# Cisco Wireless LAN Controller Commands

---

The Cisco Wireless LAN Solution command line interface (CLI) enables operators to connect an ASCII console to the Cisco Wireless LAN Controller and configure the controller and its associated access points.

This document covers the commands available in the Cisco CLI release 5.0. The controllers currently covered include:

- Cisco 2100 and 4400 Series Wireless LAN Controllers
- Cisco Wireless Services Modules (WiSM)
- Cisco Wireless LAN Controller Network Modules
- Catalyst 3750G Integrated Wireless LAN Controller Switches

This chapter contains the following sections:

- [Using the ? command](#)
- [Using the Help Command](#)
- [Show Commands for Viewing Configuration](#)
- [Configuring Controller Settings](#)
- [Saving Configurations](#)
- [Clearing Configurations, Logfiles, and Other Actions](#)
- [Uploading and Downloading Files and Configurations](#)
- [Troubleshooting Commands](#)

# Using the ? command

To display all of the commands in your current level of the command tree, or to display more information about a particular command, use the ? command.

?

command name ?

When you enter a command information request, put a space between **command name** and ?.

---

## Examples

The following command shows you all the commands and levels available from the root level.

> ?

```
clear      Clear selected configuration elements.  
config     Configure switch options and settings.  
debug      Manages system debug options.  
help       Help  
linktest   Perform a link test to a specified MAC address.  
logout    Exit this session. Any unsaved changes are lost.  
ping      Send ICMP echo packets to a specified IP address.  
reset     Reset options.  
save      Save switch configurations.  
show      Display switch options and settings.  
transfer  Transfer a file to or from the switch.
```

The following command shows you that datatype is the only entry at the transfer download level:

```
> transfer download d?  
datatype
```

The following command shows you the permissible entries for the transfer download datatype command:

```
> transfer download datatype ?
```

```
config     Download Configuration File.  
code       Download an executable image to the system.  
image      Download a web page logo to the system.  
signature  Download a signature file to the system.  
webadmincert Download a certificate for web administration to the system.  
webauthcert Download a web certificate for web portal to the system.
```

# Using the Help Command

To look up keyboard commands, use the **help** command at the root level.

```
help
```

---

## Examples

```
> help
```

```
HELP:  
Special keys:  
    DEL, BS... delete previous character  
    Ctrl-A .... go to beginning of line  
    Ctrl-E .... go to end of line  
    Ctrl-F .... go forward one character  
    Ctrl-B .... go backward one character  
    Ctrl-D .... delete current character  
    Ctrl-U, X. delete to beginning of line  
    Ctrl-K .... delete to end of line  
    Ctrl-W .... delete previous word  
    Ctrl-T .... transpose previous character  
    Ctrl-P .... go to previous line in history buffer  
    Ctrl-N .... go to next line in history buffer  
    Ctrl-Z .... return to root command prompt  
    Tab, <SPACE> command-line completion  
    Exit .... go to next lower command prompt  
    ? .... list choices
```

# Show Commands for Viewing Configuration

To view Cisco Wireless LAN controller options and settings, use the **show** commands.

## Show 802.11x Commands

To view **show** commands for the 802.11a, 802.11b, or other supported 802.11 network, use the **show 802.11x** commands.

### show 802.11a

To display basic 802.11a options and settings, use the **show 802.11a** command.

**show 802.11a**

<b>Syntax Description</b>	<b>show</b> Displays configurations. <b>802.11a</b> 802.11a configurations.
---------------------------	--

<b>Defaults</b>	None.
-----------------	-------

<b>Examples</b>	> 802.11a Network..... Enabled 11nSupport..... Enabled 802.11a Low Band..... Enabled 802.11a Mid Band..... Enabled 802.11a High Band..... Enabled 802.11a Operational Rates 802.11a 6M Rate..... Mandatory 802.11a 9M Rate..... Supported 802.11a 12M Rate..... Mandatory 802.11a 18M Rate..... Supported 802.11a 24M Rate..... Mandatory 802.11a 36M Rate..... Supported 802.11a 48M Rate..... Supported 802.11a 54M Rate..... Supported 802.11n MCS Settings: MCS 0..... Supported MCS 1..... Supported MCS 2..... Supported MCS 3..... Supported MCS 4..... Supported MCS 5..... Supported MCS 6..... Supported MCS 7..... Supported MCS 8..... Supported MCS 9..... Supported MCS 10..... Supported MCS 11..... Supported MCS 12..... Supported MCS 13..... Supported MCS 14..... Supported
-----------------	--

MCS 15.....	Supported
802.11n Status:	
A-MPDU Tx .....	Enabled
Priority 0.....	Enabled
Priority 1.....	Enabled
Priority 2.....	Enabled
Priority 3.....	Enabled
Priority 4.....	Enabled
Priority 5.....	Disabled
Priority 6.....	Disabled
Priority 7.....	Enabled
A-MSDU Tx .....	Enabled
Rifs Tx .....	Enabled
Guard Interval .....	Short
Beacon Interval.....	100
CF Pollable mandatory.....	Disabled
CF Poll Request mandatory.....	Disabled
CFP Period.....	4
CFP Maximum Duration.....	60
Default Channel.....	36
Default Tx Power Level.....	1
DTPC Status.....	Enabled
Fragmentation Threshold.....	2346
Long Retry Limit.....	4
Maximum Rx Life Time.....	512
Max Tx MSDU Life Time.....	512
Medium Occupancy Limit.....	100
Pico-Cell Status.....	Disabled
Pico-Cell-V2 Status.....	Disabled
RTS Threshold.....	2347
Short Retry Limit.....	7
TI Threshold.....	-50
Traffic Stream Metrics Status.....	Disabled
Expedited BW Request Status.....	Disabled
EDCA profile type.....	default-wmm
Voice MAC optimization status.....	Disabled
Call Admission Control (CAC) configuration	
Voice AC - Admission control (ACM).....	Disabled
Voice max RF bandwidth.....	75
Voice reserved roaming bandwidth.....	6
Voice load-based CAC mode.....	Disabled
Voice tspec inactivity timeout.....	Disabled
Video AC - Admission control (ACM).....	Disabled
Voice Stream-Size.....	84000
Voice Max-Streams.....	2
Video max RF bandwidth.....	Infinite
Video reserved roaming bandwidth.....	0

**Related Commands****show 802.11b****show advanced 802.11a summary**

## show 802.11a l2roam

To display 802.11a Layer 2 client roaming information, use the **show 802.11a l2roam** command.

**show 802.11a l2roam {rf-param | statistics *mac\_address*}**

---

### Syntax Description

<b>show</b>	Displays configurations.
<b>802.11a</b>	802.11a configurations.
<b>l2roam</b>	Layer 2 client roaming configurations.
<b>rf-param</b>	Radio frequency parameters.
<b>statistics</b>	Layer 2 client roaming statistics.
<i>mac_address</i>	The MAC address of the client.

---

---

### Defaults

None.

---

### Examples

```
> show 802.11a l2roam rf-param

L2Roam 802.11a RF Parameters.....
  Config Mode..... Default
  Minimum RSSI..... -85
  Roam Hysteresis..... 2
  Scan Threshold..... -72
  Transition time..... 5
```

---

### Related Commands

**show 802.11b l2roam**  
**config {802.11a | 802.11b} l2roam rf-params**

# show 802.11b

To display basic 802.11b/g options and settings, use the **show 802.11b** command.

## show 802.11b

<b>Syntax Description</b>	<b>show</b> Displays configurations. <b>802.11b</b> 802.11b/g configurations.
---------------------------	--

<b>Defaults</b>	None.
-----------------	-------

## Examples

```
> show 802.11b
> 802.11b Network..... Enabled
  11nSupport..... Enabled
    802.11b Low Band..... Enabled
    802.11b Mid Band..... Enabled
    802.11b High Band..... Enabled
  802.11a Operational Rates
    802.11b 6M Rate..... Mandatory
    802.11b 9M Rate..... Supported
    802.11b 12M Rate..... Mandatory
    802.11b 18M Rate..... Supported
    802.11b 24M Rate..... Mandatory
    802.11b 36M Rate..... Supported
    802.11b 48M Rate..... Supported
    802.11b 54M Rate..... Supported
  802.11n MCS Settings:
    MCS 0..... Supported
    MCS 1..... Supported
    MCS 2..... Supported
    MCS 3..... Supported
    MCS 4..... Supported
    MCS 5..... Supported
    MCS 6..... Supported
    MCS 7..... Supported
    MCS 8..... Supported
    MCS 9..... Supported
    MCS 10..... Supported
    MCS 11..... Supported
    MCS 12..... Supported
    MCS 13..... Supported
    MCS 14..... Supported
    MCS 15..... Supported
  802.11n Status:
    A-MPDU Tx ..... Enabled
      Priority 0..... Enabled
      Priority 1..... Enabled
      Priority 2..... Enabled
      Priority 3..... Enabled
      Priority 4..... Enabled
      Priority 5..... Disabled
      Priority 6..... Disabled
      Priority 7..... Enabled
    A-MSDU Tx ..... Enabled
    Rifs Tx ..... Enabled
```

Guard Interval .....	Short
Beacon Interval.....	100
CF Pollable mandatory.....	Disabled
CF Poll Request mandatory.....	Disabled
CFP Period.....	4
CFP Maximum Duration.....	60
Default Channel.....	36
Default Tx Power Level.....	1

Video reserved roaming bandwidth.....	0

---

**Related Commands****show 802.11a****show advanced 802.11b summary**

# show 802.11b l2roam

To display 802.11b/g Layer 2 client roaming information, use the **show 802.11b l2roam** command.

**show 802.11b l2roam {rf-param | statistics *mac\_address*}**

<b>Syntax Description</b>	<b>show</b> Displays configurations. <b>802.11b</b> 802.11b/g configurations. <b>l2roam</b> Layer 2 client roaming configurations. <b>rf-param</b> Radio frequency parameters. <b>statistics</b> Layer 2 client roaming statistics. <i>mac_address</i> The MAC address of the client.
---------------------------	--

<b>Defaults</b>	None.
-----------------	-------

<b>Examples</b>	<pre>&gt; show 802.11b l2roam rf-param</pre> <pre>L2Roam 802.11bg RF Parameters..... Config Mode..... Default Minimum RSSI..... -85 Roam Hysteresis..... 2 Scan Threshold..... -72 Transition time..... 5</pre>
-----------------	---

<b>Related Commands</b>	<a href="#">show 802.11a l2roam</a> <a href="#">config {802.11a   802.11b} l2roam rf-params</a>
-------------------------	--

## show 802.11h

To display basic 802.11h options and settings, use the **show 802.11h** command.

**show 802.11h**

<b>Syntax Description</b>	<b>show</b> Displays configurations. <b>802.11h</b> 802.11h configurations.
---------------------------	--

**Defaults** None.

**Examples** > **show 802.11h**

```
802.11h ..... powerconstraint : 0
802.11h ..... channelswitch : Disable
802.11h ..... channelswitch mode : 0
```

**Related Commands** **show 802.11a**  
**show 802.11b**  
**config 802.11h**

# show aaa auth

To display the configuration settings for the AAA authentication server database, use the **show aaa auth** command.

## show aaa auth

**Syntax Description** This command has no arguments or keywords.

**Defaults** This command has no defaults.

**Examples**

```
> show aaa auth

Management authentication server order:
  1..... local
  2..... tacacs
```

**Related Commands** [config aaa auth](#)

# show acl

To display the access control lists (ACLs) that are configured on the controller, use the **show acl** command.

**show acl {summary | detailed *acl\_name*}**

Syntax Description	
<b>show</b>	Displays configurations.
<b>acl</b>	ACL configurations.
<b>summary</b>	Displays a summary of all ACLs configured on the controller.
<b>detailed</b>	Displays detailed information about a specific ACL.
<i>acl_name</i>	The ACL name up to 32 alphanumeric characters.

**Defaults** None.

Examples	
> <b>show acl summary</b>	<pre>ACL Counter Status      Enabled ----- ACL Name               Applied ----- acl1                  Yes acl2                  Yes acl3                  Yes</pre>
> <b>show acl detailed <i>acl_name</i></b>	<pre>Source          Destination          Source Port Dest Port I Dir IP Address/Netmask IP Address/Netmask Prot    Range Range   DSCP Action Counter ----- 1 Any 0.0.0.0/0.0.0.0  0.0.0.0/0.0.0.0  Any  0-65535 0-65535 0  Deny  0 2 In  0.0.0.0/0.0.0.0  200.200.200.0/   6    80-80   0-65535 Any  Permit 0  DenyCounter :      0</pre>

**Note** The Counter field increments each time a packet matches an ACL rule, and the DenyCounter field increments each time a packet does not match any of the rules.

Related Commands	
<b>clear acl counters</b>	
<b>config acl counter</b>	
<b>config interface acl</b>	

# show acl cpu

To display the access control lists (ACLs) configured on the central processing unit (CPU), use the **show acl cpu** command.

**show acl cpu**

Syntax Description	show                      Displays configurations. acl                      ACL configurations. cpu                      Displays a summary of all the ACLs configured on the CPU.
Command Default	None
Examples	> show acl cpu CPU Acl Name..... Wireless Traffic..... Disabled Wired Traffic..... Disabled Applied to NPU..... No
Related Commands	<b>config acl cpu</b>

## Show Advanced 802.11a Commands

Use the **show advanced 802.11a** commands to show advanced 802.11a parameters.

## show advanced 802.11a channel

To display the automatic channel assignment configuration and statistics, use the **show advanced 802.11a channel** command.

### show advanced 802.11a channel

Syntax Description	
<b>show</b>	Displays configurations.
<b>advanced</b>	Advanced parameters.
<b>802.11a</b>	802.11a network.
<b>channel</b>	Channel status.

**Defaults** None.

### Examples

> **show advanced 802.11a channel**

```
Automatic Channel Assignment
  Channel Assignment Mode..... ONCE
  Channel Update Interval..... 600 seconds
  Anchor time (Hour of the day)..... 15
  Channel Update Count..... 0
  Channel Update Contribution..... S.IU
  Channel Assignment Leader..... 00:0b:85:40:90:c0
  Last Run..... 501 seconds ago
  DCA Sensitivity Level..... MEDIUM (20 dB)
  DCA 802.11n Channel Width..... 40 MHz
  Channel Energy Levels
    Minimum..... -92 dBm
    Average..... -92 dBm
    Maximum..... -92 dBm
  Channel Dwell Times
    Minimum..... 0 days, 00 h 58 m 45 s
    Average..... 0 days, 00 h 58 m 45 s
    Maximum..... 0 days, 00 h 58 m 45 s
  Auto-RF Allowed Channel List..... 36,40
  Auto-RF Allowed Channel List..... 36,40,44,48,52,56,60,64,100,
                                ..... 104,108,112,116,132,136,140,
                                ..... 149,153,157,161,165,190,196
  DCA Outdoor AP option..... Disabled
```

**Related Commands** config 802.11a channel

# show advanced 802.11a coverage

To display the configuration and statistics for coverage hole detection, use the **show advanced 802.11a coverage** command.

## show advanced 802.11a coverage

Syntax Description	<b>show</b> Displays configurations. <b>advanced</b> Advanced parameters. <b>802.11a</b> 802.11a network. <b>coverage</b> Coverage hole detection.
<b>Defaults</b>	None.
<b>Examples</b>	<pre>&gt; show advanced 802.11a coverage  Coverage Hole Detection   802.11a Coverage Hole Detection Mode..... Enabled   802.11a Coverage Voice Packet Count..... 100 packets   802.11a Coverage Voice Packet Percentage..... 50%   802.11a Coverage Voice RSSI Threshold..... -80 dBm   802.11a Coverage Data Packet Count..... 50 packets   802.11a Coverage Data Packet Percentage..... 50%   802.11a Coverage Data RSSI Threshold..... -80 dBm   802.11a Global coverage exception level..... 25 %   802.11a Global client minimum exception lev.... 3 clients</pre>

  

Related Commands	<a href="#">config advanced 802.11a coverage</a> <a href="#">config advanced 802.11a coverage exception global</a> <a href="#">config advanced 802.11a coverage fail-rate</a> <a href="#">config advanced 802.11a coverage level global</a> <a href="#">config advanced 802.11a coverage packet-count</a> <a href="#">config advanced 802.11a coverage rssi-threshold</a>
------------------	--

## show advanced 802.11a group

To display the advanced 802.11a Cisco radio RF grouping, use the **show advanced 802.11a group** command.

**show advanced 802.11a group**

Syntax Description	
<b>show</b>	Displays configurations.
<b>advanced</b>	Advanced parameters.
<b>802.11a</b>	802.11a network.
<b>group</b>	RF grouping values.

**Defaults** None.

**Examples** > **show advanced 802.11a group**

```
Radio RF Grouping
 802.11a Group Mode..... AUTO
 802.11a Group Update Interval..... 600 seconds
 802.11a Group Leader..... xx:xx:xx:xx:xx:xx
 802.11a Group Member..... xx:xx:xx:xx:xx:xx
 802.11a Last Run..... 133 seconds ago
```

**Related Commands** config advanced 802.11a group-mode

# show advanced 802.11a logging

To display advanced 802.11a RF event and performance logging, use the **show advanced 802.11a logging** command.

**show advanced 802.11a logging**

<b>Syntax Description</b>	<b>show</b> Displays configurations. <b>advanced</b> Advanced parameters. <b>802.11a</b> 802.11a network. <b>logging</b> RF event and performance logging.
---------------------------	---

**Defaults** None.

**Examples** > **show advanced 802.11a logging**

```
RF Event and Performance Logging
  Channel Update Logging..... Off
  Coverage Profile Logging..... Off
  Foreign Profile Logging..... Off
  Load Profile Logging..... Off
  Noise Profile Logging..... Off
  Performance Profile Logging..... Off
  TxPower Update Logging..... Off
```

**Related Commands** config advanced 802.11a logging channel, config advanced 802.11a logging coverage, config advanced 802.11a logging foreign, config advanced 802.11a logging load, config advanced 802.11a logging noise, config advanced 802.11a logging performance, config advanced 802.11a logging power

## show advanced 802.11a monitor

To display the advanced 802.11a default Cisco radio monitoring, use the **show advanced 802.11a monitor** command.

**show advanced 802.11a monitor**

Syntax Description	
<b>show</b>	Displays configurations.
<b>advanced</b>	Advanced parameters.
<b>802.11a</b>	802.11a network.
<b>monitor</b>	Cisco radio monitoring values.

**Defaults** None.

**Examples** > **show advanced 802.11a monitor**

```
Default 802.11a AP monitoring
 802.11a Monitor Mode..... enable
 802.11a Monitor Channels..... Country channels
 802.11a AP Coverage Interval..... 180 seconds
 802.11a AP Load Interval..... 60 seconds
 802.11a AP Noise Interval..... 180 seconds
 802.11a AP Signal Strength Interval..... 60 seconds
```

**Related Commands** **config advanced 802.11a monitor coverage**  
**config advanced 802.11a monitor load**  
**config advanced 802.11a monitor noise**  
**config advanced 802.11a monitor signal**

# show advanced 802.11a profile

To display the advanced 802.11a lightweight access point performance profiles, use the **show advanced 802.11a profile** command.

**show advanced 802.11a profile {global | Cisco\_AP}**

<b>Syntax Description</b>	<b>show</b> Displays configurations. <b>advanced</b> Advanced parameters. <b>802.11a</b> 802.11a network. <b>profile</b> Cisco radio performance profile. <b>global</b> All Cisco lightweight access points. <b>Cisco_AP</b> The name of a specific Cisco lightweight access point.
---------------------------	--

**Defaults** None.

**Examples**

```
> show advanced 802.11a profile global

Default 802.11a AP performance profiles
 802.11a Global Interference threshold..... 10%
 802.11a Global noise threshold..... -70 dBm
 802.11a Global RF utilization threshold..... 80%
 802.11a Global throughput threshold..... 1000000 bps
 802.11a Global clients threshold..... 12 clients
 802.11a Global coverage threshold..... 12 dB
 802.11a Global coverage exception level..... 80%
 802.11a Global client minimum exception lev..... 3 clients
```

```
> show advanced 802.11a profile AP1
```

Cisco AP performance profile not customized

This response indicates that the performance profile for this lightweight access point is using the global defaults and has not been individually configured.

**Related Commands**

- config advanced 802.11b profile clients**
- config advanced 802.11b profile customize**
- config advanced 802.11b profile foreign**
- config advanced 802.11b profile noise,**
- config advanced 802.11b profile throughput**
- config advanced 802.11b profile utilization**

# show advanced 802.11a receiver

To display the configuration and statistics of the 802.11a receiver, use the **show advanced 802.11a receiver** command.

**show advanced 802.11a receiver**

Syntax Description	
<b>show</b>	Displays configurations.
<b>advanced</b>	Advanced parameters.
<b>802.11a</b>	802.11a network.
<b>receiver</b>	Receiver.

**Defaults** None.

**Examples** > **show advanced 802.11a receiver**

```
802.11a Advanced Receiver Settings
RxStart    : Signal Threshold..... 15
RxStart    : Signal Lamp Threshold..... 5
RxStart    : Preamble Power Threshold..... 2
RxReStart : Signal Jump Status..... Enabled
RxReStart : Signal Jump Threshold..... 10
TxStomp   : Low RSSI Status..... Enabled
TxStomp   : Low RSSI Threshold..... 30
TxStomp   : Wrong BSSID Status..... Enabled
TxStomp   : Wrong BSSID Data Only Status..... Enabled
RxAbort   : Raw Power Drop Status..... Disabled
RxAbort   : Raw Power Drop Threshold..... 10
RxAbort   : Low RSSI Status..... Disabled
RxAbort   : Low RSSI Threshold..... 0
RxAbort   : Wrong BSSID Status..... Disabled
RxAbort   : Wrong BSSID Data Only Status..... Disabled
```

**Related Commands** **config advanced 802.11a monitor coverage**  
**config advanced 802.11a monitor load**  
**config advanced 802.11a monitor noise**  
**config advanced 802.11a monitor signal**

# show advanced 802.11a summary

To display the advanced 802.11a Cisco lightweight access point name, channel, and transmit level summary, use the **show advanced 802.11a summary** command.

## show advanced 802.11a summary

### Syntax Description

<b>show</b>	Displays configurations.
<b>advanced</b>	Advanced parameters.
<b>802.11a</b>	802.11a network.
<b>summary</b>	Cisco lightweight access point name, channel, and transmit level summary.

### Defaults

None.

### Examples

> **show advanced 802.11a summary**

AP Name	Channel	TxPower Level
AP03	36*	1*
AP02	52	5*
AP01	64	5

An asterisk (\*) next to a channel number or power level indicates that it is being controlled by the global algorithm settings.

### Related Commands

**show advanced 802.11b summary**

## show advanced 802.11a txpower

To view the advanced 802.11a automatic transmit power assignment, use the **show advanced 802.11a txpower** command.

**show advanced 802.11a txpower**

Syntax Description	
<b>show</b>	Displays configurations.
<b>advanced</b>	Advanced parameters.
<b>802.11a</b>	802.11a network.
<b>txpower</b>	Transmit power.

**Defaults** None.

**Examples** > **show advanced 802.11a txpower**

```
Automatic Transmit Power Assignment
  Transmit Power Assignment Mode..... AUTO
  Transmit Power Update Interval..... 600 seconds
  Transmit Power Threshold..... -65 dBm
  Transmit Power Neighbor Count..... 3 APs
  Transmit Power Update Contribution..... SN.
  Transmit Power Assignment Leader..... xx:xx:xx:xx:xx:xx
  Last Run..... 384 seconds ago
```

**Related Commands** config advanced 802.11a txpower-update, config 802.11a txPower

## Show Advanced 802.11b Commands

Use the **show advanced 802.11b** commands to show advanced 802.11b parameters.

# show advanced 802.11b channel

To display the automatic channel assignment status and statistics, use the **show advanced 802.11b channel** command.

## show advanced 802.11b channel

### Syntax Description

<b>show</b>	Displays configurations.
<b>advanced</b>	Advanced parameters.
<b>802.11b</b>	802.11b/g network.
<b>channel</b>	Channel status.

### Defaults

None.

### Examples

```
> show advanced 802.11b channel

Automatic Channel Assignment
  Channel Assignment Mode..... ONCE
  Channel Update Interval..... 600 seconds
  Anchor time (Hour of the day)..... 14
  Channel Update Count..... 0
  Channel Update Contribution..... S.IU
  Channel Assignment Leader..... 00:0b:85:40:90:c0
  Last Run..... 10 seconds ago

  DCA Sensitivity Level: ..... MEDIUM (15 dB)
  Channel Energy Levels
    Minimum..... unknown
    Average..... unknown
    Maximum..... unknown
  Channel Dwell Times
    Minimum..... 0 days, 01 h 44 m 25 s
    Average..... 0 days, 01 h 45 m 00 s
    Maximum..... 0 days, 01 h 45 m 35 s
  Auto-RF Allowed Channel List..... 1,6,11
  Auto-RF Unused Channel List..... 2,3,4,5,7,8,9,10
```

### Related Commands

**config 802.11b channel**

## show advanced 802.11b coverage

To display the configuration and statistics for coverage hole detection, use the **show advanced 802.11b coverage** command.

**show advanced 802.11b coverage**

Syntax Description	
<b>show</b>	Displays configurations.
<b>advanced</b>	Advanced parameters.
<b>802.11b</b>	802.11a network.
<b>coverage</b>	Coverage hole detection.

**Defaults** None.

**Examples** > **show advanced 802.11b coverage**

```
Coverage Hole Detection
 802.11b Coverage Hole Detection Mode..... Enabled
 802.11b Coverage Voice Packet Count..... 100 packets
 802.11b Coverage Voice Packet Percentage..... 50%
 802.11b Coverage Voice RSSI Threshold..... -80 dBm
 802.11b Coverage Data Packet Count..... 50 packets
 802.11b Coverage Data Packet Percentage..... 50%
 802.11b Coverage Data RSSI Threshold..... -80 dBm
 802.11b Global coverage exception level..... 25 %
 802.11b Global client minimum exception lev.... 3 clients
```

**Related Commands**

[config advanced 802.11b coverage](#)  
[config advanced 802.11b coverage exception global](#)  
[config advanced 802.11b coverage fail-rate](#)

# show advanced 802.11b group

To display the advanced 802.11b/g Cisco radio RF grouping, use the **show advanced 802.11b group** command.

## show advanced 802.11b group

### Syntax Description

<b>show</b>	Displays configurations.
<b>advanced</b>	Advanced parameters.
<b>802.11b</b>	802.11b/g network.
<b>group</b>	RF grouping values.

### Defaults

None.

### Examples

> **show advanced 802.11b group**

```
Radio RF Grouping
 802.11b Group Mode..... AUTO
 802.11b Group Update Interval..... 600 seconds
 802.11b Group Leader..... xx:xx:xx:xx:xx:xx
 802.11b Group Member..... xx:xx:xx:xx:xx:xx
 802.11b Last Run..... 511 seconds ago
```

### Related Commands

**config advanced 802.11b group-mode**

## show advanced 802.11b logging

To display advanced 802.11b/g RF event and performance logging, use the **show advanced 802.11b logging** command.

**show advanced 802.11b logging**

Syntax Description	
<b>show</b>	Displays configurations.
<b>advanced</b>	Advanced parameters.
<b>802.11b</b>	802.11b network.
<b>logging</b>	RF event and performance logging.

**Defaults** None.

**Examples** > **show advanced 802.11b logging**

```
RF Event and Performance Logging
  Channel Update Logging..... Off
  Coverage Profile Logging..... Off
  Foreign Profile Logging..... Off
  Load Profile Logging..... Off
  Noise Profile Logging..... Off
  Performance Profile Logging..... Off
  Transmit Power Update Logging..... Off
```

**Related Commands** **config advanced 802.11b logging channel**  
**config advanced 802.11b logging coverage**  
**config advanced 802.11b logging foreign**  
**config advanced 802.11b logging load**  
**config advanced 802.11b logging noise**  
**config advanced 802.11b logging performance**  
**config advanced 802.11b logging power**

# show advanced 802.11b monitor

To display the advanced 802.11b/g default Cisco radio monitoring, use the **show advanced 802.11b monitor** command.

## show advanced 802.11b monitor

### Syntax Description

<b>show</b>	Displays configurations.
<b>advanced</b>	Advanced parameters.
<b>802.11b</b>	802.11b/g network.
<b>monitor</b>	Cisco radio monitoring values.

### Defaults

None.

### Examples

```
> show advanced 802.11b monitor

Default 802.11b AP monitoring
  802.11b Monitor Mode..... enable
  802.11b Monitor Channels..... Country channels
  802.11b AP Coverage Interval..... 180 seconds
  802.11b AP Load Interval..... 60 seconds
  802.11b AP Noise Interval..... 180 seconds
  802.11b AP Signal Strength Interval..... 60 seconds
```

### Related Commands

- config advanced 802.11b monitor coverage**
- config advanced 802.11b monitor load**
- config advanced 802.11b monitor noise**
- config advanced 802.11b monitor signal**

# show advanced 802.11b profile

To display the advanced 802.11b/g Cisco radio performance profiles, use the **show advanced 802.11b profile** command.

**show advanced 802.11b profile {global | Cisco\_AP}**

Syntax Description	
<b>show</b>	Displays configurations.
<b>advanced</b>	Advanced parameters.
<b>802.11b</b>	802.11b/g network.
<b>profile</b>	Cisco lightweight access point performance profile.
<b>global</b>	All Cisco lightweight access points.
<i>Cisco_AP</i>	The name of Cisco lightweight access point.

**Defaults** None.

**Examples**

```
> show advanced 802.11b profile global

Default 802.11b AP performance profiles
 802.11b Global Interference threshold..... 10%
 802.11b Global noise threshold..... -70 dBm
 802.11b Global RF utilization threshold..... 80%
 802.11b Global throughput threshold..... 1000000 bps
 802.11b Global clients threshold..... 12 clients
 802.11b Global coverage threshold..... 12 dB
 802.11b Global coverage exception level..... 80%
 802.11b Global client minimum exception lev..... 3 clients
```

```
> show advanced 802.11b profile API
```

```
Cisco AP performance profile not customized
```

This response indicates that the performance profile for this Cisco lightweight access point is using the global defaults and has not been individually configured.

**Related Commands**

**config advanced 802.11b profile clients**  
**config advanced 802.11b profile customize**  
**config advanced 802.11b profile foreign**  
**config advanced 802.11b profile noise**  
**config advanced 802.11b profile throughput**  
**config advanced 802.11b profile utilization**

# show advanced 802.11b receiver

To display the advanced 802.11b/g default Cisco radio receiver parameters, use the **show advanced 802.11b receiver** command.

## show advanced 802.11b receiver

<b>Syntax Description</b>	<b>show</b> Displays configurations. <b>advanced</b> Advanced parameters. <b>802.11b</b> 802.11b/g network. <b>receiver</b> Cisco radio receiver values.
---------------------------	---

<b>Defaults</b>	None.
-----------------	-------

## Examples

```
> show advanced 802.11b receiver

Default 802.11b Receiver Settings
  RxStart      : Signal Threshold..... 15
  RxStart      : Signal Jump Threshold..... 5
  RxStart      : Preamble Power Threshold..... 2
  RxRestart    : Signal Jump Status..... Enabled
  RxRestart    : Signal Jump Threshold..... 10
  TxStomp     : Low RSS Status. .... Disabled
  TxStomp     : Low RSSI Threshold..... 37
  TxStomp     : Wrong BSSID Status..... Disabled
  TxStomp     : Wrong BSSID Data Only Status... Disabled
  RxAbort     : Raw Power Drop Status..... Disabled
  RxAbort     : Raw Power Drop Threshold..... 0
  RxAbort     : Low RSSI Status..... Enabled
  RxAbort     : Low RSSI Threshold..... 0
  RxAbort     : Wrong BSSID Status..... Disabled
  RxAbort     : Wrong BSSID Data Only Status... Disabled
```

<b>Related Commands</b>	<a href="#">config advanced 802.11b monitor coverage</a> <a href="#">config advanced 802.11b monitor load</a> <a href="#">config advanced 802.11b monitor noise</a> <a href="#">config advanced 802.11b monitor signal</a>
-------------------------	---

## show advanced 802.11b summary

To display the advanced 802.11b/g Cisco lightweight access point name, channel, and transmit level summary, use the **show advanced 802.11b summary** command.

**show advanced 802.11b summary**

<b>Syntax Description</b>	
<b>show</b>	Displays configurations.
<b>advanced</b>	Advanced parameters.
<b>802.11b</b>	802.11b/g network.
<b>summary</b>	Cisco lightweight access point name, channel, and transmit level summary.

**Defaults** None.

**Examples** > **show advanced 802.11b summary**

AP name	Channel	Txpower Level
AP1	11*	1*
AP2	10*	4
AP3	6*	2

**Note** Asterisks next to channel numbers or power levels indicate that they are being controlled by the global algorithm settings.

**Related Commands** **show advanced 802.11a summary**

# show advanced 802.11b txpower

To view the advanced 802.11b/g automatic transmit power assignment, use the **show advanced 802.11b txpower** command.

## show advanced 802.11b txpower

### Syntax Description

<b>show</b>	Displays configurations.
<b>advanced</b>	Advanced parameters.
<b>802.11b</b>	802.11b/g network.
<b>txpower</b>	Transmit power.

### Defaults

None.

### Examples

> **show advanced 802.11b txpower**

```
Automatic Transmit Power Assignment
  Transmit Power Assignment Mode..... AUTO
  Transmit Power Update Interval..... 600 seconds
  Transmit Power Threshold..... -65 dBm
  Transmit Power Neighbor Count..... 3 APs
  Transmit Power Update Contribution..... SNI.
  Transmit Power Assignment Leader..... xx:xx:xx:xx:xx:xx
  Last Run..... 427 seconds ago
```

### Related Commands

**config 802.11b txPower**

# show advanced backup-controller

To display a list of primary and secondary backup controllers, use the **show advanced backup-controller** command.

**show advanced backup-controller**

Syntax Description	
<b>show</b>	Displays configurations.
<b>advanced</b>	Advanced parameters.
<b>backup-controller</b>	Advanced backup controller list.

<b>Defaults</b>	None.
-----------------	-------

<b>Examples</b>	> <b>show advanced backup-controller</b>
	AP primary Backup Controller ..... controller 10.10.10.10 AP secondary Backup Controller ..... 0.0.0.0

<b>Related Commands</b>	<b>config advanced backup-controller primary</b> , <b>config advanced backup-controller secondary</b>
-------------------------	---

## Other Show Advanced Commands

Use these **show advanced** commands to show other advanced parameters.

# show advanced client-handoff

To display the number of automatic client handoffs after retries, use the **show advanced client-handoff** command.

**show advanced client-handoff**

---

**Syntax Description**

**show** Displays configurations.

**advanced** Advanced parameters.

**client-handoff** Advanced client handoff count.

---

---

**Defaults**

None.

---

**Examples**

> **show advanced client-handoff**

Client auto handoff after retries..... 130

---

**Related Commands**

**config advanced timers auth-timeout**

**config advanced timers rogue-ap**

# show advanced eap

To display advanced Extensible Authentication Protocol (EAP) settings, use the **show advanced eap** command.

**show advanced eap**

Syntax Description	
<b>show</b>	Displays configurations.
<b>advanced</b>	Advanced parameters.
<b>eap</b>	Advanced client handoff count.

**Defaults** None.

**Examples** > **show advanced eap**

```
EAP-Identity-Request Timeout (seconds)..... 1
EAP-Identity-Request Max Retries..... 20
EAP Key-Index for Dynamic WEP..... 0
EAP Max-Login Ignore Identity Response..... enable
EAP-Request Timeout (seconds)..... 1
EAP-Request Max Retries..... 20
EAPOL-Key Timeout (seconds)..... 1
EAPOL-Key Max Retries..... 2
```

**Related Commands** None.

# show advanced max-1x-sessions

To display the maximum number of simultaneous 802.1x sessions allowed per access point, use the **show advanced max-1x-sessions** command.

**show advanced max-1x-sessions**

Syntax Description	<b>show</b> Displays configurations. <b>advanced</b> Advanced parameters. <b>max-1x-sessions</b> Maximum number of simultaneous 802.1x sessions allowed per access point.
Defaults	None.
Examples	> <b>show advanced max-1x-sessions</b> Max 802.1x session per AP at a given time..... 0
Related Commands	None.

## show advanced probe-limit

To display the number of probes sent to the WLAN controller per access point per client and the probe interval in milliseconds, use the **show advanced probe-limit** command.

**show advanced probe-limit**

Syntax Description	
<b>show</b>	Displays configurations.
<b>advanced</b>	Advanced parameters.
<b>probe-limit</b>	Number of probes sent to the WLAN controller per access point per client and the probe interval in milliseconds.

**Defaults** None.

**Examples** > **show advanced probe-limit**

```
Probes sent to switch per AP slot per client.... 2  
Probe interval in msec..... 500
```

**Related Commands** None.

# show advanced rate

To display whether control path rate limiting is enabled or disabled, use the **show advanced rate** command.

## show advanced rate

Syntax Description	
<b>show</b>	Displays configurations.
<b>advanced</b>	Advanced parameters.
<b>rate</b>	Control path rate limiting enabled or disabled.
Defaults	None.
Examples	<pre>&gt; show advanced rate  Control Path Rate Limiting..... Disabled</pre>
Related Commands	None.

## show advanced send-disassoc-on-handoff

To display whether the WLAN controller disassociates clients after a handoff, use the **show advanced send-disassoc-on-handoff** command.

**show advanced send-disassoc-on-handoff**

Syntax Description	
<b>show</b>	Displays configurations.
<b>advanced</b>	Advanced parameters.
<b>send-disassoc-on-handoff</b>	WLAN controller disassociates clients after a handoff enabled or disabled. <b>off</b>

Defaults	None.
<b>Examples</b>	> <b>show advanced send-disassoc-on-handoff</b> Send Disassociate on Handoff..... Disabled

Related Commands	None.
------------------	-------

# show advanced statistics

To display whether or not the Cisco Wireless LAN controller port statistics are enabled or disabled, use the **show advanced statistics** command.

**show advanced statistics**

---

**Syntax Description**

<b>show</b>	Displays configurations.
<b>advanced</b>	Advanced parameters.
<b>statistics</b>	Show Cisco Wireless LAN controller port statistics state.

---

---

**Defaults**

None.

---

**Examples**

```
> show advanced statistics  
Switch port statistics..... Enabled
```

---

**Related Commands**

**config advanced timers auth-timeout**  
**config advanced timers rogue-ap**

## show advanced timers

To display the advanced mobility anchor, authentication response, and rogue access point entry timers, use the **show advanced timers** command.

### show advanced timers

Syntax Description	
<b>show</b>	Displays configurations.
<b>advanced</b>	Advanced parameters.
<b>timers</b>	Advanced system timers.

**Defaults** Shown below in examples.

### Examples

```
> show advanced timers

Authentication Response Timeout (seconds)..... 10
Rogue Entry Timeout (seconds)..... 1200
AP Heart Beat Timeout (seconds)..... 30
AP Discovery Timeout (seconds)..... 10
AP Local mode Fast Heartbeat (seconds)..... disable
AP Hreap mode Fast Heartbeat (seconds)..... disable
AP Primary Discovery Timeout (seconds)..... 120
```

**Related Commands** **config advanced timers auth-timeout**  
**config advanced timers rogue-ap**

## Show AP Commands

Use the **show ap** commands to show access point parameters.

# show ap auto-rf

To display the auto-RF settings for a Cisco lightweight access point, use the **show ap auto-rf** command.

**show ap auto-rf {802.11a | 802.11b} Cisco\_AP**

<b>Syntax Description</b>	<b>show</b> Displays configurations. <b>ap auto-rf</b> Cisco radio. <b>{802.11a   802.11b}</b> 802.11a or 802.11b/g setting. <b>Cisco_AP</b> Cisco lightweight access point name.
---------------------------	--

<b>Defaults</b>	None.
-----------------	-------

<b>Examples</b>	<pre>&gt; show ap auto-rf 802.11a AP1</pre> <table> <tbody> <tr><td>Number Of Slots.....</td><td>2</td></tr> <tr><td>AP Name.....</td><td>AP03</td></tr> <tr><td>MAC Address.....</td><td>00:0b:85:01:18:b7</td></tr> <tr><td>    Radio Type.....</td><td>RADIO_TYPE_80211a</td></tr> <tr><td>    Noise Information</td><td></td></tr> <tr><td>        Noise Profile.....</td><td>PASSED</td></tr> <tr><td>            Channel 36.....</td><td>-88 dBm</td></tr> <tr><td>            Channel 40.....</td><td>-86 dBm</td></tr> <tr><td>            Channel 44.....</td><td>-87 dBm</td></tr> <tr><td>            Channel 48.....</td><td>-85 dBm</td></tr> <tr><td>            Channel 52.....</td><td>-84 dBm</td></tr> <tr><td>            Channel 56.....</td><td>-83 dBm</td></tr> <tr><td>            Channel 60.....</td><td>-84 dBm</td></tr> <tr><td>            Channel 64.....</td><td>-85 dBm</td></tr> <tr><td>        Interference Information</td><td></td></tr> <tr><td>            Interference Profile.....</td><td>PASSED</td></tr> <tr><td>                Channel 36.....</td><td>-66 dBm @ 1% busy</td></tr> <tr><td>                Channel 40.....</td><td>-128 dBm @ 0% busy</td></tr> <tr><td>                Channel 44.....</td><td>-128 dBm @ 0% busy</td></tr> <tr><td>                Channel 48.....</td><td>-128 dBm @ 0% busy</td></tr> <tr><td>                Channel 52.....</td><td>-128 dBm @ 0% busy</td></tr> <tr><td>                Channel 56.....</td><td>-73 dBm @ 1% busy</td></tr> <tr><td>                Channel 60.....</td><td>-55 dBm @ 1% busy</td></tr> <tr><td>                Channel 64.....</td><td>-69 dBm @ 1% busy</td></tr> <tr><td>        Rogue Histogram (20/40 ABOVE/40 BELOW)</td><td></td></tr> <tr><td>            Channel 36.....</td><td>16 / 0 / 0</td></tr> <tr><td>            Channel 40.....</td><td>28 / 0 / 0</td></tr> <tr><td>            Channel 44.....</td><td>9 / 0 / 0</td></tr> <tr><td>            Channel 48.....</td><td>9 / 0 / 0</td></tr> <tr><td>            Channel 52.....</td><td>3 / 0 / 0</td></tr> <tr><td>            Channel 56.....</td><td>4 / 0 / 0</td></tr> <tr><td>            Channel 60.....</td><td>7 / 1 / 0</td></tr> <tr><td>            Channel 64.....</td><td>2 / 0 / 0</td></tr> <tr><td>        Load Information</td><td></td></tr> <tr><td>            Load Profile.....</td><td>PASSED</td></tr> <tr><td>            Receive Utilization.....</td><td>0%</td></tr> <tr><td>            Transmit Utilization.....</td><td>0%</td></tr> <tr><td>            Channel Utilization.....</td><td>1%</td></tr> <tr><td>            Attached Clients.....</td><td>1 clients</td></tr> </tbody> </table>	Number Of Slots.....	2	AP Name..... # show ap ccx rm

To display an access point's ccx radio management status information, use the **show ap ccx rm** command.

**show ap ccxrm *ap\_name* status**

<b>Syntax Description</b>	<i>ap_name</i>	Specified the access point name.
---------------------------	----------------	----------------------------------

<b>Defaults</b>	This command has no defaults.
-----------------	-------------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	4.1	This command was introduced.

**Examples** > **show ap ccx rm AP1240-21ac status**

```
A Radio
  Channel Load Request ..... Disabled
  Noise Histogram Request ..... Disabled
  Beacon Request ..... Disabled
  Frame Request ..... Disabled
  Interval ..... 60
  Iteration ..... 10

G Radio
  Channel Load Request ..... Disabled
  Noise Histogram Request ..... Disabled
  Beacon Request ..... Disabled
  Frame Request ..... Disabled
  Interval ..... 60
  Iteration ..... 10
```

**Related Commands** show client ccx

## show ap cdp neighbors detail

This command is used to display information regarding the access point's CDP neighbors.

**show ap cdp neighbors detail [all | ap\_name]**

### Syntax Description

<b>all</b>	Displays the CDP neighbors for all the access points.
<i>ap_name</i>	Displays the CDP neighbors for the specified access point.

### Defaults

This command has no defaults.

### Command History

Release	Modification
4.1	This command was introduced.

### Examples

```
> show ap cdp neighbors all

AP Name:A10-1130
AP IP address:10.00.231.100
-----
Device ID: Switch
Entry address(es): 10.00.231.2
Platform: cisco WS-C3750-24P, Capabilities: Router Switch IGMP
Interface: enet, Port ID (outgoing port): FastEthernet1/0/23 Holdtime: 180 sec

Version:
Cisco Internetwork Operating System Software IOS (tm) C3750 Software (C3750-I9-M),
Version 12.2(20)SE4, RELEASE SOFTWARE (fc1) Copyright (c) 1986-2005 by Cisco Systems,

advertisement version: 2
```

### Related Commands

None.

# show ap config

To display the detailed configuration for a lightweight access point, use the **show ap config** command.

**show ap config {802.11a | 802.11b | general} Cisco\_AP**

<b>Syntax Description</b>	<b>802.11a</b> Displays the 802.11a radio settings. <b>802.11b</b> Displays the 802.11b/g radio settings. <b>general</b> Displays general access point settings. <b>Cisco_AP</b> Specifies the lightweight access point name.
---------------------------	--

<b>Defaults</b>	None.
-----------------	-------

## show ap config global

To display the global syslog server settings for all access points that join the controller, use the **show ap config global** command.

**show ap config global**

<b>Syntax Description</b>	<b>show ap config</b> Displays Cisco radio configurations. <b>global</b> Targeted towards all access points joined to the controller.
---------------------------	--

**Defaults**      None.

**Examples**

```
> show ap config global
AP global system logging host..... 255.255.255.255
```

**Related Commands**      [show ap config general](#)

# show ap core-dump

To display the memory core dump setting for a lightweight access point, use the **show ap core-dump** command.

**show ap core-dump *Cisco\_AP***

<b>Syntax Description</b>	<i>Cisco_AP</i>	Cisco lightweight access point name.
<b>Defaults</b>	None.	
<b>Examples</b>	> show ap core-dump AP02	
<b>Related Commands</b>	config ap core-dump	

## show ap crash-file

To display the list of both crash and radio core dump files generated by lightweight access points, use the **show ap crash-file** command.

**show ap crash-file**

**Syntax Description** This command has no arguments or keywords.

**Defaults** This command has no defaults.

**Examples** > **show ap crash-file**

**Related Commands** **config ap crash-file**

# show ap eventlog

To view the contents of the event log file for an access point that is joined to the controller, use the **show ap eventlog *ap\_name*** command.

**show ap eventlog *ap\_name***

<b>Syntax Description</b>	<i>ap_name</i>	Displays the event log for the specified access point.	
<b>Defaults</b>	None		
<b>Command History</b>	<b>Release</b>	<b>Modification</b>	
	5.1	This command was introduced.	
<b>Examples</b>	<pre>show ap eventlog CiscoAP AP event log download has been initiated Waiting for download to complete  AP event log download completed. ===== *Feb 13 11:54:17.146: %LWAPP-3-CLIENTEVENTLOG: AP event log has been cleared from the controller 'admin' *Feb 13 11:54:32.874: *** Access point reloading. Reason: Reload Command *** *Mar 1 00:00:39.134: %CDP_PD-4-POWER_OK: Full power - NEGOTIATED inline power source *Mar 1 00:00:39.174: %LINK-3-UPDOWN: Interface Dot11Radio1, changed state to up *Mar 1 00:00:39.211: %LINK-3-UPDOWN: Interface Dot11Radio0, changed state to up *Mar 1 00:00:49.947: %LWAPP-3-CLIENTEVENTLOG: Did not get vendor specific options from DHCP. ...</pre>		
<b>Related Commands</b>	<a href="#">clear ap-eventlog</a>		

# show ap inventory

This command is used to display inventory information for an access point.

**show ap inventory *ap\_name***

<b>Syntax Description</b>	<i>ap_name</i>	Displays the inventory for the specified access point.
---------------------------	----------------	--

<b>Defaults</b>	This command has no defaults.
-----------------	-------------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	4.1	This command was introduced.

<b>Examples</b>	> <b>show ap inventory test101</b>  NAME: "test101" , DESC: "Cisco Wireless Access Point" PID: AIR-LAP1131AG-A-K9 , VID: V01, SN: FTX1123T2XX
-----------------	--

<b>Related Commands</b>	None.
-------------------------	-------

# show ap join stats detailed

To display all join-related statistics collected for a specific access point, use the **show ap join stats detailed** command.

**show ap join stats detailed *ap\_mac***

<b>Syntax Description</b>	<b>show</b> Displays configurations. <b>ap</b> All Cisco lightweight access points. <b>join stats detailed</b> Join-related statistics collected for a specific access point. <b>ap_mac</b> Access point Ethernet MAC address or the MAC address of the 802.11 radio interface.
---------------------------	--

<b>Defaults</b>	None.
-----------------	-------

<b>Examples</b>	<pre>&gt; show ap join stats detail 00:0b:85:02:0d:20  Discovery phase statistics - Discovery requests received..... 2 - Successful discovery responses sent..... 2 - Unsuccessful discovery request processing..... 0 - Reason for last unsuccessful discovery attempt..... Not applicable - Time at last successful discovery attempt..... Aug 21 12:50:23:335 - Time at last unsuccessful discovery attempt..... Not applicable  Join phase statistics - Join requests received..... 1 - Successful join responses sent..... 1 - Unsuccessful join request processing..... 1 - Reason for last unsuccessful join attempt..... RADIUS authorization is pending for the AP - Time at last successful join attempt..... Aug 21 12:50:34:481 - Time at last unsuccessful join attempt..... Aug 21 12:50:34:374  Configuration phase statistics - Configuration requests received..... 1 - Successful configuration responses sent..... 1 - Unsuccessful configuration request processing..... 0 - Reason for last unsuccessful configuration attempt... Not applicable - Time at last successful configuration attempt..... Aug 21 12:50:34:374 - Time at last unsuccessful configuration attempt..... Not applicable  Last AP message decryption failure details - Reason for last message decryption failure..... Not applicable  Last AP disconnect details - Reason for last AP connection failure..... Not applicable  Last join error summary - Type of error that occurred last..... Lwapp join request rejected - Reason for error that occurred last..... RADIUS authorization is pending for the AP - Time at which the last join error occurred..... Aug 21 12:50:34:374</pre>
-----------------	--

■ **show ap join stats detailed**

**Related Commands**

- **show ap join stats summary all**
- **show ap join stats summary**

# show ap join stats summary

To display the last join error detail for a specific access point, use the **show ap join stats summary** command.

**show ap join stats summary *ap\_mac***

**Note** To obtain the MAC address of the 802.11 radio interface, enter the **show interfaces Dot11Radio 0** command on the access point.

<b>Syntax Description</b>	<b>show</b> Displays configurations. <b>ap</b> All Cisco lightweight access points. <b>join stats summary</b> Summary of all access points that joined or attempted to join to the controller. <b>ap_mac</b> Access point Ethernet MAC address or the MAC address of the 802.11 radio interface.
---------------------------	---

<b>Defaults</b>	None.
-----------------	-------

<b>Examples</b>	<pre>&gt; show ap join stats summary 00:0b:85:02:0d:20</pre> <table> <tr> <td>Is the AP currently connected to controller.....</td><td>No</td></tr> <tr> <td>Time at which the AP joined this controller last time.....</td><td>Aug 21 12:50:36:061</td></tr> <tr> <td>Type of error that occurred last.....</td><td>Lwapp join request rejected</td></tr> <tr> <td>Reason for error that occurred last.....</td><td>RADIUS authorization is pending for the AP</td></tr> <tr> <td>Time at which the last join error occurred.....</td><td>Aug 21 12:50:34:374</td></tr> </table>	Is the AP currently connected to controller..... ■ **show ap join stats summary all**

## show ap join stats summary all

To display the MAC addresses of all the access points that are joined to the controller or that have tried to join, use the **show ap join stats summary all** command.

**show ap join stats summary all**

Syntax Description	
<b>show</b>	Displays configurations.
<b>ap</b>	All Cisco lightweight access points.
<b>join stats summary</b>	Summary of all access points that joined or attempted to join to the controller.

Defaults	None.
<b>Examples</b>	

> **show ap join stats summary all**

```
Number of APs..... 3
00:0b:85:1b:7c:b0..... Joined
00:12:44:bb:25:d0..... Joined
00:13:19:31:9c:e0..... Not joined
```

Related Commands	show ap join stats summary

# show ap stats

To display the statistics for a Cisco lightweight access point, use the **show ap stats** command.

**show ap stats {802.11a | 802.11b | wlan} Cisco\_AP**

Syntax Description	
<b>show</b>	Displays configurations.
<b>ap stats</b>	Cisco radio.
<b>802.11a</b>	802.11a statistics.
<b>802.11b</b>	802.11b/g statistics.
<b>wlan</b>	WLAN statistics.
<i>Cisco_AP</i>	Cisco lightweight access point name.

**Defaults** None.

**Examples** > **show ap stats 802.11b AP02**

```
Number Of Slots..... 2
AP Name..... AP02
MAC Address..... 00:0b:85:18:b6:50
Radio Type..... RADIO_TYPE_80211a
Stats Information
    Number of Users..... 0
    TxFragmentCount..... 1679
    MulticastTxFrameCnt..... 1260
    FailedCount..... 15892
    RetryCount..... 331
    MultipleRetryCount..... 0
    FrameDuplicateCount..... 0
    RtsSuccessCount..... 0
    RtsFailureCount..... 0
    AckFailureCount..... 80212
    RxFragmentCount..... 248671

    TxFrameCount..... 1679
    WepUndecryptableCount..... 0
```

**Related Commands** **config ap enable**  
**show ap summary**

## show ap summary

To display a summary of all lightweight access points attached to the controller, use the **show ap summary** command. A list containing each lightweight access point name, number of slots, manufacturer, MAC address, location and the controller port number is displayed.

**show ap summary**

<b>Syntax Description</b>	<b>show</b> Displays configurations. <b>ap</b> All Cisco lightweight access points. <b>summary</b> Summary of all Cisco lightweight access points.
---------------------------	--

<b>Defaults</b>	None.
-----------------	-------

<b>Examples</b>	<pre>&gt; show ap summary Number of APs..... 2 Global AP User Name..... user Global AP Dot1x User Name..... Not Configured  Number of APs..... 2 Global AP User Name..... user Global AP Dot1x User Name..... Not Configured  AP Name   Slots   AP Model          Ethernet MAC      Location    Port Country Priority -----  -----  ----- wolverine  2       AIR-LAP1252AG-A-K9 00:1b:d5:13:39:74 Reception  1   US        3 ap:1120    1       AIR-LAP1121G-A-K9  00:1b:d5:a9:ad:08 Hall 235   1   US        1</pre>
-----------------	---

<b>Related Commands</b>	<b>config ap enable</b> <b>config ap priority</b> <b>config network ap-priority</b> <b>show advanced 802.11a summary</b> <b>show advanced 802.11b summary</b>
-------------------------	---

# show ap wlan

To display whether or not a Cisco Wireless LAN controller radio is in wireless LAN override mode (as described in the related product guide), use the **show ap wlan** command.

**show ap wlan {802.11a | 802.11b} Cisco\_AP**

Syntax Description	
<b>show</b>	Displays configurations.
<b>ap</b>	All Cisco lightweight access points.
<b>wlan</b>	Wireless LAN parameter.
<b>802.11a</b>	Displays the access point's 802.11a radio statistics.
<b>802.11b</b>	Displays the access point's 802.11b radio statistics.
<i>ap_name</i>	Specifies the lightweight access point name.

**Defaults** None.

**Examples** > **show ap wlan 802.11a AP01**

```
AP has following wlan Id's configured as override wlanId
Wlan Id:..... 3
```

> **show ap wlan 802.11a AP15**

```
Cisco AP is not in override mode.
```

**Related Commands** **show ap summary**  
**config ap wlan enable**

## show arp switch

To display the Cisco Wireless LAN controller MAC addresses, IP Addresses, and port types, use the **show arp switch** command.

**show arp switch**

### Syntax Description

<b>show</b>	Displays configurations.
<b>arp</b>	arp MAC addresses, IP Addresses, and port types.
<b>switch</b>	Cisco Wireless LAN controller parameters.

### Defaults

None.

### Examples

> **show arp switch**

MAC Address	IP Address	Port	VLAN	Type
xx:xx:xx:xx:xx:xx	xxx.xxx.xxx.xxx	service port	1	
xx:xx:xx:xx:xx:xx	xxx.xxx.xxx.xxx	service port		
xx:xx:xx:xx:xx:xx	xxx.xxx.xxx.xxx	service port		

### Related Commands

**debug arp**

## **show auth-list**

To display the access point authorization list, use the **show auth-list** command.

## **show auth-list**

Syntax Description	show	Displays configurations.
	auth-list	Displays access point authorization list.

---

**Defaults** None.

Examples	> show auth-list	
	Authorize APs against AAA..... disabled	
	Allow APs with Self-signed Certificate (SSC)... disabled	
Mac Addr	Cert Type	Key Hash
xx:xx:xx:xx:xx:xx	MIC	

---

**Related Commands**

## show boot

Each Cisco Wireless LAN controller retains one primary and one backup operating system software load in non-volatile RAM. This allows operators to have the Cisco Wireless LAN controllers boot off the primary load (default), or revert to the backup load when desired. To display the primary and backup software build numbers with an indication of which is active, use the **show boot** command.

**show boot**

<b>Syntax Description</b>	<b>show</b> Displays configurations. <b>boot</b> Software bootable versions.
---------------------------	---

<b>Defaults</b>	None.
-----------------	-------

<b>Examples</b>	> <b>show boot</b> Primary Boot Image..... 3.2.13.0 (active) Backup Boot Image..... 3.2.15.0
-----------------	--

<b>Related Commands</b>	<b>config exclusionlist add</b> <b>config exclusionlist delete</b> <b>config exclusionlist description</b> <b>show client</b>
-------------------------	--

## Show Certificate Commands

Use the **show certificate** commands to display certificate settings.

# show certificate compatibility

To display whether or not certificates are verified as compatible in the Cisco Wireless LAN controller, use the **show certificate compatibility** command.

**show certificate compatibility**

---

**Syntax Description**

**show** Displays configurations.

**certificate** All certificates.

**compatibility** Compatibility of certificates.

---

---

**Defaults**

None.

---

**Examples**

> **show certificate compatibility**

Certificate compatibility mode:..... off

---

**Related Commands**

**show certificate summary**

## show certificate summary

To verify that the controller has generated a certificate, use the **show certificate summary** command.

**show certificate summary**

Syntax Description	
<b>show</b>	Displays configurations.
<b>certificate</b>	All certificates.
<b>summary</b>	Synopsis of all certificates.

Defaults	None.
----------	-------

Examples	> <b>show certificate summary</b>  Web Administration Certificate..... Locally Generated Web Authentication Certificate..... Locally Generated Certificate compatibility mode:..... off
----------	---

Related Commands	<b>show certificate compatibility</b>
------------------	---------------------------------------

## Show Client Commands

Use the **show client** commands to display client settings.

# show client ap

To display the clients on a Cisco lightweight access point, use the **show client ap** command.

The show client ap command may list the status of automatically disabled clients. Use the **show exclusionlist** command to view clients on the exclusion list (blacklisted).

**show client ap {802.11a | 802.11b} *Cisco\_AP***

## Syntax Description

<b>show</b>	Displays configurations.
<b>client ap</b>	Cisco radio.
<b>802.11a</b>	802.11a clients.
<b>802.11b</b>	802.11b/g clients.
<i>Cisco_AP</i>	Cisco lightweight access point name.

## Defaults

None.

## Examples

> **show client ap 802.11b AP1**

MAC Address	AP Id	Status	WLAN Id	Authenticated
xx:xx:xx:xx:xx:xx	1	Associated	1	No

## Related Commands

# show client location-calibration summary

To display client location calibration summary information, use the **show client location-calibration summary** command.

## show client location-calibration summary

**Syntax Description** This command has no arguments or keywords.

**Defaults** This command has no defaults.

Command History	Release	Modification
	4.1	This command was introduced.

**Examples**

```
> show client location-calibration summary
MAC Address Interval
-----
10:10:10:10:10:10 60
21:21:21:21:21:21 45
```

**Related Commands** None.

# show client report

To display detail client information, use the **show client detail** command.

## show client detail

**Syntax Description** This command has no arguments or keywords.

**Defaults** This command has no defaults.

Command History	Release	Modification
	4.1	This command was introduced.

**Examples**

```
> show client detail 00:14:6c:0a:57:77

Client MAC Address..... 00:14:6c:0a:57:77
Client Username ..... N/A
AP MAC Address..... 00:0b:85:0e:19:a0
Client State..... Diagnostics
Wireless LAN Id..... 1
BSSID..... 00:0b:85:0e:19:a0
Channel..... 40
IP Address..... 1.100.150.53
Association Id..... 1
Authentication Algorithm..... Open System
Reason Code..... 0
Status Code..... 0
Session Timeout..... 1800
Client CCX version..... CCXv5
Re-Authentication Timeout..... 1800
QoS Level..... Silver
```

**Related Commands**

None.

# show client summary

To display a summary of clients associated with a Cisco lightweight access point, use the **show client summary** command.

**Note** The show client ap command may list the status of automatically disabled clients. Use the **show exclusionlist** command to view clients on the exclusion list (blacklisted).

## show client summary

### Syntax Description

<b>show</b>	Displays configurations.
<b>client</b>	802.11a or 802.11b/g client.
<b>summary</b>	All attached clients.

### Defaults

None.

### Examples

> **show client summary**

Number of Clients..... 24

MAC Address	AP Name	Status	WLAN	Auth	Protocol	Port
xx:xx:xx:xx:xx:xx	AP02	Probing	N/A	No	802.11a	1
xx:xx:xx:xx:xx:xx	AP02	Probing	N/A	No	802.11a	1
xx:xx:xx:xx:xx:xx	AP02	Probing	N/A	No	802.11b	1
xx:xx:xx:xx:xx:xx	AP02	Probing	N/A	No	802.11a	1
xx:xx:xx:xx:xx:xx	AP02	Probing	N/A	No	802.11b	1
xx:xx:xx:xx:xx:xx	AP02	Probing	N/A	No	802.11b	1
xx:xx:xx:xx:xx:xx	AP02	Probing	N/A	No	802.11b	1
xx:xx:xx:xx:xx:xx	AP02	Probing	N/A	No	802.11b	1
xx:xx:xx:xx:xx:xx	AP02	Probing	N/A	No	802.11b	1
xx:xx:xx:xx:xx:xx	AP02	Probing	N/A	No	802.11a	1
xx:xx:xx:xx:xx:xx	AP02	Probing	N/A	No	802.11a	1
xx:xx:xx:xx:xx:xx	AP02	Probing	N/A	No	802.11b	1
xx:xx:xx:xx:xx:xx	AP02	Probing	N/A	No	802.11a	1
xx:xx:xx:xx:xx:xx	AP02	Probing	N/A	No	802.11a	1

Number of Clients..... 2

### Related Commands

None.

# show client summary guest-lan

To display the active wired guest LAN clients, use the **show client summary guest-lan** command.

**show client summary guest-lan**

## Syntax Description

<b>show</b>	Displays configurations.
<b>client</b>	802.11a or 802.11b/g client.
<b>summary</b>	All attached clients.
<b>guest-LAN</b>	Indicates the active wired guest LAN.

## Defaults

None.

## Examples

> **show client summary**

Number of Clients.....	.....	.....	.....	.....	.....	.....	.....	.....
MAC Address	AP Name	Status	WLAN	Auth	Protocol	Port	Wired	
00:16:36:40:ac:58	N/A	Associated	1	No	802.3	1	Yes	

# show client username

To display client data by username, use the **show client username** command.

**show client username** *username*

## Syntax Description

<b>show</b>	Displays configurations.
<b>client</b>	Displays client data.
<b>username</b>	Cisco radio.
<i>username</i>	Client's username.

## Defaults

None.

## Examples

> **show client username IT\_007**

MAC Address	AP ID	Status	WLAN Id	Authenticated
xx:xx:xx:xx:xx:xx	1	Associated	1	No

## Related Commands

- **show client ap**

# show cpu

To display current WLAN Controller CPU usage information, use the **show cpu** command.

**show cpu**

**Syntax Description** This command has no arguments or keywords.

**Defaults** None.

**Examples**

```
> show cpu
Current CPU load: 2.50%
```

**Related Commands** **show sysinfo**

# show custom-web

To display web authentication customization information, use the **show custom-web** command.

**show custom-web**

---

**Syntax Description** This command has no arguments or keywords.

---

**Defaults** None.

---

**Examples** > **show custom-web**

```
Radius Authentication Method..... PAP
Cisco Logo..... Enabled
CustomLogo..... None
Custom Title..... None
Custom Message..... None
Custom Redirect URL..... None
External web authentication Mode..... Disabled
External web authentication URL..... None
```

---

**Related Commands** **config custom-web**

# show database summary

To display the maximum number of entries in the database, use the **show database summary** command.

## show database summary

**Syntax Description** This command has no arguments or keywords.

**Defaults** This command has no defaults.

Command History	Release	Modification
	4.1	This command was introduced.

**Examples**

```
> show database summary

Current Max database entries..... 512
Max database entries on next reboot..... 512
```

**Related Commands** config database size

## show debug

Use the **show debug** command to determine if MAC address and other flag debugging is enabled or disabled.

### show debug

<b>Syntax Description</b>	
<b>show</b>	Displays configurations.
<b>debug</b>	MAC address debugging.

<b>Defaults</b>	None.
-----------------	-------

<b>Examples</b>	> <b>show debug</b>
	MAC debugging..... disabled Debug Flags Enabled: arp error enabled. bcast error enabled.

<b>Related Commands</b>	<b>debug mac</b>
-------------------------	------------------

# show dhcp

Use the **show dhcp** command to display the internal DHCP server configuration.

**show dhcp {leases | summary | scope}**

<b>Syntax Description</b>	<b>show dhcp</b> Displays internal DHCP server configuration information. <b>leases</b> Enter <b>leases</b> to display allocated DHCP leases. <b>summary</b> Enter <b>summary</b> to display DHCP summary information. <b>scope</b> Enter the name of a scope to display the DHCP information for that scope.
---------------------------	--

<b>Defaults</b>	None.
-----------------	-------

<b>Examples</b>	<pre>&gt; show dhcp leases</pre> <p>No leases allocated.</p> <pre>&gt; show dhcp summary</pre> <table> <thead> <tr> <th>Scope Name</th><th>Enabled</th><th>Address Range</th></tr> </thead> <tbody> <tr> <td>003</td><td>No</td><td>0.0.0.0 -&gt; 0.0.0.0</td></tr> </tbody> </table> <pre>&gt; show dhcp 003</pre> <table> <tbody> <tr> <td>Enabled.....</td><td>No</td></tr> <tr> <td>Lease Time.....</td><td>0</td></tr> <tr> <td>Pool Start.....</td><td>0.0.0.0</td></tr> <tr> <td>Pool End.....</td><td>0.0.0.0</td></tr> <tr> <td>Network.....</td><td>0.0.0.0</td></tr> <tr> <td>Netmask.....</td><td>0.0.0.0</td></tr> <tr> <td>Default Routers.....</td><td>0.0.0.0 0.0.0.0 0.0.0.0</td></tr> <tr> <td>DNS Domain.....</td><td></td></tr> <tr> <td>DNS.....</td><td>0.0.0.0 0.0.0.0 0.0.0.0</td></tr> <tr> <td>Netbios Name Servers.....</td><td>0.0.0.0 0.0.0.0 0.0.0.0</td></tr> </tbody> </table>	Scope Name	Enabled	Address Range	003	No	0.0.0.0 -> 0.0.0.0	Enabled..... -------------------------	--------------------

## show dhcp proxy

Use the **show dhcp proxy** command to display the status of DHCP proxy handling.

**show dhcp proxy**

<b>Syntax Description</b>	<b>show dhcp proxy</b>	Displays the status of DHCP proxy handling.
<b>Defaults</b>	None.	
<b>Examples</b>	> <b>show dhcp proxy</b>	DHCP Proxy Behaviour: enabled
<b>Related Commands</b>	<b>config dhcp proxy</b>	

# show eventlog

Use the **show eventlog** command to display the event log.

**show eventlog**

<b>Syntax Description</b>	<b>show</b> Displays configurations. <b>eventlog</b> System events.
---------------------------	--

**Defaults** None.

**Examples** > **show eventlog**

File	Line	TaskID	Code	Time
				d h m s
EVENT> bootos.c	788	125CEBCC	AAAAAAAAAA	0 0 0 6
EVENT> bootos.c	788	125CEBCC	AAAAAAAAAA	0 0 0 6

**Related Commands** **show msglog**

## show exclusionlist

To display a summary of all clients on the manual exclusion list (blacklisted) from associating with this Cisco Wireless LAN controller, use the **show exclusionlist** command. A list containing each manually Excluded MAC address is displayed.

**show exclusionlist**

<b>Syntax Description</b>	<b>show</b> Displays configurations. <b>exclusionlist</b> Manual exclusion list.
---------------------------	---

<b>Defaults</b>	None.
-----------------	-------

<b>Examples</b>	> <b>show exclusionlist</b>
	MAC Address Description ----- xx:xx:xx:xx:xx:xx Disallowed Client

<b>Related Commands</b>	<b>config exclusionlist add</b> <b>config exclusionlist delete</b> <b>config exclusionlist description</b> <b>show client</b>
-------------------------	--

# show guest-lan

To display the configuration of a specific wired guest LAN, use the **show guest-lan** command.

**show guest-lan *guest\_lan\_id***

**Note** Enter **show guest-lan summary** to view all wired guest LANs configured on the controller.

---

## Syntax Description

<b>show</b>	Displays configurations.
<b>guest-lan</b>	Indicates the active wired guest LAN.

---

## Defaults

None.

---

## Examples

> **show guest-lan 2**

```

Guest LAN Identifier..... 1
Profile Name..... guestlan
Network Name (SSID)..... guestlan
Status..... Enabled
AAA Policy Override..... Disabled
Number of Active Clients..... 1
Exclusionlist Timeout..... 60 seconds
Session Timeout..... Infinity
Interface..... wired
Ingress Interface..... wired-guest
WLAN ACL..... unconfigured
DHCP Server..... 10.20.236.90
DHCP Address Assignment Required..... Disabled
Quality of Service..... Silver (best effort)
Security
    Web Based Authentication..... Enabled
    ACL..... Unconfigured
    Web-Passthrough..... Disabled
    Conditional Web Redirect..... Disabled
    Auto Anchor..... Disabled
Mobility Anchor List
GLAN ID IP Address Status

```

## show hreap group detail

To display the details for a specific hybrid-REAP group, use the **show hreap group detail** command.

**show hreap group detail** *group\_name*

<b>Syntax Description</b>	
	<b>show hreap</b> Displays configurations.
	<b>group detail</b> Displays details of the hybrid-REAP group details.

**Defaults** None.

**Examples** > **show hreap group detail 192.12.1.2**

```
Number of Ap's in Group: 1  
00:0a:b8:3b:0b:c2 AP1200 Joined  
  
Group Radius Auth Servers:  
    Primary Server Index ..... Disabled  
    Secondary Server Index ..... Disabled
```

**Related Commands** **show hreap group summary**

# show hreap group summary

To display the current list of hybrid-REAP groups, use the **show hreap group summary** command.

**show hreap group summary**

<b>Syntax Description</b>	<b>show hreap</b> Displays configurations <b>group summary</b> Displays a summary of the hybrid-REAP group.
---------------------------	--

<b>Defaults</b>	None.
-----------------	-------

<b>Examples</b>	> <b>show hreap group summary</b> HREAP Group Summary: Count 1 Group Name # APs Group 1 1
-----------------	--

<b>Related Commands</b>	<b>show hreap group detail</b>
-------------------------	--------------------------------

## show ike

Use the **show ike** command to display active IKE SAs.

```
show ike {brief | IP_or_MAC_address}
```

---

### Syntax Description

<b>show</b>	Command action.
<b>ike</b>	Displays active IKE SAs.
<b>brief</b>	List of all active IKE SAs.
<i>IP_or_MAC_address</i>	IP or MAC address of active IKE SA.

---

### Defaults

None.

---

### Examples

```
> show ike
```

---

### Related Commands

None.

# show interface

Use the **show interface** command to display details of the system interfaces.

**show interface {summary | detailed *interface\_name*}**

## Syntax Description

<b>show interface</b>	Command action
<b>summary</b>	Displays a summary of the local interfaces.
<b>detailed</b>	Displays detailed interface information.
<i>interface_name</i>	Identifies interface name for detailed display

## Defaults

None.

## Examples

> **show interface summary**

Interface Name	Port	Vlan Id	IP Address	Type	Ap	Mgr	Guest
ap-manager	1	untagged	xxx.xxx.xxx.xxx	Static	Yes	No	
management	1	untagged	xxx.xxx.xxx.xxx	Static	No	No	
service-port	N/A	N/A	xxx.xxx.xxx.xxx	Static	No	No	
virtual	N/A	N/A	xxx.xxx.xxx.xxx	Static	No	No	

**Note** The interface name of the wired guest LAN in this example is *wired-guest* and its **VLAN ID** is 236.

> **show interface detailed management**

Interface Name.....	management
MAC Address.....	00:0b:85:32:ab:60
IP Address.....	1.100.49.30
IP Netmask.....	255.255.255.0
IP Gateway.....	1.100.49.1
VLAN.....	149
Active Physical Port.....	1
Primary Physical Port.....	1
Backup Physical Port.....	Unconfigured
Primary DHCP Server.....	1.100.2.15
Secondary DHCP Server.....	Unconfigured
ACL.....	Unconfigured
AP Manager.....	No

**Note** Some WLAN controllers may have only one physical port listed because they have only one physical port.

## Related Commands

**config interface**

# show inventory

To display a physical inventory of the Cisco Wireless LAN controller, use the **show inventory** command.

**show inventory**

<b>Syntax Description</b>	<b>show</b> Displays configurations. <b>inventory</b> Physical Cisco Wireless LAN controller configuration.
---------------------------	--

**Defaults** None.

<b>Examples</b>	> <b>show inventory</b>
	Switch Description..... Cisco Controller Machine Model..... WLC4404-100 Serial Number..... FLS0923003B Burned-in MAC Address..... 00:0B:85:32:AB:60 Crypto Accelerator 1..... Absent Crypto Accelerator 2..... Absent Power Supply 1..... Absent Power Supply 2..... Present, OK

**Note** Some wireless LAN controllers may have no crypto accelerator (VPN termination module) or power supplies listed because they have no provisions for VPN termination modules or power supplies.

<b>Related Commands</b>	<b>show sysinfo</b>
-------------------------	---------------------

# show ipsec

Use the **show ipsec** command to display active IPSec SAs.

```
show ipsec {brief | IP_or_MAC_address}
```

Syntax Description	
<b>show</b>	Command action.
<b>ipsec</b>	Displays active IPSec SAs
<b>{brief   IP_or_MAC_address}</b>	Enter <b>brief</b> to display active IPSec SAs. Enter the IP address or MAC address of an IPSec SA.

**Defaults** None.

**Examples** > **show ipsec brief**

**Related Commands** None.

## show known ap

To display known Cisco lightweight access point information, use the **show known ap** command.

**show known ap {summary | detailed *MAC*}**

---

### Syntax Description

<b>show</b>	Displays configurations.
<b>known ap</b>	Known Cisco lightweight access point information.
<b>summary</b>	Displays a list of all known access points.
<b>detailed</b>	Provides detailed information for all known access points.
<i>MAC</i>	MAC address of the known AP

---

---

### Defaults

None.

---

### Examples

> **show known ap summary**

MAC Address	State	# APs	# Clients	Last Heard
-----	-----	-----	-----	-----

---

### Related Commands

**config ap**

# show l2tp

To display L2TP sessions, use the **show l2tp** command.

```
show l2tp {summary | ip_address}
```

Syntax Description	
<b>show l2tp</b>	Displays configurations.
<b>summary</b>	Displays all L2TP sessions.
<i>ip_address</i>	Displays an L2TP session.

Defaults	None.
<b>Examples</b>	<pre>&gt; show l2tp summary</pre> LAC_IPaddr LTid LSid RTid RSid ATid ASid State ----- ----- ----- ----- ----- ----- -----  <b>Related Commands</b> None.

Examples	<pre>&gt; show l2tp summary</pre> LAC_IPaddr LTid LSid RTid RSid ATid ASid State ----- ----- ----- ----- ----- ----- -----  <b>Related Commands</b> None.
----------	---

# show lag summary

To display the current LAG status, use the **show lag summary** command.

**show lag summary**

**Syntax Description** This command has no arguments or keywords.

**Defaults** This command has no defaults.

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	4.1	This command was introduced.

**Examples**

> **show lag summary**

LAG Enabled

**Related Commands** **config lag**

# show ldap

To display the detailed LDAP server information, use the **show ldap** command.

**show ldap index**

<b>Syntax Description</b>	<i>index</i>	LDAP server index. Valid values are from 1 to 17.
---------------------------	--------------	---

<b>Defaults</b>	None.
-----------------	-------

<b>Examples</b>	<pre>&gt; show ldap 1 Server Index..... 1 Address..... 2.3.1.4 Port..... 389 Enabled..... Yes User DN..... name1 User Attribute..... attr1 User Type..... username1 Retransmit Timeout..... 3 seconds Bind Method .....</pre>
-----------------	---

<b>Related Commands</b>	<a href="#">config ldap</a> <a href="#">show ldap statistics</a> <a href="#">show ldap summary</a>
-------------------------	--

# show ldap statistics

To display the detailed LDAP server information, use the **show ldap statistics** command.

**show ldap statistics**

**Syntax Description** This command has no arguments or keywords.

**Defaults** None.

**Examples**

```
> show ldap statistics

Server Index..... 1
Server statistics:
    Initialized OK..... 0
    Initialization failed..... 0
    Initialization retries..... 0
    Closed OK..... 0
Request statistics:
    Received..... 0
    Sent..... 0
    OK..... 0
    Success..... 0
    Authentication failed..... 0
    Server not found..... 0
    No received attributes..... 0
    No passed username..... 0
    Not connected to server..... 0
    Internal error..... 0
    Retries..... 0

Server Index..... 2
...
```

**Related Commands**

[config ldap](#)  
[show ldap](#)  
[show ldap summary](#)

# show ldap summary

To display the current LDAP status, use the **show ldap summary** command.

## show ldap summary

**Syntax Description** This command has no arguments or keywords.

**Defaults** This command has no defaults.

**Examples**

```
> show ldap summary
```

Idx	Server Address	Port	Enabled
1	2.3.1.4	389	Yes
2	10.10.20.22	389	Yes

**Related Commands**

# show load-balancing

To display the status of the load-balancing feature, use the **show load-balancing** command.

**show load-balancing**

<b>Syntax Description</b>	<b>show</b> Displays configurations. <b>load-balancing</b> Displays the load-balancing status.
---------------------------	---

<b>Defaults</b>	None.
-----------------	-------

<b>Examples</b>	> <b>show load-balancing</b> Aggressive Load Balancing..... Enabled Aggressive Load Balancing Window..... 0 clients
-----------------	---

<b>Related Commands</b>	<b>config load-balancing</b>
-------------------------	------------------------------

# show local-auth certificates

This command is used to display local authentication certificate information:

**show local-auth certificates**

**Syntax Description** This command has no arguments or keywords.

**Defaults** This command has no defaults.

Command History	Release	Modification
	4.1	This command was introduced.

**Examples**

```
> show local-auth certificates

Certificates available for Local EAP authentication:

Certificate issuer ..... vendor
  CA certificate:

**Related Commands** config local-auth eap-profile

# show local-auth config

This command is used to display local authentication configuration information:

**show local-auth config**

**Syntax Description** This command has no arguments or keywords.

**Defaults** This command has no defaults.

Command History	Release	Modification
	4.1	This command was introduced.

**Examples**

```
> show local-auth config
User credentials database search order:
    Primary ..... Local DB

Configured EAP profiles:
    Name ..... fast-test
    Certificate issuer ..... default
    Enabled methods ..... fast
    Configured on WLANs ..... 2

EAP Method configuration:
    EAP-TLS:
        Certificate issuer ..... default
        Peer verification options:
            Check against CA certificates ..... Enabled
            Verify certificate CN identity ..... Disabled
            Check certificate date validity ... Enabled
    EAP-FAST:
        TTL for the PAC ..... 3 600
        Initial client message ..... <none>
        Local certificate required ..... No
        Client certificate required ..... No
        Vendor certificate required ..... No
        Anonymous provision allowed ..... Yes
        Authenticator ID ..... 7b7fffff000000000000000000000000
        Authority Information ..... Test

    EAP Profile..... tls-prof
        Enabled methods for this profile ..... tls
        Active on WLANs ..... 1 3

EAP Method configuration:
    EAP-TLS:
        Certificate issuer used ..... cisco
        Peer verification options:
            Check against CA certificates ..... disabled
            Verify certificate CN identity ..... disabled
            Check certificate date validity ... disabled
```

■ **show local-auth config**

---

**Related Commands**

- **config local-auth eap-profile**
- **config local-auth method fast**

# show local-auth statistics

This command is used to display local EAP authentication statistics:

**show local-auth statistics**

---

**Syntax Description** This command has no arguments or keywords.

---

**Defaults** This command has no defaults.

---

Command History	Release	Modification
	4.1	This command was introduced.

---

---

**Examples**

```
> show local-auth statistics

Local EAP authentication DB statistics:
Requests received ..... 14
Responses returned ..... 14
Requests dropped (no EAP AVP) ..... 0
Requests dropped (other reasons) ..... 0
Authentication timeouts ..... 0

Authentication statistics:
Method Success Fail
-----
Unknown 0 0
LEAP 0 0
EAP-FAST 2 0
EAP-TLS 0 0
PEAP 0 0

Local EAP credential request statistics:
Requests sent to LDAP DB ..... 0
Requests sent to File DB ..... 2
Requests failed (unable to send) ..... 0
Authentication results received:
Success ..... 2
Fail ..... 0
Certificate operations:
Local device certificate load failures ..... 0
Total peer certificates checked ..... 0
Failures:
CA issuer check ..... 0
CN name not equal to identity ..... 0
Dates not valid or expired ..... 0
```

# show location

To display location system information, use the **show location** command.

**show location [detail *mac\_address* | summary]**

Syntax Description	
<b>detail</b>	Displays detailed location information
<b><i>mac_address</i></b>	Specifies the MAC address of a client.
<b>summary</b>	Displays summary location information.

Defaults	This command has no defaults.
----------	-------------------------------

Command History	Release	Modification
	4.1	This command was introduced.

Examples	
	<pre>&gt; show location summary Location Summary  Algorithm used: Average Client     RSSI expiry timeout: 5 sec     Half life: 0 sec     Notify Threshold: 0 db Calibrating Client     RSSI expiry timeout: 5 sec     Half life: 0 sec Rogue AP     RSSI expiry timeout: 5 sec     Half life: 0 sec     Notify Threshold: 0 db RFID Tag     RSSI expiry timeout: 5 sec     Half life: 0 sec     Notify Threshold: 0 db</pre>

Related Commands	<b>clear location rfid</b> <b>config location</b>
------------------	--

# show location statistics rfid

To see any RFID-related errors, use the **show location statistics rfid** command.

**show location statistics rfid**

**Syntax Description** This command has no arguments or keywords.

**Defaults** This command has no defaults.

**Examples** > **show location statistics rfid**

```
RFID Statistics

Database Full : 0 Failed Delete: 0
Null Bufhandle: 0 Bad Packet: 0
Bad LWAPP Data: 0 Bad LWAPP Encap: 0
Off Channel: 0 Bad CCX Version: 0
Bad AP Info : 0 Below Max RSSI: 0
Above Max RSSI: 0 Add RSSI Failed: 0
Invalid RSSI: 0 Smallest Overwrite: 0
Oldest Expired RSSI: 0
```

**Related Commands** **clear location statistics rfid**

# show logging

To display the syslog facility logging parameters and buffer contents, use the **show logging** command.

**show logging**

## Syntax Description

<b>show</b>	Displays configurations.
<b>logging</b>	Current parameters and buffer content details.

## Defaults

None.

## Examples

> **show logging**

```

Logging to buffer :
- Logging of system messages to buffer :
- Logging filter level..... errors
- Number of system messages logged..... 67227
- Number of system messages dropped..... 21136
- Logging of debug messages to buffer ..... Disabled
- Number of debug messages logged..... 0
- Number of debug messages dropped..... 0
Logging to console :
- Logging of system messages to console :
- Logging filter level..... errors
- Number of system messages logged..... 0
- Number of system messages dropped..... 88363
- Logging of debug messages to console ..... Enabled
- Number of debug messages logged..... 0
- Number of debug messages dropped..... 0
Logging to syslog :
- Syslog facility..... local0
- Logging of system messages to syslog :
- Logging filter level..... errors
- Number of system messages logged..... 67227
--More-- or (q)uit
- Number of system messages dropped..... 21136
- Logging of debug messages to syslog ..... Disabled
- Number of debug messages logged..... 0
- Number of debug messages dropped..... 0
- Number of remote syslog hosts..... .
  - Host 0..... Not Configured
  - Host 1..... Not Configured
  - Host 2..... Not Configured
Logging of traceback..... Disabled
Logging of process information..... Disabled
Logging of source file informational..... Enabled
Timestamping of messages..... .
- Timestamping of system messages..... Enabled
- Timestamp format..... Date and Time
- Timestamping of debug messages..... Enabled
- Timestamp format..... Date and Time

Logging buffer (67227 logged, 21136 dropped)

```

---

**Related Commands**

**config logging syslog host**  
**config logging syslog facility**  
**config logging syslog level**

## show loginsession

To display the existing sessions, use the **show loginsession** command.

**show loginsession**

<b>Syntax Description</b>	<b>show</b> Displays configurations. <b>loginsession</b> Current session details.
---------------------------	--

**Defaults** None.

**Examples** > **show loginsession**

ID	User Name	Connection From	Idle Time	Session Time
00	admin	EIA-232	00:00:00	00:19:04

**Related Commands** **config loginsession close**

# show lwapp reap association

To view the list of clients associated to an access point and their SSIDs, use the **show lwapp reap association** command.

**show lwapp reap association**

**Syntax Description** This command has no arguments or keywords.

**Defaults** This command has no defaults.

**Examples** > **show lwapp reap association**

**Related Commands** **show lwap reap status**

## show lwapp reap status

To view the status of the hybrid-REAP access point (connected or standalone), use the **show lwapp reap status** command.

**show lwapp reap status**

**Syntax Description** This command has no arguments or keywords.

**Defaults** This command has no defaults.

**Examples** > **show lwapp reap status**

**Related Commands** **show lwap reap association**

# show macfilter

To display the MAC filter parameters, use the **show macfilter** command. The MAC delimiter (none, colon, or hyphen) for MAC addresses sent to RADIUS servers is displayed. The MAC filter table lists the clients that are always allowed to associate with a wireless LAN.

**show macfilter {summary | detail *MAC*}**

---

**Syntax Description**

<b>show</b>	Displays configurations.
<b>macfilter</b>	Filter details.
<b>summary</b>	Displays a summary of all MAC filter entries.
<b>detail <i>MAC</i></b>	Detailed display of a MAC filter entry.

---

**Defaults**

None.

---

**Examples**

```
> show macfilter detail xx:xx:xx:xx:xx:xx

MAC Address..... xx:xx:xx:xx:xx:xx
WLAN Identifier..... Any
Interface Name..... management
Description..... RAP

> show macfilter summary

MAC Filter RADIUS Compatibility mode..... Cisco ACS
MAC Filter Delimiter..... None

Local Mac Filter Table

MAC Address WLAN Id Description
----- ----- -----
xx:xx:xx:xx:xx:xx Any RAP
xx:xx:xx:xx:xx:xx Any PAP2 (2nd hop)
xx:xx:xx:xx:xx:xx Any PAP1 (1st hop)
```

---

**Related Commands**

- config macfilter mac-delimiter**
- config macfilter add**
- config macfilter delete**
- config macfilter description**
- config macfilter wlan-id**

## show mgmtuser

To display the local management user accounts on the Cisco Wireless LAN controller, use the **show mgmtuser** command.

**show mgmtuser**

<b>Syntax Description</b>	<b>show</b> Displays configurations. <b>mgmtuser</b> List of management users.
---------------------------	---

**Defaults** None.

**Examples** > **show mgmtuser**

User Name	Permissions	Description
admin	read-write	

**Related Commands** **config mgmtuser add**, **config mgmtuser delete**, **config mgmtuser password**

## Show Mobility Commands

Use the **show mobility** commands to display mobility settings.

# show mobility anchor

To display the wireless LAN anchor list for the Cisco Wireless LAN controller mobility groups, use the **show mobility anchor** command.

**show mobility anchor**

Syntax Description	<b>show</b> Displays configurations. <b>mobility</b> Mobility group. <b>anchor</b> Displays the mobility wireless LAN anchor list.
Defaults	None.
Examples	> <b>show mobility anchor</b> Mobility Anchor Export List WLAN ID IP Address
Related Commands	<b>config mobility group discovery</b> <b>config mobility group member</b>

```
■ show mobility anchor {wlan | guest-lan}
```

## show mobility anchor {wlan | guest-lan}

To display a list and status of controllers configured as mobility anchors for a specific WLAN or wired guest LAN, use the **show mobility anchor {wlan | guest-lan}** command.

