **hdctrl:** HD Controller logging facility
- **igmp:** IGMP
- **ikev2:** IKEv2

- **ims-authorizatn:** IMS Authorization Service facility
- **ims-sh:** HSS SH Service facility
- **imsimgr:** SGSN IMSI Manager facility
- **ip-arp:** IP Address Resolution Protocol facility
- **ip-interface:** IP interface facility
- **ip-route:** IP route facility
- **ipsec:** IP Security logging facility
- **ipsg:** IP Service Gateway interface logging facility
- **ipsgmgr:** IP Services Gateway facility
- **ipsp:** IP Pool Sharing Protocol logging facility
- **kvstore:** KV Store facility
- **l2tp-control:** L2TP control logging facility
- **l2tp-data:** L2TP data logging facility
- **l2tpdemux:** L2TP Demux Manager logging facility
- **l2tpmgr:** L2TP Manager logging facility
- **li:** Lawful intercept facility (Logs are visible only to system accounts with li-administrator privileges.)
- **linkmgr:** SGSN/SS7 Links Manager facility
- **llc:** Logical Link Control (LLC) Protocol logging facility
- **m3ua:** MTP3 User Adaptation (M3UA) Protocol logging facility
- **map:** Mobile Application Part (MAP) Protocol logging facility
- **megadiammgr:** Megadiameter Manager (SLF Service)
- **mmgr:** Master Manager logging facility
- **mobile-ip:** Mobile IP processes
- **mobile-ip-data:** Mobile IP data facility
- **mobile-ipv6:** Mobile IPv6 control logging facility
- **mtp3:** Message Transfer Part (MTP3) Protocol logging facility
- **multicast-proxy:** Multicast Proxy logging facility
- **netwstrg:** Network Storage facility
- **npuctrl:** Network Processor Unit Control facility
- **npumgr:** Network Processor Unit Manager facility
- **nsctrl:** Charging Service Controller facility (supported in conjunction with ECSv1)
- **nsmgr:** Charging Service Manager facility
- **nsproc:** Charging Service process facility
- **orbs:** Object Request Broker System logging facility
- **ospf:** OSPF logging facility
- **pdif:** PDIF logging facility
- **pmm-app:** PMM application logging facility

- **ppp:** PPP link and packet facilities
- **ptt:** Voice push-to-talk logging facility
- **push:** VPNMGR CDR push logging facility
- **radius-acct:** RADIUS accounting logging facility
- **radius-auth:** RADIUS authentication logging facility
- **radius-coa:** RADIUS change of authorization and radius disconnect
- **ranap:** RANAP Protocol logging facility
- **rct:** Recovery Control Task logging facility
- **rdt:** Redirect Task logging facility
- **resmgr:** Resource Manager logging facility
- **rip:** RIP logging facility (RIP is not supported at this time.)
- **rohc:** RObust Header Compression facility
- **rsvp:** Reservation Protocol logging facility
- **sccp:** SCCP Protocol logging facility
- **sct:** Shared Configuration Task logging facility
- **sctp:** SCTP Protocol logging facility
- **sessctrl:** Session Controller logging facility
- **sessmgr:** Session Manager logging facility
- **sft:** Switch Fabric Task logging facility
- **sgsn-app:** SGSN-APP interface logging facility
- **sgsn-gtpc:** SGSNs GTP-C Protocol logging facility
- **sgsn-gtpu**: SGSNs GTP-U Protocol logging facility
- **sgsn-misc**: SGSN miscellaneous logging facility
- **sgsn-system:** SGSNs System Components logging facility
- **sgsn-test:** SGSN Tests logging facility
- **sgtpcmgr:** SGSN GTPC Manager facility
- **sipcdprt:** Sip Call Distributor facility
- **sitmain:** System Initialization Task main logging facility
- **sm-app:** Session Management (SM) Protocol logging facility
- **sms:** Short Message Service (SMS) logging facility
- **sndcp:** Sub-Network Dependent Convergence (SNDCP) Protocol logging facility
- **snmp:** SNMP logging facility
- **srdb:** Static Rating Database
- **srp:** Service Redundancy Protocol (SRP) logging facility
- **sscfnni:** Service Specific Co-ordination Function for UNNI (SCFNNI) Protocol logging facility
- **sscop:** Service Specific Connection Oriented Protocol (SSCOP) logging facility
- **ssh-ipsec:** SSH IP Security logging facility

- **stat:** Statistics logging facility
- **system:** System logging facility
- **tacacsplus:** TACACS+ Protocol logging facility
- **taclcp:** Type Allocation Code (TAC) Local Call Processing logging facility
- **tcap:** Transaction Capabilities Application Part (TCAP) Protocol logging facility
- **threshold:** threshold logging facility
- **ttg:** TTG logging facility
- **tucl:** TUCL logging facility
- **udr:** User detail record facility (used with the Charging Service)
- **user-data:** User data logging facility
- **user-l3tunnel:** User layer-3 tunnel logging facility
- **vim:** Voice Instant Messaging logging facility
- **vinfo:** Voice Information logging facility
- **vpn:** Virtual Private Network logging facility
- **wimax-data:** WiMAX DATA
- **wimax-r6:** WiMAX R6

`level` *`report_level`* **`[ critical-info | no-critical-info ]`**

`level` *`report_level`*: specifies the level of information to be logged, *`report_level`*, as one of:

- critical
- debug
- error
- info
- trace
- unusual
- warning.

`critical-info` | **`no-critical-info`**: indicates if critical information is to be displayed or not. The keyword **`critical-info`** specifies that events with a category attribute of critical information are to be displayed. Examples of these types of events can be seen at bootup when system processes and tasks are being initiated. The **`no-critical-info`** keyword specifies that events with a category attribute of critical information are not to be displayed.

Usage

This command is useful when it is necessary to get real time output of events. Event output may be cached otherwise which may make it difficult to trouble shoot problems which do not allow the last cache of events to be output prior to system problems.

Caution: Issuing this command could negatively impact system performance depending on system loading, the log level, and/or the type of facility(ies) being logged.

Example

Set real time output for the point-to-point protocol facility and all facilities, respectively, to avoid logging of excessive information.

```
logging filter runtime facility ppp

logging filter runtime facility all level warning
```

logging monitor

Enables/disables the monitoring of a specified user.

Product

All

Privilege

Security Administrator, Administrator

Syntax

logging monitor { ipaddr *ip_address* **| msid** *ms_id* **| username** *user_name* **}**

no logging monitor { ipaddr *ip_address* **| msid** *ms_id* **| username** *user_name* **}**

no

Disables the monitoring of the user specified by the options given.

ipaddr *ip_address*

Specifies the IP address of the user for which the monitoring filter is to be set. *ip_address* must be an IP v4 address in dotted decimal notation.

msid *ms_id*

msid *ms_id*: specifies the mobile subscriber ID for which the monitoring filter is to be set. *ms_id* must be from 7 to 16 digits.
This keyword/option can be used to specify the Mobile Subscriber ISDN (MSISDN) for GGSN calls which enables logging based on MSISDN.

username *user_name*

username *user_name*: specifies a user for which the monitoring filter is to be set. *user_name* must refer to a previously configured user.

Usage

Monitor subscribers which have complaints of service availability or to monitor a test user for system verification.

Caution: Issuing this command could negatively impact system performance depending on the number of subscribers for which monitoring is performed and/or the amount amount of data they're passing.

Example

The following command enables the monitoring of user *user1* and mobile subscriber ID 4441235555, respectively.

```
logging monitor username user1

logging monitor msid 44441235555
```

The following disables the monitoring of user *user1*.

no logging monitor username *user1*

logging runtime

Enables events to be filtered and logged in real time.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
logging runtime buffer store { all-events | filtered-events-only }
```

```
buffer store { all-events | filtered-events-only }
```

Determines which logs are stored in internal logging daemon runtime buffer.

- **all-events**: Logging daemon runtime buffer stores all logs that come to it.
- **filtered-events-only**: Logging daemon runtime buffer stores only logs that pass the runtime filter.

Usage

Sets the filtering of logged information to log in real time.

Example

The following command enables storage of logs that pass the runtime filter:

```
logging runtime buffer store filtered-events-only
```

mediation-device

This command is obsolete. Even though the CLI accepts the command no function is performed.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
mediation-device mode { tcs }

no mediation-device mode { tcs }
```

network-overload-protection

This command configures an attach rate throttle mechanism to control the number of new connections (attaches or inter-SGSN RAUs), through the SGSN, on a per second basis.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
network-overload-protection sgsn-new-connections-per-second #_new_connections
action { drop | reject with cause { congestion | network failure } }

default network-overload-protection sgsn-new-connections-per-second
```

default

Using **default** in the command, disables this attach rate throttle feature.

#_new_connections

Define the number of new connections to be accepted per second.
#_new_connections: Must be an integer from 50 to 5000.

action

Specifies the action to be taken by the SGSN when the attach rate exceeds the configured limit on the number of attaches. Select one of the following actions:

- **drop:** Drop the new connection request.
- **reject-with-cause:** Reject the new connection request. Include one of the following as the cause in the reject message:
- **congestion**
- **network failure**

Usage

Use this command to configure the rate at which the SGSN must process new connection requests. The rate is the number of new connections to be accepted per second.
In some cases, the incoming new connection rate is higher than this configured rate. When this occurs, all of the new connection requests cannot be processed. This command can also be used to configure the action to be taken when the rate limit is exceeded. The new connection requests, which cannot be processed, can be either dropped or rejected with a specific reject cause.
Counters for this feature are available in the **show gmm-sm statistics** command display in the Network Overload Protection portion of the table.

Example

Configure the throttle rate or limit to 2500 attaches per second and to drop all requests if the limit is exceeded.

network-overload-protection sgsn-new-connections-per-second *2500* **action** *drop*

network-service-entity

This command creates a new instance of an SGSN network service entity for either the IP environment or the Frame Relay environment.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] network-service-entity (ip-local | peer-nsei *peer_nsei_number* **frame-relay)**

no

Deletes the network service entity definition from the system configuration.

ip-local

Configures the local endpoint for NS/IP and enters the NSE-IP configuration mode. The prompt will change to [local]<hostname>(nse-ip-local)#

peer-nsei *peer_nsei_number* **frame-relay**

Configures a peer NSE and configures that peer with frame relay connectivity. This set of keywords also provides access to the NSE-FR configuration mode. The prompt will change to [local]<hostname>(nse-fr-peer-nsei-<*peer_nsei_number*>)#

Usage

Use this command to access the configuration modes for either the IP or Frame Relay network service entities.

Example

Enter the NSE for a Frame Relay configuration instance identified as 4554:

network-service-entity peer-nsei *4554* **frame-relay**

network-service-entity ip

This command has been deprecated. See the replacement command network-service-entity .

ntp

Enters the network timing protocol configuration mode or disables the use of NTP on the system.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ntp

no ntp

no

Disables the use of NTP for clock synchronization. When omitted, the NTP client support is enabled on the chassis.

Important: If the use of NTP is disabled the system clock may drift over a period of time. This may require manual updates to the system clock to synchronize the clock with other network elements.

Usage

Used when it is necessary to configure NTP settings.

Example

The following command enters the NTP configuration mode:

```
ntp
```

The following disables the use of the network timing protocol for system clock synchronization.

```
no ntp
```

operational-mode

Configures the systems operational mode for general use or only as a home agent.

Important: This command is only required for code versions prior to 4.5.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
operational-mode { general | ggsn-only | ha-only }
```

general

Sets the system operational mode to general use allowing for FA, HA, PSDN, and/or GGSN services to be co-located.

ggsn-only

Configures the system to only allow Gateway GPRS Support Node (GGSN) services.

Important: Executing this keyword increases the maximum number of PDP contexts supported per Session Manager from 2000 to 4000.

ha-only

This command keyword has been deprecated and no longer performs any function.

Usage

Set the operational mode to segregating services across multiple systems.

Caution: In order for this command to function properly, this command must be executed prior to configuring services on the system.

Example

The following sets the operational mode to general and home agent, respectively.

```
operational-mode general
```

orbem

Enters the object request broker element manager configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
orbem
```

Usage

Set the configuration mode to allow modification of the ORB element manager configuration data.

pac-standby-priority

This command has been renamed to **card-standby-priority**. Please refer to that command for details. Note that for backwards compatibility, the system accepts this command as valid.

port atm

Identifies a physical port on a line card that supports ATM signaling and then enters the configuration mode for the specific interface-type. For the commands to configure the port interface, see the CLI chapter ATM Port Configuration Mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

port atm *slot/port*

atm

Indicates the port identified is an ATM interface port.

slot/port

To determine valid ATM slot and port numbers, use the Exec mode's command **show port table**
slot: Identifies the chassis slot holding the line card that supplies ATM ports. The slot ID number can be any valid integer between 17 and 48.
port: Identifies the physical port that is to be configured to support ATM signaling. The ID number can be any valid integer between 1 and 4.

Usage

Change the current configuration mode to Ethernet Port Configuration mode.

Important: This command is not supported on all platforms.

Example

The following enters the ATM port configuration mode for ATM port 1 on the card in slot 19:

port atm *19/1*

port bits

Enters the BITS port configuration mode by identifying the BITS port on the active or standby SPIO.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

port bits *slot/port*

bits

Identifies the BITS port.

slot/port

slot: Identifies the chassis slot holding the SPIO. The slot ID can be either 24 (active SPIO) or 25 (standby SPIO).
port: Identifies the BITS port on the SPIO. The port ID number must be 4.

Usage

Change the current configuration mode to BITS port configuration mode.

Important: This command is not supported on all platforms.

Example

The following enters the BITS port configuration mode for the active SPIO:

port bits *24/4*

port channelized

Identifies a physical port on a channelized line card that supports Frame Relay signaling and creates a Frame Relay interface. As well, this command enters the configuration mode for the commands to configure the Frame Relay interface and the channelized port interface, see the CLI chapter Channelized Port Configuration Mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

port channelized *slot/port*

channelized

Selects the channelized frame relay interface for the selected line card and port.

slot/port

To determine valid slots and port numbers, use the Exec mode's command **show port table** to find the channelized line card**.**
slot: Identifies the chassis slot holding the Channelized line card that supplies Frame Relay ports. The slot ID number can be any valid integer between 17 and 48.
port: Identifies the physical port that is to be configured to support Frame Relay signaling. The ID number can only be 1.

Usage

Change the current configuration mode to Channelized Port configuration mode.

Example

The following enters the Channelized port configuration mode for port 1 on the card in slot 20:

port channelized *20/1*

port ethernet

Enters the Ethernet Port Configuration mode for the identified port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

port ethernet *slot/port*

ethernet

Indicates the port identified is an Ethernet interface port.

slot/port

Specifies the port for which Ethernet Port Configuration mode is being entered. The slot and port must refer to an installed card and port.

Usage

Change the current configuration mode to Ethernet Port Configuration mode.

Example

The following enters the Ethernet Port Configuration mode for ethernet port 1 in slot 17:

port ethernet *17/1*

port mac-address virtual-base-address

This command defines a block of 256 consecutive MAC addresses and enables virtual MAC addressing for Ethernet line card ports. Not available for the XT2 platform.

Product

All

Privilege

Security Administrator, Administrator

Syntax

port mac-address virtual-base-address *MAC_Address*

no port mac-address virtual-base-address

no

Disables virtual MAC addressing for Ethernet line card ports. The block of virtual MAC addresses is not saved.

MAC_Address

The beginning address of a block of 256 MAC addresses that are used for virtual MAC addressing.

Usage

Use this command to disregard the MAC addresses assigned and stored in the IDEEPROM on Ethernet Line Cards and assign MAC addresses for all ports on all Ethernet Line Cards from the specified block of virtual MAC addresses. This command does not affect the MAC addresses on SPIO cards.
There are 65536 MAC addresses (00:05:47:FF:00:00 - 00:05:47:FF:FF:FF) reserved for use by customers. This range allows for the creation of 256 address blocks each containing 256 MAC addresses (e.g. 00:05:47:FF:00:00, 00:05:47:FF:01:00, 00:05:47:FF:02:00, 00:05:47:FF:03:00, 00:05:47:FF:04:00, etc.).

Caution: This configuration requires the configuration of a valid block of unique MAC addresses that are not used anywhere else. Use of non-unique MAC addresses can degrade and impair the operation of your network.

Important: This command is not supported on all platforms.

Example

To enable virtual MAC addressing for Ethernet ports on all Ethernet line cards in the system using a block of MAC addresses starting at 00:05:47:FF:00:00, enter the following command:

port mac-address virtual-base-address *00:05:47:FF:00:00*

port rs232

Enters the RS-232 Port Configuration mode for the RS-232 port on the specified SPIO card. Not available on the XT2 platform.

Product

All

Privilege

Security Administrator, Administrator

Syntax

port rs232 *slot* **3**

rs232

Indicates the port identified is an RS-232 port on a SPIO card.

slot

Specifies the slot of the SPIO for which RS-232 Port Configuration mode is being entered. The slot must refer to an installed SPIO card. The specified port must always be 3 for an RS-232 port.
The value for *slot* must be either 24 or 25.

Usage

Change the current configuration mode to RS-232 Port Configuration mode.

Example

The following command enters the RS-232 Port Configuration mode for the SPIO in slot 24;

port rs232 *24* **3**

profile-id-qci-mapping

Creates a QCI - RAN ID mapping table or specifies an existing table and enters the QCI - RAN ID mapping configuration mode for the system.

Product

HSGW

Privilege

Administrator

Syntax

[no] profile-id-qci-mapping *name* **[-noconfrm]**

no

Removes the specified mapping table from the system

name

Creates a new or enters an existing mapping table configuration. *name* must be from 1 to 63 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Enters the QCI - RAN ID mapping configuration mode for an existing table or for a newly defined table. This command is also used to remove an existing table.
Entering this command results in the following prompt:

```
[context_name]hostname(config-hsgw-association-table)#
```

QCI Mapping Configuration Mode commands are defined in the QCI Mapping Configuration Mode Commands chapter.
Use this command when configuring the following eHRPD component: HSGW.

Important: This command creates a mapping table available to any HSGW context configured on the system.

Example

The following command enters the existing QCI mapping configuration mode (or creates it if it doesn't already exist) for a mapping table named *qci_table1*:

```
profile-id-qci-mapping qci_table1
```

The following command will remove *qci_table1* from the system:

```
no profile-id-qci-mapping qci_table1
```

qci-qos-mapping

Global QCI-QoS mapping tables are used to map QCI values to appropriate QoS parameters.

Product

HSGW, P-GW, S-GW

Privilege

Administrator

Syntax

qci-qos-mapping *name* **[-noconfirm]**

no

Removes the specified mapping configuration from the system

name

Creates a new or enters an existing mapping configuration. *name* must be from 1 to 63 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Enter the QCI-QoS mapping configuration mode for an existing table or for a newly defined table. This command is also used to remove an existing table.
Entering this command results in the following prompt:

```
[context_name]hostname(config-qci-qos-mapping)#
```

QCI - QoS Mapping Configuration Mode commands are defined in the QCI - QoS Mapping Configuration Mode Commands chapter.
Use this command when configuring the following eHRPD component: HSGW, P-GW, S-GW.

Important: This command creates a mapping configuration available to any HSGW, P-GW, S-GW context configured on the system.

Example

The following command enters the existing QCI - QoS mapping configuration mode (or creates it if it doesn't already exist) for a mapping configuration named *qci-qos3*:

qci-qos-mapping *qci-qos3*

qos npu inter-subscriber traffic bandwidth

Configures NPU QoS bandwidth allocations for the system.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

qos npu inter-subscriber traffic bandwidth gold *percent* **silver** *percent* **bronze** *percent* **best-effort** *percent*

no qos npu inter-subscriber traffic bandwidth

no

Removes a previous bandwidth allocation.

gold *percent*

Default: 10%
Specifies the maximum percentage of bandwidth to be allocated to the gold queue priority.
percent can be configured to any integer value from 0 to 100.

silver *percent*

Default: 20%
Specifies the maximum percentage of bandwidth to be allocated to the silver queue priority.
percent can be configured to any integer value from 0 to 100.

bronze *percent*

Default: 30%
Specifies the maximum percentage of bandwidth to be allocated to the bronze queue priority.
percent can be configured to any integer value from 0 to 100.

best-effort *percent*

Default: 40%
Specifies the maximum percentage of bandwidth to be allocated to the best-effort queue priority.
percent can be configured to any integer value from 0 to 100.

Usage

The bandwidth of a subscriber queue is maintained by rate limiting functions which implement packet-rate limiting at the first level and bit-rate limiting at the next level.
The packet-rate limit of a queue is defined by the number of packets-per-second (PPS) permitted for queuing. Before queuing a packet on a subscriber queue, the NPU ensures that the packet falls within the limit. If the packet to be queued exceeds the packet rate limit, it is dropped.
Each subscriber queue is configured with a bit rate limit, measured in megabits-per-second (Mbps), referred to as CP-BPS (bit-per-second to CP). The CP-BPS is available as the total bandwidth for the subscriber traffic

that a CP can sustain. Each subscriber queue receives an allocation of a certain percentage of the CP-BPS. The following maximum CP-BPS values are supported:

- Lead CP (CP0) = 128 Mbps
- Remaining CPs (CP1, CP2, CP3) = 256 Mbps

For additional information on the NPU QoS functionality, refer to the System Administration and Configuration Guide.

Important: This functionality is not supported for use with the PDSN at this time.

Example

The following command configures bandwidth allocations of 20, 30, 40, and 50% for the gold, silver, bronze, and best-effort queues respectively:

```
qos npu inter-subscriber traffic bandwidth gold 20 silver 30 bronze 40
best-effort 50
```

Upon executing this command, the priority queues will have the following PAC/PSC/PSC2 CP bandwidth allocations based on the maximum CP bandwidth specifications:

Priority	Lead CP (CP 0) Bandwidth (Mbps)	CP 1 through CP 3 Bandwidth (Mbps)
Gold	25.6	51.2
Silver	38.4	76.8
Bronze	51.2	102.4
Best-effort	64	128

qos npu inter-subscriber traffic bandwidth-sharing

Configures NPU QoS bandwidth sharing properties for the system.

Product

PDSN, GGSN

Privilege

Administrator

Syntax

```
qos npu inter-subscriber traffic bandwidth-sharing { { enable | disable } { all
| slot slot_num cpu cpu_num } }
```

enable

Enables bandwidth sharing for the specified criteria.

disable

Disables bandwidth sharing for the specified criteria.

all

Specifies that the bandwidth action is to be applied to all PACs/PSC/PSC2s and every CPU on each PAC/PSC/PSC2.

slot *slot_num*

Specifies that the bandwidth action is to be applied to a PAC/PSC/PSC2 in a specific chassis slot number. *slot_num* is an integer from 1 to 48 that represents the slot in which a PAC/PSC/PSC2 is installed. These cards can be installed in slots 1 through 8, and/or 10 through 16.

cpu *cpu_num*

Specifies a specific PAC/PSC/PSC2 CP for which to perform the bandwidth action. *cpu_num* is an integer value from 0 to 3. 0 represents the lead CP.

Usage

The available bandwidth of a subscriber queue can be shared equally among the other subscriber queues. Any unutilized bandwidth of a queue can be shared with the other queues equally. For example, if only one DSCP is configured and it is mapped to best-effort, that DSCP would get the bandwidth allocated to the best-effort in addition to the rest of the bandwidth allocated to the gold, silver, and bronze.
By default, the system enables sharing for all PACs, PSCs, or PSC2s and their CPs.
For additional information on the NPU QoS functionality, refer to the System Administration and Configuration Guide.

Important: This functionality is not supported for use with the PDSN at this time.

Example

The following command disables bandwidth sharing for the fourth CP (CP 3) on a PAC/PSC/PSC2 installed in chassis slot 4:

```
qos npu inter-subscriber traffic bandwidth-sharing disable slot 4 cpu 3
```

qos npu inter-subscriber traffic priority

Configures the DSCP-to-Priority assignments for the system.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
qos npu inter-subscriber traffic priority { best-effort | bronze | gold | silver
} assigned-to dscp { af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 |
af33 | af41 | af42 | af43 | be | ef | dscp_num } }

no qos npu inter-subscriber traffic priority [ assigned-to dscp { af11 | af12 |
af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 | af43 | be | ef }
]
```

best-effort

Specifies the best-effort queue priority.

bronze

Specifies the bronze queue priority.

gold

Specifies the gold queue priority.

silver

Specifies the silver queue priority.

af*XX*

Assigns the Assured Forwarding *XX* PHB DSCP.
Each Assured Forwarding PHB has a corresponding DSCP value as follows:

- af11 through af13: DSCP values 5 through 7 respectively
- af21 through af23: DSCP values 9 through 11 respectively
- af31 through af33: DSCP values 13 through 15 respectively
- af41 through af43: DSCP values 17 through 19 respectively

be

Assigns the Best Effort forwarding PHB which has a corresponding DSCP value of 0.

ef

Assigns the Expedited Forwarding PHB which has a corresponding DSCP value of 23.

dscp_num

Specifies a specific DSCP value. The value must be expressed as an integer value from 0 through 31.

Usage

The differentiated services (DS) field of a packet contains six bits (0-5) that represent the differentiated service code point (DSCP) value.
Five of the bits (1-5) represent the DSCP. Therefore, up to 32 (25) DSCPs can be assigned to the various priorities. By default, they're all assigned to the lowest priority (best-effort).
For additional information on the NPU QoS functionality, refer to the System Administration and Configuration Guide.

Important: This functionality is not supported for use with the PDSN at this time.

Example

The following command maps the ef DSCP to the gold priority queue:

```
qos npu inter-subscriber traffic priority gold assigned-to dscp ef
```

ran-peer-map

Creates a RAN Peer Map and enters the RAN Peer Map Configuration Mode.

Product

ASN GW, PHS

Privilege

Administrator

Syntax

[no] ran-peer-map *name* **[-noconfirm]**

no

Removes the RAN Peer Map from the system.

name

Specifies the name of the RAN Peer Map. *name* must be from 1 to 31 alpha and/or numeric characters.

Usage

Use this command to create a new RAN Peer Map or edit an existing one. RAN peer maps reconcile base station MAC addresses received in R6 protocol messages to the base station's IP address.
Entering this command results in the following prompt:
[context_name]hostname(config-ran-peer-map)#
RAN Peer Map Configuration Mode commands are defined in the ASN RAN Peer Map Configuration Mode Commands chapter in this guide.

Example

The following command creates a RAN peer map named *ran12*:

ran-peer-map *ran12*

require active-charging

This command enables/disables Active Charging Service (ACS) with or without Category-based Content Filtering application.

Product

ACS, CF

Privilege

Security Administrator, Administrator

Syntax

```
require active-charging [ isolated-mode ] [ content-filtering category [ static-and-dynamic ] ] [ optimized-mode ]

no require active-charging
```

no

Disables ACS on the system.

isolated-mode

Enables ACS, and separates ACS-related resources from other sub-system resource sharing.

Important: In Release 8.1 and later, this keyword is not supported.

optimized-mode

Enables ACS in Optimized mode, wherein ACS functionality is managed by SessMgrs.

Important: In Release 8.0 and earlier and in Release 9.0 and later, this keyword is not supported.

Important: In Release 8.1, ACS must be configured in the Optimized mode.

Important: In Release 8.1, if the active-charging mode is changed from the default (non-optimized) mode to the Optimized mode, or vice-versa, the system must be rebooted for the change to take effect.

Important: In Release 8.3, this keyword is obsolete. With or without this keyword ACS is always enabled in the Optimized mode.

Use the **require active-charging** command to enable ACS in the non-optimized mode. Wherein, ACS Managers will spawn to support ACS.
Use the **require active-charging optimized-mode** command to enable ACS in the Optimized mode. Wherein, ACS is enabled as part of Session Managers.

content-filtering category [static-and-dynamic]

Enables the Category-based Content Filtering application with ACS support and creates the necessary Static Rating Database (SRDB) tasks to utilize the internal database of static/dynamic URLs.
For Dynamic Content Filtering support, the **static-and-dynamic** keyword must be configured to specify that the Dynamic Rater Package (model and feature files) must be distributed to rating modules on startup, recovery, etc. If not configured, by default, the static-only mode is enabled.

Usage

Use this command to enable/disable ACS with or without Category-based Content Filtering application on a system.
In Release 8.0 and 8.1, this command must be configured before configuring any services. This is to ensure that the resource subsystem can appropriately reserve adequate memory for ACS Manager tasks. If this command is configured after all the Session Manager tasks are already active, the ACS Manager tasks will not be started even if additional cards are added to the chassis—instead, the chassis must be rebooted.

Example

In Release 8.0, the following command enables resource subsystem to configure ACS in isolated mode:

```
require active-charging isoated-mode
```

In Release 8.1, the following command enables ACS in Optimized mode:

```
require active-charging optimized-mode
```

In Release 8.3, the following command enables ACS in Optimized mode:

```
require active-charging
```

require demux card

This command enables/disables the demux capabilities.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] require demux card
```

default

Disables the demux capabilities on the card.

no

Disables the demux capabilities on the card.

Usage

Use this command configure the system to allow session recovery task placement scheme when session recovery is off.

Important: This command is not supported on all platforms.

Example

The following command enables demux capabilities:

```
require demux card
```

require detailed-rohc-stats

Enables or disables context-specific Robust Header Compression (RoHC) statistics.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ no ] require detailed-rohc-stats
```

no

Disables require detailed-rohc-stats. This is the default condition.

Usage

Enables context-specific statistics for RoHC calls.

Example

Enter the following command to enable context specific stats for RoHC calls:

```
require detailed-rohc-stats
```

require diameter-proxy

This command enables/disables Diameter Proxy mode.

Default: no require diameter-proxy

Product

All

Privilege

Security Administrator, Administrator

Syntax

require diameter-proxy { multiple | single }

no require diameter-proxy

no

To disable Diameter Proxy mode.

multiple

To configure one Diameter proxy for each active PSC/PSC2.

single

To configure one Diameter proxy for the entire chassis.

Usage

When the Diameter Proxy mode is enabled, each proxy process is a Diameter host, instead of requiring every Diameter application user (i.e., every ACSMgr and/or every SessMgr, depending on the application) to be a host.

Example

To configure a Diameter proxy for each active PSC/PSC2, enter the following command:

require diameter-proxy multiple

To configure a single Diameter proxy for the entire chassis, enter the following command:

require diameter-proxy single

require pac daughtercard

Directs all Packet Accelerator Cards (PACs) within an ST16 chassis to require use of the Encryption Daughter Card (EDC) for IPSec encryption. When this command is enabled, any PAC without an EDC is unusable. This command must be enabled when using IPSec encryption.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
require pac daughtercard [ -noconfirm ]

no require pac daughtercard [ -noconfirm ]
```

no

Disables the EDC requirement for PACs.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

When enabled, all PACs are required to use the installed EDC for IPSec encryption. Any PAC that does not have an EDC installed on it will not be usable.

Important: This command must be enabled for IPSec encryption.

The default setting for this command is disabled.
The no option of this command disables this feature.

require session recovery

Enables session recovery when hardware or software fault occurs within system.

Product

PDSN, GGSN, SGSN, HA, LNS, ASN GW,PDIF, MME

Privilege

Security Administrator, Administrator

Syntax

```
require session recovery

no require session recovery
```

no

Disables session recovery feature after configuration file is saved and system is restarted.

Usage

When this feature is enabled, the system attempts to recover any home agent-based Mobile IP sessions that would normally be lost due to a hardware or software fault within the system.
This functionality is available for the following call types:

- ASN GW services supporting simple IP, Mobile IP, and Proxy Mobile IP
- PDSN services supporting simple IP, Mobile IP, and Proxy Mobile IP
- HA services supporting Mobile IP and/or Proxy Mobile IP session types with or without per-user Layer 3 tunnels
- GGSN services for IPv4 and PPP PDP contexts
- SGSN services for all attached and/or activated subscribers
- LNS session types
- PDIF services supporting Simple-IP, Mobile-IP and Proxy Mobile-P
- MME services

The default setting for this command is disabled.
The no option of this command disables this feature.
It is important to note that this command only works when the Session Recovery feature is enabled through a valid Session and Feature Use License Key.

Important: Upon entering this command, the system must be restarted before the command takes effect. Remember to save the configuration file before issuing the reload command.

reveal disabled commands

Enables the input of commands for features that do not have license keys installed. The output of the command **show cli** indicates when this is enabled. This command effects all future CLI sessions. This is disabled by default.

Product

All

Privilege

Security Administrator, Administrator

Syntax

reveal disabled commands

no reveal disabled commands

no

Do not show disabled commands.

Usage

When this is enabled and a disabled command is entered, a message is displayed that informs you that the required feature is not enabled and also lists the name of the feature that you need to support the command. When this is disabled and a disabled command is entered, the CLI does not acknowledge the existence of the command and displays a message that the keyword is unrecognized.

Example

Set the CLI to accept disabled commands and display the required feature for all future CLI sessions with the following command:

```
reveal disabled commands
```

Set the CLI to reject disabled commands and return an error message for all future CLI sessions:

```
no reveal disabled commands
```

rohc-profile

This command allows you to create an RoHC (Robust Header Compression) profile and enter the RoHC Profile Configuration Mode. This mode is used to configure RoHC Compressor and Decompressor parameters. RoHC profiles can then be assigned to specific subscriber sessions when RoHC header compression is configured.

Product

HSGW, PDSN

Privilege

Security Administrator, Administrator

Syntax

rohc-profile profile-name *name* **[-noconfirm] [common-options | compression-options | decompression-options]**

no rohc-profile profile-name *name*

common-options

Configures common parameters for compressor and decompressor.

compression-options

Configures ROHC compression options.

decompression-options

Configures ROHC decompression options.

no

Remove the specified RoHC profile.

name

The name of the RoHC profile to create or remove. *name* must be an alphanumeric string of from 1 through 63 characters in length.

-noconfirm

Do not prompt for additional verification when executing this command.

Usage

Use this command to enter the RoHC Profile Configuration mode.
Entering this command results in the following prompt:

```
[context_name]host(config-rohcprofile-<profile_name>)#
```

RoHC Profile Configuration Mode commands are defined in the RoHC Profile Configuration Mode Commands chapter.

Example

Enter the following command to create an RoHC profile named *HomeUsers* and enter the RoHC Configuration mode without prompting for verification:

```
rohc-profile profile-name HomeUsers
```

The following command removes the RoHC profile named *HomeUsers*:

```
no rohc-profile profile-name HomeUsers
```

sccp-network

This command creates or removes a Signaling Connection Control Part (SCCP) network instance which is used to define the SS7 end-to-end routing in a UMTS network. As well, this command enters the SCCP network configuration mode. The SGSN supports up to 12 SCCP network instances at one time.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sccp-network *sccp_net_id* **[-noconfirm]**

no sccp-network *sccp_net_id*

no

Remove the SCCP network configuration with the specified index number from the system configuration.

sccp_net_id

This number identifies a specific SCCP network configuration.
sccp_net_id: must be an integer from 1 through 12.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create or modify an SCCP network and enter the SCCP network configuration mode. The SCCP network is not a standard SS7 or UMTS concept - this concept is specific to this platform.
For details about the commands and parameters needed to create and edit the SCCP Network configuration, check the *SCCP Network Configuration Mode* chapter.

Example

The following command creates an SCCP network with the index number of *1*:

sccp-network *1*

session trace

This command configures the type of network elements, file transfer protocol, and Trace collection entity mode to be used for the transportation of trace files collected for the subscriber session tracing on the EPC network element(s) along with network connection parameters and timers.

Product

MME, P-GW, S-GW

Privilege

Administrator

Syntax

session trace [collection-timer *sec* **] [network-element { all | mme | pgw | sgw }] [retry-timer** *sec* **] [tce-mode { none | push transport { ftp | sftp } path** *string* **username** *name* **{ encrypted password** *enc_pw* **| password** *password* **} }]**

no session trace [network-element { all | mme | pgw | sgw }]

---

no

Removes the entire session trace configuration from the system or a specific network element trace configuration.

---

collection-timer *sec*

Specifies the amount of time, in seconds, to wait from initial activation/data collection before data is reported to the Trace Collection Entity (TCE). *sec* must be an integer value from 0 to 255.

---

network-element {all | mme | pgw | sgw}

Identifies the type of service to the session trace application in order to determine the applicable interfaces.
all: Specifies that all network elements and their associated interfaces are to be made available to the session trace application.
mme: Specifies that the MME network element and it's associated interfaces is to be made available to the session trace application.
pgw: Specifies that the P-GW network element and it's associated interfaces is to be made available to the session trace application.
sgw: Specifies that the P-GW network element and it's associated interfaces is to be made available to the session trace application.

---

retry-timer *sec*

Specifies the amount of time, in seconds, to wait before retrying a file transfer after a failure. *sec* must be an integer value from 0 to 255.

---

tce-mode none

Specifies that session trace files are to be stored locally and must be pulled by the TCE.

tce-mode push transport { ftp | sftp } path *string* **username** *name* **{ encrypted password** *enc_pw* **| password** *password* **}**

Specifies that session trace files are to be pushed to the Trace Collection Entity (TCE).
{ ftp | sftp }: Specifies that FTP or Secure FTP is used to push session trace files to the TCE.
path *string*: Specifies the directory path on the TCE where files will be placed.
username *name*: Specifies the username to be used when pushing files to the TCE.
encrypted password *enc_pw*: Specifies the encrypted password to be used when pushing files to the TCE.
password *password*: Specifies the password to be used when pushing files to the TCE.

Usage

Use this command to configure the file transfer methods and modes for subscriber session trace functionality and to how and where session trace files are sent after collection.
This configuration contains collection timer, EPC network element, type of file transfer, and user credentials setting to send the collected trace files to the TCE.

Example

The following command configures the collection time for session traces to *30* seconds, identifies the network element as all elements (MME, S-GW, and P-GW), sets the retry timer to *5* seconds, and pushes session trace files to a TCE via SFTP into a directory named */trace/sgw* using a username *admin* and a pasword of *pw123*:

```
session trace collection-timer 30 network-element all retry-timer 5 tce-
mode push transport sftp path /trace/sgw username admin password pw123
```

The following command configures the collection time for session traces to *30* seconds, identifies the network element as an MME, sets the retry timer to *5* seconds, and pushes session trace files to a TCE via SFTP into a directory named */trace/sgw* using a username *admin* and a password of *pw123*:

```
session trace collection-timer 30 network-element mme retry-timer 5 tce-
mode push transport sftp path /trace/mme username admin password pw123
```

sgsn-global

This command gives access to the SGSN-Global configuration mode to set parameters relevant to the SGSN as a whole.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
sgsn-global
```

Usage

Using this command moves into SGSN-Global configuration mode. In this mode, you can set SGSN-wide parameters to perform tasks such as monitoring/managing TLLI in the BSSGP layer.

Example

Enter the SGSN-Global configuration mode with the following:

```
sgsn-global
```

sgsn-operator-policy

This command creates an SGSN Operator Policy and enters the SGSN operator policy configuration mode. Commands for configuration of the policies are available in the SGSN Operator Policy Configuration Mode chapter elsewhere in this Command Line Interface Reference.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sgsn-operator-policy (default | name *name* **} [-noconfirm]**

no sgsn-operator-policy (default | name *name* **}**

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no

Remove the specified SGSN operator policy from the system configuration.

default

default, in this case, is the name of a specific operator policy. This default policy is used when no other defined operator policy matches the incoming IMSI.

Important: We recommend that you configure this default operator policy so that is it available to handle IMSIs that are not matched with other defined policies.

name *name*

Usage

Use this command to create an SGSN operator policy and to enter the SGSN operator policy configuration mode to define or modify policies.
The SGSN Operator Policy specifies rules governing the services, facilities and privileges available to subscribers. These policies can override standard behaviors and provide mechanisms for an operator to get around the limitations of other infrastructure elements such as DNS servers and HLRs.
The system supports up to 1000 operator policies, including the default operator policy.

Important: Once the instance of an operator policy is defined, to use the policy it is necessary to go into the SGSN Operator Policy Configuration Mode to define the IMSI range with the MCC command - this requirement does not hold if you are using a default operator policy.

Example

The following command accesses the default SGSN operator policy and enters the SGSN operator policy configuration mode to view or modify the specified policy:

```
sgsn-operator-policy default
```

snmp authentication-failure-trap

Enables/disables the SNMP traps for authentication failures.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
snmp authentication-failure-trap

no snmp authentication-failure-trap
```

no

Disables SNMP traps for authentication failures. When omitted, SNMP traps for authentication failures will be generated.

Usage

Disables authentication failure traps if they are not of interest. At this time the option may be changed to support trouble shooting.
The chassis is shipped from the factory with the SNMP authentication failure traps disabled.

snmp community

Configures the SNMP v1 and v2 community strings.

Product

All

Privilege

Security Administrator, Administrator

Syntax

snmp community *string* **[context** *ctx_name* **] [view** *view_name* **] [read-only | read-write]**

no snmp community *string*

no

The specified community string is removed from the configuration.

string

Specifies a community string whose options are to be modified. *string* must be a from 1 to 31 alpha and/or numeric characters.

context *ctx_name*

Default: community string applies to all contexts.
Specifies a the context to which the community string shall be applied. *ctx_name* must be from 1 to 1023 alpha and/or numeric characters.

view *view_name*

Default: community string applies to all views.
Specifies the view to which the community string shall be applied. *view_name* must from 1 to 1023 alpha and/or numeric characters.

read-only | read-write

Default: read-only
Specifies if access rights for the community string.
read-only: the configuration may only be viewed.
read-write: the configuration may be viewed and edited.

Usage

The community strings define the privileges of SNMP users. It may be desirable to give read-only access to front line operators.

Example

snmp community *sampleString*

snmp community *sampleString* **context** *sampleContext*

snmp community *sampleString* **context** *sampleContext* **view** *sampleView*

snmp community *sampleString* **view** *sampleView* **read-write**

no snmp community *sampleString*

snmp engine-id

Configures the SNMP engine to use for SNMP requests when SNMPv3 agents are utilized.

Product

All

Privilege

Security Administrator, Administrator

Syntax

snmp engine-id local *id*

id

Specifies the SNMPv3 engine to employ. *id* must be from 1 to 31 alpha and/or numeric characters.

Usage

When SNMPv3 is used for SNMP access to the chassis the engine ID can be used to quickly change which schema is used for SNMP access.

Important: The system can send either SNMPv1, SNMPv2c, or SNMPv3 traps to numerous target devices. However, the Web Element Manager can only process SNMP version 1 (SNMPv1) and SNMP version 2c (SNMPv2c) traps. If the SNMP target being configured is Web Element Manager application, then you must not configure this command to use.

Example

snmp engine-id local *id*

snmp heartbeat

Enables the sending of periodic “heartbeat” notifications (traps).

Product

All

Privilege

Administrator

Syntax

snmp heartbeat { interval [*minutes* **] | second-interval [** *seconds* **] }**

deafult snmp heartbeat

no snmp heartbeat

default

Returns the command to its default setting of disabled.

no

Disables the feature.

interval [*minutes* **]**

Default: 60
Specifies the interval time, in minutes, between notifications. *minutes* must be an integer value between 1 and 1440.

second-interval [*seconds* **]**

Default: 30
Specifies the secondary interval time, in seconds, between notifications. *seconds* must be an integer value between 10 and 50.

Usage

Use this command to enable the sending of a heartbeat notification periodically to confirm a system is up and communicating.

Example

The following command sets the snmp heartbeat notification interval to 2 hours, 15 minutes and 30 seconds:

snmp heartbeat interval *135* **second-interval** *30*

snmp history heartbeat

Enables the recording of heartbeat notifications in SNMP history.

Product

All

Privilege

Administrator

Syntax

```
[ default | no ] snmp history heartbeat
```

default

Returns the command to the default setting of enabled.

no

Disables the history recording feature.

Usage

Use this command to enable the recording of SNMP heartbeat notifications in SNMP history files.

snmp notif-threshold

Configures the number of SNMP notification that need to be generated for a given event before it is propagated to the SNMP users.

Product

All

Privilege

Security Administrator, Administrator

Syntax

snmp notif-threshold *count* **[low** *low_count* **] [period** *seconds* **]**

no snmp notif-threshold

no

Removes all SNMP notification thresholds. All notifications will be broadcast to SNMP users.

count

Default: 100
Specifies the number of notifications that must be generated before the next notification is broadcast to SNMP users. *count* must be a value in the range from 1 to 10000.

low *low_count*

Default: 20
Specifies the number of notifications within the monitoring period before which any subsequent notification for each specific event. *low_count* must be a value in the range from 1 through 10000.

period *seconds*

Default: 300
Specifies the number of seconds of the monitoring window size used to determine when any subsequent notification may be broadcast to users. *seconds* must be a value in the range from 10 through 3600.

Usage

Set the notification threshold to avoid a flood of events which may be the result of a single failure or maintenance activity.

Example

snmp notif-threshold *100*

snmp notif-threshold *100* **period***30*

snmp server

Enables the SNMP server as well the configuration of the SNMP server port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

snmp server [port *number* **]**

no snmp server

no

Restores the default SNMP port assignment.

port *number*

Default: 161
Specifies the port number to use for SNMP communications. *number* must be a value in the range from 1 to 65535.

Usage

Set the SNMP port for communications when SNMP is enabled.

Important: This will result in restarting the SNMP agent when the **no** keyword is omitted. SNMP queries as well as notifications/traps will be blocked until the agent has restarted.

Example

snmp server port *100*

no snmp server

snmp target

Configures remote receivers of SNMP notifications.

Product

All

Privilege

Security Administrator, Administrator

Syntax

snmp target *name ip_address* **[port** *number* **] [non-default] [security-name** *string* **] [version { 1 | 2c | 3| view] [security-level { noauth | { auth | priv-auth privacy [encrypted] des** *privpassword* **} authentication [encrypted] { md5 | sha }** *authpassword* **} } [informs | traps]**

no snmp target *name*

---

no

Removes the specified target as a receiver of unsolicited SNMP messages.

---

authentication { md5 | sha } *authpassword*

Reads the authentication type and password if the security level of the SNMP messages is set to **auth** or **priv-auth**. Authentication types are:
md5: Configures the hash-algorithm to implement MD5 per RFC 1321.
sha: Specifies that the hash protocol is Secure Hash Algorithm.

---

security-level **{ noauth | { auth | priv-auth privacy [encrypted] des** *privpassword* **}**

Sets the security level of the SNMPv3 messages, as follows:
noauth: No authentication and encryption is used.
auth: Only authentication will be used.
priv-auth: Both authentication and encryption will be used.
privacy des *privpassword*: Reads the privacy type and password.

---

name

Specifies a logical name to use to refer to the remote receiver. *name* must be from 1 to 31 alpha and/or numeric characters.

---

ip_address

Specifies the IP address of the receiver. *ip_address* must be specified using the standard IPv4 dotted decimal notation.

---

non-default

Specifies that this destination is only used for SNMP traps which have been specifically identified.

port *number*

Default: 162
Specifies the port which is to be used in communicating with the remote receivers. *number* must be a value in the range from 0 through 65535.

security-name *string*

Default: no community string included
Specifies the community string to use in the unsolicited messages. *string* must be from 1 to 31 alpha and/or numeric characters.

version { 1 | 2c | 3 } | view

Default: 1
Specifies the SNMP version the target supports and consequently the version of the SNMP protocol to use for communications.

Important: The system can send either SNMPv1, SNMPv2c, or SNMPv3 traps to numerous target devices.However, the Web Element Manager can only process SNMP version 1 (SNMPv1) and SNMP version 2c (SNMPv2c) traps. If the SNMP target being configured is Web Element Manager application, then you must configure this command to use version 1 or version 2c.

informs | traps

Default: traps
Specifies the type of SNMP event to use to send notifications to SNPM targets. **traps** are unacknowledged (fire and forget) whereas **informs** require a response from the SNMP target.
If the notification type is set to **informs**, the notification is resent if no response is received within 5 seconds. The notification is resent at most two times.

Usage

The target manages the list of remote receivers to which unsolicited messages are sent, e.g., this is necessary if a new monitoring system is added to a network or removed.

Example

snmp target *sampleReceiver 1.2.3.4* **security-name** *sampleComm*

snmp target *sampleReceiver 1.2.5.6* **port** *100*

snmp target *sampleReceiver 1.2.7.8* **version 2c traps**

no snmp target *sampleReceiver*

snmp trap

This command enables/disables generation of specific or all SNMP traps.

Product

All

Privilege

Security Administrator, Administrator

Syntax

snmp trap { enable | suppress } [*trap_name1 trap_name2* ... *trap_nameN* | all]

enable

Enables or allows the generation of one or more SNMP traps by the system.

suppress

Disables the generation of one or more SNMP traps by the system.

trap_name1 trap_name2 ... *trap_nameN*

The name of the specific SNMP trap to enable or disable. Multiple traps can be listed for a single instance of this command.

Important: The system disregards character case when entering trap names.

all

Default: Enable All
Specifies that all SNMP traps will be affected by the specified operation (enable or suppress).

Usage

SNMP traps are used by the system to indicate that certain events have occurred. A complete listing of the traps supported by the system and their descriptions can be found in the SNMP MIB Reference. Additionally, a trap listing can be viewed using the following command:
snmp trap { enable | suppress } ?
By default, the system enables the generation of all traps. However, individual traps can be disabled allowing only traps of a certain type or alarm level to be generated. This command can be used to disable un-desired traps and/or re-enable previously suppressed traps.

Example
The following command suppresses the LogMessage trap:

snmp trap suppress *logmessage*

The following command suppresses the *CLISessEnd* and *CLISessStart*:

snmp trap suppress *clisessend clisessstart*

snmp trap-timestamps

Adds an additional system-time varbind to generated traps.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] snmp trap-timestamps
```

no

Disables the adding of timestamps to generated traps.

