CLI Commands

The Cisco Wireless LAN solution command-line interface (CLI) enables operators to connect an ASCII console to the Cisco Wireless LAN Controller and configure the controller and its associated access points. This chapter describes the how to control and configure Mesh access points using the controller commands and contains the following sections:

show mesh Commands

Use the **show mesh** commands to see settings for outdoor and indoor mesh access points.

show mesh ap

To display settings for mesh access points, use the **show mesh ap** command.

show mesh ap {**summary** | **tree**}

Syntax Description

summary	Displays a summary of mesh access point information including the name, model, bridge virtual interface (BVI) MAC address, United States Computer Emergency Response Team (US-CERT) MAC address, hop, and bridge group name.
tree	Displays a summary of mesh access point information in a tree configuration, including the name, hop counter, link signal-to-noise ratio (SNR), and bridge group name.

Command Default

None.

Examples

This example shows how to display a summary format:

```
> show mesh ap summary
AP Name AP Model              BVI MAC              CERT MAC         Hop    Bridge Group Name
------------------  -------------------  -----------------  ------------------   -----  --
SB_RAP1 AIR-LAP1522AG-A-K9   00:1d:71:0e:d0:00  00:1d:71:0e:d0:00   0      sbox
SB_MAP1 AIR-LAP1522AG-A-K9   00:1d:71:0e:85:00  00:1d:71:0e:85:00   1      sbox
SB_MAP2 AIR-LAP1522AG-A-K9   00:1b:d4:a7:8b:00  00:1b:d4:a7:8b:00   2      sbox
SB_MAP3 AIR-LAP1522AG-A-K9   00:1d:71:0d:ee:00  00:1d:71:0d:ee:00   3      sbox
Number of Mesh APs.............................. 4
Number of RAPs.................................. 1
Number of MAPs.................................. 3
```

This example shows how to display settings in a hierarchical (tree) format:

```
> show mesh ap tree
 ========================================================
||  AP Name [Hop Counter, Link SNR, Bridge Group Name] ||
 ========================================================
[Sector 1]
----------
SB_RAP1[0,0,sbox]
  |-SB_MAP1[1,32,sbox]
    |-SB_MAP2[2,27,sbox]
      |-SB_MAP3[3,30,sbox]
--------------------------------------------------------
Number of Mesh APs.............................. 4
Number of RAPs.................................. 1
Number of MAPs.................................. 3
--------------------------------------------------------
```

Related Commands

config mesh alarm

config mesh astools

config mesh battery-state

show mesh astools stats

To display antistranding statistics for outdoor mesh access points, use the **show mesh astools stats** command.

show mesh astools stats [*cisco_ap*]

Syntax Description

cisco_ap	(Optional) Antistranding feature statistics for a designated mesh access point.

Command Default

None.

Examples

This example shows how to display anti-stranding statistics on all outdoor mesh access points:

```
> show mesh astools stats
Total No of Aps stranded : 0
```

This example shows how to display anti-stranding statistics for access point *sb_map1*:

```
> show mesh astools stats sb_map1
Total No of Aps stranded : 0
```

Related Commands

show mesh config

config mesh astools

show mesh stats

show mesh backhaul

To check the current backhaul, use the **show mesh backhaul** command.

show mesh backhaul *cisco_ap*

Syntax Description

cisco_ap	Name of the access point.

Command Default

None.

Examples

This example shows how to display the current backhaul:

```
> show mesh backhaul
```

If the current backhaul is 5 GHz, the output is as follows:

```
Basic Basic Attributes for Slot  0
    Radio Type..................................... RADIO_TYPE_80211g
    Radio Role..................................... DOWNLINK ACCESS
    Administrative State .......................... ADMIN_ENABLED
    Operation State ............................... UP
      Current Tx Power Level ...................... 1
If the current backhaul is 2.4 GHz, the output is as follows:
Basic Attributes for Slot  1
    Radio Type..................................... RADIO_TYPE_80211a
    Radio Subband.................................. RADIO_SUBBAND_ALL
    Radio Role..................................... DOWNLINK ACCESS
    Administrative State .......................... ADMIN_ENABLED
    Operation State ............................... UP
      Current Tx Power Level ...................... 1
      Current Channel ............................. 165
      Antenna Type................................. EXTERNAL_ANTENNA
      External Antenna Gain (in .5 dBm units).... 0
Current Channel.................................6
Antenna Type....................................Externa_ANTENNA
External Antenna Gain (in .5 dBm units)...........0
```

Related Commands

show mesh config

config mesh astools

show mesh stats

show mesh cac

To display call admission control (CAC) topology and the bandwidth used or available in a mesh network, use the **show mesh cac** command.

show mesh cac {**summary** | {**bwused** {**voice** | **video**} | **access** | **callpath** | **rejected**} *cisco_ap*}

Syntax Description

summary	Displays the total number of voice calls and voice bandwidth used for each mesh access point.
bwused	Displays the bandwidth for a selected access point in a tree topology.
voice	Displays the mesh topology and the voice bandwidth used or available.
video	Displays the mesh topology and the video bandwidth used or available.
access	Displays access voice calls in progress in a tree topology.
callpath	Displays the call bandwidth distributed across the mesh tree.
rejected	Displays voice calls rejected for insufficient bandwidth in a tree topology.
cisco_ap	Mesh access point name.