```
show mobility anchor {wlan | guest-lan} {wlan_id | guest_lan_id}
```

Syntax Description	
<b>show</b>	Displays configurations.
<b>mobility</b>	Mobility group.
<b>anchor</b>	Displays the mobility wireless LAN anchor list.
<b>wlan</b>	Wireless LAN parameters.
<b>guest-lan</b>	Indicates the active wired guest LAN.
<b>wlan_id</b>	Enter a wireless LAN identifier between 1 and 16.
<b>guest_lan_id</b>	Guest LAN identifier between 1 and 5 (inclusive).

**Defaults** None.

### Examples

```
> show mobility anchor {wlan | guest-lan} 5

Mobility Anchor Export List
WLAN ID      IP Address Status
  1          10.50.234.2   UP
  1          10.50.234.6   UP
  2          10.50.234.2   UP
  2          10.50.234.3   CNTRL_DATA_PATH_DOWN

GLAN ID      IP Address Status
  1          10.20.100.2   UP
  2          10.20.100.3   UP
```

The status field shows one of the following values:

- UP—The controller is reachable and able to pass data.
- CNTRL\_PATH\_DOWN—The mpings failed. The controller cannot be reached through the control path and is considered failed.
- DATA\_PATH\_DOWN—The epings failed. The controller cannot be reached and is considered failed.
- CNTRL\_DATA\_PATH\_DOWN—Both the mpings and epings failed. The controller cannot be reached and is considered failed.

### Related Commands

```
show mobility summary

config mobility group keepalive interval
config mobility group anchor add {wlan | guest-lan}
```

```
config {wlan | guest-lan} mobility anchor add  
config {wlan | guest-lan} mobility anchor delete  
config mobility group anchor delete {wlan | guest-lan}
```

# show mobility statistics

To display the statistics information for the Cisco Wireless LAN controller mobility groups, use the **show mobility statistics** command.

**show mobility statistics**

<b>Syntax Description</b>	
<b>show</b>	Displays configurations.
<b>mobility</b>	Mobility group.
<b>statistics</b>	Displays statistics for the mobility manager.

---

**Defaults** None.

---

**Examples** > **show mobility statistics**

```
Global Mobility Statistics
  Rx Errors..... 0
  Tx Errors..... 0

```

---

**Related Commands** config mobility group discovery, config mobility group member

# show mobility summary

To display the summary information for the Cisco Wireless LAN controller mobility groups, use the **show mobility summary** command.

**show mobility summary**

---

## Syntax Description

<b>show</b>	Displays configurations.
<b>mobility</b>	Mobility group.
<b>summary</b>	Displays a summary of the mobility manager.

---

---

## Defaults

None.

---

## Examples

> **show mobility summary**

```
Symmetric Mobility Tunneling (current) ..... Disabled
Symmetric Mobility Tunneling (after reboot) .... Disabled
Mobility Protocol Port..... 16666
Mobility Security Mode..... Disabled
Default Mobility Domain..... snmp_gui
Multicast Mode ..... Disabled
Mobility Domain ID for 802.11r..... 0x66bd
Mobility Keepalive Interval..... 10
Mobility Keepalive Count..... 3
Mobility Group Members Configured..... 1
Mobility Control Message DSCP Value..... 0

Controllers configured in the Mobility Group
MAC Address IP Address Group Name Multicast IP Status
00:1b:d4:6b:87:20 1.100.163.70 snmp_gui 0.0.0.0 Up
```

Some WLAN controllers may list no mobility security mode.

---

# show nac statistics

To display detailed Network Access Control (NAC) information about a Cisco Wireless LAN controller, use the **show nac statistics** command.

## show nac statistics

### Syntax Description

<b>show</b>	Displays configurations.
<b>nac</b>	Network access control.
<b>statistics</b>	Detailed statistics.

### Defaults

None.

### Examples

```
> show nac statistics

Server Index..... 1
Server Address..... xxx.xxx.xxx.xxx
Number of requests sent..... 0
Number of retransmissions..... 0
Number of requests received..... 0
Number of malformed requests received..... 0
Number of bad auth requests received..... 0
Number of pending requests..... 0
Number of timed out requests..... 0
Number of misc dropped request received..... 0
Number of requests sent..... 0
```

### Related Commands

**show nac acl**  
**show nac summary**

## show nac summary

To display NAC summary information for a Cisco Wireless LAN controller, use the **show nac summary** command.

**show nac summary**

Syntax Description	
<b>show</b>	Displays configurations.
<b>nac</b>	Network Access Control.
<b>summary</b>	Summary information.

**Defaults** None.

**Examples**

```
> show nac summary

NAC ACL Name .....
Index  Server Address          Port      State
-----  -----
1      xxx.xxx.xxx.xxx        13336    Enabled
```

**Related Commands**

- **show nac acl**
- **show nac statistics**

# show netuser

This command is used display detailed login information about a specified netuser or displays a summary information on all network users.

To show the configuration of a particular user in the local user database—**show netuser detail *username***.

To list all users in the local user database—**show netuser summary**.

<b>Syntax Description</b>	<b>detail</b> Displays detailed information on the specified network user. <b>username</b> Specifies a network username (up to 24 alphanumeric characters). <b>summary</b> Displays summary information on all network users.
---------------------------	---

<b>Command Default</b>	This command has no defaults.
------------------------	-------------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	4.1	This command was revised to include <b>detail</b> and <b>summary</b> options.

<b>Examples</b>	<pre>&gt; show netuser summary</pre> <p>Maximum logins allowed for a given user name .....Unlimited</p> <pre>&gt; show netuser detail john10</pre> <table> <tr> <td>User Name.....</td><td>abc</td></tr> <tr> <td>WLAN Id.....</td><td>Any</td></tr> <tr> <td>Lifetime.....</td><td>Permanent</td></tr> <tr> <td>Description.....</td><td>test user</td></tr> </table>	User Name.....	abc	WLAN Id.....	Any	Lifetime.....	Permanent	Description.....	test user
User Name.....	abc								
WLAN Id.....	Any								
Lifetime.....	Permanent								
Description.....	test user								

<b>Related Commands</b>	<a href="#">config netuser maxeapuserlogin</a> <a href="#">show netuser summary</a>
-------------------------	--

## show netuser guest-roles

To display a list of the current QoS roles and their bandwidth parameters, use the **show netuser guest-roles** command.

**show netuser guest-roles**

Syntax Description	
<b>show</b>	Displays parameters.
<b>netuser</b>	Local network user.
<b>guest-role</b>	QoS role for the guest user.

**Command Default** This command has no defaults.

**Examples**

```
> show netuser guest-roles

Role Name..... Contractor
    Average Data Rate..... 10
    Burst Data Rate..... 10
    Average Realtime Rate..... 100
    Burst Realtime Rate..... 100

Role Name..... Vendor
    Average Data Rate..... unconfigured
    Burst Data Rate..... unconfigured
    Average Realtime Rate..... unconfigured
    Burst Realtime Rate..... unconfigured
```

**Related Commands**

**config netuser maxeapuserlogin**  
**show netuser summary**

# show network summary

To display the network configuration of the Cisco Wireless LAN controller, use the **show network summary** command.

## show network summary

### Syntax Description

<b>show</b>	Displays configurations.
<b>network</b>	Network configuration.
<b>summary</b>	Summary of network configuration.

### Defaults

None.

### Examples

> **show network summary**

```
RF-Network Name..... mrf
Web Mode..... Enable
Secure Web Mode..... Enable
Secure Web Mode Cipher-Option High..... Disable
Secure Shell (ssh)..... Enable
Telnet..... Enable
Ethernet Multicast Mode..... Disable
Ethernet Broadcast Mode..... Disable
IGMP snooping..... Disabled
IGMP timeout..... 60 seconds
User Idle Timeout..... 300 seconds
ARP Idle Timeout..... 300 seconds
Cisco AP Default Master..... Disable
AP Join Priority..... Enabled
Mgmt Via Wireless Interface..... Disable
Mgmt Via Dynamic Interface..... Disable
Bridge MAC filter Config..... Enable
Bridge Security Mode..... EAP
Over The Air Provisioning of AP's..... Disable
Apple Talk ..... Disable
AP Fallback ..... Enable
Web Auth Redirect Ports ..... 80
Fast SSID Change ..... Disabled
802.3 Bridging ..... Disable
```

### Related Commands

- config ap priority**
- config network ap-priority**
- config network arptimeout**
- config network bcast-ssid**
- config network broadcast**
- config network dsport**
- config network master-base**

```

config network webmode
```

# show network multicast mgid detail

To display all the clients joined to the multicast group in a specific MGID, use the **show network multicast mgid detail** command.

**show network multicast mgid detail *mgid\_value***

## Syntax Description

<b>show</b>	Displays configurations.
<b>network</b>	Network configuration.
<b><i>mgid_value</i></b>	Number between 550 and 4095.

## Defaults

None.

## Examples

```
> show network multicast mgid detail

Mgid ..... 550
Multicast Group Address ..... 239.255.255.250
Vlan ..... 0
Rx Packet Count ..... 807399588
No of clients ..... 1
Client List .....
      Client MAC           Expire TIme (mm:ss)
      00:13:02:23:82:ad  0:20
```

## Related Commands

**show network multicast mgid summary**

## show network multicast mgid summary

To display all the multicast groups and their corresponding MGIDs, use the **show network multicast mgid summary** command.

**show network multicast mgid summary**

<b>Syntax Description</b>	
<b>show</b>	Displays configurations.
<b>network</b>	Network configuration.

<b>Defaults</b>	None.
-----------------	-------

<b>Examples</b>	> <b>show network multicast mgid summary</b>
	Layer2 MGID Mapping:
	-----
	InterfaceName               vlanId       MGID
	-----
	management                0            0
	test                        0            9
	wired                      20          8
	Layer3 MGID Mapping:
	-----
	Number of Layer3 MGIDs ..... 1
	-----
	Group address       Vlan       MGID
	-----
	239.255.255.250    0        550

<b>Related Commands</b>	<b>show network multicast mgid detail</b>
-------------------------	---

# show nmstp notify-interval summary

To display the NMSP configuration settings, use the **show nmstp notify-interval summary** command.

**Syntax Description** This command has no arguments or keywords.

**Defaults** None

**Examples** >show nmstp notify-interval summary

```
NMSP Notification Interval Summary

Client
      Measurement interval: 2 sec
RFID
      Measurement interval: 8 sec
Rogue AP
      Measurement interval: 2 sec
Rogue Client
      Measurement interval: 2 sec
```

**Related Commands** [config nmstp notify-interval measurement](#)

## show nmfp statistics

To display NMFP counters., use the **show nmfp statistics** command.

**show nmfp statistics {summary | connection all}**

Syntax Description	
<b>show</b>	Displays configurations.
<b>nmfp statistics</b>	Displays NMFP counters.
<b>summary</b>	Displays common NMFP counters.
<b>connection all</b>	Displays all connection-specific counters.

**Defaults** This command has no defaults.

**Examples** > **show nmfp statistics summary**

**Related Commands** **clear lofp statistics**

# show nmsp status

To display the status of active NMSP connections, use the **show nmsp status** command.

## show nmsp status

**Syntax Description** This command has no arguments or keywords.

**Defaults** This command has no defaults.

**Examples** **>show nmsp status**

LocServer IP	TxEchoResp	RxEchoReq	TxData	RxData
10.19.35.51	34100	34100	6	6

**Related Commands** **clear locp statistics**

## show pmk-cache

To display information about the PMK cache, use the **show port** command.

**show pmk-cache {all | MAC}**

### Syntax Description

<b>show</b>	Displays configurations.
<b>pmk-cache</b>	PMK cache.
<b>all</b>	Displays information about all entries in the PMK cache.
<b>MAC</b>	Displays information about a single entry in the PMK cache.

### Defaults

None.

### Examples

```
> show pmk-cache xx:xx:xx:xx:xx:xx  
  
> show pmk-cache all
```

PMK Cache			
Station	Entry Lifetime	VLAN Override	IP Override
-----	-----	-----	-----

### Related Commands

**config pmk-cache delete**

# show port

To display the Cisco Wireless LAN controller port settings on an individual or global basis, use the **show port** command.

**show port {port | summary}**

## Syntax Description

<b>show</b>	Displays configurations.
<b>port</b>	Cisco Wireless LAN controller port.
<b>{port   summary}</b>	Individual port or all ports.

## Defaults

None.

## Examples

> **show port 1**

Pr	Type	STP Stat	Admin Mode	Physical Mode	Physical Status	Link Status	Link Trap	Mcast Appliance	POE
1	Normal	Disa	Enable	Auto	1000 Full	Down	Enable	Enable	N/A

**Note** Some WLAN controllers may not have multicast or Power over Ethernet (PoE) listed because they do not support those features.

> **show port summary**

Pr	Type	STP Stat	Admin Mode	Physical Mode	Physical Status	Link Status	Link Trap	Mcast Appliance	POE
1	Normal	Forw	Enable	Auto	1000 Full	Up	Enable	Enable	N/A
2	Normal	Disa	Enable	Auto	1000 Full	Down	Enable	Enable	N/A
3	Normal	Disa	Enable	Auto	1000 Full	Down	Enable	Enable	N/A
4	Normal	Disa	Enable	Auto	1000 Full	Down	Enable	Enable	N/A

**Note** Some WLAN controllers may have only one port listed because they have only one physical port.

## Related Commands

- config ap port**
- config network dsport**
- config mirror port**
- config port adminmode**
- config port linktrap**
- config port power**

■ **show qos queue\_length all**

## show qos queue\_length all

To display quality of service (QoS) information (queue length), use the **show qos** command.

**show qos queue\_length all**

### Syntax Description

<b>show</b>	Displays configurations.
<b>qos</b>	Quality of Service information.
<b>queue_length all</b>	Displays queue lengths.

### Defaults

None.

### Examples

```
> show qos queue_length all  
Platinum queue length..... 255  
Gold queue length..... 255  
Silver queue length..... 150  
Bronze queue length..... 100
```

### Related Commands

**config qos**

## Show Radius Commands

Use the **show radius** commands to display RADIUS settings.

# show radius acct statistics

To display the RADIUS accounting server statistics for the Cisco Wireless LAN controller, use the **show radius acct statistics** command.

**show radius acct statistics**

<b>Syntax Description</b>	<b>show</b> Displays configurations. <b>radius acct</b> RADIUS accounting server. <b>statistics</b> Displays RADIUS accounting server statistics.
<b>Defaults</b>	None.
<b>Examples</b>	<pre>&gt; show radius acct statistics  Accounting Servers: Server Index..... 1 Server Address..... 10.1.17.10 Msg Round Trip Time..... 0 (1/100 second) First Requests..... 0 Retry Requests..... 0 Accounting Responses..... 0 Malformed Msgs..... 0 Bad Authenticator Msgs..... 0 Pending Requests..... 0 Timeout Requests..... 0 Unknowntype Msgs..... 0 Other Drops..... 0</pre>

  

<b>Related Commands</b>	<a href="#">show radius auth statistics</a> <a href="#">show radius summary</a>
-------------------------	--

## show radius auth statistics

To display the RADIUS authentication server statistics for the Cisco Wireless LAN controller, use the **show radius auth statistics** command.

**show radius auth statistics**

<b>Syntax Description</b>	
<b>show</b>	Displays configurations.
<b>radius auth</b>	RADIUS authentication server.
<b>statistics</b>	Displays RADIUS authentication server statistics.

**Defaults** None.

**Examples** > **show radius auth statistics**

```
Authentication Servers:  
  Server Index..... 1  
  Server Address..... 1.1.1.1  
  Msg Round Trip Time..... 0 (1/100 second)  
  First Requests..... 0  
  Retry Requests..... 0  
  Accept Responses..... 0  
  Reject Responses..... 0  
  Challenge Responses..... 0  
  Malformed Msgs..... 0  
  Bad Authenticator Msgs..... 0  
  Pending Requests..... 0  
  Timeout Requests..... 0  
  Unknowntype Msgs..... 0  
  Other Drops..... 0
```

**Related Commands** **show radius acct statistics**  
**show radius summary**

# show radius rfc3576 statistics

To display the RADIUS rfc3576 server statistics for the Cisco Wireless LAN controller, use the **show radius rfc3576 statistics** command.

RFC 3576, an extension to the RADIUS protocol, allows dynamic changes to a user session. This includes support for disconnecting users and changing authorizations applicable to a user session; that is, it provides support for Disconnect and Change-of-Authorization (CoA) messages. Disconnect messages cause a user session to be terminated immediately, whereas CoA messages modify session authorization attributes such as data filters.

**show radius rfc3576 statistics**

<b>Syntax Description</b>	<b>show</b> Displays configurations. <b>radius rfc3576</b> RADIUS RFC3576 server. <b>statistics</b> Displays RADIUS RFC-3576 server statistics.
---------------------------	---

<b>Defaults</b>	None.
-----------------	-------

<b>Examples</b>	> <b>show radius rfc3576 statistics</b>
-----------------	---

```
RFC-3576 Servers:
Server Index..... 1
Server Address..... 10.1.17.10
Msg Round Trip Time..... 0 (1/100 second)
First Requests..... 0
Retry Requests..... 0
Accounting Responses..... 0
Malformed Msgs..... 0
Bad Authenticator Msgs..... 0
Pending Requests..... 0
Timeout Requests..... 0
Unknown type Msgs..... 0
Other Drops..... 0
```

<b>Related Commands</b>	<a href="#">show radius auth statistics</a> <a href="#">show radius summary</a> <a href="#">show radius rfc3576</a>
-------------------------	---

## show radius summary

To display the RADIUS authentication and accounting server summary, use the **show radius summary** command.

### show radius summary

Syntax Description	
<b>show</b>	Displays configurations.
<b>radius</b>	RADIUS authentication server.
<b>summary</b>	Server summary.

Defaults	None.

Examples	> <b>show radius summary</b>
	Vendor Id Backward Compatibility..... Disabled
	Credentials Caching..... Disabled
	Call Station Id Type..... IP Address
	Administrative Authentication via RADIUS..... Enabled
	Authentication Servers
	Index Type Server Address Port State Tout RFC-3576 IPSec - AuthMod e/Phase1/Group/Lifetime/Auth/Encr
	-----
	-----
	Accounting Servers
	Index Type Server Address Port State Tout RFC-3576 IPSec - AuthMod e/Phase1/Group/Lifetime/Auth/Encr
	-----
	-----

Related Commands	<b>show radius auth statistics</b>
	<b>show radius acct statistics</b>

## Show RFID Commands

Use the **show rfid** commands to display rfid settings.

# show rfid client

To list the RFID tags that are associated to the controller as clients, use the **show rfid client** command.

## show rfid client

**Syntax Description** This command has no arguments or keywords.

**Command Default** This command has no defaults.

**Command History**

Release	Modification
4.2	This command was introduced.

**Examples** When the RFID tag is in client mode, information similar to the following appears:

> **show rfid client**

```
-----  
          Heard  
RFID Mac      VENDOR   Sec Ago    Associated AP   Chnl   Client State  
-----  
00:14:7e:00:0b:b1  Pango       35     AP0019.e75c.fef4   1      Probing
```

When the RFID tag is not in client mode, the above fields are blank.

**Related Commands**

- config rfid**
- show rfid config**
- show rfid detail**
- show rfid summary**

## show rfid config

This command is used to display the current RFID configuration settings.

**show rfid config**

**Syntax Description** This command has no arguments or keywords.

**Defaults** This command has no defaults.

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	4.1	This command was introduced.

**Examples** > **show rfid config**

```
RFID Tag Data Collection ..... Enabled
RFID Tag Auto-Timeout ..... Enabled
RFID Client Data Collection ..... Disabled
RFID Data Timeout ..... 200 seconds
```

**Related Commands** **config rfid**  
**show rfid detail**  
**show rfid summary**

# show rfid detail

This command is used to display detailed RFID information for a specified tag.

**show rfid detail *mac\_address***

<b>Syntax Description</b>	<i>mac_address</i>	Specifies the MAC address of an RFID tag.
---------------------------	--------------------	---

<b>Command Default</b>	This command has no defaults.
------------------------	-------------------------------

<b>Examples</b>	> <b>show rfid detail 32:21:3a:51:01:02</b>
-----------------	---

```

## Show Rogue Adhoc Commands

Use the **rogue adhoc** commands rogue adhoc settings.

# show rogue adhoc detailed

To show details of an ad-hoc rogue access point detected by the Cisco Wireless LAN controller, use the **show rogue adhoc client detailed** command.

**show rogue adhoc detailed *MAC***

## Syntax Description

<b>show</b>	Displays configurations.
<b>rogue adhoc</b>	Ad-hoc rogue.
<b>detailed</b>	Displays detailed information.
<i>MAC</i>	Ad-hoc rogue MAC address.

## Defaults

None.

## Examples

```
> show rogue adhoc detailed 02:61:ce:8e:a8:8c

Adhoc Rogue MAC address..... 02:61:ce:8e:a8:8c
Adhoc Rogue BSSID..... 02:61:ce:8e:a8:8c
State..... Alert

## Show Rogue AP Commands

Use the **rogue ap** commands to display rogue access point settings.

# show rogue ap clients

To show details of a rogue access point clients detected by the Cisco Wireless LAN controller, use the **show rogue ap clients** command.

**show rogue ap clients *ap\_mac\_address***

---

## Syntax Description

<b>show</b>	Displays configurations.
<b>rogue ap</b>	Rogue access point.
<b>clients</b>	Summary information.
<b><i>ap_mac_address</i></b>	Rogue access point MAC address.

---

---

## Defaults

None.

---

## Examples

```
> show rogue ap clients xx:xx:xx:xx:xx:xx
MAC Address State # APs Last Heard

## show rogue ap friendly summary

To view a list of the friendly rogue access points detected by the controller, use the **show rogue-ap friendly summary** command.

**show rogue ap friendly summary**

Syntax Description	
<b>show</b>	Displays configurations.
<b>rogue ap</b>	Rogue access point.
<b>friendly</b>	Friendly rogue access points
<b>summary</b>	Displays a list of all rogue access points.

**Defaults** None.

**Examples** > **show rogue ap friendly summary**

```
Number of APs..... 1
MAC Address      State      # APs # Clients Last Heard
-----
00:0a:b8:7f:08:c0 Internal      1      0 Tue Nov 27 13:52:04 2007
```

**Related Commands**

- **show rogue ap detailed**
- **show rogue ap clients**
- **show rogue ap malicious summary**
- **show rogue ap summary**
- **show rogue ap unclassified summary**

# show rogue ap malicious summary

To view a list of the malicious rogue access points detected by the controller, use the **show rogue-ap malicious summary** command.

**show rogue ap malicious summary**

## Syntax Description

<b>show</b>	Displays configurations.
<b>rogue ap</b>	Rogue access point.
<b>malicious</b>	Malicious rogue access points
<b>summary</b>	Displays a list of all rogue access points.

## Defaults

None.

## Examples

```
> show rogue ap malicious summary

Number of APs..... 2
MAC Address      State      # APs # Clients Last Heard
-----
XX:XX:XX:XX:XX:XX Alert      1      0  Tue Nov 27 13:52:04 2007
XX:XX:XX:XX:XX:XX Alert      1      0  Tue Nov 27 13:52:04 2007
```

## Related Commands

- show rogue ap detailed**
- show rogue ap clients**
- show rogue ap friendly summary**
- show rogue ap summary**
- show rogue ap unclassified summary**

## show rogue ap unclassified summary

To view a list of the unclassified rogue access points detected by the controller, use the **show rogue-ap unclassified summary** command.

**show rogue ap unclassified summary**

Syntax Description	
<b>show</b>	Displays configurations.
<b>rogue ap</b>	Rogue access point.
<b>unclassified</b>	Unclassified rogue access points
<b>summary</b>	Displays a list of all rogue access points.

**Defaults** None.

**Examples** > **show rogue ap unclassified summary**

```
Number of APs..... 164
MAC Address      State      # APs # Clients Last Heard
-----
00:0b:85:63:cd:bd Alert    1      0      Fri Nov 30 11:12:52 2007
00:0b:85:63:cd:e7 Alert    1      0      Fri Nov 30 11:29:01 2007
00:0b:85:63:ce:05 Alert    1      0      Fri Nov 30 11:26:23 2007
00:0b:85:63:ce:07 Alert    1      0      Fri Nov 30 11:26:23 2007
```

- **show rogue ap friendly summary**
- **show rogue ap malicious summary**
- **show rogue ap summary**
- **show rogue ap unclassified summary**

## Show Rogue Client Commands

Use the following **rogue client** commands to display the rogue client settings.

# show rogue client detailed

To show details of a rogue client detected by a Cisco Wireless LAN controller, use the **show rogue client detailed** command.

**show rogue client detailed *MAC***

<b>Syntax Description</b>	<b>show</b> Displays configurations. <b>rogue client</b> Rogue client. <b>detailed</b> Provide detailed information for a rogue client. <b><i>MAC</i></b> Rogue client MAC address.
---------------------------	--

**Defaults** None.

**Examples** > **show rogue client detailed xx:xx:xx:xx:xx:xx**

```
Rogue BSSID..... 00:0b:85:23:ea:d1
State..... Alert
First Time Rogue was Reported..... Mon Dec 3 21:50:36 2007
Last Time Rogue was Reported..... Mon Dec 3 21:50:36 2007
Rogue Client IP address..... Not known
Reported By
AP 1
MAC Address..... 00:15:c7:82:b6:b0
Name..... AP0016.47b2.31ea
Radio Type..... 802.11a
RSSI..... -71 dBm
SNR..... 23 dB
Channel..... 149
Last reported by this AP..... Mon Dec 3 21:50:36 2007
```

**Related Commands** **show rogue client summary**

## show rogue client summary

To display a summary of the rogue clients detected by the Cisco Wireless LAN controller, use the **show rogue client summary** command.

**show rogue client summary**

Syntax Description	
<b>show</b>	Displays configurations.
<b>rogue client</b>	Rogue client.
<b>summary</b>	Displays a list of all rogue clients.

**Defaults** None.

**Examples** > **show rogue client summary**

```
MAC Address      State          # APs Last Heard
-----  -----
xx:xx:xx:xx:xx:xx Alert          1   Thu Aug 4 19:00:08 2005

xx:xx:xx:xx:xx:xx Alert          1   Thu Aug 4 19:12:08 2005
```

**Related Commands** **show rogue client detailed**

## show rogue ignore-list

To view a list of rogue access points that are configured to be ignored, use the **show rogue ignore-list** command.

**show rogue ignore-list**

<b>Syntax Description</b>	<b>show</b> Displays configurations. <b>rogue ignore-list</b> Rogue access points that are configured to be ignored. <b>summary</b> Displays a list of all rogue clients.
<b>Defaults</b>	None.
<b>Examples</b>	<pre>&gt; show rogue client summary  MAC Address ----- xx:xx:xx:xx:xx:xx</pre>
<b>Related Commands</b>	<b>show rogue client detailed</b>

## Show Rogue Rule Commands

Use the following **rogue rule** commands to display the rogue rule settings.

## show rogue rule detailed

To view detailed information for a specific rogue classification rule, use the **show rogue rule detailed** command.

**show rogue rule detailed** *rule\_name*

Syntax Description	
<b>show</b>	Displays configurations.
<b>rogue rule</b>	Rogue rules.
<b>detailed</b>	Shows detailed information on a specific rogue classification rule.
<i>rule_name</i>	Rogue rule name.

**Defaults** None.

**Examples** > **show rogue rule detailed Rule2**

```
Priority..... 2
Rule Name..... Rule2
State..... Enabled
Type..... Malicious
Match Operation..... Any
Hit Count..... 352
Total Conditions..... 2
Condition 1
type..... Client-count
value..... 10
Condition 2
type..... Duration
value (seconds)..... 2000
```

**Related Commands** **show rogue rule detailed**

# show rogue rule summary

To view the rogue classification rules that are configured on the controller, use the **show rogue rule summary** command.

**show rogue rule summary**

## Syntax Description

<b>show</b>	Displays configurations.
<b>rogue rule</b>	Rogue rules.
<b>summary</b>	Displays a list of all rogue rules that are configured on the controller

## Defaults

None.

## Examples

> **show rogue rule summary**

Priority	Rule Name	State	Type	Match	Hit Count
1	mtest	Enabled	Malicious	All	0
2	asdfasdfs	Enabled	Malicious	All	0

## Related Commands

**show rogue rule detailed**

## show route summary

To show the routes assigned to the Cisco Wireless LAN controller service port, use the **show route summary** command.

**show route summary**

<b>Syntax Description</b>	<b>show route</b> Command action. <b>summary</b> Displays all the configured routes.
---------------------------	---

**Defaults** None.

**Examples** > **show route summary**

```
Number of Routes..... 1  
Destination Network      Genmask          Gateway  
-----  -----  
xxx.xxx.xxx.xxx       255.255.255.0    xxx.xxx.xxx.xxx
```

**Related Commands** config route

# show rules

To show the active internal firewall rules, use the **show rules** command.

## show rules

<b>Syntax Description</b>	<b>show rules</b>	Displays active internal firewall rules.
<b>Defaults</b>	None.	
<b>Examples</b>	<pre>&gt; show rules</pre> <hr/> <pre>----- Rule ID.....: 3 Ref count....: 0 Precedence...: 99999999 Flags........: 00000001 ( PASS ) Source IP range:     (Local stack) Destination IP range:     (Local stack)</pre> <hr/> <pre>----- Rule ID.....: 25 Ref count....: 0 Precedence...: 99999999 Flags........: 00000001 ( PASS ) Service Info     Service name.....: GDB     Protocol.........: 6     Source port low...: 0     Source port high.: 0     Dest port low....: 1000     Dest port high...: 1000 Source IP range:     IP High.....: 0.0.0.0         Interface....: ANY Destination IP range:     (Local stack)</pre> <hr/> <pre>... ...</pre>	
<b>Related Commands</b>	None.	

## show run-config

To show a comprehensive view of the current Cisco Wireless LAN controller configuration, use the **show run-config** command.

**show run-config**

Syntax Description	show run-config	Command action.
--------------------	-----------------	-----------------

Defaults	None.
----------	-------

Examples	> <b>show run-config</b>
----------	--------------------------

Press Enter to continue...

```
System Inventory
Switch Description..... Cisco Controller
Machine Model..... .
Serial Number..... FLS0923003B
Burned-in MAC Address..... xx:xx:xx:xx:xx:xx
Crypto Accelerator 1..... Absent
Crypto Accelerator 2..... Absent
Power Supply 1..... Absent
Power Supply 2..... Present, OK
```

Press Enter to continue Or <Ctrl Z> to abort...

**Note** Some WLAN controllers may have no Crypto Accelerator (VPN Termination Module) or Power Supplies listed because they have no provisions for VPN Termination Modules or Power Supplies.

Related Commands	<b>config route</b>
------------------	---------------------

# show serial

To show the serial (console) port configuration, use the **show serial** command.

**show serial**

<b>Syntax Description</b>	<b>show</b> Displays configurations. <b>serial</b> Displays EIA-232 parameters and serial port inactivity timeout.
---------------------------	---

<b>Defaults</b>	9600, 8, off, 1, none.
-----------------	------------------------

<b>Examples</b>	> <b>show serial</b>
	Serial Port Login Timeout (minutes)..... 45 Baud Rate..... 9600 Character Size..... 8 Flow Control:..... Disable Stop Bits..... 1 Parity Type:..... none

<b>Related Commands</b>	<b>config serial baudrate</b> <b>config serial timeout</b>
-------------------------	---

## show sessions

To show the console port login timeout and maximum number of simultaneous Command Line Interface (CLI) sessions, use the **show sessions** command.

### show sessions

Syntax Description	
<b>show</b>	Displays configurations.
<b>sessions</b>	Displays CLI session configuration information.

**Defaults** 5 minutes, 5 sessions.

### Examples

```
> show sessions  
CLI Login Timeout (minutes)..... 0  
Maximum Number of CLI Sessions..... 5
```

The response indicates that the CLI sessions never time out and that the Cisco Wireless LAN controller can host up to five simultaneous CLI sessions.

**Related Commands** **config sessions maxsessions**  
**config sessions timeout**

# show services mobility

To view all mobility services active on the controller, use the **show services mobility** command.

```
show services mobility {summary | detail {all | ipaddr}}
```

Syntax Description	
<b>show</b>	Displays configurations.
<b>services mobility</b>	Displays mobility services.
<b>summary</b>	Displays summary of mobility services.
<b>detail</b>	Displays mobility services in detail.
<b>all</b>	Displays details for all connections.
<i>ipaddr</i>	Displays details for the specified IP connection.

Defaults	None.
----------	-------

Examples	<pre><b>show services mobility summary</b></pre> <p>Mobility Services Subscribed:</p> <table> <tr> <td>Server</td><td>IP Services</td></tr> <tr> <td>10.19.35.218</td><td>Client Tracking, Tag Tracking</td></tr> </table>	Server	IP Services	10.19.35.218	Client Tracking, Tag Tracking
Server	IP Services				
10.19.35.218	Client Tracking, Tag Tracking				

## show snmpcommunity

To display SNMP community entries, use the **show snmpcommunity** command.

**show snmpcommunity**

<b>Syntax Description</b>	<b>show</b> Displays configurations. <b>snmpcommunity</b> Displays SNMP community entries.
---------------------------	---

**Defaults** None.

**Examples** > **show snmpcommunity**

SNMP Community Name	Client IP Address	Client IP Mask	Access Mode	Status
public	0.0.0.0	0.0.0.0	Read Only	Enable
*****	0.0.0.0	0.0.0.0	Read/Write	Enable

**Related Commands** **config snmp version**  
**config snmp community mode**  
**config snmp community accessmode**  
**config snmp community create**  
**config snmp community delete**  
**config snmp community ipaddr**

# show snmptrap

To show the Cisco Wireless LAN controller SNMP trap receivers and their status, use the **show snmptrap** command.

**show snmptrap**

Syntax Description	<b>show</b> Displays configurations. <b>snmptrap</b> SNMP trap receivers.
<b>Defaults</b>	None.
<b>Examples</b>	> <b>show snmptrap</b>  SNMP Trap Receiver Name      IP Address      Status ----- xxx.xxx.xxx.xxx                xxx.xxx.xxx.xxx      Enable
<b>Related Commands</b>	<b>config snmp version</b> <b>config snmp trapreceiver</b>

## show snmpv3user

To show the SNMP version 3 configuration, use the **show snmpv3user** command.

**show snmpv3user**

<b>Syntax Description</b>	<b>show</b> Displays configurations. <b>snmpv3user</b> SNMP version 3 configuration information.
---------------------------	---

**Defaults** None.

**Examples** > **show snmpv3user**

```
SNMP v3 User Name      AccessMode  Authentication Encryption
-----
default                Read/Write  HMAC-SHA      CFB-AES
```

**Related Commands** **config snmp version**  
**config snmp v3user**

# show snmpversion

To display which versions of Simple Network Management Protocol (SNMP) are enabled or disabled on your controller, use the **show snmpversion** command.

## show snmpversion

Syntax Description	<b>show</b> Display settings. <b>snmpversion</b> Displays SNMP v1/v2/v3c status (enabled or disabled).
Defaults	Enable.
Examples	> <b>show snmpversion</b> SNMP v1 Mode..... Disable SNMP v2c Mode..... Enable SNMP v3 Mode..... Enable
Related Commands	<b>config snmp version</b>

## show spanningtree port

To show the Cisco Wireless LAN controller spanning tree port configuration, use the **show spanningtree port** command.

When the a Cisco 4400 Series wireless LAN controller is configured for port redundancy, spanning tree protocol must be disabled for all ports on the Cisco 4400 series wireless LAN controller. Spanning tree protocol can remain enabled on the switch connected to the Cisco 4400 series wireless LAN controller.

**show spanningtree port** *port*

Syntax Description	
<b>show</b>	Displays configurations.
<b>spanningtree</b>	Spanning tree.
<b>port</b>	Displays spanning tree values on a per port basis.
<i>port</i>	Physical port number: <ul style="list-style-type: none"><li>• 1 through 4 on Cisco 2100 series wireless LAN controller.</li><li>• 1 or 2 on Cisco 4402 series wireless LAN controller.</li><li>• 1 through 4 on Cisco 4404 series wireless LAN controller.</li></ul>

**Note**

Some WLAN controllers do not support the spanning tree function.

Defaults	800C, Disabled, 802.1D, 128, 100, Auto.
----------	---

**Examples**

```
> show spanningtree port 3

STP Port ID..... 800C
STP Port State..... Disabled
STP Port Administrative Mode..... 802.1D
STP Port Priority..... 128
STP Port Path Cost..... 100
STP Port Path Cost Mode..... Auto
```

Related Commands	<b>config spanningtree port</b>
------------------	---------------------------------

# show spanningtree switch

To show the Cisco Wireless LAN controller network (DS port) spanning tree configuration, use the **show spanningtree switch** command.

**show spanningtree switch**

---

## Syntax Description

<b>show</b>	Displays configurations.
<b>spanningtree</b>	Spanning tree.
<b>switch</b>	Displays spanning tree values on a per switch basis.

---

**Note** Some WLAN controllers do not support the spanning tree function.

---

---

## Defaults

None.

---

## Examples

> **show spanningtree switch**

```
STP Specification..... IEEE 802.1D
STP Base MAC Address..... 00:0B:85:02:0D:20
Spanning Tree Algorithm..... Disable
STP Bridge Priority..... 32768
STP Bridge Max. Age (seconds)..... 20
STP Bridge Hello Time (seconds)..... 2
STP Bridge Forward Delay (seconds)..... 15
```

---

## Related Commands

**config spanningtree switch bridgepriority**  
**config spanningtree switch forwarddelay**  
**config spanningtree switch hellotime**  
**config spanningtree switch maxage**  
**config spanningtree switch mode**

## Show Statistics Commands

Use the **show stats** commands to display controller statistics.

# show stats port

To show physical port receive and transmit statistics, use the **show stats port** command.

**show stats port {detailed port | summary port}**

---

## Syntax Description

<b>show</b>	Displays configurations.
<b>stats</b>	Statistics.
<b>port</b>	Port.
<b>detailed</b>	Displays detailed port statistics.
<b>summary</b>	Displays port summary statistics.
<i>port</i>	Physical port number: <ul style="list-style-type: none"><li>• 1 through 4 on Cisco 2100 Series wireless LAN controllers.</li><li>• 1 or 2 on Cisco 4402 Series wireless LAN controllers.</li><li>• 1 through 4 on Cisco 4404 Series wireless LAN controllers.</li><li>• 1 on Cisco WLCM Series wireless LAN controllers.</li></ul>

---

---

## Defaults

None.

---

## Examples

```
> show stats port summary 1

# show stats switch

To show the network (DS port) receive and transmit statistics, use the **show stats switch** command.

**show stats switch {detailed | summary}**

Syntax Description	
<b>show</b>	Displays configurations.
<b>stats</b>	Statistics.
<b>switch</b>	Cisco Wireless LAN controller.
<b>detailed</b>	Displays detailed switch statistics.
<b>summary</b>	Displays switch summary statistics.

**Defaults** None.

**Examples**

```
> show stats switch summary

Packets Received Without Error..... 136410

## show switchconfig

To display parameters that apply to the Cisco Wireless LAN controller, use the **show switchconfig** command.

### **show switchconfig**

<b>Syntax Description</b>	<b>show</b> Displays configurations. <b>switchconfig</b> Displays parameters that apply to the Cisco Wireless LAN controller.
---------------------------	--

<b>Defaults</b>	None.
-----------------	-------

### **Examples**

```
> show switchconfig  
802.3x Flow Control Mode..... Disable  
Current LWAPP Transport Mode..... Layer 3  
LWAPP Transport Mode after next switch reboot.... Layer 3
```

<b>Related Commands</b>	<b>config switchconfig flowcontrol</b> <b>config switchconfig mode</b>
-------------------------	---

# show sysinfo

To show high-level Cisco Wireless LAN controller information, use the **show sysinfo** command.

**show sysinfo**

<b>Syntax Description</b>	<b>show</b> Displays configurations. <b>sysinfo</b> Cisco Wireless LAN controller information.
---------------------------	---

**Defaults** None.

<b>Examples</b>	> <b>show sysinfo</b>
	<pre> Manufacturer's Name..... &lt;company name&gt; Product Name..... Product Version..... 1.2.48.0 RTOS Version..... 1.2.48.0 Bootloader Version..... 1.1.11.0  System Name..... ## show tech-support

To show Cisco Wireless LAN controller variables frequently requested by Cisco Technical Assistance Center (TAC), use the **show tech-support** command.

**show tech-support**

<b>Syntax Description</b>	
<b>show</b>	Displays configurations.
<b>tech-support</b>	Displays system resource information.

**Defaults** None.

**Examples** > **show tech-support**

```
Current CPU Load..... 0%  
  
System Buffers  
    Max Free Buffers..... 4608  
    Free Buffers..... 4604  
    Buffers In Use..... 4  
  
Web Server Resources  
    Descriptors Allocated..... 152  
    Descriptors Used..... 3  
    Segments Allocated..... 152  
    Segments Used..... 3  
  
System Resources  
    Uptime..... 747040 Secs  
    Total Ram..... 127552 Kbytes  
    Free Ram..... 19540 Kbytes  
    Shared Ram..... 0 Kbytes  
    Buffer Ram..... 460 Kbytes
```

**Related Commands** None.

# show time

To show the Cisco Wireless LAN controller time and date, use the **show time** command.

**show time**

<b>Syntax Description</b>	<b>show</b> Displays configurations. <b>time</b> Cisco Wireless LAN controller time and date.
---------------------------	--

<b>Defaults</b>	None.
-----------------	-------

<b>Examples</b>	> <b>show time</b>
	Time..... Thu Aug 4 19:51:49 2005
	Timezone delta..... 0:0
	Daylight savings..... disabled
	NTP Servers
	NTP Polling Interval..... 86400
	Index                  NTP Server
	-----

<b>Related Commands</b>	<b>config time</b>
-------------------------	--------------------

# show trapflags

To show the Cisco Wireless LAN controller SNMP trap flags, use the **show trapflags** command.

**show trapflags**

<b>Syntax Description</b>	<b>show</b> Displays configurations. <b>trapflags</b> Displays the Cisco Wireless LAN controller SNMP trap flags.
---------------------------	--

**Defaults** None.

## Examples

```
> show trapflags

Authentication Flag..... Enable
Link Up/Down Flag..... Enable
Multiple Users Flag..... Enable
Spanning Tree Flag..... Enable

Client Related Traps
    802.11 Disassociation..... Disable
    802.11 Deauthenticate..... Disable

## show traplog

To show the Cisco Wireless LAN controller SNMP trap log, use the **show traplog** command.

**show traplog**

<b>Syntax Description</b>	
<b>show</b>	Displays configurations.
<b>traplog</b>	Cisco Wireless LAN controller SNMP trap log.

**Defaults** None.

**Examples**

```
> show traplog

Number of Traps Since Last Reset..... 2447
Number of Traps Since Log Last Displayed... 2447

Log System Time           Trap

# show wlan

To display configuration information for a specified wireless LAN or a foreign access point, or to display wireless LAN summary information, use the **show wlan** command.

**show wlan [apgroups | summary | wlan\_id | foreignAp]**

## Syntax Description

<b>show</b>	Displays configurations.
<b>wlan</b>	Wireless LAN.
<b>apgroups</b>	Displays access point group information.
<b>summary</b>	Displays a summary of all wireless LANs.
<i>wlan_id</i>	Wireless LAN identifier from 1 to 16.
<b>foreignAp</b>	Displays the configuration for support of foreign access points.

## Defaults

None.

## Examples

```
> show wlan 1

## show wps ap-authentication

To display the access point neighbor authentication configuration on the controller, use the **show wps ap-authentication** command.

**show wps ap-authentication summary**

Syntax Description	
<b>show</b>	Command action.
<b>wps</b>	Displays WPS configuration.
<b>ap-authentication</b>	AP neighbor authentication config
<b>summary</b>	Displays the WPS summary.

**Defaults** None.

**Examples** > **show wps ap-authentication summary**

AP neighbor authentication is <disabled>.

Authentication alarm threshold is 1.

RF-Network Name: <B1>

**Related Commands**

- show wps
- show wps cids-sensor detail
- show wps cids-sensor summary
- show wps summary
- config wps ap-authentication
- config wps cids-sensor
- config wps rogue-ap

## **show wps cids-sensor detail**

To display detailed information on a specified WPS IDS sensor, use the **show wps cids-sensor detail** command.

**show wps cids-sensor detail *index***

**Syntax Description** *index* Specifies the IDS sensor index value.

Command History	Release	Modification
	4.1	This command was introduced.

> show wps cids-sensor detail 1

**Related Commands** show wps

```
show wps  
show wps ap-authentication  
show wps cids-sensor summary  
show wps summary  
config wps ap-authentication  
config wps cids-sensor
```

## show wps cids-sensor summary

To display IDS sensor summary information, use the **show wps cids-sensor summary** command.

**show wps cids-sensor summary**

**Syntax Description** This command has no arguments or keywords.

Command History	Release	Modification
	4.1	This command was introduced.

**Examples** > **show wps summary**

```
Configured IDS Sensors

Index  Server Address      Port      State       Intvl   Last Query
-----  -----              -----      -----      -----   -----

# show wps mfp

To display Management Frame Protection (MFP) information, use the **show wps mfp** command.

**show wps mfp {summary | statistics}**

<b>Syntax Description</b>	<b>show</b> Command action. <b>wps</b> Displays WPS configuration. <b>mfp</b> Displays Management Frame Protection information. <b>summary</b> Displays MFP configuration and status. <b>statistics</b> Displays MFP statistics.
---------------------------	--

## Examples

> **show wps mfp summary**

```
Global Infrastructure MFP state..... DISABLED (*all infrastructure
settings are overridden)
Controller Time Source Valid..... False
```

WLAN ID	WLAN Name	WLAN	Infra.	Client
		Status	Protection	Protection
1	homeap	Disabled	*Enabled	Optional but inactive (WPA2 not configured)
2	7921	Enabled	*Enabled	Optional but inactive (WPA2 not configured)
3	open1	Enabled	*Enabled	Optional but inactive (WPA2 not configured)
4	7920	Enabled	*Enabled	Optional but inactive (WPA2 not configured)

  

AP Name	Infra.	Operational		--Infra. Capability--	
	Validation	Radio	State	Protection	Validation
AP1252AG-EW	*Enabled	b/g a	Down Down	Full Full	Full Full

>**show wps mfp statistics**

BSSID	Radio Validator AP	Last Source Addr	Found	Error Type	Count	Frame Types
no errors

## show wps shun-list

To display IDS sensor shun list, use the **show wps shun-list** command.

**show wps shun-list**

**Syntax Description** This command has no arguments or keywords

**Defaults** None

**Examples** > **show wps shun-list**

**Related Commands** [config wps shun-list](#)

# show wps signature events {standard | custom}

To display more information on the attacks detected by a particular standard or custom signature, use the **show wps signature events summary** command.

**show wps signature events {standard | custom} precedence# summary**

**show wps signature events {standard | custom} precedence# detailed per-signature source\_mac**

**show wps signature events {standard | custom} precedence# detailed per-mac source\_mac**

<b>Syntax Description</b>	<b>standard   custom</b> Specifies the type of IDS signature to display. <b>precedence#</b> Specifies the signature precedence identification. <b>summary</b> Displays tracking signature summary information. <b>detailed</b> Displays tracking source MAC address detail information. <b>per-signature</b> Displays MAC address tracking information per signature source. <b>source_mac</b> Specifies the MAC address of the source. <b>per-mac</b> Displays MAC address tracking information per MAC address source.
---------------------------	--

## Examples

To display information on the attacks detected by standard signature 1, use this command:

```
> show wps signature events standard 1 summary

Precedence..... 1
Signature Name..... Bcast deauth
Type..... Standard
Number of active events..... 2

Source MAC Addr Track Method Frequency # APs Last Heard
----- -----
00:a0:f8:58:60:dd Per Signature 50 1 Wed Oct 25 15:03:05 2006
00:a0:f8:58:60:dd Per Mac 30 1 Wed Oct 25 15:02:53 2006
```

# Configuring Controller Settings

Use the config commands to configure Cisco Wireless LAN controller options and settings.

## Config 802.11x Commands

Use the **config 802.11x** commands to configure settings for an 802.11a, 802.11b, or other supported 802.11 network.

### **config {802.11a | 802.11b} 11nsupport**

To enable 802.11n support on the network, use the **config {802.11a | 802.11b} 11nsupport** command.

```
config {802.11a | 802.11b} 11nsupport {enable | disable}
```

Syntax Description	<b>config</b> Configure parameters. <b>802.11a</b> 802.11a Cisco radio. <b>802.11b</b> 802.11b Cisco radio. <b>11nsupport</b> Support for 802.11n devices. <b>enable</b> Enable support. <b>disable</b> Disable support.
--------------------	---

Defaults	None.
----------	-------

Examples	> config 802.11a 11nsupport enable
----------	------------------------------------

Related Commands	<b>config {802.11a   802.11b} 11nsupport mcs tx</b> <b>config {802.11a   802.11b} 11nsupport a-mpdu tx priority</b> <b>config 802.11a disable network</b> <b>config 802.11a disable</b> <b>config 802.11a channel ap</b> <b>config 802.11a txpower ap</b> <b>config 802.11a chan_width</b>
------------------	--

## config {802.11a | 802.11b} 11nsupport a-mpdu tx priority

To specify the aggregation method used for 802.11n packets, use the **config {802.11a | 802.11b} 11nsupport a-mpdu tx priority** command.

**config {802.11a | 802.11b} 11nsupport a-mpdu tx priority {0-7 | all} {enable | disable}**

**Note** Aggregation is the process of grouping packet data frames together rather than transmitting them separately. Two aggregation methods are available: Aggregated MAC Protocol Data Unit (A-MPDU) and Aggregated MAC Service Data Unit (A-MSDU). A-MPDU is performed in the software whereas A-MSDU is performed in the hardware.

Syntax Description	
<b>config</b>	Configure parameters.
<b>802.11a</b>	802.11a Cisco radio.
<b>802.11b</b>	802.11b Cisco radio.
<b>11nsupport</b>	Support for 802.11n devices.
<b>a-mpdu tx priority</b>	Aggregated MAC Protocol Data Unit priority levels assigned per traffic type: <ul style="list-style-type: none"><li>• 1—Background</li><li>• 2—Spare</li><li>• 0—Best effort</li><li>• 3—Excellent effort</li><li>• 4—Controlled load</li><li>• 5—Video, less than 100-ms latency and jitter</li><li>• 6—Voice, less than 10-ms latency and jitter</li><li>• 7—Network control</li><li>• all—Configure all of the priority levels at once.</li></ul>
<b>Note</b>	Configure the priority levels to match the aggregation method used by the clients.
<b>enable</b>	The traffic associated with the priority level uses A-MPDU transmission.
<b>disable</b>	The traffic associated with the priority level uses A-MSDU transmission.
<b>Defaults</b>	All priorities, except 5 and 6, are enabled by default. Priorities 5 and 6 are disabled by default.
<b>Examples</b>	<pre>&gt; config 802.11a 11nsupport a-mpdu tx priority all enable</pre>
<b>Related Commands</b>	<b>config {802.11a   802.11b} 11nsupport mcs tx</b> <b>config 802.11a disable network</b>

```
config 802.11a disable
config 802.11a channel ap
config 802.11a txpower ap
config 802.11a chan_width
```

## config {802.11a | 802.11b} 11nsupport antenna

To use of specific antennas for a particular access point, enter this command:

```
config {802.11a | 802.11b} 11nsupport antenna {tx | rx} Cisco_AP {A | B | C} {enable | disable}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>802.11a</b>	802.11a Cisco radio.
<b>802.11b</b>	802.11b Cisco radio.
<b>11nsupport antenna</b>	Support for 802.11n devices.
<b>tx</b>	Enable the antenna to transmit.
<b>rx</b>	Enable the antenna to receive.
<i>Cisco_AP</i>	Specify the access point.
<b>A   B   C</b>	The antenna ports. A is the right antenna port, B is the left antenna port, and C is the center antenna port.
<b>enable</b>	Enable support.
<b>disable</b>	Disable support.

Defaults	None.
----------	-------

Examples	config 802.11a 11nsupport antenna tx AP1 C enable
----------	---

Related Commands	config {802.11a   802.11b} 11nsupport mcs tx config 802.11a disable network config 802.11a disable config 802.11a channel ap config 802.11a txpower ap config 802.11a chan_width
------------------	---

# config {802.11a | 802.11b} 11nsupport mcs tx

To specify the modulation and coding scheme (MCS) rates at which data can be transmitted between the access point and the client, use the **config {802.11a | 802.11b} 11nsupport mcs tx** command.

```
config {802.11a | 802.11b} 11nsupport mcs tx {0-15} {enable | disable}
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>802.11a</b>	802.11a Cisco radio.
<b>802.11b</b>	802.11b Cisco radio.
<b>11nsupport</b>	Support for 802.11n devices.
<b>mcs tx</b>	Modulation and coding scheme data rates: <ul style="list-style-type: none"> <li>• 0 (7 Mbps)</li> <li>• 1 (14 Mbps)</li> <li>• 2 (21 Mbps)</li> <li>• 3 (29 Mbps)</li> <li>• 4 (43 Mbps)</li> <li>• 5 (58 Mbps)</li> <li>• 6 (65 Mbps)</li> <li>• 7 (72 Mbps)</li> <li>• 8 (14 Mbps)</li> <li>• 9 (29 Mbps)</li> <li>• 10 (43 Mbps)</li> <li>• 11 (58 Mbps)</li> <li>• 12 (87 Mbps)</li> <li>• 13 (116 Mbps)</li> <li>• 14 (130 Mbps)</li> <li>• 15 (144 Mbps)</li> </ul>
<b>enable</b>	Enable support.
<b>disable</b>	Disable support.

## Defaults

None.

## Examples

```
> config 802.11a 11nsupport mcs tx 5 enable
```

## Related Commands

**config {802.11a | 802.11b} 11nsupport**  
**config wlan wmm required**

■ config {802.11a | 802.11b} 11nsupport mcs tx

```
config {802.11a | 802.11b} 11nsupport a-mpdu tx priority

# config {802.11a | 802.11b} cac video acm

To enable or disable video Call Admission Control (CAC) for the 802.11a or 802.11b/g network, use the **config {802.11a | 802.11b} cac video acm** command.

```
config {802.11a | 802.11b} cac video acm {enable | disable}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>802.11a   802.11b</b>	802.11a or 802.11b Cisco radio.
<b>cac</b>	Call Admission Control parameters.
<b>video</b>	Video traffic parameters.
<b>acm</b>	Admission control.
<b>enable   disable</b>	Enable or disable video CAC.

Defaults	Disabled.
----------	-----------

Usage Guidelines	Call Admission Control (CAC) commands require that the WLAN you are planning to modify is configured for Wi-Fi Multimedia (WMM) protocol and the quality of service (QoS) level be set to Platinum.
------------------	---

Before you can configure CAC parameters on a network, you must complete the following prerequisites:

- Disable all WLANs with WMM enabled: **config wlan disable wlan\_id**
- Disable the radio network you wish to configure: **config {802.11a | 802.11b} disable network**
- Save the new configuration: **save config**
- Enable voice or video CAC for the network you wish to configure:  
**config {802.11a | 802.11b} cac voice acm enable**, or  
**config {802.11a | 802.11b} cac video acm enable**

For complete instructions, refer to the “Configuring Voice and Video Parameters” section in the “Configuring Controller Settings” chapter of the *Cisco Wireless LAN Controller Configuration Guide* for your release.

Examples	<pre>&gt; config 802.11a cac video acm enable &gt; config 802.11b cac video acm disable</pre>
----------	---

Related Commands	<b>config {802.11a   802.11b} cac video max-bandwidth</b> <b>config {802.11a   802.11b} cac video roam-bandwidth</b> <b>config {802.11a   802.11b} cac video tspec-inactivity-timeout</b>
------------------	---

## config {802.11a | 802.11b} cac video max-bandwidth

To set the percentage of the maximum bandwidth allocated to clients for video applications on the 802.11a or 802.11b/g network, use the **config {802.11a | 802.11b} cac video max-bandwidth** command.

**config {802.11a | 802.11b} cac video max-bandwidth *bandwidth***

Syntax Description	
<b>config</b>	Configure parameters.
<b>802.11a   802.11b</b>	802.11a or 802.11b Cisco radio.
<b>cac</b>	Call Admission Control parameters.
<b>video</b>	Video traffic parameters.
<b>max-bandwidth</b>	Specify the percentage of the maximum allocated bandwidth for video applications on the selected radio band.
<b><i>bandwidth</i></b>	A bandwidth percentage value from 0-100%.

Defaults	0%

Usage Guidelines	The maximum radio frequency (RF) bandwidth cannot exceed 100% for voice + video. Once the client reaches the value specified, the access point rejects new calls on this network.

**Note** If this parameter is set to zero (0), the controller assumes that the operator does not want to allocate any bandwidth and therefore allows all bandwidth requests.

Call Admission Control (CAC) commands require that the WLAN you are planning to modify is configured for Wi-Fi Multimedia (WMM) protocol and the quality of service (QoS) level be set to Platinum.

Before you can configure CAC parameters on a network, you must complete the following prerequisites:

- Disable all WLANs with WMM enabled: **config wlan disable *wlan\_id***
- Disable the radio network you wish to configure: **config {802.11a | 802.11b} disable network**
- Save the new configuration: **save config**
- Enable voice or video CAC for the network you wish to configure:  
**config {802.11a | 802.11b} cac voice acm enable**, or  
**config {802.11a | 802.11b} cac video acm enable**

For complete instructions, refer to the “Configuring Voice and Video Parameters” section in the “Configuring Controller Settings” chapter of the *Cisco Wireless LAN Controller Configuration Guide* for your release.

Examples	> config 802.11a cac video max-bandwidth 50 > config 802.11b cac video max-bandwidth 75

---

**Related Commands**

config {802.11a | 802.11b} cac video acm  
config {802.11a | 802.11b} cac video roam-bandwidth  
config {802.11a | 802.11b} cac video tspec-inactivity-timeout

**config {802.11a | 802.11b} cac video roam-bandwidth**

To configure the percentage of the maximum allocated bandwidth reserved for roaming video clients on the 802.11a or 802.11b/g network, use the **config {802.11a | 802.11b} cac video roam-bandwidth** command.

**config {802.11a | 802.11b} cac video roam-bandwidth *bandwidth***

Syntax Description	<b>config</b>	Configure parameters.
	<b>802.11a   802.11b</b>	802.11a or 802.11b Cisco radio.
	<b>cac</b>	Call Admission Control parameters.
	<b>video</b>	Video traffic parameters.
	<b>roam-bandwidth</b>	Specify the percentage of the maximum allocated bandwidth reserved for roaming video clients on the selected radio band.
	<i>bandwidth</i>	A bandwidth percentage value from 0 to 25%.

**Defaults** 0%

**Usage Guidelines** The controller reserves the specified bandwidth from the maximum allocated bandwidth for roaming video clients.

**Note** If this parameter is set to zero (0), the controller assumes that the operator does not want to do any bandwidth allocation and, therefore, allows all bandwidth requests.

Call Admission Control (CAC) commands require that the WLAN you are planning to modify is configured for Wi-Fi Multimedia (WMM) protocol and the quality of service (QoS) level be set to Platinum.

Before you can configure CAC parameters on a network, you must complete the following prerequisites:

- Disable all WLANs with WMM enabled: **config wlan disable wlan\_id**
  - Disable the radio network you wish to configure: **config {802.11a | 802.11b} disable network**
  - Save the new configuration: **save config**
  - Enable voice or video CAC for the network you wish to configure:  
**config {802.11a | 802.11b} cac voice acm enable**, or  
**config {802.11a | 802.11b} cac video acm enable**

For complete instructions, refer to the “Configuring Voice and Video Parameters” section in the “Configuring Controller Settings” chapter of the *Cisco Wireless LAN Controller Configuration Guide* for your release.

**Examples** > config 802.11a cac video roam-bandwidth 10  
 > config 802.11b cac video roam-bandwidth 0

---

**Related Commands**

**config {802.11a | 802.11b} cac video acm**  
**config {802.11a | 802.11b} cac video max-bandwidth**  
**config {802.11a | 802.11b} cac video tspec-inactivity-timeout**

## config {802.11a | 802.11b} cac video tspec-inactivity-timeout

To process or ignore the WMM traffic specifications (TSPEC) inactivity timeout received from an access point, use the **config {802.11a | 802.11b} cac video tspec-inactivity-timeout** command.

**config {802.11a | 802.11b} cac video tspec-inactivity-timeout {enable | ignore}**

Syntax Description	
<b>config</b>	Configure parameters.
<b>802.11a   802.11b</b>	802.11a or 802.11b Cisco radio.
<b>cac</b>	Call Admission Control parameters.
<b>video</b>	Video traffic parameters.
<b>tspec-inactivity-timeout</b>	Specify the response to TSPEC inactivity timeout messages received from an access point.
<b>enable   ignore</b>	Process or ignore the TSPEC inactivity timeout messages.

**Defaults** Disabled (ignore).

### Usage Guidelines

Call Admission Control (CAC) commands require that the WLAN you are planning to modify is configured for Wi-Fi Multimedia (WMM) protocol and the quality of service (QoS) level be set to Platinum.

Before you can configure CAC parameters on a network, you must complete the following prerequisites:

- Disable all WLANs with WMM enabled: **config wlan disable wlan\_id**
- Disable the radio network you wish to configure: **config {802.11a | 802.11b} disable network**
- Save the new configuration: **save config**
- Enable voice or video CAC for the network you wish to configure:  
**config {802.11a | 802.11b} cac voice acm enable**, or  
**config {802.11a | 802.11b} cac video acm enable**

For complete instructions, refer to the “Configuring Voice and Video Parameters” section in the “Configuring Controller Settings” chapter of the *Cisco Wireless LAN Controller Configuration Guide* for your release.

### Examples

```
> config 802.11a cac video tspec-inactivity-timeout enable
> config 802.11b cac video tspec-inactivity-timeout ignore
```

### Related Commands

```
config {802.11a | 802.11b} cac video acm
config {802.11a | 802.11b} cac video max-bandwidth
config {802.11a | 802.11b} cac video roam-bandwidth
```

# config {802.11a | 802.11b} cac voice acm

To enable or disable bandwidth-based voice Call Admission Control (CAC) for the 802.11a or 802.11b/g network, use the **config {802.11a | 802.11b} cac voice acm** command.

**config {802.11a | 802.11b} cac voice acm {enable | disable}**

## Syntax Description

<b>config</b>	Configure parameters.
<b>802.11a   802.11b</b>	802.11a or 802.11b Cisco radio.
<b>cac</b>	Call Admission Control parameters.
<b>voice</b>	Voice traffic parameters.
<b>acm</b>	Admission control.
<b>enable   disable</b>	Enable or disable bandwidth-based CAC.

## Defaults

Disabled.

## Command History

Release	Modification
4.1	This command was introduced.

## Usage Guidelines

Call Admission Control (CAC) commands require that the WLAN you are planning to modify is configured for Wi-Fi Multimedia (WMM) protocol and the quality of service (QoS) level be set to Platinum.

Before you can configure CAC parameters on a network, you must complete the following prerequisites:

- Disable all WLANs with WMM enabled: **config wlan disable wlan\_id**
- Disable the radio network you wish to configure: **config {802.11a | 802.11b} disable network**
- Save the new configuration: **save config**
- Enable voice or video CAC for the network you wish to configure:  
**config {802.11a | 802.11b} cac voice acm enable**, or  
**config {802.11a | 802.11b} cac video acm enable**

For complete instructions, refer to the “Configuring Voice and Video Parameters” section in the “Configuring Controller Settings” chapter of the *Cisco Wireless LAN Controller Configuration Guide* for your release.

## Examples

```
> config 802.11a cac voice acm enable
> config 802.11b cac voice acm disable
```

## Related Commands

----------	---

Related Commands	<b>config {802.11a   802.11b} cac voice acm</b> <b>config {802.11a   802.11b} cac voice max-bandwidth</b>
------------------	--

```
config {802.11a | 802.11b} cac voice roam-bandwidth  
config {802.11a | 802.11b} cac voice stream-size  
config {802.11a | 802.11b} cac voice tspec-inactivity-timeout
```

## config {802.11a | 802.11b} cac voice stream-size

To configure the number of aggregated voice WMM traffic specification (TSPEC) streams at a specified data rate for the 802.11a or 802.11b/g network, use the **config {802.11a | 802.11b} cac voice stream-size** command.

**config {802.11a | 802.11b} cac voice stream-size *number max-streams mean\_datarate***

Syntax Description	
<b>config</b>	Configure parameters.
<b>802.11a   802.11b</b>	802.11a or 802.11b Cisco radio.
<b>cac</b>	Call Admission Control parameters.
<b>voice</b>	Voice traffic parameters.
<b>stream-size</b>	Configures the number of voice streams that the controller supports.
<b>number</b>	Specifies the number (1 to 5) of voice streams.
<b>max-streams</b>	Configures the mean data rate of a voice stream.
<b>mean_datarate</b>	Specifies the mean data rate (84 to 91.2 Kbps) of a voice stream.

### Defaults

The default number of streams is 2 and the mean data rate of a stream is 84 Kbps.

### Command History

Release	Modification
4.1	This command was introduced.

### Usage Guidelines

Call Admission Control (CAC) commands require that the WLAN you are planning to modify is configured for Wi-Fi Multimedia (WMM) protocol and the quality of service (QoS) level be set to Platinum.

Before you can configure CAC parameters on a network, you must complete the following prerequisites:

- Disable all WLANs with WMM enabled: **config wlan disable *wlan\_id***
- Disable the radio network you wish to configure: **config {802.11a | 802.11b} disable network**
- Save the new configuration: **save config**
- Enable voice or video CAC for the network you wish to configure:  
**config {802.11a | 802.11b} cac voice acm enable**, or  
**config {802.11a | 802.11b} cac video acm enable**

For complete instructions, refer to the “Configuring Voice and Video Parameters” section in the “Configuring Controller Settings” chapter of the *Cisco Wireless LAN Controller Configuration Guide* for your release.

### Examples

```
> config 802.11a cac voice stream-size 5 max-streams size 85
> config 802.11b cac voice stream-size 3 max-streams size 90
```

**Related Commands**

config {802.11a | 802.11b} cac voice acm  
config {802.11a | 802.11b} cac voice load-based  
config {802.11a | 802.11b} cac voice max-bandwidth  
config {802.11a | 802.11b} cac voice roam-bandwidth

config {802.11a | 802.11b} exp-bwreq

## config {802.11a | 802.11b} chan\_width

To configure the channel width for a particular access point, enter this command:

```
config {802.11a | 802.11b} chan_width Cisco_AP {20 | 40}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>802.11a</b>	802.11a Cisco radio.
<b>802.11b</b>	802.11b Cisco radio.
<b>chan_width</b>	The channel width for a particular access point
<i>Cisco_AP</i>	Specify the access point.
<b>20</b>	Allows the radio to communicate using only 20-MHz channels. Choose this option for legacy 802.11a radios, 20-MHz 802.11n radios, or 40-MHz 802.11n radios that you want to operate using only 20-MHz channels.
<b>40</b>	Allows 40-MHz 802.11n radios to communicate using two adjacent 20-MHz channels bonded together.

### Defaults

Default channel width is **20**.

### Usage Guidelines

This parameter can be configured only if the primary channel is statically assigned.

Cisco recommends that you do not configure 40-MHz channels in the 2.4-GHz radio band because severe co-channel interference can occur.

Statically configuring an access point's radio for 20- or 40-MHz mode overrides the globally configured DCA channel width setting (configured using the **config advanced 802.11a channel dca chan-width-11n** command). If you ever change the static configuration back to global on the access point radio, the global DCA configuration overrides the channel width configuration that the access point was previously using.

### Examples

```
> config 802.11a chan_width cisco_ap 40
```

# config {802.11a | 802.11b} disable

To disable the 802.11a or 802.11b/g network before changing pico cell mode parameters, enter this command:

```
config {802.11a | 802.11b} disable
```

<b>Syntax Description</b>	<b>config</b> Configure parameters. <b>802.11a</b> 802.11a Cisco radio. <b>802.11b</b> 802.11b Cisco radio. <b>disable</b> Disable support.
---------------------------	--

<b>Defaults</b>	None.
-----------------	-------

<b>Examples</b>	> config {802.11a   802.11b} disable
-----------------	--------------------------------------

<b>Related Commands</b>	<b>config 802.11a disable network</b> <b>config 802.11a channel ap</b> <b>config 802.11b channel ap</b> <b>config 802.11a txpower ap</b> <b>config 802.11a chan_width</b>
-------------------------	---

# config {802.11a | 802.11b} l2roam rf-params

To configure 802.11a or 802.11b/g Layer 2 client roaming parameters, enter this command:

```
config {802.11a | 802.11b} l2roam rf-params {default | custom min_rssi roam_hyst scan_thresh trans_time}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>802.11a</b>	802.11a Cisco radio.
<b>802.11b</b>	802.11b/g Cisco radio.
<b>l2roam</b>	Support for Layer 2 client roaming.
<b>rf-params</b>	Radio frequency parameters.
<b>default</b>	Restores Layer 2 client roaming RF parameters to default values.
<b>custom</b>	Configures custom Layer 2 client roaming RF parameters.
<i>min_rssi</i>	The minimum received signal strength indicator (RSSI) that is required for the client to associate to the access point. If the client's average received signal power dips below this threshold, reliable communication is usually impossible. Therefore, clients must already have found and roamed to another access point with a stronger signal before the minimum RSSI value is reached. The valid range is –80 to –90 dBm, and the default value is –85 dBm.
<i>roam_hyst</i>	The hysteresis value indicates how much greater the signal strength of a neighboring access point must be in order for the client to roam to it. This parameter is intended to reduce the amount of roaming between access points if the client is physically located on or near the border between the two access points. The valid range is 2 to 4 dB, and the default value is 2 dB.
<i>scan_thresh</i>	The scan threshold value is the minimum RSSI that is allowed before the client should roam to a better access point. When the RSSI drops below the specified value, the client must be able to roam to a better access point within the specified transition time. This parameter also provides a power-save method to minimize the time that the client spends in active or passive scanning. For example, the client can scan slowly when the RSSI is above the threshold and scan more rapidly when the RSSI is below the threshold. The valid range is –70 to –77 dBm, and the default value is –72 dBm.
<i>trans_time</i>	The transition time is the maximum time allowed for the client to detect a suitable neighboring access point to roam to and to complete the roam, whenever the RSSI from the client's associated access point is below the scan threshold. The valid range is 1 to 10 seconds, and the default value is 5 seconds.
<b>Note</b> For high-speed client roaming applications in outdoor mesh environments, Cisco recommends that you set the transition time to 1 second.	

---

**Defaults**

<i>min_rssi</i>	-85
<i>roam_hyst</i>	2
<i>scan_thresh</i>	-72
<i>trans_time</i>	5

---

---

**Usage Guidelines**

For high-speed client roaming applications in outdoor mesh environments, Cisco recommends that you set the *trans\_time* to 1 second.

---

**Examples**

```
> config 802.11a l2roam rf-params custom -80 2 -70 7
```

---

**Related Commands**

```
show {802.11a | 802.11b} l2roam {rf-param | statistics mac_address}

## config {802.11a | 802.11b} picocell

To enable or disable pico cell mode parameters, enter this command:

```
config {802.11a | 802.11b} picocell {enable | disable}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>802.11a</b>	802.11a Cisco radio.
<b>802.11b</b>	802.11b Cisco radio.
<b>picocell</b>	Picocell version 1.
<b>enable</b>	Enable support.
<b>disable</b>	Disable support.

Defaults	None.
----------	-------

Examples	<pre>&gt; config {802.11a   802.11b} picocell enable</pre>
----------	--

Related Commands	<pre>config 802.11a disable network config 802.11a disable config 802.11a channel ap config 802.11b disable config 802.11b channel ap config 802.11a txpower ap config 802.11a chan_width config {802.11a   802.11b} disable config {802.11a   802.11b} picocell-V2 {enable disable}</pre>
------------------	--

## config {802.11a | 802.11b} picocell-V2

To enable or disable pico cell version 2 mode parameters, enter this command:

```
config {802.11a | 802.11b} picocell-V2 {enable | disable}
```

<b>Syntax Description</b>	<b>config</b> Configure parameters. <b>802.11a</b> 802.11a Cisco radio. <b>802.11b</b> 802.11b Cisco radio. <b>picocell-V2</b> Picocell version 2. <b>enable</b> Enable support. <b>disable</b> Disable support.
<b>Defaults</b>	None.
<b>Examples</b>	> config {802.11a   802.11b} picocell enable
<b>Related Commands</b>	<a href="#">config 802.11a disable network</a> <a href="#">config 802.11a disable</a> <a href="#">config 802.11a channel ap</a> <a href="#">config 802.11b disable</a> <a href="#">config 802.11b channel ap</a> <a href="#">config 802.11a txpower ap</a> <a href="#">config 802.11a chan_width</a> <a href="#">config {802.11a   802.11b} disable</a> <a href="#">config {802.11a   802.11b} picocell {enable disable}</a>

## Config 802.11a Commands

Use the **config 802.11a** commands to configure settings for the 802.11a network.

## config 802.11a antenna extAntGain

To configure the 802.11a external antenna gain, use the **config 802.11a antenna extAntGain** command.

**config 802.11a antenna extAntGain *antenna\_gain Cisco\_AP***

Syntax Description	
<b>config</b>	Configure parameters.
<b>802.11a antenna</b>	Antennas for 802.11a Cisco radio.
<b>extAntGain</b>	Configure external antenna gain.
<i>antenna_gain</i>	Enter antenna gain in 0.5 dBm units (for example, 2.5 dBm = 5).
<i>Cisco_AP</i>	Cisco lightweight access point name.

**Defaults** None.

**Usage Guidelines** Before you enter the **config 802.11a antenna extAntGain** command, disable the 802.11a Cisco radio with the **config 802.11a disable** command.

After you configure the external antenna gain, use the **config 802.11a enable** command to enable the 802.11a Cisco radio.

**Examples** To configure the 802.11a external antenna gain for AP1:

```
> config 802.11a antenna extAntGain 1 AP1
```

**Related Commands**

- config 802.11a disable**
- config 802.11a enable**
- config 802.11a diversity**
- config 802.11a antenna mode**
- config 802.11a selection**

# config 802.11a antenna diversity

To configure the diversity option for 802.11a antennas, use the **config 802.11a antenna diversity** command.

```
config 802.11a antenna diversity {enable | sideA | sideB} Cisco_AP
```

Syntax Description	<b>config</b> Configure parameters. <b>802.11a antenna diversity</b> Diversity antennas for 802.11a. <b>enable</b> Between the two internal antennas. <b>sideA</b> Between the internal antennas and an external antenna connected to the Cisco lightweight access point right port. <b>sideB</b> Between the internal antennas and an external antenna connected to the Cisco lightweight access point left port. <i>Cisco_AP</i> Cisco lightweight access point name.
Defaults	None.
Examples	To enable diversity for AP01: <pre>&gt; config 802.11a antenna diversity enable AP01</pre> To enable diversity for AP01 using an external antenna connected to the Cisco lightweight access point Left port (sideA). <pre>&gt; config 802.11a antenna diversity sideA AP01</pre>
Related Commands	<a href="#">show ap config 802.11a</a> <a href="#">config 802.11a disable</a> <a href="#">config 802.11a enable</a> <a href="#">config 802.11a extAntGain</a> <a href="#">config 802.11a antenna mode</a> <a href="#">config 802.11a selection.</a>

## config 802.11a antenna mode

To configure the Cisco lightweight access point to use one internal antenna for an 802.11a sectorized 180-degree coverage pattern, or both internal antennas for an 802.11a 360-degree omnidirectional pattern, use the **config 802.11a antenna mode** command.

```
config 802.11a antenna mode {omni | sectorA | sectorB} Cisco_AP
```

<b>Syntax Description</b>	
<b>config</b>	Configure parameters.
<b>802.11a antenna mode</b>	Antenna for 802.11a Cisco radio.
<b>omni</b>	Use both internal antennas.
<b>sectorA</b>	Use only the Side A internal antenna.
<b>sectorB</b>	Use only the Side B internal antenna.
<i>Cisco_AP</i>	Cisco lightweight access point name.

---

**Defaults** None.

---

**Examples** > config 802.11a antenna mode omni AP01

---

**Related Commands**

- show ap config 802.11a
- config 802.11a disable
- config 802.11a enable
- config 802.11a diversity
- config 802.11a antenna extAntGain
- config 802.11a selection

# config 802.11a antenna selection

To configure the 802.11a antenna selection (internal or external), use the **config 802.11a antenna selection** command.

**config 802.11a antenna selection {internal | external} *Cisco\_AP***

## Syntax Description

<b>config</b>	Configure parameters.
<b>802.11a antenna selection</b>	Antenna selection (internal or external) for 802.11a.
<b>internal</b>	Select internal antennas.
<b>external</b>	Select external antenna.
<i>Cisco_AP</i>	Cisco lightweight access point name.

## Defaults

None.

## Examples

```
> config 802.11a antenna selection internal AP02
```

## Related Commands

- show ap config 802.11a**
- config 802.11a disable**

- config 802.11a antenna mode.**

## config 802.11a beaconperiod

In Cisco wireless LAN solution 802.11a networks, all Cisco lightweight access point wireless LANs broadcast a beacon at regular intervals. This beacon notifies clients that 802.11a service is available, and allows the clients to synchronize with the lightweight access point. To change the 802.11a beacon period for the whole 802.11a network, use the **config 802.11a beaconperiod** command.

Before you change the beacon period using the config 802.11a beaconperiod command, make sure that you have disabled the 802.11a network using the config 802.11a disable command. When you are done changing the beacon period, remember to enable the 802.11a network using the config 802.11a enable command.

**config 802.11a beaconperiod *time\_units***

Syntax Description	
<b>config</b>	Configure parameters.
<b>802.11a</b>	802.11a network parameters.
<b>beaconperiod</b>	Send a beacon every 20 to 1000 milliseconds.
<b><i>time_units</i></b>	Beacon interval in time units (TU). One TU is 1024 micro seconds.

Defaults	None.
----------	-------

Examples	To configure an 802.11a network for a beacon period of 120 time units: > <b>config 802.11a beaconperiod 120</b>
----------	--

Related Commands	<b>show 802.11a</b> <b>config 802.11b beaconperiod</b> <b>config 802.11a disable</b> <b>config 802.11a enable</b>
------------------	--

# config 802.11a channel

To configure an 802.11a network or a single access point for automatic or manual channel selection, use the **config 802.11a channel** command.

```
config 802.11a channel { global [ auto | once | off ] } | {AP ap_name [ global | channel ] }
```

When configuring 802.11a channels for a single lightweight access point, use the **config 802.11a disable** command to disable the 802.11a network. Then use the **config 802.11a channel** command to set automatic channel selection by Radio Resource Management (RRM) or manually set the channel for the 802.11a radio. Then enable the 802.11a network using the **config 802.11a enable** command.

**Note** Refer to the *Channels and Maximum Power Settings for Cisco Aironet Lightweight Access Points* document for the channels supported by your access point. The power levels and available channels are defined by the country code setting and are regulated on a country by country basis.

## Syntax Description

<b>global</b>	Configures the 802.11a operating channel for all lightweight access points.
<b>auto</b>	Specifies the channel is automatically set by radio resource management (RRM) for the 802.11a radio.
<b>once</b>	Specifies the channel is automatically set once by RRM.
<b>off</b>	Specifies the automatic channel selection by RRM is disabled.
<b>ap</b>	Configures the 802.11a operating channel for a specified lightweight access point.
<i>ap_name</i>	Specifies the access point name.
<b>global</b>	Specifies the 802.11a operating channel is automatically set by RRM and over-rides the existing configuration setting.
<b>channel</b>	Specifies a manual channel number to be used by the access point. The supported channels depend on the specific access point used and the regulatory region.

## Defaults

This command has no defaults.

## Examples

To configures all 802.11a channels for automatic channel configuration by the RRM based on availability and interference, use this command:

```
> config 802.11a channel global auto
```

To have RRM automatically reconfigure all 802.11a channels one time based on availability and interference, use this command:

```
> config 802.11a channel global once
```

To turn 802.11a automatic channel configuration off, use this command:

```
> config 802.11a channel global off
```

To configure all 802.11a channels in access point (AP01) for automatic channel configuration, use this command:

```
> config 802.11a channel AP01 global
```

To configure 802.11a channel 36 in access point AP01 as the default channel, use this command:

```
> config 802.11a channel AP01 36
```

---

**Related Commands**

**show 802.11a**  
**config 802.11a disable**  
**config 802.11a enable**  
**config 802.11b channel**  
**config country**

# config 802.11a channel ap

To set the channel for the access point, use the **config 802.11a channel ap** command.

**config 802.11a channel ap** *Cisco\_AP*

Syntax Description	
<b>config 802.11b channel</b>	Configures the 802.11b radio channels for all access points or a specified access point.
<b>ap</b>	Configures the 802.11a operating channel for a specified lightweight access point.
<i>Cisco_AP</i>	Specifies the name of the Cisco access point.