Usage

The timestamp added to the generated trap reflects the current system time. The timestamp is proprietary. This functionality is disabled by default.

Important: If the Web Element Manager application is used as your alarm server, the application relies on the timestamp provided by enabling this command to identify duplicate traps. As a result, it is recommended that this parameter be enabled for this case.

Example

The following command enables the inclusion of a timestamp with each generated trap:

```
snmp trap-timestamps
```

snmp user

Configures an SNMPv3 user for SNMP access.

Product

All

Privilege

Security Administrator, Administrator

Syntax

snmp user *user_name* **[[encrypted] password** *password* **| engine** *id* **| group** *grp_name* **| security-model** *model* **auth [[encrypted] password** *password* **]]**

no snmp user *user_name*

no

Removes the specified user from the list of valid SNMPv3 users.

user_name

Specifies the user which is to use SNMPv3 interfaces to the system. *user_name* must be from 1 to 31 alpha and/or numeric characters.

engine *id*

The SNMP engine ID. **id** must be a string of alpha and/or numeric characters from 1 to 31characters in length.

group *grp_name*

Default: undefined (not a member of any group)
Specifies the user SNMPv3 group the into which user will be added. *grp_name* must be from 1 to 1023 alpha and/or numeric characters.

security-model *model* **auth**

Default: USM
Specifies the security model used to authenticate the user. *model* must be configured to the following:

- **usm :** User Security Model

[encrypted] password *password*

Default: undefined
Specifies the password for authenticating the user when the security model is set to USM.
The **encrypted** keyword indicates the password will be received in an encrypted form. *password* must be from 8 to 31 alpha and/or numeric characters.
The **encrypted** keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

Usage

Add and remove SNMPv3 users as operations staff or automated systems are updated. The security model will be user dependant based upon the support the users system provides.

Important: The system can send either SNMPv1, SNMPv2c, or SNMPv3 traps to numerous target devices. However, the Web Element Manager can only process SNMP version 1 (SNMPv1) and SNMP version 2c (SNMPv2c) traps. If the SNMP target being configured is Web Element Manager application, then you must not configure this command to use.

Example

```
snmp user user1

snmp user user1 security-model 2c auth

snmp user user1 group sampleGroup security-model usm auth

no snmp user user1
```

ss7-routing-domain

This command creates an SS7 routing domain instance and enters the SS7 routing domain configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ss7-routing-domain *rd_id* **variant** *v_type* **[-noconfirm]**

no ss7-routing-domain *rd_id*

no

Removes the specified SS7 routing domain from the system configuration.

rd_id

This number identifies a specific SS7 routing domain. Once it has been created, it can be accessed for further configuration and modification by entering the *rd_id* without entering the variant.
rd_id must be an integer from 1 to 12.

variant *v_type*

Identifies the national standard to be used for call setup, routing and control, signaling. Select one of the following:

- **ansi:** American National Standards Institute (U.S.A.)
- **bici:** Broadband Intercarrier Interface standard
- **china:** Chinese standard
- **itu:** International Telecommunication Union (ITU-T) Telecommunication Standardization Sector
- **ntt:** Japanese standard
- **ttc:** Japanese standard

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create an SS7 routing domain configuration instance or to enter the SS7 routing domain configuration mode to edit the configuration.
A routing domain groups configuration items to facilitate the management of the SS7 connection resources for an SGSN service. An Access Gateway supports up to 12 configured SS7 routing domains at one time.
After entering this command, the prompt appears as:
`[context_name]<hostname>(config-ss7-routing-domain-routing_domain_id)#`
For details about the commands and parameters used to define or edit an SS7 routing domain, refer *SS7 Routing Domain Configuration Mode* chapter.

Example

The following creates an SS7 routing domain with an index of 1 and the variant selection of Broadcast Intercarrier Interface (bici):

```
ss7-routing-domain 1 variant bici
```

suspend local-user

Suspends a local-user administrative account.

Product

All

Privilege

Administrator

Syntax

suspend local-user *name*

no suspend local-user *name*

no

Removes the suspended status for the specified local-user account.

name

The name of the local-user account. It can be from 3 to 16 alpha and/or numeric characters and is case sensitive.

Usage

This command allows a security administrator to suspend local-user administrative accounts.
A "suspended" user can not login to the system. The user's account information (passwords, password history, etc.), however, is preserved.

Example

The following command suspends a local-user account called Inspector1:

suspend local-user *Inspector1*

The following command removes the suspension from a local-user account called Admin300:

no suspend local-user *Admin300*

system

Configures system information which is accessible via SNMP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
system { carrier-id mcc mcc_id mnc mnc_id | contact who | hostname host_name |
location text }

default system { contact | location }
```

default

This keyword removes the configured **system contact** and **system location** on system.

carrier-id mcc *mcc_id* **mnc** *mnc_id*

Important: This carrier ID is not used by the GGSN

This keyword specifies a carrier-id that is a unique identifier for the carrier that has installed the system. When the carrier ID values are set, the carrier-id and gmt_offset attributes are included in access-request and accounting packets when using the following RADIUS dictionaries:

- 3gpp2
- 3gpp2-835
- starent
- starent-835
- starent-vsa1
- starent-vsa1-835
- custom9

mcc *mcc_id* : The mobile country code. This must be specified as a string of integers from 001 through 999. Values must be expressed as three integers.
mnc *mnc_id*: The mobile network code. This must be specified as a string of integers from 01 through 999. Values must be expressed as a minimum of two integers and a maximum of three integers.

contact *who*

Default: No contact specified.
contact *who*: specifies the contact information for the chassis. *who* must be a string of 0 to 255 characters. The string specified must be embedded in double quotes (“) if spaces and special punctuation is to be used.

hostname *host_name*

hostname *host_name*: configures the chassis host name where *host_name* must be from 1 to 63 characters.

Important: Please note that changing the chassis host name results in the command prompt changing as well to reflect the new name. This may affect any scripted interfaces from OSS or maintenance facility.

location *text*

Default: No location specified.
location *text*: specifies the location text to use which may be a string of 0 to 255 characters. The text specified must be embedded in double quotes (“) if spaces are to be used.

Usage

Specify system basic information which is useful back at a network operations center which uses the SNMP interfaces for management.

Example

The following commands configure the contact information, system host name, and location text, or remove configured location and system respectively.

```
system contact user1@company.com

system hostname system16

system location "Clark Street Closet\nBasement Rack 4"
```

The following commands remove the configured contact and location from system respectively

```
default system contact

default system location
```

task facility ipsecmgr

Configures IPSec manager settings.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
task facility ipsecmgr { max-crypto-maps-each-ipsecmgr max_num | max-ipsecmgr-
tasks max_num | start-at-a-time num | task-count { increased | normal } }

default task facility ipsecmgr { max-crypto-maps-each-ipsecmgr | max-ipsecmgr-
tasks | start-at-a-time | task-count }
```

max-crypto-maps-each-ipsecmgr *max_num*

Default: 2
The maximum number of crypto maps per IPSEC manager.
max_num must be an integer from 1 through 150.

max-ipsecmgr-tasks *max_num*

Default: 200
The maximum number of IPSEC manager tasks that can be started for all services.
max_num must be an integer from 1 through 200.

start-at-a-time *num*

Default: 1
The number of IPSEC manager tasks created at once when they are required.
num must be an integer from 1 to 128.

task-count { increased | normal }

Default: **normal**
Adjusts the IPSec manager task count to support EHA.
increased: Increases the number of IPSec manager tasks operating on the PACs/PSCs/PSC2s while reducing the number of session manager tasks.
normal: Uses the standard algorithm for allocationg memory for IPSec manager tasks.

Caution: If **task-count** is set to **normal** and session-recovery is enabled, IPSecMgr tasks are not allowed to start on most PACs/PSCs/PSC2s.

Usage

Set the IPSec manager parameters for all IPSec managers in the system.

Example

Use the following command to set the maximum number of crypto maps per IPSec manager to 25:

```
task facility ipsecmgr max-crypto-maps-each-ipsecmgr 25
```

task facility sessmgr

Configures system information which is accessible via SNMP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
task { facility sessmgr start { aggressive | normal } | resource cpu-memory-low
{ kill | warn } }
```

facility sessmgr start { aggressive | normal }

Default: Normal
Specifies the facility options for the session manager.
aggressive: specifies the maximum number of session manager processes are started immediately.

Caution: The **task facility sessmgr start aggressive** command should only be used if the system will reach capacity (for the existing configuration) during the first few minutes of service.

Caution: This command must only be executed last during configuration (or appended to the end of the configuration file) to ensure the availability of memory resources to contexts and services.

normal: indicates the session manager processes are started as needed.

resource cpu-memory-low { kill | warn }

Default: kill
Sets the action for the Resource Manager to take when the amount of free memory on a CPU falls below 12MB. An SNMP TRAP and CORBA notification are generated and the event is logged.
Once the free memory threshold is crossed, The Resource Manager examines all tasks on that cpu and finds the most over limit task and kills it. If there are no over limit tasks nothing happens. Resource Manager takes preference on killing a non-sessmgr task over a sessmgr task.
kill: The task most over memory limit (if any) is killed and recovered.
warn: The event is logged and no tasks are killed.

Usage

Set the session manager start policy to aggressive on heavily utilized systems to avoid undue delays in processing subscriber sessions.
Set the CPU memory low action to only log CPU low memory events.

Example

```
task facility sessmgr start aggressive
```

```
task facility sessmgr start normal
task resource cpu-memory-low warn
```

task facility acsmgr

This command configures the ACSMgr tasks setting.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

```
task facility acsmgr start [ aggressive | normal ]

no task facility acsmgr start
```

no

Disables the configured ACSMgr setting.

aggressive

Specifies to start the maximum possible ACSMgr tasks.

normal

Configures the resource subsystem to start/stop ACSMgr tasks on as needed basis.

Usage

This command provides option for the resource subsystem to start maximum possible ACSMgr tasks based on the license configured and the available system configuration.

Example

The following command starts the maximum possible ACSMgr tasks:

```
task facility acsmgr start aggressive
```

terminal

Configures the console port on the SPIO.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
terminal [ carrierdetect { off | on } | databits { 7 | 8 } | flowcontrol {
hardware { off | on } | none } | parity { even | none | odd } | speed { 115200 |
19200 | 38400 | 57600 | 9600 } | stopbits { 1 | 2 } ]
```

carrierdetect { off | on }

Specifies whether or not the console port is to use Data Carrier Detect (DCD) when connecting to a terminal.
Default: off
off: Do not use DCD
on: Use DCD

databits { 7 | 8 }

Specifies the number of data bits used to transmit and receive characters.
Default: **8**
7: Use 7 databits to transmit and receive characters.
8: Use 8 databits to transmit and receive characters.

flowcontrol { hardware {off | on } | none }

Specifies how the flow of data is controlled between the SPIO and a terminal.
Default: **none**
hardware: Enable or disable the use of hardware-based flow control
off: Disable the use of Ready to Send (RTS) and Clear to Send (CTS).
on: Enable the use of Ready to Send (RTS) and Clear to Send (CTS).
none: Disable the use of DCD, RTS and CTS.

parity { even | none | odd }

Specifies the type of error checking used on the port.
Default: none
even - Enables error checking by setting the parity bit to 1 (if needed) making the number of 1s in the data bits even.
none - Disables error checking.
odd - Enables error checking by setting the parity bit to 1 (if needed) making the number of 1s in the data bits odd.

speed { 115200 | 19200 | 38400 | 57600 | 9600 }

Specifies the flow of data in bits per second between the console port and terminal.
Default: **9600**

stopbits { 1 | 2 }

Specifies the number of stop bits between each transmitted character.
Default: **1**
1: Use one stop bit between each transmitted character.
2: Use two stop bits between each transmitted character.

Usage

Sets the SPIO's console port parameters for communication with the terminal device.

Example

The following command sets the SPIO's console port. The terminal must support these values.

```
terminal carrierdetect off databits 7 flowcontrol hardware on parity even
speed 115200 stopbits 1
```

threshold 10sec-cpu-utilization

Configures a threshold that measures a 10 second average of cpu utilization. Its polling interval can be set down to 30 seconds.

Product

PDSN, GGSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

threshold 10sec-cpu-utilization *percent* **[clear** *percent* **]**

percent

Default: 0
Configures the high threshold for 10 second average cpu-utilization. If the monitored CPU utilization is greater than or equal to the specified percentage an alert is sent. Regardless of the length of the polling interval, only one sample at the end of the polling interval is tested.

clear *percent*

Default: 0:
This is a low watermark value that sets the alarm clearing threshold value. If not specified it is taken from the first value.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set a threshold that sends an alert when CPU utilization over a 10 second average exceeds the limit set.
Alerts or alarms are triggered for 10-second sample of CPU utilization based on the following rules:

- **Enter condition:** 10-second average percentage of CPU utilization ³ High Threshold
- **Clear condition:** 10-second average percentage of CPU utilization < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Important: This command is not supported on all platforms.

Example

Send an alert when the 10 second average CPU utilization reaches 45 percent by entering the following command;

```
threshold 10sec-cpu-utilization 45
```

threshold aaa-acct-archive-size

This command configures accounting message archive size threshold.

Product

PDSN, GGSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

threshold aaa-acct-archive-size *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 1
The high threshold number of archived accounting messages that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value between 0 and 1044000.

clear *low_thresh*

Default: 1
The low threshold number of archived accounting messages that maintains a previously generated alarm condition. If the number of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 1044000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

In the event that the system cannot communicate with configured AAA accounting servers (RADIUS or CGFs), either due to the server being busy or loss of network connectivity, the system buffers, or archives, the accounting messages.
Accounting message archive size thresholds generate alerts or alarms based on the number of AAA accounting messages buffered in the archive during the specified polling interval. Accounting requests are counted for all AAA accounting servers that the system is configured to communicate with.
Alerts or alarms are triggered for accounting failures based on the following rules:

- **Enter condition:** Actual number of archived messages ³ High Threshold
- **Clear condition:** Actual number of archived messages < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of 250 AAA accounting archived messages and low threshold of 100 for an system using the Alarm thresholding model:

```
threshold aaa-acct-archive-size 250 clear 100
```

threshold aaa-acct-failure

Configures accounting failure thresholds for the system.

Product

PDSN, GGSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

threshold aaa-acct-failure *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold number of accounting failures that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of accounting failures that maintains a previously generated alarm condition. If the number of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Accounting failure thresholds generate alerts or alarms based on the number of failed AAA accounting message requests that occur during the specified polling interval. Accounting requests are counted for all AAA accounting servers that the system is configured to communicate with.
Alerts or alarms are triggered for accounting failures based on the following rules:

- **Enter condition:** Actual number of failures ³ High Threshold
- **Clear condition:** Actual number of failures < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of 100 AAA accounting failures and low threshold of 25 for an system using the Alarm thresholding model:

```
threshold aaa-acct-failure 100 clear 25
```

threshold aaa-acct-failure-rate

Configures accounting failure rate thresholds for the system.

Product

PDSN, GGSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

threshold aaa-acct-failure-rate *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 1
The high threshold percent of accounting failures that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh can be configured to any integer value between 0 and 100.

clear *low_thresh*

Default: 1
The low threshold percent of accounting failures that maintains a previously generated alarm condition. If the percentage of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Accounting failure rate thresholds generate alerts or alarms based on the percentage of AAA accounting message requests that failed during the specified polling interval. Accounting requests are counted for all AAA accounting servers that the system is configured to communicate with.
Alerts or alarms are triggered for accounting failure rates based on the following rules:

- **Enter condition:** Actual failure percentage ³ High Threshold
- **Clear condition:** Actual failure percentage < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a AAA accounting failure rate high threshold percentage of 30 and a low threshold percentage of 10 for an system using the Alarm thresholding model:

```
threshold aaa-acct-failure-rate 30 clear 10
```

threshold aaa-auth-failure

Configures authentication failure thresholds for the system.

Product

PDSN, GGSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

threshold aaa-auth-failure *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold number of authentication failures that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of authentication failures that maintains a previously generated alarm condition. If the number of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Authentication failure thresholds generate alerts or alarms based on the number of failed AAA authentication message requests that occur during the specified polling interval. Authentication requests are counted for all AAA authentication servers that the system is configured to communicate with.
Alerts or alarms are triggered for authentication failures based on the following rules:

- **Enter condition:** Actual number of failures ³ High Threshold
- **Clear condition:** Actual number of failures < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of 100 AAA authentication failures for an system using the Alert thresholding model:

```
threshold aaa-auth-failure 100
```

threshold aaa-auth-failure-rate

Configures authentication failure rate thresholds for the system.

Product

PDSN, GGSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

threshold aaa-auth-failure-rate *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 5
The high threshold percent of authentication failures that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh can be configured to any integer value between 0 and 100.

clear

Allows the configuration of the low threshold.

low_thresh

Default: 5
The low threshold percent of authentication failures that maintains a previously generated alarm condition. If the percentage of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Authentication failure rate thresholds generate alerts or alarms based on the percentage of AAA authentication message requests that failed during the specified polling interval. Authentication requests are counted for all AAA authentication servers that the system is configured to communicate with.
Alerts or alarms are triggered for authentication failures based on the following rules:

- **Enter condition:** Actual failure percentage ³ High Threshold
- **Clear condition:** Actual failure percentage < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a AAA authentication failure rate high threshold percentage of 30 for an system using the Alert thresholding model:

```
threshold aaa-auth-failure-rate 30
```

threshold aaa-retry-rate

Configures AAA retry rate thresholds for the system.

Product

PDSN, GGSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

threshold aaa-retry-rate *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 5
The high threshold percent of AAA request message retries that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh can be configured to any integer value between 0 and 100.

clear *low_thresh*

Default: 5
The low threshold percent of AAA request message retries that maintains a previously generated alarm condition. If the percentage of retries falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

AAA request message retry rate thresholds generate alerts or alarms based on the percentage of request messages (both authentication and accounting) that were retried during the specified polling interval. The percentage is based on a message count taken for all AAA authentication and accounting servers that the system is configured to communicate with.
Alerts or alarms are triggered for request message retries based on the following rules:

- **Enter condition:** Actual retry percentage ³ High Threshold
- **Clear condition:** Actual retry percentage < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a AAA message retry rate high threshold percentage of 25 and a low threshold percentage of 10 for an system using the Alarm thresholding model:

```
threshold aaa-retry-rate 25 clear 10
```

threshold aaamgr-request-queue

This command configures the AAA Manager internal request queue threshold.

Product

PDSN, GGSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

threshold aaamgr-request-queue *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold number of AAA Manager Requests that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh can be configured to any integer value between 1 and 100.

clear

Allows the configuration of the low threshold.

low_thresh

Default: 5
The low threshold number of AAA Manager Requests that maintains a previously generated alarm condition. If the percentage of failures falls beneath the low threshold within the polling interval, a clear alarm is generated.
low_thresh can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

AAA Manager Request thresholds generate alerts or alarms based on the number of AAA Manager Requests for an AAA manager process during the specified polling interval.
Alerts or alarms are triggered for AAA Manager Requests based on the following rules:

- **Enter condition:** Actual number of AAA Manager Requests per AAA manager [3] High Threshold
- **Clear condition:** Actual number of AAA Manager Requests per AAA manager process < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm is not generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a AAA authentication failure rate high threshold percentage of 30 for an system using the Alert thresholding model:

```
threshold aaamgr-request-queue 30
```

threshold asngw-auth-failure

Configures authentication failure thresholds for the ASN-GW system.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

threshold asngw-auth-failure *high_thresh* **[clear** *low_thresh* **]**

default threshold asngw-auth-failure

high_thresh

Default: 0
The high threshold number of authentication failures that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of authentication failures that maintains a previously generated alarm condition. If the number of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to configure threshold limits to generate alerts or alarms based on the number of failed ASN-GW authentication message requests that occur during the specified polling interval. Authentication requests are counted for all ASN Gateway authentication servers that the system is configured to communicate with.
Alerts or alarms are triggered for authentication failures based on the following rules:

- **Enter condition:** Actual number of failures ³ High Threshold
- **Clear condition:** Actual number of failures < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *100* authentication failures for an ASN-GW using the Alert thresholding model:

```
threshold asngw-auth-failure 100
```

threshold asngw-handoff-denial

Configures thresholds for hand-off denial for the ASN-GW service.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

threshold asngw-handoff-denial *high_thresh* **[clear** *low_thresh* **]**

default threshold asngw-handoff-denial

high_thresh

Default: 0
The high threshold number of hand-off denials that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of hand-off denials that maintains a previously generated alarm condition. If the number of hand-off denials falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set threshold limits to generate alerts or alarms based on the number of denied hand-off that occurred during the specified polling interval. Hand-off denial messages are counted for all ASN Gateways that the system is configured to communicate with.
Alerts or alarms are triggered for hand-off denials based on the following rules:

- **Enter condition:** Actual number of failures ³ High Threshold
- **Clear condition:** Actual number of failures < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *100* hand-off denials using the Alert thresholding model:

```
threshold asngw-handoff-denial 100
```

threshold asngw-max-eap-retry

Configures thresholds for maximum retries for Extensible Authentication Protocol (EAP) authentication on an ASN-GW service.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

threshold asngw-max-eap-retry *high_thresh* **[clear** *low_thresh* **]**

default threshold asngw-max-eap-retry

high_thresh

Default: 0
The high threshold number of retries for EAP authentication that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of retries for EAP authentication that maintains a previously generated alarm condition. If the number of retries falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set threshold limits to generate alerts or alarms based on the number of retries for EAP authentication that occur during the specified polling interval.
Alerts or alarms are triggered for maximum number of retries for EAP authentication based on the following rules:

- **Enter condition:** Actual number of failures ³ High Threshold
- **Clear condition:** Actual number of failures < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *100* alerts or alarms generated on maximum number of retries for EAP authentication for an ASN Gateway using the Alert thresholding model:

```
threshold asngw-handoff-denial 100
```

threshold asngw-network-entry-denial

Configures thresholds for denial of network entry to an MS with in the ASN-GW service.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

threshold asngw-network-entry-denial *high_thresh* **[clear** *low_thresh* **]**

default threshold asngw-network-entry-denial

high_thresh

Default: 0
The high threshold number of denial of network entry to an MS that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of denial of network entry to an MS that maintains a previously generated alarm condition. If the number of denials falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set threshold limits to generate alerts or alarms based on the number of network entry denials that occurred during the specified polling interval. Network denial messages are counted for an MS that the system is configured to communicate with.
Alerts or alarms are triggered for network entry denials based on the following rules:

- **Enter condition:** Actual number of failures ³ High Threshold
- **Clear condition:** Actual number of failures < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *100* network entry denials for an MS using the Alert thresholding model:

```
threshold asngw-network-entry-denial 100
```

threshold asngw-r6-invalid-nai

Configures thresholds to generate alert/alarm for invalid Network Access Identifier (NAI) in R6 message.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

threshold asngw-r6-invalid-nai *high_thresh* **[clear** *low_thresh* **]**

default threshold asngw-r6-invalid-nai

high_thresh

Default: 0
The high threshold number of invalid NAIs in R6 messages that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of invalid NAIs in R6 messages that maintains a previously generated alarm condition. If the number of denials falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set threshold limits to generate alerts or alarms based on the number of invalid NAIs in R6 messages that occurred during the specified polling interval. Invalid NAIs are counted for an MS that the system is configured to communicate with or per system for all R6 messages.
Alerts or alarms are triggered for invalid NAIs based on the following rules:

- **Enter condition:** Actual number of failures ³ High Threshold
- **Clear condition:** Actual number of failures < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *100* invalid NAIs in R6 messages using the Alert thresholding model:

```
threshold asngw-r6-invalid-nai 100
```

threshold asngw-session-setup-timeout

Configures thresholds to generate alert/alarm for session setup timeouts in an ASN-GW service.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

threshold asngw-session-setup-timeout *high_thresh* **[clear** *low_thresh* **]**

default threshold asngw-session-setup-timeout

high_thresh

Default: 0
The high threshold number of timeouts during session setup that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of timeouts during session setup that maintains a previously generated alarm condition. If the number of denials falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set threshold limits to generate alerts or alarms based on the number of timeouts during session setup that occurred during the specified polling interval.
Alerts or alarms are triggered for session setup timeouts based on the following rules:

- **Enter condition:** Actual number of failures ³ High Threshold
- **Clear condition:** Actual number of failures < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *100* timeouts during session setup using the Alert thresholding model:

```
threshold asngw-session-setup-timeout 100
```

threshold asngw-session-timeout

Configures thresholds to generate alert/alarm for session timeouts in an ASN-GW service.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

threshold asngw-session-timeout *high_thresh* **[clear** *low_thresh* **]**

default threshold asngw-session-timeout

high_thresh

Default: 0
The high threshold number of timeouts during session that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of timeouts during session that maintains a previously generated alarm condition. If the number of session timeouts falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set threshold limits to generate alerts or alarms based on the number of timeouts during a session that occurred during the specified polling interval.
Alerts or alarms are triggered for session timeouts based on the following rules:

- **Enter condition:** Actual number of failures ³ High Threshold
- **Clear condition:** Actual number of failures < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *100* timeouts during a session using the Alert thresholding model:

```
threshold asngw-session-timeout 100
```

threshold call-reject-no-resource

Configures thresholds on the system for calls rejected due to insufficient resources.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold call-reject-no-resource *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold number of no-resource call rejects issued by the system that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value between 0 and 100000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of no-resource call rejects issued by the system that maintains a previously generated alarm condition. If the number of rejections falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 100000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

No resource call reject thresholds generate alerts or alarms based on the total number of calls that were rejected by the system due to insufficient or no resources (memory and/or session licenses) during the specified polling interval.
Alerts or alarms are triggered for no-resource-rejected calls based on the following rules:

- **Enter condition:** Actual number of calls rejected due to no resources ³ High Threshold
- **Clear condition:** Actual number of calls rejected due to no resources < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count for the number of calls rejected by the system due to insufficient or no resources to 100 and allow threshold of 40 for an system using the Alarm thresholding model:

```
threshold call-reject-no-resource 100 clear 40
```

threshold call-setup

Configures call setup thresholds for the system.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold call-setup *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold number of calls setup by the system that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value between 0 and 100000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of calls setup by the system that maintains a previously generated alarm condition. If the number of setups falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 100000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Call setup thresholds generate alerts or alarms based on the total number of calls setup by the system during the specified polling interval.
Alerts or alarms are triggered for call setups based on the following rules:

- **Enter condition:** Actual number of call setups ³ High Threshold
- **Clear condition:** Actual number of call setups < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of 100 calls setup for an system using the Alert thresholding model:

```
threshold call-setup 100
```

threshold call-setup-failure

Configures call setup failure thresholds for the system.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold call-setup-failure *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold number of call setup failures experienced by the system that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value between 0 and 100000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of call setup failures experienced by the system that maintains a previously generated alarm condition. If the number of setup failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 100000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Call setup failure thresholds generate alerts or alarms based on the total number of call setup failures experienced by the system during the specified polling interval.
Alerts or alarms are triggered for call setup failures based on the following rules:

- **Enter condition:** Actual number of call setup failures ³ High Threshold
- **Clear condition:** Actual number of call setup failures < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of 100 call setup failures and a low threshold of 80 for an system using the Alarm thresholding model:

```
threshold call-setup-failure 100 clear 80
```

threshold cpu-available-memory

Configures thresholds for available CPU memory for the system.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold cpu-available-memory *low_thresh* **[clear** *high_thresh* **]**

low_thresh

Default: 32
The low threshold amount of CPU memory that must be met or exceeded at the polling time to generate an alert or alarm.
low_thresh is measured in mega bytes (MB) and can be configured to any integer value between 0 and 2048.

clear *high_thresh*

Default: 32
The high threshold amount of CPU memory that maintains a previously generated alarm condition. If the memory amount rises above the high threshold within the polling interval, a clear alarm will be generated.
high_thresh is measured in mega bytes (MB) and can be configured to any integer value between 0 and 2048.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

CPU available memory thresholds generate alerts or alarms based on the amount of available memory for each PAC/PSC/PSC2 CPU at the polling time. Although, a single threshold is configured for all CPUs, separate alerts or alarms can be generated for each CPU.
Alerts or alarms are triggered for available CPU memory based on the following rules:

- **Enter condition:** Average measured amount of memory/CPU for last 5 minutes £ Low Threshold
- **Clear condition:** Average measured amount of memory/CPU for last 5 minutes > High Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Important: This command is not supported on all platforms.

Example

The following command configures a low threshold count of 50 MB CPU memory available and a high threshold of 112 MB for an system using the Alarm thresholding model:

```
threshold cpu-available-memory 50 clear 112
```

threshold cpu-load

Configures the threshold for monitoring PAC/PSC/PSC2 CPU loads using a 5 minute average measurement. The threshold is enabled by enabling CPU resource monitoring.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold cpu-load *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
If the monitored CPU load is greater than or equal to the specified number an alert is sent. *high_thresh* must be an integer from 0 through 15.

clear *low_thresh*

Default: 0
This is a low watermark value that sets the alarm clearing threshold value. If not present it is taken from the first value. *low_thresh* must be an integer from 0 through 15.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

Use this command to set an alert when the card's CPU load is equal to or greater than the number specified. Alerts or alarms are triggered for CPU load based on the following rules:

- **Enter condition:** Actual CPU load ³ High Threshold
- **Clear condition:** Actual CPU load < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Important: This command is not supported on all platforms.

Example

To set an alert when the PAC/PSC/PSC2 CPU load is over 10 and set an alert clear when the CPU load drops down equal or less than 7, enter the following command;

```
threshold cpu-load 10 clear 7
```

threshold cpu-memory-usage

Configures the threshold for monitoring the percentage of total CPU memory used during the polling interval.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold cpu-memory-usage *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold for percentage of total memory used that must be met or exceeded at the end of the polling interval to generate an alert or alarm.
high_thresh is measured in percentage of total CPU memory used and can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold for percentage of total CPU memory used that maintains a previously generated alarm condition. If the memory usage falls below the low threshold within the polling interval, a clear alarm is generated.
low_thresh is measured in percentage of total CPU memory used and can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

CPU memory usage generate alerts or alarms based on the percentage of total CPU memory used during the polling interval.
Alerts or alarms are triggered for CPU memory usage session based on the following rules:

- **Enter condition:** Actual percentage of CPU memory usage ³ specified percentage of total CPU memory.
- **Clear condition:** Actual CPU memory usage < specified clear percentage of total CPU memory usage.

If a trigger condition exists at the end of the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a threshold of *65* percent of total PAC/PSC/PSC2 CPU memory usage and a clear threshold of *35* percent:

```
threshold cpu-memory-usage 65 clear 35
```

threshold cpu-orbs-crit

Configures threshold for generating critical-level alerts or alarms based on the percentage of CPU utilization by the ORBS software task

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold cpu-orbs-crit *high_thresh* **[clear** *low_thresh* **]**

[default] threshold cpu-orbs-crit

default

Restores this parameter to its default setting.

high_thresh

Default: 60
The high threshold percent of CPU utilization by the ORB software task that must be exceeded as measured at the time of polling to generate a critical-level alert or alarm.
high_thresh is measured in percentage of total CPU utilization and can be configured to any integer value 0 through 100. A value of 0 disables the threshold.

clear *low_thresh*

Default: 60
The low threshold percent of CPU utilization by the ORB software task that maintains a previously generated alarm condition. If the percentage is measured as less than or equal to the low threshold at the time of polling, a clear alarm will be generated.
low_thresh is measured in percentage of total CPU utilization and can be configured to any integer value 0 through 100. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

Object Request Broker (ORB) software task CPU utilization thresholds generate critical-level alerts or alarms based on the percentage of SPC/SMC CPU resources it is consuming at the time of polling.
Critical-level alerts or alarms are triggered for CPU usage by the ORBs software task based on the following rules:

- **Enter condition:** Actual CPU usage percentage > High Threshold
- **Clear condition:** Actual CPU usage percentage £ Low Threshold

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a critical-level alarm threshold of *35* percent of CPU utilization by the ORBS task and a clear threshold of *35* percent:

```
threshold cpu-orbs-crit 35 clear 35
```

threshold cpu-orbs-warn

Configures threshold for generating warning-level alerts or alarms based on the percentage of CPU utilization by the ORBS software task

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold cpu-orbs-warn *high_thresh* **[clear** *low_thresh* **]**

[default] threshold cpu-orbs-warn

default

Restores this parameter to its default setting.

high_thresh

Default: 50
The high threshold percent of CPU utilization by the ORB software task that must be exceeded as measured at the time of polling to generate a warning-level alert or alarm.
high_thresh is measured in percentage of total CPU utilization and can be configured to any integer value 0 through 100. A value of 0 disables the threshold.

clear *low_thresh*

Default: 50
The low threshold percent of CPU utilization by the ORB software task that maintains a previously generated alarm condition. If the percentage is measured as less than or equal to the low threshold at the time of polling, a clear alarm will be generated.
low_thresh is measured in percentage of total CPU utilization and can be configured to any integer value 0 through 100. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

Object Request Broker (ORB) software task CPU utilization thresholds generate warning-level alerts or alarms based on the percentage of SPC/SMC CPU resources it is consuming at the time of polling.
Warning-level alerts or alarms are triggered for CPU usage by the ORBs software task based on the following rules:

- **Enter condition:** Actual CPU usage percentage > High Threshold
- **Clear condition:** Actual CPU usage percentage £ Low Threshold

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a warning-level alarm threshold of *25* percent of CPU utilization by the ORBS task and a clear threshold of *25* percent:

```
threshold cpu-orbs-warn 25 clear 25
```

threshold cpu-session-throughput

Configures thresholds for CPU session throughput for the system.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold cpu-session-throughput *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold session throughput that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is measured in Kilobytes per second (Kbps) and can be configured to any integer value between 0 and 1000000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold session thereabout that maintains a previously generated alarm condition. If the throughput falls below the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is measured in Kilobytes per second (Kbps) and can be configured to any integer value between 0 and 1000000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

CPU session throughput thresholds generate alerts or alarms based on total throughput for all Session Manager tasks running on each PAC/PSC/PSC2 CPU during the polling interval. Although, a single threshold is configured for all CPUs, separate alerts or alarms can be generated for each CPU.
Alerts or alarms are triggered for CPU session throughput based on the following rules:

- **Enter condition:** Actual CPU session throughput ³ High Threshold
- **Clear condition:** Actual CPU session throughput < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Important: This command is not supported on all platforms.

Example

The following command configures a high threshold count of 900 Kbps session throughput and a low threshold of 500 KBps for an system using the Alarm thresholding model:

```
threshold cpu-session-throughput 900 clear 500
```

threshold cdr-file-space

Configures the threshold for monitoring the percentage of total file space allocated for CDRs used during the polling interval.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

threshold cdr-file-space *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 90
The high threshold for percentage of total allocated CDR file space used that must be met or exceeded at the end of the polling interval to generate an alert or alarm.
high_thresh is measured in percentage of total allocated CDR file space used and can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold for percentage of total allocated CDR file space used that maintains a previously generated alarm condition. If the space usage falls below the low threshold within the polling interval, a clear alarm is generated.
low_thresh is measured in percentage of total allocated CDR file space used and can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

CDR file space usage generate alerts or alarms based on the percentage of total allocated CDR file space used during the polling interval.
Alerts or alarms are triggered for CDR file space usage session based on the following rules:

- **Enter condition:** Actual percentage of allocated CDR file space usage ³ specified percentage of total CDR file space.
- **Clear condition:** Actual CDR file space used < specified clear percentage of total allocated CDR file space usage.

If a trigger condition exists at the end of the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a threshold of *65* percent of total allocated CDR file space usage and a clear threshold of *35* percent:

```
threshold cdr-file-space 65 clear 35
```

threshold contfilt-block

Configures the threshold for Content Filtering rating operations blocked during a polling interval at which the threshold are raised or cleared.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

threshold contfilt-block *high_thresh_value* **[clear** *low_thresh_value* **]**

default threshold contfilt-block

high_thresh

Default: 90
The high threshold for number of rating operations blocked for content filtering service that must be met or exceeded at the end of the polling interval to generate an alert or alarm.
high_thresh is measured in numbers of total rating operations blocked and can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold for the total number of rating operations blocked for a content filtering service that maintains a previously generated alarm condition. If the threshold falls below the low threshold within the polling interval, a clear alarm is generated.
low_thresh is measured in umber of total rating operations blocked and can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

Usage

Use this command to configure the threshold for a content filtering service to generates alerts or alarms based on the number of rating operations blocked for a content filtering service during the polling interval.
If a trigger condition exists at the end of the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll contfilt-block** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a threshold of *65* percent of total rating operations blocked and a clear threshold of *35* percent:

threshold contfilt-block *65* **clear** *35*

threshold contfilt-rating

Configures the threshold for Content Filtering rating operations performed during a polling interval at which the threshold are raised or cleared.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

threshold contfilt-rating *high_thresh_value* **[clear** *low_thresh_value* **]**

default threshold contfilt-rating

high_thresh

Default: 90
The high threshold for number of rating operations performed for content filtering service that must be met or exceeded at the end of the polling interval to generate an alert or alarm.
high_thresh is measured in numbers of total rating operations performed and can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold for the total number of rating operations performed for a content filtering service that maintains a previously generated alarm condition. If the threshold falls below the low threshold within the polling interval, a clear alarm is generated.
low_thresh is measured in umber of total rating operations performed and can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

Usage

Use this command to configure the threshold for a content filtering service to generates alerts or alarms based on the number of rating operations performed for a content filtering service during the polling interval.
If a trigger condition exists at the end of the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll contfilt-rating** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a threshold of *65* percent of total rating operations performed and a clear threshold of *35* percent:

threshold contfilt-rating *65* **clear** *35*

threshold cpu-utilization

Configures thresholds for CPU utilization for the system.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold cpu-utilization *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 85
The high threshold CPU utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh can be configured to any integer value between 0 and 100.

clear *low_thresh*

Default: 85
The low threshold CPU utilization percentage that maintains a previously generated alarm condition. If the utilization percentage falls below the low threshold within the polling interval, a clear alarm will be generated.
low_thresh can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

CPU utilization thresholds generate alerts or alarms based on the utilization percentage of each PAC/PSC/PSC2 CPU during the specified polling interval. Although, a single threshold is configured for all CPUs, separate alerts or alarms can be generated for each CPU.
Alerts or alarms are triggered for CPU utilization based on the following rules:

- **Enter condition:** Average measured CPU utilization for last 5 minutes ³ High Threshold
- **Clear condition:** Average measured CPU utilization for last 5 minutes < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Important: This command is not supported on all platforms.

Example

The following command configures a high threshold CPU utilization percentage of 90 for an system using the Alert thresholding model:

```
threshold cpu-utilization 90
```

threshold dcca-bad-answer

Configures the threshold for invalid or bad responses to the system from Diameter server.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

`[ default ] threshold dcca-bad-answer` *`high_thresh`* **`[ clear`** *`low_thresh`* **`]`**

`default`

Disables the threshold for configured alarm and set the *`high_thresh`* and *`low_thresh`* values to 0.

`high_thresh`

Default: 0
The high threshold number of invalid messages or responses that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value between 0 and 1044000.

`clear` *`low_thresh`*

Default: 0
The low threshold number of invalid messages/responses that maintains a previously generated alarm condition. If the number of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 1044000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

In the event that the system receives invalid message or response from Diameter server **dcca-bad-answer** is generated.
DCCA bad answer messages size threshold generates alerts or alarms based on the number of invalid response or messages received during the specified polling interval.
Alerts or alarms are triggered for DCCA bad answers based on the following rules:

- **Enter condition:** Actual number of DCCA bad answer messages ³ High Threshold
- **Clear condition:** Actual number of DCCA bad answer messages < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Example

The following command configures a high threshold count of *250* DCCA bad answer messages and low threshold of *100* for an system using the Alarm thresholding model:

```
threshold dcca-bad-answer 250 clear 100
```

threshold dcca-protocol-error

Configures the threshold for Diameter Credit Control Application (DCCA) protocol error from Diameter server.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

`[ default ] threshold dcca-protocol-error` *`high_thresh`* **`[ clear`** *`low_thresh`* **`]`**

`default`

Disables the threshold for configured alarm and sets the *`high_thresh`* and *`low_thresh`* values to 0.

`high_thresh`

Default: 0
The high threshold number of protocol error received from Diameter server that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value between 0 and 1044000.

`clear` *`low_thresh`*

Default: 0
The low threshold number of protocol error received from Diameter server that maintains a previously generated alarm condition. If the number of errors falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 1044000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

In the event that the system receives the protocol errors from Diameter server, **dcca-protocol-error** is generated.
DCCA protocol error threshold generates alerts or alarms based on the number of protocol error messages received from Diameter server during the specified polling interval.
Alerts or alarms are triggered for DCCA protocol error based on the following rules:

- **Enter condition:** Actual number of DCCA protocol error ³ High Threshold
- **Clear condition:** Actual number of DCCA protocol errors < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Example

The following command configures a high threshold count of *250* protocol errors and low threshold of *100* for an system using the Alarm thresholding model:

```
threshold dcca-protocol-error 250 clear 100
```

threshold dcca-rating-failed

Configures Diameter Credit Control Application (DCCA) Rating Group (content-id) request reject thresholds.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

[default] threshold dcca-rating-failed *high_thresh* **[clear** *low_thresh* **]**

default

Disables the threshold for configured alarm and sets the *high_thresh* and *low_thresh* values to 0.

high_thresh

Default: 0
The high threshold number of requests for a block of credits due to invalid Rating Group (content-id), rejected from the Diameter server that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value between 0 and 1044000.

clear *low_thresh*

Default: 0
The low threshold number of requests for a block of credits due to invalid Rating Group (content-id), rejected from the Diameter server that maintains a previously generated alarm condition. If the number of errors falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 1044000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

In the event that the Diameter server rejects the system request for a block of credits due to invalid Rating Group, defined as content-id, **dcca-rating-failed** message is generated.
Rating Group failed threshold generates alerts or alarms based on the number of requests rejected from Diameter server during the specified polling interval.
Alerts or alarms are triggered for Rating Group failed based on the following rules:

- **Enter condition:** Actual number of DCCA Rating Group failed ³ High Threshold
- **Clear condition:** Actual number of DCCA Rating Group failed < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Example

The following command configures a high threshold count of *250* requests rejected and low threshold of *100* for an system using the Alarm thresholding model:

```
threshold dcca-rating-failed 250 clear 100
```

threshold dcca-unknown-rating-group

Configures the unknown Diameter Credit Control Application (DCCA) Rating Group (content-id) returned by Diameter to system thresholds.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

[default] threshold dcca-unknown-rating-group *high_thresh* **[clear** *low_thresh* **]**

default

Disables the threshold for configured alarm and sets the *high_thresh* and *low_thresh* values to 0.

high_thresh

Default: 0
The high threshold number of unknown Rating Group (content-id) sent by Diameter server and received by system that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value between 0 and 1044000.

clear *low_thresh*

Default: 0
The low threshold number of unknown Rating Group (content-id) sent by Diameter server and received by system that maintains a previously generated alarm condition. If the number of errors falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 1044000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

In the event that the Diameter server sends invalid Rating Groups, **content-ids** to the system, **dcca-unk-rating-group** message is generated.
Unknown Rating Group threshold generates alerts or alarms based on the number of unknown Rating Groups received by the system from Diameter server during the specified polling interval.
Alerts or alarms are triggered for unknown rating groups based on the following rules:

- **Enter condition:** Actual number of unknown rating groups ³ High Threshold
- **Clear condition:** Actual number of unknown rating groups < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Example

The following command configures a high threshold count of *250* unknown rating groups and low threshold of *100* for an system using the Alarm thresholding model:

```
threshold dcca-unknown-rating-group 250 clear 100
```

threshold edr-file-space

Configures the threshold for monitoring the percentage of total file space allocated for EDRs used during the polling interval.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

`[ default ] threshold edr-file-space` *`high_thresh`* **`[ clear`** *`low_thresh`* **`]`**

`high_thresh`

Default: 90
The high threshold for percentage of total allocated EDR file space used that must be met or exceeded at the end of the polling interval to generate an alert or alarm.
`high_thresh` is measured in percentage of total allocated EDR file space used and can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

`clear` *`low_thresh`*

Default: 0
The low threshold for percentage of total allocated EDR file space used that maintains a previously generated alarm condition. If the space usage falls below the low threshold within the polling interval, a clear alarm is generated.
`low_thresh` is measured in percentage of total allocated EDR file space used and can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

EDR file space usage generate alerts or alarms based on the percentage of total allocated EDR file space used during the polling interval.
Alerts or alarms are triggered for EDR file space usage session based on the following rules:

- **Enter condition:** Actual percentage of allocated EDR file space usage ³ specified percentage of total EDR file space.
- **Clear condition:** Actual EDR file space used < specified clear percentage of total allocated EDR file space usage.

If a trigger condition exists at the end of the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **`threshold poll`** command to configure the polling interval and the **`threshold monitoring`** command to enable thresholding for this value.

Example

The following command configures a threshold of *65* percent of total allocated EDR file space usage and a clear threshold of *35* percent:

```
threshold edr-file-space 65 clear 35
```

threshold edr-udr-dropped flow control

This command configures thresholds to monitor the total number of EDRs and UDRs discarded due to flow control.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold edr-udr-dropped-flow-control *high_thresh* **[clear** *low_thresh* **]**

default threshold edr-udr-dropped-flow-control

default

Configures the default setting.
Default: High threshold: 90; Low threshold: 10

high_thresh

Default: 90
The high threshold for total number of EDRs + UDRs dropped due to flow control, which must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh must be an integer from 0 through 100000.
A value of 0 indicates the threshold.

clear *low_thresh*

Default: 10
The low threshold for total number of EDRs + UDRs dropped that maintains a previously generated alarm condition. If the total number of EDRs + UDRs dropped falls below the low threshold within the polling interval, a clear alarm is generated.
low_thresh must be an integer from 0 through 100000, and must be lower than *high_thresh*.
A value of 0 disables the threshold.

Usage

Use this command to configure thresholds to monitor the total number of EDRs + UDRs discarded due to flow control. Alerts or alarms are generated based on the total number of EDRs + UDRs dropped during polling interval.
Alerts or alarms are triggered for EDR file space usage session based on the following rules:

- **Enter condition:** Actual number of EDRs + UDRs dropped >= specified number of EDRs + UDRs dropped.
- **Clear condition:** Actual number of EDR + UDRs dropped < specified clear number of EDRs + UDRs dropped.

If a trigger condition exists at the end of the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold of *90* and a clear threshold of *45* to monitor EDRs + UDRs dropped due to flow control:

```
threshold edr-udr-dropped-flow-control 90 clear 45
```

threshold fw-deny-rule

This command configures thresholds for Stateful Firewall Deny Rule.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

threshold fw-deny-rule *high_thresh* **[clear** *low_thresh* **]**

default threshold fw-deny-rule

default

Disables the threshold and sets *high_thresh* and *low_thresh* to the default values.

high_thresh

Specifies the Stateful Firewall Deny-Rule threshold value, which if met or exceeded generates an alert or alarm.
high_thresh must be an integer from 0 through 1000000.
Default: 0

clear *low_thresh*

Specifies the Stateful Firewall Deny-Rule alarm clear threshold value. If, in the same polling interval, the threshold falls below *low_thresh* a clear alarm is generated.
low_thresh must be an integer from 0 through 1000000.
Default: 0

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

When the number of Deny-Rule exceeds a given value, a threshold is raised and it is cleared when the number of Deny-Rule fall below a value within the polling interval.
Refer to the **threshold poll** command to configure the polling interval, and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a Stateful Firewall Deny Rule high threshold of *1000* and a low threshold of *100* for a system using the Alarm Thresholding model:

threshold fw-deny-rule *1000* **clear** *100*

threshold fw-dos-attack

This command configures thresholds for Stateful Firewall Denial-of-Service (DoS) attacks.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

threshold fw-dos-attack *high_thresh* **[clear** *low_thresh* **]**

default threshold fw-dos-attack

default

Disables the threshold and sets *high_thresh* and *low_thresh* to the default values.

high_thresh

Specifies the Stateful Firewall DoS attacks threshold value, which if met or exceeded generates an alert or alarm.
high_thresh must be an integer from 0 through 1000000.
Default: 0

clear *low_thresh*

Specifies the Stateful Firewall DoS attacks clear threshold value. If, in the same polling interval, the threshold falls below *low_thresh* a clear alarm is generated.
low_thresh must be an integer from 0 through 1000000.
Default: 0

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

When the number of DoS attacks exceed a given value, a threshold is raised and it is cleared when the number of DoS attacks fall below a value within the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a Stateful Firewall DoS attacks high threshold of *1000* and a low threshold of *100* for a system using the Alarm Thresholding model:

threshold fw-dos-attack *1000* **clear** *100*

threshold fw-drop-packet

This command configures thresholds for Stateful Firewall drop packets.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

threshold fw-drop-packet *high_thresh* **[clear** *low_thresh* **]**

default threshold fw-drop-packet

default

Disables the threshold and sets *high_thresh* and *low_thresh* to the default values.

high_thresh

Specifies the Stateful Firewall drop packets threshold value, which if met or exceeded generates an alert or alarm.
high_thresh must be an integer from 0 through 1000000.
Default: 0

clear *low_thresh*

Specifies the Stateful Firewall drop packets clear threshold value. If, in the same polling interval, the threshold falls below *low_thresh* a clear alarm is generated.
low_thresh must be an integer from 0 through 1000000.
Default: 0

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

When the number of drop packets exceed a given value, a threshold is raised and it is cleared when the number of drop packets fall below a value within the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a Stateful Firewall drop packets high threshold of *1000* and a low threshold of *100* for a system using the Alarm thresholding model:

threshold fw-drop-packet *1000* **clear** *100*

threshold fw-no-rule

This command configures thresholds for Stateful Firewall no rules.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

threshold fw-no-rule *high_thresh* **[clear** *low_thresh* **]**

default threshold fw-no-rule

default

Disables the threshold and sets *high_thresh* and *low_thresh* to the default values.

high_thresh

Specifies the Stateful Firewall no rules threshold value, which if met or exceeded generates an alert or alarm.
high_thresh must be an integer from 0 through 1000000.
Default: 0

clear *low_thresh*

Specifies the Stateful Firewall no rules clear threshold value. If, in the same polling interval, the threshold falls below *low_thresh* a clear alarm is generated.
low_thresh must be an integer from 0 through 1000000.
Default: 0

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

When the number of no rules exceed a given value, a threshold is raised and it is cleared when the number of no rules fall below a value within the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a Stateful Firewall no rules high threshold of *1000* and a low threshold of *100* for a system using the Alarm Thresholding model:

threshold fw-no-rule *1000* **clear** *100*

threshold license

Configures thresholds for session license utilization for the system.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] threshold license remaining-sessions *low_thresh* **clear** *high_thresh*

remaining-sessions *low_thresh*

Default: 10
The low threshold session license utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
low_thresh can be configured to any integer value between 0 and 100.

clear *high_thresh*

Default: 10
The high threshold session license utilization percentage that maintains a previously generated alarm condition. If the utilization percentage rises above the high threshold within the polling interval, a clear alarm will be generated.
high_thresh can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

Session license utilization thresholds generate alerts or alarms based on the utilization percentage of all session capacity licenses during the specified polling interval.
As described in Chapter 7 of the Administration and Configuration Guide, the system uses session capacity license to dictate the maximum number of simultaneous sessions that can be supported. There are multiple session types that require licenses (i.e. Simple IP, Mobile IP, L2TP, etc.). Although, a single threshold is configured for all session types, alerts or alarms can be generated for each type.
Alerts or alarms are triggered for session license utilization based on the following rules:

- **Enter condition:** Actual session license utilization percentage per session type £ Low Threshold
- **Clear condition:** Actual session license utilization percentage per session type > High Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a session license low threshold percentage of 10 and a high threshold of 35 for an system using the Alarm thresholding model:

```
threshold license remaining-sessions 10 clear 35
```

threshold mgmt-cpu-memory-usage

Configures the thresholds for CPU memory usage.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold mgmt-cpu-memory-usage *high_thresh* **[clear** *low_thresh*

high_thresh

Default: 0
The high threshold percent of CPU memory usage that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is measured in percentage of total memory used and can be configured to any integer value 0 through 100. A value of 0 disables the threshold.

clear *low_thresh*

The low threshold percent of CPU memory usage that maintains a previously generated alarm condition. If the percentage falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is measured in percentage of total memory used and can be configured to any integer value 0 through 100. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

CPU memory usage thresholds generate alerts or alarms based on memory usage for the SPC/SMC CPU during the polling interval. A single threshold enables CPU monitoring for both the active and standby SPCs/SMCs allowing for alerts or alarms to be generated for each CPU.
Alerts or alarms are triggered for SPC/SMC CPU memory usage based on the following rules:

- **Enter condition:** Actual CPU memory usage ³ High Threshold
- **Clear condition:** Actual CPU memory usage < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Important: This command is not supported on all platforms.

Example

The following command configures a threshold of *65* percent of total SPC/SMC CPU memory usage and a clear threshold of *35* percent:

```
threshold mgmt-cpu-memory-usage 65 clear 35
```

threshold mgmt-cpu-utilization

Configures the thresholds for CPU utilization.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold mgmt-cpu-utilization *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold CPU utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh can be configured to any integer value between 0 and 100.

clear *low_thresh*

The low threshold CPU utilization percentage that maintains a previously generated alarm condition. If the utilization percentage falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

CPU utilization thresholds generate alerts or alarms based on the utilization percentage of each SPC/SMC CPU during the specified polling interval. Although, a single threshold is configured for both SPC/SMC CPUs, separate alerts or alarms can be generated for each CPU.
Alerts or alarms are triggered for SPC/SMC CPU utilization based on the following rules:

- **Enter condition:** Average measured CPU utilization for last 5 minutes ³ High Threshold
- **Clear condition:** Average measured CPU utilization for last 5 minutes < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Important: This command is not supported on all platforms.

Example

The following command configures a high threshold SPC/SMC CPU utilization percentage of *90* for an system using the Alert thresholding model:

```
threshold mgmt-cpu-utilization 90
```

threshold mme-attach-failure

Use this command to configure thresholds for the total number of MME Attach Failure messages to count across all the MME services in the system as threshold limit to generate alert or alarm.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

threshold total-mme-attach-failure *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0 (Disabled)
The high threshold number of total MME Attach Failure messages across all MMM services on a system that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 0 through 100000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0 (Disabled)
The low threshold number of total MME Attach Failure messages across all services on a system that maintains a previously generated alarm condition. If the number of MME Attach Failure messages, across all the services in a system, falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 100000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to monitor and set alarms or alerts when the total number of MME Attach Failure message across all the MME services in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for the total number of MME Attach Failure message based on the following rules:

- **Enter condition:** Actual total number of MME Attach Failure messages ³ High Threshold
- **Clear condition:** Actual total number of MME Attach Failure messages < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll mme-attach-failure** command to configure the polling interval and the **threshold monitoring mme-service** command to enable thresholding for this value.

Example

The following command configures the limit of MME Attach Failure high threshold count of *10000* for an system using the Alert thresholding model:

```
threshold mme-attach-failure 10000
```

threshold mme-auth-failure

Use this command to configure thresholds for the total number of MME Auth Failure messages to count across all the MME services in the system as threshold limit to generate alert or alarm.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

threshold total-mme-auth-failure *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0 (Disabled)
The high threshold number of total MME Auth Failure messages across all MMM services on a system that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 0 through 100000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0 (Disabled)
The low threshold number of total MME Auth Failure messages across all services on a system that maintains a previously generated alarm condition. If the number of MME Attach Failure messages, across all the services in a system, falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 100000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to monitor and set alarms or alerts when the total number of MME Auth Failure message across all the MME services in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for the total number of MME Auth Failure message based on the following rules:

- **Enter condition:** Actual total number of MME Auth Failure messages ³ High Threshold
- **Clear condition:** Actual total number of MME Auth Failure messages < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll mme-auth-failure** command to configure the polling interval and the **threshold monitoring mme-service** command to enable thresholding for this value.

Example

The following command configures a total MME Auth Failure high threshold count of *10000* for an system using the Alert thresholding model:

```
threshold mme-auth-failure 10000
```

threshold model

Configures the thresholding model for the system to use.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
threshold model { alarm | alert }
```

alarm

Selects the alarm thresholding model as described in the Usage section for this command.

alert

Selects the alert thresholding model as described in the Usage section for this command.

Usage

The system supports the following thresholding models:

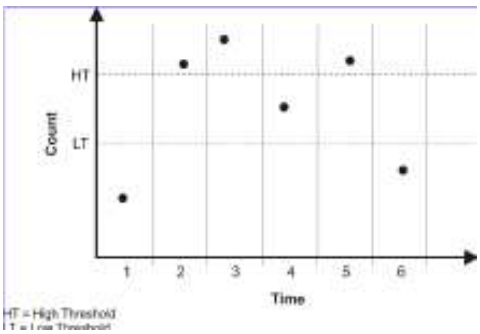
- **Alert:** A value is monitored and an alert condition occurs when the value reaches or exceeds the configured high threshold within the specified polling interval. The alert is generated then generated and/or sent at the end of the polling interval.

In the example shown in the figure below, this model generates alerts during period 2, 3, and 5 at the point where the count exceeded HT.

- **Alarm:** Both high and low threshold are defined for a value. An alarm condition occurs when the value reaches or exceeds the configured high threshold within the specified polling interval. The alert is generated then generated and/or sent at the end of the polling interval.

The alarm is cleared at the end of the first interval where the measured value is below the low threshold. In the example shown in the figure below, this model generates an alarm during period 2 when the count exceeds HT. A second alarm is generated in period 6 when the count falls beneath LT. The second alarm indicates a “clear” condition.

Figure 5. Thresholding Model Example



Important: Note that for certain values, the alert or alarm serves to warn of low quantities (i.e., memory, session licenses, etc.). In these cases, the low threshold is the condition that must be met or exceeded within the polling interval to generate the alert or alarm. Once the high threshold is exceeded during an interval, the low quantity condition is cleared.

Refer to the **`threshold monitoring`** command for additional information on thresholding.

Example

The following command configures the system to support the Alarm thresholding model:

```
threshold model alarm
```

threshold monitoring

Enables thresholding for the selected value.

Product

All

Privilege

Administrator

Syntax

[no | default] threshold monitoring { aaa-acct-archive-size | aaa-acct-failure | aaa-auth-failure | aaa-retry-rate | aaamgr-request-queue | asngw | call-setup | content-filtering | cpu-resource | cpu-session-throughput | cscf-service | ecs | fa-service | firewall | ha-service | **hsgw-service | ipsec | license | lma-service | mme-service | packets-filtered-dropped | packets-forwarded-to-cpu | pdsn-service | pdg-service | pdif-service** | pgw-service | **route-service | sgw-service | subscriber | system }**

no

Disables threshold monitoring for the specified value.

default

Sets / restores default value assigned for the specified parameter.

aaa-acct-archive-size

Enables threshold monitoring for the size of the AAA accounting record archive.

aaa-acct-failure

Enables threshold monitoring for AAA accounting failures and AAA accounting failure rate values.
Refer to the **threshold aaa-acct-failure** and **threshold aaa-acct-failure-rate** commands for additional information on these values.

aaa-auth-failure

Enables threshold monitoring for AAA authentication failures and AAA authentication failure rate values.
Refer to the **threshold aaa-auth-failure** and **threshold aaa-auth-failure-rate** commands for additional information on these values.

aaa-retry-rate

Enables threshold monitoring for the AAA retry rate value.
Refer to the **threshold aaa-retry-rate** command for additional information on this value.

aaamgr-request-queue

Enables threshold monitoring for AAA Manager Requests for each AAA manager process. Refer to the **threshold aaamgr-request-queue** command for additional information on these values.

asngw

Enables the threshold monitoring for ASN-GW services.

call-setup

Enables threshold monitoring for the call setup, call setup failures, and no-resource rejected call values.
Refer to the **threshold call-setup, threshold call-setup-failure, threshold ppp-setup-fail-rate, threshold rp-setup-fail-rate**, and **threshold call-reject-no-resource** commands for additional information on these values.

cpu-resource

Enables threshold monitoring for CPU thresholds.
Refer to the **threshold 10sec-cpu-utilization, threshold cpu-available-memory, threshold cpu-load, threshold cpu-memory-usage, threshold cpu-orbs-crit, threshold cpu-orbs-warn, threshold cpu-session-throughput, threshold cpu-utilization, threshold mgmt-cpu-memory-usage,** and **threshold mgmt-cpu-utilization** commands for additional information on these values.

cpu-session-throughput

Enables threshold monitoring for the CPU session throughput value.
Refer to the **threshold cpu-session-throughput** command for additional information on this value.

content-filtering

Enables threshold monitoring for the Content Filtering service.

cscf-service

Enables threshold monitoring for the CSCF service.

ecs

Enables threshold monitoring for the Active Charging Service (ACS)/Enhanced Charging Service (ECS).

fa-service

Enables threshold monitoring for Registration Reply errors for each FA service.
Refer to the **threshold reg-reply-error** FA Service Configuration Mode command for additional information on this value.

firewall

Enables threshold monitoring for the Stateful Firewall service.
Default: Disabled
Refer to the **threshold fw-deny-rule, threshold fw-dos-attack, threshold fw-drop-packet**, and **threshold fw-no-rule** commands for additional information on this value.

Important: Stateful Firewall thresholds can only be enabled if the Stateful Firewall license is present.

ha-service

Enables threshold monitoring for Registration Reply errors, re-registration reply errors, deregistration reply errors, and average calls setup per second for each HA service and average calls setup per second at the context level.
Refer to the **threshold init-rrq-rcvd-rate, threshold reg-reply-error, threshold rereg-reply-error,** and **threshold dereg-reply-error** HA Service Configuration Mode commands and the **threshold ha-service init-rrq-rcvd-rate** Context Configuration mode command for additional information on this value.

hsgw-service

Enables threshold monitoring for HSGW services.
Refer to the threshold total-hsgw-sessions for more information on HSGW thresholds.

ipsec

Enables monitoring of IPSec thresholds.
refer to the HA-Service Configuration Mode chapter of the Command Line Interface Reference for information on the IPSec thresholds.

license

Enables threshold monitoring for the session license value.
Refer to the **threshold license** command for additional information on this value.

lma-service

Enables threshold monitoring for LMA services.
Refer to the threshold total-lma-sessions for more information on LMA thresholds.

mme-service

Default: Disabled.
Enables threshold monitoring for the MME services.
Refer to the t**hreshold total-mme-sessions** commands for additional information on this value.

packets-filtered-dropped

Enables threshold monitoring for the filtered/dropped packet value.
Refer to the **threshold packets-filtered-dropped** command for additional information on this value.

packets-forwarded-to-cpu

Enables threshold monitoring for the forwarded packet value.
Refer to the **threshold packets-forwarded-to-cpu** command for additional information on this value.

pdg-service

Enables threshold monitoring for PDG service.
Threshold monitoring for PDG service is disabled by default.

pdif-service

Enables threshold monitoring for PDIF service.

pdsn-service

Enables threshold monitoring for average calls setup per second for contexts and for PDSN services, A11 Request.
Refer to the **threshold packets-forwarded-to-cpu** command for additional information on this value.

pgw-service

Enables threshold monitoring for P-GW services.
Refer to the threshold total-pgw-sessions for more information on P-GW thresholds.

route-service

Enables threshold monitoring for BGP/VRF route services.
Refer to the **ip maximum-routes** command in Context configuration mode and **threshold route-service bgp-routes** in this mode for more information on route thresholds.

sgw-service

Enables threshold monitoring for S-GW services.
Refer to the threshold total-sgw-sessions for more information on S-GW thresholds.

subscriber

Enables threshold monitoring for the subscriber and session values.
Refer to the **threshold subscriber active**, **threshold subscriber total, threshold total-ggsn-sessions**, **threshold total-gprs-sessions, threshold total-gprs-pdp-sessions, threshold total-ha-sessions, threshold total-lns-sessions, threshold total-pdsn-sessions, threshold total-sgsn-sessions**, **threshold total-sgsn-pdp-sessions**, **threshold per-service-ggsn-sessions**, **threshold per-service-ha-sessions**, t**hreshold per-service-lns-sessions**, and **threshold per-service-pdsn-sessions** commands for additional information on these values.

system

Enables system (chassis) thresholds monitoring.

Usage

Thresholding on the system is used to monitor the system for conditions that could potentially cause errors or outage. Typically, these conditions are temporary (i.e high CPU utilization, or packet collisions on a network) and are quickly resolved. However, continuous or large numbers of these error conditions within a specific time interval may be indicative of larger, more severe issues. The purpose of thresholding is to help identify potentially severe conditions so that immediate action can be taken to minimize and/or avoid system downtime.
Thresholding reports conditions using one of the following mechanisms:

- **SNMP traps:** SNMP traps have been created that indicate the condition (high threshold crossing and/or clear) of each of the monitored values. Complete descriptions and other information pertaining to these traps is located in the starentMIB(8164).starentTraps(2) section of the SNMP MIB Reference.

The generation of specific traps can be enabled or disabled on the system allowing you to view only those traps that are most important to you.

- **Logs:** The system provides a facility called threshold for which active and event logs can be generated. As with other system facilities, logs are generated Log messages pertaining to the condition of a monitored value are generated with a severity level of WARNING.
- **Alarm System:** High threshold alarms generated within the specified polling interval are considered "outstanding" until a the condition no longer exists and/or a condition clear alarm is generated.

"Outstanding" alarms are reported to through the system's alarm subsystem and are viewable through the system's CLI.
The following table indicates the reporting mechanisms supported by each of the above models.

Table 23. Thresholding Reporting Mechanisms by Model

Model	SNMP Traps	Logs	Alarm System
Alert	X	X	
Alarm	X	X	X

In addition to the values that can be enabled by this command, the system supports the enabling of threshold monitoring for IP pool address availability (refer to the **ip pool** and threshold commands in this reference) and port utilization (refer to the threshold commands in this chapter).

Example
The following command enables thresholding for subscriber totals:

```
threshold monitoring subscriber
```

threshold nat-port-chunks-usage

This command configures the NAT port chunk utilization threshold settings.

Important: This command is only available in Release 8.3 and later releases.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

threshold nat-port-chunks-usage *high_thresh* **[clear** *low_thresh* **]**

default threshold nat-port-chunks-usage

default

Configures the default settings.

high_thresh

Default: 0
Specifies the high nat-port-chunks-usage threshold that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh must be an integer from 0 through 100. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low nat-port-chunks-usage threshold that must be met within the polling interval for a clear alarm to be generated.
low_thresh must be an integer from 0 through 100. A value of 0 disables the threshold. If not set, the *high_thresh* will be high and low threshold setting.

Usage

Use this command to configure the NAT port chunk utilization threshold settings.

Example

The following command sets the NAT port chunk utilization threshold settings to a high of 75 and a low of 15:

threshold nat-port-chunks-usage *75* **clear** *15*

threshold packets-filtered-dropped

Configures filtered/dropped packet thresholds for the system.

Product

PDSN, GGSN, HA, SGSN, ASN GW

Privilege

Security Administrator, Administrator

Syntax

threshold packets-filtered-dropped *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold number of filtered/dropped packets experienced by the system resulting from ACL rules that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value between 0 and 1000000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of filtered/dropped packets experienced by the system resulting from ACL rules that maintains a previously generated alarm condition. If the number of packets falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 1000000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Filtered/dropped packet thresholds generate alerts or alarms based on the total number of packets that were filtered or dropped by the system as a result of access control list (ACL) rules during the specified polling interval.
Alerts or alarms are triggered for filtered/dropped packets based on the following rules:

- **Enter condition:** Actual number of filtered/dropped packets ³ High Threshold
- **Clear condition:** Actual number of filtered/dropped packets < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value. In addition, refer to information on ACLs in this reference.

Example

The following command configures a filtered/dropped packet high threshold count of 150000 for an system using the Alert thresholding model:

```
threshold packets-filtered-dropped 150000
```

threshold packets-forwarded-to-cpu

Configures forwarded packet thresholds for the system.

Product

PDSN, GGSN, HA, SGSN, ASN GW

Privilege

Security Administrator, Administrator

Syntax

threshold packets-forwarded-to-cpu *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold number of forwarded packets experienced by the system that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value between 0 and 1000000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of forwarded packets experienced by the system that maintains a previously generated alarm condition. If the number of packets falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 1000000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Forwarded packet thresholds generate alerts or alarms based on the total number of packets that were forwarded to active system CPU(s) during the specified polling interval. Packets are forwarded to active system CPUs when the NPUs do not have adequate information to properly route them.

Important: Ping and/or traceroute packets are intentionally forwarded to system CPUs for processing. These packet types are included in the packet count for this threshold.

Alerts or alarms are triggered for forwarded packets based on the following rules:

- **Enter condition:** Actual number of forwarded packets ³ High Threshold
- **Clear condition:** Actual number of forwarded packets < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a forwarded packet high threshold count of 10000 for an system using the Alert thresholding model:

```
threshold packets-forwarded-to-cpu 10000
```

threshold pdg-current-active-sessions

Configures the threshold for monitoring the total number of all current PDG sessions only.

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

threshold pdg-current-active-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Configures the total number of active PDG sessions to be monitored on a chassis. *high_thresh* is any integer from 0 to 300000.
There is no default, but 0 means that there is no threshold monitoring.

clear *low_thresh*

Clears any percentage of the number of sessions being monitored using the *high_thresh* variable defined above.
low_thresh is any integer from 0 to 300000.

Usage

Thresholds are provided for monitoring the overall PDG usage on a chassis. This command is used to monitor the total number of active PDG sessions for an entire chassis.

Example

The following command configures a monitoring threshold of 300000 active PDG sessions on a chassis:

```
threshold pdg-current-active-sessions 300000
```

which turns out to be too many, so the following command clears 100000:

```
threshold pdg-current-active-sessions 300000 clear 100000
```

threshold pdg-current-sessions

Configures the threshold for monitoring the total number of all current PDG sessions, including inactive sessions.

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

threshold pdg-current-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Configures the total number of PDG sessions on a chassis, both active and inactive. *high_thresh* is any integer from 0 to 300000.
There is no default, but 0 means that there is no threshold monitoring.

clear *low_thresh*

Clears any percentage of the number of sessions being monitored using the *high_thresh* variable defined above.
low_thresh is any integer from 0 to 300000.

Usage

Thresholds are provided for monitoring the overall PDG usage on a chassis. This command is used to monitor the total number of PDG sessions, both active and inactive, for an entire chassis.

Example

The following command configures a monitoring threshold of 300000 active and inactive PDG sessions on a chassis:

```
threshold pdg-current-sessions 300000
```

which turns out to be too many, so the following command clears 100000:

```
threshold pdg-current-sessions 300000 clear 100000
```

threshold pdif-current-sessions

Configures the threshold for monitoring the total number of all current pdif sessions, including inactive sessions.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

threshold pdif-current-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Configures the total number of PDIF sessions on a chassis, both active and inactive. *high_thresh* is any integer from 0 to 300000.
There is no default, but 0 means that there is no threshold monitoring.

clear *low_thresh*

Clears any percentage of the number of sessions being monitored using the *high_thresh* variable defined above. *low_thresh* is any integer from 0 to 300000.

Usage

Thresholds are provided for monitoring the overall PDIF usage on a chassis. This command is used to monitor the total number of PDIF sessions, both active and inactive, for an entire chassis.

Example

The following command configures a monitoring threshold of 300000 active and inactive PDIF sessions on a chassis:

threshold pdif-current-sessions *300000*

which turns out to be too many, so the following command clears 100000:

threshold pdif-current-sessions *300000* **clear** *100000*

threshold pdif-current-active-sessions

Configures the threshold for monitoring the total number of current pdif sessions only.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

threshold pdif-current-active sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Configures the total number of active PDIF sessions to be monitored on a chassis. *high_thresh* is any integer from 0 to 300000.
There is no default, but 0 means that there is no threshold monitoring.

clear *low_thresh*

Clears any percentage of the number of sessions being monitored using the *high_thresh* variable defined above. *low_thresh* is any integer from 0 to 300000.

Usage

Thresholds are provided for monitoring the overall PDIF usage on a chassis. This command is used to monitor the total number of active PDIF sessions for an entire chassis.

Example

The following command configures a monitoring threshold of 300000 active PDIF sessions on a chassis:

```
threshold pdif-current-active-sessions 300000
```

which turns out to be too many, so the following command clears 100000:

```
threshold pdif-current-active-sessions 300000 clear 100000
```

threshold per-service-ggsn-sessions

Configures thresholds for the number of PDP contexts per GGSN service in the system.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

threshold per-service-ggsn-sessions *high_thresh* **[** *clear low_thresh* **]**

high_thresh

Default: 0
The high threshold number of PDP contexts for any one GGSN service that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 0 through 4000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of PDP contexts for any one GGSN service that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 4000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the number of PDP contexts for any GGSN service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for PDP contexts based on the following rules:

- **Enter condition:** Actual number of PDP contexts for any GGSN service ³ High Threshold
- **Clear condition:** Actual number of PDP contexts < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *10000* subscriber attaches per GGSN service for the Alert thresholding model:

```
threshold per-service-ggsn-sessions 10000
```

threshold per-service-gprs-pdp-sessions

Configures thresholds for the number of 2G-activated PDP contexts per GPRS service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

threshold per-service-gprs-pdp-sessions *high_thresh* **[clear** *low_thresh*

high_thresh

Default: 0
The high threshold number of 2G-activated PDP contexts for any one GPRS service. This number must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 0 through 4000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of 2G-activated PDP contexts for any one GPRS service. This number or higher maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, then a clear alarm will be generated.
The number can be configured to any integer value between 0 and 4000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the number of 2G-activated PDP contexts for any GPRS service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for PDP contexts based on the following rules:

- **Enter condition:** Actual number of PDP contexts for any GPRS service ³ High Threshold
- **Clear condition:** Actual number of PDP contexts < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *10000* 2G-activated PDP contexts per GPRS service for the Alert thresholding model:

```
threshold per-service-gprs-sessions 10000
```

threshold per-service-gprs-sessions

Configures the thresholds for the number of 2G-attached subscribers per GPRS service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

threshold per-service-gprs-sessions *high_thresh* **[clear** *low_thresh*

high_thresh

Default: 0
The high threshold number of 2G-attached subscribers for any one GPRS service. This threshold number must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 0 through 2000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of 2G-attached subscribers for any one GPRS service. The number of subscribers must remain above this threshold in order to maintain a previously generated alarm condition. If the number of 2G subscribers falls beneath the low threshold within the polling interval, then a clear alarm will be generated.
The number can be configured to any integer value between 0 and 2000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the number of 2G-attached subscribers for any GPRS service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for PDP contexts based on the following rules:

- **Enter condition:** Actual number of 2G-attached subscribers for any GPRS service ³ High Threshold
- **Clear condition:** Actual number of 2G-attached subscribers < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *10000* 2G-attaches per GPRS service for the Alert thresholding model:

```
threshold per-service-gprs-sessions 10000
```

threshold per-service-ha-sessions

Configures thresholds for the number of HA sessions per HA service in the system.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

threshold per-service-ha-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold number of HA sessions for any one HA service that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 0 through 500000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of HA sessions for any one HA service that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 500000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the number of HA sessions for any HA service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for HA sessions based on the following rules:

- **Enter condition:** Actual number of HA sessions for any HA service ³ High Threshold
- **Clear condition:** Actual number of HA sessions < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a HA session per service high threshold count of 10000 for an system using the Alert thresholding model:

```
threshold per-service-ha-sessions 10000
```

threshold per-service-lns-sessions

Configures thresholds for the number of LNS sessions per LNS service in the system.

Product

PDSN, GGSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

threshold per-service-lns-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold number of LNS sessions for any one LNS service that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 0 through 500000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of LNS sessions for any one LNS service that maintains a previously generated alarm condition. If the number of LNS sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 500000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the number of LNS sessions for any LNS service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for LNS sessions based on the following rules:

- **Enter condition:** Actual number of LNS sessions for any LNS service ³ High Threshold
- **Clear condition:** Actual number of LNS sessions < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a LNS session per service high threshold count of *10000* for an system using the Alert thresholding model:

```
threshold per-service-lns-sessions 10000
```

threshold per-service-pdsn-sessions

Configures thresholds for the number of PDSN sessions per PDSN service in the system.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

threshold per-service-pdsn-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold number of PDSN sessions for any one PDSN service that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 0 through 500000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of PDSN sessions for any one PDSN service that maintains a previously generated alarm condition. If the number of PDSN sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 500000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the number of PDSN sessions for any PDSN service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for PDSN sessions based on the following rules:

- **Enter condition:** Actual number of PDSN sessions for any PDSN service ³ High Threshold
- **Clear condition:** Actual number of PDSN sessions < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a HA session per service high threshold count of *10000* for an system using the Alert thresholding model:

```
threshold per-service-pdsn-sessions 10000
```

threshold per-service-sgsn-pdp-sessions

Configures the thresholds for the number of 3G-activated PDP contexts per SGSN service on the system.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

threshold per-service-sgsn-pdp-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold number of 3G-activated PDP contexts for any one SGSN service. This number must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 0 through 4000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of 3G-activated PDP contexts for any one SGSN service. This number or higher maintains a previously generated alarm condition. If the number of 3G-activated PDP contexts falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 2400000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the number of 3G-activated PDP contexts for any SGSN service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for PDP contexts based on the following rules:

- **Enter condition:** Actual number of 3G-activated PDP contexts for any SGSN service ³ High Threshold
- **Clear condition:** Actual number of 3G-activated PDP contexts < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *10000* 3G-activated PDP contexts per SGSN service for the system's Alert thresholding model:

```
threshold per-service-sgsn-sessions 10000
```

threshold per-service-sgsn-sessions

Configures the thresholds for the number of 3G-attached subscribers per SGSN service in the system.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

threshold per-service-sgsn-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold number of 3G-attached subscribers for any one SGSN service. This number must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 0 through 2000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of 3G-attached subscribers for any one SGSN service. This number must be met or exceeded to maintain a previously generated alarm condition. If the number of subscribers falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 2000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the number of 3G-attached subscribers for any one SGSN service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for PDP contexts based on the following rules:

- **Enter condition:** Actual number of 3G-attached subscribers for any single SGSN service ³ High Threshold
- **Clear condition:** Actual number of 3G-attached subscribers for any single SGSN service < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *10000* 3G-attached subscribers per SGSN service for a system using the Alert thresholding model:

```
threshold per-service-sgsn-sessions 10000
```

threshold poll

This command configures the polling interval over which to count or measure the thresholding value.

Product

```

default

Restores the specified parameter to its default value.

10sec-cpu-utilization percent

Default: 300 seconds (5 minutes)
Configures the polling interval for measuring a 10 second average of CPU utilization.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

a11-rrp-failure

Default: 0
Configures the polling interval over which to count A11 Registration Response failures. When specifying **interval** *time* for this threshold, the range is from 60 through 900 seconds.

a11-rrq-msg-discard

Default: 0
Configures the polling interval over which to count how many A11 Registration Request messages are discarded. When specifying **interval** *time* for this threshold, the range is from 60 through 900 seconds.

a11-rac-msg-discard

Default: 0
Configures the polling interval over which to count how many A11 Registration Acknowledgement messages are discarded. When specifying **interval** *time* for this threshold, the range is from 60 through 900 seconds.

aaa-acct-archive-size

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count archived AAA accounting messages.

aaa-acct-failure

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count failed AAA accounting requests.

aaa-acct-failure-rate

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure the percentage of AAA accounting failures.

aaa-auth-failure

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count failed authentication requests.

aaa-auth-failure-rate

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure the percentage of AAA authentication failures.

aaa-retry-rate

Default: 300 seconds (5 minutes)

Configures the polling interval over which to measure the percent of AAA request message retries.

aaamgr-request-queue

Default: 0
Configures the polling interval over which to count the number AA Manager Requests for each AAA manager process. When specifying **interval** *time* for this threshold, the range is from 60 through 900 seconds.

active-subscriber

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of active subscriber sessions.

all-ppp-send-discard

Default: 0
Configures the polling interval over which to count the number of discarded PPP send packets. When specifying **interval** *time* for this threshold, the range is from 60 through 900 seconds.

available-ip-pool-group

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure IP pool utilization.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

call-reject-no-resource

Default: 900 seconds (15 minutes)
Configures the polling interval over which to count the number of calls rejected due to insufficient resources.

call-setup

Default: 900 seconds (15 minutes)
Configures the polling interval over which to count the number of calls setup.

call-setup-failure

Default: 900 seconds (15 minutes)
Configures the polling interval over which to count the number of calls setup failures.

call-setup-failures

Default: 300 seconds (5 minutes)
Configures the polling interval in seconds over which to count CSCF call setup failures.
time must an integer value from 60 to 60000 and expressed in multiples of 30. The system will round up all other configured values to a multiple of 30.

call-total-active

Default: 300 seconds (5 minutes)
Configures the polling interval in seconds over which to count CSCF total active calls.

time must an integer value from 60 to 60000 and expressed in multiples of 30. The system will round up all other configured values to a multiple of 30.

cpu-available-memory

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure PAC/PSC/PSC2 CPU memory availability.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

Important: This command is not supported on all platforms

cpu-load

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure PAC/PSC/PSC2 CPU load using a 5 minute average measurement.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

Important: This command is not supported on all platforms

cpu-memory-usage

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure the percentage of total PAC/PSC/PSC2 CPU memory used.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

Important: This command is not supported on all platforms

cpu-orbs-crit

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure the percentage of CPU utilization by the ORBS software task for critical-level alerts.

cpu-orbs-warn

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure the percentage of CPU utilization by the ORBS software task for warning-level alerts.

cpu-session-throughput

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure PAC/PSC/PSC2 CPU session throughput.

Important: This command is not supported on all platforms

cpu-utilization

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure PAC/PSC/PSC2 CPU utilization.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

Important: This command is not supported on all platforms

cscf-invite-rcvd

Default: 300 seconds (5 minutes)
Configures the polling interval in seconds over which to count the CSCF calls.
time must an integer value from 60 to 60000 and expressed in multiples of 30. The system will round up all other configured values to a multiple of 30.

cscf-reg-rcvd

Default: 300 seconds (5 minutes)
Configures the polling interval in seconds over which to count the CSCF registrations.
time must an integer value from 60 to 60000 and expressed in multiples of 30. The system will round up all other configured values to a multiple of 30.

cscf-service-route-failures

Default: 300 seconds (5 minutes)
Configures the polling interval in seconds over which to count the CSCF service route failures.
time must an integer value from 60 to 60000 and expressed in multiples of 30. The system will round up all other configured values to a multiple of 30.

dcca-bad-answers

Configures the polling interval in seconds over which to count Diameter bad answers.

dcca-protocol-error

Configures the polling interval in seconds over which to count Diameter protocol errors.

dcca-rating-failed

Configures the polling interval in seconds over which to count Diameter rating failures.

dcca-unknown-rating-group

Configures the polling interval in seconds over which to count Diameter unknown rating group errors.

dereg-reply-error

Default: 0
Configures the polling interval over which to measure the number of de-registration reply errors for HA services. When specifying **interval** *time* for this threshold, the range is from 60 through 900 seconds.

edr-file-space

Configures the polling interval in seconds over which to count EDR file space.

edr-udr-dropped-flow-control

Configures the polling interval in seconds over which to count EDR-UDRs Dropped due to Flow Control at ACSMGR.

error-no-resource

Default: 300 seconds (5 minutes)
Configures the polling interval in seconds over which to count CSCF No Resource Errors.
time must an integer value from 60 to 60000 and expressed in multiples of 30. The system will round up all other configured values to a multiple of 30.

error-presence

Default: 300 seconds (5 minutes)
Configures the polling interval in seconds over which to count CSCF Presence Errors.
time must an integer value from 60 to 60000 and expressed in multiples of 30. The system will round up all other configured values to a multiple of 30.

error-reg-auth

Default: 300 seconds (5 minutes)
Configures the polling interval in seconds over which to count CSCF Reg-Auth Errors.
time must an integer value from 60 to 60000 and expressed in multiples of 30. The system will round up all other configured values to a multiple of 30.

error-tcp

Default: 300 seconds (5 minutes)
Configures the polling interval in seconds over which to count CSCF TCP Errors.
time must an integer value from 60 to 60000 and expressed in multiples of 30. The system will round up all other configured values to a multiple of 30.

fa-reg-reply-error

Default: 0
Configures the polling interval over which to measure the number of registration reply errors for FA services. When specifying **interval** *time* for this threshold, the range is from 60 through 900 seconds.

fng-current-active-sessions

Configures the polling interval in seconds over which to count FNG current active sessions.

fng-current-sessions

Configures the polling interval in seconds over which to count FNG current sessions.

fw-deny-rule

Default: 900 seconds (15 minutes)
Configures the Stateful Firewall Deny-Rule threshold polling interval. For this threshold the interval time range is from 60 through 900 seconds.

fw-dos-attack

Default: 900 seconds (15 minutes)
Configures the Stateful Firewall DoS-Attacks threshold polling interval. For this threshold the interval time range is from 60 through 900 seconds.

fw-drop-packet

Default: 900 seconds (15 minutes)
Configures the Stateful Firewall Drop-Packet threshold polling interval. For this threshold the interval time range is from 60 through 900 seconds.

fw-no-rule

Default: 900 seconds (15 minutes)
Configures the Stateful Firewall No-Rule threshold polling interval. For this threshold the interval time range is from 60 through 900 seconds.

ha-init-rrq-rcvd-rate

Default: 0
Configures the polling interval over which to measure the average number of calls setup per minute for the context. When specifying **interval** *time* for this threshold, the range is from 60 through 900 seconds.

ha-svc-init-rrq-rcvd-rate

Default: 0
Configures the polling interval over which to measure the average number of calls setup per minute for HA services. When specifying **interval** *time* for this threshold, the range is from 60 through 900 seconds.

ip-pool-free

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure the percentage of the IP pool addresses that are in the free state.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

ip-pool-hold

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure the percentage of the IP pool address that are in the hold state.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

ip-pool-release

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure the percentage of IP pool address that are in the release state.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

ip-pool-used

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure the percentage of the IP pool addresses that are used.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

ipsec-ipsec-call-req-rej

Default: 900
Configures the polling interval over which to count the IPSec call requests that are rejected.

ipsec-ike-failrate

Default: 900
Configures the polling interval over which to count the IPSec IKE failure rate.

ipsec-ike-failures

Default: 900
Configures the polling interval over which to count the IPSec IKE failures.

ipsec-ike-requests

Default: 900
Configures the polling interval over which to count the IPSec IKE request.

ipsec-tunnels-established

Default: 900
Configures the polling interval over which to count the IPSec tunnels established.

ipsec-tunnels-setup

Default: 900
Configures the polling interval over which to count the IPSec tunnels setup.

license-remaining-session

Default: 900 seconds (15 minutes)
Configures the polling interval over which to measure session license utilization.

mgmt-cpu-memory-usage interval

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure SPC/SMC CPU memory usage.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

Important: This command is not supported on all platforms

mgmt-cpu-utilization

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure SPC/SMC CPU usage.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

Important: This command is not supported on all platforms.

nat-port-chunks-usage

Important: This keyword is only available in Release 8.3 and later.