**Defaults** This command has no defaults.

**Examples** > **config 802.11a channel ap ap01**

**Related Commands**

- show 802.11a
- config 802.11a disable
- config 802.11a enable

- config country

## config 802.11a/802.11b disable

To disable 802.11a transmission for the whole network or for an individual Cisco radio, use the **config 802.11a disable** command. This command can be used any time the CLI interface is active.

**Note**

You must use this command to disable the network before using many config 802.11a/b commands.

**config 802.11a disable network**

**config 802.11b disable network**

**config 802.11a disable *Cisco\_AP***

---

**Syntax Description**

<b>config</b>	Configure parameters.
<b>802.11a</b>	802.11a network parameters.
<b>disable</b>	Disables 802.11a transmission.
<b>network</b>	Disables transmission for the entire 802.11a network.
<b><i>Cisco_AP</i></b>	Disables transmission for an individual Cisco lightweight access point radio.

---

---

**Defaults**

Transmission is enabled for the entire network by default.

---

**Examples**

To disable the entire 802.11a network:

> **config 802.11a disable network**

To disable AP01 802.11a transmissions:

> **config 802.11a disable AP01**

---

**Related Commands**

**show sysinfo**  
**show 802.11a**  
**config 802.11a enable**  
**config 802.11b disable**  
**config 802.11b enable**  
**config 802.11a beaconperiod**

# config 802.11a dtpc

To configure the 802.11a DTPC setting, use the **config 802.11a dtpc** command.

**config 802.11a dtpc {enable | disable}**

<b>Syntax Description</b>	<b>config</b> Configure parameters. <b>802.11a</b> 802.11a network parameters. <b>dtcp</b> Dynamic Transmit Power Control. <b>{enable   disable}</b> <ul style="list-style-type: none"> <li>• Enter <b>enable</b> to enable DTPC setting configuration.</li> <li>• Enter <b>disable</b> to disable DTPC setting configuration.</li> </ul>
---------------------------	--

**Defaults** Enabled by default.

**Examples** > **config 802.11a dtpc disable**

**Related Commands**

- show 802.11a**
- config 802.11a beaconperiod**
- config 802.11a disable**
- config 802.11a enable**

## config 802.11a enable

Enable 802.11a transmissions for the whole network or for an individual Cisco lightweight access point using the **config 802.11a enable** command. You must use this command to enable the network after configuring other 802.11a parameters.

Note that this command only enables the Cisco wireless LAN solution 802.11a network. To disable the 802.11a, 802.11b and/or 802.11g networks for an individual wireless LAN, use the **config wlan radio** command.

This command can be used any time the CLI interface is active.

**config 802.11a enable network**

**config 802.11a enable *Cisco\_AP***

Syntax Description	
<b>config</b>	Configure parameters.
<b>802.11a</b>	802.11a network parameters.
<b>enable</b>	Disables/enables 802.11a.
<b>network</b>	For the whole network.
<i>Cisco_AP</i>	Override the network setting for an individual Cisco lightweight access point radio.

**Defaults** Network = enabled.

**Examples** To enable the whole 802.11a network:

> **config 802.11a enable network**

To enable AP1 802.11a transmissions:

> **config 802.11a enable AP1**

**Related Commands** **show sysinfo**  
**show 802.11a**  
**config wlan radio**  
**config 802.11a disable**  
**config 802.11b disable**  
**config 802.11b enable**  
**config 802.11b 11gSupport enable**  
**config 802.11b 11gSupport disable**

# config 802.11a exp-bwreq

To configure the CCX version 5 expedited bandwidth request feature for the 802.11a radio, use the **config 802.11a exp-bwreq** command. When this command is enabled, the controller configures all joining access points for this feature.

**config 802.11a exp-bwreq [enable | disable ]**

<b>Syntax Description</b>	<b>enable</b> Enables the expedited bandwidth request feature. <b>disable</b> Configures the mean datarate of a voice stream.
---------------------------	--

**Defaults**      The expedited bandwidth request feature is disabled by default.

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	4.1	This command was introduced.

**Examples**

```
> config 802.11a exp-bwreq enable
Cannot change Exp Bw Req mode while 802.11a network is opeational.

> config 802.11a disable network
> config 802.11a exp-bwreq enable
> config 802.11a enable network
```

**Related Commands**

**show 802.11a**

**show ap stats 802.11a**

## config 802.11a fragmentation

To configure the 802.11a fragmentation threshold, use the **config 802.11a fragmentation** command. This command can only be used when the network is not in operation.

**config 802.11a fragmentation *threshold***

Syntax Description	
<b>config</b>	Configure parameters.
<b>802.11a</b>	802.11a network parameters.
<b>fragmentation</b>	Fragmentation threshold.
<i>threshold</i>	Fragmentation threshold value.

**Defaults** None.

**Examples** > **config 802.11a fragmentation 6500**

**Related Commands** **config 802.11b fragmentation**  
**show 802.11b, show ap auto-rtf**

# config 802.11a pico-cell

To enable or disable the 802.11a pico-cell extensions, use the **config 802.11a pico-cell** command.

This command can only be used when the network is not operational.

```
config 802.11a pico-cell {enable | disable}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>802.11a</b>	802.11a network parameters.
<b>pico-cell</b>	Pico cell extensions.
<b>{enable   disable}</b>	Enable or disable.

Defaults	None.
----------	-------

Examples	> config 802.11a pico-cell enable
----------	-----------------------------------

Related Commands	<b>config 802.11b pico-cell</b> <b>config 802.11a, show 802.11a</b>
------------------	--

## config 802.11a rate

To set 802.11a mandatory and supported operational rates, use the **config 802.11a rate** command.

The data rates set here are negotiated between the client and the Cisco Wireless LAN controller. If the data rate is set to Mandatory, the client must support it in order to use the network. If a data rate is set as Supported by the Cisco Wireless LAN controller, any associated client that also supports that rate may communicate with the Cisco lightweight access point using that rate. But it is not required that a client be able to use all the rates marked Supported in order to associate.

**config 802.11a rate {disabled | mandatory | supported} rate**

<b>Syntax Description</b>	
<b>config</b>	Configure parameters.
<b>802.11a</b>	802.11a network parameters.
<b>rate</b>	Set data rate.
<b>{disabled   mandatory   supported}</b>	<ul style="list-style-type: none"> <li>• Enter <b>disabled</b> to disable a rate.</li> <li>• Enter <b>mandatory</b> to set a rate to mandatory.</li> <li>• Enter <b>supported</b> to set a rate to supported.</li> </ul>
<b>rate</b>	6, 9, 12, 18, 24, 36, 48, or 54 Mbps.

**Defaults** None.

**Examples** To set 802.11a transmission at a mandatory rate at 12 Mbps:

```
> config 802.11a rate mandatory 12
```

**Related Commands**

<b>show ap config 802.11a</b>
<b>config 802.11b rate</b>

# config 802.11a txPower

To configure the 802.11a transmit power level for an automatic or a manual setting for all access points or a single access point, use the **config 802.11a txPower** command.

```
config 802.11a txPower {global [ auto | once | power_level ] } |
{ ap ap_name [ global | power_level ] }
```

#### Note

Refer to the *Channels and Maximum Power Settings for Cisco Aironet Lightweight Access Points* document for the maximum transmit power limits for your access point. The power levels and available channels are defined by the country code setting and are regulated on a country by country basis.

#### Syntax Description

<b>global</b>	Configures the 802.11a transmit power level for all lightweight access points.
<b>auto</b>	Specifies the power level is automatically set by radio resource management (RRM) for the 802.11a Cisco radio.
<b>once</b>	Specifies the power level is automatically set once by RRM.
<i>power_level</i>	Specifies the transmit power level number. The supported power levels depends on the specific access point used and the regulatory region. For example, the 1240 series access point supports 8 levels and the 1200 series access point supports 6 levels.
<b>ap</b>	Configures the 802.11a transmit power level for a specified lightweight access point.
<i>ap_name</i>	Specifies the access point name.
<b>global</b>	Specifies the 802.11a transmit power level is automatically set by RRM and over-rides the existing configuration setting.
<i>power_level</i>	Specifies a manual transmit power level number to be used by the access point. The supported power levels depends on the specific access point used and the regulatory region. For example, the 1240 series access point supports 8 levels and the 1200 series access point supports 6 levels.

#### Defaults

The command default (global, auto) is for automatic configuration by RRM.

#### Examples

To have RRM automatically set the 802.11a radio transmit power level in all lightweight access points, use this command:

```
> config 802.11a txPower global auto
```

To manually set the 802.11a radio transmit power to level 5 for all lightweight access points, use this command:

```
> config 802.11a txPower global 5
```

To have RRM automatically set the 802.11a radio transmit power for access point AP1, use this command:

```
> config 802.11a txPower AP1 global
```

To set manually set the 802.11a radio transmit power to power level 2 for access point AP1, use this command:

```
> config 802.11a txPower AP1 2
```

---

**Related Commands**

**show ap config 802.11a**

**config 802.11b txPower**

**config country**

## config 802.11a txpower ap

To set the transmit power level for the access point, use the **config 802.11a txpower ap** command.

**config 802.11a txpower ap** *Cisco\_AP power\_level*

<b>Syntax Description</b>	<b>config 802.11a txPower ap</b> Configures 802.11a radio transmit power for all lightweight access points or a single access point. <b>power_level</b> Specifies the transmit power level number. The supported power levels depends on the specific access point used and the regulatory region. For example, the 1240 series access point supports 8 levels and the 1200 series access point supports 6 levels.
---------------------------	---

<b>Defaults</b>	None.
-----------------	-------

<b>Examples</b>	To set 802.11a transmission at a mandatory rate at 12 Mbps:
	> <b>config 802.11a txpower ap ap02 4</b>

<b>Related Commands</b>	<a href="#">show ap config 802.11a</a> <a href="#">config 802.11b txPower</a> <a href="#">config country</a>
-------------------------	--

## Config 802.11b Commands

Use the **config 802.11b** commands to configure settings for the 802.11b network.

## config 802.11b 11gSupport

After enabling the Cisco wireless LAN solution 802.11b network using the **config 802.11b enable command**, enable or disable the Cisco wireless LAN solution 802.11g network using the **config 802.11b 11gSupport command**. Note that you must use this command to enable the network after configuring other 802.11b parameters.

Note that this command only enables the Cisco wireless LAN solution 802.11g network after the Cisco wireless LAN solution 802.11b network is enabled using the config 802.11b enable command. To disable the 802.11a, 802.11b and/or 802.11g networks for an individual wireless LAN, use the **config wlan radio** command.

This command can be used any time the CLI interface is active:

```
config 802.11b 11gSupport {enable | disable}
```

---

### Syntax Description

<b>config</b>	Configure parameters.
<b>802.11b</b>	802.11b network parameters.
<b>11gSupport</b>	Support for the 802.11g network.
<b>{enable   disable}</b>	Enable or disable 802.11g.

---

---

### Defaults

Enabled.

---

### Examples

```
> config 802.11b 11gSupport enable
```

Changing the 11gSupport will cause all the APs to reboot when you enable 802.11b network.  
Are you sure you want to continue? (y/n) **n**

11gSupport not changed!

---

### Related Commands

**show sysinfo**  
**show 802.11b**  
**config 802.11b enable**  
**config wlan radio**  
**config 802.11b disable**  
**config 802.11a disable**  
**config 802.11a enable**

# config 802.11b antenna diversity

To configure the diversity option for 802.11b antennas, use the **config 802.11b antenna diversity** command.

```
config 802.11b antenna diversity {enable | sideA | sideB} Cisco_AP
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>802.11b antenna diversity</b>	Diversity antennas for 802.11b/g.
<b>enable</b>	Between the two internal antennas.
<b>sideA</b>	Between the internal antennas and an external antenna connected to the Cisco lightweight access point Left port.
<b>sideB</b>	Between the internal antennas and an external antenna connected to the Cisco lightweight access point Right port.
<i>Cisco_AP</i>	Cisco lightweight access point name.

## Defaults

None.

## Examples

To enable diversity for AP01:

```
> config 802.11b antenna diversity enable AP01
```

To enable diversity for AP01 using an external antenna connected to the Cisco lightweight access point Left port (sideA):

```
> config 802.11b antenna diversity sideA AP01
```

## Related Commands

- show ap config 802.11b**
- config 802.11b disable**
- config 802.11b enable**
- config 802.11b extAntGain**
- config 802.11b selection**

## config 802.11b antenna extAntGain

To configure the 802.11b/g external antenna gain, use the **config 802.11b antenna extAntGain** command.

Use the **config 802.11b disable** command to disable the 802.11b/g Cisco radio before using the **config 802.11b antenna extAntGain** command. After configuring the external antenna gain, use the **config 802.11b enable** command to enable the 802.11b/g Cisco radio.

**config 802.11b antenna extAntGain *antenna\_gain Cisco\_AP***

Syntax Description	
<b>config</b>	Configure parameters.
<b>802.11b antenna</b>	Antennas for 802.11b/g Cisco radio.
<b>extAntGain</b>	Configure external antenna gain.
<i>antenna_gain</i>	Enter antenna gain in 0.5 dBm units ( for example, 2.5 dBm = 5).
<i>Cisco_AP</i>	Cisco lightweight access point name.

**Defaults** None.

**Usage Guidelines** Before using the **config 802.11b antenna extAntGain** command, disable the 802.11b/g Cisco radio with the **config 802.11b disable** command.  
After configuring the external antenna gain, use the **config 802.11b enable** command to enable the 802.11b/g Cisco radio.

**Examples** To configure the 802.11b/g external antenna gain for AP1:

```
> config 802.11b antenna extAntGain 1 AP1
```

**Related Commands**

- config 802.11b disable**
- config 802.11b enable**
- config 802.11b diversity**
- config 802.11b selection**

# config 802.11b antenna selection

To configure the 802.11b/g antenna selection (internal or external), use the **config 802.11b antenna selection** command.

**config 802.11b antenna selection {internal | external} *Cisco\_AP***

## Syntax Description

<b>config</b>	Configure parameters.
<b>802.11b antenna selection</b>	Antenna selection (internal or external) for 802.11b.
<b>internal</b>	Select internal antennas.
<b>external</b>	Select external antenna.
<i>Cisco_AP</i>	Cisco lightweight access point name.

## Defaults

None.

## Examples

> config 802.11b antenna selection internal AP02

## Related Commands

**show ap config 802.11b**  
**config 802.11b disable**  
**config 802.11b enable**  
**config 802.11b extAntGain**  
**config 802.11b diversity**

## config 802.11b beaconperiod

In Cisco wireless LAN solution 802.11b/g networks, all Cisco lightweight access point wireless LANs broadcast a beacon at regular intervals. This beacon notifies clients that 802.11b/g service is available, and allows the clients to synchronize with the Cisco lightweight access point. To change the 802.11b/g beacon period for the whole 802.11b/g network, use the **config 802.11b beaconperiod** command.

Before you change the beacon period using the config 802.11b beaconperiod command, make sure that you have disabled the 802.11b/g network using the config 802.11b disable command. When you are done changing the beacon period, remember to enable the 802.11b/g network using the config 802.11b enable command.

**config 802.11b beaconperiod *time\_units***

Syntax Description	
<b>config</b>	Configure parameters.
<b>802.11b</b>	802.11b/g network parameters.
<b>beaconperiod</b>	Send a beacon every 20 to 1000 milliseconds.
<b><i>time_units</i></b>	Beacon interval (20–1000) in time units (TUs). One TU is 1024 microseconds.

Defaults	100
----------	-----

Examples	To configure an 802.11b/g network for a beacon period of 180 time units:
	> <b>config 802.11b beaconperiod 180</b>

Related Commands	<b>show 802.11a</b> <b>config 802.11a beaconperiod</b> <b>config 802.11b disable</b> <b>config 802.11b enable</b>
------------------	--

# config 802.11b channel

To configure an 802.11b network or a single access point for automatic or manual channel selection, use the **config 802.11b channel** command.

```
config 802.11b channel { global [ auto | once | off ] } |
{AP ap_name [ global | channel ] }
```

When configuring 802.11b channels for a single lightweight access point, use the **config 802.11b disable** command to disable the 802.11b network. Then use the **config 802.11b channel** command to set automatic channel selection by Radio Resource Management (RRM) or manually set the channel for the 802.11b radio. Then enable the 802.11b network using the **config 802.11b enable** command.

Refer to the *Channels and Maximum Power Settings for Cisco Aironet Lightweight Access Points* document for the channels supported by your access point. The power levels and available channels are defined by the country code setting and are regulated on a country by country basis.

## Syntax Description

<b>global</b>	Configures the 802.11b operating channel for all lightweight access points.
<b>auto</b>	Specifies the channel is automatically set by radio resource management (RRM) for the 802.11b radio.
<b>once</b>	Specifies the channel is automatically set once by RRM.
<b>off</b>	Specifies the automatic channel selection by RRM is disabled.
<b>ap</b>	Configures the 802.11b operating channel for a specified lightweight access point.
<i>ap_name</i>	Specifies the access point name.
<b>global</b>	Specifies the 802.11b operating channel is automatically set by RRM and over-rides the existing configuration setting.
<i>channel</i>	Specifies a manual channel number to be used by the access point. The supported channels depend on the specific access point used and the regulatory region.

## Defaults

This command has no defaults.

## Examples

To configures all 802.11b channels for automatic channel configuration by the RRM based on availability and interference, use this command:

```
> config 802.11b channel global auto
```

To have RRM automatically reconfigure all 802.11b channels one time based on availability and interference, use this command:

```
> config 802.11b channel global once
```

To turn 802.11b automatic channel configuration off, use this command:

```
> config 802.11b channel global off
```

To configure all 802.11b channels in access point AP01 for automatic channel configuration, use this command:

```
> config 802.11b channel AP01 global
```

---

**Related Commands**

**show 802.11b**  
**config 802.11b disable**  
**config 802.11b enable**  
**config 802.11a channel**  
**config country**

# config 802.11b disable

Disable or enable 802.11b/g transmissions for the whole network or for an individual Cisco radio using the **config 802.11b disable** command.

Note that you must use this command to disable the network before using other config 802.11b commands.

This command can be used any time the CLI interface is active.

```
config 802.11b disable {network | Cisco_AP}
```

<b>Syntax Description</b>	<b>config</b> Configure parameters. <b>802.11b</b> 802.11b/g network parameters. <b>disable</b> Disable 802.11b/g. <b>network</b> Whole network. <b>Cisco_AP</b> Override the network setting for an individual Cisco lightweight access point radio.
---------------------------	---

<b>Defaults</b>	Enabled.
-----------------	----------

<b>Examples</b>	To disable the whole 802.11b/g network:
-----------------	---

```
> config 802.11b disable network
```

To disable AP01 802.11b/g transmissions:
--

```
> config 802.11b disable AP01
```

<b>Related Commands</b>	<b>show sysinfo</b> <b>show 802.11a</b> <b>show 802.11b</b> <b>config 802.11a disable</b> <b>config 802.11a enable</b> <b>config 802.11b disable</b> <b>config 802.11b enable</b> <b>config 802.11b beaconperiod</b>
-------------------------	---

## config 802.11b dtpc

To configure the 802.11b DTPC setting, use the **config 802.11b dtpc** command.

```
config 802.11b dtpc {enable | disable}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>802.11b</b>	802.11b network parameters.
<b>dtcp</b>	Dynamic Transmit Power Control.
<b>{enable   disable}</b>	<ul style="list-style-type: none"><li>• Enter <b>enable</b> to enable DTPC setting configuration.</li><li>• Enter <b>disable</b> to disable DTPC setting configuration.</li></ul>

**Defaults** Enabled by default.

**Examples** > **config 802.11b dtpc disable**

**Related Commands** **show 802.11b**  
**config 802.11b beaconperiod**  
**config 802.11b disable**  
**config 802.11b enable**

# config 802.11b enable

Note that you must use this command to enable the network after configuring other 802.11b parameters.

Note that this command only enables the Cisco wireless LAN solution 802.11b network. To enable the Cisco wireless LAN solution 802.11g network, you MUST have the 802.11b network enabled, and then use the **config 802.11b 11gSupport enable** command. To disable the 802.11a, 802.11b and/or 802.11g networks for an individual wireless LAN, use the **config wlan radio** command.

This command can be used any time the CLI interface is active. Note that you must reboot the Cisco Wireless LAN controller to implement this command.

**config 802.11b enable network**

**config 802.11b enable *Cisco\_AP***

<b>Syntax Description</b>	
<b>config</b>	Configure parameters.
<b>802.11b</b>	802.11b network parameters.
<b>enable</b>	Enable or disable 802.11b. Allow support for 802.11g.
<b>network</b>	For the whole network.
<i>Cisco_AP</i>	To override the network setting for individual Cisco lightweight access point radio.

**Defaults** Enabled.

**Examples** To enable the whole 802.11b network and provide support for the 802.11g network:

> **config 802.11b enable network**

To enable AP1 802.11b transmissions and support AP1 802.11g transmissions:

> **config 802.11b enable AP1**

<b>Related Commands</b>	<b>show sysinfo</b> <b>show 802.11b</b> <b>config 802.11b 11gSupport</b> <b>config wlan radio</b> <b>config 802.11b disable</b> <b>config 802.11a disable</b> <b>config 802.11a enable</b>
-------------------------	--

## config 802.11b exp-bwreq

To configure the CCX version 5 expedited bandwidth request feature for the 802.11b radio, use the **config 802.11b exp-bwreq** command. When this command is enabled, the controller configures all joining access points for this feature.

**config 802.11b exp-bwreq [enable | disable ]**

<b>Syntax Description</b>	
<b>enable</b>	Enables the expedited bandwidth request feature.
<b>disable</b>	Configures the mean datarate of a voice stream.

**Defaults** The expedited bandwidth request feature is disabled by default.

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	4.1	This command was introduced.

**Examples**

```
> config 802.11b exp-bwreq enable  
Cannot change Exp Bw Req mode while 802.11b network is opeational.  
> config 802.11b disable network  
> config 802.11b exp-bwreq enable  
> config 802.11b enable network
```

**Related Commands**

<b>show 802.11a</b>
<b>show ap stats 802.11a</b>

# config 802.11b fragmentation

To configure the 802.11b/g fragmentation threshold, use the **config 802.11b fragmentation** command. This command can only be used when the network is not operational.

**config 802.11b fragmentation *threshold***

Syntax Description	<b>config</b> Configure parameters. <b>802.11b</b> 802.11b network parameters. <b>fragmentation</b> Fragmentation threshold. <i>threshold</i> Fragmentation threshold value.
--------------------	---

Defaults	None.
----------	-------

Examples	> config 802.11b fragmentation 6500
----------	-------------------------------------

Related Commands	<b>config 802.11a fragmentation</b> <b>show 802.11a, show auto-rft</b>
------------------	---

## config 802.11b pico-cell

To enable or disable the 802.11b/g pico-cell extensions, use the **config 802.11b pico-cell** command. This command can only be used when the network is not operational.

**config 802.11b pico-cell {enable | disable}**

Syntax Description	
<b>config</b>	Configure parameters.
<b>802.11b</b>	802.11b network parameters.
<b>pico-cell</b>	Pico cell extensions.
<b>{enable   disable}</b>	Enable or disable.

**Defaults** None.

**Examples** > **config 802.11b pico-cell enable**

**Related Commands** **config 802.11a pico-cell**  
**show 802.11b**

# config 802.11b preamble

Use this command to change the 802.11b preamble as defined in subclause 18.2.2.2 to long (slower, but more reliable) or short (faster, but less reliable). This command can be used any time the CLI interface is active.

This parameter must be set to long to optimize this Cisco Wireless LAN controller for some clients, including SpectraLink NetLink telephones.

**Note**

You must reboot the Cisco Wireless LAN controller (reset system) with save to implement this command.

**config 802.11b preamble {long | short}**

---

**Syntax Description**

<b>config</b>	Configure parameters.
<b>802.11b</b>	802.11b network parameters.
<b>preamble</b>	As defined in subclause 18.2.2.2.
<b>{long   short}</b>	Long or short 802.11b preamble.

---

---

**Defaults**

Short.

---

**Examples**

```
> config 802.11b preamble short
>(reset system with save)
> show 802.11b
Short Preamble mandatory..... Enabled
> config 802.11b preamble long
>(reset system with save)
> show 802.11b
Short Preamble mandatory..... Disabled
```

---

**Related Commands**

**show 802.11b**

# config 802.11b rate

To configure 802.11b/g mandatory and supported operational rates, use the **config 802.11b rate** command.

**config 802.11b rate {disabled | mandatory | supported} rate**

The data rates set here are negotiated between the client and the Cisco Wireless LAN controller. If the data rate is set to Mandatory, the client must support it in order to use the network. If a data rate is set as Supported by the Cisco Wireless LAN controller, any associated client that also supports that rate may communicate with the Cisco lightweight access point using that rate. But it is not required that a client be able to use all the rates marked Supported in order to associate.

## Syntax Description

<b>config</b>	Configure parameters.
<b>802.11b</b>	802.11b/g network parameters.
<b>rate</b>	Configure mandatory and supported operational rates.
<b>{disabled   mandatory   supported}</b>	<ul style="list-style-type: none"> <li>• Enter <b>disabled</b> to disable a rate.</li> <li>• Enter <b>mandatory</b> to set a rate to mandatory.</li> <li>• Enter <b>supported</b> to set a rate to supported.</li> </ul>
<i>rate</i>	1, 2, 5.5, 11, 6, 9, 12, 18, 24, 36, 48, or 54 Mbps data rate.

## Defaults

None.

## Examples

To set 802.11b/g transmission at a mandatory rate at 5.5 Mbps:

> **config 802.11b rate mandatory 5.5**

## Related Commands

**show ap config 802.11b, config 802.11a rate**

# config 802.11b txPower

To configure the 802.11b transmit power level for an automatic or a manual setting for all access points or a single access point, use the **config 802.11b txPower** command.

```
config 802.11b txPower {global [ auto | once | power_level ] } |
{ ap ap_name [ global | power_level ] }
```

#### Note

Refer to the *Channels and Maximum Power Settings for Cisco Aironet Lightweight Access Points* document for the maximum transmit power limits for your access point. The power levels and available channels are defined by the country code setting and are regulated on a country by country basis.

#### Syntax Description

<b>global</b>	Configures the 802.11b transmit power level for all lightweight access points.
<b>auto</b>	Specifies the power level is automatically set by radio resource management (RRM) for the 802.11b radio.
<b>once</b>	Specifies the power level is automatically set once by RRM.
<b>power_level</b>	Specifies the transmit power level number. The supported power levels depends on the specific access point used and the regulatory region. For example, the 1240 series access point supports 8 levels and the 1200 series access point supports 6 levels.
<b>ap</b>	Configures the 802.11b transmit power level for a specified lightweight access point.
<b>ap_name</b>	Specifies the access point name.
<b>global</b>	Specifies the 802.11b transmit power level is automatically set by RRM and over-rides the existing configuration setting.
<b>power_level</b>	Specifies a manual transmit power level number to be used by the access point. The supported power levels depends on the specific access point used and the regulatory region. For example, the 1240 series access point supports 8 levels and the 1200 series access point supports 6 levels.

#### Defaults

The command default (global, auto) is for automatic configuration by RRM.

#### Examples

To have RRM automatically set the transmit power for all 802.11b radios in all lightweight access points, use this command:

```
> config 802.11b txPower global auto
```

To manually set the 802.11b radio transmit power to level 5 for all lightweight access points, use this command:

```
> config 802.11b txPower global 5
```

To have RRM automatically set the 802.11b radio transmit power for access point AP1, use this command:

```
> config 802.11b txPower AP1 global
```

---

**■ config 802.11b txPower**

To set manually set the 802.11b radio transmit power to power level 2 for access point AP1, use this command:

```
> config 802.11b txPower AP1 global
```

To set transmit power for 802.11b/g AP1 to power level 2:

```
> config 802.11b txPower AP1 2
```

---

**Related Commands**

**show ap config 802.11b**

**config 802.11a txPower**

**config country**

# config 802.11h channelswitch

To configure 802.11h channel switch announcement, use the **config 802.11h channelswitch** command.

```
config 802.11h channelswitch {enable mode value | disable}
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>802.11h</b>	802.11h network parameters.
<b>channelswitch</b>	802.11h channel switch announcement.
<b>{enable   disable}</b>	Enable or disable 802.11h channel switch announcement.
<i>mode</i>	802.11h channel switch announcement mode.
<i>value</i>	802.11h channel announcement value.

## Defaults

None.

## Examples

```
> config 802.11h channelswitch disable
```

## Related Commands

show 802.11h

## config 802.11h powerconstraint

To configure 802.11h power constraint value, use the **config 802.11h powerconstraint** command.

**config 802.11h powerconstraint *value***

Syntax Description	
<b>config</b>	Configure parameters.
<b>802.11b</b>	802.11h network parameters.
<b><i>value</i></b>	802.11h power constraint value.

**Defaults** None.

**Examples** > **config 802.11h powerconstraint 5**

**Related Commands** **show 802.11h**

# config 802.11h setchannel

To configure a new channel using 802.11h channel announcement, use the **config 802.11h setchannel** command.

**config 802.11h setchannel *Cisco\_AP***

<b>Syntax Description</b>	
<b>config</b>	Configure parameters.
<b>802.11h</b>	802.11h network parameters.
<i>Cisco_AP</i>	Cisco lightweight access point name.

**Defaults** None.

**Examples** > config 802.11h setchannel ap02

**Related Commands** show 802.11h

## config aaa auth

To configure the AAA authentication search order for management users, use the **config aaa auth** command.

**config aaa auth mgmt [ *aaa\_server\_type*] [*aaa\_server\_type*]**

Syntax Description	
	<b>mgmt</b> Configures the AAA authentication search order for controller management users by specifying up to three AAA authentication server types . The order the server types are entered specifies the AAA authentication search order.
	<b><i>aaa_server_type</i></b> (Optional) Specifies the AAA authentication server type ( <b>local</b> , <b>radius</b> , or <b>tacacs</b> ). The <b>local</b> setting specifies the local database, the <b>radius</b> setting specifies the RADIUS server, and the <b>tacacs</b> setting specifies the TACACS+ server.

### Defaults

This command has no defaults.

### Usage Guidelines

You can enter two AAA server types as long as one of the server types is **local**. You cannot enter **radius** and **tacacs** together.

### Examples

> **config aaa auth mgmt radius local**

### Related Commands

[show aaa auth](#)

## config aaa auth mgmt

To configure the order of authentication when multiple databases are configured, use the **config aaa auth mgmt** command.

**config aaa auth mgmt [radius | tacacs]**

<b>Syntax Description</b>	<b>mgmt</b> Configure the order of authentication when multiple databases are configured <b>[radius   tacacs]</b> <ul style="list-style-type: none"> <li>• (Optional) Enter <b>radius</b> to configure the order of authentication for radius servers.</li> <li>• (Optional) Enter <b>tacacs</b> to configure the order of authentication for tacacs servers.</li> </ul>
---------------------------	---

**Defaults** This command has no defaults.

**Examples**

```
> config aaa auth mgmt radius
> config aaa auth mgmt tacacs
```

**Related Commands** **show aaa auth order**

## config acl apply

To apply the Access Control List (ACL) to the data path, use the **config acl apply** command.

**config acl apply** *rule\_name*

**Note**

For a Cisco 2100 series wireless LAN controller, you must configure a pre-authentication ACL on the wireless LAN for the external web server. This ACL should then be set as a wireless LAN pre-authentication ACL under Web Policy. However, you do not need to configure any pre-authentication ACL for Cisco 4400 series wireless LAN controllers.

---

**Syntax Description**

<b>config acl</b>	Command action.
<b>apply</b>	Applies the ACL (name with up to 32 alphanumeric characters) to the data path.
<i>rule_name</i>	ACL name up to 32 alphanumeric characters.

---

---

**Defaults**

None.

---

**Examples**

> **config acl apply acl01**

---

**Related Commands**

**show acl**

# config acl counter

To see if packets are hitting any of the ACLs configured on your controller, use the **config acl counter** command.

**config acl counter {start | stop}**

**Note** ACL counters are available only on the following controllers: 4400 series, Cisco WiSM, and Catalyst 3750G Integrated Wireless LAN Controller Switch.

---

## Syntax Description

**config acl** Command action.

**counter {start | stop}** Enables or disables ACL counters for your controller.

---

---

## Defaults

**config acl counter stop**

---

## Examples

> **config acl counter start**

---

## Related Commands

**clear acl counters**

**show acl detailed**

## config acl create

To create a new ACL, use the **config acl create** command.

**config acl create** *rule\_name*

**Note** For a Cisco 2100 series wireless LAN controller, you must configure a pre-authentication ACL on the wireless LAN for the external web server. This ACL should then be set as a wireless LAN pre-authentication ACL under Web Policy. However, you do not need to configure any pre-authentication ACL for Cisco 4400 series wireless LAN controllers.

---

### Syntax Description

<b>config acl</b>	Command action.
<b>create</b>	Create a new ACL.
<i>rule_name</i>	ACL name up to 32 alphanumeric characters.

---

---

### Defaults

None.

---

### Examples

> **config acl create acl01**

---

### Related Commands

**show acl**

# config acl cpu

To create a new ACL rule that restricts the traffic reaching the CPU, use the **config acl cpu** command. This allows you to control the type of packets reaching the CPU.

**config acl cpu rule\_name {wired | wireless | both}**

## Syntax Description

<b>config acl cpu</b>	Command action.
<b>None</b>	Disable the CPU ACL.
<i>rule_name</i>	ACL name up to 32 alphanumeric characters.
<b>wired</b>	Enable ACL on wired traffic.
<b>wireless</b>	Enable ACL on wireless traffic
<b>both</b>	Enable ACL on both wired and wireless traffic.

## Defaults

None.

## Examples

The following example shows how to create an ACL named acl101 on the CPU and apply it to wired traffic.

```
> config acl cpu acl101 wired
```

## Related Commands

[show acl cpu](#)

# config acl delete

To delete an ACL, use the **config acl delete** command.

**config acl delete** *rule\_name*

**Note** For a Cisco 2100 series wireless LAN controller, you must configure a pre-authentication ACL on the wireless LAN for the external web server. This ACL should then be set as a wireless LAN pre-authentication ACL under Web Policy. However, you do not need to configure any pre-authentication ACL for Cisco 4400 series wireless LAN controllers.

---

## Syntax Description

<b>config acl</b>	Command action.
<b>delete</b>	Delete an ACL.
<i>rule_name</i>	ACL name up to 32 alphanumeric characters.

---

---

## Defaults

None.

---

## Examples

> **config acl delete acl01**

---

## Related Commands

**show acl**

# config acl rule

To configure ACL rules, use the **config acl rule** command.

```
config acl rule {
    action rule_name rule_index {permit | deny} |
    add rule_name rule_index |
    change index rule_name old_index new_index |
    delete rule_name rule_index |
    destination address rule_name rule_index ip_address netmask |
    destination port range rule_name rule_index start_port end_port |
    direction rule_name rule_index {in | out | any} |
    dscp rule_name rule_index dscp |
    protocol rule_name rule_index protocol |
    source address rule_name rule_index ip_address netmask |
    source port range rule_name rule_index start_port end_port |
    swap index rule_name index_1 index_2}
```

**Note** For a Cisco 2100 series wireless LAN controller, you must configure a pre-authentication ACL on the wireless LAN for the external web server. This ACL should then be set as a wireless LAN pre-authentication ACL under Web Policy. However, you do not need to configure any pre-authentication ACL for Cisco 4400 series wireless LAN controllers.

## Syntax Description

<b>config acl</b>	Command action.
<b>rule</b>	Configures ACL rules.
<b>action</b>	Configures a rule's action whether to permit or deny access.
<b>add</b>	Adds a new rule.
<b>change</b>	Changes a rule's index.
<b>delete</b>	Deletes a rule.
<b>destination address</b>	Configures a rule's destination IP address and netmask.
<b>destination port range</b>	Configures a rule's destination port range.
<b>direction</b>	Configures a rule's direction to in, out, or any.
<b>dscp</b>	Configures a rule's DSCH.
<b>protocol</b>	Configures a rule's IP Protocol.
<b>source address</b>	Configures a rule's source IP address, netmask.
<b>source port range</b>	Configures a rule's source port range.
<b>swap</b>	Swaps two rules' indices.
<i>rule_name</i>	ACL name up to 32 alphanumeric characters.
<i>rule_index</i>	Rule index between 1 and 32.
<i>ip_address</i>	The rule's IP Address.
<i>netmask</i>	The rule's netmask.
<i>start_port</i>	The start port number (between 0 and 65535).
<i>end_port</i>	The end port number (between 0 and 65535).

<i>dscp</i>	A number between 0 and 63, or <b>any</b> .
<i>protocol</i>	A number between 0 and 255, or <b>any</b> .

**Defaults** None.

**Examples** > **config acl rule action lab1 4 permit**

**Related Commands** show acl

## Configure Advanced 802.11a Commands

Use the **advanced 802.11a** commands to configure advanced 802.11a settings.

# config advanced 802.11a channel dca anchor-time

To specify the time of day when the DCA algorithm is to start, use the **config advanced 802.11a channel dca anchor-time** command.

**config advanced 802.11a channel dca anchor-time *value***

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11a</b>	Advanced 802.11a parameters.
<b>channel</b>	RRM channel selections.
<b>dca</b>	Dynamic channel assignment.
<b>anchor-time</b>	Time when DCA algorithm starts.
<b><i>value</i></b>	Hour of the time between 0 and 23. These values represent the hour from 12:00 a.m. to 11:00 p.m.

**Defaults** None.

**Examples** > config advanced 802.11a channel dca anchor-time 17

**Related Commands** [config advanced 802.11a channel dca interval](#)  
[config advanced 802.11a channel dca sensitivity](#)  
[show advanced 802.11a channel](#)

## config advanced 802.11a channel dca chan-width-11n

To configures the DCA channel width for all 802.11n radios in the 5-GHz band, use this command.

```
config advanced 802.11a channel dca chan-width-11n {20 | 40}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11a</b>	Advanced 802.11a parameters.
<b>channel</b>	RRM channel selections.
<b>dca</b>	Dynamic channel assignment.
<b>chan-width-11n</b>	Channel width for all 802.11n radios.
<b>20</b>	Sets the channel width for 802.11n radios to 20 MHz.
<b>40</b>	Sets the channel width for 802.11n radios to 40 MHz.

Defaults	Channel width is <b>20</b> .
----------	------------------------------

Usage Guidelines	If you choose 40, be sure to set at least two adjacent channels in the <b>config advanced 802.11a channel {add   delete} channel_number</b> command (for example, a primary channel of 36 and an extension channel of 40). If you set only one channel, that channel is not used for 40-MHz channel width.  To override the globally configured DCA channel width setting, you can statically configure an access point's radio for 20- or 40-MHz mode using the <b>config {802.11a   802.11b} chan_width</b> command. If you ever then change the static configuration to global on the access point radio, the global DCA configuration overrides the channel width configuration that the access point was previously using.
------------------	---

Examples	> config advanced 802.11a channel dca chan-width-11n 40
----------	---

Related Commands	<a href="#">config {802.11a   802.11b} chan_width</a> <a href="#">config advanced 802.11a channel dca interval</a> <a href="#">config advanced 802.11a channel dca sensitivity</a> <a href="#">show advanced 802.11a channel</a>
------------------	---

# config advanced 802.11a channel dca interval

To specify how often the DCA algorithm is allowed to run, use the **config advanced 802.11a channel dca interval** command.

**config advanced 802.11a channel dca interval *value***

## Syntax Description

<b>config</b>	Configure parameters.
<b>advanced 802.11a</b>	Advanced 802.11a parameters.
<b>channel</b>	RRM channel selections.
<b>dca</b>	Dynamic channel assignment.
<b>interval</b>	How often the DCA algorithm is allowed to run.
<b><i>value</i></b>	Valid values are 0, 1, 2, 3, 4, 6, 8, 12, or 24 hours. 0 is 10 minutes (600 seconds).

## Defaults

0 (10 minutes).

## Examples

> config advanced 802.11a channel dca interval 8

## Related Commands

[config advanced 802.11a channel dca anchor-time](#)  
[config advanced 802.11a channel dca sensitivity](#)  
[show advanced 802.11a channel](#)

## **config advanced 802.11a channel dca sensitivity**

To specify how sensitive the DCA algorithm is to environmental changes (for example, signal, load, noise, and interference) when determining whether or not to change channels, use the **config advanced 802.11a channel dca sensitivity** command.

**config advanced 802.11a channel dca sensitivity {low | medium | high}**

Syntax Description	<b>config</b>	Configure parameters.
	<b>advanced 802.11a</b>	Advanced 802.11a parameters.
	<b>channel</b>	RRM channel selections.
	<b>dca</b>	Dynamic channel assignment.
	<b>sensitivity</b>	DCA algorithm sensitivity.
	<b>low</b>	DCA algorithm is not particularly sensitive to environmental changes. See the “Usage Guidelines” section for more information.
	<b>medium</b>	DCA algorithm is moderately sensitive to environmental changes. See the “Usage Guidelines” section for more information.
	<b>high</b>	DCA algorithm is highly sensitive to environmental changes. See the “Usage Guidelines” section for more information.

**Defaults** None.

**Usage Guidelines** The DCA sensitivity thresholds vary by radio band, as noted below:

	<b>2.4-GHz DCA Sensitivity Threshold</b>	<b>5-GHz DCA Sensitivity Threshold</b>
<b>High</b>	5 dB	5 dB
<b>Medium</b>	15 dB	20 dB
<b>Low</b>	30 dB	35 dB

> config advanced 802.11a channel dca sensitivity low

<b>Related Commands</b>	<a href="#">config advanced 802.11a channel dca anchor-time</a> <a href="#">config advanced 802.11a channel dca interval</a> <a href="#">show advanced 802.11a channel</a>
-------------------------	--

# config advanced 802.11a channel foreign

To have RRM consider or ignore foreign 802.11a interference avoidance in making channel selection updates for all 802.11a Cisco lightweight access points, use the **config advanced 802.11a channel foreign** command.

**config advanced 802.11a channel foreign {enable | disable}**

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11a</b>	Advanced 802.11a parameters.
<b>channel</b>	RRM channel selections.
<b>foreign</b>	Foreign interference.
<b>{enable   disable}</b>	Enable foreign access point 802.11a interference avoidance in the channel assignment. Disable foreign access point 802.11a interference avoidance in the channel assignment.

<b>Defaults</b>	Enabled.
<b>Examples</b>	To have RRM consider foreign 802.11a interference when making channel selection updates for all 802.11a Cisco lightweight access points: > <b>config advanced 802.11a channel foreign enable</b>
<b>Related Commands</b>	<b>show advanced 802.11a channel</b> <b>config advanced 802.11b channel foreign</b>

## config advanced 802.11a channel load

To have RRM consider or ignore traffic load in making channel selection updates for all 802.11a Cisco lightweight access points, use the **config advanced 802.11a channel load** command.

```
config advanced 802.11a channel load {enable | disable}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11a</b>	Advanced 802.11a parameters.
<b>channel</b>	RRM channel selections.
<b>load</b>	Traffic load.
<b>{enable   disable}</b>	Enable the Cisco lightweight access point 802.11a load avoidance in the channel assignment. Disable the Cisco lightweight access point 802.11a load avoidance in the channel assignment.

Defaults	Disabled.
Examples	To have RRM consider traffic load when making channel selection updates for all 802.11a Cisco lightweight access points: <pre>&gt; config advanced 802.11a channel load enable</pre>
Related Commands	<b>show advanced 802.11a channel</b> <b>config advanced 802.11b channel load</b>

# config advanced 802.11a channel noise

To have RRM consider or ignore non-802.11a noise in making channel selection updates for all 802.11a Cisco lightweight access points, use the **config advanced 802.11a channel noise** command.

```
config advanced 802.11a channel noise {enable | disable}
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>advanced 802.11a</b>	Advanced 802.11a parameters.
<b>channel</b>	RRM channel selections.
<b>noise</b>	Non-802.11a noise.
<b>{enable   disable}</b>	Enable non-802.11a noise avoidance in the channel assignment, or ignore. Disable non-802.11a noise avoidance in the channel assignment.

## Defaults

Disabled.

## Examples

To have RRM consider non-802.11a noise when making channel selection updates for all 802.11a Cisco lightweight access points:

```
> config advanced 802.11a channel noise enable
```

## Related Commands

**show advanced 802.11a channel**

**config advanced 802.11b channel noise**

## config advanced 802.11a channel update

To have RRM initiate a channel selection update for all 802.11a Cisco lightweight access points, use the **config advanced 802.11a channel update** command.

**config advanced 802.11a channel update**

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11a</b>	Advanced 802.11a parameters.
<b>channel update</b>	Have RRM update the channel selections.

Defaults	None.
----------	-------

Examples	> config advanced 802.11a channel update
----------	--

Related Commands	<b>show advanced 802.11a channel</b> <b>config advanced 802.11b channel update</b>
------------------	---

# config advanced 802.11a coverage

To enable or disable coverage hole detection, use the **config advanced 802.11a coverage** command.

```
config advanced 802.11a coverage {enable | disable}
```

Syntax Description	<b>config</b> Configure parameters. <b>advanced 802.11a</b> Advanced 802.11a parameters. <b>coverage</b> Coverage hole detection. <b>enable</b> Enable coverage hole detection. <b>disable</b> Disable coverage hole detection.
--------------------	---

Defaults	Enabled.
----------	----------

Usage Guidelines	If you enable coverage hole detection, the controller automatically determines, based on data that is received from the access points, whether any access points have clients that are potentially located in areas with poor coverage.
------------------	---

If both the number and percentage of failed packets exceed the values that you entered in the **config advanced 802.11a coverage packet-count** and **config advanced 802.11a coverage fail-rate** commands for a 5-second period, the client is considered to be in a pre-alarm condition. The controller uses this information to distinguish between real and false coverage holes and excludes clients with poor roaming logic. A coverage hole is detected if both the number and percentage of failed clients meet or exceed the values entered in the **config advanced 802.11a coverage level global** and **config advanced 802.11a coverage exception global** commands over a 90-second period. The controller determines whether the coverage hole can be corrected and, if appropriate, mitigates the coverage hole by increasing the transmit power level for that specific access point.

Examples	> config advanced 802.11a coverage enable
----------	---

Related Commands	<b>config advanced 802.11a coverage exception global</b> <b>config advanced 802.11a coverage fail-rate</b> <b>config advanced 802.11a coverage level global</b> <b>config advanced 802.11a coverage packet-count</b> <b>config advanced 802.11a coverage rssi-threshold</b> <b>show advanced 802.11a coverage</b>
------------------	--

# config advanced 802.11a coverage exception global

To specify the percentage of clients on an access point that are experiencing a low signal level but cannot roam to another access point, use the **config advanced 802.11a coverage exception global** command.

**config advanced 802.11a coverage exception global *percent***

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11a</b>	Advanced 802.11a parameters.
<b>coverage</b>	Coverage hole detection.
<b>exception</b>	Specifies the percentage of clients on an access point that are experiencing a low signal level but cannot roam to another access point.
<b>global</b>	Specifies the parameter for all 802.11a access points.
<b><i>percent</i></b>	Percentage of clients. Valid values are from 0 to 100%.

**Defaults** 25%.

**Usage Guidelines** If both the number and percentage of failed packets exceed the values that you entered in the **config advanced 802.11a coverage packet-count** and **config advanced 802.11a coverage fail-rate** commands for a 5-second period, the client is considered to be in a pre-alarm condition. The controller uses this information to distinguish between real and false coverage holes and excludes clients with poor roaming logic. A coverage hole is detected if both the number and percentage of failed clients meet or exceed the values entered in the **config advanced 802.11a coverage level global** and **config advanced 802.11a coverage exception global** commands over a 90-second period. The controller determines whether the coverage hole can be corrected and, if appropriate, mitigates the coverage hole by increasing the transmit power level for that specific access point.

**Examples** > config advanced 802.11a coverage exception global 50

**Related Commands**

[config advanced 802.11a coverage](#)  
[config advanced 802.11a coverage fail-rate](#)  
[config advanced 802.11a coverage level global](#)  
[config advanced 802.11a coverage packet-count](#)  
[config advanced 802.11a coverage rssi-threshold](#)  
[show advanced 802.11a coverage](#)

# config advanced 802.11a coverage fail-rate

To specify the failure rate threshold for uplink data or voice packets, use the **config advanced 802.11a coverage fail-rate** command.

```
config advanced 802.11a coverage {data | voice} fail-rate percent
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>advanced 802.11a</b>	Advanced 802.11a parameters.
<b>coverage</b>	Coverage hole detection.
<b>data</b>	Specifies threshold for data packets.
<b>voice</b>	Specifies threshold for voice packets.
<b>fail-rate</b>	Configures the threshold count for minimum uplink failures for data or voice packets.
<i>percent</i>	The failure rate as a percentage. Valid values are from 1 to 100 percent.

## Defaults

20.

## Usage Guidelines

If both the number and percentage of failed packets exceed the values that you entered in the **config advanced 802.11a coverage packet-count** and **config advanced 802.11a coverage fail-rate** commands for a 5-second period, the client is considered to be in a pre-alarm condition. The controller uses this information to distinguish between real and false coverage holes and excludes clients with poor roaming logic. A coverage hole is detected if both the number and percentage of failed clients meet or exceed the values entered in the **config advanced 802.11a coverage level global** and **config advanced 802.11a coverage exception global** commands over a 90-second period. The controller determines whether the coverage hole can be corrected and, if appropriate, mitigates the coverage hole by increasing the transmit power level for that specific access point.

## Examples

```
> config advanced 802.11a coverage data fail-rate 80
```

## Related Commands

## Defaults

3.

---

## Usage Guidelines

If both the number and percentage of failed packets exceed the values that you entered in the **config advanced 802.11a coverage packet-count** and **config advanced 802.11a coverage fail-rate** commands for a 5-second period, the client is considered to be in a pre-alarm condition. The controller uses this information to distinguish between real and false coverage holes and excludes clients with poor roaming logic. A coverage hole is detected if both the number and percentage of failed clients meet or exceed the values entered in the **config advanced 802.11a coverage level global** and **config advanced 802.11a coverage exception global** commands over a 90-second period. The controller determines whether the coverage hole can be corrected and, if appropriate, mitigates the coverage hole by increasing the transmit power level for that specific access point.

---

## Examples

> config advanced 802.11a coverage level global 60

---

# config advanced 802.11a coverage packet-count

To specify the minimum failure count threshold for uplink data or voice packets, use the **config advanced 802.11a coverage packet-count** command.

**config advanced 802.11a coverage {data | voice} packet-count *packets***

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11a</b>	Advanced 802.11a parameters.
<b>coverage</b>	Coverage hole detection.
<b>data</b>	Specifies threshold for data packets.
<b>voice</b>	Specifies threshold for voice packets.
<b>packet-count</b>	Configures the threshold count for minimum uplink failures for data or voice packets.
<b>packets</b>	Minimum number of packets. Valid values are from 1 to 255 packets.

Defaults	10.
----------	-----

Usage Guidelines	If both the number and percentage of failed packets exceed the values that you entered in the <b>config advanced 802.11a coverage packet-count</b> and <b>config advanced 802.11a coverage fail-rate</b> commands for a 5-second period, the client is considered to be in a pre-alarm condition. The controller uses this information to distinguish between real and false coverage holes and excludes clients with poor roaming logic. A coverage hole is detected if both the number and percentage of failed clients meet or exceed the values entered in the <b>config advanced 802.11a coverage level global</b> and <b>config advanced 802.11a coverage exception global</b> commands over a 90-second period. The controller determines whether the coverage hole can be corrected and, if appropriate, mitigates the coverage hole by increasing the transmit power level for that specific access point.
------------------	---

Examples	> config advanced 802.11a coverage data packet-count 100
----------	--

Related Commands	<a href="#">config advanced 802.11a coverage</a> <a href="#">config advanced 802.11a coverage exception global</a> <a href="#">config advanced 802.11a coverage fail-rate</a> <a href="#">config advanced 802.11a coverage level global</a> <a href="#">config advanced 802.11a coverage rssi-threshold</a> <a href="#">show advanced 802.11a coverage</a>
------------------	---

# config advanced 802.11a coverage rssi-threshold

To specify the minimum receive signal strength indication (RSSI) value for packets that are received by an access point, use the **config advanced 802.11a coverage rssi-threshold** command.

```
config advanced 802.11a coverage {data | voice} rssi-threshold rssi
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11a</b>	Advanced 802.11a parameters.
<b>coverage</b>	Coverage hole detection.
<b>data</b>	Specifies threshold for data packets.
<b>voice</b>	Specifies threshold for voice packets.
<b>rssi-threshold</b>	Receive signal strength indication threshold.
<b><i>rssi</i></b>	Valid values are from -60 to -90 dBm.

## Defaults

- Data packets: -80 dBm.
- Voice packets: -75 dBm.

## Usage Guidelines

The *rssi* value that you enter is used to identify coverage holes (or areas of poor coverage) within your network. If the access point receives a packet in the data or voice queue with an RSSI value that is below the value that you enter here, a potential coverage hole has been detected.

The access point takes RSSI measurements every 5 seconds and reports them to the controller in 90-second intervals.

If both the number and percentage of failed packets exceed the values that you entered in the **config advanced 802.11a coverage packet-count** and **config advanced 802.11a coverage fail-rate** commands for a 5-second period, the client is considered to be in a pre-alarm condition. The controller uses this information to distinguish between real and false coverage holes and excludes clients with poor roaming logic. A coverage hole is detected if both the number and percentage of failed clients meet or exceed the values entered in the **config advanced 802.11a coverage level global** and **config advanced 802.11a coverage exception global** commands over a 90-second period. The controller determines whether the coverage hole can be corrected and, if appropriate, mitigates the coverage hole by increasing the transmit power level for that specific access point.

## Examples

```
> config advanced 802.11a coverage data rssi-threshold -60
```

# config advanced 802.11a edca-parameters

To enable a specific enhanced distributed channel access (EDCA) profile on the 802.11a network, use the **config advanced 802.11a edca-parameters** command.

```
config advanced 802.11a edca-parameters {wmm-default | svp-voice | optimized-voice | optimized-video-voice}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11a</b>	Advanced 802.11a parameters.
<b>edca-parameters</b>	Enables a specific EDCA profile.
<b>wmm-default</b>	Enables the Wi-Fi Multimedia (WMM) default parameters. Choose this option when voice or video services are not deployed on your network.
<b>svp-voice</b>	Enables Spectralink voice priority parameters. Choose this option if Spectralink phones are deployed on your network to improve the quality of calls.
<b>optimized-voice</b>	Enables EDCA voice-optimized profile parameters. Choose this option when voice services other than Spectralink are deployed on your network.
<b>optimized-video-voice</b>	Enables EDCA voice- and video-optimized profile parameters. Choose this option when both voice and video services are deployed on your network.
<b>Note</b> If you deploy video services, admission control (ACM) must be disabled.	

**Defaults** wmm-default

**Examples** > config advanced 802.11a edca-parameters svp-voice

**Related Commands** show 802.11a  
config advanced 802.11b edca-parameters

## config advanced 802.11a factory

To reset 802.11a advanced settings back to the factory defaults, use the **config advanced 802.11a factory** command.

**config advanced 802.11a factory**

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11a</b>	Advanced 802.11a parameters.
<b>factory</b>	Return all 802.11a advanced settings to their factory defaults.

**Defaults** None.

**Examples** > **config advanced 802.11a factory**

**Related Commands** **show advanced 802.11a channel**

# config advanced 802.11a group-mode

To set the 802.11a automatic RF group selection mode on or off, use the **config advanced 802.11a group-mode** command.

```
config advanced 802.11a group-mode {auto | off}
```

Syntax Description	<b>config</b> Configure parameters. <b>advanced 802.11a</b> Advanced 802.11a parameters. <b>group-mode</b> Cisco radio RF grouping. <b>{auto   off}</b> Enter auto to set the 802.11a RF group selection to automatic update mode. Enter off to set the 802.11a RF group selection off.
--------------------	---

Defaults	Auto.
----------	-------

Examples	To turn the 802.11a automatic RF group selection mode on:
	> <b>config advanced 802.11a group-mode auto</b>
	To turn the 802.11a automatic RF group selection mode off:
	> <b>config advanced 802.11a group-mode off</b>

Related Commands	<a href="#">show advanced 802.11a group</a> <a href="#">config advanced 802.11b group-mode</a>
------------------	---

## config advanced 802.11a logging channel

To turn the channel change logging mode on or off, use the **config advanced 802.11a logging channel** command.

**config advanced 802.11a logging channel {on | off}**

<b>Syntax Description</b>	
<b>config</b>	Configure parameters.
<b>advanced 802.11a</b>	Advanced 802.11a parameters.
<b>logging channel</b>	Log channel changes.
<b>{on   off}</b>	Enable or disable 802.11a channel logging.

**Defaults** Off (disabled).

**Examples** > **config advanced 802.11a logging channel on**

**Related Commands** **show advanced 802.11a logging**  
**config advanced 802.11b logging channel**

# config advanced 802.11a logging coverage

To turn the coverage profile logging mode on or off, use the **config advanced 802.11a logging coverage** command.

**config advanced 802.11a logging coverage {on | off}**

<b>Syntax Description</b>	<b>config</b> Configure parameters. <b>advanced 802.11a</b> Advanced 802.11a parameters. <b>logging coverage</b> Log coverage changes. <b>{on   off}</b> Enable or disable 802.11a coverage profile violation logging.
<b>Defaults</b>	Off (disabled).
<b>Examples</b>	> config advanced 802.11a logging coverage on
<b>Related Commands</b>	<a href="#">show advanced 802.11a logging</a> <a href="#">config advanced 802.11b logging coverage</a>

## config advanced 802.11a logging foreign

To turn the foreign interference profile logging mode on or off, use the **config advanced 802.11a logging foreign** command.

```
config advanced 802.11a logging foreign {on | off}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11a</b>	Advanced 802.11a parameters.
<b>logging foreign</b>	Log foreign changes.
{ <b>on   off</b> }	Enable or disable 802.11a foreign interference profile violation logging.

**Defaults** Off (disabled).

**Examples** > config advanced 802.11a logging foreign on

**Related Commands** show advanced 802.11a logging  
config advanced 802.11b logging foreign

# config advanced 802.11a logging load

To turn the 802.11a load profile logging mode on or off, use the **config advanced 802.11a logging load** command.

```
config advanced 802.11a logging load {on | off}
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>advanced 802.11a</b>	Advanced 802.11a parameters.
<b>logging load</b>	Log load changes.
<b>{on   off}</b>	Enable or disable 802.11a load profile violation logging.

## Defaults

Off (disabled).

## Examples

```
> config advanced 802.11a logging load on
```

## Related Commands

**show advanced 802.11a logging**

**config advanced 802.11b logging load**

# config advanced 802.11a logging noise

To turn the 802.11a noise profile logging mode on or off, use the **config advanced 802.11a logging noise** command.

**config advanced 802.11a logging noise {on | off}**

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11a</b>	Advanced 802.11a parameters.
<b>logging noise</b>	Log noise changes.
<b>{on   off}</b>	Enable or disable 802.11a noise profile violation logging.

**Defaults** Off (disabled).

**Examples** > **config advanced 802.11a logging noise on**

**Related Commands** **show advanced 802.11a logging**  
**config advanced 802.11b logging noise**

# config advanced 802.11a logging performance

To turn the 802.11a performance profile logging mode on or off, use the **config advanced 802.11a logging performance** command.

```
config advanced 802.11a logging performance {on | off}
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>advanced 802.11a</b>	Advanced 802.11a parameters.
<b>logging performance</b>	Log performance changes.
<b>{on   off}</b>	Enable or disable 802.11a performance profile violation logging.

## Defaults

Off (disabled).

## Examples

```
> config advanced 802.11a logging performance on
```

## Related Commands

**show advanced 802.11a logging**  
**config advanced 802.11b logging performance**

## config advanced 802.11a logging txpower

To turn the 802.11a transmit power change logging mode on or off, use the **config advanced 802.11a logging txpower** command.

```
config advanced 802.11a logging txpower {on | off}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11a</b>	Advanced 802.11a parameters.
<b>logging txpower</b>	Log power changes.
{ <b>on   off</b> }	Enable or disable 802.11a transmit power change logging.

**Defaults** Off (disabled).

**Examples** > config advanced 802.11a logging txpower off

**Related Commands** show advanced 802.11a logging  
config advanced 802.11b logging power

# config advanced 802.11a monitor channel-list

To set the 802.11a noise, interference, and rogue monitoring channel list, use the **config advanced 802.11a monitor channel-list** command.

**config advanced 802.11a monitor channel-list {all | country | dca}**

## Syntax Description

<b>config</b>	Configure parameters.
<b>advanced 802.11a</b>	Advanced 802.11a parameters.
<b>monitor channel-list</b>	Monitor coverage interval.
{ <b>all   country   dca</b> }	<ul style="list-style-type: none"> <li>• Enter <b>all</b> to monitor all channels.</li> <li>• Enter <b>country</b> to monitor the channels used in the configured country code.</li> <li>• Enter <b>dca</b> to monitor the channels used by the automatic channel assignment.</li> </ul>

## Defaults

country.

## Examples

> config advanced 802.11a monitor channel-list country

## Related Commands

show advanced 802.11a monitor coverage

## config advanced 802.11a monitor coverage

To set the coverage measurement interval between 60 and 3600 seconds, use the **config advanced 802.11a monitor coverage** command.

**config advanced 802.11a monitor coverage** *seconds*

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11a</b>	Advanced 802.11a parameters.
<b>monitor coverage</b>	Monitor coverage interval.
<b>seconds</b>	Coverage measurement interval between 60 and 3600 seconds.

**Defaults** 180 seconds.

**Examples** To set the coverage measurement interval to 60 seconds:

```
> config advanced 802.11a monitor coverage 60
```

**Related Commands** **show advanced 802.11a monitor**  
**config advanced 802.11b monitor coverage**

# config advanced 802.11a monitor load

To set the load measurement interval between 60 and 3600 seconds, use the **config advanced 802.11a monitor load** command.

**config advanced 802.11a monitor load *seconds***

## Syntax Description

<b>config</b>	Configure parameters.
<b>advanced 802.11a</b>	Advanced 802.11a parameters.
<b>monitor load</b>	Monitor load interval.
<b><i>seconds</i></b>	Load measurement interval between 60 and 3600 seconds.

## Defaults

60 seconds.

## Examples

To set the load measurement interval to 60 seconds:

```
> config advanced 802.11a monitor load 60
```

## Related Commands

**show advanced 802.11a monitor**

**config advanced 802.11b monitor load**

## config advanced 802.11a monitor mode

To enable or disable 802.11a access point monitoring, use the **config advanced 802.11a monitor mode** command.

```
config advanced 802.11a monitor mode {enable | disable}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11a</b>	Advanced 802.11a parameters.
<b>monitor mode</b>	Monitor mode.
<b>{enable   disable}</b>	Enable or disable 802.11a access point monitoring.

**Defaults** Enabled.

**Examples** > config advanced 802.11a monitor mode enable

**Related Commands** show advanced 802.11a monitor  
config advanced 802.11b monitor mode

# config advanced 802.11a monitor noise

To set the 802.11a noise measurement interval between 60 and 3600 seconds, use the **config advanced 802.11a monitor noise** command.

**config advanced 802.11a monitor noise *seconds***

## Syntax Description

<b>config</b>	Configure parameters.
<b>advanced 802.11a</b>	Advanced 802.11a parameters.
<b>monitor noise</b>	Monitor noise interval.
<b><i>seconds</i></b>	Noise measurement interval between 60 and 3600 seconds.

## Defaults

180 seconds.

## Examples

To set the noise measurement interval to 120 seconds:

```
> config advanced 802.11a monitor noise 120
```

## Related Commands

**show advanced 802.11a monitor**

**config advanced 802.11b monitor noise**

## config advanced 802.11a monitor signal

To set the signal measurement interval between 60 and 3600 seconds, use the **config advanced 802.11a monitor signal** command.

**config advanced 802.11a monitor signal** *seconds*

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11a</b>	Advanced 802.11a parameters.
<b>monitor signal</b>	Monitor signal interval.
<i>seconds</i>	Signal measurement interval between 60 and 3600 seconds.

**Defaults** 60 seconds.

**Examples** To set the signal measurement interval to 120 seconds:

```
> config advanced 802.11a monitor signal 120
```

**Related Commands** **show advanced 802.11a monitor**  
**config advanced 802.11b monitor signal**

# config advanced 802.11a profile clients

To set the Cisco lightweight access point clients threshold between 1 and 75 clients, use the **config advanced 802.11a profile clients** command.

**config advanced 802.11a profile clients {global | Cisco\_AP} clients**

Syntax Description	<b>config</b> Configure parameters. <b>advanced 802.11a</b> Advanced 802.11a parameters. <b>profile clients</b> Cisco lightweight access point Client profile <b>{global   Cisco_AP}</b> <ul style="list-style-type: none"> <li>• Enter <b>global</b> to configure all 802.11a Cisco lightweight access points.</li> <li>• Enter a Cisco lightweight access point name.</li> </ul> <b>clients</b> 802.11a Cisco lightweight access point client threshold between 1 and 75 clients.
--------------------	--

**Defaults** 12 clients.

**Examples** To set all Cisco lightweight access point clients thresholds to 25 clients:

```
> config advanced 802.11a profile clients global 25
```

Global client count profile set.

To set the AP1 clients threshold to 75 clients:

```
> config advanced 802.11a profile clients AP1 75
```

Global client count profile set.

**Related Commands** [show advanced 802.11a profile](#)  
[config advanced 802.11b profile clients](#)

## config advanced 802.11a profile customize

To turn customizing on or off for an 802.11a Cisco lightweight access point performance profile, use the **config advanced 802.11a profile customize** command.

```
config advanced 802.11a profile customize Cisco_AP {on | off}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11a</b>	Advanced 802.11a parameters.
<b>customize</b>	Performance profile.
<i>Cisco_AP</i>	Cisco lightweight access point.
{ <b>on</b>   <b>off</b> }	Enter <b>on</b> to customize performance profiles for this Cisco lightweight access point. Enter <b>off</b> to use global default performance profiles for this Cisco lightweight access point.

**Defaults** Off.

**Examples** To turn performance profile customization on for 802.11a Cisco lightweight access point AP1:

```
> config advanced 802.11a profile customize AP1 on
```

**Related Commands** **show advanced 802.11a profile**  
**config advanced 802.11b profile customize**

# config advanced 802.11a profile foreign

To set the foreign 802.11a transmitter interference threshold between 0 and 100 percent, use the **config advanced 802.11a profile foreign** command.

**config advanced 802.11a profile foreign {global | Cisco\_AP} percent**

## Syntax Description

<b>config</b>	Configure parameters.
<b>advanced 802.11a</b>	Advanced 802.11a parameters.
<b>profile foreign</b>	Foreign interference profile.
<b>{global   Cisco_AP}</b>	Global or Cisco lightweight access point specific profile.
<b>percent</b>	802.11a foreign 802.11a interference threshold between 0 and 100 percent.

## Defaults

10.

## Examples

To set the Other 802.11a transmitter interference threshold for all Cisco lightweight access points to 50 percent:

```
> config advanced 802.11a profile foreign global 50
```

To set the Other 802.11a transmitter interference threshold for AP1 to 0 percent:

```
> config advanced 802.11a profile foreign AP1 0
```

## Related Commands

**show advanced 802.11a profile**

**config advanced 802.11b profile foreign**

## config advanced 802.11a profile noise

To set the 802.11a foreign noise threshold between -127 and 0 dBm, use the **config advanced 802.11a profile noise** command.

```
config advanced 802.11a profile noise {global | Cisco_AP} dBm
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11a</b>	Advanced 802.11a parameters.
<b>profile noise</b>	Profile noise limits.
<b>{global   Cisco_AP}</b>	Global or Cisco lightweight access point specific profile.
<b>dBm</b>	802.11a foreign noise threshold between -127 and 0 dBm.

**Defaults** -70 dBm.

**Examples** To set the 802.11a foreign noise threshold for all Cisco lightweight access points to -127 dBm:

```
> config advanced 802.11a profile noise global -127
```

To set the 802.11a foreign noise threshold for AP1 to 0 dBm:

```
> config advanced 802.11a profile noise AP1 0
```

**Related Commands** **show advanced 802.11a profile**  
**config advanced 802.11b profile noise**

# config advanced 802.11a profile throughput

To set the Cisco lightweight access point data-rate throughput threshold between 1000 and 10000000 bytes per second, use the **config advanced 802.11a profile throughput** command.

**config advanced 802.11a profile throughput {global | Cisco\_AP} value**

## Syntax Description

<b>config</b>	Configure parameters.
<b>advanced 802.11a</b>	Advanced 802.11a parameters.
<b>profile throughput</b>	Data rate threshold.
<b>{global   Cisco_AP}</b>	Global or Cisco lightweight access point specific profile.
<b>value</b>	802.11a Cisco lightweight access point throughput threshold between 1000 and 10000000 bytes per second.

## Defaults

1,000,000 bytes per second.

## Examples

To set all Cisco lightweight access point data-rate thresholds to 1000 bytes per second:

> **config advanced 802.11a profile data-rate global 1000**

To set the AP1 data-rate threshold to 10000000 bytes per second:

> **config advanced 802.11a profile data-rate AP1 10000000**

## Related Commands

**show advanced 802.11a profile**

**config advanced 802.11b profile data-rate**

## config advanced 802.11a profile utilization

To set the RF utilization threshold between 0 and 100 percent, use the **config advanced 802.11a profile utilization** command. OS generates a trap when this threshold is exceeded.

**config advanced 802.11a profile utilization {global | Cisco\_AP} percent**

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11a</b>	Advanced 802.11a parameters.
<b>profile utilization</b>	Cisco lightweight access point profile utilization
<b>{global   Cisco_AP}</b>	Global or Cisco lightweight access point specific profile.
<b>percent</b>	802.11a RF utilization threshold between 0 and 100 percent.

Defaults	80 percent.
----------	-------------

Examples	To set the RF utilization threshold for all Cisco lightweight access points to 0 percent:
	> <b>config advanced 802.11a profile utilization global 0</b>

To set the RF utilization threshold for AP1 to 100 percent:

> **config advanced 802.11a profile utilization AP1 100**

Related Commands	<b>show advanced 802.11a profile</b> <b>config advanced 802.11b profile utilization</b>
------------------	--

# config advanced 802.11a receiver

To set the advanced receiver configuration, use the **config advanced 802.11a receiver** command.

```
config advanced 802.11a receiver {default | rxstart jumpThreshold value}
```

Syntax Description	<b>config</b> Configure parameters. <b>advanced 802.11a</b> Advanced 802.11a parameters. <b>receiver</b> Receiver configuration. <b>default</b> Default advanced receiver configuration. <b>rxstart</b> 802.11a advanced receiver start signal jump threshold configuration value <b>jumpThreshold value</b> (between 0 and 127).
--------------------	--

<b>Defaults</b>	None.
<b>Examples</b>	To prevent changes to receiver parameters while network is enabled: <pre>&gt; config advanced802.11a receiver default</pre>
<b>Related Commands</b>	<b>config advanced 802.11b receiver</b>

## config advanced 802.11a receiver pico-cell-V2

If pico cell mode version 2 is enabled, use the **config advanced 802.11a receiver pico-cell-V2** command to configure the receive sensitivity.

```
config advanced 802.11a receiver pico-cell-V2 {rx_sense_threshold | cca_sense_threshold | sta_tx_pwr} min max current
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11a</b>	Advanced 802.11a parameters.
<b>receiver</b>	Receiver configuration.
<b>pico-cell-V2</b>	Pico cell version 2 parameters.
<b>rx_sense_threshold</b>	Configure the receive sensitivity threshold.
<b>cca_sense_threshold</b>	Configure the CCA sensitivity threshold.
<b>sta_tx_pwr</b>	To configure the transmit power.
<b>min max current</b>	Measured in dBm.

**Defaults** None.

**Examples**

```
> config advanced 802.11a receiver pico-cell-v2 rx_sense_threshold -127 127 10
> config advanced 802.11a receiver pico-cell-v2 cca_sense_threshold -127 127 10
> config advanced 802.11a receiver pico-cell-v2 sta_tx_power -127 127 -65
```

**Related Commands**

- config advanced 802.11a receiver**
- config advanced 802.11a receiver pico-cell-V2 send\_iapp\_req *client\_mac***

# config advanced 802.11a receiver pico-cell-V2 send\_iapp\_req

If pico cell mode version 2 is enabled and you want to transmit a unicast IAPP high-density frame request to a specific client, enter this command:

**config advanced 802.11a receiver pico-cell-V2 send\_iapp\_req *client\_mac***

<b>Syntax Description</b>	<b>config</b> Configure parameters. <b>advanced 802.11a</b> Advanced 802.11b parameters. <b>receiver</b> Receiver configuration. <b>pico-cell-V2</b> Pico cell version 2 parameters. <b>send_iapp_req</b> Send a unicast IAPP high-density frame request. <b><i>client_mac</i></b> Specify the client mac address.
---------------------------	---

<b>Defaults</b>	None.
-----------------	-------

<b>Examples</b>	> config advanced 802.11a receiver pico-cell-V2 send_iapp_req 10:2b:3c:4d:5e:62
-----------------	---

<b>Related Commands</b>	<b>config advanced 802.11a receiver</b> <b>config advanced 802.11a receiver pico-cell-V2 {rx_sense_threshold   cca_sense_threshold   sta_tx_pwr} min max current</b>
-------------------------	---

## config advanced 802.11a txpower-update

To initiate updates of the 802.11a transmit power for every Cisco lightweight access point, use the **config advanced 802.11a txpower-update** command.

**config advanced 802.11a txpower-update**

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11a</b>	Advanced 802.11a parameters.
<b>txpower-update</b>	Update transmission power

**Defaults** None.

**Examples** > **config advanced 802.11a txpower-update**

**Related Commands** config advance 802.11b txpower-update

## Configure Advanced 802.11b Commands

Use the **advanced 802.11b** commands to configure advanced 802.11b settings.

# config advanced 802.11b 7920VSIEConfig

To configure the 7920 VISE parameters, use the **config advanced 802.11b 7920VSIEConfig** command.

```
config advanced 802.11b 7920VSIEConfig {call-admission-limit limit |  
G711-CU-Quantum quantum}
```

<b>Syntax Description</b>	<b>config</b> Configure parameters. <b>advanced 802.11b</b> Advanced 802.11b/g parameters. <b>7920VSIEConfig</b> Configure 7920 VISE parameters. <b>{call-admission-limit   G711-CU-Quantum}</b> <ul style="list-style-type: none"> <li>• Enter <b>call-admission-limit</b> to configure the call admission limit for the 7920s.</li> <li>• Enter <b>G711-CU-Quantum</b> to configure the value supplied by the infrastructure indicating the current number of channel utilization units which would be used by a single G.711-20ms call.</li> </ul>
<i>limit</i>	Call admission limit (from 0 to 255). The default value is 105.
<i>quantum</i>	G711 quantum value. The default value is 15.

**Defaults** None.

**Examples** > config advanced 802.11b 7920VSIEConfig call-admission-limit 4

**Related Commands** None.

## config advanced 802.11b channel dca anchor-time

To specify the time of day when the DCA algorithm is to start, use the **config advanced 802.11b channel dca anchor-time** command.

**config advanced 802.11b channel dca anchor-time *value***

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b parameters.
<b>channel</b>	RRM channel selections.
<b>dca</b>	Dynamic channel assignment.
<b>anchor-time</b>	Time when DCA algorithm starts.
<b>value</b>	Hour of the time between 0 and 23. These values represent the hour from 12:00 a.m. to 11:00 p.m.

**Defaults** None.

**Examples** > **config advanced 802.11b channel dca anchor-time 17**

**Related Commands** [config advanced 802.11b channel dca interval](#)  
[config advanced 802.11b channel dca sensitivity](#)  
[show advanced 802.11b channel](#)

# config advanced 802.11b channel dca interval

To specify how often the DCA algorithm is allowed to run, use the **config advanced 802.11b channel dca interval** command.

**config advanced 802.11b channel dca interval *value***

## Syntax Description

<b>config</b>	Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b parameters.
<b>channel</b>	RRM channel selections.
<b>dca</b>	Dynamic channel assignment.
<b>interval</b>	How often the DCA algorithm is allowed to run.
<b><i>value</i></b>	Valid values are 0, 1, 2, 3, 4, 6, 8, 12, or 24 hours. 0 is 10 minutes (600 seconds).

## Defaults

0 (10 minutes).

## Examples

> config advanced 802.11b channel dca interval 6

## Related Commands

[config advanced 802.11b channel dca anchor-time](#)  
[config advanced 802.11b channel dca sensitivity](#)  
[show advanced 802.11b channel](#)

## config advanced 802.11b channel dca sensitivity

To specify how sensitive the DCA algorithm is to environmental changes (such as signal, load, noise, and interference) when determining whether or not to change channels, use the **config advanced 802.11b channel dca sensitivity** command.

```
config advanced 802.11b channel dca sensitivity {low | medium | high}
```

Syntax Description	config Configure parameters. advanced 802.11b Advanced 802.11b parameters. channel RRM channel selections. dca Dynamic channel assignment. sensitivity DCA algorithm sensitivity. low DCA algorithm is not particularly sensitive to environmental changes. See the “Usage Guidelines” section for more information. medium DCA algorithm is moderately sensitive to environmental changes. See the “Usage Guidelines” section for more information. high DCA algorithm is highly sensitive to environmental changes. See the “Usage Guidelines” section for more information.
--------------------	---

**Defaults** None.

**Usage Guidelines** The DCA sensitivity thresholds vary by radio band, as noted below:

	2.4-GHz DCA Sensitivity Threshold	5-GHz DCA Sensitivity Threshold
High	5 dB	5 dB
Medium	15 dB	20 dB
Low	30 dB	35 dB

**Examples** > config advanced 802.11b channel dca anchor-time medium

**Related Commands** config advanced 802.11b channel dca anchor-time  
config advanced 802.11b channel dca interval  
show advanced 802.11b channel

# config advanced 802.11b channel foreign

To have RRM consider or ignore foreign 802.11b/g interference in making channel selection updates for all 802.11b/g Cisco lightweight access points, use the **config advanced 802.11b channel foreign** command.

**config advanced 802.11b channel foreign {enable | disable}**

<b>Syntax Description</b>	
<b>config</b>	Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b/g parameters.
<b>channel</b>	RRM channel selections.
<b>foreign</b>	Foreign interference.
<b>{enable   disable}</b>	Consider or ignore foreign access point 802.11b interference avoidance in the channel assignment.

<b>Defaults</b>	Enabled.
<b>Examples</b>	<p>To have RRM consider foreign 802.11b/g interference when making channel selection updates for all 802.11b/g Cisco lightweight access points:</p> <pre>&gt; config advanced 802.11b channel foreign enable</pre>
<b>Related Commands</b>	<p><b>show advanced 802.11b channel</b>  <b>config advanced 802.11a channel foreign</b></p>

## config advanced 802.11b channel load

To have RRM consider or ignore traffic load in making channel selection updates for all 802.11b/g Cisco lightweight access points, use the **config advanced 802.11b channel load** command.

**config advanced 802.11b channel load {enable | disable}**

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b/g parameters.
<b>channel</b>	RRM channel selections.
<b>load</b>	Traffic load.
<b>{enable   disable}</b>	Consider or ignore access point 802.11b load avoidance in the channel assignment.

Defaults	Disabled.
----------	-----------

Examples	To have RRM consider traffic load when making channel selection updates for all 802.11b/g Cisco lightweight access points:
	> <b>config advanced 802.11b channel load enable</b>

Related Commands	<b>show advanced 802.11b channel</b> <b>config advanced 802.11a channel load</b>
------------------	---

# config advanced 802.11b channel noise

To have RRM consider or ignore non-802.11b/g noise in making channel selection updates for all 802.11b/g Cisco lightweight access points, use the **config advanced 802.11b channel noise** command.

**config advanced 802.11b channel noise {enable | disable}**

Syntax Description	<b>config</b> Configure parameters. <b>advanced 802.11b</b> Advanced 802.11b/g parameters. <b>channel</b> RRM channel selections. <b>noise</b> Non-802.11b/g noise. <b>{enable   disable}</b> Consider or ignore non-802.11b/g noise avoidance in the channel assignment.
Defaults	Disabled.
Examples	To have RRM consider non-802.11b/g noise when making channel selection updates for all 802.11b/g Cisco lightweight access points: <pre>&gt; config advanced 802.11b channel noise enable</pre>
Related Commands	<a href="#">show advanced 802.11b channel</a> <a href="#">config advanced 802.11a channel noise</a>

## config advanced 802.11b channel update

To have RRM initiate a channel selection update for all 802.11b/g Cisco lightweight access points, use the **config advanced 802.11b channel update** command.

**config advanced 802.11b channel update**

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b/g parameters.
<b>channel update</b>	Update the channel selections.

**Defaults** None.

**Examples** > **config advanced 802.11b channel update**

**Related Commands** **show advanced 802.11b channel**  
**config advanced 802.11a channel update**

# config advanced 802.11b coverage

To enable or disable coverage hole detection, use the **config advanced 802.11b coverage** command.

```
config advanced 802.11b coverage {enable | disable}
```

Syntax Description	<b>config</b> Configure parameters. <b>advanced 802.11b</b> Advanced 802.11b parameters. <b>coverage</b> Coverage hole detection. <b>enable</b> Enable coverage hole detection. <b>disable</b> Disable coverage hole detection.
--------------------	---

Defaults	Enabled.
----------	----------

Usage Guidelines	If you enable coverage hole detection, the controller automatically determines, based on data that is received from the access points, if any access points have clients that are potentially located in areas with poor coverage.
------------------	--

If both the number and percentage of failed packets exceed the values that you entered in the **config advanced 802.11b coverage packet-count** and **config advanced 802.11b coverage fail-rate** commands for a 5-second period, the client is considered to be in a pre-alarm condition. The controller uses this information to distinguish between real and false coverage holes and excludes clients with poor roaming logic. A coverage hole is detected if both the number and percentage of failed clients meet or exceed the values entered in the **config advanced 802.11b coverage level global** and **config advanced 802.11b coverage exception global** commands over a 90-second period. The controller determines whether the coverage hole can be corrected and, if appropriate, mitigates the coverage hole by increasing the transmit power level for that specific access point.

Examples	> config advanced 802.11b coverage disable
----------	--

Related Commands	<b>config advanced 802.11b coverage exception global</b> <b>config advanced 802.11b coverage fail-rate</b> <b>config advanced 802.11b coverage level global</b> <b>config advanced 802.11b coverage packet-count</b> <b>config advanced 802.11b coverage rssi-threshold</b> <b>show advanced 802.11b coverage</b>
------------------	--

# config advanced 802.11b coverage exception global

To specify the percentage of clients on an access point that are experiencing a low signal level but cannot roam to another access point, use the **config advanced 802.11b coverage exception global** command.

**config advanced 802.11b coverage exception global *percent***

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b parameters.
<b>coverage</b>	Coverage hole detection.
<b>exception</b>	Specifies the percentage of clients on an access point that are experiencing a low signal level but cannot roam to another access point.
<b>global</b>	Specifies the parameter for all 802.11b access points.
<b><i>percent</i></b>	Percentage of clients. Valid values are from 0 to 100%.

**Defaults** 25%.

**Usage Guidelines** If both the number and percentage of failed packets exceed the values that you entered in the **config advanced 802.11b coverage packet-count** and **config advanced 802.11b coverage fail-rate** commands for a 5-second period, the client is considered to be in a pre-alarm condition. The controller uses this information to distinguish between real and false coverage holes and excludes clients with poor roaming logic. A coverage hole is detected if both the number and percentage of failed clients meet or exceed the values entered in the **config advanced 802.11b coverage level global** and **config advanced 802.11b coverage exception global** commands over a 90-second period. The controller determines whether the coverage hole can be corrected and, if appropriate, mitigates the coverage hole by increasing the transmit power level for that specific access point.

**Examples** > config advanced 802.11b coverage exception global 60

**Related Commands**

[config advanced 802.11b coverage](#)  
[config advanced 802.11b coverage fail-rate](#)  
[config advanced 802.11b coverage level global](#)  
[config advanced 802.11b coverage packet-count](#)  
[config advanced 802.11b coverage rssi-threshold](#)  
[show advanced 802.11b coverage](#)

# config advanced 802.11b coverage fail-rate

To specify the failure rate threshold for uplink data or voice packets, use the **config advanced 802.11b coverage fail-rate** command.

**config advanced 802.11b coverage {data | voice} fail-rate *percent***

## Syntax Description

<b>config</b>	Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b parameters.
<b>coverage</b>	Coverage hole detection.
<b>data</b>	Specifies threshold for data packets.
<b>voice</b>	Specifies threshold for voice packets.
<b>fail-rate</b>	Configures the threshold count for minimum uplink failures for data or voice packets.
<b><i>percent</i></b>	The failure rate as a percentage. Valid values are from 1 to 100 percent.

## Defaults

20.