Default: 900 seconds (15 minutes)
Configures the polling interval over which to measure NAT port chunks usage.

packets-filtered-dropped

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the filtered/dropped packets.

packets-forwarded-to-cpu

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the forwarded packets.

pdg-current-active-sessions

Configures how frequently the system polls the pdg-current-active-sessions threshold.

pdg-current-sessions

Configures how frequently the system polls the pdg-current-sessions threshold.

threshold poll pdif-current-sessions interval *period*

Configures the polling interval for all current PDIF sessions in seconds rounded to the nearest multiple of 30 seconds. *period* is any integer from 30 to 60000.

threshold poll pdif-current-active-sessions interval *period*

Configures the polling interval for active sessions only in seconds rounded to the nearest multiple of 30 seconds. *period* is any integer from 30 to 60000.

pdsn-init-rrq-rcvd-rate

Default: 0
Configures the polling interval over which to measure the average number of calls setup per second for a PDSN-service. When specifying **interval** *time* for this threshold, the range is from 60 through 900 seconds.

pdsn-svc-init-rrq-rcvd-rate

Configures the polling interval in seconds over which to count PDSN per-service call received rate.

per-service-asngw-sessions

Configures the polling interval in seconds over which to count per service ASNGW sessions.

per-service-ggsn-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the number of PDP contexts per GGSN service.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

per-service-gprs-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval during which the SGSN counts the number of 2G-attached subscriber per GPRS service.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

per-service-gprs-pdp-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval during which the SGSN counts the number of 2G-activated PDP contexts per GPRS service.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

per-service-ha-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the number of HA sessions per HA service.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

per-service-lns-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the number of LNS sessions per LNS service.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

per-service-pdsn-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the number of PDSN sessions per PDSN service.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

per-service-sgsn-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval during which the SGSN counts the number of 3G-attached subscribers per SGSN service.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

per-service-sgsn-pdp-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval during which the SGSN counts the number of 3G-activated PDP contexts per SGSN service.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

port-high-activity

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure for high port activity.

Important: This command is not supported on all platforms

port-rx-utilization

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure receive port utilization.

Important: This command is not supported on all platforms

port-tx-utilization

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure transmit port utilization.

Important: This command is not supported on all platforms

ppp-setup-fail-rate

Default: 900 seconds (15 minutes)
Configure the polling interval over which to measure the PPP setup failure rate.

reg-reply-error

Default: 0
Configures the polling interval over which to measure number of registration reply errors for HA services.
When specifying **interval** *time* for this threshold, the range is from 60 through 900 seconds.

reg-total-active

Default: 300 seconds (5 minutes)
Configures the polling interval over which to measure CSCF Total Active Registrations.
time must an integer value from 60 to 60000 and expressed in multiples of 30. The system will round up all other configured values to a multiple of 30.

rereg-reply-error

Default: 0
Configures the polling interval over which to measure number of re-registration reply errors for HA services.
When specifying **interval** *time* for this threshold, the range is from 60 through 900 seconds.

rp-setup-fail-rate

Default: 900 seconds (15 minutes)
Configure the polling interval over which to measure the RP setup failure rate.

spc-cpu-memory-usage interval

Important: This command has been renamed to **threshold mgmt-cpu-memory-usage**. Please refer to that command for details. Note that for backwards compatibility, the system accepts this command as valid.

Important: This command is not supported on all platforms

spc-cpu-utilization

Important: This command has been renamed to **threshold mgmt-cpu-utilization**. Please refer to that command for details. Note that for backwards compatibility, the system accepts this command as valid.

Important: This command is not supported on all platforms

storage-utilization

Default: 900 seconds (15 minutes)
Configures the polling interval over which to record the CompactFlash utilization percentage threshold interval in seconds.

total-asngw-sessions

Configures the polling interval over which to measure total ASNGW sessions on the system.

total-ggsn-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of GGSN sessions on the system.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

total-gprs-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of 2G-attached subscribers on the system.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

total-gprs-pdp-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of 2G-activated PDP contexts per GPRS sessions on the system.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

total-ha-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of HA sessions on the system.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

total-hsgw-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of HSGW sessions on the system.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

total-lma-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of LMA sessions on the system.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

total-lns-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of LNS sessions on the system.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

total-pdsn-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of PDSN sessions on the system.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

total-pgw-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of P-GW sessions on the system.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

total-sgsn-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of SGSN sessions on the system.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

total-sgsn-pdp-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of SGSN sessions on the system.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

total-sgw-sessions

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of S-GW sessions on the system.

Important: When specifying **interval** *time* for this threshold, the range is from 30 through 60000 seconds. If the value entered is not a multiple of 30, the value is automatically rounded up to the next highest multiple of 30. (If you enter 35, the value is rounded to 60.)

total-subscriber

Default: 300 seconds (5 minutes)
Configures the polling interval over which to count the total number of subscriber sessions.

interval *time*

Specifies the amount of time that comprises the polling interval.
time is measured in seconds and can be configured to any integer value from 60 to 60000 unless otherwise noted in keyword descriptions.

Usage

This command dictates the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **`threshold model`** and **`threshold monitoring`** commands for additional information on the system's support for thresholding.

Example

The following command configures the polling interval for the total subscribers threshold value to 600 seconds (10 minutes):

```
threshold poll total-subscriber interval 600
```

threshold poll asngw-auth-failure

Configures the polling interval over which to count or measure the thresholding value for ASN Gateway authentication failure.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

threshold poll asngw-auth-failure interval *dur*

default threshold poll asngw-auth-failure interval

default

Restores the specified parameter to its default value 300 seconds.

interval *dur*

Default: 300 seconds.
Specifies the amount of time that comprises the polling interval.
dur is measured in seconds and can be configured to any integer value from 30 to 60000 in multiple of 30.

Usage

This command dictates the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *600* seconds for the ASN Gateway authentication failure threshold:

threshold poll asngw-auth-failure interval *600*

threshold poll asngw-handoff-denial

Configures the polling interval over which to count or measure the thresholding value for ASN Gateway hand-off denial.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

threshold poll asngw-handoff-denial interval *dur*

default threshold poll asngw-handoff-denial interval

default

Restores the specified parameter to its default value 300 seconds.

interval *dur*

Default: 300 seconds.
Specifies the polling interval time.
dur is measured in seconds and can be configured to any integer value from 30 to 60000 in multiple of 30.

Usage

This command dictates the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *600* seconds for hand-off denial threshold:

threshold poll asngw-handoff-denial interval *600*

threshold poll asngw-max-eap-retry

Configures the polling interval over which to count or measure the thresholding value for maximum EAP authentication retries.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

threshold poll asngw-max-eap-retry interval *dur*

default threshold poll asngw-max-eap-retry interval

default

Restores the specified parameter to its default value 300 seconds.

interval *dur*

Default: 300 seconds.
Specifies the amount of time that comprises the polling interval.
dur is measured in seconds and can be configured to any integer value from 30 to 60000 in multiple of 30.

Usage

This command dictates the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *600* seconds for maximum EAP authentication retry threshold:

threshold poll asngw-max-eap-retry interval *600*

threshold poll asngw-network-entry-denial

Configures the polling interval over which to count or measure the thresholding value for network entry denial to an MS.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

threshold poll asngw-network-entry-denial interval *dur*

default threshold poll asngw-network-entry-denial interval

default

Restores the specified parameter to its default value 300 seconds.

interval *dur*

Default: 300 seconds.
Specifies the amount of time that comprises the polling interval.
dur is measured in seconds and can be configured to any integer value from 30 to 60000 in multiple of 30.

Usage

This command dictates the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *600* seconds for network entry denial threshold:

threshold poll asngw-network-entry-denial interval *600*

threshold poll asngw-r6-invalid-nai

Configures the polling interval over which to count or measure the thresholding value for invalid NAIs in R6 messages.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

threshold poll asngw-r6-invalid-nai interval *dur*

default threshold poll asngw-r6-invalid-nai interval

default

Restores the specified parameter to its default value 300 seconds.

interval *dur*

Default: 300 seconds.
Specifies the amount of time that comprises the polling interval.
dur is measured in seconds and can be configured to any integer value from 30 to 60000 in multiple of 30.

Usage

This command dictates the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *600* seconds for invalid NAIs in R6 messages threshold:

threshold poll asngw-r6-invalid-nai interval *600*

threshold poll asngw-session-setup-timeout

Configures the polling interval over which to count or measure the thresholding value for session setup timeout.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

threshold poll asngw-session-setup-timeout interval *dur*

default threshold poll asngw-session-setup-timeout interval

default

Restores the specified parameter to its default value 300 seconds.

interval *dur*

Default: 300 seconds.
Specifies the amount of time that comprises the polling interval.
dur is measured in seconds and can be configured to any integer value from 30 to 60000 in multiple of 30.

Usage

This command dictates the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *600* seconds for session setup timeout threshold:

threshold poll asngw-session-setup-timeout interval *600*

threshold poll asngw-session-timeout

Configures the polling interval over which to count or measure the thresholding value for session timeout.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

threshold poll asngw-session-timeout interval *dur*

default threshold poll asngw-session-timeout interval

default

Restores the specified parameter to its default value 300 seconds.

interval *dur*

Default: 300 seconds.
Specifies the amount of time that comprises the polling interval.
dur is measured in seconds and can be configured to any integer value from 30 to 60000 in multiple of 30.

Usage

This command dictates the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *600* seconds for session timeout threshold:

threshold poll asngw-session-timeout interval *600*

threshold poll cdr-file-space

This command configures the polling interval for CDR File Space Usage threshold.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

threshold poll cdr-file-space interval *duration*

default threshold poll cdr-file-space interval

default

Configures trhe default setting.
Default: 300 seconds.

interval *duration*

Specifies the polling interval for CDR File Space Usage threshold, in seconds.
duration must be an integer value from 60 through 60000.

Usage

This command configures the polling interval for CDR File Space Usage threshold.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *600* seconds for the CDR file space usage threshold:

threshold poll cdr-file-space interval *600*

threshold poll contfilt-block

This command configures the polling interval Content Filtering Block threshold.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

threshold poll contfilt-block interval *duration*

default threshold poll contfilt-block

default

Configures the default setting.
Default: 300 seconds.

interval *duration*

Specifies the polling interval for Content Filtering Block threshol d, in seconds.
duration must be an integer value from 60 through 60000.

Usage

This command configures the polling interval Content Filtering Block threshold.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *600* seconds for the content filtering blocking threshold:

threshold poll contfilt-block interval *600*

threshold poll contfilt-rating

This command configures the polling interval for the Content Filtering Rating threshold.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

threshold poll contfilt-rating interval *duration*

default threshold poll contfilt-rating

default

Configures the default setting.
Default: 300 seconds.

interval *dur*

Specifies the polling interval for the Content Filtering Rating threshold, in seconds.
duration must be an integer value from 60 through 60000.

Usage

This command configures the polling interval for the Content Filtering Rating threshold.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *600* seconds for the content filtering rating processing threshold:

threshold poll contfilt-rating interval *600*

threshold poll dcca-protocol-error

This command configures the polling interval for DCCA Protocol Error threshold.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

threshold poll dcca-protocol-error interval *duration*

default threshold poll dcca-protocol-error interval

default

Configures the default setting.
Default: 900 seconds

interval *duration*

Specifies the polling interval for DCCA Protocol Error threshold, in seconds.
duration must be an integer value from 60 through 60000.

Usage

Use this the polling interval for DCCA Protocol Error threshold.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholding in this chapter.

Example

The following command configures the polling interval to 600 seconds for the DCCA protocol error threshold:

threshold poll dcca-protocol-error interval *600*

threshold poll dcca-rating-failed

This command configures the polling interval for DCCA Rating Failed threshold.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

threshold poll dcca-rating-failed interval *duration*

default threshold poll dcca-rating-failed interval

default

Configures the default setting.
Default: 900 seconds

interval *duration*

Specifies the polling interval for DCCA Rating Failed threshold.
duration must be an integer value from 60 through 60000.

Usage

This command configures the polling interval for DCCA Rating Failed threshold.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholding in this chapter.

Example

The following command configures the polling interval to 600 seconds for the Diameter Credit Control Application (DCCA) Rating Group (content-id) request reject thresholds:

threshold poll dcca-rating-failed interval *600*

threshold poll dcca-bad-answers

This command configures the polling interval for DCCA Bad Answers threshold—invalid or bad response to the system from the Diameter server.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

threshold poll dcca-bad-answers interval *duration*

default threshold poll dcca-bad-answers interval

default

Configures the default setting.
Default: 900 seconds

interval *duration*

Specifies the poling interval for DCCA Bad Answers threshold, in seconds.
duration must be an integer value from 60 through 60000.

Usage

This command configures the poling interval for DCCA Bad Answers threshold.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholding in this chapter.

Example

The following command configures the polling interval to 600 seconds for invalid or bad response threshold to the system from Diameter server:

threshold poll dcca-rating-failed interval *600*

threshold poll dcca-unknown-rating-group

This command configures the polling interval for DCCA Unknown Rating Group threshold.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

threshold poll dcca-unknown-rating-group interval *duration*

default threshold poll dcca-unknown-rating-group interval

default

Configures the default setting.
Defaut: 900 seconds

interval *duration*

Specifies the polling interval for DCCA Unknown Rating Group threshold, in seconds.
duration must be an integer value from 60 through 60000.

Usage

This command configures the polling interval for DCCA Unknown Rating Group threshold.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholding in this chapter.

Example

The following command configures the polling interval to 600 seconds to threshold for the unknown DCCA Rating Group (content-id) returned by Diameter to system:

threshold poll dcca-unknown-rating-group interval *600*

threshold poll edr-file-space

This command configures the polling interval for EDR File Space Usage threshold.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

threshold poll edr-file-space interval *duration*

interval *duration*

Default: 300 seconds.
Specifies the polling interval for EDR File Space Usage threshold, in seconds.
duration must be an integer value from 60 through 60000.

Usage

This command configures the polling interval for EDR File Space Usage threshold

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring ecs** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *600* seconds for the EDR file space usage threshold:

threshold poll edr-file-space interval *600*

threshold poll mme-attach-failure

This command configures the polling interval to count the MME Attach Failure messages across all MME services in the system.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

threshold poll mme-attach-failure interval *dur*

default threshold poll mme-attach-failure interval

default

Restores the poll interval value to its default value of 900 seconds.

interval *dur*

Default: 900 seconds.
Specifies the amount of time that comprises the polling interval for threshold to count the MME Attach Failure messages across all MME services in the system.
dur is measured in seconds and can be configured to any integer value from 30 to 60000 in multiple of 30.

Usage

Use this command to configure the polling interval to count the MME Attach Failure messages across all MME services in the system to generate threshold value.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring mme-service** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval of *600* seconds to count the MME Attach Failure messages for threshold limit:

threshold poll mme-attach-failure interval *600*

threshold poll mme-auth-failure

This command configures the polling interval to count the MME Authentication Failure messages across all MME services in the system.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

threshold poll mme-auth-failure interval *dur*

default threshold poll mme-auth-failure interval

default

Restores the specified poll interval value to its default value of 900 seconds.

interval *dur*

Default: 900 seconds.
Specifies the amount of time that comprises the polling interval for threshold to count the MME Authentication Failure messages across all MME services in the system.
dur is measured in seconds and can be configured to any integer value from 30 to 60000 in multiple of 30.

Usage

Use this command to configure the polling interval to count the MME Auth Failure messages across all MME services in the system to generate threshold value.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring mme-service** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval of *600* seconds to count the MME Auth Failure messages for threshold limit:

threshold poll mme-auth-failure interval *600*

threshold poll total-mme-sessions

This command configures the polling interval over which to count or measure the thresholding value for MME sessions on the system.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

`[ default ] threshold poll total-mme-sessions interval` *`time`*

`default`

Restores the threshold poll interval value to its default value of 300 seconds.

`interval` *`time`*

Default: 900 seconds
Specifies the amount of time that comprises the polling interval over which to count the total number of MME sessions on the system.
`time` is measured in seconds and can be configured to any integer value from 30 to 60000.

Usage

This command dictates the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **`threshold model`** and **`threshold monitoring`** commands for additional information on the system's support for thresholding.

Example

The following command configures the polling interval for the total MME session threshold polling duration value to 600 seconds (10 minutes):

`threshold poll total-mme-sessions interval` *`600`*

threshold poll port-rx-utilization

Enables the generation of alerts or alarms based on the port utilization percentage for data received during the polling interval.

Product

All

Privilege

Administrator Security Administrator

Syntax

threshold poll port-rx-utilization interval *seconds*

interval *seconds*

Configures the threshold polling interval in multiples of 30 seconds from 30 to 60000

Usage

Receive port utilization thresholds generate alerts or alarms based on the utilization percentage of each configured port in relation to data received during the specified polling interval. This threshold is configured on a per-port basis configured using the port *port-type slot#/port#* command syntax.

Important: This command is not available on all platforms

Important: Ports configured for half-duplex do not differentiate between data received and data transmitted. (The transmitted and received percentages are combined.) Therefore, to avoid redundant alarms, it is recommended that only the receive **or** transmit utilization threshold be configured.

Example

Use the following example to configure a threshold poll interval of *300* seconds (5 minutes)

threshold poll port-rx-utilization interval *300*

threshold poll port-tx-utilization

Enables the generation of alerts or alarms based on the port utilization percentage for data transmitted during the polling interval.

Product

All

Privilege

Administrator Security Administrator

Syntax

threshold poll port-tx-utilization interval *seconds*

interval *seconds*

Configures the threshold polling interval in multiples of 30 seconds from 30 to 60000

Usage

Transmit port utilization thresholds generate alerts or alarms based on the utilization percentage of each configured port in relation to data transmitted during the specified polling interval. This threshold is configured on a per-port basis configured using the port *port-type slot#/port#* command syntax.

Important: This command is not available on all platforms

Important: Ports configured for half-duplex do not differentiate between data received and data transmitted. (The transmitted and received percentages are combined.) Therefore, to avoid redundant alarms, it is recommended that only the receive **or** transmit utilization threshold be configured.

Example

Use the following example to configure a threshold poll interval of *300* seconds (5 minutes)

```
threshold poll port-tx-utilization interval 300
```

threshold poll port-high-activity

Enables the generation of alerts or alarms based on the overall port utilization percentage during the polling interval.

Product

All

Privilege

Administrator Security Administrator

Syntax

threshold poll port-high-activity interval *seconds*

interval *seconds*

Configures the threshold polling interval in multiples of 30 seconds from 30 to 60000

Usage

High port activity thresholds generate alerts or alarms based on the peak utilization percentage of each configured port during the specified polling interval. This threshold is configured on a per-port basis. Alerts or alarms are triggered for high port activity based on the following rules:
Enter condition: Actual percent peak utilization of a port ³High Threshold
Clear condition: Actual percent peak utilization of a port < Low Threshold
If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.This threshold is configured on a per-port basis configured using the port *port-type slot#/port#* command syntax.

Important: This command is not available on all platforms

Example

Use the following example to configure the polling interval over which to measure for high port activity to *300* seconds:

threshold poll port-high-activity interval *300*

threshold poll route-service

This command configures the polling interval over which to count or measure the thresholding value for route services on the system.

Product

All

Privilege

Administrator Security Administrator

Syntax

`[ default ] threshold poll route-service interval` *`dur`*

`default`

Restores the threshold poll interval value to its default value of 900 seconds.

`interval` *`time`*

Default: 900 seconds
Specifies the amount of time that comprises the polling interval over which to count the total number of BGP route on the system.
`dur` is measured in seconds and can be configured to any integer value from 30 to 60000.

Usage

This command dictates the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **`threshold model`** and **`threshold monitoring`** commands for additional information on the system's support for thresholding.

Example

The following command configures the polling interval for the total BGP routes threshold polling duration value to 600 seconds (10 minutes):

`hreshold poll route-service interval` *`600`*

threshold ppp-setup-fail-rate

Configures PPP setup failure rate thresholds.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

threshold ppp-setup-fail-rate *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold rate for PPP setup failures experienced by the system that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold rate for PPP setup failures experienced by the system that maintains a previously generated alarm condition. If the number of setup failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

PPP setup failure rate thresholds generate alerts or alarms based on the rate of call setup failures experienced by the system during the specified polling interval. The failure rate is the percentage of failures as determined by number of PPP setup failures divided by the total number of PPP sessions initiated.
Alerts or alarms are triggered for PPP setup failure rates based on the following rules:

- **Enter condition:** Actual number of call setup failures ³ High Threshold
- **Clear condition:** Actual number of call setup failures < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a PPP setup failure rate high threshold of *50* and a clear threshold of *45*:

```
threshold ppp-setup-fail-rate 50 clear 45
```

threshold route-service bgp-routes

This command configures the threshold limits for route services to BGP routes.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

threshold route-service bgp-routes *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold rate for BGP routes on the system that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold rate for BGP routes on the system that maintains a previously generated alarm condition. If the number of setup failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to configure a threshold in percentage of maximum BGP routes allowed. If the percentage of the number of BGP routes in a context (including all VRFs) reaches *high_thresh*, a notification is generated. Optionally, if the threshold subsystem is configured in 'alarm' mode, a **Threshold_Clear** notification is generated when the percentage of the number of BGP routes in a context (including all VRFs) goes below *low_thresh*. The maximum number of BGP routes is also sent by BGP task when getting the stats
Alerts or alarms are triggered for BGP routes based on the following rules:

- **Enter condition:** Actual number of call setup failures > High Threshold
- **Clear condition:** Actual number of call setup failures < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures system for high threshold of *50* and a clear threshold of *45*:

```
threshold route-service bgp-routes 50 clear 45
```

threshold rp-setup-fail-rate

Configures RP setup failure rate thresholds.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

threshold rp-setup-fail-rate *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold rate for RP setup failures experienced by the system that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold rate for RP setup failures experienced by the system that maintains a previously generated alarm condition. If the number of setup failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

RP setup failure rate thresholds generate alerts or alarms based on the rate of call setup failures experienced by the system during the specified polling interval. The failure rate is the percentage of failures as determined by number of Registration Request Messages rejected divided by the total number of Registration Request Messages received.
Alerts or alarms are triggered for RP setup failure rates based on the following rules:

- **Enter condition:** Actual number of call setup failures ³ High Threshold
- **Clear condition:** Actual number of call setup failures < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a RP setup failure rate high threshold of *50* and a clear threshold of *45*:

```
threshold rp-setup-fail-rate 50 clear 45
```

threshold spc-cpu-memory-usage

This command has been renamed to **`threshold mgmt-cpu-memory-usage`**. Please refer to that command for details. Note that for backwards compatibility, the system accepts this command as valid.

Important: This command is not supported on all platforms.

threshold spc-cpu-utilization

This command has been renamed to **`threshold mgmt-cpu-utilization`**. Please refer to that command for details. Note that for backwards compatibility, the system accepts this command as valid.

threshold storage-utilization

Configures SPC/SMC CompactFlash memory utilization thresholds.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold storage-utilization *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 90
The high threshold memory utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

clear *low_thresh*

Default: 90
The low threshold memory utilization percentage that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

CompactFlash memory utilization thresholds generate alerts or alarms based on the utilization percentage of the CompactFlash on each installed SPC/SMC during the specified polling interval. Although, a single threshold is configured for both SPCs/SMCs, separate alerts or alarms can be generated for each.
Alerts or alarms are triggered for CompactFlash memory utilization based on the following rules:

- **Enter condition:** Actual percentage memory utilization ³ High Threshold
- **Clear condition:** Actual percentage memory utilization < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold CompactFlash utilization percentage of 85 for an system using the Alert thresholding model:

threshold storage-utilization *85*

threshold subscriber active

Configures active subscriber thresholds for the system.

Product

PDSN, GGSN, SGSN, HA

Privilege

Security Administrator, Administrator

Syntax

threshold subscriber active *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold number of active subscriber sessions facilitated by the system that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value between 0 and 100000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of active subscriber sessions facilitated by the system that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 100000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Active subscriber thresholds generate alerts or alarms based on the total number of active subscriber sessions facilitated by the system during the specified polling interval.
Alerts or alarms are triggered for active subscriber totals based on the following rules:

- **Enter condition:** Actual total number of active subscriber sessions ³ High Threshold
- **Clear condition:** Actual total number of active subscriber sessions < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures an active subscriber high threshold count of *150000* and a low threshold of *1500* for an system using the Alarm thresholding model:

threshold subscriber active *150000* **clear** *1500*

threshold subscriber total

Configures total subscriber thresholds for the system.

Product

PDSN, GGSN, HA

Privilege

Security Administrator, Administrator

Syntax

threshold subscriber total *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold number of subscriber sessions (active and dormant) facilitated by the system that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value between 0 and 100000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of subscriber sessions (active and dormant) facilitated by the system that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 100000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Total subscriber thresholds generate alerts or alarms based on the total number of subscriber sessions (active and dormant) facilitated by the system during the specified polling interval.
Alerts or alarms are triggered for subscriber totals based on the following rules:

- **Enter condition:** Actual total number of subscriber sessions ³ High Threshold
- **Clear condition:** Actual total number of subscriber sessions < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures an active subscriber high threshold count of *450000* and a low threshold of *250000* for an system using the Alarm thresholding model:

threshold subscriber total *450000* **clear** *250000*

threshold total-ggsn-sessions

Configures thresholds for the total number of GGSN sessions across all the services in the system.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

threshold total-ggsn-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0 (Disabled)
The high threshold number of total GGSN sessions across all the sessions in the system that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 0 through 4000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0 (Disabled)
The low threshold number of total GGSN sessions that maintains a previously generated alarm condition. If the number of GGSN sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 4000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of GGSN sessions across all the services in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for the total number of GGSN sessions based on the following rules:

- **Enter condition:** Actual total number of GGSN sessions ³ High Threshold
- **Clear condition:** Actual total number of GGSN sessions < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a total GGSN session high threshold count of *10000* for an system using the Alert thresholding model:

```
threshold total-ggsn-sessions 10000
```

threshold total-gprs-sessions

Configures thresholds for the total number of GPRS sessions in the system.

Product

SGSN

Privilege

Administrator

Syntax

threshold total-gprs-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold number of total GPRS sessions for all GPRS services that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 1 through 2000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of total GPRS sessions for all GPRS services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 2000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of GPRS sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for GPRS sessions based on the following rules:

- **Enter condition:** Actual total number of GPRS sessions ³ High Threshold
- **Clear condition:** Actual total number of GPRS sessions < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a total number of GPRS sessions high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold total-gprs-sessions 10000
```

threshold total-gprs-pdp-sessions

Configures thresholds for the total number of PDP contexts per GPRS sessions in the system.

Product

SGSN

Privilege

Administrator

Syntax

threshold total-gprs-pdp-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold number of total PDP contexts per GPRS session for all GPRS services that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 1 through 2000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of total PDP contexts per GPRS session for all GPRS services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 2000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of GPRS sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for GPRS sessions based on the following rules:

- **Enter condition:** Actual total number of PDP Contexts ³ High Threshold
- **Clear condition:** Actual total number of PDP contexts < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a total number of PDP contexts per GPRS session high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold total-gprs-pdp-sessions 10000
```

threshold total-ha-sessions

Configures thresholds for the total number of HA sessions across all services in the system.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

threshold total-ha-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold number of HA sessions for all HA services that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 0 through 4000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of HA sessions for all HA services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 4000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of HA sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for HA sessions based on the following rules:

- **Enter condition:** Actual total number of HA sessions ³ High Threshold
- **Clear condition:** Actual total number of HA sessions < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a total number of HA sessions high threshold count of *10000* for an system using the Alert thresholding model:

threshold total-ha-sessions *10000*

threshold total-hsgw-sessions

Configures thresholds for the total number of HSGW sessions across all services in the system.

Product

HSGW

Privilege

Administrator

Syntax

threshold total-hsgw-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold number of HSGW sessions for all HSGW services that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 1 through 1500000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of HSGW sessions for all HSGW services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 1500000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of HSGW sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for HSGW sessions based on the following rules:

- **Enter condition:** Actual total number of HSGW sessions ³ High Threshold
- **Clear condition:** Actual total number of HSGW sessions < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a total number of HSGW sessions high threshold count of *500000* for an system using the Alert thresholding model:

threshold total-hsgw-sessions *500000*

threshold total-lma-sessions

Configures thresholds for the total number of LMA sessions across all services in the system.

Product

P-GW

Privilege

Administrator

Syntax

threshold total-lma-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold number of LMA sessions for all LMA services that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 1 through 1500000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of LMA sessions for all LMA services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 1500000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of LMA sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for LMA sessions based on the following rules:

- **Enter condition:** Actual total number of LMA sessions ³ High Threshold
- **Clear condition:** Actual total number of LMA sessions < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a total number of LMA sessions high threshold count of *500000* for an system using the Alert thresholding model:

threshold total-lma-sessions *500000*

threshold total-lns-sessions

Configures thresholds for the total number of LNS sessions in the system.

Product

PDSN, GGSN, HA

Privilege

Security Administrator, Administrator

Syntax

threshold total-lns-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold number of total LNS sessions that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 0 through 4000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of total LNS sessions that maintains a previously generated alarm condition. If the number of LNS sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 4000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of LNS sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for the total number of LNS sessions based on the following rules:

- **Enter condition:** Actual total number of LNS sessions ³ High Threshold
- **Clear condition:** Actual total number of LNS sessions < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a total LNS session high threshold count of *10000* for an system using the Alert thresholding model:

threshold total-lns-sessions *10000*

threshold total-mme-sessions

Use this command to configure thresholds for the total number of MME sessions across all the MME services in the system.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

threshold total-mme-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0 (Disabled)
The high threshold number of total MME sessions that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 0 through 4000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0 (Disabled)
The low threshold number of total MME sessions that maintains a previously generated alarm condition. If the number of MME sessions, across all the services in a system, falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 4000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to monitor and set alarms or alerts when the total number of MME sessions across all the MME services in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for the total number of MME sessions based on the following rules:

- **Enter condition:** Actual total number of MME sessions ³ High Threshold
- **Clear condition:** Actual total number of MME sessions < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll total-mme-sessions** command to configure the polling interval and the **threshold monitoring mme-service** command to enable thresholding for this value.

Example

The following command configures a total MME session high threshold count of *10000* for an system using the Alert thresholding model:

```
threshold total-mme-sessions 10000
```

threshold total-pdsn-sessions

Configures thresholds for the total number of PDSN sessions in the system.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

threshold total-pdsn-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold number of total PDSN sessions that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 0 through 4000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of total PDSN sessions that maintains a previously generated alarm condition. If the number of PDSN sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 4000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of PDSN sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for the total number of PDSN sessions based on the following rules:

- **Enter condition:** Actual total number of PDSN sessions ³ High Threshold
- **Clear condition:** Actual total number of PDSN sessions < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a total PDSN session high threshold count of *10000* for an system using the Alert thresholding model:

threshold total-pdsn-sessions *10000*

threshold total-pgw-sessions

Configures thresholds for the total number of P-GW sessions across all services in the system.

Product

P-GW

Privilege

Administrator

Syntax

threshold total-pgw-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold number of P-GW sessions for all P-GW services that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 1 through 1500000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of P-GW sessions for all P-GW services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 1500000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of P-GW sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for P-GW sessions based on the following rules:

- **Enter condition:** Actual total number of P-GW sessions ³ High Threshold
- **Clear condition:** Actual total number of P-GW sessions < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a total number of P-GW sessions high threshold count of *500000* for an system using the Alert thresholding model:

threshold total-pgw-sessions *500000*

threshold total-sgw-sessions

Configures thresholds for the total number of S-GW sessions across all services in the system.

Product

S-GW

Privilege

Administrator

Syntax

threshold total-sgw-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold number of S-GW sessions for all S-GW services that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 1 through 1500000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of S-GW sessions for all S-GW services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 1500000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of S-GW sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for S-GW sessions based on the following rules:

- **Enter condition:** Actual total number of S-GW sessions ³ High Threshold
- **Clear condition:** Actual total number of S-GW sessions < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a total number of S-GW sessions high threshold count of *500000* for an system using the Alert thresholding model:

threshold total-sgw-sessions *500000*

threshold total-sgsn-sessions

Configures thresholds for the total number of SGSN sessions in the system.

Product

SGSN

Privilege

Administrator

Syntax

threshold total-sgsn-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold number of total SGSN sessions for all SGSN services that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 1 through 2000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of total SGSN sessions for all SGSN services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 2000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of SGSN sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for SGSN sessions based on the following rules:

- **Enter condition:** Actual total number of SGSN sessions ³ High Threshold
- **Clear condition:** Actual total number of SGSN sessions < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a total number of SGSN sessions high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold total-sgsn-sessions 10000
```

threshold total-sgsn-pdp-sessions

Configures thresholds for the total number of PDP contexts per SGSN sessions in the system.

Product

SGSN

Privilege

Administrator

Syntax

threshold total-sgsn-pdp-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
The high threshold number of total PDP contexts per SGSN session for all SGSN services that must be met or exceeded within the polling interval to generate an alert or alarm.
The number can be configured to any integer value from 1 through 2000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
The low threshold number of total PDP contexts per SGSN session for all SGSN services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number can be configured to any integer value between 0 and 2000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of SGSN sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for SGSN sessions based on the following rules:

- **Enter condition:** Actual total number of PDP contexts[3] High Threshold
- **Clear condition:** Actual total number of PDP contexts< Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a total number of PDP contexts per SGSN session high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold total-sgsn-pdp-sessions 10000
```

timestamps

Enables/disables the generation of a timestamp in response to each commands entered. The timestamp does not appear in any logs as it is a CLI output only. This command affects all future CLI sessions. Use the **timestamps** command in the Exec Mode to change the behavior for the current CLI session only.

Product

All

Privilege

Security Administrator, Administrator

Syntax

timestamps

no timestamps

no

Disables generation of timestamp output for each command entered. When omitted, the output of a timestamp for each entered command is enabled.

Usage

Enable the timestamps when logging a CLI session on a remote terminal such that each command will have a line of text indicating the time when the command was entered.

Example

timestamps

no timestamps

upgrade limit

Configures upgrade session limits, which are used to trigger the system as to when it may execute the software upgrade.

Product

All

Privilege

Security Administrator, Administrator

Syntax

upgrade limit [time *session_life* **] [usage** *session_num* **]**

upgrade limit

This command issued with no keywords sets all parameters to their defaults.

time *session_life*

Default: 120
Defines the maximum number of minutes that a session may exist on the system, undergoing a software upgrade, before it is terminated by the system. As individual user sessions reach this lifetime limit, the system terminates the individual session(s). *session_life* must be an integer ranging from 1 through 1440.

usage *session_num*

Default: 100
This keyword defines a low threshold limit of sessions running either on a PAC/PSC/PSC2 or system-wide. When a software upgrade is invoked, this parameter applies to the entire system.
When the threshold is crossed (when the number of sessions on the PAC/PSC/PSC2 or system is less than this value), the remaining sessions on the card or system are terminated allowing the upgrade to begin. The remaining sessions on the PAC/PSC/PSC2 or system are terminated regardless of their session life.
session_num must be an integer from 0 to 6000.

Usage

Use this command to configure upgrade session limits, which are used to trigger the system as to when it may execute the software upgrade.

Important: This command is not supported on all platforms.

Important: Software Patch Upgrades are not supported in this release.

Example

The following command sets the number of minutes a session can exist to *200* and the minimum number of sessions that may exist before terminating them to *50*:

upgrade limit time *200* **usage** *50*

url-blacklisting database

This command configures URL Blacklisting database directory parameters.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

url-blacklisting database { directory path *path* **| max-versions** *max_versions* **| override file** *file_name* **}**

default url-blacklisting database { directory path | max-versions | override file }

default

Configures the default values.

directory path *path*

Specifies the path to the directory to be used for storing URL Blacklisting databases.
path must be a string of 1 through 255 characters in length.
Default: /flash/bl

max-versions *max_versions*

Specifies the maximum number of URL Blacklisting database versions to be maintained in the URL Blacklisting database directory path with the base file name specified by the URL Blacklisting database override file.
max_versions must be an integer from 0 through 3.
Default: 0

override file *file_name*

Specifies the URL Blacklisting database override file name.
file_name must be in *name.extension* format. For example, *abc.bin*. And, must be a string of 1 through 10 characters in length.
Default: optblk.bin

Usage

Use this command to configure URL Blacklisting database directory parameters.

Example

The following command configures the maximum number of URL Blacklisting database versions to be maintained to *3*:

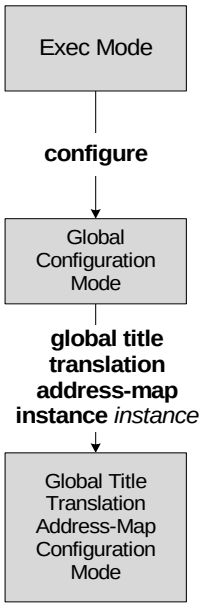
url-blacklisting database max-versions *3*

Chapter 102
Global Title Translation Address-Map Configuration Mode Commands

The Global Title Translation (GTT) Address-Map configuration mode provides the commands to create, configure, and manage a specific GTT address map database.

Upon accessing this mode, your prompt should look similar to the following:

```
[local] <hostname> (config-gtt-assoc-<instance#>)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

associate

This command associates (links) the global title translation (GTT) address-map with a specific GTT association, which includes the translation action rules.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

associate gtt-association *assoc_num* **action id** *id*

no association

no

Removes the association definition from the GTT address-map configuration.

gtt-association *assoc_num*

Identifies a specific GTT association to link (associate) with the GTT address-map.
assoc_num: Must be an integer from 1 to 16.

action id *id*

Identifies a specific action defined in the GTT association database configuration.
id: Must be an integer from 1 to 8.

Usage

Create an association between a specific translation action rule in a specific GTT association and this GTT address-map.

Example

associate gtt-association *1* **action id** *1*

description

This command defines a descriptive string to facilitate identification of this particular global title translation (GTT) address-map. This is used for operator reference only.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

description *string*

no description

no

Removes the description string from the current global title translation address-map configuration.

string

Specifies the alphanumeric string that is stored. must be from 1 through 127 alphanumeric characters. Strings with spaces must be enclosed in double-quotes. See the example below.

Usage

Use this command to set a description for reference by operators.

Example

description *"GTT for Finnish national carrier."*

end

Exits the configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the configuration mode and returns to the Global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the Global configuration mode.

gt-address

Configures the SCCP global title address.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gt-address *gt_address*

no gt-address

no

Removes the GT address from the GTT address-map configuration.

gt_address

Up to 15 digits.

Usage

Define the SCCP short address.

Example

gt-address *01040552873424*

mode

Configures the mode of operation of the SCCP entities.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
mode [ dominant | loadshare ]
```

dominant

This instructs the system to maintain the associated entity as the primary traffic pipe.

loadshare

This instructs the system to distribute the traffic load.

Usage

This command configure load balance for the system.

Example

```
mode loadshare
```

out-address

Identifies the out-going address of the SCCP entity. After this command is completed, the system enters the Out-Address configuration mode. Refer to the Out-Address Configuration Mode chapter for information about commands to define the out-address.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

out-address *name*

no out-address

no

Removes the **out-address** definition from the GSS address-map configuration.

name

Defines a unique string to identify the out-going address using 1 to 63 alphanumeric characters.

Usage

Use this command to identify the address of the SCCP in the GTT configuration. This command also provides access to the Out-Address configuration mode so that the parameters for the out-going SCCP can be configured and maintained.

Example

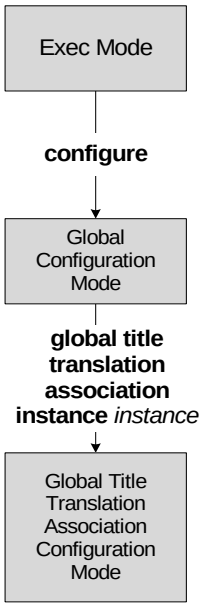
out-address *SCCP_London*

Chapter 103
Global Title Translation Association Configuration Mode Commands

The Global Title Translation (GTT) Association configuration mode provides the commands to create the rules for translating the global titles (destination point codes and subsystem address in the messages) used for routing at the SCCP layer.

Upon accessing this mode, your prompt should look similar to the following:

```
[local] <hostname> (config-gtt-addrmap-<instance#>)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

action

This command configures the actions that determine the operation of rules of the global title translation (GTT).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

action id *id* **type** *action_type* **start-digit** *value* **end-digit** *value*

no action id *id*

id

id uniquely identifies an action. The id must be an integer from 1 to 8.

type *action_type*

The following defines the action rules that will determine how global titles (GT) are translated to locally understood addresses - in most cases point codes (PC). The command can be re-issued multiple times to define multiple action rules.

- **constant:** Defines the starting digit in the range of digits in the incoming global titles that are translated to fixed addresses.
- **fixed:** Defines the starting digit in a fixed range of digits used for performing GTT.
- **gt-to-pc:** Use these digits as first of range of global title digits in incoming message to convert to point code for routing.
- insert-pc: Defines the rule for inserting destination point code before the incoming GTAI and change TT, ES and NAI. Use digits of incoming message global title digits as pc for routing.
- **selins**: Selective insertion type to perform GTT.
- **strip-pc:** Strip first 6 digits from GTAI if first 6 dgts in stripped point code are in INT format.
- **var-asc**: Use a varaible number of digits, in ascending order, to perform GTT.
- **var-des:** Use a variable number of digits. in descending order. to perform GTT.

start-digit *value*

value must be an integer from 0 to 255.

end-digit *value*

value must be an integer from 0 to 255.

Usage

Use this command to create GTT association rules. Rules can be based on ranges of digits or modified ranges depending upon the action types included in the commands.

Example

Use the following command to create a global title translation rule that bases the translation on a fixed range of digits starting at 23 and ending at 122:

```
action id 1 type fixed start-digit 23 end-digit 122
```

description

This command defines a descriptive string to facilitate identification of this particular global title translation (GTT) association. This is used for operator reference only.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

description *string*

no description

string

Specifies the alphanumeric string that is stored. must be from 1 through 127 alphanumeric characters. Strings with spaces must be enclosed in double-quotes. See the example below.

no

Removes the description string from the current global title translation association configuration.

Usage

Use this command to set a description for reference by operators.

Example

The following command sets the description to identify a routing domain for messages transmitted within a national boundary.

```
description "GTT database 2"
```

end

Exits the configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the configuration mode and returns to the Global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the Global configuration mode.

gt-format

This command creates an instance of a global title formatting that is applied to the database in the process of address translation. Once the command is completed, the system enters global title (GT) format database configuration mode. The commands for configuration can be found in the GT Format Configuration Mode chapter in this reference guide.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gt-format *format_num*

format_num

- 1: Selects GT-format 1 options which include **nature-of-address** and **odd/even.** Once selected, the system enters GT-Format1 configuration mode.
- 2: Selects GT-format2 options which include **translation-type**. Once selected, the system enters GT-Format2 configuration mode.
- 3: Selects GT-format3 options which include **encoding-scheme**, **numbering-plan,** and **translation-type**. Once selected, the system enters GT-Format3 configuration mode.
- 4: Selects GT-format4 options which include **encoding-scheme**, **nature-of-address, numbering-plan,** and **translation-type**. Once selected, the system enters GT-Format4 configuration mode.

Usage

Selects GT format #2 for the database GTT process.

Example

Use this command to associate the GT format for GTT:

gt-format *2*

variant

This command configures the choice of national standard protocols to associate with the GTT process databases.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

variant *type*

default

Sets the **variant** configuration to **itu**.

type

The following network variant national standards-based protocols are possible:

- **ansi**
- **china**
- **itu**
- **japan**

Usage

Use this command to select the national standard protocols to associate with the GTT process database.

Example

The following command sets the variant to *ansi*:

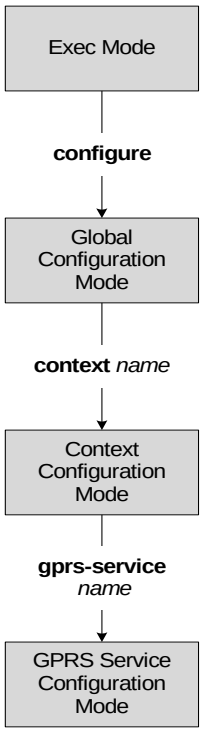
variant *ansi*

Chapter 104
GPRS Service Configuration Mode Commands

The GPRS Service Configuration Mode is used within the context configuration mode to define the criteria the SGSN needs to operate within a GPRS network. The GPRS Service works with other services, such as SGSN GPRS Tunneling Protocol (see SGTP Service Configuration Mode Commands) and Mobile Application Part (see MAP Service Configuration Mode Commands), to handle communication parameters required to work with other network entities such as the base station subsystem (BSS).

The prompt for this mode appears as:

```
[context_name]hostname(config-gprs-service)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

accounting

Defines the accounting context name and enables/disables specific types of CDR generation for the accounting in the GPRS service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

accounting { cdr-types { mcdr | scdr | sms { mo-cdr | mt-cdr } + | context *cntx_name* **}**

default accounting cdr-types

no accounting (cdr-types | context }

---

default

Returns the system to default CDR generation which includes M-CDR, S-CDR, and SMS CDRs.

---

no

Disables all CDR types.

---

cdr-types { mcdr | scdr | sms { mo-cdr | mt-cdr }

Default: all types enabled.
Defines the types of CDRs to be generated within the specified GPRS service for accounting:

- **mcdr:** Enables generation of M-CDRs.
- **scdr:** Enables generation of S-CDRs.
- **sms:** Enables generation of SMS-type CDRs based on one of the following:
- **mo-cdr:** SMS CDRs originates from the mobile.
- **mt-cdr:** SMS CDRs terminates at the mobile.

+

This symbol indicates that more than one keyword can be used and repeated. This enables you to include more than one type of CDR selection in a single command.

---

context *cntx_name*

Specifies an accounting context to be associated with the GPRS service.
cntx_name: Define a string of 1 to 79 alphanumeric characters.

Usage

Use this command to define the type of CDRs to generate for GPRS service. By default all types of CDRs are generated. Note that change of this configuration will be applied to new calls and/or to new PDP contexts only.
By default, generation of the S-CDR, M-CDR, SMS-MT-CDR, and SMS MO-CDR types is enabled.

Example
The following command configures the system to generate only M-CDRs for accounting in the current GPRS service:

accounting cdr-types *mcdr*

admin-disconnect-behavior

This command defines some of the actions the SGSN will take during an Admin-Disconnect procedure.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
admin-disconnect-behavior { clear-subscription | detach-type { reattach-not-
required | reattach-required } }

default admin-disconnect-behavior { clear-subscription | detach-type }
```

clear-subscription

Including this keyword in the configuration instructs the SGSN to clear subscriber contexts and the subscription data database whenever the **clear subscribers all** command is issued (from the Exec mode) for attached subscribers. As well, the SGSN will issue an appropriate Map-Purge-MS-Req to the HLR if needed.
Default: disabled

detach-type

Including this keyword defines which type of detach instruction to include in the Detach-Request message during an Admin-Disconnect procedure. One of the following options must be included when this command is entered:

- **reattach-not-required**
- **reattach-required**

Default: reattach-required

default

Including the **default** keyword in the command, instructs the SGSN to use the default value for the specified parameter.

no

Returns the SGSN to the default where this clear function is disabled

Usage

Using he **clear subscribers all** command (in the Exec Mode) will clear subscriber contexts and the subscription data database, and if needed, issue an appropriate Map-Purge-MS-Req to the HLR.
Include the **clear-subscription** keyword with this command configuration to ensure that more than attached MM-context and active PDP-contexts are cleared when the clear **subscribers all** command is issued for attached subscribers.
To clear subscription data for detached subscribers, refer to the **sgsn clear-detached-subscriptions** command described in the *Exec* mode chapter.

Including the **detach-type** keyword with this command instructs the SGSN to include either a 'reattach-required' or a 'reattach-no-required' instruction in the Detach-Request message.

Example

Enable the clearing function so that subscription data is cleared from the HLR database:

```
admin-disconnect-behavior clear-subscription
```

associate-service

Identifies services to be associated with the GPRS Service.

Important: This command can be used before the associated service instance is created and configured but care should be used to match the service names.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] associate-service { gs *name* **| map** *name* **| sgtp** *name* **} [context** *ctxt_name* **]**

no

Removes the service association definition from the configuration.

gs *name*

Specifies the Gs service configuration to associate with this GPRS service.
name must be a string of 1 to 63 alphanumeric characters with no spaces.

map *name*

Specifies the MAP service configuration to associate with this GPRS service.
name must be a string of 1 to 63 alphanumeric characters with no spaces.

sgtp *name*

Specifies the SGTP service configuration to associate with this GPRS service.
name must be a string of 1 to 63 alpha numeric characters with no spaces.

context *ctxt_name*

Defines the context in which the service was created.
ctxt_name must be a string of 1 to 63 alphanumeric characters with no spaces.

Usage

Use this command to associate other services, that have been or will be configured, to this GPRS service.

Example

The following command associates Gs service *gs1* with this GPRS service.

associate-service gs *gs1* **context** *sgsn2*

cc profile

Configures the charging characteristic (CC) profile index properties.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] cc profile index { buckets number | interval time | tariff time1 mins
hours [ time2 mins hours [ time3 mins hours [ time4  mins hours ] ] ] | volume {
downlink octets uplink octets | total octets } }

default cc profile index
```

no

Removes the a specific charging characteristics configuration definition.

default

Resets the charging characteristics to system defaults.

index

Configures a profile index for the parameter to be specified. index can be configured to any integer value from 0 to 15.

Important: 3GPP standards suggest that profile index values of 1, 2, 4, and 8 be used for hot billing, flat rate billing, prepaid billing and normal billing, respectively. A single charging characteristics profile can contain multiple behavior settings.

buckets *number*

Default: 4
Specifies the number of statistics container changes due to QoS changes or tariff time that can occur before an accounting record should be closed.
number can be configured to any integer value from 1 through 4.

interval *time*

time is measured in seconds and can be configured to any integer value from 60 to 40,000,000.

tariff time1 *mins hours* **time2** *mins hours* **time3** *mins hours* **time4** *mins hours*

Specifies time-of-day time values to close the current statistics container (but not necessarily the accounting record). Six different tariff times may be specified. If less than six times are required, the same time can be specified multiple times.

Important: The system assumes that the billing system uses the day/date to determine if the statistics container represents an actual tariff period.

For each of the different tariff times, the following parameters must be configured:

- *mins*: The minutes of the hour, an integer value from 0 to 59.
- *hours*: The hour of the day, an integer value from 0 to 23.

volume { downlink *vol_down_octets* **uplink** *vol_up_octets* **| total** *total_octets* **}**

Specifies the downlink, uplink, and total volumes that must be met before closing a CDR.
vol_down_octets : Measured in octets; can be configured to any integer value from 100,000 to 4,000,000,000.
vol_up_octets : Measured in octets; can be configured to any integer value from 100,000 to 4,000,000,000.
total_octets : The total traffic volume (up and downlink) measured in octets; can be configured to any integer value from 100,000 to 4,000,000,000.

Usage

Charging characteristics consist of a profile index and behavior settings. This command configures profile indexes for the SGSN's charging characteristics. The SGSN supports up to 16 profile indexes.
This command works in conjunction with the cc-sgsn command located in the APN configuration mode that dictates which CCs should be used for subscriber PDP contexts.

Example

The following command configures a profile index of 10 for tariff times of 7:00 AM and 7:30 PM:

```
cc profile 10 tariff time1 0 7 time2 30 19
```

check-imei-timeout-action

This command configures the action to be taken on the Gf interface if a Check-IMEI fails due to a timeout.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
check-imei-timeout-action [ continue | reject ]

default check-imei-timeout-action
```

default

Rejects the Attach or ISRAU procedure if a Check-IMEI timeout occurs.

continue

Instructs the SGSN to continue the Attach or ISRAU procedure if a Check-IMEI timeout occurs because the EIR is not reachable. This functionality matches standard call flow.

reject

Instructs the SGSN to reject the Attach or ISRAU procedure if a Check-IMEI timeout occurs.

Usage

Use this command to control the SGSN reaction if a Check-IMEI fails due to a timeout.
The **continue** option allows the SGSN to go forward with the MS Attach if the first Check-IMEI fails to reach the EIR due to a timeout. Any subsequent activity (such as a RAU or Service Request would force another Check-IMEI towards the EIR. If this subsequent MAP Check-IMEI should fail, then the same policy of continuing the procedure would apply.

Example

Use the following command to reject Attach Requests if the Check-IMEI timer runs out:

```
check-imei-timeout-action reject
```

ciphering-algorithm

This command configures the priority, ordering, for the use of the GPRS encryption ciphering algorithms.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ciphering-algorithm priority *priority algorithm*

default ciphering-algorithm priority *priority algorithm*

default

Returns the system ciphering-algorithm priority to the default of GEA0 - which means that no ciphering will be done.

priority

Defines the priority or order of use for the ciphering algorithm.
priority must be an integer from 1 to 8.

algorithm

Identifies the algorithm to be matched to the priority. Options include:

- gea0 - No ciphering
- gea1 - GPRS Encryption Algorithm - GEA1
- gea2 - GPRS Encryption Algorithm - GEA2
- gea3 - GPRS Encryption Algorithm - GEA3
- gea4 - GPRS Encryption Algorithm - GEA4 (not yet supported)
- gea5 - GPRS Encryption Algorithm - GEA5 (not yet supported)
- gea6 - GPRS Encryption Algorithm - GEA6 (not yet supported)
- gea7 - GPRS Encryption Algorithm - GEA7 (not yet supported)

Usage

Use this command to specify the order (priority) of usage for the GPRS encryption algorithms. All of the GPRS encapsulation algorithms use a 64-bit key derived from a common mechanism: the mobile receives a random challenge, then the SIM calculates an authentication signature and an encryption key.

Example

The following command sets no ciphering to be used after two encryption algorithms have been used:

ciphering-algorithm priority *3 gea0*

dns israu-mcc-mnc-encoding

Configures either decimal or hexadecimal format for the MCC and MNC values in the DNS query.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
dns israu-mcc-mnc-encoding { decimal | hexidecimal }

default dns israu-mcc-mnc-encoding
```

default

Resets the SGSN to send the MCC and MNC values in decimal format for DNS queries.

decimal

Default.
Instructs the SGSN to send the MCC and MNC in decimal format in the DNS query.

hexadecimal

Instructs the SGSN to send the MCC and MNC in hexadecimal format in the DNS query.

Usage

Use this command to determine the type of encoding for the MCC and MNC to be included in the DNS query. For example:
In decimal, the MNC/MCC in a DNS query would appear like:

```
rac0017.lac42e3.mnc310.mcc722.gprs
```

In hexadecimal, the MNC/MCC in a DNS query would appear like:

```
rac0017.lac42e3.mnc0136.mcc02d2.gprs
```

Example

Use hexadecimal values for the MCC/MNC in the DNS query.

```
dns israu-mcc-mnc-encoding hexadecimal
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the previous configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the context configuration mode.

gmm

This command defines the GPRS mobility management parameters for the SGSN service.

Important: The **gmm** command can be repeated to set each timer as needed.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gmm { accept-procedure [new-tlli | old-tlli] | ciph-gmm-msg-from-unknown-ms { detach | ignore } | mobile-reachable-timeout *mins* **| negotiate-t3314-timeout** *secs* **| purge-timeout** *mins* **| T3302-timeout** *mins* **| T3312-timeout** *mins* **| T3313-timeout** *secs* **| T3350-timeout** *secs* **| T3360-timeout** *secs* **| T3370-timeout** *secs* **| trau-timeout***secs* **}**

default gmm { ciph-gmm-msg-from-unknown-ms | mobile-reachable-timeout | negotiate-t3314-timeout | purge-timeout | T3302-timeout | T3312-timeout | T3313-timeout | T3350-timeout | T3360-timeout | T3370-timeout | trau-timeout }

no gmm negotiate-t3314-timeout

default

Resets the specified timer timeout to the system default.

no

Removes the specified GMM definition from the configuration.

accept-procedure [new-tlli | old-tlli]

Default: new-tlli
This keyword enables the use of either a new TLLI (temporary logical link identifier) or an old TLLI for attach-accept or RAU-accept messages sent by the SGSN to the MS during related procedures.

ciph-gmm-msg-from-unknown-ms { detach | ignore }

Configures how the SGSN will behave when it receives a ciphered GMM message from an unknown MS.
detach - Instructs the SGSN to send a Detach message to the MS.
ignore - Instructs the SGSN to send an Ignore (drop) message to the MS.
Default: **ignore**

mobile-reachable-timeout *mins*

Default: 58 minutes
Timer value for the mobile reachability timer.

mins must be an integer from 4 to 1440.

negotiate-T3314-timeout *secs*

Set the number of seconds for the T3314-timeout ready timer value. Value sent out from SGSN so MS can negotiate ready timer.
secs must be an integer from 0 to 11160. Default is 44 seconds.

- If the MS does not send the ready timer in the Attach/RAU request, then the SGSN sends this T3314-timeout (ready timer) value.
- If the MS sends the requested value of the ready timer in the Attach/RAU Request, and if the requested value is less than or equal to the value of the negotiate-T3314-timeout timer, then the SGSN sends Att/RAU Accept with the requested T3314 value.
- If the MS sends the requested value of the ready timer in the Attach/RAU Request, and if the requested value is greater than the value of the negotiate-T3314-timeout timer, then the SGSN sends Att/RAU Accept with the negotiate-T3314-timeout value.

Important: This is the only GMM timer that can be disabled by entering **no** at the beginning of the command syntax. **no gmm negotiate-t3314-timeout** By disabling negotiation of the T3314-timeout value, if the MS sends the requested value of the ready timer in the Att/RAU Request, then the SGSN sends the T3314-timeout value in the Att/RAU Accept.

purge-timeout *mins*

Default: 10080 minutes
Value defines the mm-context lifetime in minutes.
mins must be an integer from 1 to 20160.

T3302-timeout *mins*

Default: 12 minutes
Defines the number of minutes for timer to send to MS.
mins is an integer from 1 to 186.

T3312-timeout *min*

Default: 54 minutes
Periodic RAU update timer to send to MS.
mins is an integer from 0 to 186.

T3313-timeout *secs*

Default: 5 seconds
Initial page timeout timer for retransmission for Paging Requests.
secs is an integer from 1 to 60.

T3314-timeout *secs*

Default: 44 seconds
Ready Timer for controlling Cell Update Procedure.
secs must be an integer from 0 to 11519.

T3350-timeout *secs*

Default :6 seconds
Retransmission timer for Attach Accept/RAU Accept/P-TMSI Realloc Command.
secs must be an integer from 1 to 20.

T3360-timeout*secs*

Default :6 seconds
Retransmission timer for Authentication Request.
secs must be an integer from 1 to 20.

T3370-timeout *secs*

Default :6 seconds
Retransmission timer for Identity Request.
secs must be an integer from 1 to 20.

trau-timeout *secs*

This timer is available in releases 9.0 and higher.
Default: 30
Specifies the number of seconds the "old" 3G SGSN waits to purge the MS's data. This timer is started by the "old" SGSN after completion of the inter-SGSN RAU.
secs : Must be an integer from 5 to 60.

Usage

Use this command to set GMM timers.

Example

Set the t3370 timer expiration for 15 seconds:

```
gmm t3370-timeout 15
```

llc

Configures the timers that control the data flow for the logical link control (LLC) sub-layer.

Important: This command may be repeated as often as necessary to define the needed timers.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

llc { iov-ui-in-xid-reset | n201u-max { sapi11 *pkt-size* **| sapi3** *pkt-size* **| sapi5** *pkt-size* **| sapi9** *pkt-size* **} | pdu-lifetime** *secs* **| t200 sapi1** *time* **| t200 sapi11** *time* **| t200 sapi3** *time* **| t200 sapi5** *time* **| t200 sapi7** *time* **| t200 sapi9** *time* **| uplink-pdu-len-validation }**

default { iov-ui-in-xid-reset | n201u-max { sapi11 | sapi3 | sapi5 | sapi9 } | pdu-lifetime | T200 sapi1 | T200 sapi11 | T200 sapi3 | T200 sapi5 | T200 sapi7 | T200 sapi9 | uplink-pdu-len-validation }

no llc uplink-pdu-len-validation

default

Resets the configuration to the default values.

no

Disables the **uplink-pdu-len-validation** .

iov-ui-in-xid-reset

This keyword makes it possible for the operator to configure whether or not to send IOV-UI in an XID-RESET. This is useful when the MS is not setup to accept IOV-UI (for example, MS sends Attach/RAU Requests with cksn=7) and including IOV-UI in the XID-Reset would result in Attach/RAU failure.
Default: Enabled

n201u-max sapi *n* *pkt_size*

This keyword sets the maximum number of octets, per service access point identifier (SAPI), for the downlink data packets. This is the upper limit that the SGSN will negotiate with the subscriber for packets sent from the SGSN to the BSC.
sapi *n* : Command must identify one of the following SAPI: sapi11, sapi3, sapi5, or sapi9.
pkt_size : Must be an integer from 140 to 1520. Default size is 1520 octets.

pdu-lifetime *secs*

Defines LLC layer PDU lifetime at the BSC. .

secs must be an integer from 0 to 90.
Default: 6

T200 sapi1 *time*

Sets the retransmission timer (in seconds) for sapi1.
time must be an integer of 1 to 10.
Default: 5

T200 sapi11 *time*

Sets the retransmission timer (in seconds) for sapi11.
time must be an integer of 1 to 50.
Default: 40

T200 sapi3 *time*

Sets the retransmission timer (in seconds) for sapi3.
time must be an integer of 1 to 10.
Default: 5

T200 sapi5 *time*

Sets the retransmission timer (in seconds) for sapi5.
time must be an integer of 1 to 20.
Default: 10

T200 sapi7 *time*

Sets the retransmission timer (in seconds) for sapi7.
time must be an integer of 1 to 40.
Default: 20

T200 sapi9 *time*

Sets the retransmission timer (in seconds) for sapi9.
time must be an integer of 1 to 40.
Default: 20

uplink-pdu-len-validation

Available in releases 8.1 and higher.
This feature enables validation of the size of the uplink LLC packets. With validation enabled, the SGSN will drop any uplinked packets that are larger than the negotiated limit.
If the **no** form of the command is used, then this feature is disabled. The SGSN will be more flexible with uplink packet sizes. So if the SGSN and MS have a mismatch and the MS sends packets that are larger than expected, then the SGSN will not drop the packets.
Default: Enabled.

Usage

Use the command repeatedly to configure additional timers and features for the LLC sub-layer.

Example

Set the T200 retransmission timer to timeout at 12 seconds for SAPI5:

```
llc t200 sapi5 12
```

Use the following command to instruct the SGSN to ignore the N201_U packet size limits for uplink packets from an MS:

```
no uplink-pdu-len-validation
```

nri

This command configures the network resource identifier (NRI) to identify a specific SGSN. The NRI is stored in the P-TMSI. The SGSN uses a portion of this NRI to set the parameters for Gb flex (SGSN pooling) functionality.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
nri length nri_length  { nri-value nri_value  | null-nri-value null_nri_value
non-broadcast-lac lac_id rac rac_id [ nri-value  value }

no nri
```

no

Removes the configured NRI value and location in P-TMSI for retrieval by this SGSN operator policy.

nri length *nri_length*

Specifies the number of bits to be used in the P-TMSI, bits 23 to 18. to define the network resource identifier (NRI). The NRI length configuration also sets the maximum size of the pool. If not configured, the NRI length will be of zero length.
nri_length : Must be an integer from 1 to 6 to identify the number of bits.

null-nri-value *null_nri_value*

Configures the null NRI value which must be unique across the pool areas. This keyword is used for the offloading procedure for SGSN pooling (enabled with the **sgsn offloading** command, see the *Exec Mode* chapter).
null_nri_value : 0 (zero) indicates the keyword is not to be used and 1 to 63 are used to identify the SGSN to be used for the offloading procedure for SGSN pooling. There is no default value for this parameter.

non-broadcast lac *lac_id* **rac** *rac_id*

Defines the non-broadcast LAC/RAC to be used in combination with the null-NRI for the offloading procedure.
lac_id defines a location area code associated with a BSS. Must be an integer between 1 and 65535.
rac_id defines the remote area code to be associated with a BSS. Must be an integer between 1 and 255.

nri-value *nri_value*

Specifies the MS-assigned value of the NRI to retrieve from the P-TMSI. This value must not exceed the maximum possible value specified by the NRI length. The NRI value must be unique across the pool or across all overlapping pools.
nri_value must be an integer from 1 to 63 to identify a specific SGSN in a pool. Use of 0 (zero) value is not recommended.
Multiple NRI values can be identified by providing multiple nri-values separated by a blank space for example: **nri length** *6* **nri-value** *29 43 61*

Usage

Use this command to add or remove the Gb flex pool configuration for this GPRS service. The command can be repeated to specify different values for any of the keyword parameters. If more than one NRI is configured, the GPRS service will round-robin between the available NRIs when new subscribers (re)connect.

Use this command to retrieve the NRI (identity of an SGSN) stored in in bits 23 to 18 of the packet-temporary mobile subscriber identity (P-TMSI). If more than one NRI value is configured, the GPRS service will round-robin between the available NRIs when new subscribers (re)connect.

Example

The following command specifies the the NRI length as 5 bits, identifies SGSN 23 with LAC 222 and RAC 12 for offloading procedure with NRIs 6 and 41:

```
nri length 5 null-nri-value 34 non-broadcast lac 222 rac 12 nri-value 6
41
```

paging-policy

Configures the paging parameters for the GPRS service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
paging-policy { last-known-area { all | bsc | cell | location-area | routing-
area } + | max-retransmissions retran_num }

no paging-policy last-known-area { bsc | cell | location-area | routing-area }

default paging-policy { last-known-area | max-retransmissions }
```

no

Disables the paging-policy definition for this GPRS service configuration.

default

Resets the defaults for parameters managed by this paging policy.

last-known-area

Select one or more paging areas and enter them in preferred paging order:

- **all** : Pages in the last known BSC.
- **bsc** : Pages in last known BSC.
- **cell** : Pages in last known cell.
- **location area** : Pages in last known location area.
- **routing area** : Pages in last known routing area.

By default, paging occurs in the following order:
cell, BSC, routing area, location area.

max-retransmission *retran_num*

Configures the maximum number of retries for a page request per paging area.
retran_num: Enter an integer from 0 to 5.

- 2 : default.
- 0 : disables retransmission for paging request so that the SGSN only sends a single 2G PS-paging request to the BSC with no retransmissions.

+

Keywords can be repeated or combined as needed to complete the paging policy configuration.

Usage

Use this command to configure the order of preference for retransmitting into specified paging-areas.

Example

Use the following command to instruct the SGSN to page the cell and BSC as the last-known areas :

```
paging-policy last-known-area cell bsc
```

peer-nsei

This command associates a peer (remote) network service entity (NSEI) for a BSS with this GPRS service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

peer-nsei *nse_id* **{ lac** *lac_id* **rac** *rac_id* **| pooled }**

[no] peer-nsei *nse_id* **{ lac** *lac_id* **rac** *rac_id* **| pooled }**

no

Removes the NSEI LAC/RAC or pooling configuration from this BSS peer configuration.

nse_id

Defines the NSEI for this GPRS service.
nse_id must be an integer from 0 to 65535.

lac *lac_id*

Defines a location area code associated with the NSE BSS.
lac_id must be an integer between 1 and 65535.

rac *rac_id*

Defines the remote area code to be associated with the NSE BSS
rac_id must be an integer between 1 and 255.

pooled

Enables pooling with non-pooled BSCs within the pool area.

Usage

Use this command repeatedly to associate one or more LAC/RAC combinations and/or pooling with this peer-GPRS service configuration.
The Network Service Entity (NSE) at the BSS and the SGSN provides the network management functionality required for the operation of the Gb interface. Each NSE is identified by means of NSE identifier (NSEI).

Example

The following command configures the NSE with identifier as *4114* having location area code *234* and routing area code as *22*:

peer-nsei *4114* **lac** *234* **rac** *22*

The following command enables Gb flex (pooling) functionality for this GPRS service:

peer-nsei *4114* **pooled**

plmn

This command identifies the Public Land Mobile Network (PLMN) for the GPRS service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

plmn id mcc *mcc_num* **mnc** *mnc_num*

no plmn id

no

Removes the PLMN information from the configuration for the current SGSN service.

mcc *mcc_num*

Define the mobile country code (MCC) portion of the PLMN Id.
mnc_num must be a 3 digit integer from 100 to 999.

mnc *mnc_num*

Define the mobile network code (MNC) portion of the PLMN Id.
mnc_num must be a 2 or 3 digit integer from 00 to 999.

Usage

Use this command to set PLMN parameters for the current SGSN service.

Example

The following command identifies the PLMN MCC as 200 and the MNC as 10:

plmn id mcc *200* **mnc** *10*

setup-timout

This command configures the maximum number of seconds allowed for session setup.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

setup-timout *seconds*

default setup-timout

default

Returns the configuration to the default, 60 seconds.

seconds

An integer from 1 to 1000000.

Usage

Use this command to set the time allowed for session setup.

Example

The following command sets the maximum session setup time to 300 seconds:

setup-timout *300*

sgsn-context-request

This command specifies whether or not the PTMSI signature check should be skipped if the PTMSI signature is not included in the SGSN context request.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] sgsn-context-request ptmsi-signature-absence allowed
```

default

Returns the configuration to the default action to perform the PTMSI signature check.

no

Removes this definition from the system configuration.

Usage

Use this command to skip the PTMSI signature check.

Example

The following command instructs the system to perform the PTMSI signature check.

```
default sgsn-context-request ptmsi-signature-absence
```

sgsn-number

Define the SGSN E.164 number to be used when interacting via MAP protocol for this GPRS service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sgsn-number *sgsn_number*

no sgsn-number

no

Disables the use of this definition in the system configuration.

sgsn-number

Enter a string of 1 to 16 digits to identify the SGSN's E.164 identification.

Usage

Use this command to identify the ISDN number for the SGSN associated with this GPRS service.
The SGSN supports multiple SGSN numbers – different numbers in the 2G GPRS service configuration and the the 3G SGSN service configuration. If an HLR-initiated dialog is received, the SGSN will perform a lookup based on the IMSI and find the correct SGSN number with which the MS is associated. Subsequent messaging will use this address.

Example

Disable the E.164 number for this GPRS service.

```
no sgsn-number
```

sm

This command configures the session management (SM) parameters associated with this particular GPRS service context.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sm { activate-max-retransmissions *num_retries* **| deactivate- max-retransmissions** *num_retries* **| ignore-pco-decode-error | modify-max-retransmissions** *num_retries* **| partial-apn-match | requested-apn-from-first-subrec | t3385-timeout** *secs* **| t3386-timeout** *secs* **| t3395-timeout** *secs* **| trim-trailing-spaces-in-apn }**

default sm { activate-max-retransmissions | deactivate-max-retransmissions | ignore-pco-decode-error | modify-max-retransmissions | t3385-timeout | t3386-timeout | t3395-timeout | trim-trailing-spaces-in-apn }

default

Resets the SM parameters to the defaults.

activate-max-retransmissions *num_retries*

Defines the maximum number of retries to transmit 'activate PDP context request'.
num_retries : Must be an integer from 1 to 10.
Default: 4

deactivate-max-retransmissions *num_retries*

Defines the maximum number of retries to transmit 'deactivate PDP context request'.
num_retries : Must be an integer from 1 to 10.
Default: 4

ignore-pco-decode-error

Enables the SGSN to ignore received decode errors that are due to incorrectly encoded PCO IE length in SM Requests.
Default: disabled

modify-max-retransmissions *num_retries*

Defines the maximum number of retries to transmit 'modify PDP context request'.
num_retries: integer from 1 to 10.
Default: 4

partial-apn-match

Enables partial matching of requested APN during APN selection.

Partial APN or APN with trailing spaces may be present in an Activate Request because incorrect information was keyed in by the user. Though it is valid to reject such Activation Requests, it increases the signaling between the MS and the SGSN. This has an impact on the radio resources.

requested-apn-from-first-subrec

Enables use of a 'requested APN' from the first subscription record. When this feature is enabled, the PDP Activation is not rejected during APN Selection; instead, the APN from the first subscription record is used as the requested APN and the SGSN continues with the rest of the APN Selection process.
A requested APN is an optional IE in an Activate PDP Request. To get the requested PDP type, if multiple PDP subscription records exist for the subscriber, then the MS has to include the APN information to choose the PDP subscription record during APN selection. Otherwise, such activations will be rejected during APN selection (per TS 23.060 Appendix A). Though it is valid to reject such activation requests, it increases the signaling between the MS and the SGSN, which impacts the radio resources.

t3385-timeout*secs*

Defines the maximum amount of time for retransmission of 'activate request' messages.
secs : Must be an integer from 1 to 60.
Default: 8

t3386-timeout *secs*

Defines the maximum amount of time for retransmission of 'modify request' messages.
secs : Must be an integer from 1 to 60.
Default: 8 seconds.

t3395-timeout *secs*

Defines the maximum amount of time for retransmission of 'deactivate request' messages.
secs : Must be an integer from 1 to 60.
Default: 8

trim-trailing-spaces-in-apn

Enables SGSN to strip off any trailing space(s) in requested APN.
If a requested APN in an Activate PDP Context Request has any trailing spaces, then those trailing spaces will be removed and the length field will be updated.

Usage

Repeat this command with different keywords (parameters) to configure the SM (session management) as needed for this GPRS service. Keywords can be used to optimize signaling between the MS and the SGSN to reduce the impact on the radio resources.

Example

Reset the number of retransmission messages for deactivate PDP context request to 5.

```
sm deactivate-max-retransmissions 5
```

sndcp

Define the SNDCP reassembly-timeout interval associated with this GPRS service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sndcp reassembly-timeout *time*

default sndcp reassembly-timeout

default

Resets the timer configuration to the default value.

time

Defines the interval.
time: Must be an integer from 1 to 5. The default is 5 seconds.

Usage

Use this command to modify the SNDCP reassembly timer.

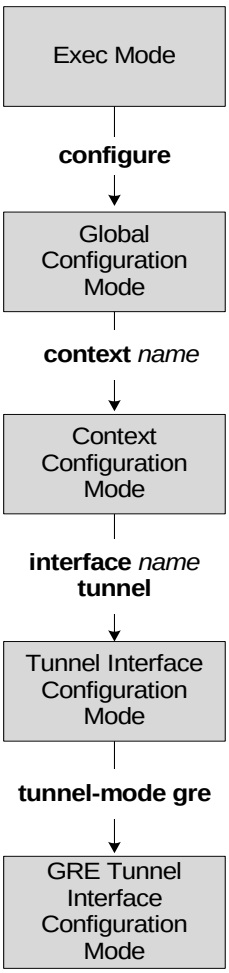
Example

Reset the default for the timer.

```
default sndcp reassembly-timeout
```

Chapter 105
GRE Tunnel Interface Configuration Mode Commands

The Generic Routing Encapsulation (GRE) Tunnel Interface Configuration Mode is used to create and manage the GRE tunneling interfaces for addresses, address resolution options, etc.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

destination

This command configures the destination IPv4 address of the tunnel by specifying the IPv4 destination end address. This is a mandatory configuration for GRE tunnel interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] destination address *ip_address*

no

Removes/disassociates the configured destination IP address from specific GRE tunnel interface configuration.

address *ip_address*

Configures the IP address for the interface specifying the IPv4 IP address.
ip_address must be specified using the standard IPv4 dotted decimal notation.

Usage

Use this command to configure the destination IPv4 address of the tunnel by specifying the IP address of destination tunnel end for GRE tunnel interface.

Important: State of source address will affect the operational state of the tunnel.

Example

The following command sets the 1.2.3.4 as destination IP address of the GRE tunnel interface:

destination address*1.2.3.4*

end

Exits the interface configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the Interface Configuration Mode and returns to the Context Configuration Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the context configuration mode.

keepalive

This command configures various parameters for sending Keepalives to the remote end-point in GRE tunnel interface configuration. By default sending keepalives is disabled.

Product

All

Privilege

Security Administrator, Administrator

Syntax

keepalive [interval *time_interval* **num-retry** *retry*]

[default | no] keepalive

default

Sets the sending of Keepalives with default parameters.
interval: 10 seconds
num-retry: 3 retries

no

Disables the keepalive and turns off the sending of Keepalives messages.

interval *time_interval*

Default: 10
Specifies the time interval (in seconds) between two Keepalives sent to remote ends of GRE tunnel interface configuration.
time_interval must be an integer from 5 through 3600.

num-retry *retry*

Default: 3
Specifies number of retransmission of keepalives to remote node without getting any response before the remote node is marked as dead/down.
retry must be an integer between 0 through 10.

Usage

Use this command to configure the parameters for sending Keepalives to the remote end-point of GRE tunnel. It also configures the interval at which GRE Keepalives are sent on the interface and number of retries without getting a response from the remote end-point before the tunnel is shutdown. By default, Keepalives will not be sent.

Example

The following command enables the keepalive and sets the other parameters to defaults:

```
default keepalive
```

source

This command configures the source IPv4 address of the tunnel either by specifying the IP address (host address) or by specifying another configured non-tunnel IPv4 interface. This is a mandatory configuration for GRE tunnel interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] source {address ip_address | interface interface_name}
```

no

Removes/disassociates the configured source IP address or host interface from specific GRE tunnel interface configuration.

address *ip_address*

Configures the IP address for the interface specifying the IPv4 IP address.
ip_address must be specified using the standard IPv4 dotted decimal notation.

interface *interface_name*

Specifies the name of the preconfigured non-tunnel IPv4 interface, whose address is used as the source address of the GRE tunnel.

Usage

Use this command to configure the source IPv4 address of the tunnel either by specifying the IP address (host address) or by specifying another configured non-tunnel IPv4 interface for GRE tunnel interface.

Important: State of source address will affect the operational state of the tunnel.

Example

The following command sets the 1.2.3.4 as source IP address of the GRE tunnel interface:

```
source address 1.2.3.4
```

tos

This command configures the parameters/action for the TOS parameter in the IPv4 tunnel transport protocol header.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
ip tos {value [ af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 |
af41 | af42 | af43 | be | ef | lower-bits tos_value] | copy}

no ip tos
```

default

Sets the IP TOS to lower bits value of 0.

value [*tos_value*]

Default: **af11**
Specifies the IP QoS DSCP per-hop behavior to be marked on the outer header of signalling packets originating from the Access Gateway. This is a standards-based feature (RFC 2597). The following forwarding types are supported:
af11: Designates the use of Assured Forwarding 11 per-hop behavior
af12: Designates the use of Assured Forwarding 12 per-hop behavior
af13: Designates the use of Assured Forwarding 13 per-hop behavior
af21: Designates the use of Assured Forwarding 21 per-hop behavior
af22: Designates the use of Assured Forwarding 22 per-hop behavior
af23: Designates the use of Assured Forwarding 23 per-hop behavior
af31: Designates the use of Assured Forwarding 31 per-hop behavior
af32: Designates the use of Assured Forwarding 32 per-hop behavior
af33: Designates the use of Assured Forwarding 33 per-hop behavior
af41: Designates the use of Assured Forwarding 41 per-hop behavior
af42: Designates the use of Assured Forwarding 42 per-hop behavior
af43: Designates the use of Assured Forwarding 43 per-hop behavior
be: Designates the use of Best Effort forwarding per-hop behavior
ef: Designates the use of Expedited Forwarding per-hop behavior typically dedicated to low-loss, low-latency traffic.
The assured forwarding behavior groups are listed in the table below.

	Class 1	Class 2	Class 3	Class 4
Low Drop	AF11	AF21	AF31	AF41
Medium Drop	AF12	AF22	AF32	AF42
High Drop	AF13	AF23	AF33	AF43

Traffic marked with a higher class is given priority during congestion periods. If congestion occurs to traffic with the same class, the packets with the higher AF value are dropped first.

lower-bits *tos_value*

Default: 0
Sets the least-significant 6 bits in the TOS byte with the specified numeric value.
tos_value must be an integer from 0 through 255.

copy

This keyword instructs the system to copy the TOS value from the passenger IPv4 packet or Traffic class value from the passenger IPv6 packet to the TOS value of the IPv4 tunnel transport protocol header

Usage

Use this command either to set the TOS parameter in the IPv4 tunnel transport protocol header to the specified value or instructs to copy the TOS value from the passenger IPv4 packet or Traffic class value from the passenger IPv6 packet to the TOS value of the IPv4 tunnel transport protocol header. If one of the enumerated values is set, the DSCP bits which are the six most-significant bits in the TOS byte are marked. If the integer value is set, it will be written into the six least-significant bits of the TOS byte.

Example

The following command instructs the system to copy the TOS value from the passenger IPv4 packet or Traffic class value from the passenger IPv6 packet to the TOS value of the IPv4 tunnel transport protocol header:

```
tos copy
```

ttl

This command configures the Time to live (TTL) parameter to be used in the tunnel transport protocol header for the current GRE tunnel interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ttl *ttl_value*

default ttl

default

Sets the TTL value to system default value; i.e. 15.

ttl_value

Default: 15
Specifies the maximum time to live to be used in the tunnel transport protocol header
The time to live (TTL) is not a measure of time but the number of hops through the network.
ttl_value must be an integer between 1 through 255.

Usage

Use this command to set the TTL parameter to be used in tunnel transport protocol header for GRE tunnel configuration.

Example

The following configures the IP address to associate with the interface:

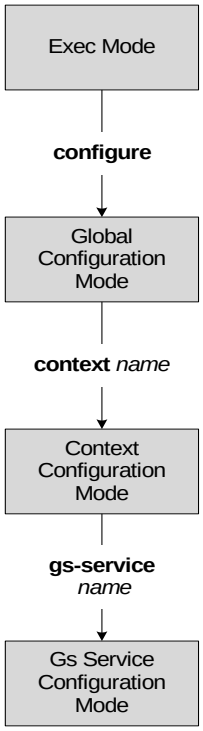
ttl *10*

Chapter 106
Gs Service Configuration Mode Commands

The Gs Service configuration mode configures the parameters used to setup and maintain a Gs interface for a connection between the SGSN and an MSC/VLR.

Upon accessing this mode, your prompt should look similar to the following:

```
[<context_name>]<hostname>(config-gs-service)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

associate-sccp-network

This command associates a previously defined Signaling Connection Control Part (SCCP) network instance with the Gs service. This association is required to access Visitor Location Register(s) (VLRs).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

associate-sccp-network *sccp_net_id*

no associate-sccp-network

no

Removes the associated SCCP network configuration instance from this Gs service configuration.

sccp_net_id

Identifies the SCCP network configuration instance to associate with this Gs interface to enable connection with VLR(s).
sccp_network_num: Must be an integer from 1 through 12.

Usage

Use this command to associate the SCCP network configuration instance with the Gs interface in this service.

Important: A single SCCP network configuration instance can not be shared with multiple Gs services.

Important: To enable a Gs service, the user needs to configure **ssn** with the **bssap+** command.

Example

Following command associates SCCP network 2 with this Gs service.

associate-sccp-network *2*

bssap+

This command defines the Base Station System Application Part Plus configuration parameters for the Gs service to enable the SGSN to access a Visitor Location Register(s) (VLRs).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] bssap+ ssn *ss_num*

no

Removes the configured BSSAP+ subsystem number from this Gs service.

ssn *ss_num*

Specifies the subsystem number to configure in this Gs interface to use BSSAP+.
ss_num must be an integer from 1 through 255.

Usage

Use this command to configure the BSSAP+ subsystem with Gs interface in this service to communicate with VLR(s).

Important: A single SCCP network configuration instance can not be shared with multiple Gs services.

Important: To start a Gs service, the user needs to configure the command parameter.

Example

Following command configures subsystem 101 with BSSAP+ in this Gs service.

bssap+ ssn *101*

end

Exits the current configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the previous configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the previous configuration mode.

max-retransmission

This command configures the retransmission values for different procedure counters in Gs service as described in TS 29.018.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

max-retransmissions { n8 | n9 | n10 | n12 } *retrans_num*

default max-retransmissions { n8 | n9 | n10 | n12 }

no

Removes the configured Gs procedures from this Gs service.

{ n8 | n9 | n10 | n12 }

Specifies the various Gs service procedures that are available to be used to communicate with VLR(s).

- n8: Defines the maximum number of retries for explicit IMSI detach from a non-GPRS service. Default is 2.
- **n9**: Defines the maximum number of retries for explicit IMSI detach from a non-GPRS service. Default is 2.
- **n10**: Defines the maximum number of retries for implicit IMSI detach from the GPRS service. Default is 2.
- **n12**: Defines the maximum number of retries for BSSAP+ to send Reset Indication messages. Default is 2.

retrans_num

Default: 2
Specifies the number of re-transmission of message for specified procedures.
retrans_num: Must be an integer from 0 through 10.

Usage

Use this command to configure the retransmission values for specific procedure counters in Gs service. counters are based on TS 29.018.
This command can be entered for each procedure counter separately.

Example

Following command configure retransmission value as *3* for counter for procedure to send BSSAP+ Reset Indication messages in this Gs service.

max-retransmissions n12 *3*

non-pool-area

This command creates a non-pool area for a set of subscriber location area code (LAC) values that can be used with a specific VLR for the Gs service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

non-pool-area *non_pool_name* **{ use-vlr** *vlr_name* **lac** *lac_num* **} +**

no non-pool-area *non_pool_name*

no

Removes the configured non-pool area from this Gs service.

non_pool_name

Specifies the name of the non-pool area to configure with this command.
non_pool_name must be an alpha and/or numeric string of 1 to 63 characters.

use-vlr *vlr_name*

Specifies the name of the VLR to be associated with this non-pool area.
vlr_name is the name of VLR and must be an alpha and/or numeric string of 1 to 63 characters.

lac *lac_num*

Specifies the subscribers' location area code to be attached with this non-pool area and specific VLR. This LAC of subscriber is obtained from the radio area indicator (RAI).
lac_num is the LAC value and must be an integer value from 1 through 65535.

+

More than one of the above keywords can be entered within a single command.

Usage

Use this command to specify the non-pool area containing VLR name to use for a set of LAC.
This command can be used multiple times, subject to a limit of 32 LAC values (the total for **non-pool-area** and **pool-area** configurations) per Gs service.

Example

Following command configure a non-pool area *starpool1* to use VLR named *starvlr1* for LAC *101* in a Gs service.

non-pool-area *starpool1* **use-vlr** *starvlr1* **lac** *101*

pool-area

This command creates a pool area configuration instance. This command also enters the Pool Area configuration mode to define the set of VLRs to use for a pool area for a set of subscriber location area code (LAC) values in the Gs service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

pool-area *pool_name* **[-noconfirm]**

no pool-area *non_pool_name*

no

Removes the configured pool area from this Gs service.

pool_name

Specifies the name of the pool area to configure with this command for VLR pooling and association of a LAC.
pool_name: Must be an alpha and/or numeric string of 1 to 63 characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create/enter the pool area configuration mode. This mode is used configure the set of VLRs to be used for a set of subscriber LAC.
This command can be used multiple times, subject to a limit of 32 LAC values (the total number of **non-pool-area** and **pool-area** configurations) per Gs service.

Example

The following command configures a pool area named *starpool1* in a Gs service without any confirmation prompt.

pool-area *starpool1* **-noconfirm**

sgsn-number

Define the SGSN's E164 number to associate an SGSN with this Gs Service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sgsn-number *E.164_number*

E.164_number

Defines the SGSN's 'telephone' number, the ISDN number for per ITU-T E.164 numbering plan. The number must be a numerical string of 1 to 15 digits.

Usage

For releases 8.1 or higher, use this command to define the SGSN's E.164 ISDN number. This value should match the **sgsn-number** defined for SGSN Service or GPRS Service.

Important: Note: the Gs Service will not start unless the SGSN's E.164 number is configured.

Example

sgsn-number *12345678901234*

timeout

This command configures various timers defining the wait before retransmitting a specific message for Gs service procedures.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

timeout { t6-1-timer *t6_1_dur* **| t8-timer** *t8_dur* **| t9-timer** *t9_dur* **| t10-timer** *t10_dur* **| t12-1-timer minute** *t12_1_dur* **| t12-2-timer** *t12_2_dur***}**

[default] timeout { t6-1-timer | t8-timer | t9-timer | t10-timer | t12-1-timer | t12-2-timer }

default

Sets the timer value to wait in seconds/minutes to default values. Default values for timers are:

- **t6-1-timer**: 10 seconds
- **t8-timer**: 4 seconds
- **t9-timer**: 4 seconds
- **t10-timer**: 4
- **t12-1-timer**: 54 mins (+ 8 seconds)
- **t12-2-timer**: 4 seconds

t6-1-timer *t6_1_dur*

Default: 10
Specifies the retransmission timer value to guard the location update.
t6_1_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 10 through 90.

t8-timer *t8_dur*

Default: 4
Specifies the retransmission timer value to guard the explicit IMSI detach from the GPRS service procedure.
t8_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 30.

t9-timer *t9_dur*

Default: 4
Specifies the retransmission timer value to guard the explicit IMSI detach from the non-GPRS service procedure.
t9_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 30.

t10-timer *t10_dur*

Default: 4
Specifies the retransmission timer value to guard the implicit IMSI detach from the GPRS service procedure.
t10_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 30.

t12-1-timer minute *t12_1_dur*

Default: 54 minutes (plus 8 seconds for transmission delay)
Specifies the retransmission timer value to control the resetting of SGSN-Reset variable procedure.
t12_1_dur is the waiting duration in minutes before retransmitting reset message for the SGSN Reset variable and must be an integer from 0 through 380.

t12-2-timer *t12_2_dur*

Default: 4
Specifies the retransmission timer value to guard the SGSN reset procedure.
t12_2_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 30.

Usage

Use this command to configure the time, for different procedure timers, to wait before retransmitting a procedure message.
This command can be repeated for each timer to configure multiple timers.

Example

Following command sets the timeout duration of 4 seconds for t8 timer to wait before retransmitting the procedure message to explicitly do the IMSI detach from GPRS service:

```
default timeout t8-timer
```

vlr

This command defines a VLR configuration for use with this Gs service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

vlr *vlr_name* **isdn-number** *E164_num* **[bssap+ ssn** *ssn* **] [point-code** *pt_code* **]**

no vlr *vlr_name*

no

Removes the configured VLR from the Gs service.

vlr_name

Specifies the name of the VLR to configure in this Gs mode with ISDN number.
vlr_name must be an alpha and/or numeric string of 1 to 63 characters.

isdn-number *E164_num*

Specifies the VLR number to configure with this command.
E164_num: The ISDN number for the target VLR. Value must be defined according to the E.164 numbering plan and must be a numeric string of 1 to 15 digits.

bssap+ ssn *ssn*

Specifies the subsystem number to configure with this VLR to use BSSAP+.
ssn: Must be an integer from 1 through 255. Default value is 252.

point-code *pt_code*

Specifies SS7 address of VLR in point code value to this configured VLR name.
pt_code: Must be in SS7 point code dotted-decimal ###.###.### format or decimal ######## format.

Usage

Use this command to define VLR configuration instances to be associated with the Gs service.
A maximum of 32 VLRs can be configured per Gs service.

Example

Following command configures the VLR named *starvlr1* with an ISDN number *12344567*, a subsystem number of *252*, and a point code value of *123.345.567*:

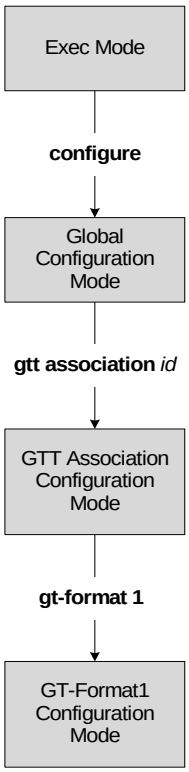
vlr *starvlr1* **isdn-number** *12344567* **point-code** *123.345.567*

Chapter 107
GT-Format1 Configuration Mode Commands

The GT-Format1 configuration mode is a sub-mode for either the Global Title Translation Association configuration mode or the Global Title Translation Address-Map configuration mode. This sub-mode configures a set of rules used in the global title translation (GTT) process.

Upon accessing this mode, your prompt should look similar to the following:

```
[local]<hostname>(config-gtt-1-format1)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the configuration mode and returns to the Global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the Global configuration mode.

nature-of-address

Configures the indicator to identify the nature of the address.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
nature-of-address { international | national | subscriber )
```

international

Identifies the numbers as international.

national

Identifies the numbers as matching the national configuration.

subscriber

Identifies the numbers as subscriber numbers.

Usage

Configure the identify of the GT format as national.

Example

nature-or-address *national*

odd-even-indicator

Configures the bits for matching the global title translation.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

odd-even-indicator *type*

type

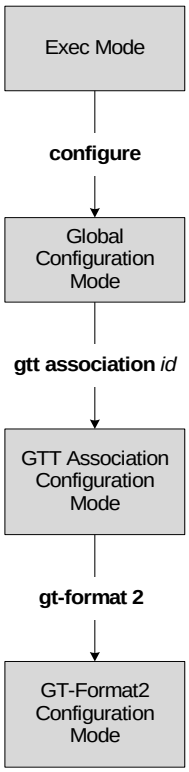
- **odd**: Sets the odd bit for matching the GTT.
- **even**: Sets the even bit for matching the GTT.

Chapter 108
GT-Format2 Configuration Mode Commands

The GT-Format2 configuration mode is a sub-mode for either the Global Title Translation Association configuration mode or the Global Title Translation Address-Map configuration mode. This sub-mode configures a set of rules used in the global title translation (GTT) process.

Upon accessing this mode, your prompt should look similar to the following:

```
[local]<hostname>(config-gtt-format<#>)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the configuration mode and returns to the Global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the Global configuration mode.

translation-type

Configures the translation type to be applied during the translation process.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

translation-type *number*

number

Must be an integer between 0 and 255.
Default is 0

Usage

Use this command to configure the GTT translation type to be applied during global title translation process.