## Usage Guidelines

If both the number and percentage of failed packets exceed the values that you entered in the **config advanced 802.11b coverage packet-count** and **config advanced 802.11b coverage fail-rate** commands for a 5-second period, the client is considered to be in a pre-alarm condition. The controller uses this information to distinguish between real and false coverage holes and excludes clients with poor roaming logic. A coverage hole is detected if both the number and percentage of failed clients meet or exceed the values entered in the **config advanced 802.11b coverage level global** and **config advanced 802.11b coverage exception global** commands over a 90-second period. The controller determines whether the coverage hole can be corrected and, if appropriate, mitigates the coverage hole by increasing the transmit power level for that specific access point.

## Examples

> config advanced 802.11b coverage data fail-rate 60

## Related Commands

[show advanced 802.11b coverage](#)

# config advanced 802.11b coverage level global

To specify the minimum number of clients on an access point with an RSSI value at or below the data or voice RSSI threshold, use the **config advanced 802.11b coverage level global** command.

**config advanced 802.11b coverage level global *clients***

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b parameters.
<b>coverage</b>	Coverage hole detection.
<b>level</b>	Specifies the minimum number of clients on an access point with an RSSI value at or below the RSSI threshold.
<b>global</b>	Specifies the parameter for all 802.11b access points.
<b>clients</b>	Minimum number of clients. Valid values are from 1 to 75.

---

## Defaults

3.

---

## Usage Guidelines

If both the number and percentage of failed packets exceed the values that you entered in the **config advanced 802.11b coverage packet-count** and **config advanced 802.11b coverage fail-rate** commands for a 5-second period, the client is considered to be in a pre-alarm condition. The controller uses this information to distinguish between real and false coverage holes and excludes clients with poor roaming logic. A coverage hole is detected if both the number and percentage of failed clients meet or exceed the values entered in the **config advanced 802.11b coverage level global** and **config advanced 802.11b coverage exception global** commands over a 90-second period. The controller determines whether the coverage hole can be corrected and, if appropriate, mitigates the coverage hole by increasing the transmit power level for that specific access point.

---

## Examples

> config advanced 802.11b coverage level global 60

---

[show advanced 802.11b coverage](#)

# config advanced 802.11b coverage packet-count

To specify the minimum failure count threshold for uplink data or voice packets, use the **config advanced 802.11b coverage packet-count** command.

```
config advanced 802.11b coverage {data | voice} packet-count packets
```

Syntax Description	<b>config</b> Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b parameters.
<b>coverage</b>	Coverage hole detection.
<b>data</b>	Specifies threshold for data packets.
<b>voice</b>	Specifies threshold for voice packets.
<b>packet-count</b>	Configures the threshold count for minimum uplink failures for data or voice packets.
<b>packets</b>	Minimum number of packets. Valid values are from 1 to 255 packets.

Defaults	10.
----------	-----

Usage Guidelines	If both the number and percentage of failed packets exceed the values that you entered in the <b>config advanced 802.11b coverage packet-count</b> and <b>config advanced 802.11b coverage fail-rate</b> commands for a 5-second period, the client is considered to be in a pre-alarm condition. The controller uses this information to distinguish between real and false coverage holes and excludes clients with poor roaming logic. A coverage hole is detected if both the number and percentage of failed clients meet or exceed the values entered in the <b>config advanced 802.11b coverage level global</b> and <b>config advanced 802.11b coverage exception global</b> commands over a 90-second period. The controller determines whether the coverage hole can be corrected and, if appropriate, mitigates the coverage hole by increasing the transmit power level for that specific access point.
------------------	---

Examples	> config advanced 802.11b coverage voice packet-count 70
----------	--

Related Commands	<a href="#">config advanced 802.11b coverage</a> <a href="#">config advanced 802.11b coverage exception global</a> <a href="#">config advanced 802.11b coverage fail-rate</a> <a href="#">config advanced 802.11b coverage level global</a> <a href="#">config advanced 802.11b coverage rssi-threshold</a> <a href="#">show advanced 802.11b coverage</a>
------------------	---

## config advanced 802.11b coverage rssi-threshold

To specify the minimum receive signal strength indication (RSSI) value for packets that are received by an access point, use the **config advanced 802.11b coverage rssi-threshold** command.

```
config advanced 802.11b coverage {data | voice} rssi-threshold rssi
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b parameters.
<b>coverage</b>	Coverage hole detection.
<b>data</b>	Specifies threshold for data packets.
<b>voice</b>	Specifies threshold for voice packets.
<b>rssi-threshold</b>	Receive signal strength indication threshold.
<b><i>rssi</i></b>	Valid values are from -60 to -90 dBm.

### Defaults

- Data packets: -80 dBm.
- Voice packets: -75 dBm.

### Usage Guidelines

The *rssi* value that you enter is used to identify coverage holes (or areas of poor coverage) within your network. If the access point receives a packet in the data or voice queue with an RSSI value that is below the value that you enter here, a potential coverage hole has been detected.

The access point takes RSSI measurements every 5 seconds and reports them to the controller in 90-second intervals.

If both the number and percentage of failed packets exceed the values that you entered in the **config advanced 802.11b coverage packet-count** and **config advanced 802.11b coverage fail-rate** commands for a 5-second period, the client is considered to be in a pre-alarm condition. The controller uses this information to distinguish between real and false coverage holes and excludes clients with poor roaming logic. A coverage hole is detected if both the number and percentage of failed clients meet or exceed the values entered in the **config advanced 802.11b coverage level global** and **config advanced 802.11b coverage exception global** commands over a 90-second period. The controller determines whether the coverage hole can be corrected and, if appropriate, mitigates the coverage hole by increasing the transmit power level for that specific access point.

### Examples

```
> config advanced 802.11b coverage data rssi-threshold -70
```

### Related Commands

# config advanced 802.11b edca-parameters

To enable a specific enhanced distributed channel access (EDCA) profile on the 802.11b network, use the **config advanced 802.11b edca-parameters** command.

```
config advanced 802.11b edca-parameters {wmm-default | svp-voice | optimized-voice | optimized-video-voice}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b parameters.
<b>edca-parameters</b>	Enables a specific EDCA profile.
<b>wmm-default</b>	Enables the Wi-Fi Multimedia (WMM) default parameters. Choose this option when voice or video services are not deployed on your network.
<b>svp-voice</b>	Enables Spectralink voice priority parameters. Choose this option if Spectralink phones are deployed on your network to improve the quality of calls.
<b>optimized-voice</b>	Enables EDCA voice-optimized profile parameters. Choose this option when voice services other than Spectralink are deployed on your network.
<b>optimized-video-voice</b>	Enables EDCA voice- and video-optimized profile parameters. Choose this option when both voice and video services are deployed on your network.
<b>Note</b>	If you deploy video services, admission control (ACM) must be disabled.

**Defaults** config advanced 802.11b edca-parameters wmm-default

**Examples** > config advanced 802.11b edca-parameters svp-voice

**Related Commands** show 802.11b  
config advanced 802.11a edca-parameters

## config advanced 802.11b factory

To reset 802.11b/g advanced settings back to the factory defaults, use the **config advanced 802.11b factory** command.

**config advanced 802.11b factory**

<b>Syntax Description</b>	
<b>config</b>	Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b/g parameters.
<b>factory</b>	Return all 802.11b/g advanced settings to their factory defaults.

<b>Defaults</b>	None.
-----------------	-------

<b>Examples</b>	To reset all 802.11b/g advanced settings back to the factory defaults:
	> <b>config advanced 802.11b factory</b>

<b>Related Commands</b>	<b>show advanced 802.11b channel</b>
-------------------------	--------------------------------------

# config advanced 802.11b group-mode

To set the 802.11b/g RF group selection mode on or off, use the **config advanced 802.11b group-mode** command.

**config advanced 802.11b group-mode {auto | off}**

<b>Syntax Description</b>	<b>config</b> Configure parameters. <b>advanced 802.11b</b> Advanced 802.11b/g parameters. <b>group-mode</b> Cisco radio RF grouping. <b>{auto   off}</b> <ul style="list-style-type: none"> <li>• Enter <b>auto</b> to set the 802.11b RF group selection to automatic update mode.</li> <li>• Enter <b>off</b> to set the 802.11b RF group selection to off.</li> </ul>
<b>Defaults</b>	Auto.
<b>Usage Guidelines</b>	Use to enable or disable 802.11b/g automatic RF group selection mode.
<b>Examples</b>	<p>To set the 802.11b/g RF group selection mode to automatic:</p> <pre>&gt; config advanced 802.11b group-mode auto</pre> <p>To disable the 802.11b/g RF group selection mode:</p> <pre>&gt; config advanced 802.11b group-mode off</pre>
<b>Related Commands</b>	<a href="#">show advanced 802.11b group</a> <a href="#">config advanced 802.11a group-mode</a>

## config advanced 802.11b logging channel

To turn the 802.11b/g channel change logging mode on or off, use the **config advanced 802.11b logging channel** command.

```
config advanced 802.11b logging channel {on | off}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b/g parameters.
<b>logging channel</b>	Log channel changes.
{ <b>on   off</b> }	Enable or disable 802.11b channel logging.

**Defaults** Disabled.

**Examples** > `config advanced 802.11b logging channel on`

**Related Commands** `show advanced 802.11b logging`  
`config advanced 802.11a logging channel`

# config advanced 802.11b logging coverage

To turn the 802.11b/g coverage profile logging mode on or off, use the **config advanced 802.11b logging coverage** command.

**config advanced 802.11b logging coverage {on | off}**

<b>Syntax Description</b>	<b>config</b> Configure parameters. <b>advanced 802.11b</b> Advanced 802.11b/g parameters. <b>logging coverage</b> Log coverage changes. <b>{on   off}</b> Enable or disable 802.11b coverage profile violation logging.
---------------------------	---

**Defaults** Off (disabled).

**Examples** > config advanced 802.11b logging coverage on

**Related Commands** show advanced 802.11b logging  
config advanced 802.11a logging coverage

## config advanced 802.11b logging foreign

To turn the 802.11b/g foreign interference profile logging mode on or off, use the **config advanced 802.11b logging foreign** command.

```
config advanced 802.11b logging foreign {on | off}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b/g parameters.
<b>logging foreign</b>	Log foreign changes.
<b>{on   off}</b>	Enable or disable foreign interference profile logging mode.

**Defaults** Off (disabled).

**Examples** > config advanced 802.11b logging foreign on

**Related Commands** show advanced 802.11b logging  
config advanced 802.11a logging foreign

# config advanced 802.11b logging load

To turn the 802.11b/g load profile logging mode on or off, use the **config advanced 802.11b logging load** command.

**config advanced 802.11b logging load {on | off}**

## Syntax Description

<b>config</b>	Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b/g parameters.
<b>logging load</b>	Log load changes.
<b>{on   off}</b>	Enable or disable 802.11b load profile violation logging.

## Defaults

Off (disabled).

## Examples

> **config advanced 802.11b logging load on**

## Related Commands

**show advanced 802.11b logging**

**config advanced 802.11a logging load**

## config advanced 802.11b logging noise

To turn the 802.11b/g noise profile logging mode on or off, use the **config advanced 802.11b logging noise** command.

```
config advanced 802.11b logging noise {on | off}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b/g parameters.
<b>logging noise</b>	Log noise changes.
<b>{on   off}</b>	Enable or disable 802.11b noise profile violation logging.

**Defaults** Off (disabled).

**Examples** > config advanced 802.11b logging noise on

**Related Commands** show advanced 802.11b logging  
config advanced 802.11a logging noise

# config advanced 802.11b logging performance

To turn the 802.11b/g performance profile logging mode on or off, use the **config advanced 802.11b logging performance** command.

```
config advanced 802.11b logging performance {on | off}
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b/g parameters.
<b>logging performance</b>	Log performance changes.
<b>{on   off}</b>	Enable or disable 802.11b performance profile violation logging.

## Defaults

Off (disabled).

## Examples

```
> config advanced 802.11b logging performance on
```

## Related Commands

**show advanced 802.11b logging**  
**config advanced 802.11a logging performance**

## config advanced 802.11b logging txpower

To turn the 802.11b/g transmit power change logging mode on or off, use the **config advanced 802.11b logging txpower** command.

```
config advanced 802.11b logging txpower {on | off}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b/g parameters.
<b>logging txpower</b>	Log power changes.
<b>{on   off}</b>	Enable or disable 802.11b transmit power change logging.

Defaults	Off (disabled).
----------	-----------------

Examples	> config advanced 802.11b logging txpower off
----------	---

Related Commands	<b>show advanced 802.11b logging</b> <b>config advanced 802.11a logging power</b>
------------------	--

# config advanced 802.11b monitor channel-list

To set the 802.11b/g noise/interference/rogue monitoring channel list coverage, use the **config advanced 802.11b monitor channel-list** command.

**config advanced 802.11b monitor channel-list {all | country | dca}**

## Syntax Description

<b>config</b>	Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b/g parameters.
<b>monitor channel-list</b>	Monitor channel list.
<b>{all   country   dca}</b>	<ul style="list-style-type: none"> <li>• Enter <b>all</b> to monitor all channels.</li> <li>• Enter <b>country</b> to monitor channels used in configured country code.</li> <li>• Enter <b>dca</b> to monitor channels used by automatic channel assignment.</li> </ul>

## Defaults

The default channel list is **country**.

## Examples

> **config advanced 802.11b monitor channel-list country**

## Related Commands

**show advanced 802.11b monitor**  
**config advanced 802.11a monitor coverage**

## config advanced 802.11b monitor coverage

To set the 802.11b/g coverage measurement interval between 60 and 3600 seconds, use the **config advanced 802.11b monitor coverage** command.

**config advanced 802.11b monitor coverage** *seconds*

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b/g parameters.
<b>monitor coverage</b>	Monitor coverage interval.
<b>seconds</b>	Coverage measurement interval between 60 and 3600 seconds.

**Defaults** 180 seconds.

**Examples** To set the coverage measurement interval to 60 seconds:

```
> config advanced 802.11b monitor coverage 60
```

**Related Commands** [show advanced 802.11b monitor](#)  
[config advanced 802.11a monitor coverage](#)

# config advanced 802.11b monitor load

To set the 802.11b/g load measurement interval between 60 and 3600 seconds, use the **config advanced 802.11b monitor load** command.

**config advanced 802.11b monitor load *seconds***

## Syntax Description

<b>config</b>	Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b/g parameters.
<b>monitor load</b>	Monitor load interval.
<b><i>seconds</i></b>	Load measurement interval between 60 and 3600 seconds.

## Defaults

60 seconds.

## Examples

To set the load measurement interval to 60 seconds:

```
> config advanced 802.11b monitor load 60
```

## Related Commands

**show advanced 802.11b monitor**

**config advanced 802.11a monitor load**

## config advanced 802.11b monitor mode

To enable or disable the 802.11b monitor mode, use the **config advanced 802.11b monitor mode** command.

**config advanced 802.11b monitor mode {enable | disable}**

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b parameters.
<b>monitor mode</b>	Monitor mode.
<b>{enable   disable}</b>	Enable or disable 802.11b access point monitoring.

**Defaults** Enabled.

**Examples** > **config advanced 802.11b monitor mode enable**

**Related Commands** **show advanced 802.11b monitor**  
**config advanced 802.11a monitor mode**

# config advanced 802.11b monitor noise

To set the 802.11b/g noise measurement interval between 60 and 3600 seconds, use the **config advanced 802.11b monitor noise** command.

**config advanced 802.11b monitor noise *seconds***

## Syntax Description

<b>config</b>	Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b/g parameters.
<b>monitor noise</b>	Monitor noise interval.
<b><i>seconds</i></b>	Noise measurement interval between 60 and 3600 seconds.

## Defaults

180 seconds.

## Examples

To set the noise measurement interval to 120 seconds:

```
> config advanced 802.11b monitor noise 120
```

## Related Commands

**show advanced 802.11b monitor**

**config advanced 802.11a monitor noise**

## config advanced 802.11b monitor signal

To set the 802.11b/g signal measurement interval between 60 and 3600 seconds, use the **config advanced 802.11b monitor signal** command.

**config advanced 802.11b monitor signal** *seconds*

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b/g parameters.
<b>monitor signal</b>	Monitor signal interval.
<b>seconds</b>	Signal measurement interval between 60 and 3600 seconds.

**Defaults** 60 seconds.

**Examples** To set the signal measurement interval to 120 seconds:

```
> config advanced 802.11b monitor signal 120
```

**Related Commands** **show advanced 802.11b monitor**  
**config advanced 802.11a monitor signal**

# config advanced 802.11b profile clients

To set the number of 802.11b/g Cisco lightweight access point clients threshold between 1 and 75 clients, use the **config advanced 802.11b profile clients** command.

**config advanced 802.11b profile clients {global | Cisco\_AP} clients**

## Syntax Description

<b>config</b>	Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b/g parameters.
<b>profile clients</b>	Client profiles.
<b>{global   Cisco_AP}</b>	Global or Cisco lightweight access point specific profile.
<b>clients</b>	802.11b Cisco lightweight access point clients threshold between 1 and 75 clients.

## Defaults

12 clients

## Examples

To set the Cisco lightweight access point clients threshold for all Cisco radios to 25:

```
> config advanced 802.11b profile clients global 25
```

To set the Cisco lightweight access point clients threshold for AP1 to 75:

```
> config advanced 802.11b profile clients AP1 75
```

## Related Commands

[config advanced 802.11a profile clients](#)

## config advanced 802.11b profile customize

To turn customization on or off for an 802.11b/g Cisco lightweight access point performance profile, use the **config advanced 802.11b profile customize** command.

```
config advanced 802.11b profile customize Cisco_AP {on | off}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b/g parameters.
<b>profile customize</b>	Customize the performance profile for a Cisco lightweight access point.
<i>Cisco_AP</i>	Cisco lightweight access point name.
<b>{on   off}</b>	<ul style="list-style-type: none"><li>• Enter <b>on</b> to customize performance profiles for the specified Cisco lightweight access point .</li><li>• Enter <b>off</b> to use global default performance profiles for the specified Cisco lightweight access point.</li></ul>

**Defaults** Off

**Examples** To turn customization on for the AP1 performance profile:

```
> config advanced 802.11b profile customize on
```

**Related Commands** config advanced 802.11a profile customize

# config advanced 802.11b profile foreign

To set the foreign 802.11b/g transmitter interference threshold between 0 and 100 percent, use the **config advanced 802.11b profile foreign** command.

**config advanced 802.11b profile foreign {global | Cisco\_AP} percent**

## Syntax Description

<b>config</b>	Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b/g parameters.
<b>profile foreign</b>	Foreign interference profile.
<b>{global   Cisco_AP}</b>	Global or Cisco lightweight access point specific profile.
<b>percent</b>	802.11b foreign 802.11b interference threshold between 0 and 100 percent.

## Defaults

10.

## Examples

To set the foreign 802.11b/g transmitter interference threshold for the whole 802.11b/g network to 50 percent:

```
> config advanced 802.11b profile foreign global 50
```

To set the foreign 802.11b/g transmitter interference threshold for AP1 to 0 percent:

```
> config advanced 802.11b profile foreign AP1 0
```

## Related Commands

**config advanced 802.11b profile foreign**

## config advanced 802.11b profile noise

To set the 802.11b/g foreign noise threshold between -127 and 0 dBm, use the **config advanced 802.11b profile noise** command.

```
config advanced 802.11b profile noise {global | Cisco_AP} dBm
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b/g parameters.
<b>profile noise</b>	Cisco lightweight access point profile noise
<b>{global   Cisco_AP}</b>	Global or Cisco lightweight access point specific profile
<i>dBm</i>	802.11b foreign noise threshold between -127 and 0 dBm.

**Defaults** -70 dB

**Examples** To set the 802.11b/g foreign noise threshold for the whole 802.11b/g network to -90 dBm:

```
> config advanced 802.11b profile noise global -90
```

To set the 802.11b/g foreign noise threshold for AP1 to -30 dBm:

```
> config advanced 802.11b profile noise AP1 -30
```

**Related Commands** config advanced 802.11a profile noise

# config advanced 802.11b profile throughput

To set the 802.11b/g Cisco lightweight access point throughput threshold between 1000 and 10000000 bytes per second, use the **config advanced 802.11b profile throughput** command.

**config advanced 802.11b profile throughput {global | Cisco\_AP} rate**

## Syntax Description

<b>config</b>	Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b/g parameters.
<b>profile throughput</b>	Throughput profile.
<b>{global   Cisco_AP}</b>	Global or Cisco lightweight access point specific profile.
<b>rate</b>	1,000 to 10,000,000 bps.

## Defaults

1,000,000 bps

## Examples

To set the Cisco lightweight access point throughput threshold for all Cisco radios to 1000 bytes per second:

```
> config advanced 802.11b profile throughput global 1000
```

To set the Cisco lightweight access point throughput threshold for AP1 to 10000000 bytes per second:

```
> config advanced 802.11b profile throughput AP1 10000000
```

## Related Commands

**config advanced 802.11a profile throughput**

## config advanced 802.11b profile utilization

To set the 802.11b/g RF utilization threshold between 0 and 100 percent, use the **config advanced 802.11b profile utilization** command.

```
config advanced 802.11b profile utilization {global | Cisco_AP} percent
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b/g parameters.
<b>profile utilization</b>	Cisco lightweight access point profile utilization
<b>{global   Cisco_AP}</b>	Global or Cisco lightweight access point specific profile
<b>percent</b>	802.11b RF utilization threshold between 0 and 100 percent.

**Defaults** 80%

**Examples** To set the RF utilization threshold for the whole 802.11b/g network to 100 percent:

```
> config advanced 802.11b profile utilization global 100
```

To set the RF utilization threshold for the AP1 to 50 percent:

```
> config advanced 802.11b profile utilization AP1 50
```

**Related Commands** config advanced 802.11a profile utilization

# config advanced 802.11b receiver

To set the advanced receiver configuration, use the **config advanced 802.11b receiver** command.

```
config advanced 802.11b receiver {default | rxstart}
```

Syntax Description	<b>config</b> Configure parameters. <b>advanced 802.11b</b> Advanced 802.11b parameters. <b>receiver</b> Receiver configuration. <b>{default   rxstart}</b> <ul style="list-style-type: none"> <li>• Enter <b>default</b> to specify default advanced receiver configuration.</li> <li>• Enter <b>rxstart</b> to specify advanced receiver start configuration.</li> </ul>
--------------------	---

Defaults	None.
----------	-------

Examples	Cannot change receiver params while network is enabled:
	> <b>config advanced 802.11b receiver default</b>

Related Commands	<b>config advanced 802.11a receiver</b>
------------------	---

## config advanced 802.11b receiver pico-cell-V2

If pico cell mode version 2 is enabled, use the **config advanced 802.11b receiver pico-cell-V2** command to configure the receive sensitivity.

```
config advanced 802.11b receiver pico-cell-V2 {rx_sense_threshold | cca_sense_threshold | sta_tx_pwr} min max current
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b parameters.
<b>receiver</b>	Receiver configuration.
<b>pico-cell-V2</b>	Pico cell version 2 parameters
<b>rx_sense_threshold</b>	Configure the receive sensitivity threshold
<b>cca_sense_threshold</b>	Configure the CCA sensitivity threshold
<b>sta_tx_pwr</b>	To configure the transmit power
<b>min max current</b>	Measured in dBm.

**Defaults** None.

**Examples**

```
> config advanced 802.11b receiver pico-cell-v2 rx_sense_threshold -127 127 10
> config advanced 802.11b receiver pico-cell-v2 cca_sense_threshold -127 127 10
> config advanced 802.11b receiver pico-cell-v2 sta_tx_power -127 127 -65
```

**Related Commands**

- config advanced 802.11a receiver**
- config advanced 802.11b receiver pico-cell-V2 send\_iapp\_req *client\_mac***

# config advanced 802.11b receiver pico-cell-V2 send\_iapp\_req

If pico cell mode version 2 is enabled and you want to transmit a unicast IAPP high-density frame request to a specific client, enter this command:

**config advanced 802.11b receiver pico-cell-V2 send\_iapp\_req *client\_mac***

## Syntax Description

<b>config</b>	Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b parameters.
<b>receiver</b>	Receiver configuration.
<b>pico-cell-V2</b>	Pico cell version 2 parameters
<b>send_iapp_req</b>	Send a unicast IAPP high-density frame request
<i>client_mac</i>	Specify the client mac address

## Defaults

None.

## Examples

```
> config advanced 802.11b receiver pico-cell-V2 send_iapp_req 10:2b:3c:4d:5e:62
```

## Related Commands

<b>config advanced 802.11a receiver</b>
<b>config advanced 802.11b receiver pico-cell-V2 {rx_sense_threshold   cca_sense_threshold   sta_tx_pwr} min max current</b>

## config advanced 802.11b txpower-update

To initiate updates of the 802.11b transmit power for every Cisco lightweight access point, use the **config advanced 802.11b txpower-update** command.

**config advanced 802.11b txpower-update**

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced 802.11b</b>	Advanced 802.11b parameters.
<b>txpower-update</b>	Update transmission power

**Defaults** None.

**Examples** > **config advanced 802.11b txpower-update**

**Related Commands** **config advance 802.11a txpower-update**

# config advanced arp

To configure advanced address resolution protocol (ARP) settings, use the **config advanced arp** command.

**show advanced arp [ padding *number* ]**

Syntax Description	
<b>padding</b>	Configures the amount of padding to be added to an ARP frame.
<b>number</b>	Specifies the number (0 to 32 bytes) of padding characters.
Defaults	None.
Examples	> config advanced arp padding 5
Related Commands	<b>show advanced arp</b>

# config advanced backup-controller primary

To configure a primary backup controller for a specific controller, use the **config advanced backup-controller primary** command.

```
config advanced backup-controller primary backup_controller_name  
                                backup_controller_ip_address
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced</b>	Advanced parameters.
<b>backup-controller primary</b>	Configure the primary backup controller.
<i>backup_controller_name</i>	Name of the backup controller.
<i>backup_controller_ip_address</i>	IP address of the backup controller.

**Defaults** None.

**Usage Guidelines** To delete a primary backup controller entry, enter 0.0.0.0 for the controller IP address.

**Examples** > config advanced backup-controller primary Controller\_1 10.10.10.10

**Related Commands** show advanced backup-controller

# config advanced backup-controller secondary

To configure a primary backup controller for a specific controller, use the **config advanced backup-controller secondary** command.

```
config advanced backup-controller secondary backup_controller_name
                                              backup_controller_ip_address
```

<b>Syntax Description</b>	<b>config</b> Configure parameters. <b>advanced</b> Advanced parameters. <b>backup-controller secondary</b> Configure the secondary backup controller. <i>backup_controller_name</i> Name of the backup controller. <i>backup_controller_ip_address</i> IP address of the backup controller.
---------------------------	--

**Defaults** None.

**Usage Guidelines** To delete a secondary backup controller entry, enter 0.0.0.0 for the controller IP address.

**Examples** > config advanced backup-controller secondary Controller\_1 10.10.10.10

**Related Commands** show advanced backup-controller

## config advanced client-handoff

To set the client handoff to occur after a selected number of 802.11 data packet excessive retries, use the **config advanced client-handoff** command.

**config advanced client-handoff *num\_of\_retries***

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced</b>	Advanced parameters.
<b>client-handoff</b>	Client handoff.
<i>num_of_retries</i>	Number of excessive retries before client handoff (from 0 to 255).

**Defaults** 0 excessive retries (disabled).

**Examples** To set the client handoff to 100 excessive retries:

```
> config advanced client-handoff 100
```

**Related Commands** [show advanced client-handoff](#)

# config advanced eap

To configure advanced extensible authentication protocol (EAP) settings, use the **config advanced eap** command.

```
config advanced eap [ eapol-key-timeout timeout | eapol-key-retries retries |
    identity-request-timeout timeout | identity-request-retries retries |
    key-index index | max-login-ignore-identity-response {enable | disable} |
    request-timeout timeout | request-retries retries ]
```

Syntax Description		
	<b>eapol-key-timeout</b>	(Optional) Specifies the amount of time (1 to 5 seconds) in which the controller attempts to send an EAP key over the LAN to wireless clients using local EAP.
	<b>eapol-key-retries</b>	(Optional) Specifies the maximum number of times (0 to 4 retries) that the controller attempts to send an EAP key over the LAN to wireless clients using local EAP.
	<b>identity-request-timeout</b>	(Optional) Specifies the amount of time (1 to 120 seconds) in which the controller attempts to send an EAP identity request to wireless clients using local EAP.
	<b>identity-request-retries</b>	(Optional) Specifies the maximum number of times (1 to 20 retries) that the controller attempts to retransmit the EAP identity request to wireless clients using local EAP.
	<b>key-index</b>	(Optional) index—Specifies the key index (0 or 3) used for dynamic wired equivalent privacy (WEP).
	<b>max-login-ignore-identity-response</b>	(Optional) Specifies that the maximum EAP identity response login count for a user is ignored. When enabled, this command limits the number of devices that can be connected to the controller with the same username.
	<b>request-timeout</b>	(Optional) Specifies the amount of time (1 to 120 seconds) in which the controller attempts to send an EAP request to wireless clients using local EAP..
	<b>request-retries</b>	(Optional) Specifies the maximum number of times (1 to 120 retries) that the controller attempts to retransmit the EAP request to wireless clients using local EAP.

## Defaults

Default for **eapol-key-timeout**: 1 second.

Default for **eapol-key-retries**: 2 retries.

## Examples

```
> config advanced eap key-index 0
```

## Related Commands

**show advanced eap**

# config advanced rate

To enable or disable switch control path rate limiting, use the **config advanced rate** command.

**config advanced rate [ enable | disable]**

Syntax Description	
<b>enable</b>	Enables the feature.
<b>disable</b>	Disables the feature.

**Defaults** This command has no defaults.

Command History	Release	Modification
	4.1	This command was introduced.

**Examples** > **config ap tftp-downgrade 10.0.23.8 1238.tar ap1240\_102301**

**Related Commands** None.

# config advanced statistics

To enable or disable Cisco Wireless LAN controller port statistics collection, use the **config advanced statistics** command.

```
config advanced statistics {enable | disable}
```

<b>Syntax Description</b>	
<b>config</b>	Configure parameters.
<b>advanced</b>	Advanced parameters.
<b>statistics</b>	Statistics.
<b>{enable   disable}</b>	Enable or disable switch port statistics.

**Defaults** Enabled.

**Examples** To disable statistics:

```
> config advanced statistics disable
```

**Related Commands**

- show advanced statistics
- show stats port
- show stats switch

## Configure Advanced Timers Commands

User the **advanced timers** commands to configure advanced 802.11a settings.

## config advanced timers ap-discovery-timeout

The Cisco lightweight access point discovery time-out is how often a Cisco Wireless LAN controller attempts to discover unconnected Cisco lightweight access points. To configure the Cisco lightweight access point discovery time-out, use the **config advanced timers ap-discovery-timeout** command.

**config advanced timers ap-discovery-timeout** *seconds*

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced</b>	Advanced parameters.
<b>timers</b>	Network timers.
<b>ap-discovery-timeout</b>	Cisco lightweight access point discovery timeout.
<b>seconds</b>	Timeout value between 1 and 10 seconds.

**Defaults** 10 seconds.

**Examples** > config advanced timers ap-discovery-timeout 20

**Related Commands**

[show advanced timers](#)  
[config advanced timers ap-fast-heartbeat](#)  
[config advanced timers ap-heartbeat-timeout](#)  
[config advanced timers ap-primary-discovery-timeout](#)  
[config advanced timers auth-timeout](#)

# config advanced timers ap-fast-heartbeat

To enable or disable the fast heartbeat timer thus reducing the amount of time it takes to detect a controller failure for local, hybrid-REAP, or all access points, use the **config advanced timers ap-fast-heartbeat** command.

**config advanced timers ap-fast-heartbeat {local | hreap | all} {enable | disable} interval**

<b>Syntax Description</b>	
<b>config</b>	Configure parameters.
<b>advanced</b>	Advanced parameters.
<b>timers</b>	Network timers.
<b>ap-fast-heartbeat</b>	Configure the fast heartbeat interval
<b>{local   hreap   all}</b>	<ul style="list-style-type: none"> <li>• Enable <b>local</b> to configure the fast heartbeat interval for access points in local mode only.</li> <li>• Enable <b>hreap</b> to configure the fast heartbeat interval for access points in hybrid-REAP mode only.</li> <li>• Enable <b>all</b> to configure the fast heartbeat interval for all access points.</li> </ul>
<b>{enable   disable}</b>	<ul style="list-style-type: none"> <li>• Select <b>enable</b> to enable a fast heartbeat interval.</li> <li>• Select <b>disable</b> to disable a fast heartbeat interval</li> </ul>
<b>interval</b>	Specify a small heartbeat interval (between 1 and 10 seconds inclusive) reduces the amount of time it takes to detect a controller failure.

**Defaults** Disabled.

**Examples**

```
> config advanced timers ap-fast-heartbeat local enable 5
> config advanced timers ap-fast-heartbeat hreap enable 8
> config advanced timers ap-fast-heartbeat all enable 6
> config advanced timers ap-fast-heartbeat all disable
```

[config advanced timers ap-heartbeat-timeout](#)  
[config advanced timers ap-primary-discovery-timeout](#)  
[config advanced timers auth-timeout](#)

## config advanced timers ap-heartbeat-timeout

The Cisco lightweight access point heartbeat timeout controls how often the Cisco lightweight access point sends a heartbeat keep-alive signal to the Cisco Wireless LAN controller. To configure the Cisco lightweight access point heartbeat timeout, use the **config advanced timers ap-heartbeat-timeout** command.

**config advanced timers ap-heartbeat-timeout** *seconds*

Syntax Description	<b>config</b> Configure parameters. <b>advanced</b> Advanced parameters. <b>timers</b> Network timers. <b>ap-heartbeat-timeout</b> Cisco lightweight access point heartbeat timeout. <b>seconds</b> Timeout value between 1 and 30 seconds.
--------------------	---

**Defaults** 30 seconds.

**Usage Guidelines** This *seconds* value should be at least three times larger than the fast heartbeat timer.

**Examples** > config advanced timers ap-heartbeat-timeout 20

**Related Commands** [show advanced timers](#)  
[config advanced timers ap-discovery-timeout](#)  
[config advanced timers ap-fast-heartbeat](#)  
[config advanced timers ap-primary-discovery-timeout](#)  
[config advanced timers auth-timeout](#)

# config advanced timers ap-primary-discovery-timeout

To configure the access point primary discovery request timer, use the **config advanced timers ap-primary-discovery-timeout** command.

**config advanced timers ap-primary-discovery-timeout *interval***

## Syntax Description

<b>config</b>	Configure parameters.
<b>advanced</b>	Advanced parameters.
<b>timers</b>	Network timers.
<b>ap-primary-discovery-</b>	Configure the amount of time the access point will wait for a discovery timeout
<b>interval</b>	Timeout value between 30 and 3600 seconds.

## Defaults

120 seconds.

## Examples

> config advanced timers ap-primary-discovery-timeout 1200

## Related Commands

[config advanced timers ap-discovery-timeout](#)  
[config advanced timers ap-fast-heartbeat](#)  
[config advanced timers ap-heartbeat-timeout](#)  
[config advanced timers auth-timeout](#)

## config advanced timers auth-timeout

To configure the authentication timeout, use the **config advanced timers auth-timeout** command.

**config advanced timers auth-timeout *seconds***

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced</b>	Advanced parameters.
<b>timers</b>	Network timers.
<b>auth-timeout</b>	Authentication response timeout.
<b><i>seconds</i></b>	Timeout value in seconds between 10 and 600.

Defaults	10 seconds.
----------	-------------

Examples	> <b>config advanced timers auth-timeout 20</b>
----------	---

Related Commands	<a href="#">show advanced timers</a> <a href="#">config advanced timers ap-fast-heartbeat</a> <a href="#">config advanced timers ap-discovery-timeout</a> <a href="#">config advanced timers ap-heartbeat-timeout</a> <a href="#">config advanced timers ap-primary-discovery-timeout</a>
------------------	---

# config advanced timers eap-timeout

To configure the EAP expiration timeout, use the **config advanced timers eap-timeout** command.

**config advanced timers eap-timeout *seconds***

Syntax Description	
<b>config</b>	Configure parameters.
<b>advanced</b>	Advanced parameters.
<b>timers</b>	Network timers.
<b>eap-timeout</b>	EAP timeout.
<b>seconds</b>	Timeout value in seconds between 8 and 120.

**Defaults** None.

**Examples** > **config advanced timers eap-timeout 10**

**Related Commands** show advanced timers

## config advanced timers eap-identity-request-delay

To configure the advanced EAP identity request delay in seconds, use the **config advanced timers eap-identity-request-delay** command.

**config advanced timers eap-identity-request-delay** *seconds*

Syntax Description	
<b>show</b>	Displays configurations.
<b>advanced</b>	Advanced parameters.
<b>timers</b>	Advanced system timers.
<b>eap-identity-request-d elay</b>	
<b>seconds</b>	Number of seconds between 0 and 10.

**Defaults** None.

**Examples** > **show advanced timers eap-identity-request-delay 8**

**Related Commands** config advanced timers auth-timeout, config advanced timers rogue-ap, show advanced timers

## Configure Access Point Commands

User the **config ap** commands to configure access point settings.

# config ap add

To add a Foreign Access Point, use the **config ap add** command.

**config ap add** *MAC port {enable | disable} IP\_address*

Syntax Description	
<b>config</b>	Displays configurations.
<b>ap</b>	Advanced parameters.
<b>add</b>	Add a Foreign Access Point.
<i>MAC</i>	Foreign Access Point MAC address.
<i>port</i>	Port number for accessing the Foreign Access Point.
<b>{enable   disable}</b>	Enable or disable 802.1X authentication for a Foreign Access Point.
<i>IP_address</i>	IP Address for a Foreign Access Point. A value of 0 (default) means that the address is assigned by a DHCP server.

**Defaults** None.

**Examples** > config ap add 12:12:12:12:12:12 2033 enable 192.12.12.1

**Related Commands** config ap

# config ap bhmode

To configure the Cisco Bridge Backhaul Mode, use the **config ap bhmode** command.

```
config ap bhmode {11a | 11b | 11g} Cisco_AP
```

Syntax Description	
<b>config</b>	Displays configurations.
<b>ap</b>	Advanced parameters.
<b>bhmode</b>	Configure the Cisco Bridge Backhaul Mode.
{11a   11b   11g}	<ul style="list-style-type: none"> <li>• Enter <b>11a</b> to set 11a as the Cisco Bridge Backhaul Mode.</li> <li>• Enter <b>11b</b> to set 11b as the Cisco Bridge Backhaul Mode.</li> <li>• Enter <b>11g</b> to set 11g as the Cisco Bridge Backhaul Mode.</li> </ul>
<i>Cisco_AP</i>	Name of a Cisco lightweight access point.

---

**Defaults** None.

---

**Examples** > **config ap bhmode 11g AP02**

Changing the AP's backhaul mode will cause the AP to reboot.  
Are you sure you want to continue? (y/n)

---

**Related Commands** **config ap**

# config ap bhrate

To configure the Cisco Bridge Backhaul Tx Rate, use the **config ap bhrate** command.

**config ap bhrate** *rate Cisco\_AP*

Syntax Description	
<b>config</b>	Displays configurations.
<b>ap</b>	Advanced parameters.
<b>bhrate</b>	Configure Cisco Bridge Backhaul Tx Rate.
<i>rate</i>	Cisco Bridge Backhaul Tx Rate in Kbps. The legal values are: 6000, 12000, 18000, 24000, 36000, 48000, and 54000.
<i>Cisco_AP</i>	Name of a Cisco lightweight access point.

**Defaults** None.

**Examples** > config ap bhrate 54000 AP01

**Related Commands** config ap

# config ap bridgegroupname

To set or delete bridgegroupname on a Cisco lightweight access point, use the **config ap bridgegroupname** command.

**Note**

Only access points with the same bridgegroupname can connect to each other.

**config ap bridgegroupname {set *groupname* | delete} *Cisco\_AP***

## Syntax Description

<b>config</b>	Displays configurations.
<b>ap</b>	Advanced parameters.
<b>bridgegroupname</b>	Set or delete bridgegroupname on a Cisco lightweight access point.
{ <b>set</b> <i>groupname</i>   <b>delete</b> }	<ul style="list-style-type: none"><li>Enter <b>set</b> <i>groupname</i> to set a Cisco lightweight access point's bridgegroupname.</li><li>Enter <b>delete</b> to delete a Cisco lightweight access point's bridgegroupname.</li></ul>
<i>Cisco_AP</i>	Name of a Cisco lightweight access point.

## Defaults

None.

## Examples

> **config ap bridgegroupname delete AP02**

Changing the AP's bridgegroupname may strand the bridge AP. Please continue with caution.  
Changing the AP's bridgegroupname will also cause the AP to reboot.  
Are you sure you want to continue? (y/n)

## Related Commands

**config ap**

# config ap bridging

To enable or disable Ethernet-to-Ethernet bridging on a Cisco lightweight access point, use the **config ap bridging** command.

**config ap bridging {enable | disable} *Cisco\_AP***

Syntax Description	<b>config</b> Displays configurations. <b>ap</b> Advanced parameters. <b>bridging</b> enable or disable Ethernet-to-Ethernet bridging on a Cisco lightweight access point. <b>{enable   disable}</b> Enable or disable Ethernet-to-Ethernet bridging. <b><i>Cisco_AP</i></b> Name of a Cisco lightweight access point.
--------------------	--

**Defaults** None.

**Examples** To enable bridging on an access point enter:

```
config ap bridging enable nyc04-44-1240
```

To disable bridging on an access point enter:

```
config ap bridging disable nyc04-44-1240
```

**Related Commands** config ap

# config ap cdp

To enable or disable Cisco Discovery Protocol (CDP) on a Cisco lightweight access point, use the **config ap cdp** command.

**config ap cdp {enable | disable} {Cisco\_AP | all}**

Syntax Description	
<b>config</b>	Configure parameters.
<b>ap</b>	Configure lightweight access points.
<b>cdp</b>	Cisco Discovery Protocol.
<b>enable   disable</b>	Enable or disable CDP.
<i>Cisco_AP   all</i>	Name of a Cisco lightweight access point or <b>all</b> to specify all access points.

Defaults	Disabled.
----------	-----------

Usage Guidelines	The <b>config ap cdp disable all</b> command disables CDP on all access points that are joined to the controller and all access points that join in the future. CDP remains disabled on both current and future access points even after the controller or access point reboots. To enable CDP, enter <b>config ap cdp enable all</b> .
------------------	---

After you enable CDP on all access points joined to the controller, you may disable and then re-enable CDP on individual access points using **config ap cdp {enable | disable} Cisco\_AP**. After you disable CDP on all access points joined to the controller, you may not enable and then disable CDP on individual access points.

Examples	<pre>&gt; config ap cdp enable all &gt; config ap cdp disable ap02</pre>
----------	--

Related Commands	<b>config cdp {enable   disable}</b> <b>config cdp advertise</b> <b>config cdp holdtime</b> <b>config cdp timer</b> <b>debug cdp events</b> <b>debug cdp packets</b> <b>show ap cdp neighbors detail</b> <b>show cdp entry all</b> <b>show cdp traffic</b>
------------------	--

# config ap core-dump

To configure a Cisco lightweight access point's memory core dump, use the **config ap core-dump** command.

```
config ap core-dump {enable IP_address filename {compress | uncompress} | disable}
{Cisco_AP | all}
```

<b>Syntax Description</b>	
<b>config</b>	Displays configurations.
<b>ap</b>	Advanced parameters.
<b>core-dump</b>	Configure a Cisco lightweight access point's memory core dump.
<b>{enable   disable}</b>	Enable or disable Ethernet-to-Ethernet bridging.
<i>IP_address</i>	IP Address for the TFTP server.
<i>filename</i>	Image file name on the TFTP server.
<b>{compress   uncompress}</b>	<ul style="list-style-type: none"> <li>• Enter <b>compress</b> to compress the core dump file.</li> <li>• Enter <b>uncompress</b> to not compress the core dump file.</li> </ul>
<b>{Cisco_AP   all}</b>	Name of a Cisco lightweight access point or <b>all</b> to specify all access points.

**Defaults** None.

**Examples** > config ap core-dump enable 192.1.1.1 log compress AP02

**Related Commands** config ap

## config ap crash-file clear-all

To delete all crash and radio core dump files, use the **config ap crash-file clear-all** command.

**config ap crash-file clear-all**

Syntax Description	
<b>config</b>	Displays configurations.
<b>ap</b>	Advanced parameters.
<b>crash-file clear-all</b>	Delete all crash and radio core dump files.

Defaults	None.
----------	-------

Examples	> config ap crash-file clear-all
----------	----------------------------------

Related Commands	config ap
------------------	-----------

# config ap crash-file delete

To delete a single crash or radio core dump file, use the **config ap crash-file delete** command.

**config ap crash-file delete** *filename*

Syntax Description	
<b>config</b>	Displays configurations.
<b>ap</b>	Advanced parameters.
<b>crash-file delete</b>	Delete a single crash or radio core dump file.
<i>filename</i>	Name of the file to delete.
Defaults	None.
Examples	> config ap crash-file delete crash-file-1
Related Commands	config ap

■ config ap crash-file get-crash-file

## config ap crash-file get-crash-file

To collect the latest crash data for a Cisco lightweight access point, use the **config ap crash-file get-crash-file** command. Use the **transfer upload datatype** command to transfer the collected data to the Cisco Wireless LAN controller.

**config ap crash-file get-crash-file *Cisco\_AP***

Syntax Description	
<b>config</b>	Configure parameters.
<b>ap</b>	Cisco lightweight access point.
<b>crash-file</b>	Collect the latest crash data for an access point.
<b>get-crash-file</b>	
<i>Cisco_AP</i>	Name of the Cisco lightweight access point.

**Defaults** None.

**Examples** > config ap crash-file get-crash-file AP3

**Related Commands** config ap crash-file delete

# config ap crash-file get-radio-core-dump

To get a Cisco lightweight access point's radio core dump, use the **config ap crash-file get-radio-core-dump** command.

**config ap crash-file get-radio-core-dump *Slot\_ID Cisco\_AP***

Syntax Description	
<b>config</b>	Displays configurations.
<b>ap</b>	Advanced parameters.
<b>crash-file</b>	Get a Cisco lightweight access point's radio core dump.
<b>radio-core-dump</b>	
<i>Slot_ID</i>	The slot ID (either 0 or 1).
<i>Cisco_AP</i>	Name of a Cisco lightweight access point.

**Defaults** None.

**Examples** > config ap crash-file get-radio-core-dump 0 AP02

**Related Commands** config ap

## config ap delete

To delete a Foreign Access Point, use the **config ap delete** command.

**config ap delete** *MAC*

Syntax Description	
<b>config</b>	Displays configurations.
<b>ap</b>	Advanced parameters.
<b>delete</b>	Delete a Foreign Access Point.
<i>MAC</i>	Foreign Access Point MAC address.

**Defaults** None.

**Examples** > **config ap delete 12:12:12:12:12:12**

**Related Commands** config ap

# config ap dot1xuser

To configure the global authentication username and password for all access points currently joined to the controller as well as any access points that join the controller in the future, enter this command. Alternatively, you can set the values for a specific access point.

**config ap dot1xuser add username *user* password *password* {all | Cisco\_AP}**

<b>Syntax Description</b>	<b>config</b> Configure parameters. <b>ap</b> Cisco lightweight access point. <b>dot1xuser</b> Descriptive location. <b>add username</b> Add username. <b>user</b> Specify username. <b>password</b> Add password. <b>password</b> Specify password. <b>all</b> For all access points. <b>Cisco_AP</b> For a specific access point.
---------------------------	---

**Defaults** None.

**Usage Guidelines** You must enter a strong *password*. Strong passwords have the following characteristics:

- They are at least eight characters long.
- They contain a combination of upper- and lowercase letters, numbers, and symbols.
- They are not a word in any language.

**Examples**

```
config ap dot1xuser add username cisco123 password cisco2020 all
config ap dot1xuser add username cisco123 password cisco2020 Cisco_AP
```

**Related Commands**

[config ap dot1xuser delete](#)  
[config ap dot1xuser disable](#)  
[show ap summary](#)

## config ap dot1xuser delete

To force a specific access point to use the controller's global authentication settings, enter the following command:

**config ap dot1xuser delete *Cisco\_AP***

Syntax Description	
<b>config</b>	Configure parameters.
<b>ap</b>	Cisco lightweight access point.
<b>dot1xuser</b>	Descriptive location.
<b>delete</b>	Delete authentication.
<i>Cisco_AP</i>	Specify the access point.

**Defaults** None.

**Examples** config ap mgmtuser delete Cisco\_AP1

**Related Commands** [config ap dot1xuser](#)  
[config ap dot1xuser disable](#)  
[show ap summary](#)

# config ap dot1xuser disable

To disable authentication for all access points or for a specific access point, enter the following command:

```
config ap dot1xuser disable {all | Cisco_AP}
```

Syntax Description	<b>config</b> Configure parameters. <b>ap</b> Cisco lightweight access point. <b>dot1xuser</b> Descriptive location. <b>disable</b> Delete authentication. <b>all</b> For all access points. <i>Cisco_AP</i> Specify the access point
--------------------	--

**Defaults** None.

**Usage Guidelines** You can disable 802.1X authentication for a specific access point only if global 802.1X authentication is not enabled. If global 802.1X authentication is enabled, you can disable 802.1X for all access points only.

**Examples** `config ap mgmtuser disable Cisco_AP1`

**Related Commands**

- [config ap dot1xuser](#)
- [config ap dot1xuser delete](#)
- [show ap summary](#)

## config ap disable

To disable a Cisco lightweight access point, use the **config ap disable** command.

**config ap disable** *Cisco\_AP*

---

### Syntax Description

<b>config</b>	Configure parameters.
<b>ap</b>	Cisco lightweight access point.
<b>disable</b>	Disable command.
<i>Cisco_AP</i>	Name of the Cisco lightweight access point.

---

### Defaults

None.

---

### Examples

> **config ap disable AP1**

---

### Related Commands

**config ap enable**

# config ap enable

To enable a Cisco lightweight access point, use the **config ap enable** command.

**config ap enable** *Cisco\_AP*

Syntax Description	<b>config</b> Configure parameters. <b>ap</b> Cisco lightweight access point. <b>enable</b> Enable command. <b><i>Cisco_AP</i></b> Name of the Cisco lightweight access point.
Defaults	None.
Examples	> config ap enable AP1
Related Commands	<b>config ap disable</b>

## config ap group-name

To specify a descriptive group name for a Cisco lightweight access point, use the **config ap group-name** command. The Cisco lightweight access point must be disabled before changing this parameter.

**config ap group-name** *groupname Cisco\_AP*

Syntax Description	
<b>config</b>	Configure parameters.
<b>ap</b>	Cisco lightweight access point.
<i>groupname</i>	Descriptive group name.
<i>Cisco_AP</i>	Name of the Cisco lightweight access point.

**Defaults** None.

**Examples** > config ap group-name superusers AP01

**Related Commands** show ap summary

# config ap h-reap radius auth set

To configure a primary or secondary RADIUS server for a specific hybrid-REAP access point, use the **config ap h-reap radius auth set** command.

```
config ap h-reap radius auth set {primary | secondary}ip_address auth_port secret
```

## Syntax Description

<b>config ap</b>	Configure access point.
<b>h-reap</b>	Enter <b>h-reap</b> to specify the hybrid remote edge access point mode.
<b>radius auth set</b>	
<b>primary</b>	
<b>secondary</b>	
<i>ip_address</i>	Name of the Cisco lightweight access point.
<i>auth_port secret</i>	

## Defaults

None.

## Examples

```
> config ap h-reap radius auth set primary 192.12.12.1
```

## Related Commands

- config ap mode h-reap**
- config ap h-reap vlan wlan**
- config ap h-reap vlan**
- config ap h-reap vlan native**

## config ap h-reap vlan

To enable or disable VLAN tagging for a hybrid-REAP access, use the **config ap h-reap vlan** command.

**config ap h-reap vlan {enable | disable} Cisco\_AP**

Syntax Description	
<b>config ap</b>	Configure access point.
<b>h-reap</b>	Enter <b>h-reap</b> to specify the hybrid remote edge access point mode.
<b>{enable   disable}</b>	Enable or disable the access point's VLAN tagging.
<b>Cisco_AP</b>	Name of the Cisco lightweight access point.

**Defaults** Disabled. Once enabled, WLANs enabled for local switching inherit the VLAN assigned at the controller.

**Examples** > **config ap h-reap vlan wlan enable AP02**

**Related Commands** **config ap mode h-reap**  
**config ap h-reap radius auth set**  
**config ap h-reap vlan wlan**  
**config ap h-reap vlan native**

# config ap h-reap vlan native

To configure a native VLAN for a hybrid-REAP access, use the **config ap h-reap vlan native** command.

**config ap h-reap vlan native *vlan-id Cisco\_AP***

Syntax Description	
<b>config ap</b>	Configure access point.
<b>h-reap</b>	Enter <b>h-reap</b> to specify the hybrid remote edge access point mode.
<b>vlan native</b>	The “managing” VLAN.
<b><i>vlan-id</i></b>	VLAN identifier.
<b><i>Cisco_AP</i></b>	Name of the Cisco lightweight access point.

Defaults	None.
----------	-------

Examples	> config ap h-reap vlan native 6 AP02
----------	---------------------------------------

Related Commands	<a href="#">config ap mode h-reap</a> <a href="#">config ap h-reap radius auth set</a> <a href="#">config ap h-reap wlan wlan</a>
------------------	---

## config ap h-reap vlan wlan

To assign a VLAN ID to a hybrid-REAP access point, use the **config ap h-reap vlan wlan** command.

**config ap h-reap vlan wlan *ip\_address* *vlan-id* *Cisco\_AP***

Syntax Description	
<b>config ap</b>	Configure access point.
<b>h-reap</b>	Enter <b>h-reap</b> to specify the hybrid remote edge access point mode.
<i>ip_address</i>	Name of the Cisco lightweight access point.
<i>vlan-id</i>	VLAN identifier.
<i>Cisco_AP</i>	Name of the Cisco lightweight access point.

**Defaults** VLAN ID associated to the WLAN.

**Examples** > **config ap h-reap vlan wlan 192.12.12.1 6 AP02**

**Related Commands** **config ap mode h-reap**  
**config ap h-reap radius auth set**  
**config ap h-reap vlan**  
**config ap h-reap vlan native**

# config ap led-state

To enable or disable the LED-State for an access point, use the **config ap led-state** command.

```
config ap led-state {enable | disable} {Cisco_AP | all}
```

Syntax Description	
<b>config</b>	Displays configurations.
<b>ap</b>	Advanced parameters.
<b>led-state</b>	Enable or disable the LED-State for an access point.
<b>{enable   disable}</b>	Enable or disable the access point's LED-State.
<b>{Cisco_AP   all}</b>	Name of a Cisco lightweight access point or <b>all</b> to specify all access points.

**Defaults** None.

**Examples** > **config ap led-state enable AP02**

**Related Commands** config ap

## config ap link-latency

To enable or disable link latency for a specific access point or for all access points currently associated to the controller, enter this command:

**config ap link-latency {enable | disable | reset} {Cisco\_AP | all}**

Syntax Description	
<b>config</b>	Configure parameters.
<b>ap</b>	Cisco lightweight access point.
<b>link-latency</b>	Configure link-latency.
<b>enable   disable</b>	Enable or disable link-latency.
<b>reset</b>	Reset all link-latency statistics.
<i>Cisco_AP</i>	Name of the Cisco lightweight access point.
<b>all</b>	Configure all Cisco access points.

### Defaults

Link latency is disabled by default.

### Usage Guidelines

This command enables or disables link latency only for access points that are currently joined to the controller. It does not apply to access points that join in the future.

### Examples

>config ap link-latency enable all

### Related Commands

[show ap config](#)

# config ap location

To modify the descriptive location of a Cisco lightweight access point, use the **config ap location** command. The Cisco lightweight access point must be disabled before changing this parameter.

**config ap location** *location Cisco\_AP*

Syntax Description	
<b>config</b>	Configure parameters.
<b>ap</b>	Cisco lightweight access point.
<b>location</b>	Descriptive location.
<i>location</i>	Location name (enclosed by double quotation marks).
<i>Cisco_AP</i>	Name of the Cisco lightweight access point.

**Defaults** None.

**Examples** > config ap location "Building 1" AP1

**Related Commands** show ap summary

## config ap mgmtuser

To configure the global username, password, and enable password for all access points currently joined to the controller as well as any access points that join the controller in the future, enter this command. Alternatively, you can set the values for a specific access point.

```
config ap mgmtuser add username user password password enablesecret enable_password {all  
| Cisco_AP}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>ap</b>	Cisco lightweight access point.
<b>mgmtuser</b>	Descriptive location.
<b>add username</b>	Add username.
<i>user</i>	Specify username.
<b>password</b>	Add password.
<i>password</i>	Specify password.
<b>enablesecret</b>	Add configuration password.
<i>enable_password</i>	Specify password.
<b>all</b>	For all access points.
<i>Cisco_AP</i>	For a specific access point.

Defaults	None.
----------	-------

Examples	<pre>&gt; config ap mgmtuser add username cisco123 password cisco2020 enablesecret cisco0202 all &gt; config ap mgmtuser add username cisco123 password cisco2020 enablesecret cisco0202 Cisco_AP</pre>
----------	---

Related Commands	<b>show ap summary</b> <b>config ap mgmtuser delete</b>
------------------	--

# config ap mgmtuser delete

To force a specific access point to use the controller's global credentials, enter the following command:

```
config ap mgmtuser delete Cisco_AP
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>ap</b>	Cisco lightweight access point.
<b>mgmtuser</b>	Descriptive location.
<b>delete</b>	Delete local credentials.
<i>Cisco_AP</i>	Specify the access point

Defaults	None.
----------	-------

Examples	<pre>&gt;config ap mgmtuser delete Cisco_AP1</pre>
----------	--

Related Commands	<a href="#">show ap summary</a>
------------------	---------------------------------

# config ap mode

Cisco wireless LAN controllers communicate with Cisco lightweight access points in a variety of modes. To change a Cisco wireless LAN controller communication option for an individual Cisco lightweight access point, use the **config ap mode** command.

```
config ap mode {local | reap | monitor | rogue | sniffer | bridge} Cisco_AP
```

<b>Syntax Description</b>	<b>config ap mode</b> Configure boot option. <b>{local   reap   monitor   rogue   sniffer   bridge}</b> You have six choices: <b>Cisco_AP</b> Name of the Cisco lightweight access point.
---------------------------	---

<b>Defaults</b>	Local.
<b>Examples</b>	<p>Sets the Cisco Wireless LAN controller to communicate with AP01 in local (normal) mode:</p> <pre>&gt; <b>config ap mode local AP01</b></pre> <p>Sets the Cisco Wireless LAN controller to communicate with Cisco lightweight access point AP91 in remote office mode:</p> <pre>&gt; <b>config ap mode reap AP91</b></pre> <p>Sets the Cisco Wireless LAN controller to communicate with AP02 in monitor (listen-only) mode:</p> <pre>&gt; <b>config ap mode monitor AP02</b></pre> <p>Sets the AP91 in rogue access point detector mode:</p> <pre>&gt; <b>config ap mode rogue AP91</b></pre> <p>Sets the AP02 in wireless sniffer mode. It will capture and forward all the packets from the clients on that channel to a remote machine that runs AiroPeek (A packet analyzer for IEEE 802.11 wireless LANs). It will include information on timestamp, signal strength, packet size and so on.</p> <pre>&gt; <b>config ap mode sniffer AP02</b></pre> <p>Sets the AP91 in bridge mode:</p> <pre>&gt; <b>config ap mode bridge AP91</b></pre>
<b>Related Commands</b>	<b>show ap config</b>

# config ap mode h-reap

To enable hybrid REAP for an access point, use the **config ap mode h-reap** command.

**config ap mode h-reap** *Cisco\_AP*

Syntax Description	
<b>config ap mode</b>	Configure boot option.
<b>h-reap</b>	Enter <b>h-reap</b> to specify the hybrid remote edge access point mode.
<i>Cisco_AP</i>	Name of the Cisco lightweight access point.

Defaults	None.
<b>Examples</b>	> config ap mode h-reap AP01

Related Commands	
	<b>config ap h-reap radius auth set</b>
	<b>config ap h-reap vlan wlan</b>
	<b>config ap h-reap vlan</b>
	<b>config ap h-reap vlan native</b>

## config ap name

To modify the name of a Cisco lightweight access point, use the **config ap name** command.

**config ap name** *new\_name old\_name*

Syntax Description	
<b>config</b>	Configure parameters.
<b>ap</b>	Cisco lightweight access point.
<b>name</b>	Name of the Cisco lightweight access point.
<i>new_name</i>	Desired Cisco lightweight access point name.
<i>old_name</i>	Current Cisco lightweight access point name.

**Defaults** None.

**Examples** > **config ap name AP1 AP2**

**Related Commands** [show ap config](#)

# config ap port

To configure the port for a Foreign Access Point., use the **config ap port** command.

**config ap port** *MAC port*

Syntax Description	
<b>config</b>	Displays configurations.
<b>ap</b>	Advanced parameters.
<b>port</b>	Configure the port for a Foreign Access Point
<i>MAC</i>	Foreign Access Point MAC address.
<i>port</i>	Port number for accessing the Foreign Access Point.

**Defaults** None.

**Examples** > config ap port 12:12:12:12:12:12 20

**Related Commands** config ap

# config ap power injector

To configure the Power Injector State for an access point, use the **config ap power injector** command.

```
config ap power injector {enable | disable} {Cisco_AP | all} {installed | override | switch_MAC}
```

## Syntax Description

<b>config</b>	Displays configurations.
<b>ap</b>	Advanced parameters.
<b>power</b>	Configure the power injector state for an access point.
<b>{enable   disable}</b>	Enable or disable the power injector state for an access point.
<i>Cisco_AP</i>	Name of the Cisco lightweight access point.
<b>all</b>	Configure all Cisco lightweight access points connected to the controller.
<b>installed</b>	Detect the MAC address of the current switch port that has a power injector.
<b>override</b>	Override the safety checks and assume a power injector is always installed.
<i>switch_MAC</i>	The MAC address of the switch port with an installed power injector.

## Defaults

None.

## Examples

```
> config ap power injector enable all 12:12:12:12:12:12
```

## Related Commands

**config ap**

# config ap power pre-standard

To enable or disable the Inline Power Cisco Pre-Standard switch state for an access point, use the **config ap power pre-standard** command.

```
config ap power pre-standard {enable | disable} Cisco_AP
```

<b>Syntax Description</b>	
<b>config</b>	Displays configurations.
<b>ap</b>	Advanced parameters.
<b>power pre-standard</b>	Configure the Inline Power Cisco Pre-Standard switch state for an access point.
<b>{enable   disable}</b>	Enable or disable the Inline Power Cisco pre-standard switch state for an access point.
<i>Cisco_AP</i>	Name of the Cisco lightweight access point.
<b>Defaults</b>	None.
<b>Examples</b>	> config ap power pre-standard enable AP02
<b>Related Commands</b>	config ap

## config ap primary-base

To set the Cisco lightweight access point primary Cisco Wireless LAN controller, use the **config ap primary-base** command. The Cisco lightweight access point associates with this Cisco Wireless LAN controller for all network operation and in the event of a hardware reset.

**config ap primary-base** *controller\_name Cisco\_AP* [*controller\_ip\_address*]

Syntax Description	
<b>config</b>	Configure parameters.
<b>ap</b>	Cisco lightweight access point.
<b>primary-base</b>	Cisco lightweight access point primary Cisco Wireless LAN controller.
<i>controller_name</i>	Name of Cisco Wireless LAN controller.
<i>Cisco_AP</i>	Cisco lightweight access point name.
<i>controller_ip_address</i>	[Optional] If the backup controller is outside the mobility group to which the access point is connected, then you need to provide the IP address of the primary, secondary, or tertiary controller.

**Defaults** None.

**Examples** > **config ap primary-base SW\_1 AP2**

**Related Commands** **show sysinfo**  
**config sysname**  
**config ap secondary-base**  
**config ap tertiary-base**

# config ap priority

To assign a priority designation to an access point that allows it to reauthenticate after a controller failure by priority rather than on a first-come-until-full basis, use the **config ap priority** command.

In a failover situation, if the backup controller does not have enough ports to allow all the access points in the affected area to reauthenticate, it gives priority to higher-priority access points over lower-priority ones, even if it means replacing lower-priority access points.

**config ap priority {1 | 2 | 3 | 4} Cisco\_AP**

<b>Syntax Description</b>	<table border="1"> <tr> <td><b>config</b></td><td>Configure parameters.</td></tr> <tr> <td><b>ap</b></td><td>Cisco lightweight access point.</td></tr> <tr> <td><b>priority</b></td><td>Configure AP failover priority command</td></tr> <tr> <td><b>{1   2   3   4}</b></td><td>Assign a reauthentication priority:           <ul style="list-style-type: none"> <li>• 1 to specify low priority</li> <li>• 2 to specify medium priority</li> <li>• 3 to specify high priority</li> <li>• 4 to specify highest (critical) priority</li> </ul> </td></tr> <tr> <td><i>Cisco_AP</i></td><td>Cisco lightweight access point name.</td></tr> </table>	<b>config</b>	Configure parameters.	<b>ap</b>	Cisco lightweight access point.	<b>priority</b>	Configure AP failover priority command	<b>{1   2   3   4}</b>	Assign a reauthentication priority: <ul style="list-style-type: none"> <li>• 1 to specify low priority</li> <li>• 2 to specify medium priority</li> <li>• 3 to specify high priority</li> <li>• 4 to specify highest (critical) priority</li> </ul>	<i>Cisco_AP</i>	Cisco lightweight access point name.
<b>config</b>	Configure parameters.										
<b>ap</b>	Cisco lightweight access point.										
<b>priority</b>	Configure AP failover priority command										
<b>{1   2   3   4}</b>	Assign a reauthentication priority: <ul style="list-style-type: none"> <li>• 1 to specify low priority</li> <li>• 2 to specify medium priority</li> <li>• 3 to specify high priority</li> <li>• 4 to specify highest (critical) priority</li> </ul>										
<i>Cisco_AP</i>	Cisco lightweight access point name.										

**Defaults** 1 - Low priority.

**Examples** > **config ap priority 3 AP02**

**Related Commands**
[config network ap-priority](#)  
[show ap summary](#)  
[show network summary](#)

## config ap reporting-period

To reset a Cisco lightweight access point, use the **config ap reset** command.

**config ap reporting-period *period***

Syntax Description	
<b>config</b>	Configure parameters.
<b>ap</b>	Cisco lightweight access point.
<b>reporting-period</b>	Reporting-period command.
<i>period</i>	Time period in seconds between 10 and 120.

**Defaults** None.

**Examples** > **config ap reporting-period 120**

**Related Commands** **show ap config 802.11a**  
**show ap config 802.11ab**

# config ap reset

To reset a Cisco lightweight access point, use the **config ap reset** command.

**config ap reset *Cisco\_AP***

Syntax Description	
<b>config</b>	Configure parameters.
<b>ap</b>	Cisco lightweight access point.
<b>reset</b>	Reset command.
<i>Cisco_AP</i>	Cisco lightweight access point name.

Defaults	None.
----------	-------

Examples	> config ap reset AP2
----------	-----------------------

Related Commands	show ap config
------------------	----------------

## config ap role

To configure a Cisco Bridge role of operation, use the **config ap role** command.

```
config ap role {rooftop | poletop | auto} Cisco_AP
```

Syntax Description	
<b>config</b>	Displays configurations.
<b>ap</b>	Advanced parameters.
<b>role</b>	Configure a Cisco Bridge role of operation.
{ <b>rooftop</b>   <b>poletop</b>   <b>auto</b> }	Set the Cisco Bridge role of operation to <b>rooftop</b> , <b>poletop</b> , or <b>auto</b> . <ul style="list-style-type: none"><li>• Rooftop role for the Cisco Bridge.</li><li>• Poletop role for the Cisco Bridge.</li><li>• Auto Role for the Cisco Bridge.</li></ul>
<i>Cisco_AP</i>	Name of the Cisco lightweight access point.

**Defaults** None.

**Examples** > **config ap role auto AP02**

```
Changing the AP's role will cause the AP to reboot.  
Are you sure you want to continue? (y/n)
```

**Related Commands** config ap

# config ap rst-button

To configure the Reset button for an access point, use the **config ap rst-button** command.

```
config ap rst-button {enable | disable} Cisco_AP
```

Syntax Description	config                Displays configurations. ap                    Advanced parameters. rst-button           Configure the Reset button for an access point. {enable   disable}  Enable or disable the Reset button for an access point. <i>Cisco_AP</i> Name of the Cisco lightweight access point.
--------------------	--

**Defaults** None.

**Examples** > config ap rst-button enable AP03

**Related Commands** config ap

## config ap secondary-base

To set the Cisco lightweight access point secondary Cisco Wireless LAN controller, use the **config ap secondary-base** command. The Cisco lightweight access point associates with this Cisco Wireless LAN controller for all network operation and in the event of a hardware reset.

**config ap secondary-base** *controller\_name Cisco\_AP* [*controller\_ip\_address*]

Syntax Description	
<b>config</b>	Configure parameters.
<b>ap</b>	Cisco lightweight access point.
<b>primary-base</b>	Cisco lightweight access point secondary Cisco Wireless LAN controller.
<i>controller_name</i>	Name of Cisco Wireless LAN controller.
<i>Cisco_AP</i>	Cisco lightweight access point name.
<i>controller_ip_address</i>	[Optional] If the backup controller is outside the mobility group to which the access point is connected, then you need to provide the IP address of the primary, secondary, or tertiary controller.

**Defaults** None.

**Examples** > **config ap secondary-base SW\_1 AP2**

**Related Commands** **show sysinfo**  
**config sysname**  
**config ap primary-base**  
**config ap tertiary-base**

# config ap sniff 802.11a

To enable or disable sniffing on the access point, use the **config ap sniff 802.11a** command.

When the sniffer feature is enabled on an access point, it starts sniffing the signal on the given channel. It captures and forwards all the packets to the remote computer that runs Omnipacket, Airopeek, AirMagnet, or Wireshark. It includes information on timestamp, signal strength, packet size and so on.

Before an access point can act as a sniffer, a remote computer that runs one of the listed packet analysers must be set up so that it can receive packets sent by the access point. After the Airopeek installation, copy the following .dll files to the location where airopeek is installed.

- socket.dll file to the Plug-ins folder (for example, C:\Program Files\WildPackets\AiroPeek\Plugins)
- socketres.dll file to the PluginRes folder (for example, C:\Program Files\WildPackets\AiroPeek\1033\PluginRes)

**config ap sniff 802.11a {enable *channel server\_IP\_address* | disable} Cisco\_AP**

## Syntax Description

<b>config</b>	Configure parameters.
<b>ap</b>	Configure access point.
<b>sniff</b>	Sniffer command.
<b>802.11a {enable   disable}</b>	Enable or disable sniffing.
<i>channel</i>	Channel to be sniffed.
<i>server_IP_address</i>	The IP address of the remote machine running Omnipacket, Airopeek, AirMagnet, or Wireshark
<i>Cisco_AP</i>	Access point configured as the sniffer.

## Defaults

Channel 36.

## Examples

```
> config ap sniff 802.11a enable 23 11.22.44.55 AP01
```

## Related Commands

**show ap config**

**config ap sniff 802.11b**

## config ap sniff 802.11b

To enable or disable sniffing on the access point, use the **config ap sniff 802.11b** command.

When the sniffer feature is enabled on an access point, it starts sniffing the signal on the given channel. It captures and forwards all the packets to the remote computer that runs Omnipacket, Airopeek, AirMagnet, or Wireshark. It includes information on timestamp, signal strength, packet size and so on.

Before an access point can act as a sniffer, a remote computer that runs one of the listed packet analysers must be set up so that it can receive packets sent by the access point. After the Airopeek installation, copy the following .dll files to the location where airopeek is installed.

- socket.dll file to the Plug-ins folder (for example, C:\Program Files\WildPackets\AiroPeek\Plugins)
- socketres.dll file to the PluginRes folder (for example, C:\Program Files\WildPackets\AiroPeek\1033\PluginRes)

**config ap sniff 802.11b {enable channel server\_IP\_address | disable} Cisco\_AP**

### Syntax Description

<b>config</b>	Configure parameters.
<b>ap</b>	Configure access point.
<b>sniff</b>	Sniffer command.
<b>802.11b {enable   disable}</b>	Enable or disable sniffing.
<i>channel</i>	Channel to be sniffed.
<i>server_IP_address</i>	The IP address of the remote machine running Omnipacket, Airopeek, AirMagnet, or Wireshark
<i>Cisco_AP</i>	Access point configured as the sniffer.

### Defaults

Channel 1.

### Examples

> config ap sniff 80211b enable 23 11.22.44.55 AP01

### Related Commands

**show ap config**

**config ap sniff 802.11a**

# config ap static-ip

To configure Cisco lightweight access point static IP address settings, use the **config ap static-ip** command.

```
config ap static-ip {enable Cisco_AP ip_address net_mask gateway | disable Cisco_AP}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>ap</b>	Cisco lightweight access point.
<b>static-ip</b>	Configure Cisco lightweight access point static IP address settings.
<b>{enable   disable}</b>	Configure the Cisco lightweight access point static IP address. Disable the Cisco lightweight access point static IP address. The access point uses DHCP to get the IP address.
<i>Cisco_AP</i>	Cisco lightweight access point name.
<i>ip_address</i>	Cisco lightweight access point IP address
<i>net_mask</i>	The Cisco lightweight access point network mask.
<i>gateway</i>	IP address of the Cisco lightweight access point gateway.

Defaults	None.
Examples	<pre>&gt; config ap static-ip enable AP2 1.1.1.1 255.255.255.0 10.1.1.1</pre>

Related Commands	<a href="#">show sysinfo</a> <a href="#">config sysname</a> <a href="#">config ap secondary-base</a> <a href="#">config ap primary-base</a>
------------------	--

## config ap stats-timer

Use this command to set the time in seconds that the Cisco lightweight access point sends its DOT11 statistics to the Cisco Wireless LAN controller. A value of 0 (zero) means the Cisco lightweight access point will not send any DOT11 statistics. The acceptable range for the timer is from 0 to 65535 seconds, and the Cisco lightweight access point must be disabled to set this value.

**config ap stats-timer *period Cisco\_AP***

Syntax Description	
<b>config</b>	Configure parameters.
<b>ap</b>	Cisco lightweight access point.
<b>stats-timer</b>	Cisco lightweight access point primary Cisco Wireless LAN controller.
<b>period</b>	Time in seconds from 0 to 65535. A zero value disables the timer.
<b><i>Cisco_AP</i></b>	Cisco lightweight access point name.

Defaults	0 (disabled).
----------	---------------

Examples	<b>&gt; config ap stats-timer 600 AP2</b>
----------	---

Related Commands	<b>config ap disable</b>
------------------	--------------------------

# config ap syslog host global

To configure a global syslog server for all access points that join the controller, use the **config ap syslog host global** command.

**config ap syslog host global** *syslog\_server\_IP\_address*

**Note** By default, the global syslog server IP address for all access points is 255.255.255.255. Make sure that the access points can reach the subnet on which the syslog server resides before configuring the syslog server on the controller. If the access points cannot reach this subnet, the access points are unable to send out syslog messages.

## Syntax Description

<b>config</b>	Configure parameters.
<b>ap</b>	Cisco lightweight access point.
<b>syslog</b>	System logs.
<b>host</b>	Remote host.
<b>global</b>	All Cisco lightweight access points.
<i>syslog_server_IP_addr</i>	IP address of the syslog server.
<i>ess</i>	

## Defaults

255.255.255.255.

## Examples

```
> config ap syslog host global 255.255.255.255
```

## Related Commands

**config ap syslog host specific**  
**show ap config global**  
**show ap config general**

## config ap syslog host specific

To configure a syslog server for a specific access point, use the **config ap syslog host specific** command.

**config ap syslog host specific** *Cisco\_AP syslog\_server\_IP\_address*

**Note** By default, the syslog server IP address for each access point is 0.0.0.0, indicating that it is not yet set. When the default value is used, the global access point syslog server IP address is pushed to the access point.

### Syntax Description

<b>config</b>	Configure parameters.
<b>ap</b>	Cisco lightweight access point.
<b>syslog</b>	System logs.
<b>host</b>	Remote host.
<b>specific</b>	A single, specified Cisco access point.
<i>syslog_server_IP_addr</i>	IP address of the syslog server.
<i>ess</i>	

### Defaults

0.0.0.0

### Examples

> **config ap syslog host specific 0.0.0.0**

### Related Commands

**config ap syslog host global**  
**show ap config global**  
**show ap config general**

# config ap {telnet | ssh}

To enable Telnet or SSH connectivity on an access point, use the **config ap {telnet | ssh}** command. The Cisco lightweight access point associates with this Cisco Wireless LAN controller for all network operation and in the event of a hardware reset.

```
config ap {telnet | ssh} {enable | disable} Cisco_AP
```

<b>Syntax Description</b>	<b>config</b> Configure parameters. <b>ap</b> Configure access point. <b>{telnet   ssh}</b> <ul style="list-style-type: none"> <li>Enter <b>telnet</b> to configure Telnet connectivity on the access point.</li> <li>Enter <b>ssh</b> to configure Secure Shell (SSH) connectivity on the access point.</li> </ul> <b>{enable   disable}</b> <ul style="list-style-type: none"> <li>Enter <b>enable</b> to enable Telnet or SSH connectivity on the access point.</li> <li>Enter <b>disable</b> to disable Telnet or SSH connectivity on the access point.</li> </ul>
	<i>Cisco_AP</i> Cisco access point name.

**Defaults** None.

**Examples**

```
> config ap telnet enable cisco_ap1
> config ap telnet disable cisco_ap1
> config ap ssh enable cisco_ap2
> config ap ssh disable cisco_ap2
```

**Related Commands** show ap config general

## config ap tertiary-base

To set the Cisco lightweight access point tertiary Cisco Wireless LAN controller, use the **config ap tertiary-base** command. The Cisco lightweight access point associates with this Cisco Wireless LAN controller for all network operation and in the event of a hardware reset.

**config ap tertiary-base** *controller\_name* *Cisco\_AP* [*controller\_ip\_address*]

<b>Syntax Description</b>	
<b>config</b>	Configure parameters.
<b>ap</b>	Cisco lightweight access point.
<b>tertiary-base</b>	Cisco lightweight access point tertiary Cisco Wireless LAN controller.
<i>controller_name</i>	Name of Cisco Wireless LAN controller.
<i>Cisco_AP</i>	Cisco lightweight access point name.
<i>controller_ip_address</i>	[Optional] If the backup controller is outside the mobility group to which the access point is connected, then you need to provide the IP address of the primary, secondary, or tertiary controller.

**Defaults** None.

**Examples** > **config ap tertiary-base SW\_1 AP2**

**Related Commands**

- show sysinfo
- config sysname
- config ap secondary-base
- config ap primary-base

# config ap tftp-downgrade

This command is used to configure the settings used for downgrading a lightweight access point to an autonomous access point.

```
config ap tftp-downgrade (tftp_ip_address) (image_filename) (ap_name)
```

<b>Syntax Description</b>	<i>tftp_ip_address</i> Specifies the IP address of the TFTP server. <i>image_filename</i> Specifies the filename of the access point image file on the TFTP server. <i>ap_name</i> Specifies the access point name.
---------------------------	---

<b>Defaults</b>	None.
-----------------	-------

<b>Examples</b>	> config ap tftp-downgrade 10.0.23.8 1238.tar ap1240_102301
-----------------	---

<b>Related Commands</b>	show running-config show version
-------------------------	-------------------------------------

## config ap wlan

To enable or disable wireless LAN override for a Cisco lightweight access point radio, and to add or delete wireless LANs to or from a Cisco lightweight access point radio, as described in the related product guide, use the **config ap wlan** command.

```
config ap wlan {add | delete | enable | disable} {802.11a | 802.11b} wlan_id Cisco_AP
```

<b>Syntax Description</b>	
<b>config</b>	Configure parameters.
<b>ap</b>	Cisco lightweight access point.
<b>wlan</b>	Reset command.
<b>{add   delete   enable   disable}</b>	<ul style="list-style-type: none"> <li>• Add or delete a wireless LAN on an access point. (Cisco lightweight access point must have wireless LAN override enabled to add or delete a wireless LAN.)</li> <li>• Enable or disable per access point wireless LAN override on an access point.</li> </ul>
<b>{802.11a   802.11b}</b>	Select 802.11a or 802.11b/g radio.
<b>wlan_id</b>	Optional Cisco Wireless LAN controller ID assigned to a wireless LAN.
<b>Cisco_AP</b>	Cisco lightweight access point name.

---

**Defaults** None.

---

**Examples** To enable wireless LAN override on the AP03 802.11a radio:

```
> config ap wlan enable 802.11a AP03
```

To add wireless LAN ID 1 on the AP03 802.11a radio:

```
> config ap wlan add 802.11a 1 AP03
```

To delete wireless LAN ID 1 from the AP03 802.11a radio:

```
> config ap wlan delete 802.11a AP03
```

To disable wireless LAN override on the AP03 802.11a radio:

```
> config ap wlan disable 802.11a AP03
```

---

**Related Commands** **show ap wlan**

# config ap username

To assign a username and password to access either a specific access point or all access points, use this command:

```
config ap username user_id password passwd [all | ap_name]
```

## Syntax Description

<b>username</b>	Configures the access point's administrator username.
<i>user_id</i>	Specifies the administrator username.
<b>password</b>	Configures the access point's administrator password.
<i>passwd</i>	Specifies the administrator password.
<b>all</b>	Configures all
<i>ap_name</i>	Specifies the name of a specific access point.

## Defaults

This command has no defaults.

## Command History

<b>Release</b>	<b>Modification</b>
4.1	This command was introduced.

## Examples

To assign a username and password to a specific access point enter a command similar to the following:

```
config ap username jack password blue 1a204
```

To assign the same username and password to all access points enter a command similar to the following:

```
config ap username jack password blue all
```

## Related Commands

None.

## config auth-list add

To create an authorized access point entry, use the **config auth-list add** command.

```
config auth-list add {mic | ssc} AP_MAC [AP_key]
```

---

### Syntax Description

<b>config auth-list</b>	Command action.
<b>add</b>	Create an authorized access point entry.
<b>mic</b>	Access point has manufacture installed certificate.
<b>ssc</b>	Access point has self-signed certificate.
<b>AP_MAC</b>	MAC address of a Cisco lightweight access point.
<b>AP_key</b>	A key hash value equal to 20 bytes or 40 digits.

---

### Defaults

None.

---

### Examples

```
> config auth-list add mic 00:0b:85:02:0d:20
```

---

### Related Commands

**config auth-list delete**

**config auth-list ap-policy**

# config auth-list ap-policy

To configure an access point authorization policy, use the **config auth-list ap-policy** command.

```
config auth-list ap-policy {authorize-ap {enable | disable} | ssc {enable | disable}}
```

---

## Syntax Description

<b>config auth-list</b>	Command action.
<b>ap-policy</b>	Create an authorized access point entry.
<b>authorize-ap {enable   disable}</b>	Enable or disable access point authorization.
<b>ssc {enable   disable}</b>	Enable or disable access point with self-signed certificate to connect.

---

## Defaults

None.

---

## Examples

```
> config auth-list ap-policy authorize-ap enable
> config auth-list ap-policy ssc disable
```

---

## Related Commands

**config auth-list add**  
**config auth-list delete**

## config auth-list delete

To delete an access point entry, use the **config auth-list delete** command.

**config auth-list delete *AP\_MAC***

Syntax Description	
<b>config auth-list</b>	Command action.
<b>delete</b>	Delete an access point entry.
<b><i>AP_MAC</i></b>	MAC address of a Cisco lightweight access point.

Defaults	None.
----------	-------

Examples	> config auth-list delete 00:0b:85:02:0d:20
----------	---

Related Commands	<b>config auth-list add</b> <b>config auth-list ap-policy</b>
------------------	--

# config boot

Each Cisco Wireless LAN controller can boot off the primary, last-loaded OS image or boot off the backup, earlier-loaded OS image. To change a Cisco Wireless LAN controller boot option, use the **config boot** command.

**config boot {primary | backup}**

<b>Syntax Description</b>	<b>config boot</b> Configure boot option. <b>{primary   backup}</b> Set the primary image or backup image as active.
<b>Defaults</b>	primary
<b>Examples</b>	> <b>config boot primary</b> > <b>config boot backup</b>
<b>Related Commands</b>	<b>show boot</b>

## config cdp timer

This command is used to configure the CDP maximum hold timer.

**config cdp timer** *seconds*

<b>Syntax Description</b>	<i>seconds</i>	Specifies the maximum hold timer value (5 to 254 seconds).
---------------------------	----------------	--

<b>Defaults</b>	This command has no defaults.
-----------------	-------------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	4.1	This command was introduced.

<b>Examples</b>	> config cdp timer 150
-----------------	------------------------

<b>Related Commands</b>	None.
-------------------------	-------

# config certificate

To configure SSL certificates, use the **config certificate** command.

```
config certificate {generate {webadmin | webauth} | compatibility {on | off}}
```

<b>Syntax Description</b>	<b>config certificate</b> Command action. <b>generate {webadmin   webauth}</b> Generates a new web administration certificate or a a new web authentication certificate. <b>compatibility {on   off}</b> Enables or disables compatibility mode for inter-Cisco Wireless LAN controller ipsec
<b>Defaults</b>	None.
<b>Examples</b>	<pre>&gt; config certificate generate webadmin Creating a certificate may take some time. Do you wish to continue? (y/n) &gt; config certificate compatibility</pre>
<b>Related Commands</b>	<a href="#">show certificate summary</a> <a href="#">show certificate compatibility</a>

## config certificate generate webadmin

To generate a new certificate, use the **config certificate generate webadmin** command.

```
config certificate generate webadmin
```

---

### Syntax Description

<b>config certificate</b>	Command action.
<b>generate webadmin</b>	Generates a new web administration certificate.

---

### Defaults

None.

---

### Examples

```
> config certificate generate webadmin
```

```
Creating a certificate may take some time. Do you wish to continue? (y/n)
```

---

### Related Commands

```
show certificate summary  
show certificate compatibility
```

## Configure Client Commands

User the **config client** commands to configure client settings.

# config client ccx clear-reports

To clear the client reporting information, use the **config client ccx clear-reports** command.

**config client ccx clear-reports *client\_mac\_address***

---

<b>Syntax Description</b>	<i>client_mac_address</i> Specifies the MAC address of the client.
---------------------------	--

---

<b>Defaults</b>	This command has no defaults.
-----------------	-------------------------------

---

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	4.2	This command was introduced.

---

<b>Examples</b>	> config client ccx clear-reports 172.19.28.40
-----------------	--

---

# config client ccx clear-results

To clear the test results on the controller, use the **config client ccx clear-results** command.

**config client ccx clear-results** *client\_mac\_address*

<b>Syntax Description</b>	<i>client_mac_address</i> Specifies the MAC address of the client.
---------------------------	--

<b>Defaults</b>	This command has no defaults.
-----------------	-------------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	4.2	This command was introduced.

<b>Examples</b>	> config client deauthenticate 172.19.28.40
-----------------	---

<b>Related Commands</b>	config client ccx default-gw-ping config client ccx dhcp config client ccx dns-ping config client ccx dns-resolve config client ccx test-association config client ccx test-dot1x config client ccx test-profile config client ccx test-abort config client ccx send-message show client ccx last-test-status show client ccx last-response-status show client ccx results show client ccx frame-data
-------------------------	---

# config client ccx default-gw-ping

To send a request to the client to perform the default gateway ping test, use the **config client ccx default-gw-ping** command.

**config client ccx default-gw-ping** *client\_mac\_address*

**Note** This test does not require the client to use the diagnostic channel.

<b>Syntax Description</b>	<i>client_mac_address</i> Specifies the MAC address of the client.
---------------------------	--

<b>Defaults</b>	This command has no defaults.
-----------------	-------------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	4.2	This command was introduced.

<b>Examples</b>	> config client ccx default-gw-ping 00:E0:77:31:A3:55
-----------------	---

-------------------------	--

## config client ccx dhcp-test

To send a request to the client to perform the DHCP test, use the **config client ccx dhcp-test** command.

**config client ccx dhcp-test *client\_mac\_address***

**Note** This test does not require the client to use the diagnostic channel.

<b>Syntax Description</b>	<i>client_mac_address</i> Specifies the MAC address of the client.
---------------------------	--

<b>Defaults</b>	This command has no defaults.
-----------------	-------------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	4.2	This command was introduced.

<b>Examples</b>	> config client ccx dhcp-test 00:E0:77:31:A3:55
-----------------	---

<b>Related Commands</b>	config client ccx default-gw-ping config client ccx dns-ping config client ccx dns-resolve config client ccx test-association config client ccx test-dot1x config client ccx test-profile config client ccx test-abort config client ccx clear-results config client ccx send-message show client ccx last-test-status show client ccx last-response-status show client ccx results show client ccx frame-data
-------------------------	--

# config client ccx dns-ping

To send a request to the client to perform the DNS server IP address ping test, use the **config client ccx dns-ping** command.

**config client ccx dns-ping** *client\_mac\_address*

**Note** This test does not require the client to use the diagnostic channel.

## Syntax Description

<i>client_mac_address</i>	Specifies the MAC address of the client.
---------------------------	--

## Defaults

This command has no defaults.

## Command History

Release	Modification
4.2	This command was introduced.

## Examples

```
> config client ccx dns-ping 00:E0:77:31:A3:55
```

## config client ccx dns-resolve

To send a request to the client to perform the DNS name resolution test to the specified host name, use the **config client ccx dns-resolve** command.

**config client ccx dns-resolve** *client\_mac\_address host\_name*

**Note** This test does not require the client to use the diagnostic channel.

### Syntax Description

*client\_mac\_address* Specifies the MAC address of the client.

*host\_name* Specifies the host name of the client.

### Defaults

This command has no defaults.

### Command History

#### Release

#### Modification

4.2 This command was introduced.

### Examples

```
> config client ccx dns resolve 00:E0:77:31:A3:55 host_name
```

-------------------------	---

# config client ccx get-operating-parameters

To send a request to the client to send its current operating parameters, use the **config client ccx get-operating-parameters** command.

**config client ccx get-operating-parameters** *client\_mac\_address*

<b>Syntax Description</b>	<i>client_mac_address</i> Specifies the MAC address of the client.	
<b>Defaults</b>	This command has no defaults.	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	4.2	This command was introduced.
<b>Examples</b>	<pre>&gt; config client ccx get-operating-parameters 172.19.28.40</pre>	
<b>Related Commands</b>	<a href="#">config client ccx get-profiles</a> <a href="#">config client ccx get-manufacturer-info</a> <a href="#">config client ccx get-client-capability</a> <a href="#">config client ccx clear-reports</a> <a href="#">show client ccx profiles</a> <a href="#">show client ccx operating-parameters</a> <a href="#">show client ccx manufacturer-info</a> <a href="#">show client ccx client-capability</a> <a href="#">config client ccx stats-request</a> <a href="#">show client ccx stats-report</a>	

## config client ccx get-profiles

To send a request to the client to send its profiles, use the **config client ccx get-profiles** command.

**config client ccx get-profiles** *client\_mac\_address*

<b>Syntax Description</b>	<i>client_mac_address</i> Specifies the MAC address of the client.
---------------------------	--

<b>Defaults</b>	This command has no defaults.
-----------------	-------------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	4.2	This command was introduced.

<b>Examples</b>	> config client ccx get-profiles 172.19.28.40

<b>Related Commands</b>	config client ccx get-operating-parameters config client ccx get-manufacturer-info config client ccx get-client-capability config client ccx clear-reports show client ccx profiles show client ccx operating-parameters show client ccx manufacturer-info show client ccx client-capability config client ccx stats-request show client ccx stats-report
-------------------------	--

# config client ccx log-request

To configure a Cisco client extension (CCX) log request for a specified client device, use the **config client CCX log-request** command.

```
config client ccx log-request log_type [ roam | rsna | syslog ] client_mac_address
```

Syntax Description	<b>roam</b>	Specifies the request to specify the client CCX roaming log.
	<b>rsna</b>	Specifies the request to specify the client CCX RSNA log.
	<b>syslog</b>	Specifies the request to specify the client CCX system log.
	<i>client_mac_address</i>	Specifies the MAC address of the client.

**Defaults** This command has no defaults.

Command History	Release	Modification
	4.1	This command was introduced.

**Examples**

```
> config client ccx log-request syslog 00:40:96:a8:f7:98

## config client ccx send-message

To send a message to the client, use the **config client ccx send-message** command.

```
config client ccx send-message client_mac_address message_id
```

Syntax Description	
	<i>client_mac_address</i> Specifies the MAC address of the client.
	<i>message_type</i> Involves one of the following: <ul style="list-style-type: none"><li>• 1—The SSID is invalid.</li><li>• 2—The network settings are invalid.</li><li>• 3—There is a WLAN credibility mismatch.</li><li>• 4—The user credentials are incorrect.</li><li>• 5—Please call support.</li><li>• 6—The problem is resolved.</li><li>• 7—The problem has not been resolved.</li><li>• 8—Please try again later.</li><li>• 9—Please correct the indicated problem.</li><li>• 10—Troubleshooting is refused by the network.</li><li>• 11—Retrieving client reports.</li><li>• 12—Retrieving client logs.</li><li>• 13—Retrieval complete.</li><li>• 14—Beginning association test.</li><li>• 15—Beginning DHCP test.</li><li>• 16—Beginning network connectivity test.</li><li>• 17—Beginning DNS ping test.</li><li>• 18—Beginning name resolution test.</li><li>• 19—Beginning 802.1X authentication test.</li><li>• 20—Redirecting client to a specific profile.</li><li>• 21—Test complete.</li><li>• 22—Test passed.</li><li>• 23—Test failed.</li><li>• 24—Cancel diagnostic channel operation or select a WLAN profile to resume normal operation.</li><li>• 25—Log retrieval refused by the client.</li><li>• 26—Client report retrieval refused by the client.</li><li>• 27—Test request refused by the client.</li><li>• 28—Invalid network (IP) setting.</li><li>• 29—There is a known outage or problem with the network.</li><li>• 30—Scheduled maintenance period.</li><li>• 31—The WLAN security method is not correct.</li><li>• 32—The WLAN encryption method is not correct.</li><li>• 33—The WLAN authentication method is not correct.</li></ul>

# config client ccx stats-request

To send a request for statistics, use the **config client ccx stats-request** command.

```
config client ccx stats-request measurement_duration stats_name [dot11 | security]  
          client_mac_address
```

Syntax Description	
<i>duration</i>	Specifies the measurement duration in seconds.
<b>dot11</b>	Specifies dot11 counters.
<b>security</b>	Specifies security counters.
<i>client_mac_address</i>	Specifies the MAC address of the client.

## Defaults

This command has no defaults.

Command History	Release	Modification
	4.1	This command was introduced.

## Examples

```
> config client ccx stat-request 1 dot11 00:40:96:a8:f7:98

## config client ccx test-association

To send a request to the client to perform the association test, use the **config client ccx test-association** command.

```
config client ccx test-association client_mac_address ssid bssid {802.11a | 802.11b | 802.11g}  
channel
```

<b>Syntax Description</b>	<i>client_mac_address</i> Specifies the MAC address of the client. <i>ssid</i> Network name. <i>bssid</i> Basic ssid. <b>802.11a</b>   <b>802.11b</b>      802.11a, 802.11b, or 802.11g setting. <b>802.11g</b>
---------------------------	---

**Defaults**                  This command has no defaults.

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	4.2	This command was introduced.

**Examples**                  > config client ccx test-association 00:E0:77:31:A3:55 ssid bssid 802.11a

-------------------------	--

# config client ccx test-dot1x

To send a request to the client to perform the 802.1x test, use the **config client ccx test-dot1x** command.

```
config client ccx test-dot1x client_mac_address profile_id bssid {802.11a | 802.11b | 802.11g}  
channel
```

## Syntax Description

<i>client_mac_address</i>	Specifies the MAC address of the client.
<i>profile_id</i>	Specifies the test profile name.
<i>bssid</i>	Basic ssid.
<b>802.11a</b>   <b>802.11b</b>   <b>802.11g</b>	802.11a, 802.11b, or 802.11g setting.

## Defaults

This command has no defaults.

## Command History

Release	Modification
4.2	This command was introduced.

## Examples

```
> config client ccx test-dot1x 172.19.28.40 profile_01 bssid 802.11b
```

## config client ccx test-profile

To send a request to the client to perform the profile redirect test, use the **config client ccx test-profile** command.

**config client ccx test-profile** *client\_mac\_address* *profile\_id*

<b>Syntax Description</b>	<i>client_mac_address</i> Specifies the MAC address of the client. <i>profile_id</i> Specifies the test profile name. <b>Note</b> The <i>profile_id</i> should be from one of the client profiles for which client reporting is enabled.
---------------------------	--

<b>Defaults</b>	This command has no defaults.
-----------------	-------------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	4.2	This command was introduced.

<b>Examples</b>	<pre>&gt; config client ccx test-dot1 11:11:11:11:11:11 profile_01</pre>
-----------------	--

# config client deauthenticate

To disconnect a client, use the **config client deauthenticate** command.

**config client deauthenticate *MAC***

Syntax Description	<b>config</b> Configure parameters. <b>client</b> Network client. <b>deauthenticate</b> Deauthenticate command. <b><i>MAC</i></b> Client MAC address.
Defaults	None.
Examples	> <b>config client deauthenticate 11:11:11:11:11:11</b>
Related Commands	<b>show client summary</b> <b>show client detail</b>

# config client location-calibration

This command is used to configure link aggregation.

```
config client location-calibration [enable mac_address interval | disable mac_address ]
```

## Syntax Description

<b>enable</b>	Specifies that client location calibration is enabled.
<b>disable</b>	Specifies that client location calibration is disabled.
<i>mac_address</i>	Specifies the MAC address of the client.
<i>interval</i>	Specifies the measurement interval in seconds.

## Defaults

This command has no defaults.

## Command History

Release	Modification
4.1	This command was introduced.

## Examples

```
> config client location-calibration enable 37:15:86:2a:Bc:cf 45
```

## Related Commands

# config country

To configure the controller's country code, use the **config country** command. Use the **show country** command to display a list of supported countries.

**config country** *country\_code*

**Note**

Cisco Wireless LAN controllers must be installed by a network administrator or qualified IT professional and the installer must select the proper country code. Following installation, access to the unit should be password protected by the installer to maintain compliance with regulatory requirements and to ensure proper unit functionality. Refer to the related product guide for the most recent country codes and regulatory domains.

---

**Syntax Description**

<b>config</b>	Configure parameters.
<b>country</b>	Set this Cisco Wireless LAN controller to comply with selected country's regulations.
<i>country_code</i>	A two-letter or three-letter country code.

---

---

**Defaults**

us (country code of the United States of America).

---

**Examples**

> **config country DE**

---

**Related Commands**

**show country**

## config custom-web ext-webauth-mode

To configure external URL web-based client authorization for the custom-web authentication page, use the **config custom-web ext-webauth-mode** command.

```
config custom-web ext-webauth-mode {enable | disable}
```

Syntax Description	
<b>config custom-web</b>	Command action.
<b>ext-webauth-mode</b>	Enable or disable external URL web-based client authorization.
<b>{enable   disable}</b>	
Defaults	None.
Examples	> config custom-web ext-webauth-mode enable
Related Commands	<b>config custom-web redirectUrl</b> <b>config custom-web weblogo</b> <b>config custom-web webmessage</b> <b>config custom-web webtitle</b> <b>config custom-web ext-webauth-url</b> <b>show custom-web</b>

# config custom-web ext-webauth-url

To configure the complete external web authentication URL for the custom-web authentication page, use the **config custom-web ext-webauth-url** command.

**config custom-web ext-webauth-url *URL***

---

## Syntax Description

<b>config custom-web</b>	Command action.
<b>ext-webauth-url <i>URL</i></b>	Set the complete external web authentication URL used for web-based client authorization.

---

---

## Defaults

None.

---

## Examples

> **config custom-web ext-webauth-url http://www.AuthorizationURL.com/**

---

## Related Commands

**config custom-web redirectUrl**  
**config custom-web weblogo**  
**config custom-web webmessage**  
**config custom-web webtitle**  
**config custom-web ext-webauth-mode**  
**show custom-web**

## config custom-web ext-webserver

To configure an external web server, use the **config custom-web ext-webserver** command.

```
config custom-web ext-webserver {add index IP_address | delete index}
```

Syntax Description	
<b>config custom-web</b>	Command action.
<b>ext-webserver</b>	The URL used for web-based client authorization.
<b>{add   delete}</b>	Add or delete an external web server.
<i>index</i>	Index of the external web server in the list of external web server. Must be a number between 1 and 20.
<i>IP_address</i>	The IP address of the external web server.

**Defaults** None.

**Examples**

```
> config custom-web ext-webserver add 2 192.23.32.19
```

**Related Commands**

- config custom-web redirectUrl
- config custom-web weblogo
- config custom-web webmessage
- config custom-web webtitle
- config custom-web ext-webauth-mode
- config custom-web ext-webauth-url
- show custom-web

# config custom-web redirectUrl

To configure the redirect URL for the custom-web authentication page, use the **config custom-web redirectUrl** command.

**config custom-web redirectUrl *URL***

---

## Syntax Description

<b>config custom-web</b>	Command action.
<b>redirectUrl <i>URL</i></b>	Set the redirect URL to the specified address.

---

---

## Defaults

None.

---

## Examples

```
> config custom-web redirectUrl abc.com
```

---

## Related Commands

**config custom-web weblogo**  
**config custom-web webmessage**  
**config custom-web webtitle**  
**config custom-web ext-webauth-mode**  
**config custom-web ext-webauth-url**  
**show custom-web**

## config custom-web weblogo

To configure the web authentication logo for the custom-web authentication page, use the **config custom-web weblogo** command.

```
config custom-web weblogo {enable | disable}
```

Syntax Description	<b>config custom-web</b> Command action. <b>weblogo {enable   disable}</b> Enable or disable the web authentication logo.
Defaults	None.
Examples	> config custom-web weblogo enable
Related Commands	<b>config custom-web redirectUrl</b> <b>config custom-web webmessage</b> <b>config custom-web webtitle</b> <b>config custom-web ext-webauth-mode</b> <b>config custom-web ext-webauth-url</b> <b>show custom-web</b>

# config custom-web webmessage

To configure the custom web authentication message text for the custom-web authentication page, use the **config custom-web webmessage** command.

**config custom-web webmessage *message***

---

## Syntax Description

<b>config custom-web</b>	Command action.
<b>webmessage <i>message</i></b>	Set custom message text for web authentication.

---

---

## Defaults

None.

---

## Examples

```
> config custom-web webmessage Thisistheplace
```

---

## Related Commands

**config custom-web redirectUrl**  
**config custom-web weblogo**  
**config custom-web webtitle**  
**config custom-web ext-webauth-mode**  
**config custom-web ext-webauth-url**  
**show custom-web**

## config custom-web webtitle

To configure the web authentication title text for the custom-web authentication page, use the **config custom-web webtitle** command.

**config custom-web webtitle *title***

Syntax Description	
	<b>config custom-web</b> Command action.
	<b>webtitle <i>title</i></b> Set the custom title text for web authentication.

Defaults	
	None.

Examples	
	> config custom-web webtitle Helpdesk

Related Commands	
	<b>config custom-web redirectUrl</b>
	<b>config custom-web weblogo</b>
	<b>config custom-web webmessage</b>
	<b>config custom-web ext-webauth-mode</b>
	<b>config custom-web ext-webauth-url</b>
	<b>show custom-web</b>

# config database size

To configure the local database, use the **config database** command. Use the **show database** command to display local database configuration.

**config database size** *count*

<b>Syntax Description</b>	<b>config database size</b> Command action. <i>count</i> A database size value between 512 and 2040
<b>Defaults</b>	None.
<b>Examples</b>	Configures the dhcp lease for scope 003. > <b>config database size 1024</b>
<b>Related Commands</b>	<b>show database</b>

# config dhcp

To configure the internal DHCP, use the **config dhcp** command. Use the **show dhcp** command to display the internal DHCP configuration.

```
config dhcp {address-pool scope start end | create-scope scope |
default-router scope router_1 [router_2] [router_3] | delete-scope scope | disable scope |
dns-servers scope dns1 [dns2] [dns3] | domain scope domain |
enable scope | lease scope lease_duration |
netbios-name-server scope wins1 [wins2] [wins3] |
network scope network netmask}
```

Syntax Description	
<b>config dhcp</b>	Command action.
<b>address-pool scope start end</b>	Configure an address range to allocate. You must specify the scope name and the first and last addresses of the address range.
<b>create-scope name</b>	Create a new dhcp scope. You must specify the scope name.
<b>default-router scope router_1 [router_2] [router_3]</b>	Configure the default routers for the specified scope and specify the IP address of a router. Optionally, you can specify the IP addresses of secondary and tertiary routers.
<b>delete-scope scope</b>	Delete the specified DHCP scope.
<b>disable scope</b>	Disable the specified DHCP scope.
<b>dns-servers scope dns1 [dns2] [dns3]</b>	Configure the name servers for the given scope. You must also specify at least one name server. Optionally, you can specify secondary and tertiary name servers.
<b>domain scope domain</b>	Configure the DNS domain name. You must specify the scope and domain names.
<b>enable scope</b>	Enable the specified dhcp scope.
<b>lease scope lease_duration</b>	Configure the lease duration (in seconds) for the specified scope.
<b>netbios-name-server scope wins1 [wins2] [wins3]</b>	Configure the netbios name servers. You must specify the scope name and the IP address of a name server. Optionally, you can specify the IP addresses of secondary and tertiary name servers.
<b>network scope network netmask</b>	Configure the network and netmask. You must specify the scope name, the network address, and the network mask.

Defaults	None.
----------	-------

Examples	Configures the DHCP lease for the scope 003. > <b>config dhcp lease 003</b>
----------	--

Related Commands	<b>show dhcp</b>
------------------	------------------

# config dhcp proxy

To specify the level at which DHCP packets are modified, use the **config dhcp proxy** command. Use the **show dhcp proxy** command to display the status of DHCP proxy handling.

```
config dhcp proxy{enable | disable}
```

Syntax Description	config dhcp proxy	Command action.
	{enable   disable}	<ul style="list-style-type: none"><li>Enter <b>enable</b> to allow the controller to modify the DHCP packets without limit.</li><li>Enter <b>disable</b> to reduce DHCP packet modification to the level of a relay.</li></ul>
Defaults	Enabled.	
Examples	> config dhcp proxy disable	
Related Commands	show dhcp proxy	

# config exclusionlist

To create or delete an exclusion list entry, use the **config exclusionlist** command.

```
config exclusionlist {add MAC [description] | delete MAC | description MAC [description]}
```

<b>Syntax Description</b>	<b>config exclusionlist</b> Configure the exclusion list. <b>{add   delete   description}</b> <ul style="list-style-type: none"> <li>Enter <b>add</b> to create a local exclusion-list entry.</li> <li>Enter <b>delete</b> to delete a local exclusion-list entry.</li> <li>Enter <b>description</b> to set the description for an exclusion-list entry.</li> </ul>
<b>MAC</b>	MAC address of the local Excluded entry.
<b>[description]</b>	[Optional] The description, up to 32 characters, for an excluded entry.

---

**Defaults** None.

---

**Examples**

```
> config exclusionlist add xx:xx:xx:xx:xx:xx lab
> config exclusionlist delete xx:xx:xx:xx:xx:xx lab
```

---

**Related Commands** **show exclusionlist**

## Configure Interface Commands

Use the **config interface** commands to configure interface commands.

# config guest-lan

To enable or disable a wired guest LAN, use the **config guest-lan** command.

```
config guest-lan {enable | disable} guest_lan_id
```

**Note** To delete a wired guest LAN, use the **config guest-lan delete *guest\_lan\_id***.

## Syntax Description

<b>config</b>	Command action.
<b>guest-lan</b>	Configure the guest LAN.
<i>guest_lan_id</i>	Guest LAN identifier between 1 and 5 (inclusive).

## Defaults

None.

## Examples

```
> config guest-lan enable 1
```

## Related Commands

**config interface guest-lan, config guest-lan create**

## config guest-lan create

To create a wired LAN for wired client traffic and associate it to an interface, use the **config guest-lan create** command.

**config guest-lan create** *guest\_lan\_id* *interface\_name*

**Note** To delete a wired guest LAN, use the **config guest-lan delete** *guest\_lan\_id*.

### Syntax Description

<b>config</b>	Command action.
<b>guest-lan</b>	Configure the guest LAN.
<i>guest_lan_id</i>	Guest LAN identifier between 1 and 5 (inclusive).
<i>interface_name</i>	Interface name

### Defaults

None.

### Examples

> **config guest-lan create 1 guest01**

### Related Commands

**config interface guest-lan**

# config guest-lan custom-web ext-webauth-url

To redirect guest users to an external server before accessing the web login page, use the **config guest-lan custom-web ext-webauth-url** command to specify the URL of the external server.

```
config guest-lan custom-web ext-webauth-url ext_web_url guest_lan_id
```

## Syntax Description

<b>config</b>	Command action.
<b>guest-lan</b>	Configure the guest LAN.
<b>custom-web</b>	Customized web login page for wired guest users.
<i>ext_web_url</i>	Indicates the URL for the external server
<i>guest_lan_id</i>	Guest LAN identifier between 1 and 5 (inclusive).

## Defaults

None.

## Examples

```
> config guest-lan custom-web ext-webauth-url http://www.AuthorizationURL.com/ 1
```

## Related Commands

- config guest-lan**
- config guest-lan create**
- config guest-lan custom-web login\_page**

## config guest-lan custom-web global disable

To use a guest-LAN specific custom web configuration rather than a global custom web configuration, use the **config guest-lan custom-web global disable** command.

**config guest-lan custom-web global disable** *guest\_lan\_id*

**Note** If you enter the **config guest-lan custom-web global enable** *guest\_lan\_id* command, the custom web authentication configuration at the global level is used.

### Syntax Description

<b>config</b>	Command action.
<b>guest-lan</b>	Configure the guest LAN.
<b>custom-web global</b>	Indicates the disabling of the global custom web configuration.
<b>disable</b>	
<i>guest_lan_id</i>	Guest LAN identifier between 1 and 5 (inclusive).

### Defaults

None.

### Examples

```
> config guest-lan custom-web global disable 1
```

### Related Commands

**config guest-lan**  
**config guest-lan create**  
**config guest-lan custom-web ext-webauth-url**  
**config guest-lan custom-web login\_page**  
**config guest-lan custom-web webauth-type {internal | customized | external}**

# config guest-lan custom-web login\_page

To enable wired guest users to log into a customized web login page, use the **config guest-lan custom-web login\_page** command to specify the filename of the web login page and the wired LAN for which it should display.

**config guest-lan custom-web login\_page *page\_name* *guest\_lan\_id***

<b>Syntax Description</b>	
<b>config</b>	Command action.
<b>guest-lan</b>	Configure the guest LAN.
<b>custom-web</b>	Customized web login page for wired guest users.
<b>login_page</b>	
<i>page_name</i>	Indicates the name of the customized web login page.
<i>guest_lan_id</i>	Guest LAN identifier between 1 and 5 (inclusive).

**Defaults** None.

**Examples** > config guest-lan custom-web login\_page custompage1 1

**Related Commands**

- config guest-lan
- config guest-lan create
- config guest-lan custom-web ext-webauth-url

## config guest-lan custom-web webauth-type

To define the web login page for wired guest users, use the **config guest-lan custom-web webauth-type** command.

```
config guest-lan custom-web webauth-type {internal | customized | external} guest_lan_id
```

Syntax Description	
<b>config</b>	Command action.
<b>guest-lan</b>	Configure the guest LAN.
<b>custom-web</b>	Indicates the type of web authorization page.
<b>webauth-type</b>	
<b>internal</b>	Displays the default web login page for the controller. This is the default value.
<b>customized</b>	Displays the custom web login page that was previously configured.
<b>external</b>	Redirects users to the URL that was previously configured.
<i>guest_lan_id</i>	Guest LAN identifier between 1 and 5 (inclusive).

**Defaults** Internal.

**Examples**

```
> config guest-lan custom-web webauth-type internal 1
```

**Related Commands**

- config guest-lan**
- config guest-lan create**
- config guest-lan custom-web ext-webauth-url**

# config guest-lan ingress-interface

To configure the wired guest VLAN's ingress interface which provides a path between the wired guest client and the controller by way of the Layer 2 access switch, use the **config guest-lan ingress-interface** command.

**config guest-lan ingress-interface *guest\_lan\_id* *interface\_name***

<b>Syntax Description</b>	<b>config interface</b> Command action. <b>guest-lan</b> Configure the guest LAN. <b>ingress-interface</b> Provides a path between the wired guest client and the controller by way of the Layer 2 access switch. <i>guest_lan_id</i> Guest LAN identifier between 1 and 5 (inclusive). <i>interface_name</i> Interface name
---------------------------	--

**Defaults** None.

**Examples** > config interface ingress-interface 1 guest01

**Related Commands** config interface guest-lan  
config guest-lan create

## config guest-lan interface

To configure an egress interface to transmit wired guest traffic out of the controller, use the **config guest-lan interface** command.

**config guest-lan interface** *guest\_lan\_id* *interface\_name*

Syntax Description	
<b>config</b>	Command action.
<b>guest-lan</b>	Configure the guest LAN.
<b>interface</b>	Provides a path between the wired guest client and the controller by way of the Layer 2 access switch.
<i>guest_lan_id</i>	Guest LAN identifier between 1 and 5 (inclusive).
<i>interface_name</i>	Interface name

**Defaults** None.

**Examples** > config guest-lan interface 1 guest01

**Related Commands** config ingress-interface guest-lan  
config guest-lan create

# config guest-lan nac

To enable or disable NAC out-of-band support for a guest LAN, enter this command:

```
config guest-lan nac {enable | disable} guest_lan_id
```

Syntax Description	
<b>config</b>	Command action.
<b>guest-lan</b>	Configure the guest LAN.
<b>nac</b>	NAC out-of-band support.
<b>enable   disable</b>	Enable or disable NAC out-of-band support.
<b><i>guest_lan_id</i></b>	Guest LAN identifier between 1 and 5 (inclusive).

<b>Defaults</b>	None
-----------------	------

<b>Examples</b>	<b>&gt;config guest-lan nac enable 3</b>
-----------------	--

<b>Related Commands</b>	<b>config guest-lan create</b>
-------------------------	--------------------------------

# config guest-lan security

To configure the security policy for the wired guest LAN, use the **config guest-lan security** command.

```
config guest-lan security {web-auth enable guest_lan_id | web-passthrough enable  
                           guest_lan_id}
```

Syntax Description	
<b>config</b>	Command action.
<b>guest-lan</b>	Configure the guest LAN.
<b>security</b>	Indicates the security policy for the wired guest LAN.
<i>guest_lan_id</i>	Guest LAN identifier between 1 and 5 (inclusive).
<b>web-auth enable</b>	Enable web authentication.
<b>web-passthrough enable</b>	Enable the web captive portal with no authentication required.

**Defaults** Web authentication.

**Examples**

```
> config guest-lan security web-auth enable 1
```

**Related Commands**

- config ingress-interface guest-lan
- config guest-lan create
- config interface guest-lan

# config hreap group (add or delete)

To add or delete a hybrid-REAP group, use the **config hreap group** command.

```
config hreap group group_name {add | delete}
```

Syntax Description	
<b>config hreap group</b>	Command action
<i>group_name</i>	Enter group name.
{ <b>add</b>   <b>delete</b> }	Specify whether you want to add or delete a group.

Defaults	
	None.

Examples	
	> config hreap group 192.12.1.2 add

Related Commands	
	<b>config hreap group <i>group_name</i> radius server</b>
	<b>config hreap group <i>group_name</i> ap</b>
	<b>show hreap group summary</b>
	<b>show hreap group detail</b>

## config hreap group (RADIUS server)

To configure a primary or secondary RADIUS server for the hybrid-REAP group, use the **config hreap group *group\_name* radius server** command.

```
config hreap group group_name radius server {add | delete} {primary | secondary}  
server_index
```

Syntax Description	
<b>config hreap group</b>	Command action
<i>group_name</i>	Enter group name.
<b>radius server</b>	RADIUS server
{ <b>add   delete</b> }	Specify whether you want to add or delete a group.
{ <b>primary   secondary</b> }	Specify primary or secondary server index
<i>server_index</i>	Server index

**Defaults** None.

**Examples**

```
> config hreap group 192.12.1.2 radius server add primary 1
```

**Related Commands**

- config hreap group *group\_name***
- config hreap group *group\_name* ap**
- show hreap group summary**
- show hreap group detail**

# config hreap group (ap)

To add an access point to the hybrid-REAP group, use the **config hreap group *group\_name* ap** command.

```
config hreap group group_name ap {add | delete} ap_mac
```

## Syntax Description

<b>config hreap group</b>	Command action
<i>group_name</i>	Enter group name.
{ <b>add   delete</b> }	Specify whether you want to add or delete a group.
<i>ap_mac</i>	MAC address of the access point

## Defaults

None.

## Examples

```
> config hreap group 192.12.1.2 ap add 00:E0:77:31:A3:55
```

## Related Commands

- config hreap group *group\_name***
- config hreap group *group\_name* radius server**
- show hreap group summary**
- show hreap group detail**

# config interface acl

To configure an interface's Access Control List, use the **config interface acl** command.

**config interface acl {ap-manager | management | *interface\_name*} {ACL | none}**

**Note** For a Cisco 2100 series wireless LAN controller, you must configure a pre-authentication ACL on the wireless LAN for the external web server. This ACL should then be set as a wireless LAN pre-authentication ACL under Web Policy. However, you do not need to configure any pre-authentication ACL for Cisco 4400 series wireless LAN controllers.

## Syntax Description

<b>config interface acl</b>	Command action
<b>ap-manager</b>	Configures the access point manager interface.
<b>management</b>	Configures the management interface.
<i>interface_name</i>	Enter interface name.
{ <b>ACL   none</b> }	Specify an ACL name up to 32 alphanumeric characters or enter <b>none</b> .

## Defaults

None.

## Examples

```
> config interface acl management none
```

## Related Commands

**show interface**

# config interface address

To configure address information for an interface's, use the **config interface address** command.

```
config interface address
  {ap-manager IP_address netmask gateway |
   management IP_address netmask gateway |
   service-port IP_address netmask |
   virtual IP_address |
   interface-name interface-name IP_address netmask gateway}
```

<b>Syntax Description</b>	
<b>ap-manager</b>	Specifies the access point manager interface.
<b>management</b>	Specifies the management interface.
<b>service-port</b>	Specifies the out-of-band service port interface.
<b>virtual</b>	Specifies the virtual gateway interface.
<b>interface-name</b>	Specifies the interface identified by the <i>interface-name</i> parameter.
<i>interface-name</i>	Specifies the interface name.
<i>IP_address</i>	Specifies the IP address.
<i>netmask</i>	Specifies the network mask.
<i>gateway</i>	Specifies the IP address of the gateway.

**Defaults** None.

**Examples** > **config interface address ap-manager 10.109.15.7 255.255.0.0 10.109.15.1**

**Related Commands** **show interface**

## config interface ap-manager

To enable or disable access point manager features on a dynamic interface, use the **config interface ap-manager** command.

```
config interface ap-manager interface_name {enable | disable}
```

Syntax Description	
<b>config interface</b>	Command action.
<b>ap-manager</b>	Configures access point manager features on a dynamic interface.
<i>interface_name</i>	Interface's name.
<b>{enable   disable}</b>	Enable or disable access point manager features on a dynamic interface.

**Defaults** None.

**Examples** > config interface ap-manager myinterface disable

**Related Commands** show interface

# config interface create

To create a dynamic interface (VLAN) for wired guest user access, use the **config interface create** command.

**config interface create** *interface\_name* *vlan-id*

## Syntax Description

<b>config interface</b>	Command action
<b>create</b>	Create a new dynamic interface.
<i>interface_name</i>	Interface's name.
<i>vlan-id</i>	VLAN identifier.

## Defaults

None.

## Examples

```
> config interface create lab2 6
```

## Related Commands

show interface

# config interface delete

To delete a dynamic interface, use the **config interface delete** command.

**config interface delete** *interface-name*

Syntax Description	
<b>config interface</b>	Command action.
<b>delete</b>	Delete the specified dynamic interface.
<i>interface-name</i>	Interface's name.

Defaults	None.
----------	-------

Examples	> <b>config interface delete VLAN501</b>
----------	--

Related Commands	<b>show interface</b>
------------------	-----------------------

# config interface dhcp

To configure DHCP options on an interface, use the **config interface dhcp** command.

```
config interface dhcp {
    ap-manager [primary dhcp_server secondary dhcp_server | option-82 {enable | disable} ] |
    management [primary dhcp_server secondary dhcp_server | option-82 {enable | disable} ] |
    service-port {enable | disable} |
    interface-name name [primary dhcp_server secondary dhcp_server | option-82 {enable | disable} ]}
```

Syntax Description	
<b>ap-manager</b>	Configures the access point manager interface.
<b>server-1</b>	Configures the primary DHCP server.
<i>dhcp_server</i>	Specifies the IP address of the server.
<b>server-2</b>	Configures the alternate DHCP server.
<b>option-82</b>	Configures DHCP option 43 on the interface.
<b>enable</b>	Enables the feature.
<b>disable</b>	Disables the feature.
<b>management</b>	Configures the management interface.
<b>service-port</b>	Enables or disables DHCP for the out-of-band service port.
<b>interface-name</b>	Enter the interface name and the primary DHCP server. Optionally, you can also enter the address of the alternate DHCP server.

<b>Defaults</b>	None.
<b>Examples</b>	
	<pre>&gt; config interface dhcp ap-manager server-1 10.21.15.01 server-2 10.21.15.25 &gt; config interface dhcp ap-manager option-82 enable &gt; config interface dhcp service-port enable</pre>

<b>Related Commands</b>	show interface
-------------------------	----------------

## config interface guest-lan

To enable or disable the guest LAN VLAN, use the **config interface guest-lan** command.

```
config interface guest-lan interface_name {enable | disable}
```

---

### Syntax Description

<b>config interface</b>	Command action.
<b>guest-lan</b>	Configure the guest LAN.
<i>interface_name</i>	Interface name.
<b>enable   disable</b>	Enable or disable the feature.

---

---

### Defaults

None.

---

### Examples

```
> config interface guest-lan myinterface enable
```

---

### Related Commands

**config guest-lan create**

# config interface hostname

To configure the DNS host name of the virtual gateway interface, use the **config interface hostname** command.

**config interface hostname virtual *DNS\_host***

Syntax Description	
<b>config interface</b>	Command action.
<b>hostname</b>	Configure the DNS host name
<b>virtual <i>DNS_host</i></b>	Configures the virtual gateway interface to use the specified virtual address of the fully qualified DNS name.  (The Virtual Gateway IP Address is any fictitious, unassigned IP address, such as 1.1.1.1, to be used by Layer 3 security and mobility managers.)

**Defaults** None.

**Examples** > **config interface hostname virtual DNS\_Host**

**Related Commands** **show interface**

# config interface port

To map a physical port to the interface (if a link aggregation trunk is not configured), use the **config interface port** command.

**config interface port** *interface\_name primary\_port {secondary\_port}*

Syntax Description	
<b>config interface port</b>	Command action.
<i>interface_name</i>	Interface name
<i>primary_port</i> <i>{secondary_port}</i>	Interface's primary or secondary physical port number.

**Defaults** None.

**Examples** > config interface port lab02 3

**Related Commands** show interface, config interface create

# config interface quarantine vlan

To configure a quarantine VLAN on any dynamic interface, use the **config interface quarantine vlan** command.

**config interface quarantine vlan *interface-name* *vlan\_id***

---

**Syntax Description**

<b>config interface</b>	Command action.
<b>quarantine vlan</b>	Configure quarantine VLAN for this interface.
<i>interface-name</i>	Interface's name.
<i>vlan_id</i>	VLAN identifier.
<b>Note</b>	Enter <b>0</b> to disable quarantine processing.

---

---

**Defaults**

None.

---

**Examples**

> config interface quarantine vlan quarantine 10

---

**Related Commands**

show interface

# config interface vlan

To configure an interface's VLAN identifier, use the **config interface vlan** command.

```
config interface vlan {ap-manager | management | interface-name} vlan
```

Syntax Description	
<b>config interface</b>	Command action.
<b>vlan</b>	Configure an interface's VLAN identifier
{ <b>ap-manager</b>   <b>management</b>   <b>interface-name</b> }	<ul style="list-style-type: none"><li>Enter <b>ap-manager</b> to configure the access point manager interface.</li><li>Enter <b>management</b> to configure the management interface.</li><li>Enter the interface's name.</li></ul>
<i>interface-name</i>	Interface's name.
<i>vlan</i>	VLAN identifier.

**Defaults** None.

**Examples**

```
> config interface vlan management 01
```

**Related Commands** show interface

# config known ap

To configure a known Cisco lightweight access point, use the **config known ap** command.

**config known ap {add | alert | delete} MAC**

<b>Syntax Description</b>	<table border="1"> <tr> <td><b>config</b></td><td>Configure parameters.</td></tr> <tr> <td><b>known ap</b></td><td>Known Cisco lightweight access point.</td></tr> <tr> <td><b>{add   alert   delete}</b></td><td> <ul style="list-style-type: none"> <li>• Add a new known access point Entry.</li> <li>• Generate a trap upon detection of the access point.</li> <li>• Delete an existing known access point Entry.</li> </ul> </td></tr> <tr> <td><b>MAC</b></td><td>MAC address of the known Cisco lightweight access point.</td></tr> </table>	<b>config</b>	Configure parameters.	<b>known ap</b>	Known Cisco lightweight access point.	<b>{add   alert   delete}</b>	<ul style="list-style-type: none"> <li>• Add a new known access point Entry.</li> <li>• Generate a trap upon detection of the access point.</li> <li>• Delete an existing known access point Entry.</li> </ul>	<b>MAC</b>	MAC address of the known Cisco lightweight access point.
<b>config</b>	Configure parameters.								
<b>known ap</b>	Known Cisco lightweight access point.								
<b>{add   alert   delete}</b>	<ul style="list-style-type: none"> <li>• Add a new known access point Entry.</li> <li>• Generate a trap upon detection of the access point.</li> <li>• Delete an existing known access point Entry.</li> </ul>								
<b>MAC</b>	MAC address of the known Cisco lightweight access point.								

**Defaults** None.

**Examples** > config known ap add ac:10:02:72:2f:bf 12

**Related Commands** config ap

# config lag

This command is used to enable or disable link aggregation (LAG).

**config lag [enable | disable]**

Syntax Description	
<b>enable</b>	Specifies that link aggregation is enabled.
<b>disable</b>	Specifies that link aggregation is disabled.

**Defaults** This command has no defaults.

Command History	Release	Modification
	4.1	This command was introduced.

**Examples**

> **config lag enable**

Enabling LAG will map your current interfaces setting to LAG interface,  
All dynamic AP Manager interfaces and Untagged interfaces will be deleted  
All WLANs will be disabled and mapped to Mgmt interface  
Are you sure you want to continue? (y/n)

You must now reboot for the settings to take effect.

> **config lag disable**

Disabling LAG will map all existing interfaces to port 1.  
Are you sure you want to continue? (y/n)

You must now reboot for the settings to take effect.

**Related Commands** **show lag summary**

# config ldap

To configure lightweight directory access protocol (LDAP) server settings, use the **config ldap** command.

**config ldap {add | delete | disable | enable | retransmit-timeout} index**

## Syntax Description

<b>add</b>	Specifies that an LDAP server is being added.
<b>delete</b>	Specifies that an LDAP server is being deleted.
<b>enable</b>	Specifies that an LDAP server is enabled.
<b>disable</b>	Specifies that an LDAP server is disabled.
<b>retransmit-timeout</b>	Changes the default retransmit timeout for an LDAP server.
<b>index</b>	LDAP server index. Valid values are from 1 to 17.

## Defaults

This command has no defaults.

## Command History

Release	Modification
4.1	This command was introduced.

## Examples

> config ldap enable 10

## Related Commands

# config ldap add

This command is used configure a lightweight directory access protocol (LDAP) server.

**config ldap add** *index server\_ip\_address port user\_base user\_attr user\_type*

## Syntax Description

<i>index</i>	Specifies the LDAP server index.
<i>server_ip_address</i>	Specifies the IP address of the LDAP server.
<i>port</i>	Specifies the port.
<i>user_base</i>	Specifies the distinguished name for the subtree that contains all of the users.
<i>user_attr</i>	Specifies the attribute that contains the users name.
<i>user_type</i>	Specifies the objectType that identifies the user.

## Defaults

This command has no defaults..

## Command History

Release	Modification
4.1	This command was introduced.

## Examples

```
> config ldap add 10 10.31.15.45 2 base_name attr_name type_name
```

## Related Commands

# config ldap simple-bind

To configure the local authentication bind method for the LDAP server, use the **config ldap simple-bind** command.

```
config ldap simple-bind {anonymous index | authenticated index username username password password}
```

<b>Syntax Description</b>	
<b>anonymous</b>	Allows anonymous access to the LDAP server
<b>index</b>	Specifies the LDAP server index.
<b>authenticated</b>	Requires that a username and password be entered to secure access to the LDAP server.
<b>username</b> <i>username</i>	Username for authenticated bind method.
<b>password</b> <i>password</i>	Password for authenticated bind method.

**Defaults** The default bind method is **anonymous**.

**Examples** > **config ldap simple-bind anonymous**

# config load-balancing

To change the state of the load-balancing feature, use the **config load-balancing** command.

```
config load-balancing {status {enable | disable} | window clients}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>load-balancing</b>	Configures aggressive load-balancing.
<b>status {enable   disable}</b>	Enable or disable the aggressive load balancing status.
<b>window clients</b>	Set the aggressive load balancing client window with the number of clients from 0 to 20.

Defaults	Enabled
----------	---------

Examples	> config load-balancing enable
----------	--------------------------------

Related Commands	show load-balancing
------------------	---------------------

# config local-auth active-timeout

To specify the amount of time in which the controller attempts to authenticate wireless clients using local EAP after any pair of configured RADIUS servers fails, enter this command:

**config local-auth active-timeout *timeout***

Syntax Description	<b>config</b> Configure parameters. <b>local-auth</b> Configures local authentication. <b>active-timeout</b> The amount of time in which the controller attempts to authenticate wireless clients using local EAP <b><i>timeout</i></b> The timeout measured in seconds. Valid range is 1 to 3600.
--------------------	---

**Defaults**      This command has a default of 100 seconds.

**Examples**      > **config local-auth active-timeout 500**

**Related Commands**      **config local-auth eap-profile**  
**show local-auth config**

# config local-auth eap-profile

This command is used to configure local EAP authentication profiles.

```
config local-auth eap-profile {[add | delete] profile_name |
    cert-issuer {cisco | vendor} |
    method [add | delete] method profile_name |
    method method local-cert {enable | disable} profile_name |
    method method client-cert {enable | disable} profile_name |
    method method peer-verify ca-issuer {enable | disable} |
    method method peer-verify cn-verify {enable | disable} |
    method method peer-verify date-valid {enable | disable}}
```

Syntax Description	
<b>config</b>	Configures parameters.
<b>local-auth</b>	Configures local authentication.
<b>eap-profile</b>	Configures a local EAP profile.
<b>add</b>	Specifies that an EAP profile or method is being added.
<b>delete</b>	Specifies that an EAP profile or method is being deleted.
<b>cert-issuer</b>	(For use with EAP-TLS, PEAP, or EAP-FAST with certificates) Specifies the issuer of the certificates that will be sent to the client. The supported certificate issuers are Cisco or a third-party vendor.
<b>method</b>	Configures an EAP profile method.
<i>method</i>	Specifies the EAP profile method name. The supported methods are leap, fast, tls, and peap.
<i>profile_name</i>	Specifies the EAP profile name (up to 63 alphanumeric characters). Do not include spaces within a profile name.
<b>local-cert</b>	(For use with EAP-FAST) Specifies whether the device certificate on the controller is required for authentication.
<b>client-cert</b>	(For use with EAP-FAST) Specifies whether wireless clients are required to send their device certificates to the controller in order to authenticate.
<b>peer-verify</b>	Configures the peer certificate verification options.
<b>ca-issuer</b>	(For use with EAP-TLS or EAP-FAST with certificates) Specifies whether the incoming certificate from the client is to be validated against the Certificate Authority (CA) certificates on the controller.
<b>cn-verify</b>	(For use with EAP-TLS or EAP-FAST with certificates) Specifies whether the common name (CN) in the incoming certificate is to be validated against the CA certificates' CN on the controller.
<b>date-valid</b>	(For use with EAP-TLS or EAP-FAST with certificates) Specifies whether the controller is to verify that the incoming device certificate is still valid and has not expired.
<b>enable</b>	Specifies that the parameter is enabled.
<b>disable</b>	Specifies that the parameter is disabled.

---

## Defaults

This command has no defaults.

Command History	Release	Modification
	4.1	This command was introduced.

<b>Examples</b>	To create a local EAP profile named “FAST01,” enter this command: <pre>&gt; config local-auth eap-profile add FAST01</pre> To add the EAP-FAST method to a local EAP profile, enter this command: <pre>&gt; config local-auth eap-profile method add fast FAST01</pre> To specify Cisco as the issuer of the certificates that will be sent to the client for an EAP-FAST profile, enter this command: <pre>&gt; config local-auth eap-profile method fast cert-issuer cisco</pre> To specify that the incoming certificate from the client be validated against the CA certificates on the controller, enter this command: <pre>&gt; config local-auth eap-profile method fast peer-verify ca-issuer enable</pre>
<b>Related Commands</b>	<p><b>config local-auth method fast</b></p> <p><b>show local-auth config</b></p>

# config local-auth method fast

This command is used to configure an EAP-FAST profile.

```
config local-auth method fast {anon-prov [enable | disable] |  
    authority-id auth_id  
    pac-ttl days |  
    server-key key_value}
```

<b>Syntax Description</b>	<b>anon-prov</b> (Optional) Configures the controller to allow anonymous provisioning, which allows PACs to be sent automatically to clients that do not have one during PAC provisioning.
	<b>authority-id</b> (Optional) Configures the authority identifier of the local EAP-FAST server.
	<i>auth_id</i> Specifies the authority identifier of the local EAP-FAST server (2 to 32 hexadecimal digits).
	<b>pac-ttl</b> (Optional) Configures the number of days for the Protected Access Credentials (PAC) to remain viable [also known as the time-to-live (TTL) value].
	<i>days</i> Specifies the time-to-live value (TTL) value (1 to 1000 days).
	<b>server-key</b> (Optional) Configures the server key to encrypt or decrypt PACs.
	<i>key</i> Specifies the encryption key value (2 to 32 hexadecimal digits).
	<b>enable</b> (Optional) Specifies that the parameter is enabled.
	<b>disable</b> (Optional) Specifies that the parameter is disabled.

**Defaults**      This command has no defaults.

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	4.1	This command was released.

**Examples**

```
> config local-auth method fast anon-prov disable  
> config local-auth method fast authority-id 0125631177  
> config local-auth method fast pac-ttl 10  
> config local-auth method fast server-key 210967Fa7D4A11AA
```

**Related Commands**

- **config local-auth eap-profile**
- **show local-auth config**

# config local-auth user-credentials

To configure the local EAP authentication database search order for user credentials, use the **config local-auth user credentials** command.

**config local-auth user-credentials { local [ldap] | ldap [local]}**

**Note**

The order of the specified database parameters indicate the database search order.

---

**Syntax Description**

<b>local</b>	(Optional) Specifies that the local database is searched for the user credentials.
<b>ldap</b>	(Optional) Specifies that the LDAP database is searched for the user credentials.

---

---

**Defaults**

This command has no defaults.

---

**Command History**

<b>Release</b>	<b>Modification</b>
4.1	This command was introduced.

---

---

**Examples**

> config local-auth user-credentials local ldap

---

**Related Commands**

show local-auth config

# config location

This command is used to configure a location-based system.

```
config location {802.11b monitor {enable | disable} Cisco_AP |
    algorithm {simple | rssi-average} |
    rssi-half-life [client | calibrating-client | tags | rogue-aps] seconds |
    expiry [client | calibrating-client | tags | rogue-aps] seconds }
```

<b>Syntax Description</b>	<b>802.11b monitor</b>	Configures Location Optimized Monitor Mode (LOMM).
	<b>enable   disable</b>	Enable or disable an option.
	<i>Cisco_AP</i>	The name of the Cisco access point.
	<b>algorithm</b>	Configures the algorithm used to average RSSI and SNR values.
	<b>simple</b>	Specifies a faster algorithm that requires low CPU overhead but provides less accuracy.
	<b>rssi-average</b>	Specifies a more accurate algorithm but requires more CPU overhead.
	<b>rssi-half-life</b>	Configures the half life when averaging two RSSI readings.
	<b>expiry</b>	Configures the timeout for RSSI values.
	<b>client</b>	Specifies the parameter applies to client devices.
	<b>calibrating-client</b>	Specifies the parameter is used for calibrating client devices.
	<b>tags</b>	Specifies the parameter applies to radio frequency identification (RFID) tags.
	<b>rogue-aps</b>	Specifies the parameter applies to rogue access points.
	<b>seconds</b>	Specifies a time value (0, 1, 2, 5, 10, 20, 30, 60, 90, 120, 180, 300 seconds).

<b>Defaults</b>	This command has no defaults.
-----------------	-------------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	4.1	This command was introduced.

# config location add

To create a new Cisco lightweight access point location, use the **config location add** command.

**config location add** *location* [*description*]

Syntax Description	
<b>config</b>	Configure parameters.
<b>location</b>	Cisco lightweight access point location.
<b>add</b>	Add a location.
<i>location</i>	Location name.
[ <i>description</i> ]	(Optional) Location description.

Defaults	None.
----------	-------

Examples	> config location add warehouse
----------	---------------------------------

Related Commands	show location config location enable config location disable config location delete config location description config interlace-mapping
------------------	---

# config location delete

To delete an existing Cisco lightweight access point location, use the **config location delete** command.

**config location delete** *location*

---

## Syntax Description

<b>config</b>	Configure parameters.
<b>location</b>	Cisco lightweight access point location.
<b>delete</b>	Delete a location.
<i>location</i>	Location name.

---

## Defaults

None.

---

## Examples

> **config location delete warehouse**

---

# config location interface-mapping

To add or delete a new Cisco lightweight access point location/wireless LAN/interface mapping, use the **config location interface-mapping** command.

```
config location interface-mapping {add location_name wlan_id interface_name |  
delete location_name wlan_id}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>location</b>	Cisco lightweight access point location.
<b>interface-mapping</b>	Add or delete location/wireless LAN/interface mapping.
<b>{add   delete}</b>	Add or delete a new location/wireless LAN/interface mapping.
<i>location_name</i>	Location name.
<i>wlan_id</i>	Wireless LAN Identifier between 1 and 16.
<i>interface_name</i>	Interface's name.

**Defaults** None.

**Examples** > config location interface-mapping add warehouse 13

**Related Commands** show location  
config location add  
config location delete

config location

# config logging buffered

To set the severity level for logging messages to the controller buffer, use the **config logging buffered** command.

**config logging buffered** *security\_level*

## Syntax Description

<b>config</b>	Configure parameters.
<b>logging</b>	Syslog facility logging.
<b>buffered</b>	Controller buffer.
<i>security_level</i>	One of the following: <ul style="list-style-type: none"> <li>• emergencies—Severity level 0</li> <li>• alerts—Severity level 1</li> <li>• critical—Severity level 2</li> <li>• errors—Severity level 3</li> <li>• warnings—Severity level 4</li> <li>• notifications—Severity level 5</li> <li>• informational—Severity level 6</li> <li>• debugging—Severity level 7</li> </ul>

## Defaults

None.

## Examples

> **config logging buffered 4**

## Related Commands

**config logging syslog facility**  
**config logging syslog level**  
**show logging**

# config logging console

To set the severity level for logging messages to the controller console, use the **config logging console** command.

**config logging console** *security\_level*

Syntax Description	
<b>config</b>	Configure parameters.
<b>logging</b>	Syslog facility logging.
<b>console</b>	Controller console.
<i>security_level</i>	One of the following: <ul style="list-style-type: none"><li>• emergencies—Severity level 0</li><li>• alerts—Severity level 1</li><li>• critical—Severity level 2</li><li>• errors—Severity level 3</li><li>• warnings—Severity level 4</li><li>• notifications—Severity level 5</li><li>• informational—Severity level 6</li><li>• debugging—Severity level 7</li></ul>
Defaults	None.
Examples	> <b>config logging console 3</b>
Related Commands	<b>config logging syslog facility</b> <b>config logging syslog level</b> <b>show logging</b>

# config logging debug

To save debug messages to the controller buffer, the controller console, or a syslog server, use the **config logging debug** command.

```
config logging debug {buffered | console | syslog} {enable | disable}
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>logging</b>	Syslog facility logging.
<b>debug</b>	Set debug message logging parameters.
<b>buffered</b>	Save debug messages to the controller buffer.
<b>console</b>	Save debug messages to the controller console.
<b>syslog</b>	Save debug messages to the syslog server.
<b>{enable   disable}</b>	<ul style="list-style-type: none"> <li>• Enter <b>enable</b> to enable logging of debug messages.</li> <li>• Enter <b>disable</b> to disable logging of debug messages.</li> </ul>

## Command Default

The **console** command is enabled,  
The **buffered** and **syslog** commands are disabled.

## Examples

```
>config logging debug console enable
```

## Related Commands

**show logging**

## config logging fileinfo

To cause the controller to include information about the source file in the message logs or to prevent the controller from displaying this information, use the **config logging fileinfo** command.

**config logging fileinfo {enable | disable}**

Syntax Description	
<b>config</b>	Configure parameters.
<b>logging</b>	Syslog facility logging.
<b>fileinfo</b>	Information about the source file
<b>{enable   disable}</b>	<ul style="list-style-type: none"><li>Enter <b>enable</b> to include information about the source file in the message logs.</li><li>Enter <b>disable</b> to prevent the controller from displaying information about the source file in the message logs.</li></ul>

**Defaults** None.

**Examples** > **config logging fileinfo enable**

**Related Commands** **show logging**

# config logging procinfo

To cause the controller to include process information in the message logs or to prevent the controller from displaying this information, use the **config logging procinfo** command.

```
config logging procinfo {enable | disable}
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>logging</b>	Syslog facility logging.
<b>procinfo</b>	Process information.
<b>{enable   disable}</b>	<ul style="list-style-type: none"><li>Enter <b>enable</b> to include process information in the message logs.</li><li>Enter <b>disable</b> to prevent the controller from displaying process information in the message logs.</li></ul>

## Defaults

None.

## Examples

```
> config logging procinfo enable
```

## Related Commands

**show logging**

## config logging traceinfo

To cause the controller to include traceback information in the message logs or to prevent the controller from displaying this information, use the **config logging traceinfo** command.

**config logging traceinfo {enable | disable}**

Syntax Description	
<b>config</b>	Configure parameters.
<b>logging</b>	Syslog facility logging.
<b>traceinfo</b>	Traceback information.
<b>{enable   disable}</b>	<ul style="list-style-type: none"><li>Enter <b>enable</b> to include traceback information in the message logs.</li><li>Enter <b>disable</b> to prevent the controller from displaying traceback information in the message logs.</li></ul>
Defaults	None.
Examples	> <b>config logging traceinfo disable</b>
Related Commands	<b>show logging</b>

# config logging syslog host

To configure a remote host for sending syslog messages, use the **config logging syslog host** command.

**config logging syslog host {host\_IP\_address}**

**Note** To remove a remote host that was configured for sending syslog messages, enter this command:  
**config logging syslog host host\_IP\_address delete**.

<b>Syntax Description</b>	<b>config</b> Configure parameters. <b>logging</b> Syslog facility logging. <b>syslog</b> System logs. <b>host</b> Remote host. <b>IP_address</b> IP address for the remote host.
---------------------------	---

<b>Defaults</b>	None.
-----------------	-------

<b>Examples</b>	> config logging syslog host 10.92.125.51
-----------------	---

<b>Related Commands</b>	<a href="#">config logging syslog facility</a> <a href="#">config logging syslog level</a> <a href="#">show logging</a>
-------------------------	---

# config logging syslog facility

To set the facility for outgoing syslog messages to the remote host, use the **config logging syslog facility** command.

**config logging syslog facility {facility\_code}**

Syntax Description	
<b>config</b>	Configure parameters.
<b>logging</b>	Syslog facility logging.
<b>syslog</b>	System logs.
<b>facility</b>	Syslog facility
<i>facility_code</i>	One of the following: <ul style="list-style-type: none"><li>• authorization—Authorization system. Facility level—4.</li><li>• auth-private—Authorization system (private). Facility level—10.</li><li>• cron—Cron/at facility. Facility level—9.</li><li>• daemon—System daemons. Facility level—3.</li><li>• ftp—FTP daemon. Facility level—11.</li><li>• kern—Kernel. Facility level—0.</li><li>• local0—Local use. Facility level—16.</li><li>• local1—Local use. Facility level—17.</li><li>• local2—Local use. Facility level—18.</li><li>• local3—Local use. # config logging syslog level

To set the severity level for filtering syslog messages to the remote host, use the **config logging syslog level** command.

**config logging syslog level {severity\_level}**

Syntax Description	
<b>config</b>	Configure parameters.
<b>logging</b>	Syslog facility logging.
<b>syslog</b>	System logs.
<b>level</b>	Syslog message severity level
<i>severity_level</i>	One of the following: <ul style="list-style-type: none"><li>• emergencies—Severity level 0</li><li>• alerts—Severity level 1</li><li>• critical—Severity level 2</li><li>• errors—Severity level 3</li><li>• warnings—Severity level 4</li><li>• notifications—Severity level 5</li><li>• informational—Severity level 6</li><li>• debugging—Severity level 7</li></ul>
Defaults	None.
Examples	None.
Related Commands	<b>config logging syslog host</b> <b>config logging syslog facility</b> <b>show logging</b>

# config loginsession close

To close all active telnet session(s), use the **config loginsession close** command.

```
config loginsession close {session_id | all}
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>loginsession close</b>	Close specified telnet sessions.
{ <i>session_id</i>   <b>all</b> }	Enter the ID of the session to close. Enter <b>all</b> to close all telnet sessions.

## Defaults

None.

## Examples

```
> config loginsession close all
```

# Configure Macfilter Commands

Use the **config macfilter** commands to configure macfilter settings.

## config macfilter add

To create a MAC filter entry on the Cisco Wireless LAN controller, use the **config mac filter add** command. Use this command to add a client locally to a wireless LAN on the Cisco Wireless LAN controller. This filter bypasses the RADIUS authentication process.

**config macfilter add** *MAC\_address wlan\_id [interface\_name] [description] [IP address]*

<b>Syntax Description</b>	
<i>MAC_address</i>	Client MAC address.
<i>wlan_id</i>	Wireless LAN Identifier to associate with. A zero value associates the entry with any wireless LAN.
<i>interface_name</i>	Interface's name. Enter <b>0</b> to specify no interface.
<i>description</i>	(Optional) Short description of the interface (up to 32 characters), in double quotes. <b>Note</b> Description is mandatory if IP address is specified.
<i>IP address</i>	(Optional) Specifies the IP address of the local MAC filter database.

**Defaults** None.

**Examples** > **config macfilter add 00:E0:77:31:A3:55 1 lab02 "labconnect" 10.92.125.51**

**Related Commands** [show macfilter](#)  
[config macfilter ip-address](#)

# config macfilter delete

Use to remove a local client from the Cisco Wireless LAN controller, use the **config macfilter delete** command.

**config macfilter delete *MAC***

## Syntax Description

<b>config</b>	Configure parameters.
<b>macfilter</b>	Local MAC address filter.
<b>delete</b>	Delete a client.
<i>MAC</i>	Client MAC address.

## Defaults

None.

## Examples

```
> config macfilter delete 11:11:11:11:11:11
```

```
Deleted user 111111111111
```

## Related Commands

[show macfilter](#)

# config macfilter description

Use to add a description to a MAC filter, use the **config macfilter description** command.

**config macfilter description *MAC* [*description*]**

Syntax Description	
<b>config</b>	Configure parameters.
<b>macfilter</b>	Local MAC address filter.
<b>description</b>	Sets the description for a mac filter.
<i>MAC</i>	Client MAC address.
[ <i>description</i> ]	Optional description within double quotes (up to 32 characters).

**Defaults** None.

**Examples** > **config macfilter description 11:11:11:11:11:11 "MAC Filter 01"**

**Related Commands** [show macfilter](#)

# config macfilter interface

Use to create a MAC filter client interface, use the **config macfilter interface** command.

**config macfilter interface *MAC interface***

Syntax Description	
<b>config</b>	Configure parameters.
<b>macfilter</b>	Local MAC address filter.
<b>interface</b>	Create interface.
<i>MAC</i>	Client MAC address.
<i>interface</i>	Interface's name. A value of zero is equivalent to no name.

**Defaults** None.

**Examples** > **config macfilter interface 11:11:11:11:11:11 Lab01**

**Related Commands** [show macfilter](#)

## config macfilter ip-address

To assign an IP address to an existing MAC filter entry, if one was not assigned using the **config macfilter add** command, use the following command:

**config macfilter ip-address *MAC\_address IP address***

Syntax Description	
<i>MAC_address</i>	Client MAC address.
<i>IP address</i>	Specifies the IP address for a specific MAC address in the local MAC filter database.

**Defaults** None.

**Examples** config macfilter ip-address 00:E0:77:31:A3:55 10.92.125.51

**Related Commands** [show macfilter](#)  
[config macfilter add](#)

# config macfilter mac-delimiter

To set the MAC delimiter (colon, hyphen, none, and single-hyphen) for MAC addresses sent to RADIUS servers, use the **config macfilter mac-delimiter** command.

```
config macfilter mac-delimiter {none | colon | hyphen | single-hyphen}
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>macfilter</b>	Local MAC address filter.
<b>mac-delimiter</b>	Configure MAC address format for RADIUS servers.
{none   colon   hyphen   single-hyphen}	<ul style="list-style-type: none"> <li>• Enter <b>none</b> to disable delimiters (for example, xxxxxxxxxx).</li> <li>• Enter <b>colon</b> to set the delimiter to colon (for example, xx:xx:xx:xx:xx:xx).</li> <li>• Enter <b>hyphen</b> to set the delimiter to hyphen (for example, xx-xx-xx-xx-xx-xx).</li> <li>• Enter <b>single-hyphen</b> to set the delimiter to a single hyphen (for example, xxxx-xxxx-xxxx).</li> </ul>

## Defaults

None.

## Examples

To have OS send MAC address to RADIUS servers in the form aa:bb:cc:dd:ee:ff:

```
> config macfilter mac-delimiter colon
```

To have OS send MAC address to RADIUS servers in the form aa-bb-cc-dd-ee-ff:

```
> config macfilter mac-delimiter hyphen
```

To have OS send MAC address to RADIUS servers in the form aabbcccddeeff:

```
> config macfilter mac-delimiter none
```

## Related Commands

[show macfilter](#)

# config macfilter radius-compat

Use to configure the Cisco Wireless LAN controller for compatibility with selected RADIUS servers.

**config macfilter radius-compat {cisco | free | other}**

---

## Syntax Description

<b>config</b>	Configure parameters.
<b>macfilter</b>	Local MAC address filter.
<b>radius-compat</b>	Compatibility with selected RADIUS server.
{ <b>cisco</b>   <b>free</b>   <b>other</b> }	<ul style="list-style-type: none"><li>• Enter <b>cisco</b> to configure Cisco ACS Compatibility mode (password is the MAC address of the server).</li><li>• Enter <b>free</b> to configure Free RADIUS Server Compatibility mode (password is secret).</li><li>• Enter <b>other</b> to configure for other server behaviors (no password necessary).</li></ul>

---

---

## Defaults

Other.

---

## Examples

> **config macfilter radius-compat other**

---

## Related Commands

[show macfilter](#)

## config macfilter wlan-id

To modify a wireless LAN ID for a MAC filter, use the **config macfilter wlan-id** command.

**config macfilter wlan-id *MAC wlan\_id***

Syntax Description	
<b>config</b>	Configure parameters.
<b>macfilter</b>	Local MAC address filter
<b>wlan-id</b>	Modify client wireless LAN ID.
<i>MAC</i>	Client MAC address
<i>wlan_id</i>	Wireless LAN Identifier to associate with. A value of zero is not allowed.

Defaults	None.
----------	-------

Examples	> config macfilter wlanid 11:11:11:11:11:11 2
----------	---

Related Commands	<a href="#">show macfilter</a> <a href="#">show wlan</a>
------------------	---

## Configure Management-User Commands

Use the **config mgmtuser** commands to configure mgmtuser settings.

## config mgmtuser add

To add a local management user to the Cisco Wireless LAN controller, use the **config mgmtuser add** command.

**config mgmtuser add** *username* *password* {**read-write** | **read-only**} [*description*]

Syntax Description	
<b>config</b>	Configure parameters.
<b>mgmtuser</b>	Management user account.
<b>add</b>	Add a management user account.
<i>username</i>	Account username. Up to 24 alphanumeric characters.
<i>password</i>	Account password. Up to 24 alphanumeric characters.
<b>lobby-admin</b>	Adds a management user of type lobby ambassador who can create guest accounts.
{ <b>read-write</b>   <b>read-only</b> }	<ul style="list-style-type: none"><li>Enter <b>read-write</b> to create a management user with read-write access.</li><li>Enter <b>read-only</b> to create a management user with read-only access.</li></ul>
[ <i>description</i> ]	Optional description of the account. Up to 32 alphanumeric characters within double quotes.

**Defaults** None.

**Examples** > **config mgmtuser add admin admin read-write "Main account"**

**Related Commands** **show mgmtuser**

# config mgmtuser delete

To delete a management user from the Cisco Wireless LAN controller, use the **config mgmtuser delete** command.

**config mgmtuser delete *username***

## Syntax Description

<b>config</b>	Configure parameters.
<b>mgmtuser</b>	Management user account.
<b>delete</b>	Delete a management user account.
<i>username</i>	Account username up to 24 alphanumeric characters.

## Defaults

None.

## Examples

```
> config mgmtuser delete admin
```

```
Deleted user admin
```

## Related Commands

**show mgmtuser**

# config mgmtuser description

To add a description to an existing management user login to the Cisco Wireless LAN controller, use the **config mgmtuser description** command.

**config mgmtuser description** *username* *description*

Syntax Description	
<b>config</b>	Configure parameters.
<b>mgmtuser</b>	Management user account.
<b>description</b>	Add a description of the management user account.
<i>username</i>	Account username. Up to 24 alphanumeric characters.
<i>description</i>	Description of the account. Up to 32 alphanumeric characters within double quotes.

**Defaults** None.

**Examples** > config mgmtuser description admin "master-user"

**Related Commands**

- config mgmtuser add
- config mgmtuser delete
- config mgmtuser password
- show mgmtuser

# config mgmtuser password

To change a management user password, use the **config mgmtuser password** command.

**config mgmtuser password *username* *password***

Syntax Description	
<b>config</b>	Configure parameters.
<b>mgmtuser</b>	Management user account
<b>password</b>	Add a management user account
<i>username</i>	Account username. Up to 24 alphanumeric characters.
<i>password</i>	Account password. Up to 24 alphanumeric characters.

**Defaults** None.

**Examples** > **config mgmtuser password admin 5rTfm**

**Related Commands** **show mgmtuser**

## Configure Mobility Commands

Use the **config mobility** commands to configure mobility settings.

# config mobility group anchor

To configure the mobility wireless LAN anchor list, use the **config mobility group anchor** command.

```
config mobility group anchor {add | delete} wlan_id IP_address
config mobility group anchor {add | delete} guest_lan_id IP_address
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>mobility group</b>	Mobility group member.
<b>{add   delete}</b>	<ul style="list-style-type: none"> <li>Enter <b>add</b> to add or change a mobility anchor to a wireless LAN.</li> <li>Enter <b>delete</b> to delete a mobility anchor from a wireless LAN.</li> </ul>
<i>wlan_id</i>	Wireless LAN identifier between 1 and 16.
<i>guest_lan_id</i>	Guest LAN identifier between 1 and 5 (inclusive).
<i>IP_address</i>	Member switch IP address to anchor wireless LAN.

---

**Defaults** None.

---

**Examples**

```
> config mobility group anchor add 2 192.12.1.5
> config mobility group anchor delete 5 193.13.1.5
```

---

**Related Commands**

<b>config mobility group domain</b>
<b>config mobility group member</b>

# config mobility group anchor add {wlan | guest-lan}

To create a new mobility anchor for the WLAN or wired guest LAN, use the **config mobility group anchor add {wlan | guest-lan}** command.

```
config mobility group anchor add {wlan | guest-lan} {wlan_id | guest_lan_id}
    anchor_controller_ip_address
```

**Note** You can also use the **config {wlan | guest-lan} mobility anchor add {wlan\_id | guest\_lan\_id} anchor\_controller\_ip\_address** command.

**Note** The *wlan\_id* or *guest\_lan\_id* must exist and be disabled, and the *anchor\_controller\_ip\_address* must be a member of the default mobility group.

**Note** Auto-anchor mobility is enabled for the WLAN or wired guest LAN when you configure the first mobility anchor.

## Syntax Description

<b>config</b>	Configure parameters.
<b>mobility group</b>	Mobility group member.
<b>wlan</b>	Wireless LAN parameters.
<b>guest-lan</b>	Indicates the active wired guest LAN.
<b>add</b>	Add a wireless LAN or a wired guest LAN.
<i>wlan_id</i>	Enter a wireless LAN identifier between 1 and 16.
<i>guest_lan_id</i>	Guest LAN identifier between 1 and 5 (inclusive).
<i>anchor_controller_ip_address</i>	IP address of the anchor controller.

## Defaults

None.

## Examples

```
> config mobility group anchor add {wlan|guest-lan} 5 255.255.255.0
```

## Related Commands

**config {wlan | guest-lan} mobility anchor add**  
**config mobility group keepalive count**  
**config mobility group keepalive interval**  
**config mobility group anchor delete {wlan | guest-lan}**  
**config {wlan | guest-lan} mobility anchor delete**

## config mobility group anchor delete {wlan | guest-lan}

To delete a new mobility anchor for the WLAN or wired guest LAN, use the **config mobility group anchor delete {wlan | guest-lan}** command.

```
config mobility group anchor delete {wlan | guest-lan} {wlan_id | guest_lan_id}  
anchor_controller_ip_address
```

**Note** You can also use the **config {wlan | guest-lan} mobility anchor delete {wlan\_id | guest\_lan\_id} anchor\_controller\_ip\_address** command.

**Note** The *wlan\_id* or *guest\_lan\_id* must exist and be disabled.

**Note** Deleting the last anchor disables the auto-anchor mobility feature and resumes normal mobility for new associations.

### Syntax Description

<b>config</b>	Configure parameters.
<b>mobility group</b>	Mobility group member.
<b>wlan</b>	Wireless LAN parameters.
<b>guest-lan</b>	Indicates the active wired guest LAN.
<b>delete</b>	delete a wireless LAN or a wired guest LAN.
<i>wlan_id</i>	Enter a wireless LAN identifier between 1 and 16.
<i>guest_lan_id</i>	Guest LAN identifier between 1 and 5 (inclusive).
<i>anchor_controller_ip_address</i>	IP address of the anchor controller.

### Defaults

None.

### Examples

```
> config mobility group anchor delete {wlan|guest-lan} 5 255.255.255.0
```

### Related Commands

```
config mobility group anchor add {wlan | guest-lan}  
config mobility group keepalive count  
config mobility group keepalive interval  
config mobility group anchor delete {wlan | guest-lan}  
config {wlan | guest-lan} mobility anchor delete
```

# config mobility group domain

To configure the mobility domain name, use the **config mobility group domain** command.

**config mobility group domain** *domain\_name*

Syntax Description	
<b>config</b>	Configure parameters.
<b>mobility group</b>	Mobility group member.
<b>domain</b>	Enable or disable mobility group feature.
<i>domain_name</i>	Domain name. Up to 31 characters; case sensitive.

Defaults	None.
----------	-------

Examples	> config mobility group domain lab1
----------	-------------------------------------

Related Commands	<b>show mobility summary</b> <b>config mobility group anchor</b> <b>config mobility group member</b>
------------------	--

## config mobility group keepalive count

To configure the controller to detect failed mobility group members (including anchor controllers), use the **config mobility group keepalive count** commands.

**config mobility group keepalive count** *count*—Specifies the number of times a ping request is sent to a mobility group member before the member is considered unreachable. The valid range is 3 to 20, and the default value is 3.

Syntax Description	
<b>config</b>	Configure parameters.
<b>mobility group</b>	Mobility group member.
<b>keepalive count</b>	Specifies the number of times a ping request is sent to a mobility group member before the member is considered unreachable.
<i>count</i>	The valide range is 3 to 20. The default is 3.

**Defaults** 3.

**Examples** > **config mobility group keepalive count 3**

**Related Commands** **config mobility group keepalive interval**

# config mobility group keepalive interval

To configure the controller to detect failed mobility group members (including anchor controllers), use the **config mobility group keepalive** commands.

**config mobility group keepalive interval *seconds***—Specifies the amount of time (in seconds) between each ping request sent to a mobility group member. The valid range is 1 to 30 seconds, and the default value is 10 seconds.