Example

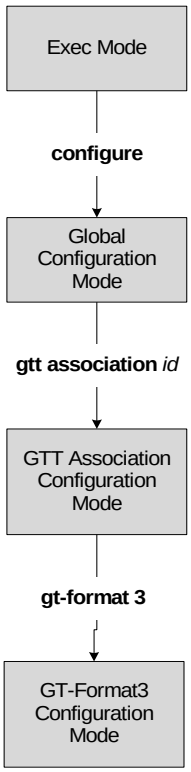
translation-type *232*

Chapter 109
GT-Format3 Configuration Mode Commands

The GT-Format3 configuration mode is a sub-mode for either the Global Title Translation Association configuration mode or the Global Title Translation Address-Map configuration mode. This sub-mode configures a set of rules used in the global title translation (GTT) process.

Upon accessing this mode, your prompt should look similar to the following:

```
[local]<hostname>(config-gtt-1-format<#>)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

encoding-scheme

Configures the encoding-scheme to use during global title translation (GTT).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

encoding scheme *scheme_type*

scheme_type

Select one of the following encoding scheme types to determine the encoding type to be used during GTT:

- **bcd-even:** BCD even encoding scheme
- **bcd-odd:** BCD odd encoding scheme
- **nw-specfic:** Network specific encoding scheme
- **unknown:** Unknown encoding scheme

Usage

Select BCD even encoding for GTT

Example

encoding scheme *bcd-even*

end

Exits the configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the configuration mode and returns to the Global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the Global configuration mode.

numbering-plan

Configures the GTT process to apply one of the numbering-plans during the GT translation process.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

numbering-plan *plan_type*

plan_type

Select one of the following numbering plans be employed during GTT:

- **data:** Data numbering plan
- **generic**: Generic number plan
- **isdn** : ISDN tel numbering plan
- **isdn-mobile:** ISDN mobile numbering plan
- **land-mobile:** Land mobile numbering plan
- **maritime-mobile:** Maritime mobile numbering plan
- **nw-specific** : Private network / network-specific numbering plan
- **telex:** Telex numbering plan
- **unknown**: Unknown numbering plan

Usage

Select ISN telephone number plan for GTT process.

Example

The following command sets the numbering plan to use during GTT processing to isdn

```
numbering-plan isdn
```

translation-type

Configures the global title translation (GTT) process to apply a specific number for translation during the GTT process.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

translation-type *number*

number

Must be an integer between 0 and 255.
Default is 0

Usage

Use this command to define the translation-type to be used during the global title translation process.

Example

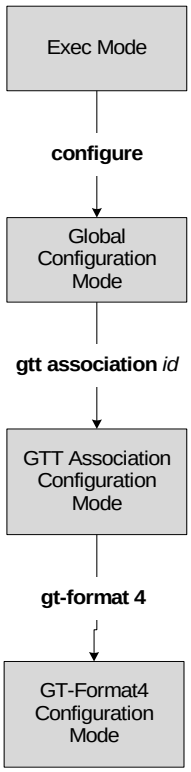
translation-type *233*

Chapter 110
GT-Format4 Configuration Mode Commands

The GT-Format4 configuration mode is a sub-mode for either the Global Title Translation Association configuration mode or the Global Title Translation Address-Map configuration mode. This sub-mode configures a set of rules used in the global title translation (GTT) process.

Upon accessing this mode, your prompt should look similar to the following:

```
[local]<hostname>(config-gtt-1-format<#>)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

encoding-scheme

Configures the encoding-scheme to use during GTT.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

encoding scheme *scheme_type*

scheme_type

Select one of the following encoding scheme types to determine the encoding type to be used during GTT:

- **bcd-even:** BCD even encoding scheme
- **bcd-odd:** BCD odd encoding scheme
- **nw-specfic:** Network-specific encoding scheme
- **unknown:** Unknown encoding scheme

Usage

Select BCD even encoding for GTT

Example

encoding scheme *bcd-even*

end

Exits the configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the configuration mode and returns to the Global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the Global configuration mode.

nature-of-address

Configures the indicator to identify the nature of the address.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
nature-of-address { international | national | subscriber )
```

international

Identifies the numbers as international.

national

Identifies the numbers as matching the national configuration.

subscriber

Identifies the numbers as subscriber numbers.

Usage

Configure the identify of the GT format as national.

Example

```
nature-or-address national
```

numbering-plan

Configures the GTT process to apply one of the numbering-plans during the GT translation process.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

numbering-plan *plan_type*

plan_type

Select one of the following numbering plans be employed during GTT:

- **data:** Data numbering plan
- **generic**: Generic number plan
- **isdn** : ISDN tel numbering plan
- **isdn-mobile:** ISDN mobile numbering plan
- **land-mobile:** Land mobile numbering plan
- **maritime-mobile:** Maritime mobile numbering plan
- **nw-specific** : Private network/ network-specific numbering plan
- **telex:** Telex numbering plan
- **unknown**: Unknown numbering plan

Usage

Select ISN telephone number plan for GTT process.

Example

numbering-plan *isdn*

translation-type

Configures the GTT process to apply a specific number for translation during the GTT process.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

translation-type *number*

number

Must be an integer between 0 and 255.
Default is 0.

Usage

Use this command to configure the translation-type to be implemented during the global title translation process.

Example

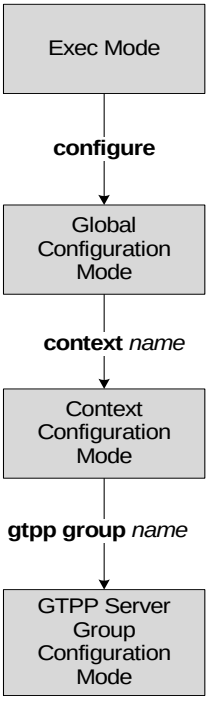
translation-type *231*

Chapter 111
GTPP Server Group Configuration Mode Commands

The GTPP Server Group Configuration Mode is used to create and manage the GTPP server groups within the context or system.

GTPP server group commands facilitate the setup of the SMC hard disk for CDR storage. As well, for accounting and charging functionality within a context, these commands can be used to configure the management of a group (list) of charging gateway function (CGF) servers on a per subscriber or per GGSN APN level.

In this mode, your prompt will be similar to **[***context_name***]***hostname***(config-gtpp-group)#**



gtpp attribute

Enables the specification of some of the optional fields in the CDRs that the GSN (GGSN or SGSN) generates and/or how the information is to be presented.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp attribute { camel-info | cell-plmn-id | diagnostics | duration-ms | imei |
local-record-sequence-number | msisdn | node-id-suffix STRING  | plmn-id | rat |
record-extensions rat |sms { destination-number | recording-entity | service-
centre }  } +

default gtpp attribute { cell-plmn-id | diagnostics | duration-ms | imei |
local-record-sequence-number | msisdn | plmn-id | rat | record-extensions rat |
sms { destination-number | recording-entity | service-centre } }

no gtpp attribute { cell-plmn-id | diagnostics | duration-ms | imei | local-
record-sequence-number | msisdn | node-id-suffix | plmn-id | rat | record-
extensions rat | sms { destination-number | recording-entity | service-centre }
}
```

default

Resets the default attribute values for this GTPP group configuration.

no

Disables the specified optional field so that the information will not be present in generated CDRs.

camel-info

SGSN only
Default: Disabled
Enter this keyword to include CAMEL-specific fields in SGSN CDRs.

cell-plmn-id

SGSN only
Default: Disabled
Enter this keyword to enable the system to include the Cell PLMN ID field in the M-CDR.

diagnostics

Default: Disabled
Enter this keyword to enable the system to include the Diagnostic field in the CDR that is created when PDP contexts are released. The field will include one of the following values:

- **26** - For GGSN: if the GGSN sends “delete PDP context request” for any other reason (e.g., the operator types “clear subscribers” on the GGSN). For SGSN: The SGSN includes this cause code in

the S-CDR to indicate that a secondary PDP context activation request or a PDP context modification request has been rejected due to insufficient resources.

- **36** - For GGSN: this cause code is sent in the G-CDR to indicate the PDP context has been deactivated in the GGSN due to the SGSN having sent a "delete PDP context request" to the GGSN. For SGSN, this cause code is used to indicate a regular MS or network-initiated PDP context deactivation.
- **37** - when the network initiates a QoS modification, the SGSN sends in the S-CDR to indicate that the MS initiation deactivate request message has been rejected with QoS not accepted as the cause.
- **38** - if the GGSN sends "delete PDP context request" due to GTP-C/GTP-U echo timeout with SGSN. If the SGSN sends this cause code, it indicates PDP context has been deactivated due to path failure, specifically GTP-C/GTP-U echo timeout.
- **39** - SGSN only - this code indicates the network (GGSN) has requested a PDP context reactivation after a GGSN restart.
- **40** - if the GGSN sends "delete PDP context request" due to receiving a RADIUS Disconnect-Request message.

`duration-ms`

Default: Disabled
Specifies that the information contained in the mandatory Duration field be reported in milliseconds instead of seconds (as the standards require).

`imei`

Default: Disabled
For SGSN: includes the IMEI value in the S-CDR.
For GGSN: includes the IMEISV value in the G-CDR.

`local-record-sequence-number`

Default: Disabled
This keyword provides both the local record sequence number and the Node ID. In the x-CDRs, this field indicates the number of CDRs generated by the node and is unique within the session manager.
The Node ID field is included in the x-CDR for any of several reasons, such as when PDP contexts are released or if partial-CDR is generated based on configuration. The field will consist of a AAA Manager identifier automatically appended to the name of the SGSN or GGSN service.
The name of the SGSN or GGSN service may be truncated, because the maximum length of the Node ID field is 20 bytes. Since each AAA Manager generates CDRs independently, this allows the Local Record Sequence Number and Node ID fields to uniquely identify a CDR.

Important: If this keyword is enabled and the **`gtpp centralized-lrsn-creation`** option is enabled with the **`gtpp single-source centralized-lrsn`** command, then the Node ID format changes as follows. <1-byte-AAAproxy-restart-counter> <3-byte AAAproxy instance number> <node-id-suffix> If "centralized-lrsn-creation" is not enabled, then node-id format for CDRs generated by Sessmgr is as follows. <1-byte Sessmgr restart-value> <3-byte Sessmgr instance number> <node-id-suffix> If "centralized-lrsn-creation" is not enabled, then node-id format for CDRs generated by ACSMGR is as follows. <1-byte ACSmgr restart-value> <3-byte ACSmgr instance number> <Active charging service-name>

`msisdn`

Default: Enabled
For SGSN: includes the MSISDN value in the S-CDR.

For GGSN: includes the MSISDN value in the G-CDR.

node-id-suffix *STRING*

Default: Disabled
Specifies the string suffix to use in the NodeID field of GTPP CDRs. Each Session Manager task generates a unique NodeID string per GTPP context.
STRING: This is the configured Node-ID-Suffix having any string between 1 to16 characters.

Important: The NodeID field is a printable string of the *ndddSTRING* format: *n*: The first digit is the Sessmgr restart counter having a value between 0 and 7. *ddd*: The number of sessmgr instances. Uses the specified NodeID-suffix in all CDRs. The "Node-ID" field consists of sessMgr Recovery counter (1 digit) *n* + AAA Manager identifier (3 digits) *ddd* + the configured Node-Id-suffix (1 to 16 characters) *STRING*. If the centralized LRSN feature is enabled, the "Node-ID" field will consist of only the specified NodeID-suffix (NodeID-prefix is not included). If this option is not configured, then GTPP group name will be used instead (For default GTPP groups, context-name will be used).

Important: If this **node-id-suffix** is not configured, the GGSN uses the GTPP context name as the Node-id-suffix (truncated to 16 characters) and the SGSN uses the GTPP group named as the node-id-suffix.

plmn-id [unknown-use]

Default: Enabled
For SGSN, reports the SGSN PLMN Identifier value (the RAI) in the S-CDR provided if the dictionary supports it.
For GGSN, reports the SGSN PLMN Identifier value (the RAI) in the G-CDR if it was originally provided by the SGSN in the GTP create PDP context request. It is omitted if the SGSN does not supply one.
Normally when SGSN PLMN-id information is not available, the attribute sgsnPLMNIdentifier is not included in the CDR. This keyword enables the inclusion of the sgsnPLMNIdentifier with a specific value when the SGSN PLMN-id is not available.
unknown-use *hex_num*: must be a hexadecimal number from 0x0 through 0xFFFFFF to identify a foreign SGSN that has not provided a PLMN-id. For GGSN only.

rat

Default: Enabled
For SGSN: includes the RAT (identifies the radio access technology type) value in the S-CDR.
For GGSN: includes the RAT (identifies the radio access technology type) value in the G-CDR.

record-extensions rat

Default: Disabled
Enables network operators and/or manufacturers to add their own recommended extensions to the CDRs according to the standard record definitions from 3GPP TS 32.298 Release 7 or higher.

sms { destination-number | recording-entity | service-centre }

This keyword is specific to the SGSN.
Entering this keyword causes the inclusion of an SMS-related field in the SMS-MO-CDR or SMS-MT-CDR.
destination-number - Entering this option includes the "destinationNumber" field in the SMS-MO-CDR or SMS-MT-CDR.
recording-entity - Entering this option includes the "recordingEntity" field in the SMS-MO-CDR or SMS-MT-CDR.

service-centre - Entering this option includes the "serviceCentre" field in the SMS-MO-CDR or SMS-MT-CDR.

+

Indicates that this command can be entered multiple times to configure multiple attributes.

Usage

This command dictates some of the optional information fields that should be reported in CDRs generated by the GGSN. In addition, it controls how the information for some of the mandatory fields are reported. Fields described as optional by the standards but not listed above will always be present in the CDRs, except for Record Extensions (which will never be present).

Example

The following command dictates that the time provided in the Duration field of the CDR is reported in milliseconds:

```
gtpp attribute duration-ms
```

gtpp charging-agent

Configures the IP address and port of the system interface within the current context used to communicate with the CGF or the GSS.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp charging-agent address *ip_address* **[port** *port* **]**

no gtpp charging-agent

no

Removes a previously configured charging agent address.

address *ip_address*

Specifies the IP address of the interface configured within the current context that is used to transmit G-CDR records to the CGF or the GSS.
ip_address must be configured using dotted decimal notation.

port *port*

It is an optional parameter. It specifies the Charging Agent UDP port. If **port** is not defined, the IP will take the default port number 49999.
Default: 49999
port must be followed by an integer, ranging from 1 to 65535.

Important: Configuring GTPP charging-agent on port 3386 may interfere with ggsn-service configured with the same ip address.

Usage

This command can be used to establish a UDP interface to connect to the GSS or this command can establish a Ga interface to connect to the CFG. These interfaces must exist in the same context in which GTPP functionality is configured (refer to the **gtpp** commands in this chapter).
This command instructs the system as to what interface to use. The IP address supplied is also the address by which the GGSN/SGSN is known to the CGF or the GSS. Therefore, the IP address used for the Ga or UDP interface could be identical to one bound to a GGSN/SGSN service (a Gn interface).
If no GGSN/SGSN services are configured in the same context as the Ga/UDP interface, the address configured by this command is used to receive unsolicited GTPP packets.

Example

The following command configures the system to use the interface with an IP address of 192.168.13.10 as the accounting interface with port *20000* to the CGF:

```
gtpp charging-agent address 192.168.13.10

gtpp charging-agent address  192.168.13.10 port  20000
```

gtpp data-request sequence-numbers

Configures the range of sequence numbers to be used in the GTPP data record transfer record (DRT). Use this command to set the start value for the sequence number.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp data-request sequence-numbers start { 0 | 1 }

default gtpp data-request sequence-numbers start
```

default

Default is 0 (zero).

start { *0* | *1* }

Specifies the value of the start sequence number for the GTPP Data Record Transfer Request. Default: 0

- **0:** Designates the start sequence number as 0.
- **1:** Designates the start sequence number as 1.

Usage

When the GGSN/SGSN is configured to send GTPP echo request packets, the SGSN always uses 0 as the sequence number in those packets. Re-using 0 as a sequence number in the DRT packets is allowed by the 3GPP standards; however, this CLI command ensures the possibility of inter-operating with CGFs that can not properly handle the re-use of sequence number 0 in the echo request packets.

Example

The following command sets the sequence to start at 1.

```
gtpp data-request sequence-numbers start 1
```

gtpp deadtime

Configures the amount of time the GGSN/SGSN waits before attempting to communicate with a CGF that was previously marked as unreachable (non-responsive).

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp deadtime *time*

default deadtime

default

Resets the deadtime to the default of 120 seconds.

time

Default: 120
Specifies the amount of time that must elapse before the system attempts to communicate with a CGF that was previously unreachable.
time is measured in seconds and can be configured to any integer value from 1 to 65535.

Usage

If the system is unable to communicate with a configured CGF, after a pre-configured number of failures the system marks the CGF as being down.
This command specifies the amount of time that the system waits prior to attempting to communicate with the downed CGF.
Refer to the **gtpp detect-dead-server** and **gtpp max-retries** commands for additional information on the process the system uses to mark a CGF as down.

Example

The following command configures the system to wait 60 seconds before attempting to re-communicate with a CGF that was marked as down:

gtpp deadtime *60*

gtpp dead-server suppress-cdrs

This command configures the action the GGSN or the SGSN will take on CDRs generated during a communication failure between the GGSN or the SGSN and the GTPP servers.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] gtpp dead-server suppress-cdrs
```

no

Removes the suppression instruction from the configuration and sets the CDR suppression mode as disabled.

default

Resets the GGSN or the SGSN to the default mode: disable suppression of CDRs when GTPP server detected as "dead" or unreachable.

Usage

For the GGSN: This command works in conjunction with the **gtpp detect-dead-server** to set an action when a communication failure is detected between the GGSN and a configured GTPP server. It disables the archiving of CDRs on the system when the GTPP server is unreachable or dead.
For the GGSN and the SGSN: Typically, duing a communication or server failure, the GGSN or SGSN retains the GTPP requests until the system buffer runs out of resources. This command enables suppression of the CDRs, so with this command the GGSN or the SGSN will start purging all CDRs associated with this GTPP group as soon as the GGSN/SGSN detects that the GTPP server is down or that a communication failure has occurred. The CDRs generated, for the period while the server is down/unreachable, will also be purged.

Example

The following command configures the system to start purging CDRs when a communication failure with a server is detected:

```
gtpp dead-server suppress-cdrs
```

gtpp detect-dead-server

Configures the number of consecutive communication failures that could occur before the system marks a CGF as 'dead' (unreachable).

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp detect-dead-server consecutive-failures *max_number*

default gtpp detect-dead-server consecutive-failures

default

Resets the system to the default number of consecutive failures.

consecutive-failures *max_number*

Default: 5
Specifies the number of failures that could occur before marking a CGF as down. If 0 (zero) is the value entered, then the system will mark the CGF as dead after a single instance of **max-retries** has been attempted with no success, regardless of configured **deadtime**.
max_number could be configured to any integer value from 0 to 1000.

Usage

This command works in conjunction with the **gtpp max-retries** parameter to set a limit to the number of communication failures that can occur with a configured CGF.
The **gtpp max-retries** parameter limits the number of attempts to communicate with a CGF. Once that limit is reached, the system treats it as a single failure. The **gtpp detect-dead-server** parameter limits the number of consecutive failures that can occur before the system marks the CGF as down and communicate with the CGF of next highest priority.
If all of the configured CGFs are down, the system ignores the detect-dead-server configuration and attempt to communicate with highest priority CGF again.
If the system receives a GTPP Node Alive Request, Echo Request, or Echo Response message from a CGF that was previously marked as down, the system immediately treats it as being active.
Refer to the **gtpp max-retries** command for additional information.

Example

The following command configures the system to allow 8 consecutive communication failures with a CGF before it marks it as down:

gtpp detect-dead-server consecutive-failures *8*

gtpp dictionary

This command designates specific dictionary used by GTPP for specific context.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp dictionary {custom1 | custom10 | custom11 | custom12 | custom13 | custom14
| custom15 | custom16 | custom17 | custom18 | custom19 | custom20 | custom21 |
custom22 | custom23 | custom24 | custom25 | custom26 | custom27 | custom28 |
custom29 | custom3 | custom30 | custom4 | custom5 | custom6 | custom7 | custom8
| custom9 | standard}

default gtpp dictionary
```

default

Configures the default dictionary.

custom1

Custom-defined dictionary. It conforms to TS 32.015 v 3.6.0 for R99. It supports the encoding of IP addresses in text format for G-CDRs.

custom2

Custom-defined dictionary.

custom3

Custom-defined dictionary. It conforms to TS 32.015 v 3.6.0 for R99 but it does support the encoding of IP addresses in binary format for CDRs.

custom4

Custom-defined dictionary. It conforms to TS 32.015 v 3.6.0 for R99 except that:

- the Data Record Format Version information element contains 0x1307 instead of 0x1308
- "QoSRequested" is not present in the LoTV containers
- "QoSnegotiated" is added only for the first container and the container after a QoS change

custom5 ... custom20

Custom-defined dictionaries.

custom21 ... custom25

Custom-defined dictionaries for GGSN only.

custom26

Custom-defined dictionary for customization of G-CDR records for GGSN only. This is compliant to 3GPP TS 32298 (R6 v 6.5.0) for proprietory fields and encoding.

custom27

Custom-defined dictionary for customization of S-CDR records for SGSN only. This is compliant to 3GPP TS 32298 (R6 v 6.6.0) for propriet fields and encoding.

custom28 ... custom30

Custom-defined dictionaries for GGSN only.

standard

Default: Enabled
A dictionary conforming to TS 32.215 v 4.6.0 for R4 (and also R5 - extended QoS format).

Usage

Use this command to designate specific dictionary used by GTPP for specific context.

Example

The following command configures the system to use custom3 dictionary to encode IP address in Binary format in G-CDRs:

```
gtpp dictionary custom3
```

gtpp duplicate-hold-time

This command configures the number of minutes to hold onto CDRs that are possibly duplicates while waiting for the primary CGF to come back up.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp duplicate-hold-time minutes *minutes*

default gtpp duplicate-hold-time

default

Resets the configuration to the default value of 60 minutes for the duplicate hold time.

minutes

When the primary CGF is down, the number of minutes to hold onto CDRs that may be duplicates. *minutes* must be an integer from 1 to 10080. Default is 60.

Usage

Use this command to configure how long to hold onto CDRs, that are possibly duplicates, while waiting for the primary CGF to come back up. If the GGSN determines that the primary CGF is down, CDRs that were sent to the primary CGF, but not acknowledged, are sent by the GGSN to the secondary CGF as "possibly duplicates". When the primary CGF comes back up, the GGSN uses GTPP to determine whether the possibly duplicate CDRs were received by the primary CGF. Then the secondary CGF is told whether to release or cancel those CDRs. This command configures how long the system should wait for the primary CGF to come back up. As soon as the configured time expires, the secondary CGF is told to release all of the possibly duplicate CDRs.

Example

Use the following command to set the amount of time to hold onto CDRs to 2 hours (120 minutes):

gtpp duplicate-hold-time minutes *120*

gtpp echo-interval

Configures the frequency at which the system sends GTPP echo packets to configured CGFs.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp echo-interval *time*

{ default | no } gtpp echo-interval

default

Resets the configuration to the default echo-interval of 60 seconds.

no

Disables the use of the echo protocol except for the scenarios described in the Usage section for this command.

time

Specifies the number of seconds for sending GTPP echo packets.
time must be an integer from 60 to 3600. Default: 60

Usage

The GTPP echo protocol is used by the system to ensure that it can communicate with configured CGFs. The system initiates this protocol for each of the following scenarios:

- Upon system boot
- Upon the configuration of a new CGF server on the system using the **gtpp server** command as described in this chapter
- Upon the execution of the **gtpp test accounting** command as described in the Exec Mode Commands chapter of this reference
- Upon the execution of the **gtpp sequence-numbers private-extensions** command as described in this chapter

The echo-interval command is used in conjunction with the **gtpp max-retries** and **gtpp timeout** commands as described in this chapter.
In addition to receiving an echo response for this echo protocol, if we receive a GTPP Node Alive Request message or a GTPP Echo Request message from a presumed dead CGF server, we will immediately assume the server is active again.
The alive/dead status of the CGFs is used by the AAA Managers to affect the sending of CDRs to the CGFs. If all CGFs are dead, the AAA Managers will still send CDRs, (refer to the **gtpp deadtime** command), albeit at a slower rate than if a CGF were alive. Also, AAA Managers independently determine if CGFs are alive/dead.

Example

The following command configures an echo interval of 120 seconds:

```
gtpp echo-interval 120
```

gtpp egcdr

Configures the eG-CDR parameters and triggers.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp egcdr {final-record [closing-cause [same-in-all-partials | unique] | include-content-ids [all | only-with-traffic]] | losdv-max-containers *number* **| service-data-flow threshold [interval** *seconds* **volume { downlink | total | uplink }** *bytes* **] | service-idle-timeout** *seconds*}

default gtpp egcdr {final-record include-content-ids only-with-traffic closing-cause same-in-all-partials | losdv-max-containers | lotdv-max-containers | service-idle-timeout *0*}

no gtpp egcdr service-data-flow threshold {interval | volume { downlink [uplink] | total | uplink [downlink] } }

---

final-record [closing-cause [same-in-all-partials | unique] | include-content-ids [all | only-with-traffic]]

Enables configuration of the final eG-CDR.

- **closing-cause** - Configures closing cause for the final eG-CDR.
- **same-in-all-partials** - Specifies that the same closing cause is to be included for multiple final eG-CDRs
- **unique** - Specifies that the closing cause for final eG-CDRs is to be unique.
- **include-content-ids** - Controls which content-ids are being included inthe final eG-CDR.
- **all** - Specifies that all content-ids be included in the final eG-CDR.
- **only-with-traffic** - Specifies that only content-ids with traffic be included in the final eG-CDRs.

---

losdv-max-containers *number*

The maximum number of List of Service Data Volume (LoSDV) containers in one eG-CDR. number can be configured to any integer value from 1 to 255.
Default: 10

---

lotdv-max-containers *number*

The maximum number of List of Traffic Data Volume (LoTDV) containers in one eG-CDR. number can be configured to any integer value from 1 to 8.
Default: 8

service-data-flow threshold [interval *seconds* **| volume { downlink | total | uplink }** *bytes* **]**

Configures the thresholds for closing a service data flow container within an eG-CDR.

- interval - configures the time interval in seconds
- volume - can specify uplink or downlink or combined total (uplink + downlink) byte thresholds.

A service data flow container has statistics for an individual content-id. When the threshold is reached, the service data flow container is closed.
Default: disabled

service-idle-timeout *seconds*

Specifies a time period where if no data is reported for a service flow, then the service container is closed and added to eG-CDR (as part of LOSDV container list) with service condition change as ServiceIdleOut.
seconds can be configured to any integer value from 10 to 86,400.
Default: 0. This means there is no service-idle-timeout trigger.

Usage

Use this command to configure individual triggers for eG-CDR generation.

Example

Use the following command to set the maximum number of LoSDV containers to 7.

```
gtpp egcdr losdv-max-containers 7
```

gtpp error-response

This command configures the response when the system receives an error response after transmitting a DRT (data record transfer) request.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp error-response { discard-cdr | retry-request }

default gtpp error-response
```

default

Resets the system's configuration to the default value for error-response. Default is retry-request.

discard-cdr

Instructs the system to purge the request upon receipt of an error response and not to retry.

retry-request

Instructs the system to retry sending a DRT after receiving an error response. This is the default behavior.

Usage

This command configures the system's response to receiving an error message after sending a DRT request.

Example

```
gtpp error-response discard-cdr
```

gtpp max-cdrs

Configures the maximum number of charging data records (CDRs) to be included in a packet.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp max-cdrs *number_cdrs* **[wait-time** *seconds* **]**

default gtpp max-cdrs

default

Sets the default configuration.

number_cdrs

Default: 1
Specifies the maximum number of CDRs to insert in a single packet must be an integer from 1 to 255.

wait-time*seconds*

Default: Disabled
Configures the number of seconds the GSN waits to send the packet while accumulating CDRs as defined by **max-cdr**. If the **wait-time** interval expires before **max-cdrs** is reached, then this keyword over-rides and the packet is sent.
seconds any integer from 1 to 300.

Important: **wait-time** interval can only be enabled if the value for **max-cdrs** *number_cdrs* is greater than 1.

Usage

The system places CDRs into a packet until either **max-cdrs** is met, **wait-time** times out, or the maximum PDU size, configured by the **gtpp max-pdu-size** command, is met.
The **gtpp max-pdu-size** and the **wait-time** parameters take priority over **max-cdrs.**

Important: This command's configuration is ignored if CDRs are stored on an SMC hard disk.

Example

The following command configures the system to place a maximum of 10 CDRs in a single GTPP packet with a wait-time of *30* seconds:

gtpp max-cdrs *10* **wait-time** *30*

gtpp max-pdu-size

Configures the maximum payload size of a single GTPP packet that could be sent by the system.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp max-pdu-size *pdu_size*

default gtpp max-pdu-size

default

Resets the default **max-pdu-size** of 4096.

pdu_size

Default: 4096
Specifies the maximum payload size of the GTPP packet. The payload includes the CDR and the GTPP header.
pdu_size is measured in octets and can be configured to any integer value from 1024 to 65400.

Usage

The GTPP packet contains headers (layer 2, IP, UDP, and GTPP) followed by the CDR. Each CDR contains one or more volume containers. If a packet containing one CDR exceeds the configured maximum payload size, the system creates and send the packet containing the one CDR regardless.
The larger the packet data unit (PDU) size allowed, the more volume containers that can be fit into the CDR.
The system performs standard IP fragmentation for packets that exceed the system's maximum transmission unit (MTU).

Important: The maximum size of an IPv4 PDU (including the IPv4 and subsequent headers) is 65,535. However, a slightly smaller limit is imposed by this command because the system's max-pdu-size doesn't include the IPv4 and UDP headers, and because the system may need to encapsulate GTPP packets in a different/larger IP packet (for sending to a backup device).

Example

The following command configures a maximum PDU size of 2048 octets:

gtpp max-pdu-size *2048*

gtpp max-retries

Configures the maximum number of times the system attempts to communicate with an unresponsive CGF.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp max-retries *max_attempts*

default gtpp max-retries

default

Resets the systems **max-retries** to the default of 4.

max_attempts

Default: 4
Specifies the number of times the system attempts to communicate with a CGF that is not responding. *max_attempts* can be configured to any integer value from 1 to 15.

Usage

This command works in conjunction with the **gtpp detect-dead-server** and **gtpp timeout** parameters to set a limit to the number of communication failures that can occur with a configured CGF. When the value specified by this parameter is met, a failure is logged. The **gtpp detect-dead-server** parameter specifies the number of consecutive failures that could occur before the server is marked as down. In addition, the **gtpp timeout** command controls the amount of time between re-tries.
If the value for the max-retries is met, the system begins storing CDRs in Random Access Memory (RAM). The system allocates memory as a buffer, enough to store one million CDRs for a fully loaded chassis (a maximum of one outstanding CDR per PDP context). Archived CDRs are re-transmitted to the CGF until they are acknowledged or the system's memory buffer is exceeded.
Refer to the **gtpp detect-dead-server** and **gtpp timeout** commands for additional information.

Example

The following command configures the maximum number of re-tries to be 8.

gtpp max-retries *8*

gtpp mbms bucket

This command configures the traffic data volume (bucket) limit of charging buckets due to QoS changes of tariff time that can occur before a G-MBMS-CDR should be closed.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp mbms buckets *number*

[no] gtpp mbms buckets

no

Disables the configured traffic data volume bucket limits trigger for G-MBMS-CDR generation for MBMs user service data.

buckets *number*

Default: 4
Specifies the number of statistics container changes due to QoS changes or tariff time that can occur before a G-MBMS-CDR should be closed.
number can be configured to any integer value from 1 through 4.

Usage

Use this command to configure the traffic data volume (bucket) based G-MBMS-CDR generation triggers for MBMS user data service.

Example

The following command configures the bucket-based trigger to generate G-MBMS-CDRs after changes in *2* container:

gtpp mbms buckets *2*

gtpp mbms interval

This command configures the interval duration for interval-based triggers for GTPP MBMS Charging Data Record (G-MBMS-CDR) generation.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp mbms interval *duration_sec*

no gtpp mbms interval

no

Disables the interval-based trigger for G-MBMS-CDR generation for MBMs user service data.

interval *duration_sec*

Default: Disabled
Specifies the normal time duration that must elapse before closing an accounting record provided that any or all of the following conditions occur:

- Downlink traffic volume is reached within the time interval
- Tariff time based trigger occurred within the time interval
- Data volume (up and downlink) bucket trigger occurred within the time interval

duration_sec is measured in seconds and can be configured to any integer value from 60 through 40,000,000.

Usage

Use this command to configure the G-MBMS-CDR generation triggers for MBMS user data service.

Example

The following command configures the interval-based trigger to generate G-MBMS-CDRs in every *60* seconds:

gtpp mbms interval *60*

gtpp mbms tariff

This command configures the tariff slots for tariff-based triggers for GTPP MBMS Charging Data Record (G-MBMS-CDR) generation.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp mbms tariff time1 *mins hours* **[time2** *mins hours* **[time3***mins hours* **[time4***mins hours* **]]]**

[no] gtpp mbms tariff

no

Disables the tariff-based triggers for GTPP MBMS Charging Data Record (G-MBMS-CDR) generation.

tariff time1 *mins hours* **[time2***mins hours* **[time3***mins hours* **[time4***mins hours* **]]]**

Default: Disabled
Specifies time-of-day time values to close the current statistics container (but not necessarily the accounting record).

Important: The system assumes that the billing system uses the day/date to determine if the statistics container represents an actual tariff period.

For each of the different tariff times, the following parameters must be configured:

- *mins*: The minutes of the hour, an integer value from 0 through 59.
- *hours*: The hour of the day, an integer value from 0 through 23.

Usage

Use this command to configure the tariff-time-based triggers for G-MBMS-CDR generation in MBMS user data service.

Example

The following command configures the tariff-time-based trigger to generate G-MBMS-CDRs every day at 11 hours and 30 min:

gtpp mbms tariff time1 *30 11*

gtpp mbms volume

This command configures the download traffic data volume based trigger for GTPP MBMS Charging Data Record (G-MBMS-CDR) generation.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp mbms volume *download_bytes*

[no] gtpp mbms volume

no

Disables the configured download traffic data volume based trigger for G-MBMS-CDR generation for MBMs user service data.

volume *download_bytes*

Default: Disabled
Specifies the threshold of downlink data volumes that must be met before a G-MBMS-CDR should be closed. *download_bytes* is the total download traffic volume measured in octets and can be configured to any integer value from 100,000 through 4,000,000,000.

Usage

Use this command to configure the traffic data volume (download) based G-MBMS-CDR generation triggers for MBMS user data service.

Example

The following command configures the traffic data volume (download) limit to trigger to generate G-MBMS-CDRs after reaching 150,000 octets:

gtpp mbms volume *download_bytes*

gtpp redirection-allowed

Configures the system to allow/disallow the redirection of CDRs when the primary CGF is unavailable.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] gtpp redirection-allowed
```

default

Resets the system to allow redirection of CDRs.

no

Removes the redirection definition from the configuration.

Usage

This command allows operators to better handle erratic network links, without having to remove the configuration of the backup server(s) via the **no gtpp server** command.
This functionality is enabled by default.
If the **no gtpp redirection-allowed** command is executed, the system only sends CDRs to the primary CGF. If that CGF goes down, the system will buffer the CDRs in memory until the CGF comes back or until the system runs out of buffer memory. In addition, if the primary CGF announces its intent to go down (with a GTPP Redirection Request message), the system responds to that request with an error response.

Example

The following command configures the system to allow the redirection of CDRs when the primary CGF is unavailable:

```
default gtpp redirection-allowed
```

gtpp redirection-disallowed

This command has been obsoleted and is replaced by the **gtpp redirection-allowed** command.

gtpp server

Configures the charging gateway function (CGF) accounting server(s) with in GTPP server group that the system is to communicate with.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp server *ip_address* **[max** *msgs* **] [priority** *priority* **] [udp-port** *port* **] [node-alive { enable | disable }] [-noconfirm]**

no gtpp server *ip_address* **[udp-port** *port* **]**

no

Deletes a previously configured CGF.

ip_address

Specifies the IP address of the CGF in dotted decimal notation for IPv4 or colon notation for IPv6.

max *msgs*

Default: 256
Specifies the maximum number of outstanding or unacknowledged GTPP packets (from any one AAA Manager task) allowed for this CGF before the system begins buffering the packets.
msgs can be configured to any integer value from 1 to 256.

priority*priority*

Default:1000
Specifies the relative priority of this CGF. When multiple CGFs are configured, the priority is used to determine which CGF server to send accounting data to.
priority can be configured to any integer value from 1 to 1000. When configuring two or more servers with the same priority you will be asked to confirm that you want to do this. If you use the **-noconfirm** option, you are not asked for confirmation and multiple servers could be assigned the same priority.

udp-port*port*

Default: 3386
Specifies the UDP port over which the GGSN communicates with the CGF. *port* can be configured to any integer value between 1 and 65535.

node-alive { enable | disable }

Default: Disable.
This optional keyword allows operator to enable/disable GGSN to send Node Alive Request to GTPP Server (i.e. CGF). This configuration can be done per GTPP Server basis.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to configure the CGF(s) that the system sends CDR accounting data to.
Multiple CGFs can be configured using multiple instances of this command subject to the following limits:

- Up to 4 CGFs can be configured in one GTPP server group
- Total 32 CGFs can be configured per context.

Each configured CGF can be assigned a priority. The priority is used to determine which server to use for any given subscriber based on the routing algorithm that has been implemented. A CGF with a priority of "1" has the highest priority.

Important: The configuration of multiple CGFs with the same IP address but different port numbers is not supported.

Each CGF can also be configured with the maximum allowable number of unacknowledged GTPP packets. Since multiple AAA Manager tasks could be communicating with the same CGF, the maximum is based on any one AAA Manager instance. If the maximum is reached, the system buffers the packets Random Access Memory (RAM). The system allocates memory as a buffer, enough to store one million CDRs for a fully loaded chassis (a maximum of one outstanding CDR per PDP context).

Example

The following command configures a CGF with an IP address of 192.168.2.2 and a priority of 5.

```
gtpp server 192.168.2.2 priority 5
```

The following command deletes a previously configured CGF with an IP address of 100.10.35.7:

```
no gtpp server 100.10.35.7
```

gtpp source-port-validation

This command configures whether the system validates the UDP source port in received GTPP messages.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[no | default] gtpp source-port-validation
```

no

Validates the IP source address but not the UDP source port.

default

Restores this parameter to its default setting of enabled.

Usage

This command configures whether the system validates the UDP source port in received GTPP messages.

Example

The following command disables UDP port validation:

```
no gtpp source-port-validation
```

gtpp storage-server

Configures information for the GTPP back-up storage server.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp storage-server *ip_address* **port** *port_num*

no gtpp storage-server *ip_address* **port** *port_num*

no

Removes a previously configured back-up storage server.

ip_address

The IP address of the back-up storage server expressed in dotted decimal notation.

port *port_num*

Default: 3386
Specifies the UDP port number over which the GGSN communicates with the back-up storage server.

Usage

This command identifies the connection to the GSS. One backup storage server can be configured per GTPP group.

Example

The following command configures a GSS with an IP address of 192.168.1.2:

gtpp storage-server *192.168.1.2*

gtpp storage-server local file

Configures the parameters for GTPP files stored locally on the GTPP storage server.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp storage-server local file { compression { gzip | none } | format { custom1 | custom2 | custom3 | custom4 | custom5 | custom6 | custom7 | custom8 | }name prefix *prefix* **| purge-processed-files [purge-interval** *purge_dur* **] | rotation { cdr-count** *count* **| time-interval** *time* **| volume** *size* **} }**

default gtpp storage-server local file { compression | format | name prefix | purge-processed-files | rotation { cdr-count | time-interval | volume } }

no gtpp storage-server local file rotation { purge-processed-files | rotation { cdr-count | time-interval } }

---

no

Removes a previously configured parameters for local storage of CDR files on HDD on SMC card.

---

compression { gzip | none }

Configures the type of compression to be used on the files stored locally.
gzip — Enables Gzip file compression.
none — Disables Gzip file compression -this is the default value.