<b>Syntax Description</b>	<b>config</b> Configure parameters. <b>mobility group</b> Mobility group member. <b>keepalive interval</b> Specifies the amount of time (in seconds) between each ping request sent to a mobility group member. <b>interval</b> The valid range is 1 to 30 seconds. The default value is 10 seconds.
---------------------------	---

**Defaults** **config mobility group keepalive interval**—10 seconds.

**Examples** > config mobility group keepalive interval 10

**Related Commands** **config mobility group keepalive count**

# config mobility group member

To add or delete users from the mobility group member list, use the **config mobility group member** command.

```
config mobility group member {add MAC IP_address [group_name] | delete MAC}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>mobility group member</b>	Mobility group member.
{ <b>add</b>   <b>delete</b> }	<ul style="list-style-type: none"><li>Enter <b>add</b> to add or change a mobility group member to the list.</li><li>Enter <b>delete</b> to delete a mobility group member from the list.</li></ul>
<i>MAC</i>	Member switch MAC address.
<i>IP_address</i>	Member switch IP address.
<i>group_name</i>	Optional member switch group name (if different from the default group name).

Defaults	None.
----------	-------

Examples	> config mobility group member add 11:11:11:11:11:11 192.12.1.2
----------	---

Related Commands	<b>show mobility summary</b> <b>config mobility group anchor</b> <b>config mobility group domain</b>
------------------	--

# config mobility group multicast-address

You can configure the multicast group IP address for non-local groups within the mobility list. To do so, enter this command:

**config mobility group multicast-address *group\_name* *IP\_address***

## Syntax Description

<b>config</b>	Configure parameters.
<b>mobility group</b>	Mobility group
<b>multicast-address</b>	Multicast address
<i>group_name</i>	Optional member switch group name (if different from the default group name).
<i>IP_address</i>	Member switch IP address.

## Defaults

None.

## Examples

> config mobility group multicast-address test 10.10.10.1

## Related Commands

**show mobility summary**  
**config mobility group anchor**  
**config mobility group domain**

# config mobility multicast-mode

To enable or disable multicast mobility mode, enter this command:

```
config mobility multicast-mode {enable | disable} local_group_multicast_address
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>mobility</b>	Mobility multicast mode.
<b>multicast-mode</b>	
<b>{enable   disable}</b>	<ul style="list-style-type: none"><li>Enter <b>enable</b> to enable multicast mode, the controller uses multicast mode to send Mobile Announce messages to the local group</li><li>Enter <b>disable</b> to disable multicast mode, the controller uses unicast mode to send the Mobile Announce messages to the local group.</li></ul>
<i>local_group_multicast_address</i>	IP address for the local mobility group

Defaults	Disabled.
Examples	> <b>config mobility multicast-mode enable 157.168.20.0</b>
Related Commands	<b>show mobility summary</b> <b>config mobility group multicast-address <i>group_name IP_address</i></b> <b>debug mobility multicast {enable   disable}</b>

# config mobility secure-mode

To configure the secure mode for mobility messages between Cisco Wireless LAN controllers, use the **config mobility secure-mode** command.

```
config mobility secure-mode {enable | disable}
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>mobility</b>	Mobility group member.
<b>secure-mode</b>	Configure the secure mode for mobility messages.
<b>{enable   disable}</b>	Enable or disable mobility group message security.

## Defaults

None.

## Examples

```
> config mobility secure-mode enable
```

## Related Commands

**show mobility summary**

## config mobility statistics reset

To reset the mobility statistics, use the **config mobility statistics** command.

**config mobility statistics reset**

Syntax Description	
<b>config</b>	Configure parameters.
<b>mobility</b>	Mobility group.
<b>statistics reset</b>	Reset mobility group statistics.

Defaults	None.
----------	-------

Examples	> <b>config mobility statistics reset</b>
----------	---

Related Commands	<b>show mobility statistics</b>
------------------	---------------------------------

## Configure Message Log Level Commands

Use the **config msglog** commands to configure msglog level settings.

# config msglog level critical

To reset the message log so that it collects and displays only critical (highest-level) messages, use the **config msglog level critical** command.

**Note** The message log always collects and displays critical messages, regardless of the message log level setting.

**config msglog level critical**

## Syntax Description

<b>config</b>	Configure parameters.
<b>msglog level</b>	Configure msglog severity levels.
<b>critical</b>	Collect and display critical messages.

## Defaults

Config msglog level error.

## Examples

```
> config msglog level critical
> show msglog

Message Log Severity Level..... CRITICAL
(messages)
```

## Related Commands

**show msglog**

## config msglog level error

To reset the message log so that it collects and displays both critical (highest-level) and error (second-highest) messages, use the **config msglog level error** command.

**config msglog level error**

Syntax Description	
<b>config</b>	Configure parameters.
<b>msglog level</b>	Configure msglog severity levels.
<b>error</b>	Collect and display critical and non-critical error messages.
Defaults	Config msglog level error.
Examples	<pre>&gt; config msglog level error &gt; show msglog  Message Log Severity Level..... ERROR (messages)</pre>
Related Commands	<b>show msglog</b>

# config msglog level security

To reset the message log so that it collects and displays critical (highest-level), error (second-highest), and security (third-highest) messages, use the **config msglog level security** command.

**config msglog level security**

## Syntax Description

<b>config</b>	Configure parameters.
<b>msglog level</b>	Configure msglog severity levels.
<b>security</b>	Collect and display critical, non-critical, and authentication- or security-related errors.

## Defaults

Config msglog level error.

## Examples

```
> config msglog level security
> show msglog
Message Log Severity Level..... SECURITY
(messages)
```

## Related Commands

**show msglog**

## config msglog level verbose

To reset the message log so that it collects and displays all messages, use the **config msglog level verbose** command.

**config msglog level verbose**

Syntax Description	
<b>config</b>	Configure parameters.
<b>msglog level</b>	Configure msglog severity levels.
<b>verbose</b>	Collect and display all messages.

**Defaults** Config msglog level error.

**Examples** > **config msglog level verbose**

> **show msglog**

```
Message Log Severity Level..... VERBOSE  
(messages)
```

**Related Commands** **show msglog**

# config msglog level warning

To reset the message log so that it collects and displays critical (highest-level), error (second-highest), security (third-highest), and warning (fourth-highest) messages, use the **config msglog level warning** command.

## config msglog level warning

<b>Syntax Description</b>	<b>config</b> Configure parameters. <b>msglog level</b> Configure msglog severity levels. <b>warning</b> Collect and display warning messages in addition to critical, non-critical, and authentication- or security-related errors.
---------------------------	--

**Defaults** Config msglog level error.

**Examples**

```
> config msglog level warning
> show msglog
Message Log Severity Level..... WARNING
(messages)
```

**Related Commands** [show msglog](#)

# config nac acl

To configure the NAC ACL name for a Cisco Wireless LAN controller, use the **config nac acl** command.

**config nac acl {none | *acl-name*}**

**Note**

For a Cisco 2100 series wireless LAN controller, you must configure a pre-authentication ACL on the wireless LAN for the external web server. This ACL should then be set as a wireless LAN pre-authentication ACL under Web Policy. However, you do not need to configure any pre-authentication ACL for Cisco 4400 series wireless LAN controllers.

---

**Syntax Description**

<b>config</b>	Configure.
<b>nac acl</b>	Network Access Control acl.
<b>{none   <i>acl-name</i>}</b>	<ul style="list-style-type: none"><li>• Enter <b>none</b> to clear the ACL name.</li><li>• Enter <i>acl-name</i> to specify the ACL name.</li></ul>

---

**Defaults**

None.

---

**Examples**

> **config nac acl none**

---

**Related Commands**

**show nac, config nac add, config nac delete, config nac disable, config nac enable, show nac summary, show nac statistics**

# config nac add

To add a NAC server index for a Cisco Wireless LAN controller, use the **config nac add** command.

**config nac add** *index IP\_address port secret*

Syntax Description	
<b>config</b>	Configure.
<b>nac</b>	Network Access Control.
<b>add</b>	Command action.
<i>index</i>	NAC server index number.
<i>IP_address</i>	NAC server IP address.
<i>port</i>	NAC server UDP port number.
<i>secret</i>	NAC server secret.

**Defaults** None.

**Examples** > **config nac add none**

**Related Commands**

- show nac
- config nac acl
- config nac delete
- config nac disable
- config nac enable
- show nac summary
- show nac statistics

## config nac delete

To delete a NAC server for a Cisco Wireless LAN controller, use the **config nac delete** command.

**show nac delete** *index*

---

### Syntax Description

<b>config</b>	Configure.
<b>nac</b>	Network Access Control.
<b>delete</b>	Delete a NAC server.
<i>index</i>	NAC server index.

---

### Defaults

None.

---

### Examples

> **config nac delete 23**

---

### Related Commands

**show nac**  
**config nac acl**  
**config nac add**  
**config nac disable**  
**config nac enable**  
**show nac summary**  
**show nac statistics**

# config nac disable

To disable a NAC server for a Cisco Wireless LAN controller, use the **config nac disable** command.

**show nac disable** *index*

Syntax Description	
<b>config</b>	Configure.
<b>nac</b>	Network Access Control.
<b>disable</b>	Disable a NAC server.
<b><i>index</i></b>	Index number for NAC server.

**Defaults** None.

**Examples** > **config nac disable 1**

**Related Commands**

- show nac
- config nac acl**
- config nac add**
- config nac delete**
- show nac summary**
- show nac statistics**
- config nac enable**

## config nac enable

To enable a NAC server for a Cisco Wireless LAN controller, use the **config nac disable** command.

**show nac enable** *index*

---

### Syntax Description

<b>config</b>	Configure.
<b>nac</b>	Network Access Control.
<b>enable</b>	Enable a NAC server.
<i>index</i>	Index number for NAC server.

---

### Defaults

None.

---

### Examples

> **config nac disable** 1

---

### Related Commands

**show nac**  
**config nac acl**  
**config nac add**  
**config nac delete**  
**show nac summary**  
**show nac statistics**  
**config nac disable**

## Configure Net User Commands

Use the **config netuser** commands to configure netuser settings.

# config netuser add

To add a guest user to the local network, use the **config netuser add** command.

To add a permanent user to the local user database on the controller—**config netuser add *username password wlan\_id userType permanent description description***

To add a guest user on a WLAN or wired guest LAN to the local user database on the controller—**config netuser add *username password {wlan\_id | guestlan} {wlan\_id | guest\_lan\_id} userType guest lifetime seconds description description***

**Note** Local network usernames must be unique because they are stored in the same database.

---

## Syntax Description

<i>username</i>	Guest username. Up to 24 alphanumeric characters.
<i>password</i>	User password. Up to 24 alphanumeric characters.
<i>wlan_id</i>	Wireless LAN identifier assigned to the user. A zero value associates the user with any wireless LAN.
[ <i>description</i> ]	(Optional) Short description of user. Up to 32 characters enclosed in double-quotes.
<b>guest</b>	(Optional) Indicates a guest lifetime value is specified.
<i>lifetime_value</i>	Specify a lifetime value (60 to 259200 or 0) in seconds for the guest user.

**Note** A value of 0 indicates an unlimited lifetime.

---

---

## Defaults

None.

---

## Examples

This example adds a permanent user named Jane to the wireless network for 1 hour:  
**> config netuser add jane able2 1 wlan\_id 1 userType permanent**

This example adds a guest user named George to the wireless network for 1 hour:  
**> config netuser add george able1 guestlan 1 3600**

---

## Related Commands

**show netuser**

**config netuser delete**

## config netuser delete

To delete an existing user from the local network, use the **config netuser delete** command.

**config netuser delete *username***

**Note** Local network usernames must be unique because they are stored in the same database.

### Syntax Description

<b>config</b>	Configure parameters.
<b>netuser</b>	Local network user.
<b>delete</b>	Delete a user.
<i>username</i>	Network username. Up to 24 alphanumeric characters.

### Defaults

None.

### Examples

```
> config netuser delete able1
```

Deleted user able1

### Related Commands

**show netuser**

# config netuser description

To add a description to an existing net user, use the **config netuser description** command.

**config netuser description** *username description*

---

## Syntax Description

<b>config</b>	Configure parameters.
<b>netuser</b>	Local network user of up to 24 alphanumeric characters.
<b>description</b>	Add a user description.
<i>username</i>	Network username.
<i>description</i>	Optional user description. Up to 32 alphanumeric characters enclosed in double quotes.

---

---

## Defaults

None.

---

## Examples

```
> config netuser description able1 "HQ1 Contact"
```

---

## Related Commands

show netuser

# config netuser guest-role apply

To apply a QoS role to a guest user, use the **config netuser guest-role apply** command.

**config netuser guest-role apply *username role\_name***

**Note** If you do not assign a QoS role to a guest user, the Role field in the User Details shows the role as “default.” The bandwidth contracts for this user are defined in the QoS profile for the WLAN.

**Note** If you want to unassign a QoS role from a guest user, use the **config netuser guest-role apply *username default***. This user now uses the bandwidth contracts defined in the QoS profile for the WLAN.

## Syntax Description

<b>config</b>	Configure parameters.
<b>netuser</b>	Local network user.
<b>guest-role</b>	QoS role for the guest user.
<b>apply</b>	Apply a QoS role to a guest user.
<i>username</i>	User name.
<i>role name</i>	QoS guest role name.

## Defaults

None.

## Examples

```
> config netuser guest-role apply jsmith Contractor
```

## Related Commands

**config netuser guest-role create**  
**config netuser guest-role delete**

# config netuser guest-role create

To create a QoS role for a guest user, use the **config netuser guest-role create** command.

**config netuser guest-role create *role\_name***

**Note** To delete a QoS role, use the **config netuser guest-role delete** role-name.

## Syntax Description

<b>config</b>	Configure parameters.
<b>netuser</b>	Local network user.
<b>guest-role</b>	QoS role for the guest user.
<b>create</b>	Create a user.
<i>role name</i>	QoS guest role name.

## Defaults

None.

## Examples

> config netuser guest-role create guestuser1

## Related Commands

**config netuser guest-role delete**

■ **config netuser guest-role delete**

## config netuser guest-role delete

To delete a QoS role for a guest user, use the **config netuser guest-role delete** command.

**config netuser guest-role delete *role\_name***

### Syntax Description

<b>config</b>	Configure parameters.
<b>netuser</b>	Local network user.
<b>guest-role</b>	QoS role for the guest user.
<b>delete</b>	Delete a user.
<i>role name</i>	QoS guest role name.

### Defaults

None.

### Examples

```
> config netuser guest-role delete guestuser1
```

### Related Commands

**config netuser guest-role create**

# config netuser guest-role qos data-rate average-data-rate

To configure the average data rate for TCP traffic on a per user basis, use the **config netuser guest-role qos data-rate average-data-rate** command.

**config netuser guest-role qos data-rate average-data-rate *role\_name* *rate***

**Note** For the *role\_name* parameter in each of these commands, enter a name for the new QoS role. The name uniquely identifies the role of the QoS user (such as Contractor, Vendor, etc.). For the *rate* parameter, you can enter a value between 0 and 60,000 Kbps (inclusive). A value of 0 imposes no bandwidth restriction on the QoS role.

## Syntax Description

<b>config</b>	Configure parameters.
<b>netuser</b>	Local network user.
<b>guest-role</b>	QoS role for the guest user.
<b>qos</b>	Quality of service
<b>data-rate</b>	Rate in Kbps for TCP traffic.
<b>average-data-rate</b>	Average rate in Kbps for TCP traffic.
<i>role_name</i>	QoS guest role name.
<i>rate</i>	Rate for TCP traffic on a per user basis.

## Defaults

None.

## Examples

```
> config netuser guest-role qos data-rate average-data-rate guestuser1 0
```

## Related Commands

**config netuser guest-role create**  
**config netuser guest-role delete**  
**config netuser guest-role qos data-rate burst-data-rate**

■ config netuser guest-role qos data-rate average-realtime-rate

## config netuser guest-role qos data-rate average-realtime-rate

To configure the average data rate for TCP traffic on a per user basis, use the **config netuser guest-role qos data-rate average-realtime-rate** command.

**config netuser guest-role qos data-rate average-realtime-rate *role\_name rate***

**Note** For the *role\_name* parameter in each of these commands, enter a name for the new QoS role. The name uniquely identifies the role of the QoS user (such as Contractor, Vendor, etc.). For the *rate* parameter, you can enter a value between 0 and 60,000 Kbps (inclusive). A value of 0 imposes no bandwidth restriction on the QoS role.

### Syntax Description

<b>config</b>	Configure parameters.
<b>netuser</b>	Local network user.
<b>guest-role</b>	QoS role for the guest user.
<b>qos</b>	Quality of service
<b>data-rate</b>	Rate in Kbps for TCP traffic.
<b>average-realtime-rate</b>	Average real-time rate for UDP traffic.
<i>role_name</i>	QoS guest role name.
<i>rate</i>	Rate for TCP traffic on a per user basis.

### Defaults

None.

### Examples

```
> config netuser guest-role qos data-rate average-realtime-rate guestuser1 0
```

### Related Commands

**config netuser guest-role**  
**config netuser guest-role qos data-rate average-data-rate**

# config netuser guest-role qos data-rate burst-data-rate

To configure the peak data rate for TCP traffic on a per user basis, use the **config netuser guest-role qos data-rate burst-data-rate** command.

**config netuser guest-role qos data-rate burst-data-rate *role\_name* *rate***

**Note** The Burst Data Rate should be greater than or equal to the Average Data Rate. Otherwise, the QoS policy may block traffic to and from the wireless client.

**Note** For the *role\_name* parameter in each of these commands, enter a name for the new QoS role. The name uniquely identifies the role of the QoS user (such as Contractor, Vendor, etc.). For the *rate* parameter, you can enter a value between 0 and 60,000 Kbps (inclusive). A value of 0 imposes no bandwidth restriction on the QoS role.

## Syntax Description

<b>config</b>	Configure parameters.
<b>netuser</b>	Local network user.
<b>guest-role</b>	QoS role for the guest user.
<b>qos</b>	Quality of service
<b>data-rate</b>	Rate in Kbps for TCP traffic.
<b>burst-data-rate</b>	Peak rate in Kbps for TCP traffic.
<b><i>role_name</i></b>	QoS guest role name.
<b><i>rate</i></b>	Rate for TCP traffic on a per user basis.

## Defaults

None.

## Examples

```
> config netuser guest-role qos data-rate burst-data-rate guestuser1 0
```

## Related Commands

## config netuser guest-role qos data-rate burst-realtime-rate

To configure the peak real-time data rate for UDP traffic on a per user basis, use the **config netuser guest-role qos data-rate burst-realtime-rate** command.

**config netuser guest-role qos data-rate burst-realtime-rate *role\_name rate***

**Note**

The Burst Real-Time Rate should be greater than or equal to the Average Real-Time Rate. Otherwise, the QoS policy may block traffic to and from the wireless client.

**Note**

For the *role\_name* parameter in each of these commands, enter a name for the new QoS role. The name uniquely identifies the role of the QoS user (such as Contractor, Vendor, etc.). For the *rate* parameter, you can enter a value between 0 and 60,000 Kbps (inclusive). A value of 0 imposes no bandwidth restriction on the QoS role.

### Syntax Description

<b>config</b>	Configure parameters.
<b>netuser</b>	Local network user.
<b>guest-role</b>	QoS role for the guest user.
<b>qos</b>	Quality of service
<b>data-rate</b>	Rate in Kbps for TCP traffic.
<b>burst-realtime-rate</b>	Peak real-time rate for UDP traffic.
<b><i>role_name</i></b>	QoS guest role name.
<b><i>rate</i></b>	Rate for TCP traffic on a per user basis.

### Defaults

None.

### Examples

```
> config netuser guest-role qos data-rate burst-realtime-rate guestuser1 0
```

### Related Commands

**config netuser guest-role**

# config netuser maxEapUserLogin

To configure the maximum number of EAP user login attempts allowed for a network user, use the **config netuser maxEapUserLogin** command.

**config netuser maxEapUserLogin *count***

<b>Syntax Description</b>	<i>count</i>	Maximum number of login sessions for a single user. The allowed values are from 0 (unlimited) to 8.
<b>Defaults</b>	0 (unlimited)	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	4.1	This command was introduced.
<b>Examples</b>	> config netuser maxEapUserLogin 8	
<b>Related Commands</b>	show netuser	

## config netuser maxuserLogin

To configure the maximum number of login sessions allowed for a network user, use the **config netuser maxuserlogin** command.

**config netuser maxuserlogin *count* [per method]**

---

### Syntax Description

<b>config</b>	Configure parameters.
<b>netuser</b>	Local network user.
<b>maxUserLogin</b>	Configure the maximum number of login sessions allowed for a network user.
<i>count</i>	Maximum number of login sessions for a single user. The allowed values are from 0 (unlimited) to 8.

---

---

### Defaults

0 (unlimited)

---

### Examples

> config netuser maxuserlogin 8

---

### Related Commands

show netuser

# config netuser password

To change a local network user password, use the **config netuser password** command.

**config netuser password** *username password*

Syntax Description	
<b>config</b>	Configure parameters.
<b>netuser</b>	Local network user
<b>password</b>	Modify the password.
<i>username</i>	Network username. Up to 24 alphanumeric characters.
<i>password</i>	Network user password. Up to 24 alphanumeric characters.

**Defaults** None.

**Examples** > **config netuser password aire1 aire2**

**Related Commands** show netuser

## config netuser wlan-id

To configure a wireless LAN ID for a network user, use the **config netuser wlan-id** command.

```
config netuser wlan-id username wlan_id
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>netuser</b>	Local network user.
<b>wlan-id</b>	Configure a wireless LAN ID for a network user.
<i>username</i>	Network username. Up to 24 alphanumeric characters.
<i>wlan_id</i>	Wireless LAN identifier to associate with the user. A zero value associates the user with any wireless LAN.

**Defaults** None.

**Examples** > **config netuser wlan-id aire1 2**

**Related Commands** **show netuser**  
**show wlan summary**

## Configure Network Commands

Use the **config network** commands to configure network settings.

# config network 802.3-bridging

To enable or disable 802.3 bridging on a controller, use the **config network 802.3-bridging** command.

**config network 802.3-bridging {enable | disable}**

<b>Syntax Description</b>	<b>enable</b> Enable 802.3 bridging. <b>disable</b> Disable 802.3 bridging.
---------------------------	--

<b>Defaults</b>	Disabled.
-----------------	-----------

<b>Usage Guidelines</b>	Because some applications use and relay 802.3 (LLC/SNAP) frame formats, you can enable the controller to support 802.3 bridging. When enabled, all 802.3 frames are forwarded to and from the client. The original LLC/SNAP and length of the frame is preserved during the encapsulation and decapsulation of the LWAPP data frame. For short frames, the trailer is stripped before the LWAPP header is added.
-------------------------	--

To determine the status of 802.3 bridging, enter the [show netuser guest-roles](#) command.

This command is only supported on the 2006 controller.

<b>Examples</b>	> config network 802.3-bridging enable
-----------------	--

<b>Related Commands</b>	<a href="#">show netuser guest-roles</a>
-------------------------	--

## config network allow-old-bridge-aps

To configure an old bridge access point's ability to associate with a switch, use the **config network allow-old-bridge-aps** command.

```
config network allow-old-bridge-aps {enable | disable}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>network</b>	Cisco Wireless LAN controller network parameter.
<b>allow-old-bridge-aps</b>	Configure an old bridge access point's ability to associate with a switch.
<b>{enable   disable}</b>	Enable or disable switch association.

**Defaults** Enabled.

**Examples** > config network allow-old-bridge-aps enable

**Related Commands** show network summary

# config network ap-fallback

To configure Cisco lightweight access point fallback, use the **config network ap-fallback** command.

```
config network ap-fallback {enable | disable}
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>network</b>	Cisco Wireless LAN controller network parameter.
<b>ap-fallback</b>	Configure Cisco lightweight access point fallback.
<b>{enable   disable}</b>	Enable or disable Cisco lightweight access point fallback.

## Defaults

Enabled.

## Examples

```
> config network ap-fallback enable
```

## Related Commands

**show network summary**

## config network ap-priority

To enable or disable the option to prioritize lightweight access points so that after a controller failure they reauthenticate by priority rather than on a first-come-until-full basis, use the **config network ap-priority** command.

```
config network ap-priority {enable | disable}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>network</b>	Cisco Wireless LAN controller network parameter.
<b>ap-priority</b>	Configure lightweight access point priority reauthentication.
<b>{enable   disable}</b>	Enable or disable lightweight access point priority reauthentication.

Defaults	Disabled.
----------	-----------

Examples	> config network ap-priority enable
----------	-------------------------------------

Related Commands	<a href="#">config ap priority</a> <a href="#">show ap summary</a> <a href="#">show network summary</a>
------------------	---

# config network apple-talk

To configure AppleTalk bridging, use the **config network apple-talk** command.

```
config network apple-talk {enable | disable}
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>network</b>	Cisco Wireless LAN controller network parameter.
<b>apple-talk</b>	Configure AppleTalk bridging.
<b>{enable   disable}</b>	Enable or disable AppleTalk bridging.

## Defaults

None.

## Examples

```
> config network apple-talk enable
```

## Related Commands

**show network summary**

## config network arptimeout

To set the ARP entry timeout value, use the **config network arptimeout** command.

**config network arptimeout** *seconds*

---

### Syntax Description

<b>config</b>	Configure parameters.
<b>network</b>	Cisco Wireless LAN controller network parameter.
<b>arptimeout</b>	Set the ARP entry timeout value.
<b>seconds</b>	Timeout in seconds. Minimum value is 10. Default value is 300.

---

### Defaults

300

---

### Examples

> **config network arptimeout 240**

---

### Related Commands

**show network summary**

# config network bridging-shared-secret

To configure the bridging shared secret, use the **config network bridging-shared-secret** command. This command creates a secret that encrypts backhaul user data for the mesh access points that connect to the switch.

**Note**

Zero-touch configuration must be enabled for this command to work.

**config network bridging-shared-secret *shared\_secret***

**Syntax Description**

<b>config</b>	Configure parameters.
<b>network</b>	Cisco Wireless LAN controller network parameter.
<b>bridging-shared-secret</b>	Configure the bridging shared secret.
<i>shared_secret</i>	Bridging shared secret string. Up to ten bytes.

**Defaults**

Enabled.

**Examples**

```
> config network bridging-shared-secret shhh2
```

**Related Commands**

**show network summary**

# **config network broadcast**

To enable or disable broadcast packet forwarding, use the **config network broadcast** command. This command allows you to enable or disable broadcasting without enabling or disabling multicasting as well. It uses the multicast mode configured on the controller (using the **config network multicast mode** command) to operate.

**config network broadcast {enable | disable}**

Syntax Description	<b>config</b> Configure parameters. <b>network</b> Network parameters. <b>broadcast</b> Configure broadcast support. <b>{enable   disable}</b> Enable or disable broadcast packet forwarding.
Defaults	Disabled.
Examples	> <b>config network broadcast enable</b>
Related Commands	<b>show network summary</b> <b>config network multicast global</b> <b>config network multicast mode</b>

# config network fast-ssid-change

To enable or disable fast SSID (Service Set Identifier) changing for mobile stations, use the **config network fast-ssid-change** command.

```
config network fast-ssid-change {enable | disable}
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>network</b>	Cisco Wireless LAN controller network parameter.
<b>fast-ssid-change</b>	Configure fast ssid on mobile stations.
<b>{enable   disable}</b>	Enable or disable fast SSID changing for mobile stations.

## Defaults

None.

## Usage Guidelines

When you enable the Fast SSID Change feature, the controller allows clients to move between SSIDs. When the client sends a new association for a different SSID, the client entry in the controller connection table is cleared before the client is added to the new SSID.

When you disable the FastSSID Change feature, the controller enforces a delay before clients are allowed to move to a new SSID.

## Examples

```
> config network fast-ssid-change enable
```

## Related Commands

**show network summary**

# config network master-base

To enable or disable the Cisco Wireless LAN controller as an access point default master, use the **config network master-base** command. This setting is only used upon network installation and should be disabled after the initial network configuration.

**Note** Because the Master Cisco Wireless LAN controller is normally not used in a deployed network, the Master Cisco Wireless LAN controller setting is automatically disabled upon reboot or OS code upgrade.

**config network master-base {enable | disable}**

## Syntax Description

<b>config</b>	Configure parameters.
<b>network</b>	Cisco Wireless LAN controller network parameter.
<b>master-base</b>	Configure the Cisco Wireless LAN controller.
<b>{enable   disable}</b>	Enable or disable a Cisco Wireless LAN controller acting as a Cisco lightweight access point default master.

## Defaults

None.

## Examples

> **config network master-base enable**

## Related Commands

None.

# config network mgmt-via-wireless

To enable Cisco Wireless LAN controller management from an associated wireless client, use the **config network mgmt-via-wireless** command.

This feature allows wireless clients to manage only the Cisco Wireless LAN controller associated with the client AND the associated Cisco lightweight access point. That is, clients cannot manage another Cisco Wireless LAN controller with which they are not associated.

**config network mgmt-via-wireless {enable | disable}**

## Syntax Description

<b>config</b>	Configure parameters.
<b>network</b>	Cisco Wireless LAN controller network parameter.
<b>mgmt-via-wireless</b>	Configure switch management via wireless interface.
<b>{enable   disable}</b>	Enable or disable switch management via wireless interface.

## Defaults

Disabled.

## Examples

> **config network mgmt-via-wireless enable**

## Related Commands

**show network summary**

# config network multicast global

To enable or disable multicasting on the controller, use the **config network multicast global** command.

**config network multicast global {enable | disable}**

**Note** The **config network broadcast {enable | disable}** command allows you to enable or disable broadcasting without enabling or disabling multicasting as well. This command uses the multicast mode configured on the controller (using the **config network multicast mode** command) to operate.

## Syntax Description

<b>config</b>	Configure parameters.
<b>network</b>	Network parameters.
<b>multicast global</b>	Configure multicast support.
<b>{enable   disable}</b>	Enable or disable multicast global support.

## Defaults

Disabled.

## Examples

> **config network multicast global enable**

## Related Commands

**show network summary**  
**config network broadcast**  
**config network multicast mode**

# config network multicast igmp snooping

To enable or disable IGMP snooping, use the **config network multicast igmp snooping** command.

**config network multicast igmp snooping**

---

**Syntax Description**

<b>config</b>	Configure parameters.
<b>network</b>	Network parameters.
<b>multicast</b>	Configure multicast support.
<b>igmp snooping</b>	Internet Group Multicast Protocol snooping.

---

---

**Defaults**

None.

---

**Examples**

> **config network multicast igmp snooping**

---

**Related Commands**

**config network multicast igmp timeout**

# config network multicast igmp timeout

To set the IGMP timeout value, use the **config network multicast igmp timeout** command.

**config network multicast igmp timeout**

**Note**

You can enter a timeout value between 30 and 300 seconds. The controller sends three queries in one timeout value at an interval of *timeout*/3 to see if any clients exist for a particular multicast group. If the controller does not receive a response through an IGMP report from the client, the controller times out the client entry from the MGID table. When no clients are left for a particular multicast group, the controller waits for the IGMP timeout value to expire and then deletes the MGID entry from the controller. The controller always generates a general IGMP query (to destination address 224.0.0.1) and sends it on all WLANs with an MGID value of 1.

---

**Syntax Description**

<b>config</b>	Configure parameters.
<b>network</b>	Network parameters.
<b>multicast</b>	Configure multicast support.
<b>igmp</b>	Internet Group Multicast Protocol.
<b>timeout</b>	Number of seconds between 30 and 300.

---

---

**Defaults**

None.

---

**Examples**

> **config network multicast igmp timeout**

---

**Related Commands**

**config network multicast igmp snooping**

# config network multicast mode multicast

To configure the controller to use the multicast method to send broadcast or multicast packets to an access point, use the **config network multicast mode multicast** command.

**config network multicast mode multicast**

## Syntax Description

<b>config</b>	Configure parameters.
<b>network</b>	Network parameters.
<b>multicast</b>	Configure multicast support.
<b>mode multicast</b>	Sends a single copy of data to multiple receivers.

## Defaults

None.

## Examples

```
> config network multicast mode multicast
```

## Related Commands

**config network multicast global**  
**config network broadcast**  
**config network multicast mode unicast**

## config network multicast mode unicast

To configure the controller to use the unicast method to send broadcast or multicast packets to an access point, use the **config network multicast mode unicast** command.

**config network multicast mode unicast**

Syntax Description	
<b>config</b>	Configure parameters.
<b>network</b>	Network parameters.
<b>multicast</b>	Configure multicast support.
<b>mode unicast</b>	Sends multiple copies of data, one copy for each receiver.

**Defaults** None.

**Examples** > **config network multicast mode unicast**

**Related Commands** **config network multicast global**  
**config network broadcast**  
**config network multicast mode multicast**

# config network otap-mode

To enable or disable over-the-air provisioning (OTAP) of Cisco lightweight access points, use the **config network otap-mode** command.

```
config network otap-mode {enable | disable}
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>network</b>	Network parameters.
<b>otap-mode</b>	Configure OTAP provisioning.
<b>{enable   disable}</b>	Enable or disable OTAP provisioning.

## Defaults

Enabled.

## Examples

```
> config network otap-mode disable
```

## Related Commands

**show network summary**

## config network rf-network-name

To set the RF-Network name, use the **config network rf-network-name** command.

**config network rf-network-name** *name*

---

### Syntax Description

<b>config</b>	Configure parameters.
<b>network</b>	Cisco Wireless LAN controller network parameter.
<b>rf-network-name</b>	Set the RF-network name.
<i>name</i>	RF-Network name. Up to 19 characters.

---

### Defaults

None.

---

### Examples

> **config network rf-network-name travelers**

---

### Related Commands

**show network summary**

# config network secureweb

To change the state of the secure web (https = http + SSL) interface, use the **config network secureweb** command.

**config network secureweb {enable | disable}**

**Note** This command allows users to access the controller GUI using *http://ip-address*. Web mode is *not* a secure connection.

---

## Syntax Description

<b>config</b>	Configure parameters.
<b>network</b>	Network parameters.
<b>secureweb</b>	Configure the secure web interface.
<b>{enable   disable}</b>	Enable or disable the secure web interface.

---

---

## Defaults

Enabled.

---

## Examples

> **config network secureweb enable**

You must reboot for the change to take effect.

---

## Related Commands

**show network summary**  
**config network secureweb cipher-option high**

## config network secureweb cipher-option high

To enable or disable secure web mode with increased security, use the **config network secureweb cipher-option high** command.

**config network secureweb cipher-option high {enable | disable}**

**Note** This command allows users to access the controller GUI using *http://ip-address* but only from browsers that support 128-bit (or larger) ciphers.

---

### Syntax Description

<b>config</b>	Configure parameters.
<b>network</b>	Network parameters.
<b>secureweb</b>	Configure the secure web interface.
<b>{enable   disable}</b>	Enable or disable the secure web interface.

---

---

### Defaults

Disabled.

---

### Examples

> **config network secureweb cipher-option high enable**

---

### Related Commands

# config network ssh

To allow or disallow new ssh sessions, use the **config network ssh** command.

```
config network ssh {enable | disable}
```

Syntax Description	config network ssh {enable   disable}
config	Configure parameters.
network	Network parameters.
ssh	Secure Shell sessions
{enable   disable}	Allow or disallow new ssh sessions.
Defaults	Enabled.
Examples	> config network ssh enable
Related Commands	show network summary

## config network telnet

To allow or disallow new telnet sessions, use the **config network telnet** command.

```
config network telnet {enable | disable}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>network</b>	Network parameters.
<b>telnet</b>	Configure new telnet sessions.
<b>{enable   disable}</b>	Allow or disallow new telnet sessions.

**Defaults** Disabled.

**Examples** > **config network telnet enable**

**Related Commands** **show network summary**

# config network usertimeout

To change the timeout for idle client sessions, use the **config network usertimeout** command. Use this command to set the idle client session duration on the Cisco Wireless LAN controller. The minimum duration is 10 seconds.

**config network usertimeout** *seconds*

<b>Syntax Description</b>	
<b>config</b>	Configure parameters.
<b>network</b>	Network parameters.
<b>usertimeout</b>	Configure idle session timeout.
<b>seconds</b>	Timeout duration in seconds. Minimum value is 10. Default value is 300.

<b>Defaults</b>	300
-----------------	-----

<b>Examples</b>	> config network usertimeout 1200
-----------------	-----------------------------------

<b>Related Commands</b>	show network summary
-------------------------	----------------------

## config network web-auth-port

To configure an additional port to be redirected for web authentication, use the **config network web-auth-port** command.

**config network web-auth-port** *port*

Syntax Description	
<b>config</b>	Configure parameters.
<b>network</b>	Network parameters.
<b>web-auth-port</b>	Configure an additional port to be redirected for web authentication.
<i>port</i>	Port number.

**Defaults** None.

**Examples** > **config network web-auth-port 1200**

**Related Commands** **show network summary**

# config network webmode

To enable or disable the web mode, use the **config network webmode** command.

```
config network webmode {enable | disable}
```

Syntax Description	<b>config</b> Configure parameters. <b>network</b> Network parameters. <b>webmode</b> Configure web user interface access. <b>{enable   disable}</b> Enable or disable the web interface.
Defaults	Enabled.
Examples	> config network webmode disable
Related Commands	show network summary

# config network zero-config

To configure bridge access point ZeroConfig support, use the **config network zero-config** command.

```
config network zero-config {enable | disable}
```

---

## Syntax Description

<b>config</b>	Configure parameters.
<b>network</b>	Cisco Wireless LAN controller network parameter.
<b>zero-config</b>	Configure bridge access point ZeroConfig support.
<b>{enable   disable}</b>	Enable or disable bridge access point ZeroConfig support.

---

## Defaults

Enabled.

---

## Examples

```
> config network zero-config enable
```

---

## Related Commands

**show network summary**

# config nmsp notify-interval measurement

**Note**

The TCP port (16113) that the controller and location appliance communicate over must be open (not blocked) on any firewall that exists between the controller and the location appliance for Network Mobility Services Protocol (NMSP) to function.

To modify the NMSP notification interval value on the controller to address latency in the network, use the **config nmsp notify-interval measurement** command.

**config nmsp notify-interval measurement {client | rfid | rogue} interval**

---

**Syntax Description**

<b>config</b>	Configure parameters.
<b>nmsp notify-interval measurement</b>	Modify the NMSP notification interval.
<b>client</b>	Modify the interval for clients,
<b>rfid</b>	Modify the interval for active RFID tags.
<b>rogue</b>	Modify the interval for rogue access points and rogue clients.
<i>interval</i>	Between 1 and 30 seconds

---

---

**Defaults**

None

---

**Examples**

> config nmsp notify-interval measurement rfid 25

---

**Related Commands**

[show nmsp notify-interval summary](#)

## config pmk-cache delete

To delete an entry in the PMK cache from all Cisco Wireless LAN controllers in the mobility group, use the **config pmk-cache delete** command.

```
config pmk-cache delete {all | MAC}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>pmk-cache delete</b>	Delete an entry in the PMK cache.
{ <b>all</b>   <b>MAC</b> }	<ul style="list-style-type: none"><li>• Enter <b>all</b> to delete all Cisco Wireless LAN controllers.</li><li>• Enter the MAC address of the Cisco Wireless LAN controller to delete.</li></ul>

**Defaults** None.

**Examples** > **config pmk-cache delete all**

**Related Commands** show pmk-cache

## Configure Port Commands

Use the **config port** commands to configure port settings.

# config port adminmode

To configure the administration mode of a single port or all Cisco Wireless LAN controller ports, use the **config port adminmode** command.

```
config port adminmode {all | port} {enable | disable}
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>port</b>	Port parameters.
<b>adminmode</b>	Administrative mode.
<b>{all   port}</b>	<ul style="list-style-type: none"> <li>• Enter <b>all</b> to configure all ports.</li> <li>• Enter the number of the port to configure.</li> </ul>
<b>{enable   disable}</b>	Enable or disable the specified ports.

## Defaults

Enabled.

## Examples

To disable port 8:

```
> config port adminmode 8 disable
```

To enable all ports:

```
> config port adminmode all enable
```

## Related Commands

[show port](#)

## config port autoneg

To configure 10/100BASE-T Ethernet ports for physical port autonegotiation, use the **config port autoneg** command.

**Note** Port autoconfiguration must be disabled before you make physical mode manual settings using the config port physicalmode command. Also note that the config port autoneg command overrides settings made using the config port physicalmode command.

**config port autoneg {all | port} {enable | disable}**

### Syntax Description

<b>config</b>	Configure parameters.
<b>port</b>	10/100BASE-T Ethernet.
<b>autoneg</b>	Configure a port's auto negotiation mode.
<b>{all   port}</b>	<ul style="list-style-type: none"><li>• Enter <b>all</b> to configure all ports.</li><li>• Enter the number of the port to configure.</li></ul>
<b>{enable   disable}</b>	Enable or disable the specified ports.

### Defaults

All Ports = autonegotiation enabled.

### Examples

To turn on physical port autonegotiation for all front-panel Ethernet ports:

```
> config port autoneg all enable
```

To disable physical port autonegotiation for front-panel Ethernet port 19:

```
> config port autoneg 19 disable
```

### Related Commands

**show port**  
**config port physicalmode**

# config port linktrap

To change up/down trap settings for link status alert for a single port or all Cisco Wireless LAN controller ports, use the **config port linktrap** command.

**config port linktrap {all | port} {enable | disable}**

## Syntax Description

<b>config</b>	Configure parameters.
<b>port</b>	Port parameters.
<b>linktrap</b>	Link status alert.
<b>{all   port}</b>	<ul style="list-style-type: none"> <li>• Enter <b>all</b> to configure all ports.</li> <li>• Enter the number of the port to configure.</li> </ul>
<b>{enable   disable}</b>	Enable or disable the specified ports.

## Defaults

Enabled.

## Examples

To disable port 8 traps:

> **config port linktrap 8 disable**

To enable all port traps:

> **config port linktrap all enable**

## Related Commands

**show port**

# config port multicast appliance

To change the multicast appliance service for a single port or all Cisco Wireless LAN controller ports, use the **config port multicast appliance** command.

**config port multicast appliance** *port* {enable | disable}

Syntax Description	
<b>config</b>	Configure parameters.
<b>port</b>	Port parameters.
<b>multicast appliance</b>	Configure multicast appliance service for the specified port.
<i>port</i>	Number of the port to configure.
{enable   disable}	Enable or disable service for the specified port.

**Defaults** Enabled.

**Examples** To enable appliance service for port 3:

```
> config port multicast appliance 3 enable
```

**Related Commands** show port

# config port physicalmode

To set any or all front-panel 10/100BASE-T Ethernet ports for dedicated 10 Mbps or 100 Mbps, Half or Full Duplex operation, use the **config port physicalmode** command.

Note that you must disable autonegotiation using the config port autoneg command before manually configuring any port's physical mode. Also note that the config port autoneg command overrides settings made using the config port physicalmode command.

**config port physicalmode {all | port} {100h | 100f | 10h | 10f}**

## Syntax Description

<b>config</b>	Configure parameters.
<b>port</b>	Port parameters.
<b>physicalmode</b>	Port physical mode.
<b>{all   port}</b>	<ul style="list-style-type: none"> <li>• Enter <b>all</b> to configure all ports.</li> <li>• Enter the number of the port to configure.</li> </ul>
<b>{100h   100f   10h   10f}</b>	<ul style="list-style-type: none"> <li>• Enter <b>100h</b> for 100 Mbps/Half Duplex operation.</li> <li>• Enter <b>100f</b> for 100 Mbps/Full Duplex operation.</li> <li>• Enter <b>10h</b> for 10 Mbps/Half Duplex operation.</li> <li>• Enter <b>10f</b> for 10 Mbps/Full Duplex operation.</li> </ul>

## Defaults

All Ports are set to auto negotiate.

## Examples

To set all ports to 100 Mbps/Full Duplex operation:

> **config port physicalmode all 100f**

To set port 20 to 100 Mbps/Half Duplex operation:

> **config port physicalmode 20 100h**

To set port 21 to 10 Mbps/Full Duplex operation:

> **config port physicalmode 21 10f**

To set port 22 to 10 Mbps/Half Duplex operation:

> **config port physicalmode 22 10h**

## Related Commands

**config port autoneg**

**show port**

## config port power

To configure a Cisco Wireless LAN controller's port's power over ethernet, use the **config port power** command.

```
config port power {all | port} {enable | disable}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>port</b>	Port parameters.
<b>power</b>	Configure a port's power over ethernet.
{ <b>all</b>   <i>port</i> }	<ul style="list-style-type: none"><li>• Enter <b>all</b> to configure all ports.</li><li>• Enter the number of the port to configure.</li></ul>
{ <b>enable</b>   <b>disable</b> }	Enable or disable the specified ports.

**Defaults** Enabled.

**Examples** To enable all ports' power:

```
> config port power all enable
```

**Related Commands** show port

# config prompt

To change the CLI system prompt, use the **config prompt** command.

**config prompt** *prompt*

Because the system prompt is a user-defined variable, it is omitted from the rest of this documentation.

---

## Syntax Description

<b>config</b>	Configure parameters.
<b>prompt</b>	Change the CLI system prompt.
<i>prompt</i>	New CLI system prompt enclosed in double quotes. Up to 31 alphanumeric characters; case sensitive.

---

---

## Defaults

The system prompt is configured using the startup wizard.

---

## Examples

```
> config prompt "Cisco 4400"
(Cisco 4400)>
```

---

## Related Commands

None.

## config qos average-data-rate

To define the average data rate in Kbps for TCP traffic per user, use the **config qos average-data-rate** command.

**config qos average-data-rate {bronze | silver | gold | platinum} *rate***

**Note** For the *rate* parameter, you can enter a value between 0 and 60,000 Kbps (inclusive). A value of 0 imposes no bandwidth restriction on the QoS profile.

---

### Syntax Description

<b>config qos</b>	Command action.
<b>average-data-rate</b>	Rate in Kbps for TCP traffic.
<b>{bronze   silver   gold   platinum}</b>	Enter one of the four supported queue names.

---

---

### Defaults

None.

---

### Examples

> config qos average-data-rate gold 0

---

### Related Commands

**show qos description**  
**config qos burst-data-rate**  
**config qos average-realtime-rate**  
**config qos burst-realtime-rate**  
**config qos max-rf-usage**

# config qos average-realtime-rate

To define the average real-time data rate in Kbps for UDP traffic per user, use the **config qos average-realtime-rate** command.

```
config qos average-realtime-rate {bronze | silver | gold | platinum} rate
```

## Syntax Description

<b>config qos</b>	Command action.
<b>average-realtime-rate</b>	Average actual rate in Kbps for UDP traffic.
<b>{bronze   silver   gold   platinum}</b>	Enter one of the four supported queue names.

## Defaults

None.

## Examples

```
> config qos average-realtime-rate gold rate
```

## Related Commands

**show qos description**  
**config qos average-data-rate**  
**config qos burst-data-rate**  
**config qos burst-realtime-rate**  
**config qos max-rf-usage**

## config qos burst-data-rate

To define the peak data rate in Kbps for TCP traffic per user, use the **config qos burst-data-rate** command.

```
config qos burst-data-rate {bronze | silver | gold | platinum} rate
```

Syntax Description	
<b>config qos</b>	Command action.
<b>burst-data-rate</b>	Peak rate in Kbps for TCP traffic.
<b>{bronze   silver   gold   platinum}</b>	Enter one of the four supported queue names.

---

**Defaults** None.

---

**Examples** > config qos burst-data-rate gold 30000

---

**Related Commands** show qos description,  
config qos average-data-rate  
config qos average-realtime-rate  
config qos burst-realtime-rate  
config qos max-rf-usage

# config qos burst-realtime-rate

To define the average real-time data rate in Kbps for UDP traffic per user, use the **config qos burst-realtime-rate** command.

```
config qos burst-realtime-rate {bronze | silver | gold | platinum} rate
```

## Syntax Description

<b>config qos</b>	Command action.
<b>burst-realtime-rate</b>	Peak actual rate in Kbps for UDP traffic.
<b>{bronze   silver   gold   platinum}</b>	Enter one of the four supported queue names.

## Defaults

None.

## Examples

```
> config qos burst-realtime-rate gold rate
```

## Related Commands

- show qos description**
- config qos average-data-rate**
- config qos burst-data-rate**
- config qos average-realtime-rate**
- config qos max-rf-usage**

## config qos description

To change the profile description, use the **config qos description** command.

```
config qos description {bronze | silver | gold | platinum} description
```

Syntax Description	<b>config qos</b> Command action. <b>description</b> Configure QoS profile description. <b>{bronze   silver   gold   platinum}</b> Enter one of the four supported queue names.
Defaults	None.
Examples	> config qos description gold <i>description</i>
Related Commands	<b>show qos average-data-rate</b> <b>config qos burst-data-rate</b> <b>config qos average-realtime-rate</b> <b>config qos burst-realtime-rate</b> <b>config qos max-rf-usage</b>

# config qos max-rf-usage

To specify the maximum percentage of RF usage per access point, use the **config qos max-rf-usage** command.

```
config qos max-rf-usage {bronze | silver | gold | platinum} usage_percentage
```

## Syntax Description

<b>config qos</b>	Command action.
<b>max-rf-usage</b>	Maximum percentage of RF usage.
{bronze   silver   gold   platinum}	Enter one of the four supported queue names.

## Defaults

None.

## Examples

```
> config qos max-rf-usage gold 20
```

## Related Commands

- show qos description
- config qos average-data-rate
- config qos burst-data-rate
- config qos average-realtime-rate
- config qos burst-realtime-rate

**config qos protocol-type/config qos dot1p-tag**

**config qos protocol-type/config qos dot1p-tag**

To define the maximum value (0-7) for the priority tag associated with packets that fall within the profile, use the **config qos protocol-type** and **config qos dot1p-tag** commands.

```
config qos protocol-type {bronze | silver | gold | platinum} {none | dot1p}
```

```
config qos dot1p-tag {bronze | silver | gold | platinum} dot1p_tag
```

Syntax Description	<b>config qos</b>	Command action.
	<b>protocol-type</b>	Configure the QoS protocol type (bronze, silver, gold, platinum)
	<b>dot1p-tag</b>	Configure a QoS 802.1p tag.
	{ <b>bronze</b>   <b>silver</b>   <b>gold</b>   <b>platinum</b> }	Enter one of the four supported queue names.
	<b>none</b>	Enter when no specific protocol is assigned.
	<b>dot1p</b>	Specify a 802.1p tag.
	<i>dot1p_tag</i>	Specify a dot1p tag value of between 1 and 7.

---

**Defaults** None.

**Examples**

```
> config qos protocol-type silver dot1p  
> config qos dot1p-tag gold 5
```

**Related Commands** show qos queue length all

## config qos queue\_length

To specify the maximum number of packets that access points keep in their queues, use the **config qos queue\_length** command.

```
config qos queue_length {bronze | silver | gold | platinum} queue_length
```

### Syntax Description

<b>config qos</b>	Command action.
<b>queue_length</b>	Configure QoS queue length.
<b>{bronze   silver   gold   platinum}</b>	Enter one of the four supported queue names.
<i>length</i>	Enter the maximum queue length value (10 to 255).

### Defaults

None.

### Examples

```
> config qos queue_length gold 12
```

### Related Commands

**show qos [bronze | silver | gold | platinum]**

## Configure Radius Account Commands

Use the **config radius acct** commands to configure RADIUS account server settings.

## config radius acct add

To configure a RADIUS accounting server for the Cisco Wireless LAN controller, use the **config radius acct add** command.

**config radius acct add** *index ip\_address port {ascii | hex} secret*

Syntax Description	
<b>config</b>	Configure parameters.
<b>radius acct</b>	RADIUS accounting server.
<b>add</b>	Add a RADIUS server.
<i>index</i>	RADIUS server index. Cisco Wireless LAN controller begins search with 1.
<i>ip_address</i>	RADIUS server's IP address.
<i>port</i>	RADIUS server's UDP port number for the interface protocols.
<b>{ascii   hex}</b>	RADIUS server's secret type: <b>ascii</b> or <b>hex</b> .
<i>secret</i>	RADIUS server's secret.

**Defaults** When added the port number defaults to 1813 and state is enabled.

**Examples** To configure a priority 1 RADIUS server at 10.10.10.10 using port 1813 with a login password of admin:

```
> config radius acct add 1 10.10.10.10 1813 ascii admin
```

**Related Commands** **show radius acct statistics**

# config radius acct delete

To delete a RADIUS accounting server for the Cisco Wireless LAN controller, use the **config radius acct delete** command.

**config radius acct delete** *index*

## Syntax Description

<b>config</b>	Configure parameters.
<b>radius acct</b>	RADIUS accounting server.
<b>delete</b>	Delete a RADIUS server.
<i>index</i>	RADIUS server index.

## Defaults

None.

## Examples

```
> config radius acct delete 1
```

## Related Commands

**show radius acct statistics**

## config radius acct disable

To disable a RADIUS accounting server for the Cisco Wireless LAN controller, use the **config radius acct disable** command.

**config radius acct disable** *index*

Syntax Description	
<b>config</b>	Configure parameters.
<b>radius acct</b>	RADIUS accounting server.
<b>disable</b>	Disable a RADIUS server.
<i>index</i>	RADIUS server index.

**Defaults** None.

**Examples** > **config radius acct disable 1**

**Related Commands** **show radius acct statistics**

# config radius acct enable

To enable a RADIUS accounting server for the Cisco Wireless LAN controller, use the **config radius acct enable** command.

**config radius acct enable** *index*

## Syntax Description

<b>config</b>	Configure parameters.
<b>radius acct</b>	RADIUS accounting server.
<b>enable</b>	Enable a RADIUS server.
<i>index</i>	RADIUS server index.

## Defaults

None.

## Examples

```
> config radius acct enable 1
```

## Related Commands

**show radius acct statistics**

# config radius fallback-test

To configure the RADIUS server fallback behavior, use the **config radius fallback-test** command.

```
config radius fallback-test {mode {off | passive | active}} | {username username} | {interval interval}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>radius</b>	RADIUS accounting server.
<b>fallback-test</b>	Configure the RADIUS server fallback behavior.
<b>mode {off   passive   active}</b>	<ul style="list-style-type: none"> <li>• <b>Off</b> disables RADIUS server fallback.</li> <li>• <b>Passive</b> causes the controller to revert to a preferable server (with a lower server index) from the available backup servers without using extraneous probe messages. The controller simply ignores all inactive servers for a time period and retries later when a RADIUS message needs to be sent.</li> <li>• <b>Active</b> causes the controller to revert to a preferable server (with a lower server index) from the available backup servers by using RADIUS probe messages to proactively determine whether a server that has been marked inactive is back online. The controller simply ignores all inactive servers for all active RADIUS requests.</li> </ul>
<b>username</b>	Specifies the name to be sent in the inactive server probes.
<i>username</i>	You can enter up to 16 alphanumeric characters for the <i>username</i> parameter.
<b>interval</b>	Specifies the probe interval value.
<i>interval</i>	Probe interval range is 180 to 3600.

**Defaults** Default probe interval: 300.

---

## Examples

```
> config radius fallback-test mode off
> config radius fallback-test mode passive
> config radius fallback-test mode active
> config radius fallback-test username user_1
> config radius fallback-test interval 500
```

**Related Commands** **show radius acct statistics**

# config radius acct network

To configure a default RADIUS server for network users, use the **config radius acct network** command.

```
config radius acct network index {enable | disable}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>radius acct</b>	Default RADIUS accounting server.
<b>network</b>	Configure a default RADIUS server for network users.
<i>index</i>	RADIUS server index.
<b>{enable   disable}</b>	Enable or disable the server as a network user's default RADIUS Server.

Defaults	None.
----------	-------

Examples	> config radius acct network 1 enable
----------	---------------------------------------

Related Commands	show radius acct statistics

## config radius acct ipsec authentication

To configure IPSec authentication for the Cisco Wireless LAN controller, use the **config radius acct ipsec authentication** command.

```
config radius acct ipsec authentication {hmac-md5 | hmac-sha1} index
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>radius acct</b>	RADIUS accounting server.
<b>ipsec authentication</b>	Configure IPSec authentication service.
{ <b>hmac-md5  </b> <b>hmac-sha1}</b>	<ul style="list-style-type: none"><li>• Enter <b>hmac-md5</b> to enable IPSec HMAC-MD5 authentication.</li><li>• Enter <b>hmac-sha1</b> to IPSec HMAC-SHA1 authentication.</li></ul>
<i>index</i>	RADIUS server index.

**Defaults** None.

**Examples** > config radius acct ipsec authentication hmac-md5 1

**Related Commands** show radius acct statistics

# config radius acct ipsec disable

To disable IPSec support for an accounting server for the Cisco Wireless LAN controller, use the **config radius acct ipsec disable** command.

**config radius acct ipsec disable** *index*

## Syntax Description

<b>config</b>	Configure parameters.
<b>radius acct</b>	RADIUS accounting server.
<b>ipsec disable</b>	Disable IPSec support for an accounting server.
<i>index</i>	RADIUS server index.

## Defaults

None.

## Examples

```
> config radius acct ipsec disable 1
```

## Related Commands

**show radius acct statistics**

■ config radius acct ipsec enable

## config radius acct ipsec enable

To enable IPSec support for an accounting server for the Cisco Wireless LAN controller, use the **config radius acct ipsec enable** command.

**config radius acct ipsec enable** *index*

Syntax Description	
<b>config</b>	Configure parameters.
<b>radius acct</b>	RADIUS accounting server.
<b>ipsec enable</b>	Enable IPSec support for an accounting server.
<i>index</i>	RADIUS server index.

**Defaults** None.

**Examples** > **config radius acct ipsec enable 1**

**Related Commands** **show radius acct statistics**

# config radius acct ipsec encryption

To configure IPSec encryption for an accounting server for the Cisco Wireless LAN controller, use the **config radius acct ipsec encryption** command.

**config radius acct ipsec encryption {3des | aes | des} index**

## Syntax Description

<b>config</b>	Configure parameters.
<b>radius acct</b>	RADIUS accounting server.
<b>ipsec encryption</b>	Configure IPSec encryption.
<b>{3des   aes   des}</b>	<ul style="list-style-type: none"> <li>• Enter <b>3des</b> to enable IPSec 3DES Encryption.</li> <li>• Enter <b>aes</b> to enable IPSec AES Encryption.</li> <li>• Enter <b>des</b> to enable IPSec DES Encryption.</li> </ul>
<b>index</b>	Enter a RADIUS server index value of between 1 and 17.

## Defaults

None.

## Examples

> config radius acct ipsec encryption 3des 3

## Related Commands

**show radius acct statistics**  
**show radius summary**

## config radius acct ipsec ike

To configure Internet Key Exchange (IKE) for the Cisco Wireless LAN controller, use the **config radius acct ipsec** command.

```
config radius acct ipsec ike {dh-group {group-1 | group-2 | group-5} |  
    lifetime seconds | phase1 {aggressive | main}} index
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>radius acct</b>	RADIUS accounting server.
<b>ipsec ike</b>	Configure IKE.
<b>dh-group {group-1   group-2   group-5}</b>	Configure the IKE Diffie-Hellman group. <ul style="list-style-type: none"><li>• Enter <b>group-1</b> to configure DH Group 1 (768 bits).</li><li>• Enter <b>group-2</b> to configure DH Group 2 (1024 bits).</li><li>• Enter <b>group-5</b> to configure DH Group 2 (1024 bits).</li></ul>
<b>lifetime seconds</b>	Configure the IKE lifetime in seconds.
<b>phase1 {aggressive   main}</b>	Configure the IKE Phase1 mode. <ul style="list-style-type: none"><li>• Enter <b>aggressive</b> to enable the aggressive mode.</li><li>• Enter <b>main</b> to enable the main mode.</li></ul>
<i>index</i>	RADIUS server index.

---

### Defaults

None.

---

### Examples

```
> config radius acct ipsec ike lifetime 23 1
```

---

### Related Commands

**show radius acct statistics**

# config radius acct retransmit-timeout

To change the default transmission timeout for a RADIUS accounting server for the Cisco Wireless LAN controller, use the **config radius acct retransmit-timeout** command.

**config radius acct retransmit-timeout *index timeout***

## Syntax Description

<b>config</b>	Configure parameters.
<b>radius acct</b>	RADIUS accounting server.
<b>retransmit-timeout</b>	Configure retransmission timeout.
<i>index</i>	RADIUS server index.
<i>timeout</i>	Number of seconds (from 2 to 30) between retransmissions.

## Defaults

None.

## Examples

> config radius acct retransmit-timeout 5

## Related Commands

# Configure RADIUS Authentication Server Commands

Use the **config radius auth** commands to configure RADIUS authentication server settings.

## config radius auth add

To configure a RADIUS authentication server for the Cisco Wireless LAN controller, use the **config radius auth add** command.

```
config radius auth add index ip_address port {ascii | hex} secret
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>radius auth</b>	RADIUS authentication server.
<b>add</b>	Add a RADIUS server.
<i>index</i>	RADIUS server index. Cisco Wireless LAN controller begins search with 1.
<i>ip_address</i>	RADIUS server's IP address.
<i>port</i>	RADIUS server's UDP port number for the interface protocols.
{ <b>ascii</b>   <b>hex</b> }	RADIUS server's secret type: <b>ascii</b> or <b>hex</b> .
<i>secret</i>	RADIUS server's secret.

**Defaults** When added the port number defaults to 1812 and state is enabled.

**Examples** To configure a priority 1 RADIUS server at 10.10.10.10 using port 1812 with a login password of admin:

```
> config radius auth add 1 10.10.10.10 1812 ascii admin
```

**Related Commands** show radius auth statistics

# config radius auth delete

To delete a RADIUS authentication server for the Cisco Wireless LAN controller, use the **config radius auth delete** command.

**config radius auth delete** *index*

## Syntax Description

<b>config</b>	Configure parameters.
<b>radius auth</b>	RADIUS authentication server.
<b>delete</b>	Delete a RADIUS server.
<i>index</i>	RADIUS server index.

## Defaults

None.

## Examples

```
> config radius auth delete 1
```

## Related Commands

**show radius auth statistics**

## config radius auth disable

To disable a RADIUS authentication server for the Cisco Wireless LAN controller, use the **config radius auth disable** command.

**config radius auth disable** *index*

Syntax Description	
<b>config</b>	Configure parameters.
<b>radius auth</b>	RADIUS authentication server.
<b>disable</b>	Disable a RADIUS server.
<i>index</i>	RADIUS server index.

**Defaults** None.

**Examples** > **config radius auth disable 1**

**Related Commands** **show radius auth statistics**

# config radius auth enable

To enable a RADIUS authentication server for the Cisco Wireless LAN controller, use the **config radius auth enable** command.

**config radius auth enable** *index*

## Syntax Description

<b>config</b>	Configure parameters.
<b>radius auth</b>	RADIUS authentication server.
<b>enable</b>	Enable a RADIUS server.
<i>index</i>	RADIUS server index.

## Defaults

None.

## Examples

```
> config radius auth enable 1
```

## Related Commands

**show radius auth statistics**

## config radius auth ipsec authentication

To configure IPSec support for an authentication server for the Cisco Wireless LAN controller, use the **config radius auth ipsec authentication** command.

**config radius auth ipsec authentication {hmac-md5 | hmac-sha1} index**

Syntax Description	
<b>config</b>	Configure parameters.
<b>radius auth</b>	RADIUS authentication server.
<b>ipsec authentication</b>	Configure IPSec authentication service.
{ <b>hmac-md5  </b> <b>hmac-sha1}</b>	<ul style="list-style-type: none"><li>• Enter <b>hmac-md5</b> to enable IPSec HMAC-MD5 authentication.</li><li>• Enter <b>hmac-sha1</b> to IPSec HMAC-SHA1 authentication.</li></ul>
<i>index</i>	RADIUS server index.

**Defaults** None.

**Examples** > **config radius auth ipsec authentication hmac-md5 1**

**Related Commands** **show radius acct statistics**

# config radius auth ipsec disable

To disable IPSec support for an authentication server for the Cisco Wireless LAN controller, use the **config radius auth ipsec disable** command.

**config radius auth ipsec {enable | disable} *index***

## Syntax Description

<b>config</b>	Configure parameters.
<b>radius auth</b>	RADIUS authentication server.
<b>ipsec {enable   disable}</b>	<ul style="list-style-type: none"> <li>Enter <b>enable</b> to enable IPSec support for an authentication server.</li> <li>Enter <b>disable</b> to disable IPSec support for an authentication server.</li> </ul>
<b><i>index</i></b>	RADIUS server index.

## Defaults

None.

## Examples

```
> config radius auth ipsec enable 1
> config radius auth ipsec disable 1
```

## Related Commands

**show radius acct statistics**

## config radius auth ipsec encryption

To configure IPSec support for an authentication server for the Cisco Wireless LAN controller, use the **config radius auth ipsec** command.

**config radius auth ipsec encryption {3des | aes | des} index**

Syntax Description	
<b>config</b>	Configure parameters.
<b>radius auth</b>	RADIUS authentication server.
<b>ipsec encryption</b>	Configure IPSec encryption.
{3des   aes   des}	<ul style="list-style-type: none"><li>• Enter <b>3des</b> to enable IPSec 3DES Encryption.</li><li>• Enter <b>aes</b> to enable IPSec AES Encryption.</li><li>• Enter <b>des</b> to enable IPSec DES Encryption.</li></ul>
<i>index</i>	RADIUS server index.

**Defaults** None.

**Examples** > **config radius acct ipsec encryption 3des 3**

**Related Commands** **show radius acct statistics**

# config radius auth ipsec ike

To configure IKE for the Cisco Wireless LAN controller, use the **config radius auth ipsec ike** command.

```
config radius auth ipsec ike {dh-group {group-1 | group-2 | group-5} |
                             lifetime seconds | phase1 {aggressive | main}} index
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>radius auth</b>	RADIUS authentication server.
<b>ipsec ike</b>	Configure IKE.
<b>dh-group {group-1   group-2   group-5}</b>	Configure the IKE Diffie-Hellman group. <ul style="list-style-type: none"> <li>• Enter <b>group-1</b> to configure DH Group 1 (768 bits).</li> <li>• Enter <b>group-2</b> to configure DH Group 2 (1024 bits).</li> <li>• Enter <b>group-5</b> to configure DH Group 2 (1024 bits).</li> </ul>
<b>lifetime seconds</b>	Configure the IKE lifetime in seconds.
<b>phase1 {aggressive   main}</b>	Configure the IKE Phase1 mode. <ul style="list-style-type: none"> <li>• Enter <b>aggressive</b> to enable the aggressive mode.</li> <li>• Enter <b>main</b> to enable the main mode.</li> </ul>
<b>index</b>	RADIUS server index.

## Defaults

None.

## Examples

```
> config radius auth ipsec ike lifetime 23 1
```

# config radius auth keywrap

To enable and configure AES key wrap, which makes the shared secret between the controller and the RADIUS server more secure, use the **config radius auth keywrap** command.

**config radius auth keywrap {enable | disable | add {ascii | hex} *kek mack index*}**

## Syntax Description

<b>config</b>	Configure parameters.
<b>radius auth</b>	RADIUS authentication server.
<b>keywrap</b>	Configure AES key wrap
<b>{enable   disable   add}</b>	<ul style="list-style-type: none"><li>• Enter <b>enable</b> to enable AES key wrap.</li><li>• Enter <b>disable</b> to disable AES key wrap.</li><li>• Enter <b>add</b> to configure the AES key wrap attributes.</li></ul>
<b>{ascii   hex}</b>	<ul style="list-style-type: none"><li>• Enter <b>ascii</b> to configure the key wrap in ascii format.</li><li>• Enter <b>hex</b> to configure the key wrap in hexadecimal format.</li></ul>
<b>kek</b>	Specifies the 16-byte Key Encryption Key (KEK).
<b>mack</b>	Specifies the 20-byte Message Authentication Code Key (MACK).
<b>index</b>	Specifies the index of the RADIUS authentication server on which to configure the AES key wrap.

## Defaults

None.

## Examples

```
> config radius auth keywrap enable  
> config radius auth keywrap disable  
> config radius auth keywrap add ascii kek mack index
```

## Related Commands

**show radius auth statistics**

# config radius auth management

To configure a default RADIUS server for management users, use the **config radius auth management** command.

**config radius auth management index {enable | disable}**

## Syntax Description

<b>config</b>	Configure parameters.
<b>radius auth</b>	Default RADIUS authentication server.
<b>management</b>	Configure a RADIUS server for management users.
<i>index</i>	RADIUS server index.
<b>{enable   disable}</b>	Enable or disable the server as a management user's default RADIUS Server.

## Defaults

None.

## Examples

> config radius auth management 1 enable

## Related Commands

**show radius acct statistics**  
**config radius acct network**

## config radius auth network

To configure a default RADIUS server for network users, use the **config radius auth network** command.

```
config radius auth network index {enable | disable}
```

### Syntax Description

<b>config</b>	Configure parameters.
<b>radius auth</b>	Default RADIUS authentication server.
<b>network</b>	Configure a default RADIUS server for network users.
<i>index</i>	RADIUS server index.
<b>{enable   disable}</b>	Enable or disable the server as a network user default RADIUS Server.

### Defaults

None.

### Examples

```
> config radius auth network 1 enable
```

### Related Commands

**show radius acct statistics**  
**config radius acct network**

# config radius auth retransmit-timeout

To change the default transmission timeout for a RADIUS authentication server for the Cisco Wireless LAN controller, use the **config radius auth retransmit-timeout** command.

**config radius auth retransmit-timeout *index timeout***

## Syntax Description

<b>config</b>	Configure parameters.
<b>radius auth</b>	RADIUS authentication server.
<b>retransmit-timeout</b>	Configure retransmission timeout.
<i>index</i>	RADIUS server index.
<i>timeout</i>	Number of seconds (from 2 to 30) between retransmissions.

## Defaults

None.

## Examples

```
> config radius auth retransmit-timeout 5
```

## Related Commands

**show radius auth statistics**

## config radius auth rfc3576

To configure RADIUS rfc3576 support for the authentication server for the Cisco Wireless LAN controller, use the **config radius auth rfc3576** command.

RFC 3576, an extension to the RADIUS protocol, allows dynamic changes to a user session. This includes support for disconnecting users and changing authorizations applicable to a user session, that is, provide support for disconnect and CoA messages. Disconnect messages cause a user session to be terminated immediately, whereas CoA messages modify session authorization attributes such as data filters.

**config radius auth rfc3576 {enable | disable} index**

Syntax Description	
<b>config</b>	Configure parameters.
<b>radius auth</b>	Default RADIUS authentication server.
<b>rfc3576</b>	Configure RADIUS rfc3576 support.
<b>{enable   disable}</b>	Enable or disable RFC-3576 support for an authentication server.
<i>index</i>	RADIUS server index.

**Defaults** None.

**Examples** > **config radius auth rfc3576 enable 2**

**Related Commands** **show radius auth statistics**  
**show radius summary**  
**show radius rfc3576**

# config radius auth server-timeout

To configures the retransmission timeout value for a RADIUS accounting server, use the **config radius auth server-timeout** command.

**config radius auth server-timeout** *index timeout*

Syntax Description	
<b>config</b>	Configure parameters.
<b>radius auth</b>	Default RADIUS authentication server.
<b>server-timeout</b>	Configure the retransmission timeout value for a RADIUS accounting server
<i>index</i>	RADIUS server index.
<i>timeout</i>	Timeout value, valid range is 2 to 30 seconds

**Defaults** Default timeout: 2 seconds.

**Examples** > **config radius auth server-timeout 2 10**

**Related Commands** **show radius auth statistics**  
**show radius summary**

## config radius aggressive-failover disabled

To configure the controller to mark a RADIUS server as down (not responding) after the server does not reply to three consecutive clients, use the **config radius aggressive-failover disabled** command.

**config radius aggressive-failover disabled**

**Syntax Description** This command does not have any arguments or keywords.

**Defaults** This command has no defaults.

Command History	Release	Modification
	3.2.171	This command was introduced.

**Examples** > **config radius aggressive-failover disabled**

**Related Commands** **show radius summary**

# config radius backward compatibility

To configure RADIUS backward compatibility for the Cisco Wireless LAN controller, use the **config radius backward** command.

```
config radius backward compatibility {enable | disable}
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>radius backward</b>	RADIUS authentication server.
<b>compatibility</b>	Configure RADIUS backward compatibility.
<b>{enable   disable}</b>	Enable or disable RADIUS vendor ID backward compatibility.

## Defaults

Enabled.

## Examples

```
> config radius backward compatibility disable
```

## Related Commands

## config radius callStationIdType

To configure callStationIdType information sent in radius messages for the Cisco Wireless LAN controller, use the **config radius callStationIdType** command. This command uses the selected calling station ID for communications with RADIUS servers and other applications.

**config radius callStationIdType {ipAddr | macAddr | ap-macAddr}**

Syntax Description	
<b>config</b>	Configure parameters.
<b>radius</b>	Configure callStationIdType information.
<b>callStationIdType</b>	
<b>{ipAddr   macAddr   ap-macAddr}</b>	<ul style="list-style-type: none"><li>• Enter <b>ipAddr</b> to configure Call Station ID type to IP address (only layer 3).</li><li>• Enter <b>macAddr</b> to configure Call Station ID type to the system's MAC address (layers 2 and 3).</li><li>• Enter <b>ap-macAddr</b> to configure Call Station ID type to use the access point's MAC address (layers 2 and 3).</li></ul>
<b>Defaults</b>	Enabled.
<b>Examples</b>	<pre>&gt; config radius callStationIdType ipAddr &gt; config radius callStationIdType macAddr &gt; config radius callStationIdType ap-macAddr</pre>
<b>Related Commands</b>	<b>show radius summary</b>

# config rfid auto-timeout

To configure the automatic timeout of RFID tags, use the **config rfid auto-timeout** command.

```
config rfid auto-timeout {enable | disable}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>rfid auto-timeout</b>	Configure automatic timeout of RFID tags.
<b>{enable   disable}</b>	Enable or disable automatic timeout.

Defaults	
	None.

Examples	
	> config rfid auto-timeout enable

Related Commands	
	<b>show rfid summary</b>
	<b>config rfid status</b>
	<b>config rfid timeout</b>

# config rfid status

To configure RFID tag data collection, use the **config rfid status** command.

```
config rfid status {enable | disable}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>rfid status</b>	Configure RFID tag data collection.
<b>{enable   disable}</b>	Enable or disable RFID tag tracking.

Defaults	None.
----------	-------

Examples	> config rfid status enable
----------	-----------------------------

Related Commands	show rfid summary, config rfid auto-timeout config rfid timeout
------------------	---

# config rfid timeout

To configure the static RFID tag data timeout, use the **config rfid timeout** command.

**config rfid timeout *seconds***

## Syntax Description

<b>show</b>	Displays configurations.
<b>rfid timeout</b>	Configure the static RFID tag data timeout.
<b><i>seconds</i></b>	Timeout in seconds (from 60 to 7200).

## Defaults

None.

## Examples

```
> config rfid timeout 60
```

## Related Commands

**show rfid summary**

# config rogue adhoc

To configure the status of an ad-hoc rogue access point (IBSS), use the **config rogue adhoc** command.

```
config rogue adhoc {acknowledged MAC | alert MAC | contain MAC num_of_AP | enable | disable}
```

<b>Syntax Description</b>	
<b>config</b>	Configure parameters.
<b>rogue adhoc</b>	Ad hoc rogue access point.
<b>{acknowledged   alert   contain   enable   external   disable}</b>	<ul style="list-style-type: none"> <li>• Enter <b>acknowledged</b> to acknowledge presence of a adhoc rogue.</li> <li>• Enter <b>alert</b> to generate a trap upon detection of the adhoc rogue.</li> <li>• Enter <b>contain</b> to start containing adhoc rogue.</li> <li>• Enter <b>enable</b> to enable ad-hoc rogue detection and reporting.</li> <li>• Enter <b>external</b> to set the controller to acknowledge the presence of this ad-hoc rogue.</li> <li>• Enter <b>disable</b> to disable ad-hoc rogue detection and reporting</li> </ul>
<b>MAC</b>	MAC address of the ad-hoc rogue access point.
<b>num_of_AP</b>	The maximum number of Cisco access points to actively contain the rogue access point (1–4).

<b>Defaults</b>	None.
-----------------	-------

<b>Examples</b>	<pre>&gt; config rogue adhoc acknowledge 11:11:11:11:11:11 &gt; config rogue adhoc alert 11:11:11:11:11:11 &gt; config rogue adhoc contain 11:11:11:11:11:11 3 &gt; config rogue adhoc enable &gt; config rogue adhoc external 11:11:11:11:11:11 &gt; config rogue adhoc disable</pre>

# config rogue ap

To configure the status of a rogue access point, use the **config rogue ap** command.

```
config rogue ap {acknowledged MAC | alert MAC | known MAC | contain MAC num_of_AP | timeout timeout}
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>rogue ap</b>	Rogue access point status.
{ <b>acknowledged</b>   <b>alert</b>   <b>contain</b>   <b>known</b>   <b>timeout</b> }	<ul style="list-style-type: none"> <li>Enter <b>acknowledged</b> to acknowledge presence of an access point.</li> <li>Enter <b>alert</b> to generate a trap upon detection of the access point.</li> <li>Enter <b>contain</b> to start containing a rogue access point.</li> <li>Enter <b>known</b> to trust a foreign access point.</li> <li>Enter <b>timeout</b> to specify the number of seconds after which the rogue access point and client entries expire and are removed from the list</li> </ul>
<i>MAC</i>	MAC address of the rogue access point.
<i>num_of_AP</i>	The maximum number of Cisco access points to actively contain the rogue access point (1–4).
<i>timeout</i>	Measured in seconds between 240 and 3600

## Defaults

Default timeout: 1200 seconds.

## Examples

```
> config rogue ap acknowledge 11:11:11:11:11:11
> config rogue ap alert 11:11:11:11:11:11
> config rogue ap contain 11:11:11:11:11:11
> config rogue ap known 11:11:11:11:11:11
> config rogue ap timeout 2000
```

## Related Commands

# config rogue ap classify

To classify a rogue access point as friendly, malicious or unclassified, use the **config rogue ap classify** command.

```
config rogue ap classify{friendly state {internal | external} | malicious state {alert | contain} | unclassified state {alert | contain}}ap_mac_address
```

<b>Syntax Description</b>	
<b>config</b>	Configure parameters.
<b>rogue ap</b>	Rogue access point status.
{friendly state   malicious state   unclassified state}	<ul style="list-style-type: none"> <li>Enter <b>friendly state</b> to classify a rogue access point as friendly.</li> <li>Enter <b>malicious state</b> to classify a rogue access point as malicious.</li> <li>Enter <b>unclassified state</b> to classify a rogue access point as unclassified.</li> </ul>
{internal   external}	<ul style="list-style-type: none"> <li>Enter <b>internal</b> to set the controller to trust this rogue access point.</li> <li>Enter <b>external</b> to set the controller to acknowledge the presence of this access point.</li> </ul>
{alert   contain}	<ul style="list-style-type: none"> <li>Enter <b>alert</b> to set the controller to forward an immediate alert to the system administrator for further action.</li> <li>Enter <b>contain</b> to set the controller to contain the offending device so that its signals no longer interfere with authorized clients.</li> </ul>
<i>ap_mac_address</i>	MAC address of the access point to be classified.

---

**Defaults** None.

---

**Examples**

```
> config rogue ap classify friendly state internal 11:11:11:11:11:11
> config rogue ap classify malicious state alert 11:11:11:11:11:11
> config rogue ap classify unclassified state contain 11:11:11:11:11:11
```

# config rogue ap rldp

To enable, disable, or initiate Rogue Location Discovery Protocol (RLDP), enter these commands.

```
config rogue ap rldp enable alarm-only [monitor_ap_only]
config rogue ap rldp initiate rogue_mac_address
config rogue ap rldp disable
```

<b>Syntax Description</b>	
<b>config</b>	Configure parameters.
<b>rogue ap</b>	Rogue access point status.
<b>rldp</b>	Configure RLDP.
<b>enable alarm-only</b>	Enable RLDP on all access points.
<i>monitor_ap_only</i>	(Optional) Enable RLDP only on access points in monitor mode.
<b>initiate</b>	Initiate RLDP on a specific rogue access point.
<i>rogue_mac_address</i>	MAC address of specific rogue access point.
<b>disable</b>	Disable RLDP on all access points.

<b>Defaults</b>	None.
-----------------	-------

<b>Examples</b>	<p>To enable RLDP on all access points, enter this command:</p> <pre>&gt; config rogue ap rldp enable alarm-only</pre> <p>To enable RLDP on monitor-mode access point Cisco_AP_1, enter this command:</p> <pre>&gt; config rogue ap rldp enable alarm-only Cisco_AP_1</pre> <p>To start RLDP on the rogue access point with MAC address 123.456.789.000, enter this command:</p> <pre>&gt; config rogue ap rldp initiate 123.456.789.000</pre> <p>To disable RLDP on all access points, enter this command:</p> <pre>&gt; config rogue ap rldp disable</pre>
-----------------	--

# config rogue client

To configure rogue clients, use the **config rogue client** command.

```
config rogue client {aaa {enable | disable} | alert MAC | contain MAC num_of_AP}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>rogue client</b>	Rogue client status.
{aaa   alert   contain}	<ul style="list-style-type: none"> <li>Enter <b>aaa</b> to configure AAA server or local database to validate if rogue clients are valid clients.</li> <li>Enter <b>alert</b> to configure the rogue client to the alarm state.</li> <li>Enter <b>contain</b> to start containing a rogue client.</li> </ul>
{enable   disable}	<ul style="list-style-type: none"> <li>Enter <b>enable</b> to enable the AAA server or local database to check MAC addresses of a rogue clients for validity.</li> <li>Enter <b>disable</b> to disable the AAA server or local database from checking MAC addresses of rogue clients for validity.</li> </ul>
<i>MAC</i>	MAC address of the rogue client.
<i>num_of_AP</i>	The maximum number of Cisco access points to actively contain the rogue access point (1–4).

---

**Defaults** None.

---

**Examples**

```
> config rogue client aaa enable
> config rogue client aaa disable
> config rogue client alert 11:11:11:11:11:11
> config rogue client contain 11:11:11:11:11:11 2
```

---

**Related Commands** **show rogue client summary**  
**show rogue client detailed, config rogue client**

# config rogue rule

To configure rogue classification rules, use the **config rogue rule** command.

```
config rogue rule {add ap priority priority classify {friendly | malicious}rule_name | classify
{friendly | malicious}rule_name | condition ap set condition_type condition_value rule_name
| {enable | delete | disable} {all | rule_name} | match {all | any} | priority priority
rule_name}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>rogue rule</b>	Configure rogue rule.
<b>add ap</b>	Create a new rule
<b>{classify   condition ap set   enable   delete   disable   match   priority}</b>	<ul style="list-style-type: none"> <li>Enter <b>classify</b> to change the classification of a rule.</li> <li>Enter <b>condition ap set</b> to add conditions to a rule that the rogue access point must meet.</li> <li>Enter <b>enable</b> to enable all rules or a single specific rule.</li> <li>Enter <b>delete</b> to delete all rules or a single specific rule.</li> <li>Enter <b>disable</b> to disable all rules or a single specific rule.</li> <li>Enter <b>match</b> To specify whether a detected rogue access point must meet all or any of the conditions specified by the rule in order for the rule to be matched and the rogue access point to adopt the classification type of the rule.</li> <li>Enter <b>priority</b> to change the priority of specific rule and shift others in the list accordingly.</li> </ul>
<b>{all   any}</b>	<ul style="list-style-type: none"> <li>Enter all to affect all rules defined.</li> <li>Enter any to effect any rule meeting certain criteria.</li> </ul>
<b>{friendly   malicious}</b>	<ul style="list-style-type: none"> <li>Enter <b>friendly</b> to classify a rule as friendly</li> <li>Enter <b>malicious</b> to classify a rule as malicious.</li> </ul>
<b>condition_type</b>	The type of the condition to be configured. The condition types are listed below: <ul style="list-style-type: none"> <li><b>client-count</b>—Requires that a minimum number of clients be associated to the rogue access point. Valid range is 1 to 10 (inclusive)</li> <li><b>duration</b>—Requires that the rogue access point be detected for a minimum period of time. Valid range is 0 to 3600 seconds (inclusive)</li> <li><b>managed-ssid</b>—Requires that the rogue access point's SSID be known to the controller.</li> <li><b>no-encryption</b>—Requires that the rogue access point's advertised WLAN does not have encryption enabled.</li> <li><b>rssi</b>—Requires that the rogue access point have a minimum RSSI value. Valid range is -95 to -50 dBm (inclusive)</li> <li><b>ssid</b>—Requires that the rogue access point have a specific SSID.</li> </ul>
<b>condition_value</b>	The value of the condition. this is dependent on condition_type

## ■ config rogue rule

<i>priority</i>	Select the priority of the rule.
<i>rule_name</i>	The name of the rule to be configured.

**Defaults** None.

### Examples

```
> config rogue rule add ap priority 1 classify friendly rule_1
> config rogue rule priority 2 rule_1
> config rogue rule classify friendly rule_1
> config rogue rule condition ap set rssi -50 rule_1
> config rogue rule enable rule_2
> config rogue rule delete all
> config rogue rule disable all
> config rogue rule match any rule_2
```

**Related Commands** [show rogue rule summary](#)  
[show rogue rule detailed](#)

# config route add

To configure a network route from the Service Port to a dedicated workstation IP address range, use the **config route add** command.

**config route add** *ip\_address netmask gateway*

## Syntax Description

<b>config</b>	Configure parameters.
<b>route</b>	Network route.
<b>add</b>	Add a route.
<i>ip_address</i>	Network IP Address.
<i>netmask</i>	The subnet mask for the network.
<i>gateway</i>	IP Address of the gateway for the route network.

## Defaults

None.

## Examples

```
> config route add 10.1.1.0 255.255.255.0 10.1.1.1
```

## Related Commands

**show route summary**

**config route delete**

## config route delete

To remove a network route from the Service Port, use the **config route delete** command.

**config route delete *ip\_address***

Syntax Description	
<b>config</b>	Configure parameters.
<b>route</b>	Network route.
<b>delete</b>	Delete a route.
<i>ip_address</i>	Network IP Address.

**Defaults** None.

**Examples** > **config route delete 10.1.1.0**

**Related Commands** show route all, config route add

## Configure Serial Commands

Use the **config serial** commands to configure serial port settings.

# config serial baudrate

To set the serial port baud rate, use the **config serial baudrate** command.

```
config serial baudrate {1200 | 2400 | 4800 | 9600 | 19200 | 38400 | 57600}
```

Syntax Description	<b>config</b> Configure parameters. <b>serial baudrate</b> Configure serial port baud rate. <b>{1200   2400   4800   9600   19200   38400   57600}</b> Enter one of the supported connection speeds.
Defaults	9600.
Examples	> config serial baudrate 9600
Related Commands	config serial timeout

## config serial timeout

To set the timeout of a serial port session, use the **config serial timeout** command.

Use this command to set the timeout for a serial connection to the front of the Cisco Wireless LAN controller from 0 to 160 minutes where 0 is no timeout.

**config serial timeout** *minutes*

Syntax Description	
<b>config</b>	Configure parameters.
<b>serial</b>	Serial connection settings.
<b>timeout</b>	Configure timeout of a serial port session.
<i>minutes</i>	Timeout in minutes from 0 to 160. A value of 0 indicates no timeout.

Defaults	0 (no timeout).
----------	-----------------

Examples	> <b>config serial timeout 10</b>
----------	-----------------------------------

Related Commands	<b>config serial timeout</b>
------------------	------------------------------

# config service timestamps

To enable or disable timestamps in message logs, use the **config service timestamps** command.

```
config service timestamps {debug | log} {datetime | disable}
```

Syntax Description	<b>config</b> Configure parameters. <b>service</b> Configure service settings. <b>timestamps</b> Configure timestamps. <b>debug</b> Configure timestamps in debug messages. <b>log</b> Configure timestamps in log messages. <b>{datetime   disable}</b> <ul style="list-style-type: none"> <li>Enter <b>datetime</b> to timestamp message logs with the standard date and time.</li> <li>Enter <b>disable</b> to prevent message logs being timestamped.</li> </ul>
<b>Defaults</b>	Disabled.
<b>Examples</b>	<pre>&gt; config service timestamps log datetime &gt; config service timestamps debug disable</pre>
<b>Related Commands</b>	<b>show logging</b>

## Configure CLI Sessions Commands

Use the **config sessions** commands to configure CLI session settings.

## config sessions maxsessions

To configure the number of telnet CLI sessions allowed by the Cisco Wireless LAN controller, use the **config sessions maxsessions** command. Up to five sessions are possible while a setting of zero prohibits any telnet CLI sessions.

**config sessions maxsessions** *session\_num*

Syntax Description	
<b>config</b>	Configure parameters.
<b>sessions</b>	Telnet CLI session parameters.
<b>maxsessions</b>	Configure the number of allowed CLI sessions.
<i>session_num</i>	Number of sessions from 0 to 5.

**Defaults** 5.

**Examples** > **config sessions maxsessions 2**

**Related Commands** **show sessions**

# config sessions timeout

To configure the inactivity timeout for telnet CLI sessions, use the **config sessions timeout** command.

**config sessions timeout *timeout***

Syntax Description	
<b>config</b>	Configure parameters.
<b>sessions</b>	Telnet CLI session parameters.
<b>timeout</b>	Configure the inactivity timeout for telnet CLI sessions
<b><i>timeout</i></b>	Timeout of telnet session in minutes (from 0 to 160). A value of 0 indicates no timeout.

**Defaults** 5.

**Examples** > **config sessions timeout 20**

**Related Commands** show sessions

## Configure SNMP Community Commands

Use the **config snmp community** commands to configure SNMP community settings.

## config snmp community accessmode

To modify the access mode (Read only or Read/Write) of an SNMP community, use the **config snmp community accessmode** command.

**config snmp community accessmode {ro | rw} name**

### Syntax Description

<b>config</b>	Configure parameters.
<b>snmp</b>	SNMP parameters.
<b>community</b>	SNMP community parameters.
<b>accessmode</b>	Configure the access mode for an SNMP community.
{ <b>ro</b>   <b>rw</b> }	<ul style="list-style-type: none"><li>• Enter <b>ro</b> to specify a Read Only mode.</li><li>• Enter <b>rw</b> to specify a Read/Write mode.</li></ul>
<b>name</b>	SNMP community name.

### Defaults

Two communities are provided by default with the following parameters:

SNMP Community Name	Client IP Address	Client IP Mask	Access Mode	Status
public	0.0.0.0	0.0.0.0	Read Only	Enable
private	0.0.0.0	0.0.0.0	Read/Write	Enable

### Examples

> **config snmp community accessmode rw private**

### Related Commands

**show snmp community**  
**config snmp community mode**  
**config snmp community create**  
**config snmp community delete**  
**config snmp community ipaddr**

# config snmp community create

To create a new SNMP community, use the **config snmp community create** command. Use this command to create a new community with the following default configuration:

**config snmp community create *name***

## Syntax Description

<b>config</b>	Configure parameters.
<b>snmp</b>	SNMP parameters.
<b>community</b>	SNMP community parameters.
<b>create</b>	Create a new community.
<i>name</i>	SNMP community name. Up to 16 characters.

## Defaults

None.

## Examples

```
> config snmp community create test
> show snmpcommunity

SNMP Community Name Client IP Address Client IP Mask Access Mode Status
-----
public          0.0.0.0      0.0.0.0      Read Only   Enable
*****          0.0.0.0      0.0.0.0      Read/Write  Enable
test           0.0.0.0      0.0.0.0      Read Only   Disable
```

## Related Commands

- config snmp community delete**
- config snmp community ipaddr**

## config snmp community delete

To delete an SNMP community, use the **config snmp community delete** command.

**config snmp community delete** *name*

Syntax Description	
<b>config</b>	Configure parameters.
<b>snmp</b>	SNMP parameters.
<b>community</b>	SNMP community parameters.
<b>delete</b>	Delete an SNMP community.
<i>name</i>	SNMP community name.

**Defaults** None.

**Examples** > **config snmp community delete test**

**Related Commands** **show snmp community**  
**config snmp community mode**  
**config snmp community accessmode**  
**config snmp community create**  
**config snmp community ipaddr**

# config snmp community ipaddr

To configure the IP Address of an SNMP community, use the **config snmp community ipaddr** command.

**config snmp community ipaddr *ip\_address* *ip\_mask* *name***

## Syntax Description

<b>config</b>	Configure parameters.
<b>snmp</b>	SNMP parameters.
<b>community</b>	SNMP community parameters.
<b>ipaddr</b>	Set IP Address parameters.
<i>ip_address</i>	SNMP community IP address.
<i>ip_mask</i>	SNMP community subnet mask.
<i>name</i>	SNMP community name.

## Defaults

None.

## Examples

```
> config snmp community ipaddr 10.10.10.10.2 255.255.255.0 public
```

## Related Commands

- show snmp community**
- config snmp community mode**
- config snmp community accessmode**
- config snmp community create**
- config snmp community delete**
- config snmp community ipaddr**

## config snmp community mode

To enable or disable an SNMP community, use the **config snmp community mode** command.

```
config snmp community mode {enable | disable} name
```

Syntax Description	
<b>config snmp community</b>	Configure SNMP community parameters.
<b>mode</b>	Configure an SNMP community
<b>{enable   disable}</b>	Enable or disable the community.
<b><i>name</i></b>	SNMP community name.

**Defaults** None.

**Examples** > config snmp community mode disable public

**Related Commands**

- show snmp community
- config snmp community accessmode
- config snmp community create
- config snmp community delete
- config snmp community ipaddr

# config snmp syscontact

To set the SNMP system contact name, use the **config snmp syscontact** command.

**config snmp syscontact** *contact*

Syntax Description	
<b>config</b>	Configure parameters.
<b>snmp</b>	SNMP parameters.
<b>syscontact</b>	Set the SNMP system contact name.
<i>contact</i>	SNMP system contact name. Up to 31 alphanumeric characters.

**Defaults** None.

**Examples** > **config snmp syscontact Cisco WLAN Solution\_administrator**

**Related Commands** **show snmpcommunity**

## config snmp syslocation

To configure the SNMP system location name, use the **config snmp syslocation** command.