---

format custom1 .. 8

Configures the file format to be used to format files to be stored locally.
custom1 — File format custom1 - this is the default file format.
custom2 to custom5 Customer specific CDR file formats.
custom6 — File format custom6 with a block size of 8K for CDR files.
custom7 — File format custom7 is a customer specific CDR file formate.
custom8 — File format custom8 is a customer specific CDR file format. It uses *node-id-suffix_date_time_fixed-length-seq-num*.u format for file naming where:

- *date* is date in MMDDYYYYY (01312010) for mat
- *time* is time in HHMMSS (023508) format
- *fixed-length-seq-num* is the fixed length of srquence number for specific file having 6 digit counter starting from 000001 and end to 999999. Once file sequence reached to 999999 the sequence will be reset to 000001.

---

name prefix *prefix*

Defines the prefix to be used for the file name. By default the file name prefix would be ‘GTPP-group-name + VPN-ID’.

prefix — Enter a string of 1 to 64 alphanumeric characters.

purge-processed-files [purge-interval *purge_dur* **]**

Default: Disabled
Enables the GSN to periodically delete locally processed (*.p) CDR files from the HDD on the SMC card.

Important: This option is available only when GTPP server storage mode is configured for local storage of CDRs with the **gtpp storage-server mode local** command.

purge-interval *purge_dur* provides an option for user to control the purge interval duration in minutes by setting *purge_dur*.
purge_dur must be an integer from 1 through 259200.
Default: 60 minutes

rotation {cdr-count *count* **| time-interval** *time* **| volume** *size* **}**

Specifies rotation related configuration for GTPP files stored locally.
cdr-count *count* - Configure the CDR count for the file rotation. Enter a value from 1000 to 65000. Default value 10000.
time-interval *time* - Configure the time interval for file rotation. Enter a value in seconds ranging from 30 to 86400. Default value is 3600 seconds (1 hour).
volume *size* — Configure the file volume, in MB, for file rotation. Enter a value ranging from 2 to 40. This trigger can not be disabled. Default value is 10MB.

Usage

This command configures the parameters for storage of GTPP packets as files on the local server - meaning the hard disk.

Example

The following command configures rotation for every 1.5 hours for locally stored files.

```
gtpp storage-server local file rotation time-interval 5400
```

gtpp storage-server max-retries

Configures the maximum number of times the system attempts to communicate with an unresponsive GTPP back-up storage server.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp storage-server max-retries *max_attempts*

default gtpp storage-server max-retries

default

Restores the system to the default value of 2 retry attempts.

max_attempts

Default: 2
Specifies the number of times the system attempts to communicate with a GTPP back-up storage server that is not responding.
max_attempts can be configured to any integer value from 1 to 15.

Usage

This command works in conjunction with the **gtpp storage-server timeout** parameters to set a limit to the number of communication failures that can occur with a configured GTPP back-up storage server. The **gtpp storage-server** timeout command controls the amount of time between re-tries.
Refer to the **gtpp storage-server** timeout command for additional information.

Example

The following command configures the maximum number of re-tries to be 8.

gtpp storage-server max-retries *8*

gtpp storage-server mode

This command configures storage mode, local or remote, for CDRs. Local storage mode is available with ASR 5000 platforms only.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp storage-server mode { local | remote | streaming }

default gtpp storage-server mode
```

default

Returns the GTPP group configuration to the default 'remote' value for the GTPP storage server mode.

local

Default: Disabled
Specifies the use of the hard disk on the SMC for storing CDRs.

Important: This option is available with ASR 5000 platforms only.

remote

Specifies the use of an external server for storing CDRs. This is the default value.

Important: When the external server is down, the Session Managers will start buffering up to a maximum of 26400 CDRs or a total of 120 MB worth of CDRs, whichever limit reaches first.

streaming

Default: Disabled
This keyword allows the operator to configure "streaming" mode of operation for GTPP group. When this keyword is supplied the CDRs will be stored in following fashion:

- When GTPP link is active with CGF, CDRs are sent to a CGF via GTPP and local hard disk is NOT used as long as every record is acknowledged in time.
- If the GTPP connection is considered to be down, all streaming CDRs will be saved temporarily on the local hard disk and once the connection is restored, unacknowledged records will be retrieved from the hard disk and sent to the CGF.

Important: This option is available with ASR 5000 platforms only.

Usage

This command configures whether the CDRs should be stored on the hard disk of the SMC or remotely, on an external server.

Example

The following command configures use of a hard disk for storing CDRs.

```
gtpp storage-server mode local
```

gtpp storage-server timeout

Configures the amount of time that must pass with no response before the system re-attempts to communicate with the GTPP back-up storage server.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp storage-server timeout *duration*

default gtpp storage-server timeout

default

Restores the timeout duration to the 30-second default.

duration

Default: 30
Specifies the maximum amount of time the system waits for a response from the GTPP back-up storage server before assuming the packet is lost.
duration is measured in seconds and can be configured to any integer value from 30 to 120.

Usage

This command works in conjunction with the **gtpp storage-server max-retries** command to establish a limit on the number of times that communication with a GTPP back-up storage server is attempted before a failure is logged.
This parameter specifies the time between retries.

Example

The following command configures a retry timeout of *60* seconds:

gtpp storage-server timeout *60*

gtpp suppress-cdrs zero-volume-and-duration

This command suppresses the CDRs created by session having zero duration and/or zero volume. By default this mode is 'disabled'.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp suppress-cdrs zero-volume-and-duration { gcdrs [ egcdrs ] | egcdrs [ gcdrs ] }

default gtpp suppress-cdrs zero-volume-and-duration
```

default

Disables the CDR suppression mode.

gcdrs [egcdrs]

Specifies that this command will handle G-CDRs before eG-CDRs.

gcdrs [egcdrs]

Specifies that this command will handle eG-CDRs before G-CDRs.

Usage

Use this command to suppress the CDRs (G-CDRs and eG-CDRs) which were created due with zero-duration session and zero-volume session due to any reason. By default this command is disabled and system will not suppress any CDR.

Example

The following command configures the system to suppression the eG-CDRs created for a zero duration session or zero volume session:

```
gtpp suppress-cdrs zero-volume-and-duration egcdrs gcdrs
```

gtpp timeout

Configures the amount of time that must pass with no response before the system re-attempts to communicate with the CGF.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp timeout *time*

default gtpp timeout

default

Resets the systems GTPP timeout value to 20 seconds.

time

Default: 20
Specifies the maximum amount of time the system waits for a response from the CGF before assuming the packet is lost.
time is measured in seconds and can be configured to any integer value from 1 to 60.

Usage

This command works in conjunction with the **gtpp max-retries** command to establish a limit on the number of times that communication with a CGF is attempted before a failure is logged.
This parameter specifies the time between retries.

Example

The following command configures a retry timeout of 30 seconds:

gtpp timeout *30*

gtpp trigger

This commands disables GTPP trigger conditions that cause either partial CDR record closure or opening of a new CDR record container. GTPP Triggers are specified in 3GPP TS 32.251 v6.6.0. All GTPP trigger changes take affect immediately, except **volume-limit**.

Product

ECS, GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] gtpp trigger { cell-update | direct-tunnel | egcdr max-losdv | inter-plmn-sgsn-change | ms-timezone-change | plmn-id-change | qos-change | rat-change | routing-area-update | sgsn-change-limit | tariff-time-change | time-limit | volume-limit }

default gtpp trigger
```

default

Sets the specified trigger condition back to the default setting. All trigger conditions are enabled by default.

no

Re-enables the specified trigger condition.

cell-update

Enables the cell update trigger for S-CDRs, if the dictionary specified in the **gtpp dictionary** configuration includes support for cell update. This trigger is available only for 2G. Currently, custom18 dictionary supports the cell update trigger.

direct-tunnel

Enables the direct tunnel trigger for CDRs.

egcdr max-losdv

Default: Disabled
Enables the trigger for an eG-CDR if the List of Service Data Volume (LoSDV) containers crosses the configured limit for LOSDV containers.

inter-plmn-sgsn-change

This keyword is for GGSN only.
Default: Enabled
Disabling this trigger ignores an Inter-PLMN SGSN change and doesn't release a G-CDR.

ms-timezone-change

This keyword is specific to GGSN.
Default: Enabled

No partial record closure for a time zone change occurs when this trigger is disabled. MS Time zone change should be applicable only for 3GPP R6 based GTPP dictionaries.

plmn-id-change

This trigger keyword is specific to the 2G SGSN and is proprietary (non-standard).
Default: Disabled
Enables the PLMNID change trigger for S-CDRs if the dictionary specified in the **gtpp dictionary** configuration supports the PLMNID change. If enabled, the SGSN generates a partial S-CDR when the MS changes the PLMN while under the same SGSN (intra-system intra-SGSN PLMN-ID handover). Currently, custom18 dictionary supports this trigger.

qos-change

Default: Enabled
Enables the QoS-change trigger for CDRs. Disabling this trigger ignores a QoS-change and does not open a new CDR for it.

rat-change

Default: Enabled
This keyword enable/disable the partial record closure for a RAT change. If disabled no partial record closure for a RAT change occurs. RAT change should be applicable only for 3GPP R6 based GTPP dictionaries.
In SGSN, RAT change trigger (2G<->3G) means inter-service handoff (SGSN service <-> GPRS service). If this trigger is enabled, after the RAT change interim CDR is generated. After this RAT change CDR, CDR thresholds such as volume/time etc. and GTPP Group are applicable from new service. If RAT change trigger is disabled, the CDR thresholds and GTPP group etc. will not change and will continue to use from old service.
After the RAT change the **System Type** field in CDR changes to indicate the new system type. If this trigger is disabled then the next CDR generated will indicate **System Type** but the data count in the CDR doesnot necessarily belong to the system type indicated in CDR instead it may belong to both 2G and 3G as CDR is not closing when handover takes place.

Important: However **System Type** field in CDR related change is not applicable to customized CDR formats which does not use **System Type** field

routing-area-update

Enables the routing-area-update trigger for CDRs.

sgsn-change-limit [also-intra-sgsn-multiple-address-group-change]

This keyword is for GGSN only.
Default: Enabled
Disabling this trigger ignores an SGSN change and does not add the SGSN IP address into the SGSN address list of the CDR. This helps to reduce the release of CDRs due to SGSN changes crossing the configured limit.
also-intra-sgsn-multiple-address-group-change : This keyword includes Intra-SGSN group changes as an SGSN change.

tariff-time-change

Default: Enabled
When this trigger is disabled container closure does not happen for a tariff-time change.
This trigger is applicable for G-MB-CDRs for MBMS session too.

time-limit

Default: Enabled
When this trigger is disabled no partial record closure occurs when the configured time limit is reached.
This trigger is applicable for G-MB-CDRs for MBMS session too.

volume-limit

Default: Enabled
When this trigger is disabled no partial record closure occurs when volume limit is reached.
This trigger is applicable for G-MB-CDRs for MBMS session too.

Usage

Use this command to disable or re-enable GTTP triggers that can cause partial CDR record closure or cause a new CDR to be created.

Example

The following command disables partial record closure when a configured time limit is reached:

```
gtpp trigger time-limit
```

The following command re-enables partial record closure when a configured time limit is reached:

```
no gtpp trigger time-limit
```

gtpp transport-layer

This commands selects the transport layer protocol for Ga interface for communication between AGW (GSNs) and GTPP servers.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpp transport-layer { tcp | udp }

default gtpp transport-layer
```

default

Resets the transport layer protocol to GTPP servers to the default UDP.

tcp

Default: Disabled
Enables the system to implement TCP as transport layer protocol for communication with GTPP server.

udp

Default: Enabled
Enables the system to implement UDP as transport layer protocol for communication with GTPP server.

Usage

Use this command to select the TCP or UDP as the transport layer protocol for Ga interface communication between GTPP servers and AGWs (GSNs).

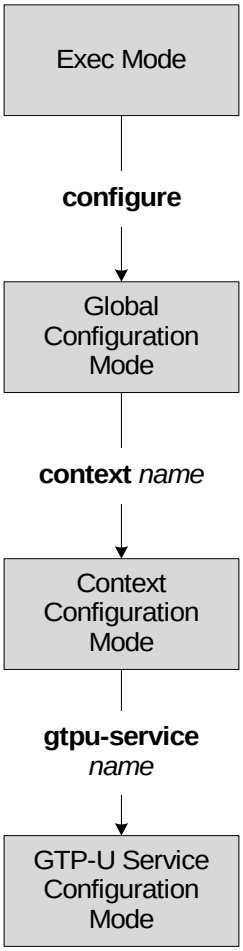
Example

The following command enables TCP as the transport layer protocol for the GSN's Ga interface.

```
gtpp transport-layer tcp
```

Chapter 112
GTP-U Service Configuration Mode Commands

The GTP-U Service Configuration Mode is used to manage parameters applied to incoming GTP-U packets.



bind

Configures the IP address to use for GTP-U data packets.

Product

GGSN, P-GW, S-GW

Privilege

Administrator

Syntax

[no] bind { ipv4-address *ipv4_address* **[ipv6-address** *ipv6_address* **] | ipv6-address** *ipv6_address* **[ipv4-address** *ipv4_address* **] }**

no

removes a configured IP address from this service.

bind { ipv4-address *ipv4_address* **[ipv6-address** *ipv6_address* **] | ipv6-address** *ipv6_address* **[ipv4-address** *iv4p_address* **] }**

Binds the service to an interface with an IPv4 address, IPv6 address or both.
ipv4-address *ipv4_address* **[ipv6-address** *ipv6_address* **]**: Binds this service to the IPv4 address of a configured interface. Optionally, bind the service to a configured interface with an IPv6 address. *ipv4_address* must be entered as a standard IPv4 address in dotted decimal notation. *ipv6_address* must be entered as a standard IPv6 address in colon-separated notation.
ipv6-address *ipv6_address* **[ipv4-address** *ipv4_address* **]**: Binds this service to the IPv6 address of a configured interface. Optionally, bind the service to a configured interface with an IPv4 address. *ip6_address* must be entered as a standard IPv6 address in colon-separated notation. *ipv4_address* must be entered as a standard IPv4 address in dotted decimal notation.

Usage

Use this command to bind the service to an interface for sending/receiving GTP-U packets.

Example

The following command configures the IPv4 address for this GTP-U service as *1.2.3.4*:

```
bind ipv4-address 1.2.3.4
```

echo-interval

Configures the rate at which GPRS Tunneling Protocol (GTP) v1-U echo packets are sent.

Product

GGSN, P-GW, S-GW

Privilege

Administrator

Syntax

echo-interval *seconds*

[default | no] echo-interval

default

Returns the command to its default setting of disabled.

no

Removes the configured echo-interval setting.

seconds

Specifies the number of seconds between the sending of a GTP-Uv1 echo packet. *seconds* must be an integer value from 60 to 3600.

Usage

Use this command to configure the rate at which GTP-Uv1 echo packets are sent.

Example

The following command sets the rate between the sending of echo packets at *120* seconds:

echo-interval *120*

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

extention-header

Configures the addition of an extention header ,in the GTP-U packet header, allowing for error indication messages.

Product

GGSN, P-GW, S-GW

Privilege

Administrator

Syntax

```
[ default | no ] extention-header source-udp-port
```

default

Returns the command to its default setting of disabled.

no

Disables the feature.

source-udp-port

Configures extension header type UDP Port support in GTP-U header for GTP-U Error Indication messages.

Usage

Example

The following command enables the inclusion of an extention header to allow for error indication messages:

```
extention-header source-udp-port
```

max-retransmissions

Configures the maximum retry limit for GTP-U echo retransmissions.

Product

GGSN, P-GW, S-GW

Privilege

Administrator

Syntax

max-retransmissions *num*

no max-retransmissions

no

Disables the feature.

num

Default: 4
Specifies the number of GTP-U echo message retransmissions allowed before triggering a path failure error condition. *num* must be an integer value from 0 to 15.

Usage

Use this command to set the maximum number of GTP-U echo message retransmissions in order to define a limit that triggers a path failure error.

Example

The following command sets the maximum GTP-U echo message retransmissions for this service to *10*:

```
max-retransmissions 10
```

path-failure detection-policy

Configures a path failure detection policy on GTP-U echo messages that have been retransmitted the maximum number of retry times.

Product

GGSN, P-GW, S-GW

Privilege

Administrator

Syntax

```
path-failure detection-policy gtp echo

[ default | no ] path-failure detection-policy
```

default

Resets the command to its default setting of enabled.

no

Disables the feature.

gtp echo

Sets the detection policy to detect a failure upon reaching the maximum number of GTP-U echo message retransmissions.

Usage

Use this command to set the detection policy for path failures.

Example

The following command sets the path failure detection policy to detect failures upon reaching the maximum number of GTP-U echo message retries:

```
path-failure detection-policy gtp echo
```

retransmission-timeout

Configures retransmission timeout for GTPU echo message retransmissions for this service.

Product

GGSN, P-GW, S-GW

Privilege

Administrator

Syntax

retransmission-timeout *seconds*

default retransmission-timeout

default

Returns the command to its default setting of 5.

seconds

Default: 5
Specifies the number of seconds between the re-sending of GTP-U echo messages. *seconds* must be an integer value between 1 and 20.

Usage

Use this command to set the number of seconds between the retransmission of GTP-U echo messages.

Example

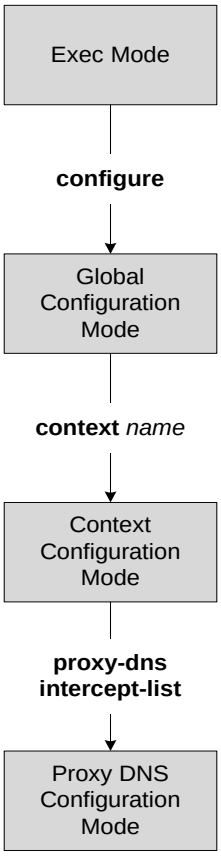
The following command sets the number of seconds between the sending of GTP-U echo messages to 7:

retransmission-timeout 7

Chapter 113
HA Proxy DNS Configuration Mode Commands

The HA Proxy DNS Configuration Mode is used to create rules for HA proxy DNS intercept lists that redirect packets with unknown foreign DNS addresses to a home network DNS server.

Important: HA Proxy DNS Intercept is a license-enabled feature.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the HA Proxy DNS Configuration Mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the HA Proxy DNS Configuration Mode and returns to the Context Configuration Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the Context Configuration Mode.

pass-thru

Sets IP addresses that should be allowed through the proxy DNS intercept feature.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

[no] pass-thru *ip_address* **[/***ip_mask* **]**

no

Removes the DNS IP address from the pass-thru rule.

pass-thru *ip_address* **[/***ip_mask* **]**

Specifies an DNS IP address that is allowed through the intercept feature.
ip_address [/*ip_mask*]: Specifies the IP address and network mask bits. *ip_address* [/*ip_mask*] is specified using the standard IPv4 or IPv6 dotted decimal notation and the mask bits are a numeric value which is the number of bits in the subnet mask (x.x.x.x/x).

Usage

Use this command to identify DNS IP addresses that should be allowed through the intercept feature. For a more detailed explanation of the proxy DNS intercept feature, see the **proxy-dns intercept-list** command in the *Context Configuration Mode Commands* chapter. A maximum of 16 intercept rules (either **redirect** or **pass-thru**) are allow for each intercept list.

Important: To allow packets through that do not match either the **pass-thru** or **redirect** rules, set a **pass-thru** rule address as: 0.0.0.0/0. If a packet does not match either the **pass-thru** or **redirect** rule, the packet is dropped.

Example

The following command allows a foreign network's DNS with an IP address of 12.3.456.789 to avoid being redirected:

```
pass-thru 12.3.456.789
```

redirect

DNS IP addresses from foreign networks matching an IP address in this command are redirected to a home network DNS.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

[no] redirect *any* **[primary-dns** *ip_address* **[secondary-dns** *ip_address* **]]**

no

Removes the DNS IP address from the redirect rule.

primary-dns *ip_address*

Specifies the IP address of the primary home network DNS.
ip_address is specified using the standard IPv4 or IPv6 dotted decimal notation.

secondary-dns *ip_address*

Specifies the IP address of the secondary home network DNS.
ip_address is specified using the standard IPv4 or IPv6 dotted decimal notation.

Usage

Use this command to identify DNS IP addresses from foreign networks that are to be redirected to the home DNS. For a more detailed explanation of the Proxy DNS feature, see the proxy-dns intercept-list command in the Context Configuration Mode Commands chapter. A maximum of 16 intercept rules (either **redirect** or **pass-thru**) are allow for each intercept list.
Since this command is configured in the source context, the destination context containing the path to the home network DNS is identified using the Context Configuration Mode command **ip dns-proxy source-address**.

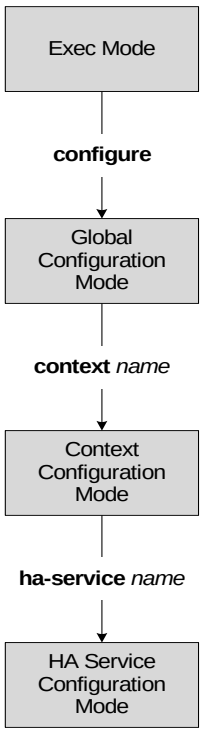
Important: If a packet does not match the **pass-thru** or **redirect** rule, the packet is dropped. If **primary-dns** or **secondary-dns** is not configured, DNS messages are redirected to the primary-dns-server (or the secondary-dns-server) configured for the subscriber OR inside the context.

The following command identifies a foreign network DNS with an IP address of 1.23.456.789 and redirects it to a primary home network DNS with an IP address of 1.98.765.432:

```
redirect 1.23.456.789 primary-dns 1.98.765.432.
```

Chapter 114
HA Service Configuration Mode Commands

The Home Agent Service Configuration Mode is used to create and manage the Home Agent (HA) services associated with the current context.



aaa

Configures the sending of subscriber session AAA accounting by the HA service.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
aaa { accounting | group string }

       { accounting | group }
```

no

Disables AAA accounting for the HA service.

accounting

accounting Enables the sending of AAA accounting information for subscriber sessions by the Home Agent (HA), by default is enabled.

group

group configures aaa group for ha-service, **group** has lower priority than subscriber/apn config.

Usage

Enabling the HA service will send all accounting data (start, stop, and interim) to the configured AAA servers.
The chassis is shipped from the factory with the AAA accounting enabled.

Important: In order for this command to function properly, AAA accounting must be enabled for the context in which the HA service is configured using the aaa accounting subscriber radius command.

Example

The following command disables aaa accounting for the HA service:

```
no aaa accounting
```

authentication

Configures authentication parameters for a specific HA service of a specific context.

Product

HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
authentication {aaa-distributed-mip-keys [ disabled | optional | required ]|dmu-
refresh-key | imsi-auth|mn-aaa {allow-noauth  | always | dereg-noauth | noauth |
renew-reg-noauth | renew-and-dereg-noauth } | mn-ha { allow-noauth | always } |
pmip-auth | stale-key-disconnect }

no authentication {imsi-auth | pmip-auth }

default authentication { aaa-distributed-mip-keys |  dmu-refresh-key |  imsi-
auth |  mn-aaa |  mn-ha |  pmip-auth | stale-key-disconnect }
```

no

Disable the parameter.

default

Reset the specified option to its default setting.

aaa-distributed-mip-keys [disabled | optional |required]

Configures use of AAA distributed MIP keys for authenticating RRQ for WiMAX HA calls.
Default is disabled.
disabled: Disables using AAA distributed WiMAX MIP keys for authenticating MIP RRQ.
optional: Use AAA distributed WiMAX MIP keys for authenticating RRQ with fallback option to use static/3GPP2 based MIP keys.
required: AAA distributed WiMAX MIP keys for authenticating MIP RRQ are mandatory

dmu-refresh-key

Typically, when a DMU resets then the next MIP re-registration causes MN-HA authorization failure and the HA rejects the MIP RRQ. This parameter enables the HA to retrieve the MN-HA key again from the AAA during the call and to use the freshly retrieved key value to recheck authentication.
Default is disabled.

imsi-auth

Enable uses the IMSI to determine if MN-AAA or MN-FAC extensions are not present in the RRQ.
Default is disabled.

mn-aaa { allow-noauth | always | dereg-noauth | noauth | renew-reg-noauth | renew-and-dereg-noauth }

Specifies how mobile node-to-AAA authentication extension in registration requests from the mobile node should be handled by the HA service.
Default is always.
allow-noauth: Specifies that the HA service does not require authentication for every mobile node registration request. However, if the mn-aaa extension is received, the HA service will authenticate it.
always: Specifies that the HA service will perform authentication each time a mobile node registers.
dereg-noauth: Disables authentication request upon de-registration.
noauth: Specifies that the HA service will not look for mn-aaa extension and will not authenticate it.
renew-reg-noauth: Specifies that the HA service will not perform authentication for mobile node re-registrations. Initial registration and de-registration will be handled normally.
renew-and-dereg-noauth: Disables authentication request upon re-registration and de-registration.

mn-ha { allow-noauth | always }

Specifies whether the HA service looks for an MN-HA authentication extension in the RRQ.
Default is always.
allow-noauth: Allows a request that does not contain the auth extension.
always: A request should always contain the auth extension to be accepted.

pmip-auth

Specifies whether the HA service looks for an MN-HA authentication extension in the RRQ.
Default is always.
allow-noauth: Allows a request that does not contain the auth extension.
always: A request should always contain the auth extension to be accepted.

stale-key-disconnect

If MN-HA auth fails for MIP renew and dereg, disconnects the call immediately.
Disabled by default.

Usage

The **authentication** command, combined with a keyword, can be used to specify how the system will perform authentication of registration request messages.

Example

The following command configures the HA service to always perform mobile node authentication for every registration request.
authentication mn-aaa always
The following command configures the HA service to always look for an MN-HA authentication extension in the RRQ.
authentication mn-ha always

bind

Binds the HA service to a logical IP interface serving as the Pi interface and specifies the maximum number of subscribers that can access this service over the interface.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

bind address *address* [**max-subscribers** *count*]

no bind address

address

Specifies the IP address (address) of the interface configured as the Pi interface. address is specified in dotted decimal notation.

max-subscribers *count*

Default: 500000
Specifies the maximum number of subscribers that can access this service on this interface.
count can be configured to any integer value between 0 and 4,000,000.

Important: The maximum number of subscribers supported is dependant on the license key installed and the number of active PACs/PSCs installed in the system. A fully loaded system with 13 active PACs/PSCs can support 1,000,000 total subscribers. Refer to the license key command for additional information.

Usage

Associate the HA service to a specific logical IP address. The logical IP address or interface takes on the characteristics of an Pi interface. Only one interface can be bound to a service. The interface should be configured prior to issuing this command.
This command also sets a limit as to the number of simultaneous subscribers sessions that can be facilitated by the service/interface at any given time.
When configuring the **max-subscribers** option, be sure to consider the following:

- The total number of interfaces that you will configuring for use as Pi interfaces
- The maximum number of subscriber sessions that all of these interfaces may handle during peak busy hours
- The average bandwidth for each of the sessions
- The type of physical port (10/100Base-T or 1000Base-Tx) that these interfaces will be bound to

Taking these factors into account and distributing your subscriber session across all available interfaces will allow you to configure your interfaces to optimally handle sessions without degraded performance.
Use the **no bind address** command to delete a previously configured binding.

Example

The following command would bind the logical IP interface with the address of 192.168.3.1 to the HA service and specifies that a maximum of 600 simultaneous subscriber sessions can be facilitated by the interface/service at any given time.

bind address *192.168.3.1* **max-subscribers** *600*

The following command disables a binding that was previously configured:

no bind address

default subscriber

Specifies the name of a subscriber profile configured within the same context as the HA service from which to base the handling of all other subscriber sessions handled by the HA service.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

default subscriber *profile_name*

no default subscriber *profile_name*

profile_name

Specifies the name of the configured subscriber profile. *profile_name* can be between 1 and 127 alpha and/or number characters and is case sensitive.

Usage

Each subscriber profile specifies "rules" such as permissions, PPP settings, and timeout values.
By default, the HA service will use the information configured for the subscriber named default within the same context. This command allows for multiple HA services within the same context to apply different "rules" to sessions they process. Each set of rules can be configured under a different subscriber name which is pointed to by this command.
Use the **no default subscriber** *profile_name* command to delete the configured default subscriber.

Example

To configure the HA service to apply the rules configured for a subscriber named *user1* to every other subscriber session it processes, enter the following command:
default subscriber *user1*

encapsulation allow gre

Enables or disables the use of Generic Routing Encapsulation (GRE) when establishing a MIP (Mobile IP) session with an FA. When enabled, if requested by the FA, GRE encapsulation is used when establishing a Mobile IP (MIP) session. If disabled, when an FA requests GRE encapsulation, the HA denies the request.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
encapsulation allow { gre | keyless-gre }
no encapsulation allow { gre | keyless-gre }
```

gre

Default: Enabled.
Configures the use of GRE in Mobile IP session with an FA.

keyless-gre

Default: Disabled.
Configures the GRE without key encapsulation in Mobile IP session with an FA.

Usage

Use to disable or re-enable the use of GRE encapsulation or Key-less encapsulation for MIP sessions.
In case of chassis HA operating with other vendor equipment, which does not support the 3GPP2 to exchange key, this command with **keyless-gre** keyword will make the chassis HA to accept MIP data with legacy GRE.

Example

To disable GRE encapsulation for MIP sessions, enter the following command:
no encapsulation allow gre
To re-enable GRE encapsulation for MIP sessions, enter the following command:
encapsulation allow gre
To enable Key-less GRE encapsulation for MIP sessions, enter the following command:
encapsulation allow keyless-gre

end

Exits the HA service configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the HA service configuration mode and returns to the context configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the context configuration mode.

fa-ha-spi

Configures the security parameter index (SPI) between the HA service and the FA.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

fa-ha-spi remote-address *fa_ip_address* **spi-number** *number* { **encrypted secret** *enc_secret* | **secret** *secret* } [**description** *string*] [**hash-algorithm** { **hmac-md5** | **md5** | **rfc2002-md5** }] [**replay-protection** { **timestamp** [**timestamp-tolerance** *tolerance*]| **nonce** }] **+**
no fa-ha-spi remote-address *ha_ip_address* **spi-number** *number*

remote-address *fa_ip_address*

Specifies the IP address of the FA. fa_ip_address is an IP address or an IP address and mask expressed in dotted decimal notation.

Important: The system supports unlimited peer FA addresses per HA but only maintains statistics for a maximum of 8192 peer FAs. If more than 8192 FAs are attached, older statistics are identified and overwritten.

spi-number *number*

Specifies the SPI (number) which indicates a security context between the FA and the HA in accordance with RFC 2002.
number can be configured to any integer value between 256 and 4294967295.

encrypted secret *enc_secret* | **secret** *secret*

Configures the shared-secret between the HA service and the FA. The secret can be either encrypted or non-encrypted.
encrypted secret enc_secret: Specifies the encrypted shared key (enc_secret) between the HA service and the FA. enc_secret must be between 1 and 254 alpha and/or numeric characters and is case sensitive.
secret secret: Specifies the shared key (secret) between the HA service and the FA. secret must be between 1 and 127 alpha and/or numeric characters and is case sensitive.
The **encrypted** keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **secret** keyword is the encrypted version of the plain text secret key. Only the encrypted secret key is saved as part of the configuration file.

description *string*

This is a description for the SPI. *string* must be an alpha and or numeric string of from 1 through 31 characters.

hash-algorithm { hmac-md5 | md5 | rfc2002-md5 }

Default: hmac-md5

Specifies the hash-algorithm used between the HA service and the FA.
hmac-md5: Configures the hash-algorithm to implement HMAC-MD5 per RFC 2002bis.
md5: Configures the hash-algorithm to implement MD5 per RFC 1321.
rfc2002-md5: Configures the hash-algorithm to implement keyed-MD5 per RFC 2002.

replay-protection { timestamp [timestamp-tolerance tolerance]| nonce }

Specifies the replay-protection scheme that should be implemented by the FA service for this SPI.
nonce: Configures replay protection to be implemented using NONCE per RFC 2002.
timestamp: Configures replay protection to be implemented using timestamps per RFC 2002.
timestamp-tolerance: Specifies the allowable difference (tolerance) in timestamps that is acceptable. If the difference is exceeded, then the session will be rejected. *tolerance* is measured in seconds and can be configured to any integer value between 1 and 65535. The default is 60.

traffic-group *grp_num*

The traffic-group attribute is meant to tag the remote FA so that traffic policy can be enforced according to the traffic-group value. This attribute can be used by ECS to handle subscriber traffic coming from FAs with a specified traffic group differently.
Note: the functionality controlled by this keyword is only available if a License for Content Access Control has been purchased and enabled.
grp_num must be an integer from 1 through 255.

+

More than one of the above keywords can be entered within a single command.

Usage

An SPI is a security mechanism configured and shared by the HA service and the FA. Please refer to RFC 2002 for additional information.
Though it is possible for FAs and HAs to communicate without SPIs being configured, the use of them is recommended for security purposes. It is also recommended that a “default” SPI with a remote address of 0.0.0.0/0 be configured on both the HA and FA to prevent hackers from spoofing addresses.

Important: The SPI configuration on the HA must match the SPI configuration for the FA service on the system in order for the two devices to communicate properly.

A maximum of 2048 SPIs can be configured per HA service.
Use the **no** version of this command to delete a previously configured SPI.

Example

The following command configures the FA service to use an SPI of 512 when communicating with an HA with the IP address 192.168.0.2. The key that would be shared between the HA and the FA service is q397F65. When communicating with this HA, the FA service will also be configured to use the rfc2002-md5 hash-algorithm.
fa-ha-spi remote-address *192.168.0.2* **spi-number** *512* **secret** *q397F65* **hash-algorithm rfc2002-md5**
The following command deletes the configured SPI of 400 for an HA with an IP address of 172.100.3.200:
no fa-ha-spi remote-address *172.100.3.200* **spi-number** *400*

gre

Configures Generic Routing Encapsulation (GRE) parameters.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

gre { **checksum** | **checksum-verify** | **reorder-timeout** *timeout* | **sequence-mode** { **none** | **reorder** } | **sequence-numbers** }

no gre { checksum | checksum-verify | sequence-numbers }no

Disables the specified functionality.

checksum

Default: disabled
Enables the introduction of the checksum field in outgoing GRE packets.

checksum-verify

Default: disabled
Enables verification of the GRE checksum (if present) in incoming GRE packets.

reorder-timeout *timeout*

Default: 100
Configures maximum number of milliseconds to wait before processing reordered out-of-sequence GRE packets. *timeout* must be an integer from 0 through 5000.

sequence-mode { none | reorder }

Default: none
Configures how incoming out-of-sequence GRE packets should be handled.
none: Disables reordering of incoming out-of-sequence GRE packets.
reorder: Enables reordering of incoming out-of-sequence GRE packets.

sequence-numbers

Default: Disabled
Enables the insertion of sequence numbers into the GRE packets.

Usage

Use this command to configure how the HA service handles GRE packets.

Example

To set maximum number of milliseconds to wait before processing reordered out-of-sequence GRE packets to 500 milliseconds, enter the following command:

gre reorder-timeout 500
To enable the reordering of incoming out of sequence GRE packets, enter the following command:
gre sequence-mode reorder
To enable the insertion or removal of GRE sequence numbers in GRE packets, enter the following command:
gre sequence-numbers

idle-timeout-mode

Configures the method the HA service uses to determine when to reset a session idle timer.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
idle-timeout-mode { aggressive | handoff | normal } [ upstream-only ]
default idle-timeout-mode
```

default

Reset the idle timeout mode to the default settings.
Defaults: aggressive, upstream -only is disabled.

aggressive

The session idle timer is reset only when MIP user data is detected. This is the default behavior.

handoff

The session idle timer is reset MIP user data is detected and when an inter-Access Gateway/FA handoff occurs.

normal

The session idle timer is reset when MIP user data is detected and when any MIP control signaling occurs.

upstream-only

Only upstream user data (data from the mobile node) resets the idle timer for the session. This is disabled by default.

Usage

Use this command to set how the current HA service resets the idle timer for a session.

Example

To reset the idle timer whenever user data is detected or whenever an inter-Access Gateway/FA occurs, use the following command:

```
idle-timeout-mode handoff
```

ip context-name

Specifies name of the destination context to be applied to the subscribers; this would take precedence over the same in subscriber configuration and RADIUS return attributes.

This new configuration overrides the local subscriber configuration as well as the return attributes sent by RADIUS. All calls coming to this HA service are assigned this particular destination context and IP address is allocated from the specified IP pool or group that is configured in the context specified in the service.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

ip context-name *name*

name

Specifies the name of the context to assign the subscriber to once authenticated. name must be from 1 to 79 alpha and/or numeric characters.

no

Usage

Removes the current assigned context from the subscriber's data.Set the name of the destination context to be applied to the subscribers.

Example

ip context-name *sampleName*
no ip context-name *sampleName*

ip local-port

Configures the local User Datagram Protocol (UDP) port for the Pi interfaces' IP socket on which to listen for MObile IP Registration messages.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

ip local-port *number*

number

Specifies the UDP port number.
number can be any integer value between 1 and 65535.

Usage

Specify the UDP port that should be used for communications between the FA service and the HA.
The chassis is shipped from the factory with the local port set to 434.

Example

The following command specifies a UDP port of 3950 for the HA service to use to communicate with the HA on the Pi interface:
ip local-port *3950*

ip pool

Specifies name of the IP address pool or group to use for subscriber IP address allocation; this takes precedence over the same in subscriber configuration and RADIUS return attributes.

This new configuration overrides the local subscriber configuration as well as the return attributes sent by RADIUS. All calls coming to this HA service are assigned this particular destination context and IP address is allocated from the specified IP pool or group that is configured in the context specified in the service.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

ip pool *name*

name

Specifies the logical name of the IP address pool. *name* must be from 1 to 31 alpha and/or numeric characters.

no

Indicates the IP address pool specified is to be removed from the current context's configuration or disable the specified option for an IP pool.

Usage

Define a pool of IP addresses for the context to use in assigning IPs for this service.

Example

ip pool *pool1*no ip pool *pool1*

isakmp

Configures the crypto map for a peer HA and configures the default crypto map for the FA service.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

isakmp { peer-fa *fa_address* **| skew-lifetime** *time* **| aaa-context** *context_name* **}**

---

no

Deletes the reference to the crypto map for the specified HA, deletes the reference for the default crypto map, resets the skew-lifetime to the default, or resets the aaa-context to the default.

---

peer-fa *fa_address* **{crypto map** *map_name* **[[encrypted] secret** *secret* **]}**

Configures a crypto map for a peer FA.

- *fa_address*: IP address of the peer FA to which this IPSEC SA will be established.
- **crypto map** *map_name***:** The name of a crypto map configured in the same context that defines the IPSec tunnel properties. *map_name* is the name of the crypto map and can be from 1 to 63 alpha and/or numeric characters.
- **encrypted**: This keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **secret** keyword is the encrypted version of the plain text secret key. Only the encrypted secret key is saved as part of the configuration file.
- **secret** *secret*: The pre-shared secret that will be used to during the IKE negotiation. *secret* is the secret string and can be from 1 to 127 alpha and/or numeric characters.

---

skew-lifetime *time*

Default: 10 seconds
Configures the IKE pre-shared key's time skew.
time is the amount of time the IKE S key fetched from AAA is considered valid after the key has expired. It is measured in seconds and can be configured to any integer value from 1 to 65534.

---

aaa-context context_name

Default: The context in which the service is configured
Configures the name of the context on the system in which AAA functionality is performed.
context_name is the name of the context through which the HA service accesses the HAAA server to fetch the IKE S Key and S Lifetime parameters. The name must be from 1 to 63 alpha and/or numeric characters and is case sensitive.

Usage

Use this command to configure the FA-service's per-HA IPSec parameters. These dictate how the HA service is to establish an IPSec SA with the specified FA.

Important: For maximum security, it is recommended that the above command be executed for every possible FA that the HA service communicates with.

Note that once an IPSec tunnel is established between the FA and HA for a particular subscriber, all new Mobile IP sessions using the same FA and HA are passed over the tunnel regardless of whether or not IPSec is supported for the new subscriber sessions. Data for existing Mobile IP sessions is unaffected.

Example

The following command creates a reference for an HA with the IP address 1.2.3.4 to a crypto map named map1:

```
isakmp peer-fa 1.2.3.4 crypto-map map1
```

The following command deletes the crypto map reference for the HA with the IP address 1.2.3.4.

```
no isakmp peer-fa 1.2.3.4
```

The following command sets the time an S key can used after the S lifetime expires to 120 seconds.

isakmp skew-lifetime 120

The following command creates the default reference for an HA to a crypto map named *map1*, where peer address is unknown:

```
isakmp default crypto-map map1
```

mn-ha-spi

Configures the security parameter index (SPI) between the HA service and the mobile node.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

mn-ha-spi spi-number *number* [**description** *string*] [**encrypted secret** *enc_secret* | **secret** *secret*] [**hash-algorithm** { **hmac-md5** | **md5** | **rfc2002-md5** }] [**permit-any-hash-algorithm**] [**replay-protection** { **nonce** | **timestamp** }] [**timestamp-tolerance** *tolerance*]

no mn-ha-spi spi-number *number*

spi-number *number*

Specifies the SPI (number) which indicates a security context between the mobile node and the HA service in accordance with RFC 2002. number can be configured to any integer value between 256 and 4294967295.

description *string*

This is a description for the SPI. *string* must be an alpha and or numeric string of from 1 through 31 characters.

encrypted secret *enc_secret* | **secret** *secret*

Configures the shared-secret between the HA service and the mobile node. The secret can be either encrypted or non-encrypted.
encrypted secret enc_secret: Specifies the encrypted shared key (enc_secret) between the HA service and the mobile node. enc_secret must be between 1 and 254 alpha and/or numeric characters and is case sensitive.
secret secret: Specifies the shared key (secret) between the HA service and the mobile node. secret must be between 1 and 127 alpha and/or numeric characters and is case sensitive.
The **encrypted** keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **secret** keyword is the encrypted version of the plain text secret key. Only the encrypted secret key is saved as part of the configuration file.

hash-algorithm { hmac-md5 | md5 | rfc2002-md5 }

Default: hmac-md5
Specifies the hash-algorithm used between the HA service and the mobile node.
hmac-md5: Configures the hash-algorithm to implement HMAC-MD5 per RFC 2002bis.
md5: Configures the hash-algorithm to implement MD5 per RFC 1321.
rfc2002-md5: Configures the hash-algorithm to implement keyed-MD5 per RFC 2002.

permit-any-hash-algorithm

Default: disabled

Allows verification of the MN-HA authenticator using all other hash-algorithms after failure with configured hash-algorithm. Successful algorithm is logged to aid in troubleshooting and is used to create the MN-HA authenticator in the Registration Reply message.

replay-protection { nonce | timestamp }

Default: timestamp
Specifies the replay-protection scheme that should be implemented by the HA service for this SPI.
nonce: configures replay protection to be implemented using NONCE per RFC 2002.
timestamp: configures replay protection to be implemented using timestamps per RFC 2002.

timestamp-tolerance *tolerance*

Default: 60
Specifies the allowable difference (tolerance) in timestamps that is acceptable. If the difference is exceeded, then the session will be rejected. If this is set to 0, then time stamp tolerance checking is disabled at the receiving end.
tolerance is measured in seconds and can be configured to any integer value between 0 and 65535.

Usage

An SPI is a security mechanism configured and shared by the HA service and the mobile node. Please refer to RFC 2002 for additional information.
Use the no version of this command to delete a previously configured SPI.

Example

The following command configures the HA service to use an SPI of 640 when communicating with a mobile node. The key that would be shared between the mobile node and the HA service is q397F65.
mn-ha-spi spi-number *640* **secret** *q397F65*
The following command deletes the configured SPI of 400:
no mn-ha-spi spi-number *400*

nat-traversal

This command enables NAT traversal and also configures the forcing of UDP tunnels for NAT traversal.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
nat-traversal [force-accept]
no nat-traversal [force-accept]
default nat-traversal [force-accept]
```

no

Disables NAT traversal or disables forcing the acceptance of UDP tunnels for NAT traversal.

default

Reset the defaults for this command.
Default: NAT traversal disabled, force-accept disabled.

force-accept

This keyword configures the HA to accept requests when NAT is not detected but the Force (F) bit is set in the RRQ with the UDP Tunnel Request. By default this type of request is rejected if NAT is not detected.

Usage

Use this command to enable NAT traversal and enable the forcing of UDP tunnels for NAT traversal.

Example

The following command enables NAT traversal for the current HA service and forces the HA to accept UDP tunnels for NAT traversal:

```
nat-traversal force-accept
```

optimize tunnel-reassembly

Configures HA to FA optimization for tunnel reassembly.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
optimize tunnel-reassembly

    no optimize tunnel-reassembly
```

Usage

Enabling this functionality fragments large packets prior to encapsulation for easier processing. Tunnel reassembly optimization is disabled by default.

Important: Cisco Systems strongly recommends that you do not use this command without first consulting Cisco Systems Technical Support. This command applies to very specific scenarios where packet reassembly is not supported at the far end of the tunnel. There are cases where the destination network may either discard the data, or be unable to reassemble the packets.

Important: This functionality works best when the HA service is communicating with an FA service running in a system. However, an HA service running in the system communicating with an FA from a different manufacturer will operate correctly even if this parameter is enabled.

Use the **no** version of this command to disable tunnel optimization if enabled.