**config snmp syslocation** *location*

---

### Syntax Description

<b>config</b>	Configure parameters.
<b>snmp</b>	SNMP parameters.
<b>syslocation</b>	configure the SNMP system location name.
<i>location</i>	SNMP system location name. Up to 31 alphanumeric characters.

---

### Defaults

None.

---

### Examples

> **config snmp syslocation Building\_2a**

---

### Related Commands

**show snmpcommunity**

## Configure SNMP Trap Receiver Commands

Use the **config smp trapreceiver** commands to configure SNMP trapreceiver settings.

# config snmp trapreceiver create

To add server to receive a SNMP traps, use the **config snmp trapreceiver create** command. The IP address must be valid for the command to add the new server.

**config snmp trapreceiver create** *name ip\_address*

## Syntax Description

<b>config</b>	Configure parameters.
<b>snmp</b>	SNMP parameters.
<b>trapreceiver</b>	SNMP trap server parameters.
<b>create</b>	Add a new SNMP trap receiver.
<i>name</i>	SNMP community name. Up to 16 characters.
<i>ip_address</i>	SNMP community IP address.

## Defaults

None.

## Examples

> config snmp trapreceiver create test 10.1.1.1

## Related Commands

show snmp trap

■ config snmp trapreceiver delete

## config snmp trapreceiver delete

To delete a server from the trap receiver list, use the **config snmp trapreceiver delete** command.

**config snmp trapreceiver delete *name***

---

### Syntax Description

<b>config</b>	Configure parameters.
<b>snmp</b>	SNMP parameters.
<b>trapreceiver</b>	Server to receive traps.
<b>delete</b>	Delete an SNMP trap receiver.
<i>name</i>	SNMP community name. Up to 16 characters.

---

### Defaults

None.

---

### Examples

> **config snmp trapreceiver delete test**

---

### Related Commands

**show snmp trap**

# config snmp trapreceiver mode

To send or disable sending traps to a selected server, use the **config snmp trapreceiver mode** command. This enables or disables the Cisco Wireless LAN controller from sending the traps to the selected server.

**config snmp trapreceiver mode {enable | disable} name**

## Syntax Description

<b>config</b>	Configure parameters.
<b>snmp</b>	SNMP parameters.
<b>trapreceiver</b>	Server to receive traps.
<b>mode</b>	Configure an SNMP trap receiver.
<b>{enable   disable}</b>	Enable or disable an SNMP trap receiver.
<b>name</b>	SNMP community name.

## Defaults

None.

## Examples

> config snmp trapreceiver mode disable server1

## Related Commands

show snmp trap

# Configure SNMP V3 User Commands

Use the **config snmp v3user** commands to configure SNMP version 3 settings.

## config snmp v3user create

To create a version 3 SNMP user, use the **config snmp v3user create** command.

```
config snmp v3user create username {ro | rw} {none | hmacmd5 | hmacsha} {none | des | aescfb128} [auth_key] [encrypt_key]
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>snmp</b>	SNMP parameters.
<b>v3user create</b>	Creates a version 3 SNMP user.
<i>username</i>	Version 3 SNMP username.
{ <b>ro</b>   <b>rw</b> }	<ul style="list-style-type: none"><li>Enter <b>ro</b> to specify a read-only user privilege.</li><li>Enter <b>rw</b> to specify a read-write user privilege.</li></ul>
{ <b>none</b>   <b>hmacmd5</b>   <b>hmacsha</b> }	<ul style="list-style-type: none"><li>Enter <b>none</b> if no authentication is required.</li><li>Enter <b>hmacmd5</b> to use Hashed Message Authentication Coding-Message Digest 5 (HMAC-MD5) for authentication.</li><li>Enter <b>hmacsha</b> to use Hashed Message Authentication Coding-Secure Hashing Algorithm (HMAC-SHA) for authentication.</li></ul>
{ <b>none</b>   <b>des</b>   <b>aes</b> }	<ul style="list-style-type: none"><li>Enter <b>none</b> if no encryption is required.</li><li>Enter <b>des</b> to use Cipher Block Chaining-Digital Encryption Standard (CBC-DES) encryption.</li><li>Enter <b>aescfb128</b> to use Cipher Feedback Mode-Advanced Encryption Standard-128 (CFB-AES-128) encryption.</li></ul>
[ <i>auth_key</i> ]	Authentication key for the HMAC-MD5 or HMAC-SHA authentication protocol.
[ <i>encrypt_key</i> ]	Encryption key for the CBC-DES or CFB-AES-128 encryption protocol.

**Defaults**      SNMP v3 User Name    AccessMode    Authentication    Encryption

```
-----  
default                Read/Write    HMAC-SHA            CFB-AES
```

**Examples**      To add an SNMP username called “test” with read-only privileges and no encryption or authentication, enter this command:

```
> config snmp v3user create test ro none none
```

**Related Commands**    **show snmpv3user**

# config snmp v3user delete

To delete a version 3 SNMP user, use the **config snmp v3user delete** command.

**config snmp v3user delete *username***

Syntax Description	
<b>config</b>	Configure parameters.
<b>snmp</b>	SNMP parameters.
<b>v3user</b>	Version 3 SNMP.
<b>delete</b>	Delete a v3 user.
<i>username</i>	Username to delete.

**Defaults** None.

**Examples** This will remove an SNMP user named test.

```
> config snmp v3user delete test
```

**Related Commands** **show snmp v3user**

## config snmp version

To enable or disable selected SNMP versions, use the **config snmp version** command.

```
config snmp version {v1 | v2 | v3} {enable | disable}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>snmp</b>	SNMP parameters.
<b>version</b>	Configure SNMP version.
<b>{v1   v2   v3}</b>	Enter an SNMP version to enable or disable.
<b>{enable   disable}</b>	Enable or disable specified version

**Defaults** All versions enabled

**Examples** > `config sessions timeout 20`

**Related Commands** show snmpversion

## Configure Spanning Tree Port Commands

Use the **config spanningtree port** commands to configure spanningtree port settings.

# config spanningtree port mode

To turn fast or 802.1D Spanning Tree Protocol on or off for one or all Cisco Wireless LAN controller ports, use the **config spanningtree port mode** command.

**Note** When the a Cisco 4400 series wireless LAN controller is configured for port redundancy, Spanning Tree Protocol must be disabled for all ports on the Cisco 4400 series wireless LAN controller. Spanning tree protocol can remain enabled on the switch connected to the Cisco 4400 series wireless LAN controller.

Note that you must disable Cisco Wireless LAN controller STP using the config spanningtree switch mode command, select STP mode for all Ethernet ports using this command, and then enable Cisco Wireless LAN controller STP using the config spanningtree switch mode command. This procedure allows the Cisco Wireless LAN controller to most efficiently set up STP, detect logical network loops, place redundant ports on standby, and build a network with the most efficient pathways.

**config spanningtree port mode {off | 802.1d | fast} {port | all}**

<b>Syntax Description</b>	
<b>config</b>	Configure parameters.
<b>spanningtree</b>	Spanning Tree Protocol.
<b>port</b>	Configure spanning tree values on a per port basis.
<b>mode</b>	Configure the STP port mode.
<b>{off   802.1d   fast}</b>	Enter a supported port mode or <b>off</b> to disable STP for the specified ports.
<b>{port   all}</b>	Enter a port number (1 through 12 or 1 through 24), or <b>all</b> to configure all ports.

## Defaults

Port STP = off.

## Examples

To disable STP for all Ethernet ports:

```
> config spanningtree port mode off all
```

To turn on STP 802.1D mode for Ethernet port 24:

```
> config spanningtree port mode 802.1d 24
```

To turn on fast STP mode for Ethernet port 2:

```
> config spanningtree port mode fast 2
```

## Related Commands

**show spanningtree port**  
**config spanningtree switch mode**  
**config spanningtree port pathcost**  
**config spanningtree port priority**

## config spanningtree port pathcost

To set the STP path cost for an Ethernet port, use the **config spanningtree port pathcost** command.

**Note** When the a Cisco 4400 series wireless LAN controller is configured for port redundancy, Spanning Tree Protocol must be disabled for all ports on the Cisco 4400 series wireless LAN controller. Spanning tree protocol can remain enabled on the switch connected to the Cisco 4400 series wireless LAN controller.

**config spanningtree port pathcost {cost | auto} {port | all}**

---

### Syntax Description

<b>config</b>	Configure parameters.
<b>spanningtree</b>	Spanning Tree Protocol.
<b>port</b>	Configure spanning tree values on a per port basis.
<b>pathcost</b>	Configure the STP port path cost.
<b>{cost   auto}</b>	Enter cost in decimal as determined by the network planner or <b>auto</b> (default cost).
<b>{port   all}</b>	Enter a port number (1 through 12 or 1 through 24), or <b>all</b> to configure all ports.

---

---

### Defaults

auto.

---

### Examples

To have the STP algorithm automatically assign a path cost for all ports:

> **config spanningtree port pathcost auto all**

To have the STP algorithm use a port cost of 200 for port 22:

> **config spanningtree port pathcost 200 22**

---

### Related Commands

**show spanningtree port**  
**config spanningtree port mode**  
**config spanningtree port priority**

# config spanningtree port priority

To configure the STP port priority, use the **config spanningtree port priority** command.

**Note** When the a Cisco 4400 series wireless LAN controller is configured for port redundancy, Spanning Tree Protocol must be disabled for all ports on the Cisco 4400 series wireless LAN controller. Spanning tree protocol can remain enabled on the switch connected to the Cisco 4400 series wireless LAN controller.

**config spanningtree port priority *priority\_num port***

## Syntax Description

<b>config</b>	Configure parameters.
<b>spanningtree</b>	Spanning Tree Protocol.
<b>port</b>	Configure spanning tree values on a per port basis.
<b>priority</b>	Configure the STP port priority.
<b><i>priority_num</i></b>	Enter a priority number from 0 to 255.
<b><i>port</i></b>	Enter a port number (1 through 12 or 1 through 24).

## Defaults

STP Priority = 128.

## Examples

To set Ethernet port 2 to STP priority 100:

```
> config spanningtree port priority 100 2
```

## Related Commands

**show spanningtree port**  
**config spanningtree switch mode**  
**config spanningtree port mode**  
**config spanningtree port pathcost**

# Configure Spanning Tree Switch Commands

Use the **config spanningtree switch** commands to configure spanning tree switch settings.

## config spanningtree switch bridgepriority

To set the bridge ID, use the **config spanningtree switch bridgepriority** command. The value of the writable portion of the Bridge ID, that is, the first two octets of the (8 octet long) Bridge ID. The other (last) 6 octets of the Bridge ID are given by the value of Bridge MAC Address. The value may be specified as a number between 0 and 65535.

**Note**

When the a Cisco 4400 series wireless LAN controller is configured for port redundancy, Spanning Tree Protocol must be disabled for all ports on the Cisco 4400 series wireless LAN controller. Spanning tree protocol can remain enabled on the switch connected to the Cisco 4400 series wireless LAN controller.

**config spanningtree switch bridgepriority *priority\_num***

---

**Syntax Description**

<b>config</b>	Configure parameters.
<b>spanningtree</b>	Spanning Tree Protocol.
<b>switch</b>	Configure spanning tree values on a per switch basis.
<b>bridgepriority</b>	Configure the STP bridge priority.
<b><i>priority_num</i></b>	Enter a priority number between 0 and 65535.

---

**Defaults**

The factory default is 32768.

---

**Examples**

> **config spanningtree switch bridgepriority 40230**

---

**Related Commands**

**show spanningtree switch**  
**config spanningtree switch forwarddelay**  
**config spanningtree switch hellotime**  
**config spanningtree switch maxage**  
**config spanningtree switch mode**

# config spanningtree switch forwarddelay

To set the bridge timeout, use the **config spanningtree switch forwarddelay** command.

The value that all bridges use for ForwardDelay when this bridge is acting as the root. Note that 802.1D-1990 specifies that the range for this parameter is related to the value of Stp Bridge Maximum Age. The granularity of this timer is specified by 802.1D-1990 to be 1 second. An agent may return a badValue error if a set is attempted to a value which is not a whole number of seconds. The Factory default is 15. Valid values are 4 through 30 seconds.

**config spanningtree switch forwarddelay *seconds***

## Syntax Description

<b>config</b>	Configure parameters.
<b>spanningtree</b>	Spanning Tree Protocol.
<b>switch</b>	Configure spanning tree values on a per switch basis.
<b>forwarddelay</b>	Configure the STP bridge forward delay.
<b>seconds</b>	Timeout in seconds (between 4 and 30).

## Defaults

The factory default is 15.

## Examples

> config spanningtree switch forwarddelay 20

## Related Commands

**show spanningtree switch**  
**config spanningtree switch bridgepriority**  
**config spanningtree switch hellotime**  
**config spanningtree switch maxage**  
**config spanningtree switch mode**

## config spanningtree switch hellotime

To set the hello time, use the **config spanningtree switch hellotime** command.

This is the value all bridges use for HelloTime when this bridge is acting as the root. The granularity of this timer is specified by 802.1D- 1990 to be 1 second. Valid values are 1 through 10 seconds.

**config spanningtree switch hellotime *seconds***

Syntax Description	
<b>config</b>	Configure parameters.
<b>spanningtree</b>	Spanning Tree Protocol.
<b>switch</b>	Configure spanning tree values on a per switch basis.
<b>hellotime</b>	Configure the STP hello time.
<b>seconds</b>	STP hello time in seconds.

**Defaults** The factory default is 15.

**Examples** > **config spanningtree switch hellotime 4**

**Related Commands** **show spanningtree switch**  
**spanningtree switch bridgepriority**  
**config spanningtree switch forwarddelay**  
**config spanningtree switch maxage**  
**config spanningtree switch mode**

# config spanningtree switch maxage

To set the maximum age, use the **config spanningtree switch maxage** command.

This is the value all bridges use for MaxAge when this bridge is acting as the root. Note that 802.1D-1990 specifies that the range for this parameter is related to the value of Stp Bridge Hello Time. The granularity of this timer is specified by 802.1D-1990 to be 1 second. Valid values are 6 through 40 seconds.

**config spanningtree switch maxage *seconds***

## Syntax Description

<b>config</b>	Configure parameters.
<b>spanningtree</b>	Spanning Tree Protocol.
<b>switch</b>	Configure spanning tree values on a per switch basis.
<b>maxage</b>	Configure the STP bridge maximum age.
<b>seconds</b>	STP bridge maximum age in seconds.

## Defaults

The factory default is 20.

## Examples

> **config spanningtree switch maxage 30**

## Related Commands

**show spanningtree switch**  
**config spanningtree switch bridgepriority**  
**config spanningtree switch forwarddelay**  
**config spanningtree switch hellotime**  
**config spanningtree switch mode**

## config spanningtree switch mode

To turn the Cisco Wireless LAN controller Spanning Tree Protocol on or off, use the **config spanningtree switch mode** command.

Note that you must disable the Cisco Wireless LAN controller STP using this command, select STP mode for all Ethernet ports using the **config spanningtree port mode** command, and then enable the Cisco Wireless LAN controller STP using this command. This procedure allows the Cisco Wireless LAN controller to most efficiently set up STP, detect logical network loops, place redundant ports on standby, and build a network with the most efficient pathways.

**config spanningtree switch mode {enable | disable}**

Syntax Description	
<b>config</b>	Configure parameters.
<b>spanningtree</b>	Spanning Tree Protocol.
<b>switch</b>	Configure spanning tree values on a per switch basis.
<b>mode</b>	Configure Spanning Tree Protocol on the switch.
<b>{enable   disable}</b>	Enable or disable Spanning Tree Protocol on the switch.

**Defaults** STP = Disabled.

**Examples** To support STP on all Cisco Wireless LAN controller Ports:

> **config spanningtree switch mode enable**

**Related Commands** **show spanningtree switch**, **config spanningtree switch bridgepriority**, **config spanningtree switch forwarddelay**, **config spanningtree switch hello time**, **config spanningtree switch maxage**, **config spanningtree port mode**

## Configure Switch Configuration Commands

Use the **config switchconfig** commands to configure switch settings.

# config switchconfig flowcontrol

To enable or disable 802.3x flow control, use the **config switchconfig flowcontrol** command.

```
config switchconfig flowcontrol {enable | disable}
```

---

**Syntax Description**

<b>config</b>	Configure parameters.
<b>switchconfig</b>	Cisco Wireless LAN controller parameters.
<b>flowcontrol</b>	Configure flow control.
<b>{enable   disable}</b>	Enable or disable 802.3x flow control.

---

---

**Defaults**

Disabled

---

**Examples**

```
> config switchconfig flowcontrol enable
```

---

**Related Commands**

**show switchconfig**

## config switchconfig mode

To configure LWAPP transport mode for Layer 2 or Layer 3, use the **config switchconfig flowcontrol** command.

**config switchconfig mode {L2 | L3}**

Syntax Description	
<b>config</b>	Configure parameters.
<b>switchconfig</b>	Cisco Wireless LAN controller parameters.
<b>mode</b>	Configure LWAPP transport mode to Layer 2 or Layer 3.
<b>{L2   L3}</b>	Enter a transport mode: <b>L2</b> for Layer 2 or <b>L3</b> for Layer 3.

Defaults	L3
----------	----

Examples	> <b>config switchconfig mode L3</b>
----------	--------------------------------------

Related Commands	<b>show switchconfig</b>
------------------	--------------------------

# config switchconfig secret-obfuscation

To enable or disable secret obfuscation, use the **config switchconfig secret-obfuscation** command.

**config switchconfig secret-obfuscation {enable | disable}**

**Note**

To keep the secret contents of your configuration file secure, do not disable secret obfuscation. To further enhance the security of the configuration file, enable configuration file encryption.

**Syntax Description**

<b>config</b>	Configure parameters.
<b>switchconfig</b>	Cisco Wireless LAN controller parameters.
<b>{enable   disable}</b>	Enable or disable secret obfuscation.

**Defaults**

Secrets and user passwords are obfuscated in the exported XML configuration file.

**Examples**

> config switchconfig secret-obfuscation enable

**Related Commands**

show switchconfig

## config sysname

To set the Cisco Wireless LAN controller system name, use the **config sysname** command.

**config sysname** *name*

---

### Syntax Description

<b>config</b>	Configure parameters.
<b>sysname</b>	Configures the system name.
<i>name</i>	System name. Up to 31 alphanumeric characters.

---

---

### Defaults

None.

---

### Examples

> **config sysname Ent\_01**

---

### Related Commands

show sysinfo

## Configure TACACS Commands

Use the **config tacacs** commands to configure TACACS+ settings.

# config tacacs

To configure TACACS+ accounting, authentication, and authorization servers, use the **config tacacs** command.

**config tacacs [ acct | auth | athr ]**

<b>Syntax Description</b>	
<b>acct</b>	(Optional) Configures a TACACS+ accounting server.
<b>auth</b>	(Optional) Configures a TACACS+ authentication server
<b>athr</b>	(Optional) Configures a TACACS+ authorization server

**Defaults** This command has no defaults.

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	4.1	This command was introduced.

**Examples** None.

**Related Commands**

- show run-config
- show tacacs summary

# config tacacs acct

To configure TACACS+ accounting server settings, use the **config tacacs acct** command.

```
config tacacs acct {add server_index ip_address port type secret_key |
delete server_index |
disable server_index |
enable server_index |
retransmit-timeout server_index seconds }
```

Syntax Description	
<b>add</b>	(Optional) Add a new TACACS+ accounting server.
<i>server_index</i>	Specifies the TACACS+ accounting server index (1 to 3).
<i>ip_address</i>	Specifies the IP address for the TACACS+ accounting server.
<i>port</i>	Specifies the controller port used for the TACACS+ accounting server.
<i>type</i>	Specifies the type of secret key being used (ASCII or HEX).
<i>secret_key</i>	Specifies the secret key in ASCII or hexadecimal characters.
<b>delete</b>	(Optional) Deletes a TACACS+ server.
<b>disable</b>	(Optional) Disables a TACACS+ server.
<b>enable</b>	(Optional) Enables a TACACS+ server.
<b>retransmit-timeout</b>	(Optional) Changes the default retransmit timeout for the TACACS+ server.
<b>seconds</b>	Specifies the retransmit timeout (2 to 30 seconds).

---

## Defaults

This command has no defaults.

Command History	Release	Modification
	4.1	This command was introduced.

---

## Examples

```
> config tacacs acct add 1 10.0.0.0 10 ascii 12345678
> config tacacs acct retransmit-timeout 30
> config tacacs acct enable 1
```

---

## Related Commands

- show run-config**
- show tacacs acct statistics**
- show tacacs summary**

# config tacacs athr

To configure TACACS+ authorization server settings, use the **config tacacs athr** command.

```
config tacacs athr {add server_index ip_address port type secret_key |
    delete server_index |
    disable server_index |
    enable server_index |
    retransmit-timeout server_index seconds }
```

## Syntax Description

<b>add</b>	(Optional) Add a new TACACS+ authorization server.
<i>server_index</i>	Specifies the TACACS+ authorization server index (1 to 3).
<i>ip_address</i>	Specifies the IP address for the TACACS+ authorization server.
<i>port</i>	Specifies the controller port used for the TACACS+ authorization server.
<i>type</i>	Specifies the type of secret key being used (ASCII or HEX).
<i>secret_key</i>	Specifies the secret key in ASCII or hexadecimal characters.
<b>delete</b>	(Optional) Deletes a TACACS+ server.
<b>disable</b>	(Optional) Disables a TACACS+ server.
<b>enable</b>	(Optional) Enables a TACACS+ server.
<b>retransmit-timeout</b>	(Optional) Changes the default retransmit timeout for the TACACS+ server.
<b>seconds</b>	Specifies the retransmit timeout (2 to 30 seconds).

## Defaults

This command has no defaults.

## Command History

Release	Modification
4.1	This command was introduced.

## Examples

```
> config tacacs athr add 3 10.0.0.0 4 ascii 12345678
> config tacacs athr retransmit-timeout 30
> config tacacs athr enable 3
```

## Related Commands

- show run-config
- show tacacs athr statistics
- show tacacs summary

# config tacacs auth

To configure TACACS+ authentication server settings, use the **config tacacs auth** command.

```
config tacacs auth {add server_index ip_address port type secret_key |
delete server_index |
disable server_index |
enable server_index |
retransmit-timeout server_index seconds }
```

Syntax Description	
<b>add</b>	(Optional) Add a new TACACS+ authentication server.
<i>server_index</i>	Specifies the TACACS+ authentication server index (1 to 3).
<i>ip_address</i>	Specifies the IP address for the TACACS+ authentication server.
<i>port</i>	Specifies the controller port used for the TACACS+ authentication server.
<i>type</i>	Specifies the type of secret key being used (ASCII or HEX).
<i>secret_key</i>	Specifies the secret key in ASCII or hexadecimal characters.
<b>delete</b>	(Optional) Deletes a TACACS+ server.
<b>disable</b>	(Optional) Disables a TACACS+ server.
<b>enable</b>	(Optional) Enables a TACACS+ server.
<b>retransmit-timeout</b>	(Optional) Changes the default retransmit timeout for the TACACS+ server.
<b>seconds</b>	Specifies the retransmit timeout (2 to 30 seconds).

## Defaults

This command has no defaults.

## Command History

	Release	Modification
	4.1	This command was introduced.

## Examples

```
> config tacacs auth add 2 10.0.0.3 6 ascii 12345678
> config tacacs auth retransmit-timeout 30
> config tacacs auth enable 2
```

## Related Commands

- show run-config**
- show tacacs auth statistics**
- show tacacs summary**

# config tacacs all

To configure a single TACACS+ server for accounting, authentication, and authorization, use the **config tacacs all** command.

**config tacacs all (index ) (ip\_address) (port) (secret\_key)**

<b>Syntax Description</b>	
<i>index</i>	Specifies the TACACS+ server index (1 to 3).
<i>ip_address</i>	Specifies the IP address of the TACACS+ server.
<i>port</i>	Specifies the port used on the TACACS+ server.
<i>secret_key</i>	Specifies the secret key in ASCII or hexadecimal characters.

**Defaults** This command has no defaults.

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	4.1	This command was introduced.

**Examples** None.

**Related Commands**

- show run-config
- show tacacs summary

# config time manual

To set the system time, use the **config time manual** command.

**config time manual** *MM/DD/YY HH:MM:SS*

Syntax Description	
<b>config</b>	Command action.
<b>time</b>	Configures system time or servers.
<b>manual</b>	Configures the system time.
<i>MM/DD/YY</i>	Enter date.
<i>HH:MM:SS</i>	Enter time.

**Defaults** None.

**Examples** > **config time manual 02/11/2003 15:29:00**

**Related Commands** **show time**

# config time ntp

To set the Network Time Protocol, use the **config time ntp** command.

```
config time ntp {interval seconds | server index ip_address}
```

<b>Syntax Description</b>	
<b>config</b>	Command action.
<b>time</b>	Configures system time or servers.
<b>ntp</b>	Configures the Network Time Protocol.
<b>interval</b>	
<b>{interval   server}</b>	<ul style="list-style-type: none"> <li>• Enter interval to configure the Network Time Protocol polling interval.</li> <li>• Enter server to configure the Network Time Protocol servers.</li> </ul>
<b>seconds</b>	NTP polling interval in seconds (between 6800 and 604800).
<b>index</b>	NTP server index.
<b>ip_address</b>	NTP server's IP address. Use 0.0.0.0 to delete entry.

**Defaults** None.

**Examples** > **config time ntp interval 7000**

**Related Commands** **show time**

## config time timezone

To configures the system's timezone, use the **config time timezone** command.

```
config time timezone {enable | disable} delta_hours delta_mins
```

Syntax Description	
<b>config</b>	Command action.
<b>time</b>	Configures system time or servers.
<b>timezone</b>	Disables or enables daylight savings time for the system.
<b>{enable   disable}</b>	Enable or disable daylight savings time.
<i>delta_hours</i>	Enter the local hour difference from Universal Coordinated Time (UCT).
<i>delta_mins</i>	Enter the local minute difference from UCT.

---

**Defaults** None.

---

**Examples** > config time timezone enable 2 0

---

**Related Commands** show time

# config time timezone location

To set the timezone location in order to have Daylight Savings Time (DST) set automatically when it occurs, use the **config time timezone location** command.

**config time timezone location** *location\_index*

Syntax Description	
<b>config</b>	Command action.
<b>time</b>	Configures system time or servers.
<b>timezone</b>	Enables daylight savings time for the system.
<b>location</b>	Configure the location automatically
<i>location_index</i>	<p>A number representing the timezone required. The Timezones are as follows:</p> <ul style="list-style-type: none"> <li>• 1. (GMT-12:00) International Date Line West</li> <li>• 2. (GMT-11:00) Samoa</li> <li>• 3. (GMT-10:00) Hawaii</li> <li>• 4. (GMT-9:00) Alaska</li> <li>• 5. (GMT-8:00) Pacific Time (US and Canada)</li> <li>• 6. (GMT-7:00) Mountain Time (US and Canada)</li> <li>• 7. (GMT-6:00) Central Time (US and Canada)</li> <li>• 8. (GMT-5:00) Eastern Time (US and Canada)</li> <li>• 9. (GMT-4:00) Atlantic Time (Canada)</li> <li>• 10. (GMT-3:00) Buenos Aires (Argentina)</li> <li>• 11. (GMT-2:00) Mid-Atlantic</li> <li>• 12. (GMT-1:00) Azores</li> <li>• 13. (GMT) London, Lisbon, Dublin, Edinburgh (default value)</li> <li>• 14. (GMT +1:00) Amsterdam, Berlin, Rome, Vienna</li> <li>• 15. (GMT +2:00) Jerusalem</li> <li>• 16. (GMT +3:00) Baghdad</li> <li>• 17. (GMT +4:00) Muscat, Abu Dhabi</li> <li>• 18. (GMT +4:30) Kabul</li> <li>• 19. (GMT +5:00) Karachi, Islamabad, Tashkent</li> <li>• 20. (GMT +5:30) Colombo, Kolkata, Mumbai, New Delhi</li> <li>• 21. (GMT +5:45) Katmandu</li> <li>• 22. (GMT +6:00) Almaty, Novosibirsk</li> <li>• 23. (GMT +6:30) Rangoon</li> <li>• 24. (GMT +7:00) Saigon, Hanoi, Bangkok, Jakarta</li> <li>• 25. (GMT +8:00) Hong Kong, Bejing, Chongquing</li> <li>• 26. (GMT +9:00) Tokyo, Osaka, Sapporo</li> <li>• 27. (GMT +9:30) Darwin</li> <li>• 28. (GMT+10:00) Sydney, Melbourne, Canberra</li> <li>• 29. (GMT+11:00) Magadan, Solomon Is., New Caledonia</li> <li>• 30. (GMT+12:00) Kamchatka, Marshall Is., Fiji</li> </ul>

---

## Defaults

None.

---

**Examples**

```
> config time timezone location 10
```

---

## Configure Trap Flag Commands

Use the **config trapflags** commands to configure trap flags settings.

# config trapflags 802.11-Security

To enable or disable sending 802.11 Security related traps, use the **config trapflags 802.11-Security** command.

```
config trapflags 802.11-Security wepDecryptError {enable | disable}
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>trapflags</b>	Trap parameters.
<b>802.11-Security</b>	802.11 security traps flag.
<b>wepDecryptError</b>	Send the WEP decrypt error to clients.
<b>{enable   disable}</b>	Enable or disable sending 802.11 Security related traps.

## Defaults

Enabled

## Examples

```
> config trapflags 802.11-Security wepDecryptError disable
```

## Related Commands

**show trapflags**

■ config trapflags aaa

## config trapflags aaa

To enable or disable the sending of AAA server related traps, use the **config trapflags aaa** command.

```
config trapflags aaa {auth | servers} {enable | disable}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>trapflags</b>	Trap parameters.
<b>aaa</b>	Configure the of sending AAA related traps.
<b>{auth   servers}</b>	<ul style="list-style-type: none"><li>Enter <b>auth</b> to enable trap sending when AAA authentication failure occurs for mgmt user or net user or macfilter.</li><li>Enter <b>servers</b> to enable trap sending when No Radius servers are responding.</li></ul>
<b>{enable   disable}</b>	Enable or disable the sending of AAA server related traps.

  

<b>Defaults</b>	Enabled
-----------------	---------

  

<b>Examples</b>	> config trapflags aaa auth disable
-----------------	-------------------------------------

  

<b>Related Commands</b>	show trapflags
-------------------------	----------------

# config trapflags ap

To enable or disable the sending of Cisco lightweight access point related traps, use the **config trapflags ap** command.

```
config trapflags ap {register | interfaceUp} {enable | disable}
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>trapflags</b>	Trap parameters.
<b>ap</b>	Cisco lightweight access point traps flag.
<b>{register   interfaceUp}</b>	<ul style="list-style-type: none"> <li>• Enter <b>register</b> to enable sending trap when a Cisco lightweight access point registers with Cisco switch.</li> <li>• Enter <b>interfaceUp</b> to enable sending trap when a Cisco lightweight access point interface (A or B) comes up.</li> </ul>
<b>{enable   disable}</b>	Enable or disable sending access point related traps.

## Defaults

Enabled

## Examples

```
> config trapflags ap register disable
```

## Related Commands

show trapflags

# config trapflags authentication

To enable or disable sending traps on invalid SNMP access, use the **config trapflags authentication** command.

**config trapflags authentication {enable | disable}**

Syntax Description	
<b>config</b>	Configure parameters.
<b>trapflags</b>	Trap parameters.
<b>authentication</b>	Configure trap sending on invalid SNMP access.
<b>{enable   disable}</b>	Enable or disable sending traps on invalid SNMP access.

**Defaults** Enabled

**Examples** > **config trapflags authentication disable**

**Related Commands** **show trapflags**

# config trapflags client

To enable or disable the sending of client related DOT11 traps, use the **config trapflags client** command.

```
config trapflags client {802.11-disassociate | 802.11-deauthenticate | 802.11-authfail |
802.11-assocfail | excluded} {enable | disable}
```

<b>Syntax Description</b>	<table border="1"> <tr> <td><b>config</b></td><td>Configure parameters.</td></tr> <tr> <td><b>trapflags</b></td><td>Trap parameters.</td></tr> <tr> <td><b>client</b></td><td>Configure the sending of client related Dot11 traps.</td></tr> <tr> <td>{802.11-disassociate   802.11-deauthenticate   802.11-authfail   802.11-assocfail   excluded}</td><td> <ul style="list-style-type: none"> <li>Enter <b>802.11-disassociate</b> to enable the sending of Dot11 disassociation traps to clients.</li> <li>Enter <b>802.11-deauthenticate</b> to enable the sending of Dot11 deauthentication traps to clients.</li> <li>Enter <b>802.11-authfail</b> to enable the sending of Dot11 authentication fail traps to clients.</li> <li>Enter <b>802.11-assocfail</b> to enable the sending of Dot11 association fail traps to clients.</li> <li>Enter <b>excluded</b> to enable the sending of excluded trap to clients.</li> </ul> </td></tr> <tr> <td>{enable   disable}</td><td>Enable or disable the sending of client related DOT11 traps.</td></tr> </table>	<b>config</b>	Configure parameters.	<b>trapflags</b>	Trap parameters.	<b>client</b>	Configure the sending of client related Dot11 traps.	{802.11-disassociate   802.11-deauthenticate   802.11-authfail   802.11-assocfail   excluded}	<ul style="list-style-type: none"> <li>Enter <b>802.11-disassociate</b> to enable the sending of Dot11 disassociation traps to clients.</li> <li>Enter <b>802.11-deauthenticate</b> to enable the sending of Dot11 deauthentication traps to clients.</li> <li>Enter <b>802.11-authfail</b> to enable the sending of Dot11 authentication fail traps to clients.</li> <li>Enter <b>802.11-assocfail</b> to enable the sending of Dot11 association fail traps to clients.</li> <li>Enter <b>excluded</b> to enable the sending of excluded trap to clients.</li> </ul>	{enable   disable}	Enable or disable the sending of client related DOT11 traps.
<b>config</b>	Configure parameters.										
<b>trapflags</b>	Trap parameters.										
<b>client</b>	Configure the sending of client related Dot11 traps.										
{802.11-disassociate   802.11-deauthenticate   802.11-authfail   802.11-assocfail   excluded}	<ul style="list-style-type: none"> <li>Enter <b>802.11-disassociate</b> to enable the sending of Dot11 disassociation traps to clients.</li> <li>Enter <b>802.11-deauthenticate</b> to enable the sending of Dot11 deauthentication traps to clients.</li> <li>Enter <b>802.11-authfail</b> to enable the sending of Dot11 authentication fail traps to clients.</li> <li>Enter <b>802.11-assocfail</b> to enable the sending of Dot11 association fail traps to clients.</li> <li>Enter <b>excluded</b> to enable the sending of excluded trap to clients.</li> </ul>										
{enable   disable}	Enable or disable the sending of client related DOT11 traps.										

<b>Defaults</b>	Disabled
<b>Examples</b>	<pre>&gt; config trapflags client 802.11-disassociate disable</pre>
<b>Related Commands</b>	show trapflags

## config trapflags configsave

To enable or disable the sending of configuration saved traps, use the **config trapflags configsave** command.

```
config trapflags configsave {enable | disable}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>trapflags</b>	Trap parameters.
<b>configsav</b>	Configure the sending of configuration saved traps.
<b>{enable   disable}</b>	Enable or disable the sending of configuration saved traps.

**Defaults** Enabled

**Examples** > config trapflags configsave disable

**Related Commands** show trapflags

# config trapflags ipsec

To enable or disable the sending of IPSec traps, use the **config trapflags ipsec** command.

```
config trapflags ipsec {esp-auth | esp-reply | invalidSPI | ike-neg | suite-neg | invalid-cookie}
{enable | disable}
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>trapflags</b>	Trap parameters.
<b>ipsec</b>	IPSec trap flags.
{ <b>esp-auth   esp-reply   invalidSPI   ike-neg   suite-neg   invalid-cookie</b> }	<ul style="list-style-type: none"> <li>• Enable the sending of IPSec traps when ESP authentication failure occurs.</li> <li>• Enable the sending of IPSec traps when ESP replay failure occurs.</li> <li>• Enable the sending of IPSec traps when ESP invalid SPI is detected.</li> <li>• Enable the sending of IPSec traps when IKE negotiation failure occurs.</li> <li>• Enable the sending of IPSec traps when suite negotiation failure occurs.</li> <li>• Enable the sending of IPSec traps when Isakamp invalid cookie is detected.</li> </ul>
{ <b>enable   disable</b> }	Enable or disable the sending of IPSec traps.

## Defaults

Enabled

## Examples

```
> config trapflags ipsec esp-auth disable
```

## Related Commands

**show trapflags**

## config trapflags linkmode

To enable or disable Cisco Wireless LAN controller level Link up/down trap flags, use the **config trapflags linkmode** command.

```
config trapflags linkmode {enable | disable}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>trapflags</b>	Trap parameters.
<b>linkmode</b>	Configure switch-level link up/down trap flag.
<b>{enable   disable}</b>	Enable or disable Cisco Wireless LAN controller level Link up/down trap flags.

**Defaults** Enabled

**Examples** > **config trapflags linkmode disable**

**Related Commands** [show trapflags](#)

# config trapflags multiusers

To enable or disable the sending of traps when multiple logins active, use the **config trapflags multiusers** command.

```
config trapflags multiusers {enable | disable}
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>trapflags</b>	Trap parameters.
<b>multiusers</b>	Configure trap sending when multiple logins are active.
<b>{enable   disable}</b>	Enable or disable the sending of traps when multiple logins active.

## Defaults

Enabled

## Examples

```
> config trapflags multiusers disable
```

## Related Commands

show trapflags

## config trapflags rogueap

To enable or disable sending rogue access point detection traps, use the **config trapflags rogueap** command.

```
config trapflags rogueap {enable | disable}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>trapflags</b>	Trap parameters.
<b>rogueap</b>	Configure rogue access point detection trap sending.
<b>{enable   disable}</b>	Enable or disable the sending of rogue access point detection traps.

**Defaults** Enabled

**Examples** > config trapflags rogueap disable

**Related Commands** show trapflags

# config trapflags rrm-params

To enable or disable the sending of RRM profile related traps, use the **config trapflags rrm-params** command.

```
config trapflags rrm-params {tx-power | channel | antenna} {enable | disable}
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>trapflags</b>	Trap parameters.
<b>rrm-params</b>	RRM parameters traps flag.
{ <b>tx-power   channel   antenna</b> }	<ul style="list-style-type: none"> <li>• Enter <b>tx-power</b> to enable trap sending when RF manager automatically changes tx-power level for the Cisco lightweight access point interface.</li> <li>• Enter <b>channel</b> to enable trap sending when RF manager automatically changes channel for the Cisco lightweight access point interface.</li> <li>• Enter <b>antenna</b> to enable trap sending when RF manager automatically changes antenna for the Cisco lightweight access point interface.</li> </ul>
<b>{enable   disable}</b>	Enable or disable the sending of RRM profile related traps.

## Defaults

Enabled

## Examples

```
> config trapflags rrm-params tx-power disable
```

## Related Commands

**show trapflags**

## config trapflags rrm-profile

To enable or disable the sending of RRM profile related traps, use the **config trapflags rrm-profile** command.

```
config trapflags rrm-profile {load | noise | interference | coverage} {enable | disable}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>trapflags</b>	Trap parameters.
<b>rrm-profile</b>	RRM profile traps flag.
{ <b>load</b>   <b>noise</b>   <b>interference</b>   <b>coverage</b> }	<ul style="list-style-type: none"><li>Enter <b>load</b> to enable trap sending when the load profile maintained by the RF manager fails.</li><li>Enter <b>noise</b> to enable trap sending when the noise profile maintained by the RF manager fails.</li><li>Enter <b>interference</b> to enable trap sending when the interference profile maintained by the RF manager fails.</li><li>Enter <b>coverage</b> to enable trap sending when the coverage profile maintained by the RF manager fails.</li></ul>
{ <b>enable</b>   <b>disable</b> }	Enable or disable the sending of RRM profile related traps.

**Defaults** Enabled

**Examples** > config trapflags rrm-profile load disable

**Related Commands** show trapflags

# config trapflags stpmode

To enable or disable the sending of spanning tree traps, use the **config trapflags stpmode** command.

```
config trapflags stpmode {enable | disable}
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>trapflags</b>	Trap parameters.
<b>stpmode</b>	Configure spanning tree trap sending.
<b>{enable   disable}</b>	Enable or disable the sending of spanning tree traps.

## Defaults

Enabled

## Examples

```
> config trapflags stpmode disable
```

## Related Commands

show trapflags

## config trapflags wps

To enable or disable wireless protection system (WPS) trap sending, use the **config trapflags wps** command.

```
config trapflags wps {enable | disable}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>trapflags</b>	Trap parameters.
<b>wps</b>	Configure WPS trap sending.
<b>{enable   disable}</b>	Enable or disable WPS trap sending.

**Defaults** Enabled

**Examples** > **config trapflags wps disable**

**Related Commands** [show trapflags](#)

## Configure Watchlist Commands

Use the **config watchlist** commands to configure watchlist settings.

# config watchlist add

To add a watchlist entry for a wireless LAN, use the **config watchlist add** command.

```
config watchlist add {mac MAC | username username}
```

Syntax Description	
<b>config watchlist</b>	Command action.
<b>add</b>	Add a watchlist entry.
{ <b>mac MAC</b>   <b>username username</b> }	<ul style="list-style-type: none"><li>• Enter mac and specify the MAC address of the wireless LAN.</li><li>• Enter username and specify the name of the user to watch.</li></ul>

Defaults	None.
----------	-------

Examples	> config watchlist add mac a5:6b:ac:10:01:6b
----------	--

Related Commands	<b>config watchlist delete</b> <b>config watchlist enable</b> <b>config watchlist disable</b> <b>show watchlist</b>
------------------	--

## config watchlist delete

To delete a watchlist entry for a wireless LAN, use the **config watchlist delete** command.

```
config watchlist delete {mac MAC | username username}
```

Syntax Description	
<b>config watchlist</b>	Command action.
<b>delete</b>	Delete a watchlist entry.
{ <b>mac MAC</b>   <b>username username</b> }	<ul style="list-style-type: none"><li>• Enter mac and specify the MAC address of the wireless LAN to delete from the list.</li><li>• Enter username and specify the name of the user to delete from the list.</li></ul>

**Defaults** None.

**Examples** > config watchlist delete mac a5:6b:ac:10:01:6b

**Related Commands** config watchlist add  
config watchlist enable  
config watchlist disable  
show watchlist

# config watchlist disable

To disable the client watchlist, use the **config watchlist disable** command.

**config watchlist disable**

---

## Syntax Description

<b>config</b>	Command action.
<b>watchlist</b>	Configure the client watchlist.
<b>disable</b>	Disable the client watchlist.

---

---

## Defaults

None.

---

## Examples

> config watchlist disable

---

## Related Commands

**config watchlist add**  
**config watchlist delete**  
**show watchlist**

## config watchlist enable

To enable a watchlist entry for a wireless LAN, use the **config watchlist enable** command.

**config watchlist enable**

<b>Syntax Description</b>	
<b>config watchlist</b>	Command action.
<b>watchlist</b>	Configure the client watchlist.
<b>enable</b>	Enable the client watchlist.

<b>Defaults</b>	None.
-----------------	-------

<b>Examples</b>	> <b>config watchlist enable</b>
-----------------	----------------------------------

<b>Related Commands</b>	<b>config watchlist add</b> <b>config watchlist delete</b> <b>show watchlist</b>
-------------------------	--

## Configure Wireless LAN Commands

Use the **config wlan** commands to configure wireless LAN command settings.

# config wlan 7920-support

To configure support for phones, use the **config wlan 7920-support** command.

To enable or disable 7920 support mode for phones that require client-controlled CAC—**config wlan 7920-support client-cac-limit {enable | disable} wlan\_id**

To enable or disable 7920 support mode for phones that require access point-controlled CAC—**config wlan 7920-support ap-cac-limit {enable | disable} wlan\_id**

**Note** You cannot enable both WMM mode and client-controlled CAC mode on the same WLAN.

## Syntax Description

<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>7920-support</b>	Configure support for phones.
<b>{ap-cac-limit   client-cac-limit}</b>	<ul style="list-style-type: none"> <li>• Enter <b>ap-cac-limit</b> to support phones that expect the Cisco vendor-specific IE.</li> <li>• Enter <b>client-cac-limit</b> to support phones that expect the IEEE 802.11e Draft 6 QBSS-load.</li> </ul>
<b>{enable   disable}</b>	Enable or disable phone support.
<b>wlan_id</b>	Wireless LAN identifier between 1 and 16.

## Defaults

None.

## Examples

```
> config wlan 7920-support ap-cac-limit enable 8
```

## Related Commands

**show wlan**

## config wlan 802.11e

To configure 802.11e support on a wireless LAN, use the **config wlan 802.11e** command.

802.11e provides Quality of Service (QoS) support for LAN applications, which are critical for delay sensitive applications such as Voice over Wireless IP (VoWIP).

802.11e enhances the 802.11 Media Access Control layer (MAC layer) with a coordinated time division multiple access (TDMA) construct, and adds error-correcting mechanisms for delay sensitive applications such as voice and video. The 802.11e specification provides seamless interoperability and is especially well suited for use in networks that include multimedia capability.

```
config wlan 802.11e {allow | disable | require} wlan_id
```

### Syntax Description

<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>802.11e</b>	Configure 802.11e.
<b>{allow   disable   require}</b>	<ul style="list-style-type: none"><li>• Enter <b>allow</b> to allow 802.11e on the wireless LAN.</li><li>• Enter <b>disable</b> to disable 802.11e on the wireless LAN.</li><li>• Enter <b>require</b> to require 802.11e-enabled clients on the wireless LAN.</li></ul>
<b>wlan_id</b>	Wireless LAN identifier between 1 and 16.

### Defaults

None.

### Examples

```
> config wlan 802.11e allow 1
```

### Related Commands

**show trapflags**

# config wlan aaa-override

To configure user policy override via AAA on a wireless LAN, use the **config wlan aaa-override** command.

When AAA override is enabled, and a client has conflicting AAA and Cisco Wireless LAN controller wireless LAN authentication parameters, client authentication is performed by the AAA server. As part of this authentication, the operating system will move clients from the default Cisco wireless LAN solution wireless LAN VLAN to a VLAN returned by the AAA server and predefined in the Cisco Wireless LAN controller interface configuration (only when configured for MAC filtering, 802.1X, and/or WPA operation). In all cases, the operating system will also use QoS and ACL provided by the AAA server, as long as they are predefined in the Cisco Wireless LAN controller interface configuration. (This VLAN switching by AAA override is also referred to as Identity Networking.)

For instance, if the Corporate wireless LAN primarily uses a management interface assigned to VLAN 2, and if AAA override returns a redirect to VLAN 100, the Operating System redirects all client transmissions to VLAN 100, regardless of the physical port to which VLAN 100 is assigned.

When AAA override is disabled, all client authentication defaults to the Cisco Wireless LAN controller authentication parameter settings, and authentication is only performed by the AAA server if the Cisco Wireless LAN controller wireless LAN do not contain any client-specific authentication parameters.

The AAA override values may come from a RADIUS server, for example.

```
config wlan aaa-override {enable | disable} {wlan_id | foreignAp}
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>aaa-override</b>	Configures user policy override via AAA on a wireless LAN.
<b>{enable   disable}</b>	Enable or disable policy override.
<b>{wlan_id   foreignAp}</b>	<ul style="list-style-type: none"> <li>• Enter a wireless LAN identifier between 1 and 16.</li> <li>• Enter <b>foreignAp</b> for third party access points.</li> </ul>

## Defaults

Disabled.

## Examples

```
> config wlan aaa-override enable 1
```

## Related Commands

**show wlan**

## config wlan acl

To configure a wireless LAN access control list (ACL), use the **config wlan acl** command.

**config wlan acl *wlan\_id* [ *acl\_name* | **none** ]**

Syntax Description	
<i>wlan_id</i>	Specifies the wireless LAN identifier (1 to 16).
<i>acl_name</i>	Specifies the ACL name.
<b>none</b>	Clears the ACL settings for the specified wireless LAN.

**Defaults** This command has no defaults.

Command History	Release	Modification
	4.1	This command was introduced.

**Examples** > **config wlan acl 1 office\_1**

**Related Commands** **show wlan**

# config wlan apgroup nac

To enable or disable NAC out-of-band support for a specific AP group VLAN, enter this command:

```
config wlan apgroup nac {enable | disable} apgroup_name wlan_id
```

## Syntax Description

<i>apgroup_name</i>	AP group name.
<i>wlan_id</i>	Wireless LAN identifier between 1 and 16.

## Defaults

Disabled.

## Examples

```
> config wlan apgroup nac enable apgroup 4
```

## Related Commands

[config guest-lan nac](#)  
[config wlan nac](#)

## config wlan broadcast-ssid

To configure an SSID broadcast on a wireless LAN, use the **config wlan broadcast-ssid** command.

```
config wlan broadcast-ssid {enable | disable} wlan_id
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>broadcast-ssid</b>	Configure an SSID broadcast on a wireless LAN.
<b>{enable   disable}</b>	Enable or disable SSID broadcasts on a wireless LAN.
<b>wlan_id</b>	Wireless LAN identifier between 1 and 16.

**Defaults** Disabled.

**Examples** > config wlan broadcast-ssid enable 1

**Related Commands** show wlan

# config wlan create

To create a wireless LAN, use the **config wlan create** command.

```
config wlan create {[wlan_id] [profile_name | foreignAp] [ssid]}
```

<b>Syntax Description</b>	<p><b>wlan_id</b> Specifies the wireless LAN identifier (between 1 and 16). Also enter the SSID network name (up to 32 alphanumeric characters).</p> <p>Enter <b>foreignAp</b> for third party access points.</p>
<b>profile_name</b>	Specifies a unique profile name (up to 32 alphanumeric characters).
<b>Note</b>	If an SSID is not specified, this field is used as the SSID.
<b>foreignAp</b>	Specifies a foreign access point.

**ssid** (Optional) Specifies a unique name (up to 32 alphanumeric characters) to be used as the SSID.

<b>Defaults</b>	None.
-----------------	-------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	4.1	This command was revised to add the optional SSID field.

<b>Examples</b>	> config wlan create 1 factory SSID01
-----------------	---------------------------------------

<b>Related Commands</b>	show trapflags
-------------------------	----------------

## config wlan delete

To delete a wireless LAN, use the **config wlan delete** command.

```
config wlan delete {wlan_id | foreignAp}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>delete</b>	Delete a wireless LAN.
{ <i>wlan_id</i>   <b>foreignAp</b> }	<ul style="list-style-type: none"><li>• Enter a wireless LAN identifier between 1 and 16.</li><li>• Enter <b>foreignAp</b> for third party access points.</li></ul>

**Defaults** None.

**Examples** > config wlan delete 16

**Related Commands** **show wlan**  
**show wlan summary**

# config wlan dhcp\_server

To configure the internal DHCP server for a wireless LAN, use the **config wlan dhcp\_server** command.

```
config wlan dhcp_server {wlan_id | foreignAp} ip_address [required]
```

Syntax Description	<b>config</b> Configure parameters. <b>wlan</b> Wireless LAN parameters. <b>dhcp_server</b> Configure internal DHCP server. <b>{wlan_id   foreignAp}</b> <ul style="list-style-type: none"> <li>Enter a wireless LAN identifier between 1 and 16.</li> <li>Enter <b>foreignAp</b> for third party access points.</li> </ul> <b>ip_address</b> IP Address of the internal DHCP server (this parameter is required). <b>[required]</b> Optionally, specify whether DHCP address assignment is required.
--------------------	---

**Defaults** None.

**Examples** > **config wlan dhcp\_server 16 10.10.2.1**

**Related Commands** show wlan

## config wlan diag-channel

To enable the diagnostic channel troubleshooting on a particular WLAN, use the **config wlan diag-channel** command.

**config wlan diag-channel [ enable | disable ] wlan\_id**

Syntax Description	wlan_id      Specifies the wireless LAN identifier (1 to 16).
<b>enable</b>	(Optional) Enables the wireless LAN diagnostic channel.
<b>disable</b>	(Optional) Disables the wireless LAN diagnostic channel.

**Defaults** This command has no defaults.

Command History	Release	Modification
	4.1	This command was introduced.

**Examples** > config wlan diag-channel enable 1

**Related Commands** **show run-config**  
**show wlan**

# config wlan disable

To disable a wireless LAN, use the **config wlan disable** command.

```
config wlan disable {wlan_id | foreignAp}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>disable</b>	Disable a wireless LAN.
{ <b>wlan_id</b>   <b>foreignAp</b> }	<ul style="list-style-type: none"><li>• Enter a wireless LAN identifier between 1 and 16.</li><li>• Enter <b>foreignAp</b> for third party access points.</li></ul>

**Defaults** None.

**Examples** > config wlan disable 16

**Related Commands** show wlan

## config wlan dtim

To disable a wireless LAN, use the **config wlan disable** command.

**config wlan dtim {802.11a | 802.11b} dtim wlan\_id**

Syntax Description	
<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>dtim</b>	Delivery traffic indication map
{802.11a   802.11b}	<ul style="list-style-type: none"><li>Configure dtim for 802.11a radio network.</li><li>Configure dtim for 802.11b radio network.</li></ul>
<i>dtim</i>	Value for dtim (between 1 - 255 inclusive)
<i>wlan_id</i>	Number of the WLAN to be configured

**Defaults** Default dtim 1.

**Examples** > **config wlan dtim 802.11a 128 1**

**Related Commands** **show wlan**

# config wlan enable

To enable a wireless LAN, use the **config wlan enable** command.

```
config wlan enable {wlan_id | foreignAp}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>enable</b>	Enable a wireless LAN.
{ <i>wlan_id</i>   <b>foreignAp</b> }	<ul style="list-style-type: none"><li>Enter a wireless LAN identifier between 1 and 16.</li><li>Enter <b>foreignAp</b> for third party access points.</li></ul>
Defaults	None.
Examples	> config wlan enable 16
Related Commands	show wlan

# config wlan exclusionlist

To configure the wireless LAN exclusion list, use the config wlan exclusionlist command.

```
config wlan exclusionlist [ wlan_id [enabled | disabled | time] |  
foreignap [ enabled | disabled | time ] ]
```

Syntax Description	
<i>wlan_id</i>	Specifies the wireless LAN identifier (1 to 16).
<b>enabled</b>	Enables the exclusion list for the specified wireless LAN or foreign access point.
<b>disabled</b>	Disables the exclusion list for the specified wireless LAN or a foreign access point.
<i>time</i>	Specifies the exclusion list timeout in seconds. A value of zero (0) specifies infinite time.
<b>foreignap</b>	Specifies a third party access point.

## Defaults

This command has no defaults.

Command History	Release	Modification
	4.1	This command was introduced.

## Examples

```
> config wlan exclusionlist 1 enabled
```

## Related Commands

**show wlan**  
**show wlan summary**

# config {wlan | guest-lan} disable

To disable the WLAN or wired guest LAN for which you are configuring mobility anchors, use the **config {wlan | guest-lan} disable** command.

```
config {wlan | guest-lan} disable {wlan_id | guest_lan_id}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>guest-lan</b>	Indicates the active wired guest LAN.
<b>disable</b>	Disable a wireless LAN.
<i>wlan_id</i>	Enter a wireless LAN identifier between 1 and 16.
<i>guest_lan_id</i>	Guest LAN identifier between 1 and 5 (inclusive).

**Defaults** None.

**Examples**

```
> config {wlan|guest-lan} disable 5
```

**Related Commands**

- config mobility group anchor add {wlan | guest-lan}
- config {wlan | guest-lan} mobility anchor add
- config mobility group keepalive count
- config mobility group keepalive interval
- config mobility group anchor delete {wlan | guest-lan}
- config {wlan | guest-lan} mobility anchor delete

## config {wlan | guest-lan} mobility anchor add

To create a new mobility anchor for the WLAN or wired guest LAN, use the **config {wlan | guest-lan} mobility anchor add** command.

```
config {wlan | guest-lan} mobility anchor add {wlan_id | guest_lan_id}  
anchor_controller_ip_address
```

**Note** You can also use the **config mobility group anchor add {wlan | guest-lan} {wlan\_id | guest\_lan\_id} anchor\_controller\_ip\_address** command.

**Note** The *wlan\_id* or *guest\_lan\_id* must exist and be disabled, and the *anchor\_controller\_ip\_address* must be a member of the default mobility group.

**Note** Auto-anchor mobility is enabled for the WLAN or wired guest LAN when you configure the first mobility anchor.

### Syntax Description

<b>config</b>	Configure parameters.
<b>mobility group</b>	Mobility group member.
<b>wlan</b>	Wireless LAN parameters.
<b>guest-lan</b>	Indicates the active wired guest LAN.
<b>add</b>	Add a wireless LAN or a wired guest LAN.
<i>wlan_id</i>	Enter a wireless LAN identifier between 1 and 16.
<i>guest_lan_id</i>	Guest LAN identifier between 1 and 5 (inclusive).
<i>anchor_controller_ip_address</i>	IP address of the anchor controller.

### Defaults

None.

### Examples

```
> config {wlan|guest-lan} mobility anchor add 5 255.255.255.0
```

### Related Commands

```
config mobility group anchor add {wlan | guest-lan}  
config mobility group keepalive count  
config mobility group keepalive interval  
config mobility group anchor delete {wlan | guest-lan}  
config {wlan | guest-lan} mobility anchor delete
```

# config {wlan | guest-lan} mobility anchor delete

To delete a new mobility anchor for the WLAN or wired guest LAN, use the **config mobility group anchor delete {wlan | guest-lan}** command.

```
config {wlan | guest-lan} mobility anchor delete {wlan_id | guest_lan_id}
      anchor_controller_ip_address
```

**Note** You can also use the **config mobility group anchor delete {wlan | guest-lan} {wlan\_id | guest\_lan\_id} anchor\_controller\_ip\_address** command.

**Note** The *wlan\_id* or *guest\_lan\_id* must exist and be disabled.

**Note** Deleting the last anchor disables the auto-anchor mobility feature and resumes normal mobility for new associations.

## Syntax Description

<b>config</b>	Configure parameters.
<b>mobility group</b>	Mobility group member.
<b>wlan</b>	Wireless LAN parameters.
<b>guest-lan</b>	Indicates the active wired guest LAN.
<b>delete</b>	delete a wireless LAN or a wired guest LAN.
<i>wlan_id</i>	Enter a wireless LAN identifier between 1 and 16.
<i>guest_lan_id</i>	Guest LAN identifier between 1 and 5 (inclusive).
<i>anchor_controller_ip_a</i> <i>ddress</i>	IP address of the anchor controller.

## Defaults

None.

## Examples

```
> config {wlan|guest-lan} mobility anchor delete 5 255.255.255.0
```

## Related Commands

**config mobility group anchor add {wlan | guest-lan}**  
**config mobility group keepalive count**  
**config mobility group keepalive interval**  
**config mobility group anchor delete {wlan | guest-lan}**  
**config {wlan | guest-lan} mobility anchor delete**

## config wlan h-reap local switching

To configure the WLAN for local switching, use the **config wlan h-reap local switching** command.

```
config wlan h-reap local switching {enable | disable} wlan_id
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>h-reap</b>	Hybrid REAP.
<b>local switching</b>	Indicates that data packets are switched locally.
<b>{enable   disable}</b>	Enable or disable local switching on a wireless LAN.
<i>wlan_id</i>	Wireless LAN identifier between 1 and 16.

---

**Defaults** Disable.

---

**Examples** > config wlan h-reap local switching enable 6

---

**Related Commands** show wlan

# config wlan interface

To configure a wireless LAN interface, use the **config wlan interface** command.

```
config wlan interface {wlan_id | foreignAp} interface-name
```

Syntax Description	
<b>wlan_id</b>	(Optional) Specifies the wireless LAN identifier (1 to 16)
<b>foreignAp</b>	(Optional) Specifies third party access points.
<i>interface-name</i>	Specifies the interface name.

**Defaults** None.

**Examples** > config wlan interface 16 VLAN901

**Related Commands** show wlan

## config wlan IPv6Support

To configure IPv6 support on a wireless LAN, use the **config wlan IPv6Support** command.

```
config wlan IPv6support {enable | disable} wlan_id
```

### Syntax Description

<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>IPv6support</b>	Configure IPv6 support on a wireless LAN.
<b>{enable   disable}</b>	Enable or disable IPv6 support on a wireless LAN.
<i>wlan_id</i>	Wireless LAN identifier between 1 and 16.

### Defaults

None.

### Examples

```
> config wlan IPv6support enable 6
```

### Related Commands

show wlan

# config wlan mac-filtering

To change the state of MAC filtering on a wireless LAN, use the **config wlan mac-filtering** command.

```
config wlan mac-filtering {enable | disable} {wlan_id | foreignAp}
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>mac-filtering</b>	Configure MAC filtering on a wireless LAN.
<b>{enable   disable}</b>	Enable or disable MAC filtering on a wireless LAN.
<b>{wlan_id   foreignAp}</b>	<ul style="list-style-type: none"> <li>• Enter a wireless LAN identifier between 1 and 16.</li> <li>• Enter <b>foreignAp</b> for third party access points.</li> </ul>

## Defaults

None.

## Examples

```
> config wlan mac-filtering enable 1
```

## Related Commands

**show wlan**

## config wlan mfp

To configure management frame protection (MFP) options for the wireless LAN, use the **config wlan mfp** command.

```
config wlan mfp {client [enable | disable] wlan_id |  
    infrastructure protection [ enable | disable ] wlan_id }
```

Syntax Description	<b>client</b> (Optional) Configures client MFP for the wireless LAN.
<b>enable</b>	Enables the feature.
<b>disable</b>	Disables the feature.
<i>wlan_id</i>	Specifies the wireless LAN identifier (1 to 16).
<b>infrastructure protection</b>	(Optional) Configures infrastructure MFP for the wireless LAN.

**Defaults** This command has no defaults.

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	4.1	This command was introduced.

**Examples** > config wlan mfp client enable 1

<b>Related Commands</b>	<b>show run-config</b> <b>show wlan summary</b> <b>show wlan</b>
-------------------------	--

# config wlan mobility

To change the state of MAC filtering on a wireless LAN, use the **config wlan mobility anchor** command.

```
config wlan mobility anchor {add | delete} wlan_id ip_address
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>mobility anchor</b>	Configure the Mobility wireless LAN anchor list.
<b>{add   delete}</b>	Enable or disable MAC filtering on a wireless LAN.
<i>wlan_id</i>	Enter a wireless LAN identifier between 1 and 16.
<i>ip_address</i>	Member switch IP address for anchoring the wireless LAN.

## Defaults

None.

## Examples

```
> config wlan mobility anchor delete 1 192.12.1.3
```

## Related Commands

**show wlan**

## config wlan nac

To enable or disable NAC out-of-band support for a WLAN, enter this command:

```
config wlan nac {enable | disable} wlan_id
```

Syntax Description	
<b>config</b>	Command action.
<b>wlan</b>	WLAN parameters.
<b>nac</b>	NAC out-of-band support.
<b>enable   disable</b>	Enable or disable NAC out-of-band support.
<b>wlan_id</b>	The WLAN identifier between 1 and 16.

**Defaults** None

**Examples** >config wlan nac enable 13

**Related Commands** [config guest-lan nac](#)

# config wlan peer-blocking

To configure peer-to-peer blocking on a WLAN, use the **config wlan peer-blocking** command.

```
config wlan peer-blocking {disable | drop | forward-upstream} wlan_id
```

Syntax Description	<b>config</b> Configure parameters. <b>wlan</b> WLAN parameters. <b>peer-blocking</b> Configures a WLAN for peer-to-peer blocking. <b>{ disable   drop   forward-upstream }</b> <ul style="list-style-type: none"> <li>• Enter <b>disable</b> to disable peer-to-peer blocking and bridge traffic locally within the controller whenever possible.</li> <li>• Enter <b>drop</b> to cause the controller to discard the packets.</li> <li>• Enter <b>forward-upstream</b> to cause the packets to be forwarded on the upstream VLAN. The device above the controller decides what action to take regarding the packets.</li> </ul>
	<b>wlan_id</b> The WLAN identifier between 1 and 16.
<b>Defaults</b>	<b>config wlan peer-blocking disable wlan_id</b>
<b>Examples</b>	> config wlan peer-blocking disable 1
<b>Related Commands</b>	<b>show wlan</b>

## config wlan qos

To change the quality of service for a wireless LAN, use the **config wlan qos** command.

```
config wlan qos wlan_id {bronze | silver | gold | platinum}
```

```
config wlan qos foreignAp {bronze | silver | gold | platinum}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>qos</b>	Quality of service.
<i>wlan_id</i>	Wireless LAN identifier between 1 and 16.
<b>foreignAp</b>	Enter <b>foreignAp</b> for third party access points.
{ <b>bronze</b>   <b>silver</b>   <b>gold</b>   <b>platinum</b> }	Enter QoS policy: <b>bronze</b> , <b>silver</b> , <b>gold</b> , or <b>platinum</b> .

Defaults	Silver.
----------	---------

Examples	To set the highest level of service on wireless LAN 1, use the following command:
	> <b>config wlan qos 1 gold</b>

Related Commands	<b>show wlan</b>
------------------	------------------

# config wlan radio

To set the Cisco radio policy on a wireless LAN, use the **config wlan radio** command.

```
config wlan radio wlan_id {all | 802.11a | 802.11bg | 802.11g | 802.11ag}
```

Syntax Description	<b>config</b> Configure parameters. <b>wlan</b> Wireless LAN parameters. <b>radio</b> Configure the Cisco radio policy. <b>wlan_id</b> Wireless LAN identifier between 1 and 16. <b>{all   802.11a   802.11bg   802.11g   802.11ag}</b> <ul style="list-style-type: none"> <li>• Enter <b>all</b> to configure the wireless LAN on all radio bands.</li> <li>• Enter <b>802.11a</b> to configure the wireless LAN on only 802.11a.</li> <li>• Enter <b>802.11bg</b> to configure the wireless LAN on only 802.11b/g (only 802.11b if 802.11g is disabled).</li> <li>• Enter <b>802.11g</b> to configure the wireless LAN on 802.11g only.</li> <li>• Enter <b>802.11ag</b> to configure the wireless LAN on 802.11a and 802.11g only.</li> </ul>
--------------------	--

Defaults	None.
----------	-------

Examples	> config wlan radio 1 all
----------	---------------------------

Related Commands	<a href="#">config 802.11a enable</a> <a href="#">config 802.11a disable</a> <a href="#">config 802.11b enable</a> <a href="#">config 802.11b disable</a> <a href="#">config 802.11b 11gSupport enable</a> <a href="#">config 802.11b 11gSupport disable</a> <a href="#">show wlan</a>
------------------	--

## config wlan radius\_server

To configure a wireless LAN's radius servers, use the **config wlan radius\_server** command.

```
config wlan radius_server {auth | acct} {enable wlan_id | disable wlan_id} {add wlan_id server_id | delete wlan_id {all | server_id}}
```

Syntax Description	
<b>config</b>	Configuration settings.
<b>wlan</b>	Wireless LAN settings.
<b>radius-server</b>	RADIUS servers.
<b>{auth   acct}</b>	Configures a RADIUS authentication or accounting server.
<b>{enable   disable}</b>	Enable or disable RADIUS authentication or accounting for this WLAN.
<b>wlan_id</b>	Wireless LAN identifier between 1 and 512.
<b>{add   delete}</b>	Add or delete a link to a configured RADIUS Server.
<b>server_id</b>	RADIUS Server Index.
<b>all</b>	Enter <b>all</b> to delete all links to configured RADIUS servers.

**Defaults** None.

**Examples**

```
> config wlan radius_server auth add 1 1
> config wlan radius_server auth delete 1 1
> config wlan radius_server auth delete 1 all
```

**Related Commands**

- config 802.11a enable
- config 802.11a disable
- config 802.11b enable
- config 802.11b disable
- config 802.11b 11gSupport enable
- config 802.11b 11gSupport disable
- show wlan

## Configure Wireless LAN Security Commands

Use the **config wlan security** commands to configure wireless LAN security settings.

# config wlan security 802.1X

To change the state of 802.1X security on the wireless LAN Cisco radios, use the **config wlan security 802.1X** command.

Use to change the encryption level of 802.1X security on the wireless LAN Cisco radios to:

- 40/64 bit key
- 104/128 bit key
- 128/152 bit key

```
config wlan security 802.1X {enable {wlan_id | foreignAp} | disable {wlan_id | foreignAp} | encryption {wlan_id | foreignAp} {40 | 104 | 128}}
```

Syntax Description	<b>config</b> Configure parameters. <b>wlan</b> Wireless LAN parameters. <b>security</b> Configure the wireless LAN security policy. <b>802.1X</b> Configure 802.1X security. <b>{enable   disable   encryption}</b> <ul style="list-style-type: none"> <li>• Enter <b>disable</b> to disable 802.1X.</li> <li>• Enter <b>enable</b> to enable 802.1X.</li> <li>• Enter <b>encryption</b> to set the static WEP keys and indexes.</li> </ul> <b>{wlan_id   foreignAp}</b> <ul style="list-style-type: none"> <li>• Enter a wireless LAN identifier between 1 and 16.</li> <li>• Enter <b>foreignAp</b> for third party access points.</li> </ul> <b>{40   104   128}</b> If you're setting the static WEP keys and indexes using the <b>config wlan security 802.1X encryption</b> command, enter a WEP key size of either 40, 104, or 128 bits.
	 <b>Note</b> All keys within a wireless LAN must be same size.

Defaults	None.
Examples	> config wlan security 802.1X enable 16
Related Commands	show wlan

## config wlan security ckip

Use this command to configure CKIP security options for the wireless LAN:

```
config wlan ckip [ akm | mmh | kp | disable | enable ]
```

### Syntax Description

<b>akm</b>	(Optional) Configures key management for the CKIP wireless LAN.
<b>mmh</b>	(Optional) Configures MMH MIC validation for the CKIP wireless LAN
<b>kp</b>	(Optional) Configures key-permutation for the CKIP wireless LAN
<b>disable</b>	(Optional) Disables CKIP security.
<b>enable</b>	(Optional) Enables CKIP security.

### Defaults

This command has no defaults.

### Command History

	<b>Release</b>	<b>Modification</b>
	4.1	This command was introduced.

# config wlan security cond-web-redir

To enable or disable conditional web redirect, enter this command.

```
config wlan security cond-web-redir {enable | disable} wlan_id
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>security</b>	Configure the wireless LAN security policy.
<b>cond-web-redir</b>	Configure conditional web redirect
<b>{enable   disable}</b>	<ul style="list-style-type: none"> <li>Enter <b>enable</b> to enable conditional web redirect.</li> <li>Enter <b>disable</b> to disable conditional web redirect.</li> </ul>
<i>wlan_id</i>	Enter a wireless LAN identifier between 1 and 16.

**Defaults** None.

**Examples**

```
> config wlan security cond-web-redir enable 2
```

**Related Commands**

- show wlan
- show wlan *wlan\_id*.

## config wlan security splash-page-web-redir

To enable or disable splash page web redirect, enter this command.

```
config wlan security splash-page-web-redir {enable | disable} wlan_id
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>security</b>	Configure the wireless LAN security policy.
<b>splash-page-web-redir</b>	Configure splash page web redirect
<b>{enable   disable}</b>	<ul style="list-style-type: none"><li>• Enter <b>enable</b> to enable splash page web redirect.</li><li>• Enter <b>disable</b> to disable splash page web redirect.</li></ul>
<b>wlan_id</b>	Enter a wireless LAN identifier between 1 and 16.

**Defaults** Disabled.

**Examples**

```
> config wlan security splash-page-web-redir enable 2
```

**Related Commands** show wlan

# config wlan security ipsec disable

To disable IPSec security, use the **config wlan security ipsec disable** command.

```
config wlan security ipsec disable {wlan_id | foreignAp}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>security</b>	Configure the wireless LAN security policy.
<b>ipsec disable</b>	Disable IPSec.
{ <b>wlan_id</b>   <b>foreignAp</b> }	<ul style="list-style-type: none"> <li>• Enter a wireless LAN identifier between 1 and 16.</li> <li>• Enter <b>foreignAp</b> for third party access points.</li> </ul>

**Defaults** None.

**Examples** > config wlan security IPsec disable 16

**Related Commands** show wlan

■ **config wlan security ipsec enable**

## config wlan security ipsec enable

To enable IPSec security, use the **config wlan security ipsec enable** command.

```
config wlan security ipsec enable {wlan_id | foreignAp}
```

### Syntax Description

<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>security</b>	Configure the wireless LAN security policy.
<b>ipsec enable</b>	Enable IPSec.
{ <i>wlan_id</i>   <b>foreignAp</b> }	<ul style="list-style-type: none"><li>• Enter a wireless LAN identifier between 1 and 16.</li><li>• Enter <b>foreignAp</b> for third party access points.</li></ul>

### Defaults

None.

### Examples

```
> config wlan security IPsec enable 16
```

### Related Commands

**show wlan**

# config wlan security ipsec authentication

To modify the IPSec security authentication protocol used on the wireless LAN, use the **config wlan security ipsec authentication** command.

```
config wlan security ipsec authentication {hmac-md5 | hmac-sha-1} {wlan_id | foreignAp}
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>security</b>	Configure the wireless LAN security policy.
<b>ipsec authentication</b>	Configure IPSec security authentication parameter.
<b>{hmac-md5   hmac-sha-1}</b>	Enter the IPSec HMAC-MD5 or IPSec HMAC-SHA-1 authentication protocol.
<b>{wlan_id   foreignAp}</b>	<ul style="list-style-type: none"> <li>• Enter a wireless LAN identifier between 1 and 16.</li> <li>• Enter <b>foreignAp</b> for third party access points.</li> </ul>

## Defaults

None.

## Examples

```
> config wlan security ipsec authentication hmac-sha-1 1
```

## Related Commands

**show wlan**

## config wlan security ipsec encryption

To modify the IPsec security encryption protocol used on the wireless LAN, use the **config wlan security ipsec encryption** command.

```
config wlan security ipsec encryption {3des | aes | des} {wlan_id | foreignAp}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>security</b>	Configure the wireless LAN security policy.
<b>ipsec</b>	IPSec security.
<b>encryption</b>	Encryption parameter.
{3des   aes   des}	Enable IPsec DES encryption, IPsec AES 128-bit encryption, or IPsec 3DES encryption.
{wlan_id   foreignAp}	<ul style="list-style-type: none"><li>• Enter a wireless LAN identifier between 1 and 16.</li><li>• Enter <b>foreignAp</b> for third party access points.</li></ul>

**Defaults** None.

**Examples** > config wlan security ipsec encryption aes 1

**Related Commands** show wlan

# config wlan security ipsec config

To configure the propriety IKE CFG-Mode parameters used on the wireless LAN, use the **config wlan security ipsec config** command.

IKE is used as a method of distributing the session keys (encryption and authentication), as well as providing a way for the VPN endpoints to agree on how the data should be protected. IKE keeps track of connections by assigning a bundle of Security Associations (SAs), to each connection.

**config wlan security ipsec config qotd *ip\_address* {*wlan\_id* | **foreignAp**}**

---

## Syntax Description

<b>config</b>	Configure parameters.
<b>wlan</b>	Configure wireless LAN parameters.
<b>security</b>	Configure the wireless LAN security policy.
<b>ipsec</b>	Configure IPSec security.
<b>config</b>	Configure proprietary IKE CFG-MODE parameters.
<b>qotd</b>	Configure quote-of-the-day server IP for cfg-mode.
<i>ip_address</i>	quote-of-the-day server IP for cfg-mode.
{ <i>wlan_id</i>   <b>foreignAp</b> }	<ul style="list-style-type: none"> <li>• Enter a wireless LAN identifier between 1 and 16.</li> <li>• Enter <b>foreignAp</b> for third party access points.</li> </ul>

---

---

## Defaults

None.

---

## Examples

> **config wlan security ipsec config qotd 44.55.66.77 1**

---

## Related Commands

**show wlan**

## config wlan security ipsec ike authentication

To modify the IPSec ike authentication protocol used on the wireless LAN, use the **config wlan security ipsec ike authentication** command.

```
config wlan security ipsec ike authentication {certificates {wlan_id | foreignAp} |  
pre-share-key {wlan_id | foreignAp} key | xauth-psk {wlan_id | foreignAp} key}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>security</b>	Configure the wireless LAN security policy.
<b>ipsec</b>	IPSec security.
<b>ike</b>	IKE protocol.
<b>authentication</b>	Authentication parameter.
{certificates   pre-share-key   xauth-psk}	<ul style="list-style-type: none"><li>• Enter <b>certificates</b> to enable IKE certificate mode.</li><li>• Enter <b>pre-share-key</b> to enable IKE Xauth with pre-shared keys.</li><li>• Enter <b>xauth-psk</b> to enable IKE Pre-Shared Key.</li></ul>
{wlan_id   foreignAp}	<ul style="list-style-type: none"><li>• Enter a wireless LAN identifier between 1 and 16.</li><li>• Enter <b>foreignAp</b> for third party access points.</li></ul>
<b>key</b>	Key required for pre-share and xauth-psk.

**Defaults** None.

**Examples** > config wlan security ipsec ike authentication certificates 16

**Related Commands** show wlan

# config wlan security ipsec ike dh-group

To modify the IPSec IKE Diffie Hellman group used on the wireless LAN, use the **config wlan security ipsec ike authentication** command.

```
config wlan security ipsec ike dh-group {wlan_id | foreignAp} {group-1 | group-2 | group-5}
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>security</b>	Configure the wireless LAN security policy.
<b>ipsec</b>	Configure IPSec security.
<b>ike</b>	Configure the IKE protocol.
<b>dh-group</b>	Diffie Hellman group parameter.
{ <i>wlan_id</i>   <b>foreignAp</b> }	<ul style="list-style-type: none"> <li>Enter a wireless LAN identifier between 1 and 16.</li> <li>Enter <b>foreignAp</b> for third party access points.</li> </ul>
{ <b>group-1</b>   <b>group-2</b>   <b>group-5</b> }	<ul style="list-style-type: none"> <li>Enter <b>group-1</b> to specify DH group 1 (768 bits).</li> <li>Enter <b>group-2</b> to specify DH group 2 (1024 bits).</li> <li>Enter <b>group-5</b> to specify DH group 5 (1536 bits).</li> </ul>

## Defaults

None.

## Examples

```
> config wlan security ipsec ike dh-group 1 group-1
```

## Related Commands

**show wlan**

## config wlan security ipsec ike lifetime

To modify the IPSec IKE lifetime used on the wireless LAN, use the **config wlan security ipsec ike lifetime** command.

**config wlan security ipsec ike lifetime {wlan\_id | foreignAp} seconds**

Syntax Description	
<b>config</b>	Configure parameters.
<b>wlan</b>	Configure wireless LAN parameters.
<b>security</b>	Configure the wireless LAN security policy.
<b>ipsec</b>	Configure IPSec security.
<b>ike</b>	Configure IKE protocol.
<b>lifetime</b>	Configure IKE timeout.
{ <b>wlan_id   foreignAp</b> }	<ul style="list-style-type: none"><li>• Enter a wireless LAN identifier between 1 and 16.</li><li>• Enter <b>foreignAp</b> for third party access points.</li></ul>
<b>seconds</b>	The IKE lifetime in seconds, between 1800 and 345600.

**Defaults** None.

**Examples** > **config wlan security ipsec ike lifetime 1 1900**

**Related Commands** **show wlan**

# config wlan security ipsec ike phase1

To modify IPSec IKE Phase 1 used on the wireless LAN, use the **config wlan security ipsec ike phase1** command.

```
config wlan security ipsec ike phase1 {aggressive | main} {wlan_id | foreignAp}
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>wlan</b>	Configure wireless LAN parameters.
<b>security</b>	Configure the wireless LAN security policy.
<b>ipsec</b>	Configure IPSec security.
<b>ike</b>	Configure IKE.
<b>phase1</b>	Configure IKE's phase one mode.
{ <b>aggressive</b>   <b>main</b> }	<ul style="list-style-type: none"> <li>Enter <b>aggressive</b> to enable the IKE aggressive mode.</li> <li>Enter <b>main</b> to enable the IKE main mode.</li> </ul>
{ <b>wlan_id</b>   <b>foreignAp</b> }	<ul style="list-style-type: none"> <li>Enter a wireless LAN identifier between 1 and 16.</li> <li>Enter <b>foreignAp</b> for third party access points.</li> </ul>

## Defaults

None.

## Examples

```
> config wlan security ipsec ike phase1 aggressive 16
```

## config wlan security ipsec ike contivity

To modify Nortel's Contivity VPN client support on the wireless LAN, use the **config wlan security ipsec ike contivity** command.

```
config wlan security ipsec ike contivity {enable | disable} {wlan_id | foreignAp}
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>wlan</b>	Configure wireless LAN parameters.
<b>security</b>	Configure the wireless LAN security policy.
<b>ipsec</b>	Configure IPSec security.
<b>ike</b>	Configure IKE protocol.
<b>contivity</b>	Configure Nortel Contivity VPN client support.
<b>{enable   disable}</b>	Enable or disable contivity support for this wlan.
<b>{wlan_id   foreignAp}</b>	<ul style="list-style-type: none"><li>• Enter a wireless LAN identifier between 1 and 16.</li><li>• Enter <b>foreignAp</b> for third party access points.</li></ul>

**Defaults** None.

**Examples** > config wlan security ipsec ike contivity enable 14

**Related Commands** show wlan

# config wlan security passthru

To modify the IPSec pass-through used on the wireless LAN, use the **config wlan security ipsec ike passthru** command.

```
config wlan security passthru {enable | disable} {wlan_id | foreignAp} [ip_address]
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>wlan</b>	Configure wireless LAN parameters.
<b>security</b>	Configure the wireless LAN security policy.
<b>passthru</b>	Configure IPSec pass-through.
<b>{enable   disable}</b>	Enable or disable IPSec pass-through.
<b>{wlan_id   foreignAp}</b>	<ul style="list-style-type: none"> <li>• Enter a wireless LAN identifier between 1 and 16.</li> <li>• Enter <b>foreignAp</b> for third party access points.</li> </ul>
<b>[ip_address]</b>	If you enable security pass-through, you must specify the IP address of the IPSec gateway.

## Defaults

None.

## Examples

```
> config wlan security passthru enable 3 192.12.1.1
```

## Related Commands

**show wlan**

# config wlan security static-wep-key authentication

To configure static WEP key 802.11 authentication on a wireless LAN, use the **config wlan security static-wep-key authentication** command.

```
config wlan security static-wep-key authentication {shared-key | open} wlan_id
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>security</b>	Configure the wireless LAN security policy.
<b>static-wep-key</b>	Configure static WEP keys on a wireless LAN.
<b>authentication</b>	Authentication setting.
<b>{shared-key   open}</b>	<ul style="list-style-type: none"><li>• Enter <b>shared-key</b> to enable shared key authentication.</li><li>• Enter <b>open</b> to enable open system authentication.</li></ul>
<b>wlan_id</b>	Wireless LAN identifier between 1 and 16.

## Defaults

None.

## Examples

```
> config wlan security static-wep-key authentication shared-key 1  
> config wlan security static-wep-key authentication open 1
```

## Related Commands

show wlan

# config wlan security static-wep-key disable

To disable the use of static WEP keys, use the **config wlan security static-wep-key disable** command.

**config wlan security static-wep-key disable *wlan\_id***

Syntax Description	
<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>security</b>	Configure the wireless LAN security policy.
<b>static-wep-key</b>	Configure static WEP keys on a wireless LAN.
<b>disable</b>	Disable the use of static WEP keys.
<i>wlan_id</i>	Wireless LAN identifier between 1 and 16.

**Defaults** None.

**Examples** > **config wlan security static-wep-key disable 1**

**Related Commands** **config wlan security wpa encryption**

■ **config wlan security static-wep-key enable**

## config wlan security static-wep-key enable

To enable the use of static WEP keys, use the **config wlan security static-wep-key enable** command.

**config wlan security static-wep-key enable *wlan\_id***

---

### Syntax Description

<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>security</b>	Configure the wireless LAN security policy.
<b>static-wep-key</b>	Configure static WEP keys on a wireless LAN.
<b>enable</b>	Disable the use of static WEP keys.
<i>wlan_id</i>	Wireless LAN identifier between 1 and 16.

---

---

### Defaults

None.

---

### Examples

> **config wlan security static-wep-key enable 1**

---

### Related Commands

**config wlan security wpa encryption**

# config wlan security static-wep-key encryption

To configure the static WEP keys and indexes, use the **config wlan security static-wep-key encryption** command. Make sure to disable 802.1X before using this command.

**Note** One unique WEP Key Index can be applied to each wireless LAN. As there are only four WEP Key Indexes, only four wireless LANs can be configured for Static WEP Layer 2 encryption.

```
config wlan security static-wep-key encryption wlan_id {40 | 104 | 128} {hex | ascii} key  
key-index
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>security</b>	Configure the wireless LAN security policy.
<b>static-wep-key</b>	Configure static WEP keys on a wireless LAN.
<b>encryption</b>	Encryption setting.
<i>wlan_id</i>	Wireless LAN identifier between 1 and 16.
{40   104   128}	Encryption level.
{hex   ascii}	Specify whether to use hexadecimal or ASCII characters to enter key.
<i>key</i>	Enter WEP key in ascii
<i>key-index</i>	Key index (1 to 4).

## Defaults

None.