Example

The following command enables tunnel reassembly optimization:

```
optimize tunnel-reassembly
```

policy bc-query-result

Configures the response code to send in a binding cache (BC) query result in response to a network failure or error.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

policy bc-query-result network-failure *code*

[default] policy bc-query-result network-failure

network-failure *code*

Default: 0xFFFF
Specify the response code for BC responses sent on network failures.
code must be either 0xFFFF or 0xFFFE.

Usage

Use this command to specify the type of response code to send in a P-MIP BC query result.

Example

The following command sets the P-MIP BC query result response code to *0xFFFE*:
policy bc-query-result network-failure *0xFFFE*

policy nw-reachability-fail

Specifies the action to take upon detection of an up-stream network -reachability failure.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

policy nw-reachability-fail { **reject** [**use-reject-code** { **admin-prohibited** | **insufficient-resources** }] | **redirect** *ip_addr1* [**weight** *value*] [ip_addr2 [**weight** *value*] ... *ip_addr16* [**weight** *value*]] }
no policy nw-reachability-fail [**redirect** *ip_addr1* ... *ip_addr16*]

no policy nw-reachability-fail [redirect *ip_addr1* **... ip_addr16]**

Deletes the network reachability policy completely or deletes the specified redirect addresses fro the policy.

reject [use-reject-code { admin-prohibited | insufficient-resources }]

Upon network reachability failure reject all new calls for this context.
use-reject-code { **admin-prohibited** | **insufficient-resources** }: When rejecting calls send the specified reject code. If this keyword is not specified the admin-prohibited reject code is sent by default.

reject [use-reject-code { admin-prohibited | insufficient-resources }]

Upon network reachability failure reject all new calls for this context. If no reject code is specified, the HA sends a registration reply code of 81H (admin-prohibited).
use-reject-code { **admin-prohibited** | **insufficient-resources** }: Use the specified reject code when rejecting traffic.
admin-prohibited: When this keyword is specified and traffic is rejected, the error code 81H (admin-prohibited) is returned.
insufficient-resources: When this keyword is specified and traffic is rejected, the error code 82H (insufficient resources) is returned.

redirect *ip_addr1* **[weight** *value* **] [ip_addr2 [weight** *value* **] ...** *ip_addr16* **[weight** *value* **]]**

Upon network reachability failure redirect all calls to the specified IP address.
ip_addr1: This must be an IPv4 address specified in dotted decimal notation. Up to 16 IP addresses and optional weight values can be entered on one command line.
weight *value*: When multiple addresses are specified, they are selected in a weighted round-robin scheme. If a weight is not specified the entry is automatically assigned a weight of 1. *value* must be an integer from 1 through 10.

Usage

Use this command to set the action for the HA service to take upon a network reachability failure.

Important: Refer to the context configuration mode command **`nw-reachability server`** to configure network reachability servers.

Important: Refer to the subscriber configuration mode command **`nw-reachability-server`** to bind the network reachability to a specific subscriber.

Important: Refer to the **`nw-reachability server server_name`** keyword of the context configuration mode **`ip pool`** command bind the network reachability server to an IP pool.

Example

To set the HA service to reject all new calls on a network reachability failure, enter the following command:
policy nw-reachability-fail reject
Use the following command to set the HA service to redirect all calls to the HA at IP address 192.168.100.10 and 192.168.200.10 on a network reachability failure:
policy nw-reachability-fail redirect 192.168.100.10 192.168.200.10

policy overload

Configures the overload policy within the HA service.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
policy overload { redirectaddress [ weightweight_num ] [ address2 [
weightweight_num ] ... address16 [ weightweight_num ] ] | reject [ use-reject-
code { admin-prohibited | insufficient-resources } ] }

no policy overload [ redirectaddress [ address2...address16 ] ]
```

---

no policy overload [redirect *address* **[** *address2...address16* **]]**

Deletes a previously set policy or removes a redirect IP address.
overload: This keyword without any options deletes the complete overload policy from the PDSN service.
overload redirect *address* [*address2 ... address16*]: deletes up to 16 IP addresses from the overload redirect policy. The IP addresses must be expressed in IP v4 dotted decimal notation

---

redirect *address* **[weight** *weight_num* **] [** *address2* **[weight** *weight_num* **] ... address16 [weight** *weight_num* **]**

This option enables a redirect policy for overloading conditions. When a redirect policy is invoked, the HA service rejects new sessions with a Registration Reply Code of 136H (unknown home agent address) and provides the IP address of an alternate HA. This command can be issued multiple times.
address: The IP address of an alternate HA expressed in IP v4 dotted decimal notation. Up to 16 IP addresses can be specified either in one command or by issuing the redirect command multiple times. If you try to add more than 16 IP addresses to the redirect policy the CLI issues an error message. If you specify an IP address and weight that already exists in the redirect policy the new values override the existing values.
weight *weight_num*: When multiple addresses are specified, they are selected in a weighted round-robin scheme. Entries with higher weights are more likely to be chosen. If a weight is not specified the entry is automatically assigned a weight of 1. *weight_num* must be an integer from 1 through 10.

---

reject [use-reject-code { admin-prohibited | insufficient-resources }]

This option causes any overload traffic to be rejected. If no reject code is specified, the HA sends a registration reply code of 81H (admin-prohibited).
use-reject-code { **admin-prohibited** | **insufficient-resources** }: Use the specified reject code when rejecting traffic.
admin-prohibited: When this keyword is specified and traffic is rejected, the error code 81H (admin-prohibited) is returned.
insufficient-resources: When this keyword is specified and traffic is rejected, the error code 82H (insufficient resources) is returned.

Usage

The system invokes the overload policy if the number of calls currently being processed exceeds the licensed limit for the maximum number of sessions supported by the system.
The system automatically invokes the overload policy when an on-line software upgrade is started.
Use the **no** version of this command to restore the default policy.
The setting for overload policy is reject.

Example
The following command enables an overload redirect policy for the HA service that will send overload calls to either of two destinations with weights of 1 and 10 respectively:

```
policy overload redirect 192.168.100.10 weight 1 192.168.100.20 weight 10
```

policy null-username

Configures the current HA service to accept or reject an RRQ without an NAI extension.

Important: This command is customer specific and is license enabled.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
policy null-username { accept-static | reject }
no policy null-username
```

no

Set the HA back to the default behavior of rejecting an RRQ without an NAI extension.

accept-static

This enable the HA to accept an RRQ with a static (i.e, non-zero) home address request but without NAI extension, when MN-AAA authentication is disabled at the HA. MN-NAI is required for MN-AAA authentication.

reject

Default. This is the default behavior of rejecting an RRQ without an NAI extension.

Usage

Use this command to enable or disable the HA from accepting an RRQ without an NAI.

Example

The following command enables the current HA service to accept RRQs that do not have an NAI extension:
policy null-username accept-static

private-address allow-no-reverse-tunnel

This command allows the HA service to accept private addresses without using reverse tunneling.

Important: This command is customer specific and is license enabled.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
private-address allow-no-reverse-tunnel
no private-address allow-no-reverse-tunnel
```

no

Reject MIP calls that use private addresses and do not use reverse tunneling.

Usage

Use this command to enable or disable the HA from accepting calls that use private addresses without reverse tunneling.

Example

The following command enables the current HA service to accept MIP calls that use private addresses but do not use reverse tunneling:

```
private-address allow-no-reverse-tunnel
```

reg-lifetime

Specifies the longest registration lifetime that the HA service will allow in any Registration Request message from the mobile node.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
reg-lifetime time
no reg-lifetime
```

no

Sets the registration lifetime to infinite.

time

Specifies the registration lifetime.
time is measured in seconds and can be configured to any integer value between 1 and 65534.

Usage

Use to limit a mobile nodes lifetime. If the mobile node requests a shorter lifetime than what is specified, it is granted. However, Per RFC 2002, should a mobile node request a lifetime that is longer than the maximum allowed by this parameter, the HA service will respond with the value configured by this command as part of the Registration Reply.
The chassis is shipped from the factory with the registration lifetime set to 600 seconds.

Example

The following command configures the registration lifetime for the HA service to be 2400 seconds:

```
reg-lifetime 2400
```

The following command configures an infinite registration lifetime for MIP calls:

```
no reg-lifetime
```

reverse-tunnel

Enables the use of reverse tunneling for a Mobile IP sessions when requested by the mobile node.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
reverse-tunnel

    no reverse-tunnel
```

no

Indicates the reverse tunnel option is to be disabled. When omitted, the reverse tunnel option is enabled.

Usage

Reverse tunneling involves tunneling datagrams originated by the mobile node to the HA service via the FA. When an MN arrives at a foreign network, it listens for agent advertisements and selects an FA that supports reverse tunnels. The MN requests this service when it registers through the selected FA. At this time, the MN may also specify a delivery technique such as Direct or the Encapsulating Delivery Style.
Among the advantages of using reverse-tunneling are that:

- All datagrams from the mobile node seem to originate from its home network
- The FA can keep track of the HA that the mobile node is registered to and tunnel all datagrams from the mobile node to its HA

Use the **no** version of this command to disable reverse tunneling. If reverse tunneling is disabled, and the mobile node does not request it, triangular routing will be performed.
routing will be used.
The chassis is shipped from the factory with the reverse tunnel enabled.

Important: If reverse tunneling is disabled on the system and a mobile node requests it, the call will be rejected with a reply code of 74H (reverse-tunneling unavailable).

Example

The following command disables reverse-tunneling support for the HA service:

```
no reverse-tunnel
```

revocation

Enables the MIP revocation feature and configures revocation parameters.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

revocation { **enable** | **max-retransmission** *number* | **negotiate-i-bit** | **retransmission-timeout** *secs* | **send-nai-ext** | **trigger** { **handoff** | **idle-timeout** } }
no revocation { **enable** | **negotiate-i-bit** | **send-nai-ext** | **trigger** { **handoff** | **idle-timeout** } }

---

no

Completely disables registration revocation on the HA, disables trigger handoff, or disables revocation on idle timer expiration.

---

enable

Enables the MIP registration revocation feature on the HA. When enabled, if revocation is negotiated with an FA and a MIP binding is terminated, the HA can send a Revocation message to the FA. This feature is disabled by default.

---

max-retransmission *number*

Default: 3
The maximum number of retransmissions of a Revocation message before the revocation fails. *number* must be an integer from 0 through 10.

---

negotiate-i-bit

Default: disabled
Enables the HA to negotiate the i-bit via PRQ/RRP messages and processes the i-bit revocation messages.

---

retransmission-timeout *secs*

Default: 3
The number of seconds to wait for a Revocation Acknowledgement from the FA before retransmitting the Revocation message. *secs* must be an integer from 1 through 10.

---

send-nai-ext

Default: off
Enables sending the NAI extension in the revocation message.

---

trigger { handoff | idle-timeout }

handoff: Default: Enabled

Triggers the HA to send a Revocation message to the FA when an inter-Access Gateway/FA handoff of the MIP session occurs. If this is disabled, the HA is never triggered to send a Revocation message.
`idle-timeout`: Default: Enabled
Triggers the HA to send a Revocation message to the FA when a session idle timer expires.

Usage

Use this command to enable or disable the MIP revocation feature on the HA or to change settings for this feature. Both the HA and the FA must have Registration Revocation enabled and FA/HA authorization must be in use for Registration Revocation to be negotiated successfully.

Example

The following command enables Registration Revocation on the HA:

```
revocation enable
```

The following command sets the maximum number of retries for a Revocation message to 10:

```
revocation max-retransmission 10
```

The following command sets the timeout between retransmissions to 3:

```
revocation retransmission-timeout 3
```

The behavior of send MIP revocation to FA is as follows:
1st retry: Retransmit in 3 seconds after previous MIP revocation send.
2nd retry : Retransmit in 6 seconds after previous MIP revocation send (9 seconds after sending initial MIP revocation).
3rd retry : Retransmit in 12 seconds after previous MIP revocation send (21 seconds after sending initial MIP revocation).
4th retry : Retransmit in 24 seconds after previous MIP revocation send (45 seconds after sending initial MIP revocation).
5th retry : Retransmit in 48 seconds after previous MIP revocation send (93 seconds after sending initial MIP revocation).

Important: The value of retransmission-timeout doubles. HA disconnects the session forcibly in 120 seconds after sending initial MIP revocation.

setup-timeout

The maximum amount of time allowed for session setup.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

setup-timeout *seconds*

seconds

Default: 60 seconds
The maximum amount of time, in seconds, to allow for setup of a session. must be an integer from 1 through 1000000

Usage

Use this command to set the maximum amount of time allowed for setting up a session.

Example

To set the maximum time allowed for setting up a session to 5 minutes (300 seconds), enter the following command:
setup-timeout 300

simul-bindings

Specifies the maximum number of "care-of" addresses that can simultaneously be bound for the same user as identified by NAI and Home address.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

simul-bindings *number*

number

Configures the maximum number of simultaneous "care-of" bindings that the HA service will maintain for any given subscriber.
number can be configured to any integer value between 1 and 3.

Usage

Per RFC 2002, the HA service creates a mobile binding record (MBR) for each subscriber session it is facilitating. Each MBR is associated with a care-of address. As the mobile node roams, it is possible that the session will be associated with a new care of address.
Typically, the HA service will delete an old binding and create a new one when the information in the Registration Request changes. However, the mobile could request that the HA maintains previously stored MBRs. This command allows you to configure the maximum number of MBRs that can be stored per subscriber if the requested.
The chassis is shipped from the factory with the simultaneous sessions set to3.

Example

The following command configures the HA service to support up to 4 MBRs per subscriber:
simul-bindings *4*

threshold init-rrq-rcvd-rate

Set an alarm or alert based on the average number of calls setup per second for the context.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
threshold init-rrq-rcvd-rate high_thresh [ clear low_thresh ]
no threshold init-rrq-rcvd-rate
```

no

Deletes the alert or alarm.

high_thresh

Default: 0
The high threshold average number of calls setup per second must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100000.

clear *low_thresh*

Default:0
The low threshold average number of calls setup per second that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 100000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the average number of calls setup per second is equal to or greater than a specified number of calls per second.
Alerts or alarms are triggered for the number of calls setup per second based on the following rules:

- **Enter condition:** Actual number of calls setup per second > High Threshold
- **Clear condition:** Actual number of calls setup per second £ Low Threshold

Example

The following command configures a number of calls setup per second threshold of 1000 and a low threshold of 500 for a system using the Alarm thresholding model:
threshold init-rrq-rcvd-rate 1000 clear 500

threshold ipsec-call-req-rej

Configures a threshold for the total IPSec calls request rejected.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

threshold ipsec-call-req-rej *high_thresh* **[clear** *low_thresh* **]**

no threshold ipsec-call-req-rej

no

Deletes the alert or alarm.

high_thresh

Default: 0
The high threshold number of IPSec call requests rejected per second must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh can be configured to any integer value between 0 and 1000000.

clear *low_thresh*

Default:0
The low threshold number of IPSec call requests rejected per second that must be met or exceeded within the polling interval to clear an alert or alarm.
low_thresh can be configured to any integer value between 0 and 1000000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of IPSec call requests rejected is equal to or greater than a specified number per second.
Alerts or alarms are triggered for the number of IPSec IKE requests on the following rules:

- **Enter condition:** Actual number of IPSec IKE requests > High Threshold
- **Clear condition:** Actual number of IPSec IKE requests £ Low Threshold

Example

The following command configures a number of IPSec call requests rejected threshold of 1000 and a low threshold of 800 for a system using the Alarm thresholding model:
threshold ipsec-call-req-rej 1000 clear 800

threshold ipsec-ike-failrate

Configures a threshold for the percentage of IPSec IKE failures.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

threshold ipsec-ike-failrate *high_thresh* **[clear** *low_thresh* **]**

no threshold ipsec-ike-failrate

---

no

Deletes the alert or alarm.

---

high_thresh

Default: 0
The high threshold percentage of IPSec IKE failures per second must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh can be configured to any integer value between 0 and 100.

---

clear *low_thresh*

Default:0
The low threshold percentage of IPSec IKE failures per second that must be met or exceeded within the polling interval to clear an alert or alarm.
low_thresh can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the percentage of IPSec IKE failures is equal to or greater than a specified number per second.
Alerts or alarms are triggered for the percentage of IPSec IKE failures on the following rules:

- **Enter condition:** Percentage of IPSec IKE failures > High Threshold
- **Clear condition:** Percentage of IPSec IKE failures £ Low Threshold

---

Example

The following command configures a percentage of IPSec IKE failures threshold of 1000 and a low threshold of 800 for a system using the Alarm thresholding model:
threshold ipsec-ike-failrate 90 clear 80

threshold ipsec-ike-requests

Configures a threshold for the total IPSec IKE failures.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

threshold ipsec-ike-failures high_thresh [clear low_thresh]

no threshold ipsec-ike-failures

---

no

Deletes the alert or alarm.

---

high_thresh

Default: 0
The high threshold number of IPSec IKE failures per second must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh can be configured to any integer value between 0 and 1000000.

---

clear *low_thresh*

Default:0
The low threshold number of call IPSec IKE failures per second that must be met or exceeded within the polling interval to clear an alert or alarm.
low_thresh can be configured to any integer value between 0 and 1000000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of IPSec IKE failures is equal to or greater than a specified number per second.
Alerts or alarms are triggered for the number of IPSec IKE failures on the following rules:

- **Enter condition:** Actual number of IPSec IKE failures > High Threshold
- **Clear condition:** Actual number of IPSec IKE failures £ Low Threshold

---

Example

The following command configures a number of IPSec IKE failures threshold of 1000 and a low threshold of 800 for a system using the Alarm thresholding model:
threshold ipsec-ike-failures 1000 clear 800

threshold ipsec-ike-failures

Configures a threshold for the total IPSec IKE failures.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

threshold ipsec-ike-failures high_thresh [clear low_thresh]

no threshold ipsec-ike-failures

no

Deletes the alert or alarm.

high_thresh

Default: 0
The high threshold number of IPSec IKE failures per second must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh can be configured to any integer value between 0 and 1000000.

clear *low_thresh*

Default:0
The low threshold number of call IPSec IKE failures per second that must be met or exceeded within the polling interval to clear an alert or alarm.
low_thresh can be configured to any integer value between 0 and 1000000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of IPSec IKE failures is equal to or greater than a specified number per second.
Alerts or alarms are triggered for the number of IPSec IKE failures on the following rules:

- **Enter condition:** Actual number of IPSec IKE failures > High Threshold
- **Clear condition:** Actual number of IPSec IKE failures £ Low Threshold

Example

The following command configures a number of IPSec IKE failures threshold of 1000 and a low threshold of 800 for a system using the Alarm thresholding model:
threshold ipsec-ike-failures 1000 clear 800

threshold ipsec-tunnels-established

Configures a threshold for the total IPSec tunnels established.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

threshold ipsec-tunnels-established *high_thresh* **[clear** *low_thresh* **]**

no threshold ipsec-tunnels-established

no

Deletes the alert or alarm.

high_thresh

Default: 0
The high threshold number of IPSec tunnels established per second must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh can be configured to any integer value between 0 and 1000000.

clear *low_thresh*

Default:0
The low threshold number of call IPSec tunnels established per second that must be met or exceeded within the polling interval to clear an alert or alarm.
low_thresh can be configured to any integer value between 0 and 1000000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of IPSec tunnels established is equal to or greater than a specified number per second.
Alerts or alarms are triggered for the number of IPSec tunnels established on the following rules:

- **Enter condition:** Actual number of IPSec tunnels established > High Threshold
- **Clear condition:** Actual number of IPSec tunnels established £ Low Threshold

Example

The following command configures a number of IPSec tunnels established threshold of 1000 and a low threshold of 800 for a system using the Alarm thresholding model:
threshold ipsec-tunnels-established 1000 clear 800

threshold ipsec-tunnels-setup

Configures a threshold for the total IPSec tunnels setup.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

threshold ipsec-tunnels-setup *high_thresh* **[clear** *low_thresh* **]**

no threshold ipsec-tunnels-setup

---

no

Deletes the alert or alarm.

---

high_thresh

Default: 0
The high threshold number of IPSec tunnels setup per second must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh can be configured to any integer value between 0 and 1000000.

---

clear *low_thresh*

Default:0
The low threshold number of call IPSec tunnels setup per second that must be met or exceeded within the polling interval to clear an alert or alarm.
low_thresh can be configured to any integer value between 0 and 1000000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of IPSec tunnels setup is equal to or greater than a specified number per second.
Alerts or alarms are triggered for the number of IPSec tunnels setup on the following rules:

- **Enter condition:** Actual number of IPSec tunnels setup > High Threshold
- **Clear condition:** Actual number of IPSec tunnels setup £ Low Threshold

---

Example

The following command configures a number of IPSec tunnels setup threshold of 1000 and a low threshold of 800 for a system using the Alarm thresholding model:
threshold ipsec-tunnels-setup 1000 clear 800

threshold reg-reply-error

Set an alarm or alert based on the number of registration reply errors per HA service.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
threshold reg-reply-error high_thresh [ clear low_thresh ]
no threshold reg-reply-error
```

no

Deletes the alert or alarm.

high_thresh

Default: 0
The high threshold number of registration reply errors that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100000.

clear *low_thresh*

Default:0
The low threshold number of registration reply errors that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 100000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of registration reply errors is equal to or greater than a specified number of calls per second.
Alerts or alarms are triggered for the number of registration reply errors on the following rules:

- **Enter condition:** Actual number of registration reply errors > High Threshold
- **Clear condition:** Actual number of registration reply errors £ Low Threshold

Example

The following command configures a registration reply error threshold of 1000 and a low threshold of 500 for a system using the Alarm thresholding model:
threshold reg-reply-error 1000 clear 500

threshold rereg-reply-error

Set an alarm or alert based on the number of re-registration reply errors per HA service.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
threshold rereg-reply-error high_thresh [ clear low_thresh ]
no threshold rereg-reply-error
```

no

Deletes the alert or alarm.

high_thresh

Default: 0
The high threshold number of re-registration reply errors that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100000.

clear *low_thresh*

Default:0
The low threshold number of re-registration reply errors that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 100000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of re-registration reply errors is equal to or greater than a specified number of calls per second.
Alerts or alarms are triggered for the number of re-registration reply errors on the following rules:

- **Enter condition:** Actual number of re-registration reply errors > High Threshold
- **Clear condition:** Actual number of re-registration reply errors £ Low Threshold

Example

The following command configures a reregistration reply error threshold of 1000 and a low threshold of 500 for a system using the Alarm thresholding model:
threshold rereg-reply-error 1000 clear 500

threshold dereg-reply-error

Set an alarm or alert based on the number of de-registration reply errors per HA service.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

threshold dereg-reply-error *high_thresh* **[clear** *low_thresh* **]**
no threshold dereg-reply-error

---

no

Deletes the alert or alarm.

---

high_thresh

Default: 0
The high threshold number of de-registration reply errors that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100000.

---

clear *low_thresh*

Default:0
The low threshold number of de-registration reply errors that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 100000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of de-registration reply errors is equal to or greater than a specified number of calls per second.
Alerts or alarms are triggered for the number of de-registration reply errors on the following rules:

- **Enter condition:** Actual number of de-registration reply errors > High Threshold
- **Clear condition:** Actual number of de-registration reply errors £ Low Threshold

---

Example

The following command configures a de-registration reply error threshold of 1000 and a low threshold of 500 for a system using the Alarm thresholding model:
threshold reg-reply-error 1000 clear 500

wimax-3gpp2 interworking

Configures the interworking between WiMAX and 3GPP2 network at HA. This support provides handoff capabilities from 4G to 3G (PDSN) network access and vice-versa.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
[no | default] wimax-3gpp2 interworking
```

no

Disables the pre-configured interworking between WiMAX and 3GPP2 networks at HA level.

default

Configures the WiMAX-3GPP2 interworking to default setting; i.e. disabled.

Usage

Use this command to enable/disable the interworking between WiMAX and 3GPP2 network for seamless session continuity.
This functionality provides HA support for both 4G and 3G technology HA (WiMAX HA and PDSN/HA) for handoff from 4G and 3G network access (ASN GW/FA and PDSN/FA) and vice-versa.

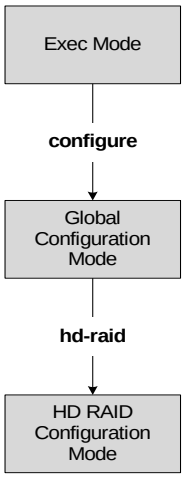
Important: Use this command in conjunction with **`authentication aaa-distributed-mip-keys required`** command.

Example

The following command enables the interworking for a subscriber between WiMAX and 3GPP2 network.
wimax-3gpp2 interworking

Chapter 115
HD RAID Configuration Mode Commands

This mode develops default policies designed to minimize administrative intervention when setting up a RAID on ASR 5000 SMC hard disks.



default

Sets or restores the default condition for the selected parameter

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
default ( overwrite { invalid | unknown | valid } disk | select }
```

overwrite { invalid | unknown | valid } disk

Configures the system to overwrite any of the disk types

select

Selects the newer of the valid RAID disks when two valid RAID disks are available.

Usage

Selects default parameters

Example

Use the following example to select the newest disk in an SMC pair:

```
default select
```

end

Exits the HD RAID configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the HD RAID configuration mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the previous mode.

overwrite

Sets the RAID overwrite properties.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] overwrite { invalid | unknown | valid } disk [ -noconfirm ]
```

no

Prevents a disk from being overwritten.

default

Configures the default overwrite action:

invalid

This option allows the system to automatically overwrite invalid disks including empty disks, wrongly partitioned disks, and partially constructed disks.
This is the default overwrite action.

unknown

This option allows the system to automatically overwrite unknown disks that has a valid RAID superblock but is not configured in the standard way; most likely because it has data from a different version.

valid

This option allows the system to automatically overwrite a disk that is a clean RAID component but not part of the current or selected RAID.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Sets a policy for automatically overwriting different disk types. If there is a disk that satisfies the changed overwrite policy then the disk would overwrite immediately.

Example

The following command configures a policy for overwriting invalid RAID disks:

```
overwrite invalid disk -noconfirm
```

select

Configures the disk preference when both hard disks on the ASR 5000 have valid RAID information.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ default ] select { newer | none } disk [ -noconfirm ]
```

default

Configures the command to its default condition.

newer

Selects the newer disk by timestamp and event counter in superblocks. If all are the same, then the same array will start with both SMC disks, but a different array will need admin intervention).

none

Does not select any disk but defers to administrator intervention.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Determines the selected disc when two valid disks from either the same or different RAIDs are running on the ASR 5000.

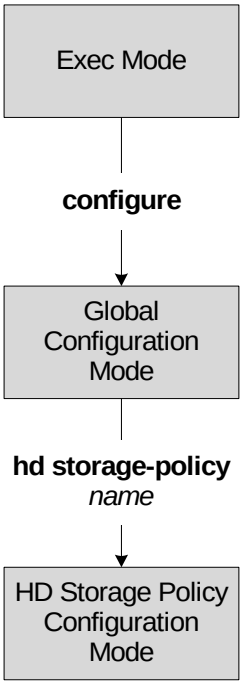
Example

This command forces the RAID to be configured on the newer SMC hard disk:

```
select newer disk -noconfirm
```

Chapter 116
HD Storage Policy Configuration Mode Commands

The HD Storage Policy Configuration Mode is used to configure directory name and file parameters for Diameter record files being stored on the HD storage device.



directory

Configures the name of the directory on the HD storage drive where Diameter records are stored.

Product

HSGW, P-GW, S-GW

Privilege

Administrator

Syntax

directory name *dir_name*

default directory name

default

Returns the command to its default setting of using the policy name as the directory name.

name *dir_name*

Specifies the name to be applied to the directory. *dir_name* must be an alpha and or numeric string from 1 to 63 characters.
When configured, the actual directory path is:

```
/hd-raid/records/<record-type>/<dir_name>/
```

So if the directory name variable is entered as "*sgwpgw*", the path is:

```
/hd-raid/records/acr/sgwpgw
```

Usage

Use this command to name a directory on the HD storage drive where Diameter records are to be stored.

Example

The following command configures a directory named *cdr1*:

directory name *cdr1*

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax `end`

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax `exit`

Usage

Return to the previous mode.

file

Configures file parameters for Diameter records being stored on the HD storage device.

Product

HSGW, P-GW, S-GW

Privilege

Administrator

Syntax

```
file { format acr { custom1...custom10 } | name { extension string | prefix
string } | rotation { record-count num | time-interval sec | volume mb mbytes }
}

default file { format acr | name prefix | rotation { record-count | time-
interval | volume } }

no file ( extension | rotation { record-count | time-interval } }
```

default

Returns the command to the default settings for the specified keywords.

no

Removes the configuration for the specified parameters.

format acr { custom1...custom10 }

Default: **custom1**
Specifies the file format used when storing records on the HD storage device. **custom1** is a vendor-specific file format.

name { extension *string* **| prefix** *string* **}**

Specifies a string to be pre-pended or appended to the filenames. By default, the policy name is used for the prefix.
extension *string*: Specifies a file extension to append to the filename. *string* must be an alpha and/or numeric string from 1 to 10 characters.
prefix *string*: Specifies a file prefix to append to the filename. *string* must be an alpha and/or numeric string from 1 to 63 characters. This parameter replaces the policy name used by default.

rotation { record-count *num* **| time-interval** *sec* **| volume mb** *mbytes* **}**

Specifies the triggers that prompt file rotation on the HD storage drive. All options can be configured and upon reaching any of the thresholds, file rotation is initiated.
record-count *num*: Specifies that file rotation is to occur when the number of records reaches the number configured in this keyword. *num* must be an integer value from 1000 tom 65000. Default = 10000
time-interval *sec*: Specifies that file rotation is to occur a time intervals configure in this keyword. *sec* must be an integer value from 30 to 86400. Default = 3600 (1 hour)
volume mb *mbytes*: Specifies that file rotation is to occur when the record volume exceeds the value configured in the keyword. *mbytes* must be an integer value from 2 to 40. Default = 4 (mb)

Usage

Use this command to configure file parameters for Diameter records being stored on the HD storage device.

Example

The following command set the file rotation thresholds for files being stored on the HD storage device:

```
file rotation volume mb 4
file rotation record-count 15000
file rotation time-interval 7200
```

The following command replaces the policy name as the prefix of all files being stored through this policy with the prefix *sgw*:

```
file name prefix sgw
```

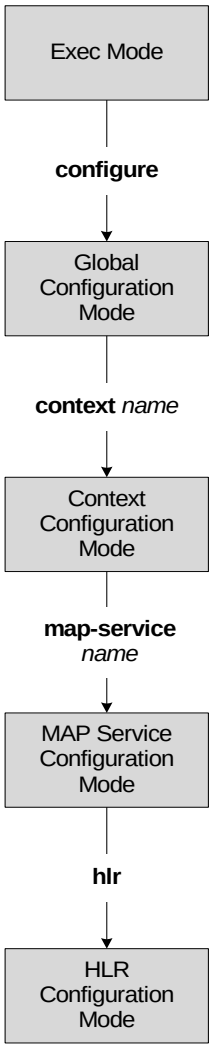
Chapter 117
HLR Configuration Mode Commands

The HLR Configuration Mode provides the commands and parameters to configure the home location register (HLR) node that is the database containing the subscriber profile and connection information for a specific GPRS/UMTS core network.

In this mode, your prompt will look similar to:

```
[<context_name>]hostname(config-map-service-<svr_name>-hlr)#
```

The HLR Configuration Mode is a sub-mode derived from the MAP Configuration Mode which controls the MAP service configuration. It is the MAP service that provides the application-layer protocol support used to connect the HLR to other nodes in the network such as the SGSN.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

acn-version-retention

This command configures the ACN version retention method.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
acn-version-retention { per-imsi-prefix | per-subscriber }

default acn-version-retention
```

default

Returns the configuration to the default value: retains the version information per IMSI prefix.

per-imsi-prefix

Retain ACN version information, for communication with the HLR, on a per IMSI prefix basis.

per-subscriber

Retain ACN version information, for communication with the HLR, on a per buscriber basis.

Usage

By default, the SGSN sends ACN version 3 SAI (service area identity) to the HLR. If the SGSN receives an error message indicating that the HLR does not support that version, then the SGSN tries again with an ACN version 2 SAI. Next time the SGSN communicates with that HLR, it retains that version information and version persists based on the IMSI prefix.
Use this command to enable the SGSN to retain version according to subscriber.

Example

Configure the SGSN to retain version information according to the IMSI prefix:

```
default acn-version-retention
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the context configuration mode.

imsi

This command sets up IMSI (International Mobile Subscriber Identity) -based configuration. (IMSI) prefix which includes the Mobile Country Code (MCC), the Mobile Network Code (MNC).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] imsi { any | starts-with *prefix_number* **} { imsi [sgsn-source-address-format point-code-ssn [source-ssn** *ssn* **] | isdn** *isdn_number* **| mobile-global-title** *mgt_number* **| point-code** *pt-code* **} }**

no

Removes the imsi-prefix definition from the configuration.

any

Configures acceptance of any IMSI prefix.

start-with *prefix_number*

Selects IMSI prefix-based routing.
prefix_number is a string of up to 15 integers.

imsi

Enables configurable default behavior for routing.
Entering **imsi** with the **any** keyword preserves the default behavior and the E.212 address is used as a destination address and the MAP request will be sent towards the HLR.
If this keyword is not used with the **any** keyword, then the MAP request will be rejected.

isdn *isdn_number*

Defines the E.164 number of the HLR.
isdn_number is a string of integers, up to 15.

mobile-global-title *mgt_number*

mgt_number is a string of integers, up to 15.

point-code *pt-code* **source-ssn** *ssn*

Defines the point code for the HLR.
pt-code is a string of digits, up to 11; SS7 format preferred.

sgsn-source-address-format point-code-ssn

Selects HLR call process according to SCCP calling party address of the SGSN. This will be filled at MAP level, including the ITU point code address.

source-ssn *ssn*

Defines the SSN of the source that will be used for the call filtering.
ssn: Must be an integer from 1 to 255.

Usage

Routing will be done according to IMSI parameters configured with this command.

Example

imsi starts-with *3* **isdn** *123456789* **sgsn-source-address-form at point-code-ssn**

policy routing

This command configures the policy for the routing of MAP messages. If this command is not configured or disabled (with the **default** keyword), then routing is done according to the configuration of the IMSI parameters.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] policy routing { hlr-isdn | ms-isdn }
```

default

Resets the policy routing to the system default, disabled.

no

Removes the policy routing configuration from the system.

hlr-isdn

Selects HLR-ISDN based routing.

ms-isdn

Selects mobile station (MS)-ISDN based routing.

Usage

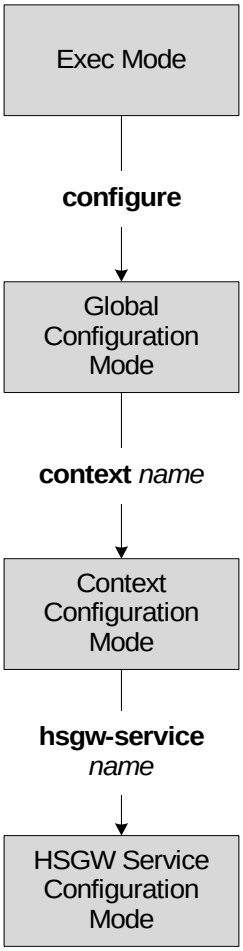
Use this command to set the policy for routing MAP messages.

Example

```
policy routing hlr-isdn
```

Chapter 118
HSGW Service Configuration Mode Commands

The HSGW Service Configuration Mode is used to create and manage a configuration allowing the HSGW to communicate, send and receive call data, and session flows to/from a eAN/PCF in an eHRPD network.



Important: This appendix will be added to the CLI Reference when the product releases. Use this appendix in conjunction with the latest release of the Command Line Interface Reference.

associate

Associates accounting policies and QCI-QoS mapping parameters with this HSGW service.

Product

HSGW

Privilege

Administrator

Syntax

associate { accounting-policy *name* **| qci-qos-mapping** *name* **}**

no associate { accounting-policy [*name* **] | qci-qos-mapping }**

no

Removes the specified associated policy or mapping from the service.

accounting-policy *name*

Specifies the accounting policy to associate with the HSGW service. *name* must be an existing accounting policy and be from 1 to 63 alpha and/or numeric characters.

qci-qos-mapping *name*

Associates the HSGW service with QCI to QoS mapping parameters. *name* must be an existing QCI-QoS mapping configuration and be from 1 to 63 alpha and/or numeric characters.

QCI-QoS mapping is configured through the qci-qos-mapping command in the Global Configuration Mode.

Usage

Use this command to associate an accounting policy with the HSGW service.

Example

The following command associates an accounting policy named *acct2* to the HSGW service:

associate accounting-policy *acct2*

bind address

Binds the service to a logical IP interface serving as the A10 interface and specifies the maximum number of subscribers that can access this service over the configured interface.

Product

HSGW

Privilege

Administrator

Syntax

bind address *ip_address* **[max-subscribers** *num* **]**

no bind address

no

Removes the interface binding from this service.

ip_address

Specifies the IPv4 address of the interface configured as the A10/A11 interface. *ip_address* is specified in dotted decimal notation.

max-subscribers *num*

Default: 2500000
Specifies the maximum number of subscribers that can access this service on this interface. *num* must be configured to an integer between 0 and 2,500,000.

Important: The maximum number of subscribers supported is dependant on the license key installed and the number of active PSCs in the system. A fully loaded system with 13 active PSCs can support 3,000,000 total subscribers. Refer to the license key command and the Usage section (below) for additional information.

Usage

Associate the HSGW service to a specific logical IP address. The logical IP address or interface takes on the characteristics of an A10/A11 interface that provides the session connectivity to/from an eAN/PCF. Only one interface can be bound to a service. The interface should be configured prior to issuing this command.
This command also sets a limit as to the number of simultaneous subscribers sessions that can be facilitated by the service/interface at any given time.
When configuring the **max-subscribers** option, be sure to consider the following:

- The total number of A10/A11 interfaces you will configure
- The total number of subscriber sessions that all of the configured interfaces may handle during peak busy hours
- An average bandwidth per session multiplied by the total number of sessions
- The type of physical port (10/100Base-T or 1000Base-Tx) that these interfaces will be bound to

Taking these factors into account and distributing your subscriber session across all available interfaces will allow you to configure your interfaces to optimally handle sessions without degraded performance.

Example

The following command would bind the logical IP interface with the address of *112.334.556.778* to the HSGW service and specifies that a maximum of *200,000* simultaneous subscriber sessions can be facilitated by the interface/service at any given time:

```
bind address 112.334.556.778 max-subscribers 200000
```

context-retention-timer

Configures the maximum number of consecutive seconds that a UE session context (which includes the LCP, authentication and A10 session context for a given UE) is maintained by the HSGW before it is torn down.

Product

HSGW

Privilege

Administrator

Syntax

context-retention-timer timeout [*sec* **]**

[default | no] context-retention-timer timeout

default

Disables the timer.

no

Disables the timer.

timeout [*sec* **]**

Default: 60
Specifies the amount of time, in seconds, that the session context is maintained before it is disassembled. *sec* must be an integer value from 1 to 3600.

Usage

Use this command to configure a timer to retain session contexts for a specified amount of time before disassembling it.

Example

The following command allows the HSGW to maintain session contexts for *120* seconds before tearing them down:

context-retention-timer timeout *120*

data-available-indicator

Enable sending Data Available Indicator extension in A10/A11 Registration Reply messages.

Product

HSGW

Privilege

Administrator

Syntax

```
data-available-indicator
```

Usage

Use this command to enable the sending of the Data Available Indicator extension in A10/A11 Registration Reply messages

data-over-signaling

Enable the data-over-signaling marking feature for A10 packets.

Product

HSGW

Privilege

Administrator

Syntax

```
[ default | no ] data-over-signaling
```

default

Enables the data-over signaling feature for A10 packets.

no

Disable the data-over signaling feature for A10 packets.

Usage

Use this command to enable or disable the data-over signaling feature for A10 packets.

dns-pgw

Identifies to the HSGW service the location of the DNS client. The DNS client is used to identify a FQDN for the peer P-GW. This command defaults to the same context as the HSGW service.

Product

HSGW

Privilege

Administrator

Syntax

dns-pgw context *name*

[default | no] dns-pgw context

default

Returns the command to its default setting of the current context.

no

Removes the configured DNS client context name from this service.

context *name*

Specifies the context in which the DNS client is configured. *name* must be an existing context and be from 1 to 63 alpha and/or numeric characters.

Usage

Use this command to identify to the HSGW service the context where the DNS client is configured.

Example

The following command identifies the context where the DNS client is configured as *isp3*:

dns-pgw context *isp3*

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the previous mode.

fqdn

Configures the Fully Qualified Domain Name (FQDN) for this HSGW service.

Product

HSGW

Privilege

Administrator

Syntax

fqdn *domain_name*

[default | no] fqdn

default

Returns the command to the default setting of "null".

no

Removes the configured FQDN name from this service.

domain_name

Specifies an FQDN for the HSGW service. *domain_name* must be from 1 to 256 alpha and/or numeric characters.

Important: In order to properly interact with other nodes in the network, the FQDN should be 96 alpha and/or numeric characters or less.

Usage

Use this command to configure an FQDN for this HSGW service. The FQDN is used when matching a P-GW with an HSGW.

Topology Matching

You may specify which P-GW you wish an HSGW interface to connect with by enabling topology matching within the FQDNs for both the HSGW service and P-GW service. Topology matching selects geographically closer nodes and reduces backhaul traffic for a specified interface.

The following optional keywords enable or disable topology matching when added to the beginning of an FQDN:

- **topon**.<*interface_name*>.

  Beginning an FQDN with **topon** initiates topology matching with available P-GWs in the network. Once this feature is enabled, the rest of the FQDN is processed from right to left until a matching regional designator is found on a corresponding P-GW FQDN.

- **topoff**.<*interface_name*>.

  By default, topology matching is disabled. If you enable topology matching for any interfaces within a node, however, all interfaces not using this feature should be designated with **topoff**.

Example

The following command configures this HSGW service with an FQDN of *abc123.com*:

```
fqdn abc123.com
```

The following command configures this HSGW service with an FQDN that enables topology matching:

```
fqdn
topon.<interface_name>.hsgw01.bos.ma.node.epc.mnc<value>.mcc<value>.3gppnetwork.org
```

Important: The associated P-GW service must have a corresponding FQDN similar to the following:

```
topon.<interface_name>.pgw01.bos.ma.node.epc.mnc<value>.mcc<value>.3gppnetwork.org
```

fragment

Enables/Disables PPP payload fragmentation.

Product

HSGW

Privilege

Administrator

Syntax

```
[ default | no ] fragment ppp-data
```

default

Returns the command to its default setting of enabled.

no

Disables PPP payload fragmentation.

Usage

Use this command to enable or disable PPP payload fragmentation.

gre

Configures Generic Routing Encapsulation (GRE) parameters for the A10 protocol within the HSGW service.

Product

HSGW

Privilege

Administrator

Syntax

gre { checksum | checksum-verify | flow control [action { disconnect-session | resume-session }] [timeout *msecs*] + | ip-header-dscp *value* { all-control-packets | setup-packets-only } | reorder-timeout *msecs* | segmentation | sequence-mode { none | reorder } | sequence-numbers | threegppp2-ext-headers qos-marking }

default gre { checksum | checksum-verify | flow-control | ip-header-dscp | reorder-timeout | sequence-mode | sequence-numbers | threegppp2-ext-headers qos-marking }

no gre { checksum | checksum-verify | flow-control | ip-header-dscp | segmentation | sequence-numbers | threegppp2-ext-headers qos-marking }

default

Restores the specified parameter to its default setting.

no

Disables the specified functionality.

checksum

Default: disabled
Enables the introduction of the checksum field in outgoing GRE packets.

checksum-verify

Default: disabled
Enables verification of the GRE checksum (if present) in incoming GRE packets.

flow-control [action { disconnect-session | resume-session }] [timeout *msecs* **] +**

Default: no GRE flow-control
Enables 3GPP2 GRE flow control which causes the HSGW to send flow control enabled Normal Vendor Specific Extensions (NVSE) in A11 RRPs.
action { disconnect-session | resume-session }:
Default: disconnect-session
Specifies the action to be taken when timeout is reached:

- **disconnect-session**: Ends the session and releases the call.
- **resume-session**: Switches flow control to XON and resumes delivery of packets to the RAN.

timeout *msecs*
Default: 1000 milliseconds (10 seconds)
Sets the amount of time wait for an XON indicator from the RAN (after receiving an XOFF). Also sets the action to be taken if the timeout limit is reached.
msecs: Specifies the amount of time in milliseconds before the timeout is reached. *msecs* must be an integer from 1 through 1000000.

---

ip-header-dscp *value* **{ all-control-packets | setup-packets-only }**

Default: Disabled
Used to configure the QoS Differentiated Services Code Point (DSCP) marking for GRE packets.

- *value*: Represents the DSCP setting. It represents the first six most-significant bits of the ToS field. It can be configured to any hex value from 0x0 through 0x3F.
- **all-control-packets**: Dictates that the DSCP marking is to be provided in all GRE control packets.
- **setup-packets-only**: Dictates that the DSCP marking is to be provided only in GRE setup packets.

---

reorder-timeout *msecs*

Default: 100
Configures max number of milliseconds to wait before processing reordered out-of-sequence GRE packets. *msecs* must be an integer from 0 through 5000.

---

segmentation

Default: disabled