## Examples

```
> config wlan security static-wep-key encryption 1 40 hex 0201702001 2
```

## Related Commands

**show wlan**

## config wlan security web-auth

To change the status of Web authentication used on the wireless LAN, use the **config wlan security web-auth** command.

**config wlan security web-auth {acl | enable | disable} {wlan\_id | foreignAp} [{acl\_name | none}]**

Syntax Description	
<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>security</b>	Configure the wireless LAN security policy.
<b>web-auth</b>	Web authentication.
<b>{acl   enable   disable}</b>	Configure the Access Control List, or enable or disable web authentication.
<b>{wlan_id   foreignAp}</b>	<ul style="list-style-type: none"><li>• Enter a wireless LAN identifier between 1 and 16.</li><li>• Enter <b>foreignAp</b> for third party access points.</li></ul>
<b>[{acl_name   none}]</b>	If configuring an ACL, enter the ACL name (up to 32 alphanumeric characters) or <b>none</b> .

Defaults	None.
<hr/>	
Examples	<pre>&gt; config wlan security web-auth acl 1 ACL03 &gt; config wlan security web-auth enable 1 &gt; config wlan security web-auth disable 1</pre>

Related Commands	<b>show wlan</b>
------------------	------------------

# config wlan security web-passthrough acl

To add an ACL to the wireless LAN definition, use the **config wlan security web acl** command.

```
config wlan security web-passthrough acl {wlan_id | foreignAp} {acl_name | none}
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>security</b>	Configure the wireless LAN security policy.
<b>web-passthrough</b>	Configure the web captive portal with no authentication required.
<b>acl</b>	Add an ACL to the wireless LAN definition.
{ <i>wlan_id</i>   <b>foreignAp</b> }	<ul style="list-style-type: none"> <li>• Enter a wireless LAN identifier between 1 and 16.</li> <li>• Enter <b>foreignAp</b> for third party access points.</li> </ul>
{ <i>acl_name</i>   <b>none</b> }	Enter the ACL name (up to 32 alphanumeric characters) or <b>none</b> .

## Defaults

None.

## Examples

```
> config wlan security web-passthrough acl 1 ACL03
```

## Related Commands

■ **config wlan security web-passthrough disable**

## config wlan security web-passthrough disable

To disable web captive portal with no authentication required on a wireless LAN, use the **config wlan security web-passthrough disable** command.

**config wlan security web-passthrough disable {wlan\_id | foreignAp}**

Syntax Description	
<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>security</b>	Configure the wireless LAN security policy.
<b>web-passthrough</b>	Configure the web captive portal with no authentication required.
<b>disable</b>	Disable web captive portal with no authentication required.
{ <i>wlan_id</i>   <b>foreignAp</b> }	<ul style="list-style-type: none"><li>• Enter a wireless LAN identifier between 1 and 16.</li><li>• Enter <b>foreignAp</b> for third party access points.</li></ul>

**Defaults** None.

**Examples** > **config wlan security web-passthrough disable 1**

**Related Commands** **show wlan**

# config wlan security web-passthrough email-input

To configure web captive portal using an email address, use the **config wlan security web-passthrough email-input** command.

```
config wlan security web-passthrough email-input {enable | disable} {wlan_id | foreignAp}
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>security</b>	Configure the wireless LAN security policy.
<b>web-passthrough</b>	Configure the web captive portal with no authentication required.
<b>email-input</b>	Configure web captive portal using an email address.
<b>{enable   disable}</b>	Enable or disable web captive portal using email address.
<b>{wlan_id   foreignAp}</b>	<ul style="list-style-type: none"> <li>• Enter a wireless LAN identifier between 1 and 16.</li> <li>• Enter <b>foreignAp</b> for third party access points.</li> </ul>

## Defaults

None.

## Examples

```
> config wlan security web-passthrough email-input enable 1
```

## Related Commands

## config wlan security web-passthrough enable

To enable web captive portal with no authentication required on the wireless LAN, use the **config wlan security web-passthrough enable** command.

**config wlan security web-passthrough enable {wlan\_id | foreignAp}**

Syntax Description	
<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>security</b>	Configure the wireless LAN security policy.
<b>web-passthrough</b>	Configure the web captive portal with no authentication required.
<b>enable</b>	Enable web captive portal with no authentication required.
{ <b>wlan_id</b>   <b>foreignAp</b> }	<ul style="list-style-type: none"><li>• Enter a wireless LAN identifier between 1 and 16.</li><li>• Enter <b>foreignAp</b> for third party access points.</li></ul>

**Defaults** None.

**Examples** > **config wlan security web-passthrough enable 1**

**Related Commands** **show wlan**

# config wlan security wpa1 disable

To disable WPA1, use the **config wlan security wpa1 disable** command.

```
config wlan security wpa1 disable wlan_id
```

Syntax Description	
<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>security</b>	Configure the wireless LAN security policy.
<b>wpa1</b>	Configure WiFi protected access.
<b>disable</b>	Disable WPA1.
<i>wlan_id</i>	Wireless LAN identifier between 1 and 16.

Defaults	None.

# config wlan security wpa1 pre-shared-key

To configure the WPA pre-shared key mode, use the **config wlan security wpa1 pre-shared-key** command.

```
config wlan security wpa1 pre-shared-key {enable wlan_id key | disable wlan_id}
```

## Syntax Description

<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>security</b>	Configure the wireless LAN security policy.
<b>wpa1</b>	Configure WiFi protected access.
<b>pre-shared-key</b>	Configure WPA pre-shared key mode (WPA-PSK).
<b>{enable   disable}</b>	Enable or disable WPA-PSK.
<i>wlan_id</i>	Wireless LAN identifier between 1 and 16.
<i>key</i>	WPA pre-shared key.

## Defaults

None.

## Examples

```
> config wlan security wpa1 pre-shared-key enable 1 r45
```

## Related Commands

**show wlan**

To change the status of WPA authentication, use the **config wlan security wpa2 wpa-compat** command.

```
config wlan security wpa2 wpa-compat {enable | disable} wlan_id
```

### Syntax Description

<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>security</b>	Configure the wireless LAN security policy.
<b>wpa2</b>	Configure WPA2.
<b>wpa-compat</b>	Configure WPA compatibility mode.
<b>{enable   disable}</b>	Enable or disable WPA compatibility mode.
<b>wlan_id</b>	Wireless LAN identifier between 1 and 16.

### Defaults

None.

### Examples

```
> config wlan security wpa2 wpa-compat enable 1
```

### Related Commands

**show wlan**

# config wlan timeout

To change the timeout of wireless LAN clients, use the **config wlan timeout** command.

**config wlan timeout {wlan\_id | foreignAp} seconds**

Syntax Description	
<b>config</b>	Configure parameters.
<b>wlan</b>	Wireless LAN parameters.
<b>timeout</b>	Configure client timeout.
{ <b>wlan_id   foreignAp</b> }	<ul style="list-style-type: none"> <li>• Enter a wireless LAN identifier between 1 and 16.</li> <li>• Enter <b>foreignAp</b> for third party access points.</li> </ul>
<b>seconds</b>	Timeout or session duration in seconds. A value of zero is equivalent to no timeout.

None.

**Examples** > **config wlan timeout 1 6000**

**Related Commands** **show wlan**

## config wlan webauth-exclude

To release the guest user IP address when the Web authentication policy time expires and exclude the guest user from acquiring an IP address for three minutes, use the **config wlan webauth-exclude** command.

```
config wlan webauth-exclude wlan_id {enable | disable}
```

Syntax Description	
<b>config</b>	Configuration settings.
<b>wlan</b>	Wireless LAN settings.
<b>webauth-exclude</b>	Web authenticaion exclusion.
<i>wlan_id</i>	Specifies the wireless LAN identifier (1 to 512).
<b>enable</b>	Enable Web authenticaion exclusion.
<b>disable</b>	Disable Web authenticaion exclusion.

**Command Default** Disabled.

**Usage Guidelines** You can use this command for guest WLANs that are configured with Web authentication.

This command is applicable when you configure the internal DHCP scope on the controller.

By default, when the Web authentication timer expires for a guest user, the guest user can immediately reassociate with the same IP address before another guest user can acquire the IP address. If there are many guest users or limited IP address in the DHCP pool, some guest users might not be able to acquire an IP address.

When you enable this feature on the guest WLAN, the guest user's IP address is released when the Web authentication policy time expires and the guest user is excluded from acquiring an IP address for three minutes. The IP address is available for another guest user to use. After three minutes, the excluded guest user can reassociate and acquire an IP address, if available.

**Examples** > config wlan webauth-exclude 5 enable

**Related Commands**

- [show run-config](#)
- [show wlan](#)

# config wlan wmm

To configure WMM on the wireless LAN, use the **config wlan wmm** command.

**config wlan wmm [ allow | disable | require ] wlan\_id**

**Note** When the controller is in Layer 2 mode and WMM is enabled, you must put the access points on a trunk port in order to allow them to join the controller.

## Syntax Description

<b>allow</b>	(Optional) Allows WMM on the wireless LAN.
<i>wlan_id</i>	Specifies the wireless LAN identifier (1 to 16).
<b>enable</b>	(Optional) Enables WMM on the wireless LAN.
<b>disable</b>	(Optional) Disables WMM on the wireless LAN.
<b>require</b>	(Optional) Requires WMM enabled clients on the wireless LAN.

## Command Default

This command has no defaults.

## Command History

Release	Modification
4.1	This command was introduced.

## Examples

```
> config wlan wmm allow 1
> config wlan wmm require 1
```

## Related Commands

# Configure WPS Commands

Use the **config wps** command to configure WPS settings.

# config wps ap-authentication

To configure access point neighbor authentication, use the **config wps ap-authentication** command.

```
config wps ap-authentication [ enable | disable | threshold threshold_value ]
```

Syntax Description
<b>enable</b> (Optional) Enables WMM on the wireless LAN.
<b>disable</b> (Optional) Disables WMM on the wireless LAN.
<b>threshold</b> (Optional) Requires WMM enabled clients on the wireless LAN.
<b><i>threshold_value</i></b> Specifies the threshold value (1 to 255).

**Command Default** This command has no defaults.

Command History	Release	Modification
	4.1	This command was introduced.

## Examples

```
> config wps ap-authentication threshold 25
> config wps ap-authentication enable

> show wps ap-authentication summary

AP neighbor authentication is <enabled>.

Authentication alarm threshold is 10.
RF-Network Name: <doc>

> config wps ap-authentication disable

> show wps ap-authentication summary

AP neighbor authentication is <disabled>.

Authentication alarm threshold is 10.
RF-Network Name: <doc>
```

**Related Commands** [show wps ap-authentication summary](#)

# **config wps cids-sensor**

This command is used to configure IDS sensors for the WPS, use the **config wps cids-sensor** command.

```
config wps cids-sensor { [ add index ip_address username password ] | [delete index] |  
[enable index] | [disable index] | [port index port] | [interval index query_interval] |  
[fingerprint index sha1 fingerprint] }
```

Syntax Description	
<b>add</b>	Configures a new IDS sensor.
<i>index</i>	Specifies IDS sensor internal index.
<i>ip_address</i>	Specifies the IDS sensor IP address.
<i>username</i>	Specifies the IDS sensor username.
<i>password</i>	Specifies the IDS sensor password.
<b>delete</b>	Deletes an IDS sensor.
<b>enable</b>	Enables an IDS sensor.
<b>disable</b>	Disables an IDS sensor.
<b>port</b>	Configures the IDS sensor's port number.
<i>port</i>	Specifies the port number.
<b>interval</b>	Configures the IDS sensor's query interval.
<i>query_interval</i>	Specifies the query interval setting.
<b>fingerprint</b>	Configures the IDS sensor's TLS fingerprint.
<b>sha1</b>	Configures the TLS fingerprint.
<i>fingerprint</i>	Specifies the TLS fingerprint.

Command History	Release	Modification
	4.1	This command was introduced.

To add a new IDS sensor to the WPS, use this command:

To add a new IDS sensor to the WPS, use this command:

```
> config wps cids-sensor add 1 10.0.0.51 Sensor_user0doc1 password01
```

## config wps mfp

To configure Management Frame Protection (MFP), use the **config wps mfp** command.

```
config wps mfp infrastructure {enable | disable}
```

Syntax Description	
	<b>mfp infrastructure</b> Configures infrastructure MFP.
	<b>enable   disable</b> Enable or disable MFP.

**Defaults** This command has no defaults.

**Examples**

```
> config wps mfp infrastructure enable  
> config wps mfp infrastructure disable
```

**Related Commands** [show wps mfp](#)

# config wps rogue-ap

To configure rogue access point and rogue client policies, use the **config wps rogue-ap** command.

```
config wps rogue-ap { aaa [enable | disable] | adhoc [enable | disable] |
    rldp [enable | disable | initiate mac_address] | timeout seconds }
```

Syntax Description		
<b>aaa</b>	(Optional)	Validates if the rogue is a valid client using the authentication, authorization, and accounting (AAA) database or the local database.
<b>adhoc</b>	(Optional)	Configures ad-hoc rogue detection and reporting policies.
<b>enable</b>	(Optional)	Enables the feature.
<b>disable</b>	(Optional)	Disables the feature.
<b>rldp</b>	(Optional)	Configures rogue location discovery protocol (RLDP).
<b>initiate</b>	(Optional)	Initiates RLDP on a specified rogue access point or client.
<i>mac_address</i>		Specifies the MAC address of the rogue access point or client.
<b>timeout</b>	(Optional)	Configures the expiration time for rogue entries.
<i>seconds</i>		Specifies the timeout value (240 to 3600 seconds).

**Defaults** This command has no defaults.

Command History	Release	Modification
	4.1	The command was revised to include the RLDP option.

**Examples**

```
> config wps rogue-ap timeout 1300
> config wps rogue-ap aaa enable
> config wps rogue-ap rldp initiate 32:7a:52:13:00:01
```

## config wps shun-list

To force the controller to sync up with other controllers in the mobility group for the shun list, enter this command:

**config wps shun-list re-sync**

**Syntax Description** This command has no arguments or keywords

**Defaults** None

**Examples** > **config wps shun-list re-sync**

**Related Commands** [show wps shun-list](#)

# config wps signature

To enable or disable IDS signature processing, or to enable or disable a specific IDS signature, use the **config wps signature** command.

**config wps signature {enable | disable}**

**config wps signature {standard | custom} state *signature\_id* {enable | disable}**

<b>Syntax Description</b>	<table border="0"> <tr> <td><b>enable   disable</b></td><td>Enables or disables IDS signature processing or a specific IDS signature.</td></tr> <tr> <td><b>standard   custom</b></td><td>Configures a standard or custom IDS signature.</td></tr> <tr> <td><b>state</b></td><td>Specifies the state of the IDS signature.</td></tr> <tr> <td><b><i>signature_id</i></b></td><td>Specifies the identifier for the signature to be enabled or disabled.</td></tr> </table>	<b>enable   disable</b>	Enables or disables IDS signature processing or a specific IDS signature.	<b>standard   custom</b>	Configures a standard or custom IDS signature.	<b>state</b>	Specifies the state of the IDS signature.	<b><i>signature_id</i></b>	Specifies the identifier for the signature to be enabled or disabled.
<b>enable   disable</b>	Enables or disables IDS signature processing or a specific IDS signature.								
<b>standard   custom</b>	Configures a standard or custom IDS signature.								
<b>state</b>	Specifies the state of the IDS signature.								
<b><i>signature_id</i></b>	Specifies the identifier for the signature to be enabled or disabled.								

**Command Default** IDS signature processing is enabled by default.

**Usage Guidelines** If IDS signature processing is disabled, all signatures are disabled, regardless of the state configured for individual signatures.

**Examples** To enable IDS signature processing, which enables the processing of all IDS signatures, enter this command:

> **config wps signature enable**

To disable a standard individual IDS signature, enter this command:

> **config wps signature standard state 15 disable**

# config wps signature frequency

To specify the number of matching packets per interval that must be identified at the individual access point level before an attack is detected, use the **config wps signature frequency** command.

**config wps signature frequency** *signature\_id frequency*

Syntax Description	
<b>frequency</b>	Sets the frequency of the IDS signature.
<b>signature_id</b>	Specifies the identifier for the signature to be configured.
<b>frequency</b>	Sets the number of matching packets per interval that must be at the individual access point level before an attack is detected. Range: 1 to 32,000 packets per interval.

**Command Default** The *frequency* default value varies per signature.

**Usage Guidelines** If IDS signature processing is disabled, all signatures are disabled, regardless of the state configured for individual signatures.

**Examples** To set the number of matching packets per interval per access point before an attack is detected to 1800 for signature ID 4, enter this command:

> **config wps signature frequency 4 1800**

**Related Commands**

# config wps signature interval

To specify the number of seconds that must elapse before the signature frequency threshold is reached within the configured interval, use the **config wps signature interval** command.

**config wps signature interval *signature\_id* *interval***

## Syntax Description

<b>interval</b>	Sets the interval of the IDS signature.
<b><i>signature_id</i></b>	Specifies the identifier for the signature to be configured
<b><i>interval</i></b>	Sets the number of seconds that must elapse before the signature frequency threshold is reached. Range: 1 to 3,600 seconds.

## Command Default

The default value of *interval* varies per signature.

## Usage Guidelines

If IDS signature processing is disabled, all signatures are disabled, regardless of the state configured for individual signatures.

## Examples

To set the number of seconds to elapse before reaching the signature frequency threshold to 200 for signature ID 1, enter this command:

> **config wps signature interval 1 200**

## Related Commands

## config wps signature mac-frequency

To specify the number of matching packets per interval that must be identified per client per access point before an attack is detected, use the **config wps signature mac-frequency** command.

**config wps signature mac-frequency** *signature\_id* *mac\_frequency*

<b>Syntax Description</b>	
<b>mac-frequency</b>	Sets the MAC frequency of the IDS signature.
<i>signature_id</i>	Specifies the identifier for the signature to be configured.
<i>mac_frequency</i>	Sets the number of matching packets per interval that must be identified per client per access point before an attack is detected. Range: 1 to 32,000 packets per interval.

**Command Default** The *mac\_frequency* default value varies per signature.

**Usage Guidelines** If IDS signature processing is disabled, all signatures are disabled, regardless of the state configured for individual signatures.

**Examples** To set the number of matching packets per interval per client before an attack is detected to 50 for signature ID 3, enter this command:

> **config wps signature mac-frequency** 3 50

**Related Commands**

# config wps signature quiet-time

To specify the length of time after which no attacks have been detected at the individual access point level and the alarm can stop, use the **config wps signature quiet-time** command.

**config wps signature quiet-time *signature\_id* *quiet\_time***

## Syntax Description

<b>quiet-time</b>	Sets the quiet time of the IDS signature.
<i>signature_id</i>	Specifies the identifier for the signature to be configured.
<i>quiet_time</i>	Sets the length of time after which no attacks have been detected at the individual access point level and the alarm can stop. Range: 60 to 32,000 seconds.

## Command Default

The default value of *quiet\_time* varies per signature.

## Usage Guidelines

If IDS signature processing is disabled, all signatures are disabled, regardless of the state configured for individual signatures.

## Examples

To set the number of seconds after which no attacks have been detected per access point to 60 for signature ID 1, enter this command:

> **config wps signature quiet-time 1 60**

## Related Commands

[show wps summary](#)

## config wps signature reset

To reset a specific IDS signature or all IDS signatures to default values, use the **config wps signature reset** command.

**config wps signature reset {signature\_id | all}**

Syntax Description	
<b>reset</b>	Resets the IDS signature.
<b>signature_id</b>	Specifies the identifier for the specific IDS signature to be reset.
<b>all</b>	Resets all IDS signatures.

**Command Default** config wps signature reset all

**Usage Guidelines** If IDS signature processing is disabled, all signatures are disabled, regardless of the state configured for individual signatures.

**Examples** To reset the IDS signature 1 to default values, enter this command:

> config wps signature reset 1

**Related Commands**

- config wps signature
- config wps signature frequency
- config wps signature interval
- config wps signature mac-frequency

# lwapp ap controller ip address

To configure the controller IP address into the H-REAP access point from the access point's console port, use the **lwapp ap controller ip address** command.

**lwapp ap controller ip address *ip\_address***

**Note**

This command must be entered from an access point's console port.

**Syntax Description**

<i>ip_address</i>	Specifies the IP address of the controller.
-------------------	---

**Defaults**

This command has no defaults.

**Command History**

<b>Release</b>	<b>Modification</b>
4.1	This command was introduced.

**Usage Guidelines**

Prior to changing the H-REAP configuration on an access point using the access point's console port, the access point must be in standalone mode (not connected to a controller) and you must remove the current LWAPP private configuration using the **clear lwapp private-config** command.

**Note**

The access point must be running Cisco IOS Release 12.3(11)JX1 or higher.

**Examples**

```
AP# clear lwapp private-config
removing the reap config file flash:/lwapp_reap.cfg
AP# lwapp ap controller ip address 10.92.109.1
```

**Related Commands**

**clear lwapp private-config**  
**debug lwapp console cli**

# Saving Configurations

Use the **save config** command before you log out of the command line interface to save all previous configuration changes.

## save config

To save Cisco Wireless LAN controller configurations, use the **save config** command.

**save config**

<b>Syntax Description</b>	
<b>save</b>	Save switch configurations.
<b>config</b>	Save current settings to NVRAM.

**Defaults** None.

**Examples** > **save config**

Are you sure you want to save? (y/n) **y**

Configuration Saved!

**Related Commands** **show sysinfo**

# Clearing Configurations, Logfiles, and Other Actions

To clear existing configurations, log files, and other functions, use the clear commands.

## clear acl counters

To clear the current counters for an access control list (ACL), use the **clear acl counters** command.

**clear acl counters *acl\_name***

**Note**

ACL counters are available only on the following controllers: 4400 series, Cisco WiSM, and Catalyst 3750G Integrated Wireless LAN Controller Switch.

**Syntax Description**

<b>clear acl</b>	Command action.
<b>counters</b>	The number of packets hitting the ACLs configured on your controller.
<b><i>acl_name</i></b>	The name of the ACL.

**Defaults**

None.

**Examples**

```
> clear acl counters acl1
```

**Related Commands**

**config acl counter**  
**show acl detailed**

## clear ap-config

Use the **clear ap-config** command to clear (reset to factory default values) a lightweight access point's configuration settings.

**clear ap-config** *ap\_name*

<b>Syntax Description</b>	<b>ap_name</b> Specifies the access point name.
---------------------------	---

<b>Defaults</b>	This command has no defaults.
-----------------	-------------------------------

<b>Examples</b>	> <b>clear ap-config ap1240_322115</b> Clear ap-config will clear ap config and reboot the AP. Are you sure you want continue? (y/n)
-----------------	--

<b>Related Commands</b>	<b>show ap config</b>
-------------------------	-----------------------

# clear ap-eventlog

To delete the existing event log and create an empty event log file for a specific access point or for all access points joined to the controller, use the **clear ap-eventlog** command

**clear ap-eventlog {specific *ap\_name* | all}**

<b>Syntax Description</b>	<i>ap_name</i> Specifies the access point name.
<b>Defaults</b>	None.
<b>Examples</b>	<pre>&gt; clear ap-eventlog all This will clear event log contents for all APs. Do you want continue? (y/n) :y  Any AP event log contents have been successfully cleared.</pre>
<b>Related Commands</b>	<a href="#">show ap eventlog</a>

## clear arp

To clear the ARP table to a Cisco lightweight access point its factory default, use the **clear arp** command.

**clear arp**

Syntax Description	
<b>clear</b>	Clear selected configuration elements.
<b>arp</b>	Clear the ARP table.

Defaults	
	None.

Examples	
	> <b>clear arp</b> Are you sure you want to clear the ARP cache? (y/n)

Related Commands	
	<b>clear transfer</b>
	<b>clear download filename</b>
	<b>clear download mode</b>
	<b>clear download path</b>
	<b>clear download serverip</b>
	<b>clear download start</b>
	<b>clear upload datatype</b>
	<b>clear upload filename</b>
	<b>clear upload mode</b>
	<b>clear upload path</b>
	<b>clear upload serverip</b>
	<b>clear upload start</b>

# clear config

To reset configuration data to factory defaults, use the **clear config** command.

**clear config**

<b>Syntax Description</b>	<b>clear</b> Clear selected configuration elements. <b>config</b> Reset configuration data to factory defaults.
---------------------------	--

**Defaults**      None.

**Examples**

```
> clear config

Are you sure you want to clear the configuration? (y/n)
n
Configuration not cleared!
```

**Related Commands**

- clear transfer
- clear download filename
- clear download mode
- clear download path
- clear download serverip
- clear download start
- clear upload datatype
- clear upload filename
- clear upload mode
- clear upload path
- clear upload serverip
- clear upload start

## clear ext-webauth-url

To clear the external web authentication URL, use the **clear ext-webauth-url** command.

**clear ext-webauth-url**

---

### Syntax Description

<b>clear</b>	Clear selected configuration elements.
<b>ext-webauth-url</b>	Clear the external web authentication URL.

---

---

### Defaults

None.

---

### Examples

> **clear ext-webauth-url**

URL cleared.

---

### Related Commands

**clear transfer**  
**clear download datatype**  
**clear download filename**  
**clear download mode**  
**clear download path**  
**clear download serverip**  
**clear download start**  
**clear upload filename**  
**clear upload mode**  
**clear upload path**  
**clear upload serverip**  
**clear upload start**

# clear location rfid

To clear a specific RFID tag or all of the RFID tags in the entire database, use the **clear location rfid** command.

```
clear location rfid {mac_address | all}
```

## Syntax Description

<b>clear location rfid</b>	Clears RFID tags.
<i>mac_address</i>	The MAC address of a specific RFID tag.
<b>all</b>	All of the RFID tags in the database.

## Defaults

This command has no defaults.

## Examples

```
> clear location rfid all
```

## Related Commands

**show location**

# clear location statistics rfid

To clear the RFID statistics, use the **clear location statistics rfid** command.

**clear location statistics rfid**

<b>Syntax Description</b>	<b>clear</b> Clear selected configuration elements. <b>location statistics rfid</b> RFID statistics.
---------------------------	---

**Defaults** This command has no defaults.

**Examples** > **clear location statistics rfid**

**Related Commands** **show location statistics rfid**

# clear locp statistics

To clear the LOCP statistics, use the **clear locp statistics** command.

**clear locp statistics**

<b>Syntax Description</b>	<b>clear</b> Clears selected configuration elements. <b>locp statistics</b> Statistics related to LOCP.
---------------------------	--

**Defaults** This command has no defaults.

**Examples** > **clear locp statistics**

**Related Commands** **show nmsp statistics**

# clear lwapp private-config

Use the **clear lwapp private-config command** to clear (reset to default values) an access point's current LWAPP private configuration, which contains static IP addressing and controller IP address configurations. This command is executed from the access point console port.

## clear lwapp private-config

**Syntax Description** This command has no arguments or keywords.

**Defaults** This command has no defaults.

Command History	Release	Modification
	4.1	This command was introduced.

**Usage Guidelines** Prior to changing the H-REAP configuration on an access point using the access point's console port, the access point must be in standalone mode (not connected to a controller) and you must remove the current LWAPP private configuration using the **clear lwapp private-config command**.

**Note** The access point must be running Cisco IOS Release 12.3(11)JX1 or higher.

**Examples**

```
AP# clear lwapp private-config  
removing the reap config file flash:/lwapp_reap.cfg
```

**Related Commands**

**lwapp ap controller ip address**  
**debug lwapp console cli**

# clear radius acct statistics

To clear the radius accounting statistics on the controller, use the **clear radius acc statistics** command.

**clear radius acct statistics [ *index* | all ]**

<b>Syntax Description</b>	<i>index</i> Specifies the index of the radius accounting server.  <b>all</b> Specifies all radius accounting servers.
---------------------------	--

<b>Defaults</b>	This command has no defaults.
-----------------	-------------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	4.1	This command was introduced.

<b>Examples</b>	> <b>clear radius acct statistics</b>
-----------------	---------------------------------------

<b>Related Commands</b>	<b>show radius acct statistics</b>
-------------------------	------------------------------------

# clear radius auth statistics

To clear the TACACS+ authentication server statistics in the controller, use the **clear tacacs auth statistics** command.

**clear radius tacacs auth statistics [ *index* | all ]**

<b>Syntax Description</b>	<hr/>
<b><i>index</i></b>	Specifies the index of the TACACS+ authentication server.
<b>all</b>	Specifies all TACACS+ authentication servers.

**Defaults** This command has no defaults.

<b>Command History</b>	<b>Release</b>	<b>Modification</b>	<hr/>
	4.1	This command was introduced.	

**Examples** > **clear radius auth statistics**

**Related Commands**

- **show tacacs auth statistics**
- **show tacacs summary**
- **config tacacs auth**

# clear redirect-url

To clear the custom web authentication redirect URL on the Cisco Wireless LAN controller, use the **clear redirect-url** command.

**clear redirect-url**

<b>Syntax Description</b>	<b>clear</b> Clear selected configuration elements. <b>redirect-url</b> Clear the custom web authentication redirect URL.
---------------------------	--

<b>Defaults</b>	None.
-----------------	-------

<b>Examples</b>	<pre>&gt; clear redirect-url</pre> <p>URL cleared.</p>
-----------------	--

<b>Related Commands</b>	<b>clear transfer</b> <b>clear download datatype</b> <b>clear download filename</b> <b>clear download mode</b> <b>clear download path</b> <b>clear download start</b> <b>clear upload datatype</b> <b>clear upload filename</b> <b>clear upload mode</b> <b>clear upload path</b> <b>clear upload serverip</b> <b>clear upload start</b>
-------------------------	---

## clear stats ap wlan

To clear the WLAN statistics, use the **clear stats ap wlan** command.

**clear stats ap wlan Cisco\_AP**

Syntax Description	Cisco_AP	Clear selected configuration elements.
--------------------	----------	--

**Defaults** This command has no defaults.

**Examples** > **clear stats ap wlan cisco-ap**

WLAN statistics cleared.

**Related Commands** [show ap stats](#)  
[show ap wlan](#)

# clear stats local-auth

To clear the local EAP statistics, use the **clear stats local-auth** command.

**clear stats local-auth**

Syntax Description	
<b>clear</b>	Clear selected configuration elements.
<b>stats</b>	Clear statistics counters.
<b>local-auth</b>	Clear local EAP statistics.

**Defaults** This command has no defaults.

**Examples**

```
> clear stats local-auth  
Local EAP Authentication Stats Cleared.
```

**Related Commands** show local-auth statistics

# clear stats mobility

To clear mobility manager statistics, use the **clear stats mobility** command.

**clear stats mobility**

Syntax Description	
<b>clear</b>	Clear selected configuration elements.
<b>stats</b>	Clear statistics counters.
<b>mobility</b>	Clear mobility manager statistics

Defaults	None.
----------	-------

Examples	<pre>&gt; clear stats mobility</pre> <p>Mobility stats cleared.</p>
----------	---

Related Commands	<b>clear transfer</b> <b>clear download datatype</b> <b>clear download filename</b> <b>clear download mode</b> <b>clear download serverip</b> <b>clear download start</b> <b>clear upload datatype</b> <b>clear upload filename</b> <b>clear upload mode</b> <b>clear upload path</b> <b>clear upload serverip</b> <b>clear upload start</b> <b>clear stats port</b>
------------------	--

# clear stats port

To clear statistics counters for a specific port, use the **clear stats port** command.

**clear stats port** *port*

<b>Syntax Description</b>	<b>clear</b> Clear selected configuration elements. <b>stats</b> Clear statistics counters. <b>port</b> Clear statistics counters for a specific port. <i>port</i> Physical interface port number.
---------------------------	---

<b>Defaults</b>	None.
-----------------	-------

<b>Examples</b>	> <b>clear stats port 9</b>
-----------------	-----------------------------

<b>Related Commands</b>	<b>clear transfer</b> <b>clear download datatype</b> <b>clear download filename</b> <b>clear download mode</b> <b>clear download serverip</b> <b>clear download start</b> <b>clear upload datatype</b> <b>clear upload filename</b> <b>clear upload mode</b> <b>clear upload path</b> <b>clear upload serverip</b> <b>clear upload start</b>
-------------------------	---

# clear stats radius

To clear the statistics for one or more RADIUS servers, use the **clear stats radius** command.

**clear stats radius {auth | acct} {index | all}**

---

## Syntax Description

<b>clear</b>	Clear selected configuration elements.
<b>stats</b>	Clear statistics counters.
<b>radius</b>	Clear statistics regarding radius servers.
{ <b>auth   acct</b> }	<ul style="list-style-type: none"> <li>• Clear statistics regarding authentication.</li> <li>• Clear statistics regarding accounting.</li> </ul>
{ <b>index   all</b> }	<ul style="list-style-type: none"> <li>• The index number of the radius server to be cleared.</li> <li>• Enter <b>all</b> to clear statistics for all radius servers.</li> </ul>

---

---

## Defaults

None.

---

## Examples

```
> clear stats radius auth all
> clear stats radius acct all
> clear stats radius auth 2
```

---

## Related Commands

**clear transfer**  
**clear download datatype**  
**clear download filename**  
**clear download mode**  
**clear download serverip**  
**clear download start**

**clear upload filename**  
**clear upload mode**  
**clear upload path**  
**clear upload serverip**  
**clear upload start**

# clear stats switch

To clear all switch statistics counters on a Cisco Wireless LAN controller, use the **clear stats switch** command.

## **clear stats switch**

<b>Syntax Description</b>	<b>clear</b> Clear selected configuration elements. <b>stats</b> Clear statistics counters. <b>switch</b> Clear all switch statistics counters.
<b>Defaults</b>	None.
<b>Examples</b>	> <b>clear stats switch</b>
<b>Related Commands</b>	<b>clear transfer</b> <b>clear download datatype</b> <b>clear download filename</b> <b>clear download mode</b> <b>clear download path</b> <b>clear download start</b> <b>clear upload datatype</b> <b>clear upload filename</b> <b>clear upload mode</b> <b>clear upload path</b> <b>clear upload serverip</b> <b>clear upload start</b>

## clear stats tacacs

To clear the TACACS+ server statistics on the controller, use the **clear stats tacacs** command.

**clear stats tacacs [ auth | athr | acct ] [ *index* | all ]**

---

### Syntax Description

<b>auth</b>	Clears the TACACS+ authentication server statistics.
<b>athr</b>	Clears the TACACS+ authorization server statistics.
<b>acct</b>	Clears the TACACS+ accounting server statistics.
<i>index</i>	Specifies the index of the TACACS+ server.
<b>all</b>	Specifies all TACACS+ servers.

---

### Defaults

This command has no defaults.

---

### Command History

Release	Modification
4.1	This command was introduced.

---

### Examples

> **clear stats tacacs acct 1**

---

### Related Commands

**show tacacs summary**

# clear transfer

To clear the transfer information, use the **clear transfer** command.

## **clear transfer**

<b>Syntax Description</b>	<b>clear</b> Clear selected configuration elements. <b>transfer</b> Clear the transfer information.
---------------------------	--

<b>Defaults</b>	None.
-----------------	-------

<b>Examples</b>	> <b>clear transfer</b> Are you sure you want to clear the transfer information? (y/n) <b>y</b> Transfer Information Cleared.
-----------------	---

<b>Related Commands</b>	<b>clear transfer</b> <b>clear download datatype</b> <b>clear download filename</b> <b>clear download mode</b> <b>clear download path</b> <b>clear download serverip</b> <b>clear upload datatype</b> <b>clear download filename</b> <b>clear download mode</b> <b>clear download path</b> <b>clear download serverip</b> <b>clear download start</b>
-------------------------	--

## clear traplog

To clear the trap log, use the **clear traplog** command.

**clear traplog**

<b>Syntax Description</b>	
	<b>clear</b> Clear selected configuration elements.
	<b>traplog</b> Clear the trap log.

**Defaults**      None.

**Examples**      > **clear traplog**

```
Are you sure you want to clear the trap log? (y/n) y
```

```
Trap Log Cleared.
```

**Related Commands**

- **clear transfer**
- **clear download datatype**
- **clear download filename**
- **clear download mode**
- **clear download path**
- **clear download serverip**
- **clear download start**
- **clear upload filename**
- **clear upload mode**
- **clear upload path**
- **clear upload serverip**
- **clear upload start**

# clear webimage

To clear the custom web authentication image, use the **clear webimage** command.

**clear webimage**

<b>Syntax Description</b>	<b>clear</b> Clear selected configuration elements. <b>webimage</b> Clear the custom web authentication image.
---------------------------	---

<b>Defaults</b>	None.
-----------------	-------

<b>Examples</b>	> <b>clear webimage</b>
-----------------	-------------------------

<b>Related Commands</b>	<b>clear transfer</b> <b>clear download datatype</b> <b>clear download filename</b> <b>clear download mode</b> <b>clear download path</b> <b>clear download serverip</b> <b>clear download start</b> <b>clear upload filename</b> <b>clear upload mode</b> <b>clear upload path</b> <b>clear upload serverip</b> <b>clear upload start</b>
-------------------------	---

## clear webmessage

To clear the custom web authentication message, use the **clear webmessage** command.

**clear webmessage**

<b>Syntax Description</b>	<b>clear</b> Clear selected configuration elements. <b>webmessage</b> Clear the custom web authentication message.
---------------------------	---

**Defaults**      None.

**Examples**      > **clear webmessage**

Message cleared.

**Related Commands**      **clear transfer**  
**clear download datatype**  
**clear download filename**  
**clear download mode**  
**clear download path**  
**clear download serverip**  
**clear download start**  
**clear upload filename**  
**clear upload mode**  
**clear upload path**  
**clear upload serverip**  
**clear upload start**

# clear webtitle

To clear the custom web authentication title, use the **clear webtitle** command.

**clear webtitle**

<b>Syntax Description</b>	<b>clear</b> Clear selected configuration elements. <b>webtitle</b> Clear the custom web authentication title.
---------------------------	---

<b>Defaults</b>	None.
-----------------	-------

<b>Examples</b>	> <b>clear webtitle</b> Title cleared.
-----------------	---

<b>Related Commands</b>	<b>clear transfer</b> <b>clear download datatype</b> <b>clear download filename</b> <b>clear download mode</b> <b>clear download path</b> <b>clear download serverip</b> <b>clear download start</b> <b>clear upload filename</b> <b>clear upload mode</b> <b>clear upload path</b> <b>clear upload serverip</b> <b>clear upload start</b>
-------------------------	---

# Uploading and Downloading Files and Configurations

To transfer files to or from the Cisco Wireless LAN controller, use the transfer commands.

## transfer download certpassword

To set the password for the .PEM file so that the operating system can decrypt the web administration SSL key and certificate, use the **transfer download certpassword** command.

**transfer download certpassword** *private\_key\_password*

Syntax Description	
<b>transfer</b>	Transfer a file to or from the switch.
<b>download</b>	Transfer a file to the switch.
<b>certpassword</b>	Set a certificate's private key password.
<i>private_key_password</i>	Enter a certificate's private key password or blank to clear the current password.

**Defaults** None.

**Examples**

```
> transfer download certpassword  
Clearing password
```

**Related Commands**

- **clear transfer**
- **transfer download filename**
- **transfer download mode**
- **transfer download path**
- **transfer download serverip**
- **transfer download start**
- **transfer upload datatype**
- **transfer upload filename**
- **transfer upload mode**
- **transfer upload path**
- **transfer upload serverip**
- **transfer upload start**

# transfer download datatype

To set the download file type, use the **transfer download datatype** command.

```
transfer download datatype {config | code | image | signature | webadmincert | webauthcert}
```

<b>Syntax Description</b>	<b>transfer</b> Transfer a file to or from the switch. <b>download</b> Transfer a file to the switch. <b>datatype</b> Set download file type. <b>{config   code   image   signature   webadmincert   webauthcert   webauthbundle   eapdevcert   eapcacert}</b> <ul style="list-style-type: none"> <li>• Enter <b>config</b> to download configuration file.</li> <li>• Enter <b>code</b> to download an executable image to the system.</li> <li>• Enter <b>image</b> to download a web page logo to the system.</li> <li>• Enter <b>signature</b> to download a signature file to the system.</li> <li>• Enter <b>webadmincert</b> to download a certificate for web administration to the system.</li> <li>• Enter <b>webauthcert</b> to download a web certificate for web portal to the system.</li> <li>• Enter <b>webauthbundle</b> to download custom webauth bundle to the system.</li> <li>• Enter <b>eapdevcert</b> to download an EAP dev certificate to the system.</li> <li>• Enter <b>eapcacert</b> to download an EAP ca certificate to the system</li> </ul>
<b>Defaults</b>	None.
<b>Examples</b>	> <b>transfer download datatype code</b>
<b>Related Commands</b>	<a href="#">transfer download filename</a> <a href="#">transfer download mode</a> <a href="#">transfer download path</a> <a href="#">transfer download serverip</a> <a href="#">transfer download start</a> <a href="#">transfer upload datatype</a> <a href="#">transfer upload filename</a> <a href="#">transfer upload mode</a> <a href="#">transfer upload path</a> <a href="#">transfer upload serverip</a> <a href="#">transfer upload start</a> <a href="#">transfer download start</a>

# transfer download filename

To download a specific file, use the **transfer download filename** command.

**transfer download filename** *webadmincert\_name.pem*

Syntax Description	
<b>transfer</b>	Transfer a file to or from the switch.
<b>download</b>	Transfer a file to the switch.
<b>filename</b>	Set the FTP or TFTP filename.
<i>filename</i>	File name up to 16 alphanumeric characters.

Defaults	None.
----------	-------

Examples	> <b>transfer download filename build603</b>
----------	--

Related Commands	<b>clear transfer</b> <b>transfer download datatype</b> <b>transfer download mode</b> <b>transfer download path</b> <b>transfer download serverip</b> <b>transfer download start</b> <b>transfer upload datatype</b> <b>transfer upload filename</b> <b>transfer upload mode</b> <b>transfer upload path</b> <b>transfer upload serverip</b> <b>transfer upload start</b>
------------------	--

# transfer download mode

To set transfer mode, use the **transfer download mode** command.

```
transfer download mode {ftp | tftp}
```

Syntax Description	<b>transfer</b> Transfer a file to or from the switch. <b>download</b> Transfer a file to the switch. <b>mode</b> Set transfer mode. <b>ftp</b> Set the transfer mode to ftp. <b>tftp</b> Set the transfer mode to tftp.
--------------------	--

Defaults	None.
----------	-------

Examples	> <b>transfer download mode tftp</b>
----------	--------------------------------------

Related Commands	<b>clear transfer</b> <b>transfer download datatype</b> <b>transfer download filename</b> <b>transfer download path</b> <b>transfer download serverip</b> <b>transfer download start</b> <b>transfer upload datatype</b> <b>transfer upload filename</b> <b>transfer upload mode</b> <b>transfer upload path</b> <b>transfer upload serverip</b> <b>transfer upload start</b>
------------------	--

# transfer download password

To set the password for FTP transfer, use the **transfer download password** command.

**transfer download password** *password*

---

## Syntax Description

<b>transfer</b>	Transfer a file to or from the switch.
<b>download</b>	Transfer a file to the switch.
<b>password</b>	Set FTP password.
<i>password</i>	Password.

---

## Defaults

None.

---

## Examples

>**transfer download password pass01**

---

## Related Commands

[transfer download mode](#)  
[transfer download port](#)  
[transfer download username](#)

# transfer download path

To set a specific FTP or TFTP path, use the **transfer download path** command.

**transfer download path** *path*

<b>Syntax Description</b>	<b>transfer</b> Transfer a file to or from the switch. <b>download</b> Transfer a file to the switch. <b>path</b> Set FTP or TFTP Path. <i>path</i> Directory path. <b>Note</b> Pathnames on a TFTP or FTP server are relative to the server's default or root directory. For example, in the case of the Solarwinds TFTP server, the path is “/”.
<b>Defaults</b>	None.
<b>Examples</b>	> <b>transfer download path c:\install\version2</b>
<b>Related Commands</b>	<a href="#">clear transfer</a> <a href="#">transfer download datatype</a> <a href="#">transfer download filename</a> <a href="#">transfer download mode</a> <a href="#">transfer download serverip</a> <a href="#">transfer download start</a> <a href="#">transfer upload datatype</a> <a href="#">transfer upload filename</a> <a href="#">transfer upload mode</a> <a href="#">transfer upload path</a> <a href="#">transfer upload serverip</a> <a href="#">transfer upload start</a>

## transfer download port

To specify the FTP port, use the transfer download port command

**transfer download port *port***

---

### Syntax Description

<b>transfer</b>	Transfer a file to or from the switch.
<b>download</b>	Transfer a file to the switch.
<b>port</b>	FTP port.
<i>port</i>	Set FTP port

---

### Defaults

The default FTP *port* is **21**.

---

### Examples

>**transfer download port 23**

---

# transfer download serverip

To configure the IP address of the TFTP server from which to download information, use the **transfer download serverip** command.

**transfer download serverip *TFTP\_server ip\_address***

<b>Syntax Description</b>	<b>transfer</b> Transfer a file to or from the switch. <b>download</b> Transfer a file to the switch. <b>serverip</b> Enter IP address of the server. <i>TFTP_server</i> TFTP IP address. <i>ip_address</i> Server IP address.
---------------------------	--

<b>Defaults</b>	None.
-----------------	-------

<b>Examples</b>	> <b>transfer download serverip 175.34.56.78</b>
-----------------	--

<b>Related Commands</b>	<b>clear transfer</b> <b>transfer download datatype</b> <b>transfer download filename</b> <b>transfer download mode</b> <b>transfer download path</b> <b>transfer download start</b> <b>transfer upload datatype</b> <b>transfer upload filename</b> <b>transfer upload mode</b> <b>transfer upload path</b> <b>transfer upload serverip</b> <b>transfer upload start</b>
-------------------------	--

# transfer download start

To initiate a download, use the **transfer download start** command.

## **transfer download start**

---

### Syntax Description

<b>transfer</b>	Transfer a file to or from the switch.
<b>download</b>	Transfer a file to the switch.
<b>start</b>	Initiate a download.

---

---

### Defaults

None.

---

### Examples

```
> transfer download start

Mode..... TFTP
Data Type..... Site Cert
TFTP Server IP..... 172.16.16.78
TFTP Path..... directory path
TFTP Filename..... webadmincert_name

This may take some time.
Are you sure you want to start? (y/n) y
TFTP Webadmin cert transfer starting.
Certificate installed.
Please restart the switch (reset system) to use the new certificate.
```

---

# transfer download tftpPktTimeout

To specify the TFTP packet timeout, use the **transfer download tftpPktTimeout** command.

**transfer download tftpPktTimeout *timeout***

<b>Syntax Description</b>	<b>transfer</b> Transfer a file to or from the switch. <b>download</b> Transfer a file to the switch. <b>tftpPktTimeout</b> Enter the tftp packet timeout. <b>timeout</b> Timeout in seconds between 1 and 254.
<b>Defaults</b>	None.
<b>Examples</b>	> <b>transfer download tftpPktTimeout 55</b>
<b>Related Commands</b>	<b>clear transfer</b> <b>transfer download datatype</b> <b>transfer download filename</b> <b>transfer download mode</b> <b>transfer download path</b> <b>transfer download serverip</b> <b>transfer upload datatype</b> <b>transfer download filename</b> <b>transfer download mode</b> <b>transfer download path</b> <b>transfer download serverip</b> <b>transfer download start</b>

## transfer download tftpMaxRetries

To specify the number of allowed TFTP packet retries, use the **transfer download tftpMaxRetries** command.

**transfer download tftpMaxRetries** *retries*

Syntax Description	
<b>transfer</b>	Transfer a file to or from the switch.
<b>download</b>	Transfer a file to the switch.
<b>tftpMaxRetries</b>	Enter the number of allowed TFTP packet retries.
<i>retries</i>	Number of allowed TFTP packet retries between 1 and 254 seconds.

**Defaults** None.

**Examples** > **transfer download tftpMaxRetries 55**

# transfer encrypt

To configure encryption for config file transfers, use the **transfer encrypt** command.

```
transfer encrypt {enable | disable | set-key key}
```

Syntax Description	
<b>transfer</b>	Transfer a file to or from the switch.
<b>encrypt</b>	Transfer a file to the switch.
<b>{enable   disable   set-key}</b>	<ul style="list-style-type: none"> <li>• Enter <b>enable</b> to enable encryption for config file transfers.</li> <li>• Enter <b>disable</b> to disables encryption for config file transfers.</li> <li>• Enter <b>set-key</b> to configures the encryption key for config file transfers.</li> </ul>
<b>key</b>	Encryption key for config file transfers.

**Defaults** None.

**Examples** > **transfer encrypt enable**

# transfer upload datatype

To set the upload file type, use the **transfer upload datatype** command.

```
transfer upload datatype [ config | crashfile | errorlog | pac | radio-core-dump | signature |
    systemtrace | traplog ]
```

Syntax Description	<b>config</b> (Optional) Specifies the upload is a system configuration file.
<b>crashfile</b>	(Optional) Specifies the upload is a system crashfile
<b>errorlog</b>	(Optional) Specifies the upload is a system error log file
<b>pac</b>	(Optional) Specifies the upload is a system PAC file.
<b>radio-core-dump</b>	(Optional) Specifies the upload is a system radio error log file.
<b>signature</b>	(Optional) Specifies the upload is a system signature file.
<b>systemtrace</b>	(Optional) Specifies the upload is a system trace file.
<b>traplog</b>	(Optional) Specifies the upload is a system trap file.

**Defaults** This command has no defaults.

Command History	Release	Modification
	4.1	This command was revised to include the pac option.

**Examples** > **transfer upload datatype errorlog**

# transfer upload filename

To upload a specific file, use the **transfer upload filename** command.

**transfer upload filename** *filename*

Syntax Description	
<b>transfer</b>	Transfer a file to or from the switch.
<b>upload</b>	Transfer a file from the switch.
<b>filename</b>	Set the FTP or TFTP filename.
<i>filename</i>	File name up to 16 alphanumeric characters.

Defaults	None.
----------	-------

Examples	> <b>transfer upload filename build603</b>
----------	--

# Troubleshooting Commands

Use the **debug** commands to manage system debugging.

**Caution**

Debug commands are reserved for use only under direction of Cisco personnel. Please do not use these commands without direction from Cisco-certified staff.

**Note**

Enabling all **debug** commands on a system with many clients authenticating may result in some debugs being lost.

# debug aaa

To configure AAA debug options, use the **debug aaa** command:

```
debug aaa { [all | detail | events | packet | ldap | local-auth | tacacs] [ enable | disable]}
```

---

## Syntax Description

<b>all</b>	Specifies debugging of all AAA messages.
<b>detail</b>	Specifies debugging of AAA errors.
<b>events</b>	Specifies debugging of AAA events.
<b>packet</b>	Specifies debugging of AAA packets.
<b>ldap</b>	Specifies debugging of the AAA LDAP events.
<b>local-auth</b>	Specifies debugging of the AAA local EAP events.
<b>tacacs</b>	Specifies debugging of the AAA TACACS+ events.
<b>enable</b>	Starts the debugging feature.
<b>disable</b>	Stops the debugging feature.

---

---

## Defaults

This command has no defaults.

---

## Command History

Release	Modification
4.1	This command was introduced.

---

---

## Examples

```
> debug aaa ldap enable
```

---

## Related Commands

**debug aaa local-auth eap**  
**show running-config**

# debug aaa local-auth

To debug AAA local authentication on the controller, use the **debug aaa local-auth** command:

```
debug aaa local-auth {
    db [enable | disable] |
    eap [framework | method] [all | errors | events | packets | sm] [enable | disable] |
    shim [enable | disable]}
```

Syntax Description	<b>db</b> Configures debugging of the AAA local authentication backend messages and events.
<b>eap</b>	Configures debugging of the AAA local EAP authentication.
<b>shim</b>	Configures debugging of the AAA local authentication shim layer events.
<b>framework</b>	Configures debugging of the local EAP framework.
<b>method</b>	Configures debugging of local EAP methods.
<b>all</b>	Specifies debugging of local EAP messages.
<b>errors</b>	Specifies debugging of local EAP errors.
<b>events</b>	Specifies debugging of local EAP events.
<b>packets</b>	Specifies debugging of local EAP packets.
<b>sm</b>	Specifies debugging of the local EAP state machine.
<b>enable</b>	Starts the debugging feature.
<b>disable</b>	Stops the debugging feature.

**Defaults** This command has no defaults.

Command History	Release	Modification
	4.1	This command was introduced.

**Examples** > **debug aaa local-auth eap method all enable**

**Related Commands** **show local-auth config**  
**show wlan**

# debug airewave-director

To configure the Airewave Director Software debug options, use the **debug airewave-director** command.

```
debug airewave-director {all | channel | detail | error | group | manager | message | packet | power | profile | radar | rf-change} {enable | disable}
```

<b>Syntax Description</b>	<b>debug</b> Debug parameters. <b>airewave-director</b> Airewave Director parameters. <b>{all   channel   detail   error   group   manager   message   packet   power   profile   radar   rf-change}</b> • Enter <b>all</b> to configure debug of all Airewave Director logs. • Enter <b>channel</b> to configure debug of Airewave Director channel assignment protocol • Enter <b>detail</b> to configure debug of Airewave Director detail logs. • Enter <b>error</b> to configure debug of Airewave Director error logs. • Enter <b>group</b> to configure debug of Airewave Director grouping protocol. • Enter <b>manager</b> to configure debug of Airewave Director manager. • Enter <b>message</b> to configure debug of Airewave Director messages. • Enter <b>packet</b> to configure debug of Airewave Director packets. • Enter <b>power</b> to configure debug of Airewave Director power assignment protocol and coverage hole detection. • Enter <b>profile</b> to configure debug of Airewave Director profile events. • Enter <b>radar</b> to configure debug of Airewave Director radar detection/avoidance protocol. • Enter <b>rf-change</b> to configure debug of Airewave Director rf changes. <b>{enable   disable}</b> • Enter <b>enable</b> to enable Airewave Director debug setting. • Enter <b>disable</b> to disable Airewave Director debug setting.
---------------------------	--

**Defaults** None.

**Examples**

```
> debug airewave-director profile enable
> debug airewave-director profile disable
```

**Related Commands**

- show sysinfo**
- debug disable-all**

# debug ap

To enable or disable remote debugging of Cisco lightweight access points or to remotely execute a command on a lightweight access point, use this command:

**debug ap {enable | disable | command *cmd*} *Cisco\_AP***

## Syntax Description

<b>debug</b>	Debug parameters.
<b>ap</b>	Debug lightweight access point parameters.
<b>enable   disable</b>	Enable or disable debugging on a lightweight access point.
<b>Note</b>	The debugging information is displayed only to the controller console and does not send output to a controller TELNET/SSH CLI session.
<b>command</b>	Specifies that a CLI command follows to be executed on the access point.
<i>cmd</i>	Command to be executed.
<b>Note</b>	The command to be executed must be enclosed in double quotes, such as <b>debug ap command "led flash 30" AP03</b> .
<b>Note</b>	The output of the command displays only to the controller console and does not send output to a controller TELNET/SSH CLI session.
<i>Cisco_AP</i>	Name of a Cisco lightweight access point.

## Defaults

Disabled.

## Examples

To enable remote debugging on access point AP01:

```
> debug ap enable AP01
```

To execute the **config ap location** command on access point AP02:

```
> debug ap command "config ap location "Building 1" AP02"
```

To execute the flash LED command on access point AP03:

```
> debug ap command "led flash 30" AP03
```

## Related Commands

**show sysinfo**

**config sysname**

## debug ap enable

To enable or disable remote debugging of Cisco lightweight access points or to remotely execute a command on a lightweight access point, use this command:

**debug ap {enable | disable | command cmd} Cisco\_AP**

Syntax Description	
<b>enable</b>	Enables remote debugging.  <b>Note</b> The debugging information is displayed only to the controller console and does not send output to a controller TELNET/SSH CLI session.
<b>disable</b>	Disables remote debugging.
<b>command</b>	Specifies that a CLI command follows to be executed on the access point.
<i>cmd</i>	Command to be executed.  <b>Note</b> The command to be executed must be enclosed in double quotes, such as <b>debug ap command "led flash 30" AP03</b> .
<i>Cisco_AP</i>	Cisco lightweight access point name.

**Defaults** None.

**Examples** To enable remote debugging on access point AP01:

> **debug ap enable AP01**

To disable remote debugging on access point AP02:

> **debug ap disable AP02**

To execute the flash LED command on access point AP03:

> **debug ap command "led flash 30" AP03**

**Related Commands** **show sysinfo**  
**config sysname**

# debug arp

To configure ARP debug options, use the **debug arp** command.

```
debug arp {all | detail | events | message} {enable | disable}
```

---

## Syntax Description

<b>debug</b>	Debug parameters.
<b>arp</b>	ARP parameters.
{ <b>all   detail   error   message</b> }	<ul style="list-style-type: none"> <li>• Enter <b>all</b> to configure debug of all arp logs.</li> <li>• Enter <b>detail</b> to configure debug of arp detail messages..</li> <li>• Enter <b>error</b> to configure debug of arp errors.</li> <li>• Enter <b>message</b> to configure debug of arp messages.</li> </ul>
{ <b>enable   disable</b> }	<ul style="list-style-type: none"> <li>• Enter <b>enable</b> to enable arp debug setting.</li> <li>• Enter <b>disable</b> to disable arp debug setting.</li> </ul>

---

---

## Defaults

None.

---

## Examples

```
> debug arp error enable
> debug arp error disable
```

---

## Related Commands

**show sysinfo**  
**debug disable-all**

# debug bcast

To configure debug of broadcast options, use the **debug bcast** command.

```
debug bcast {all | error | message | igmp | detail} {enable | disable}
```

Syntax Description	<b>debug</b> Debug parameters. <b>bcast</b> bcast parameters. <b>all   error   message   igmp   detail</b> <ul style="list-style-type: none"> <li>Enter <b>all</b> to configure debug of all broadcast logs.</li> <li>Enter <b>detail</b> to configure debug of broadcast detailed messages.</li> <li>Enter <b>error</b> to configure debug of broadcast errors.</li> <li>Enter <b>igmp</b> to configure debug of broadcast messages.</li> <li>Enter <b>message</b> to configure debug of broadcast messages.</li> </ul>
	<b>{enable   disable}</b> <ul style="list-style-type: none"> <li>Enter <b>enable</b> to enable broadcast debug setting.</li> <li>Enter <b>disable</b> to disable broadcast debug setting.</li> </ul>

---

**Defaults**      None.

---

**Examples**

```
> debug bcast message enable
> debug bcast message disable
```

---

**Related Commands**

<b>show sysinfo</b>
<b>debug disable-all</b>

# debug cac

To configure call admission control (CAC) debug options, use the **debug cac** command.

```
debug cac {all | event | packet} {enable | disable}
```

<b>Syntax Description</b>	<b>debug</b> Debug parameters. <b>cac</b> Debug call admission control parameters. <b>all   event   packet</b> <ul style="list-style-type: none"> <li>Enter <b>all</b> to configure debugging options for all CAC messages.</li> <li>Enter <b>event</b> to configure debugging options for CAC events.</li> <li>Enter <b>packet</b> to configure debugging options for selected CAC packets.</li> </ul> <b>enable   disable</b> <ul style="list-style-type: none"> <li>Enter <b>enable</b> to enable debug setting.</li> <li>Enter <b>disable</b> to disable debug setting.</li> </ul>
<b>Defaults</b>	Disabled.
<b>Examples</b>	<pre>&gt; <b>debug cac event enable</b> &gt; <b>debug cac event disable</b></pre>
<b>Related Commands</b>	<b>config {802.11a   802.11b} cac video acm</b> <b>config {802.11a   802.11b} {enable   disable} network</b> <b>config {802.11a   802.11b} cac video max-bandwidth</b> <b>config {802.11a   802.11b} cac video roam-bandwidth</b> <b>config {802.11a   802.11b} cac video tspec-inactivity-timeout</b> <b>config {802.11a   802.11b} cac voice acm</b> <b>config {802.11a   802.11b} cac voice load-based</b> <b>config {802.11a   802.11b} cac voice max-bandwidth</b> <b>config {802.11a   802.11b} cac voice roam-bandwidth</b> <b>config {802.11a   802.11b} cac voice stream-size</b> <b>config {802.11a   802.11b} cac voice tspec-inactivity-timeout</b>

# debug crypto

To configure hardware cryptographic debug options, use the **debug crypto** command.

```
debug crypto {all | sessions | trace | warning} {enable | disable}
```

---

## Syntax Description

<b>debug</b>	Debug parameters.
<b>dhcp</b>	DHCP parameters.
{ <b>all   sessions   trace   warning</b> }	<ul style="list-style-type: none"> <li>• Enter <b>all</b> to configure debug of all hardware crypto messages.</li> <li>• Enter <b>sessions</b> to configure debug of hardware crypto sessions.</li> <li>• Enter <b>trace</b> to configure debug of hardware crypto sessions.</li> <li>• Enter <b>warning</b> to configure debug of hardware crypto sessions.</li> </ul>
{ <b>enable   disable</b> }	<ul style="list-style-type: none"> <li>• Enter <b>enable</b> to enable debug setting.</li> <li>• Enter <b>disable</b> to disable debug setting.</li> </ul>

---

---

## Defaults

None.

---

## Examples

```
> debug sessions enable
> debug sessions disable
```

---

## Related Commands

**show sysinfo**  
**debug disable-all**

# debug dhcp

To configure DHCP debug options, use the **debug dhcp** command.

```
debug dhcp {message | packet} {enable | disable}
```

Syntax Description	<b>debug</b> Debug parameters. <b>dhcp</b> DHCP parameters. <b>{message   packet}</b> <ul style="list-style-type: none"> <li>Enter <b>message</b> to configure debug of DHCP error messages.</li> <li>Enter <b>packet</b> to configure debug of DHCP packets.</li> </ul> <b>{enable   disable}</b> <ul style="list-style-type: none"> <li>Enter <b>enable</b> to enable DHCP debug setting.</li> <li>Enter <b>disable</b> to disable DHCP debug setting.</li> </ul>
<b>Defaults</b>	None.
<b>Examples</b>	<pre>&gt; debug dhcp message enable &gt; debug dhcp message disable</pre>
<b>Related Commands</b>	<b>debug disable-all</b>

# debug disable-all

To disable all debug messages, use the **debug disable-all** command.

**debug disable-all**

<b>Syntax Description</b>	<b>debug</b> Debug parameters. <b>disable-all</b> Disables all debug messages.
---------------------------	---

<b>Defaults</b>	Disabled.
-----------------	-----------

<b>Examples</b>	> <b>debug disable-all</b>
-----------------	----------------------------

<b>Related Commands</b>	<b>debug aaa</b> <b>debug airewave-director</b> <b>debug arp</b> <b>debug bcast</b> <b>debug crypto</b> <b>debug dhcp</b> <b>debug dot11</b> <b>debug dot1x</b> <b>debug l2age</b> <b>debug lwapp</b> <b>debug mac</b> <b>debug mobility</b> <b>debug nac</b> <b>debug ntp</b> <b>debug pem</b> <b>debug pm</b> <b>debug poe</b> <b>debug rbcpc</b> <b>debug snmp</b> <b>debug transfer</b> <b>debug wcp</b> <b>debug wps</b>

<b>Related Commands</b>	<b>debug disable-all</b>								

# debug dot11 mgmt interface

To view 802.11 management interface events, use the **debug dot11 mgmt interface** command.

**debug dot11 mgmt interface**

**Syntax Description** This command has no arguments or keywords.

**Defaults** This command has no defaults.

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	4.2	This command was introduced.

**Examples** > **debug dot11 mgmt interface**

**Related Commands** **debug disable-all**

# debug dot11 mgmt msg

To view 802.11 management messages, use the **debug dot11 mgmt msg** command.

**debug dot11 mgmt msg**

**Syntax Description** This command has no arguments or keywords.

**Defaults** This command has no defaults.

Command History	Release	Modification
	4.2	This command was introduced.

**Examples** > **debug dot11 mgmt msg**

**Related Commands** **debug disable-all**

## debug dot11 mgmt ssid

To view 802.11 SSID management events, use the **debug dot11 mgmt ssid** command.

**debug dot11 mgmt ssid**

**Syntax Description** This command has no arguments or keywords.

**Defaults** This command has no defaults.

Command History	Release	Modification
	4.2	This command was introduced.

**Examples** > **debug dot11 mgmt ssid**

**Related Commands** **debug disable-all**

# debug dot11 mgmt state-machine

To view 802.11 state machine, use the **debug dot11 mgmt state-machine** command.

**debug dot11 mgmt state-machine**

**Syntax Description** This command has no arguments or keywords.

**Defaults** This command has no defaults.

Command History	Release	Modification
	4.2	This command was introduced.

**Examples** > **debug dot11 mgmt state-machine**

**Related Commands** **debug disable-all**

# debug dot11 mgmt station

To view client events, use the **debug dot11 mgmt station** command.

**debug dot11 mgmt station**

**Syntax Description** This command has no arguments or keywords.

**Defaults** This command has no defaults.

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	4.2	This command was introduced.

**Examples** > **debug dot11 mgmt station**

**Related Commands** **debug disable-all**

# debug dot1x

To configure dot1x debug options, use the **debug dot1x** command.

```
debug dot1x {aaa | all | events | packet | states} {enable | disable}
```

Syntax Description	<b>debug</b> Debug parameters. <b>dot1x</b> dot1x parameters. <b>{aaa   all   events   packet   states}</b> <ul style="list-style-type: none"> <li>Enter <b>aaa</b> to configure debug of 802.1X AAA interactions.</li> <li>Enter <b>all</b> to configure debug of all 802.1x messages.</li> <li>Enter <b>events</b> to configure debug of 802.1x 802.1X events.</li> <li>Enter <b>packet</b> to configure debug of 802.1x 802.1X packets.</li> <li>Enter <b>states</b> to configure debug of 802.1x mobile state transitions.</li> </ul> <b>{enable   disable}</b> <ul style="list-style-type: none"> <li>Enter <b>enable</b> to enable dot1x debug setting.</li> <li>Enter <b>disable</b> to disable dot1x debug setting.</li> </ul>
--------------------	--

Defaults	None.
----------	-------

Examples	<pre>&gt; debug dot1x state enable &gt; debug dot1x state disable</pre>
----------	---

Related Commands	<a href="#">debug disable-all</a> <a href="#">debug dot11</a>

## debug l2age

To configure debug of Layer 2 Age timeout messages, use the **debug l2age** command.

**debug l2age {enable | disable}**

---

### Syntax Description

<b>debug</b>	Debug parameters.
<b>l2age</b>	Layer 2 Age Timeout Messages.
{enable   disable}	<ul style="list-style-type: none"><li>• Enter <b>enable</b> to enable l2age debug setting.</li><li>• Enter <b>disable</b> to disable l2age debug setting.</li></ul>

---

### Defaults

None.

---

### Examples

> **debug l2age enable**  
> **debug l2age disable**

---

### Related Commands

**debug disable-all**

# debug lwapp

To configure LWAPP debug options, use the **debug lwapp** command. This is a helpful command to debug when an AP does not join a controller.

**debug lwapp {detail | error | events | packet} {enable | disable}**

## Syntax Description

<b>debug</b>	Debug parameters.
<b>lwapp</b>	lwapp parameters.
<b>{detail   error   events   packet}</b>	<ul style="list-style-type: none"> <li>• Enter <b>detail</b> to configure debug of LWAPP detail.</li> <li>• Enter <b>error</b> to configure debug of LWAPP errors.</li> <li>• Enter <b>events</b> to configure debug of LWAPP events and errors.</li> <li>• Enter <b>packet</b> to configure debug of LWAPP packet trace.</li> </ul>
<b>{enable   disable}</b>	<ul style="list-style-type: none"> <li>• Enter <b>enable</b> to enable lwapp debug setting.</li> <li>• Enter <b>disable</b> to disable lwapp debug setting.</li> </ul>

## Defaults

None.

## Examples

```
> debug lwapp packet enable
> debug lwapp packet disable
```

## Related Commands

**debug disable-all**

# debug lwapp console cli

To begin debugging of the access point console CLI, use the **debug lwapp console cli** command from the access point console port.

## **debug lwapp console cli**

**Note** This access point CLI command must be issued from the access point console port.

**Syntax Description** This command has no arguments or keywords.

**Defaults** This command has no defaults.

Command History	Release	Modification
	4.1	This command was introduced.

**Examples**

```
AP# debug lwapp console cli
LWAPP console CLI allow/disallow debugging is on
```

**Related Commands**

- **lwapp ap controller ip address**
- **clear lwapp private-config**

# debug lwapp reap

To obtain debug information regarding general hybrid-REAP activities, use the **debug lwapp reap** command.

**debug lwapp reap**

**Syntax Description** This command has no arguments or keywords.

**Defaults** This command has no defaults.

Command History	Release	Modification
	4.2	This command was introduced.

**Examples** > **debug lwapp reap**

**Related Commands**

- debug lwapp reap mgmt
- debug lwapp reap load
- debug dot11 mgmt interface
- debug dot11 mgmt msg
- debug dot11 mgmt ssid
- debug dot11 mgmt state-machine
- debug dot11 mgmt station

# debug lwapp reap load

To view payload activities, use the **debug lwapp reap load** command.

**debug lwapp reap load**

**Note** Viewing payload activities is useful when the hybrid-REAP access point boots up in standalone mode.

**Syntax Description** This command has no arguments or keywords.

**Defaults** This command has no defaults.

Command History	Release	Modification
	4.2	This command was introduced.

**Examples** > **debug lwapp reap load**

**Related Commands** **debug lwapp reap**  
**debug lwapp reap mgmt**  
**debug dot11 mgmt interface**

# debug lwapp reap mgmt

To view client authentication and association messages, use the **debug lwapp reap mgmt** command.

**debug lwapp reap mgmt**

**Syntax Description** This command has no arguments or keywords.

**Defaults** This command has no defaults.

Command History	Release	Modification
	4.2	This command was introduced.

**Examples** > **debug lwapp reap mgmt**

**Related Commands** **debug lwapp reap**  
**debug lwapp reap load**

# debug mac

To configure MAC debugging, use the **debug mac** command.

```
debug mac {disable | addr MAC}
```

---

**Syntax Description**

<b>debug</b>	Debug parameters.
<b>mac</b>	MAC address parameters.
<b>disable</b>	Enter <b>disable</b> to disable MAC debugging.
<b>addr</b>	Enter <b>addr</b> to configure the MAC address.
<i>MAC</i>	MAC address.

---

---

**Defaults**

None.

---

**Examples**

```
> debug mac addr 00.0c.41.07.33.a6  
> debug mac disable
```

---

**Related Commands**

**debug disable-all**

# debug mobility

To troubleshoot mobility issues, use the **debug mobility** command.

**debug mobility handoff {enable | disable}**—Debugs mobility handoff issues.

**debug mobility keep-alive {enable | disable} all**—Dumps the keepalive packets for all mobility anchors.

**debug mobility keep-alive {enable | disable} IP\_address**—Dumps the keepalive packets for a specific mobility anchor.

**debug mobility multicast {enable | disable}**—Enables or disables debugging of multicast usage for mobility messages.

Syntax Description	
<b>enable</b>	Starts debugging of the feature.
<b>disable</b>	Stops debugging of the feature.
<b>handoff</b>	Begins debugging mobility packets.
<b>keep-alive</b>	Begins debugging of mobility keepalive messages.
<b>multicast</b>	Begins debugging of multicast usage

**Defaults** This command has no defaults.

**Examples**

```
> debug mobility handoff enable
> debug mobility keep-alive disable all
> debug mobility keep-alive enable 172.19.28.40
> debug mobility multicast enable
```

**Related Commands**

- debug disable-all
- show mobility summary

## debug nac

To configure debug of Network Access Control (NAC), use the **debug nac** command.

```
debug nac {events | packet} {enable | disable}
```

---

### Syntax Description

<b>debug</b>	Debug parameters.
<b>nac</b>	Network Access Control (NAC) parameters.
{events   packet}	<ul style="list-style-type: none"><li>Enter <b>events</b> to configure debug of NAC events.</li><li>Enter <b>packet</b> to configure debug of NAC packets.</li></ul>
{enable   disable}	<ul style="list-style-type: none"><li>Enter <b>enable</b> to enable NAC debug setting.</li><li>Enter <b>disable</b> to disable NAC debug setting.</li></ul>

---

---

### Defaults

None.

---

### Examples

```
> debug nac events enable  
> debug nac events disable
```

---

### Related Commands

**debug disable-all**

# debug ntp

To configure debug of Network Time Protocol (NTP), use the **debug ntp** command.

```
debug ntp {detail | low | packet} {enable | disable}
```

<b>Syntax Description</b>	<b>debug</b> Debug parameters. <b>ntp</b> Network Time Protocol (NTP) parameters. <b>{detail   low   packet}</b> <ul style="list-style-type: none"> <li>Enter <b>detail</b> to configure debug of detailed NTP messages.</li> <li>Enter <b>low</b> to configure debug of NTP messages.</li> <li>Enter <b>packet</b> to configure debug of NTP packets.</li> </ul> <b>{enable   disable}</b> <ul style="list-style-type: none"> <li>Enter <b>enable</b> to enable NTP debug setting.</li> <li>Enter <b>disable</b> to disable NTP debug setting.</li> </ul>
<b>Defaults</b>	None.
<b>Examples</b>	<pre>&gt; <b>debug ntp packet enable</b> &gt; <b>debug ntp packet disable</b></pre>
<b>Related Commands</b>	<b>debug disable-all</b>

## debug pem

To configure the access policy manager debug options, use the **debug pem** command.

**debug pem {events | state} {enable | disable}**

Syntax Description	<b>debug</b> Debug parameters. <b>pem</b> Access policy manager debug options. <b>{events   state}</b> • Enter <b>packet</b> to configure debug of policy manager events.. • Enter <b>events</b> to configure debug of policy manager State Machine. <b>{enable   disable}</b> • Enter <b>enable</b> to enable access policy manager debug setting. • Enter <b>disable</b> to disable access policy manager debug setting.
--------------------	---

**Defaults** None.

**Examples**  
> **debug pem state enable**  
> **debug pem state disable**

**Related Commands** **debug disable-all**

# debug pm

To configure debug of security policy manager module, use the **debug pm** command.

**debug pm all disable**

```
debug pm {config | hwcrypto | ikemsg | init | list | message | pki | rng | rules | sa-export |
          sa-import | ssh-l2tp | ssh-appgw | ssh-engine | ssh-int | ssh-pmgr | ssh-ppp | ssh-tcp} {enable |
          disable}
```

Syntax Description	<b>debug</b> Debug parameters. <b>pm</b> Security policy manager module parameters. <b>all disable</b> Used to disable all debugging in the policy manager module.  <b>{config   hwcrypto   ikemsg   init   list   message   pki   rng   rules   sa-export   sa-import   ssh-l2tp   ssh-appgw   ssh-engine   ssh-int   ssh-pmgr   ssh-ppp   ssh-tcp}</b> <ul style="list-style-type: none"> <li>• Enter <b>config</b> to configure debug of policy manager configuration.</li> <li>• Enter <b>hwcrypto</b> to configure debug of hardware offload events.</li> <li>• Enter <b>ikemsg</b> to configure debug of IKE messages.</li> <li>• Enter <b>init</b> to configure debug of policy manager initialization events.</li> <li>• Enter <b>list</b> to configure debug of policy manager list mgmt.</li> <li>• Enter <b>message</b> to configure debug of policy manager message queue events.</li> <li>• Enter <b>pki</b> to configure debug of PKI-related events.</li> <li>• Enter <b>rng</b> to configure debug of random number generation.</li> <li>• Enter <b>rules</b> to configure debug of layer 3 policy events.</li> <li>• Enter <b>sa-export</b> to configure debug of SA export (mobility).</li> <li>• Enter <b>sa-import</b> to configure debug of SA import (mobility).</li> <li>• Enter <b>ssh-l2tp</b> to configure debug of policy manager l2tp handling.</li> <li>• Enter <b>ssh-appgw</b> to configure debug of application gateways.</li> <li>• Enter <b>ssh-engine</b> to configure debug of the policy manager engine.</li> <li>• Enter <b>ssh-int</b> to configure debug of the policy manager interceptor.</li> <li>• Enter <b>ssh-pmgr</b> to configure debug of the policy manager policy mgr.</li> <li>• Enter <b>ssh-ppp</b> to configure debug of policy manager ppp handling.</li> <li>• Enter <b>ssh-tcp</b> to configure debug of policy manager tcp handling.</li> </ul>
<b>{enable   disable}</b>	<ul style="list-style-type: none"> <li>• Enter <b>enable</b> to enable mobility debug setting.</li> <li>• Enter <b>disable</b> to disable mobility debug setting.</li> </ul>
<b>Defaults</b>	None.
<b>Examples</b>	<pre>&gt; debug pm ssh-pmgr enable &gt; debug pm ssh-pmgr disable</pre>

---

**Related Commands**    **debug disable-all**

# debug poe

To configure debug of Power over ethernet debug options, use the **debug poe** command.

```
debug poe {detail | error | message} {enable | disable}
```

Syntax Description	<b>debug</b> Debug parameters. <b>poe</b> Power over ethernet debug options parameters. <b>{detail   error   message}</b> <ul style="list-style-type: none"> <li>Enter <b>detail</b> to configure debug of POE detail logs.</li> <li>Enter <b>error</b> to configure debug of POE error logs.</li> <li>Enter <b>message</b> to configure debug of POE messages.</li> </ul> <b>{enable   disable}</b> <ul style="list-style-type: none"> <li>Enter <b>enable</b> to enable POE debug setting.</li> <li>Enter <b>disable</b> to disable POE debug setting.</li> </ul>
<b>Defaults</b>	None.
<b>Examples</b>	<pre>&gt; debug poe message enable &gt; debug poe message disable</pre>
<b>Related Commands</b>	<b>debug disable-all</b>

## debug rbcp

To configure Router Blade Control (RBCP) debug options, use the **debug rbcp** command.

**debug rbcp {all | detail | errors | packet} {enable | disable}**

---

### Syntax Description

<b>debug</b>	Debug parameters.
<b>rbcp</b>	RBCP parameters.
{ <b>all   detail   errors   packet</b> }	<ul style="list-style-type: none"><li>Enter <b>all</b> to configure debug of RBCP.</li><li>Enter <b>detail</b> to configure debug of RBCP detail.</li><li>Enter <b>errors</b> to configure debug of RBCP errors.</li><li>Enter <b>packet</b> to configure debug of RBCP packet trace.</li></ul>
{ <b>enable   disable</b> }	<ul style="list-style-type: none"><li>Enter <b>enable</b> to enable RBCP debug setting.</li><li>Enter <b>disable</b> to disable RBCP debug setting.</li></ul>

---

---

### Defaults

None.

---

### Examples

```
> debug rbcp packet enable  
> debug rbcp packet disable
```

---

### Related Commands

**debug disable-all**

# debug rfid

To configure radio-frequency identification (RFID) debug options, use the **debug rfid** command.

```
debug rfid {all | detail | errors | nmfp | receive} {enable | disable}
```

Syntax Description	<b>debug</b> Debug parameters. <b>rbcp</b> RBCP parameters. <b>{all   detail   errors   nmfp   receive}</b> <ul style="list-style-type: none"> <li>Enter <b>all</b> to configure debug of all RFID messages.</li> <li>Enter <b>detail</b> to configure debug of RFID detail.</li> <li>Enter <b>errors</b> to configure debug of RFID error messages.</li> <li>Enter <b>nmfp</b> to configure debug of RFID Network Mobility Services Protocol (NMSP) messages.</li> <li>Enter <b>receive</b> to configure debug of incoming RFID tag messages.</li> </ul> <b>{enable   disable}</b> <ul style="list-style-type: none"> <li>Enter <b>enable</b> to enable RFID debug setting.</li> <li>Enter <b>disable</b> to disable RFID debug setting.</li> </ul>
--------------------	--

Defaults	None.
----------	-------

Examples	<pre>&gt; debug rfid errors enable &gt; debug rfid errors disable</pre>
----------	---

Related Commands	<b>debug disable-all</b>
------------------	--------------------------

# debug snmp

To configure SNMP debug options, use the **debug snmp** command.

```
debug snmp {agent | all | mib | trap} {enable | disable}
```

---

## Syntax Description

<b>debug</b>	Debug parameters.
<b>snmp</b>	lwapp parameters.
{ <b>agent   all   mib   trap</b> }	<ul style="list-style-type: none"> <li>• Enter <b>agent</b> to configure debug of SNMP agent.</li> <li>• Enter <b>all</b> to configure debug of all SNMP messages.</li> <li>• Enter <b>mib</b> to configure debug of SNMP MIB.</li> <li>• Enter <b>trap</b> to configure debug of SNMP traps.</li> </ul>
{ <b>enable   disable</b> }	<ul style="list-style-type: none"> <li>• Enter <b>enable</b> to enable SNMP debug setting.</li> <li>• Enter <b>disable</b> to disable SNMP debug setting.</li> </ul>

---

---

## Defaults

None.

---

## Examples

```
> debug snmp trap enable
> debug snmp trap disable
```

---

**debug disable-all**

# debug transfer

To configure transfer debug options, use the **debug transfer** command.

```
debug transfer {all | tftp | trace} {enable | disable}
```

Syntax Description	<b>debug</b> Debug parameters. <b>transfer</b> transfer parameters. <b>{all   tftp   trace}</b> <ul style="list-style-type: none"> <li>Enter <b>all</b> to configure debug of all transfer messages.</li> <li>Enter <b>tftp</b> to configure debug of tftp transfers.</li> <li>Enter <b>trace</b> to configure debug of transfer/upgrade.</li> </ul> <b>{enable   disable}</b> <ul style="list-style-type: none"> <li>Enter <b>enable</b> to enable transfer debug setting.</li> <li>Enter <b>disable</b> to disable transfer debug setting.</li> </ul>
<b>Defaults</b>	None.
<b>Examples</b>	<pre>&gt; <b>debug transfer trace enable</b> &gt; <b>debug transfer trace disable</b></pre>
<b>Related Commands</b>	<b>debug disable-all</b>

## debug wcp

To configure wcp debug options, use the **debug wcp** command.

```
debug wcp {events | packet} {enable | disable}
```

Syntax Description	
<b>debug</b>	Debug parameters.
<b>wcp</b>	wcp parameters.
{events   packet}	<ul style="list-style-type: none"><li>• Enter <b>events</b> to configure debug of WLAN Control Protocol (WCP) Events.</li><li>• Enter <b>packet</b> to configure debug of WLAN Control Protocol (WCP) Packets.</li></ul>
{enable   disable}	<ul style="list-style-type: none"><li>• Enter <b>enable</b> to enable wcp debug setting.</li><li>• Enter <b>disable</b> to disable wcp debug setting.</li></ul>

**Defaults** None.

**Examples**

```
> debug wcp packet enable  
> debug wcp packet disable
```

**Related Commands** [debug disable-all](#)

# debug wps

To configure wps debug options, use the **debug wps** command.

```
config wps sig {enable | disable}
```

Syntax Description	
<b>debug</b>	debug parameters.
<b>wps</b>	WPS parameters.
<b>sig</b>	Signature parameters.
<b>{enable   disable}</b>	<ul style="list-style-type: none"><li>• Enter <b>enable</b> to enable wps debug setting.</li><li>• Enter <b>disable</b> to disable wps debug setting.</li></ul>
Defaults	None.
Examples	<pre>&gt; debug wps sig enable &gt; debug wps sig disable</pre>
Related Commands	<b>debug disable-all</b>

# eping

To test mobility Ethernet over IP (EoIP) data packet communication between two controllers, use the **eping** command.

**eping** *mobility\_peer\_IP\_address*

<b>Syntax Description</b>	<b>eping</b> Initiate a ping request and reply message for EoIP mobility packets. <i>mobility_peer_IP_address</i> The IP address of a controller that belongs to a mobility group.
---------------------------	---

<b>Defaults</b>	None.
-----------------	-------

<b>Usage Guidelines</b>	This command tests the mobility data traffic over the management interface.
-------------------------	---

<b>Note</b>	This ping test is not Internet Control Message Protocol (ICMP) based. The term “ping” is used to indicate an echo request and an echo reply message.
-------------	--

<b>Examples</b>	> <b>eping</b> 172.12.35.31
-----------------	-----------------------------

<b>Related Commands</b>	<b>mping</b> <b>config logging buffered debugging</b> <b>show logging</b> <b>debug mobility handoff enable</b>
-------------------------	---

# mping

To test mobility UDP control packet communication between two controllers, use the **mping** command.

**mping** *mobility\_peer\_IP\_address*

<b>Syntax Description</b>	<b>mping</b> Initiate a ping request and reply message for UDP mobility packets. <i>mobility_peer_IP_address</i> The IP address of a controller that belongs to a mobility group.
---------------------------	--

<b>Defaults</b>	None.
-----------------	-------

<b>Usage Guidelines</b>	This test runs over mobility UDP port 16666. It tests whether the mobility control packet can be reached over the management interface.
-------------------------	---

<b>Note</b>	This ping test is not Internet Control Message Protocol (ICMP) based. The term “ping” is used to indicate an echo request and an echo reply message.
-------------	--

<b>Examples</b>	> <b>mping</b> 172.12.35.31
-----------------	-----------------------------

<b>Related Commands</b>	<b>eping</b> <b>config logging buffered debugging</b> <b>show logging</b> <b>debug mobility handoff enable</b>
-------------------------	---