Command Default

None.

Examples

This example shows how to display a summary of the call admission control settings:

```
> show mesh cac summary
AP Name              Slot#    Radio  BW Used/Max  Calls
-----------------  -------  -----  -----------  -----
SB_RAP1              0        11b/g   0/23437      0
                     1        11a     0/23437      0
SB_MAP1              0        11b/g   0/23437      0
                     1        11a     0/23437      0
SB_MAP2              0        11b/g   0/23437      0
                     1        11a     0/23437      0
SB_MAP3              0        11b/g   0/23437      0
                     1        11a     0/23437      0
```

This example shows how to display the mesh topology and the voice bandwidth used or available:

```
> show mesh cac bwused voice SB_MAP1
AP Name                Slot#    Radio      BW Used/Max
-------------         -------  -----      -----------
    SB_RAP1              0      11b/g       0/23437
                         1      11a         0/23437
|   SB_MAP1              0      11b/g       0/23437
                         1      11a         0/23437
||  SB_MAP2              0      11b/g       0/23437
                         1      11a         0/23437
||| SB_MAP3              0      11b/g       0/23437
                         1      11a         0/23437
```

This example shows how to display the access voice calls in progress in a tree topology:

```
> show mesh cac access 1524_Map1
    AP Name              Slot#   Radio     Calls
    --------------      -------  -----    -----
    1524_Rap              0      11b/g      0
                          1      11a        0
                          2      11a        0
|   1524_Map1             0      11b/g      0
                          1      11a        0
                          2      11a        0
||  1524_Map2             0      11b/g      0
                          1      11a        0
                          2      11a        0
```

show mesh client-access

To display the backhaul client access configuration setting, use the **show mesh client-access** command.

show mesh client-access

Syntax Description

This command has no arguments or keywords.

Command Default

None.

Examples

This example shows how to display backhaul client access configuration settings for a mesh access point:

```
> show mesh client-access
Backhaul with client access status: enabled
Backhaul with client access extended status(3 radio AP): disabled
```

Related Commands

config mesh client-access

show mesh config

To display mesh configuration settings, use the **show mesh config** command.

show mesh config

Syntax Description

This command has no arguments or keywords.

Command Default

None.

Examples

This example shows how to display global mesh configuration settings:

```
> show mesh config
Mesh Range...................................... 12000
Mesh Statistics update period................... 3 minutes
Backhaul with client access status.............. disabled
Backhaul with extended client access status..... disabled
Background Scanning State....................... enabled
Backhaul Amsdu State............................ disabled
Mesh Security
   Security Mode................................ EAP
   External-Auth................................ disabled
   Use MAC Filter in External AAA server........ disabled
   Force External Authentication................ disabled
Mesh Alarm Criteria
   Max Hop Count................................ 4
   Recommended Max Children for MAP............. 10
   Recommended Max Children for RAP............. 20
   Low Link SNR................................. 12
   High Link SNR................................ 60
   Max Association Number....................... 10
   Association Interval......................... 60 minutes
   Parent Change Numbers........................ 3
Parent Change Interval....................... 60 minutes
Mesh Multicast Mode............................. In-Out
Mesh Full Sector DFS............................ enabled
Mesh Ethernet Bridging VLAN Transparent Mode..... disabled
Mesh DCA channels for serial backhaul APs........ enabled
Mesh Slot Bias.................................. enabled
```

Related Commands

show mesh stats

show mgmtuser

config mesh alarm

show mesh env

To display global or specific environment summary information for mesh networks, use the **show mesh env** command.

show mesh env {**summary** | *cisco_ap*}

Syntax Description

summary	Displays global environment summary information.
cisco_ap	Name of access point for which environment summary information is requested.

Command Default

None.

Examples

This example shows how to display global environment summary information:

```
> show mesh env summary
AP Name             Temperature(C)  Heater   Ethernet  Battery
------------------  --------------  ------   --------  -------
ap1130:5f:be:90      N/A             N/A      DOWN     N/A
AP1242:b2.31.ea      N/A             N/A      DOWN     N/A
AP1131:f2.8d.92      N/A             N/A      DOWN     N/A
AP1131:46f2.98ac     N/A             N/A      DOWN     N/A
ap1500:62:39:70      -36             OFF      UP       N/A
```

This example shows how to display an environment summary for an access point:

```
> show mesh env SB_RAP1
AP Name..................................... SB_RAP1
AP Model.................................... AIR-LAP1522AG-A-K9
AP Role..................................... RootAP
Temperature................................. 21 C, 69 F
Heater...................................... OFF
Backhaul.................................... GigabitEthernet0
GigabitEthernet0 Status..................... UP
    Duplex.................................. FULL
    Speed................................... 100
    Rx Unicast Packets...................... 114754
    Rx Non-Unicast Packets.................. 1464
    Tx Unicast Packets...................... 9630
    Tx Non-Unicast Packets.................. 3331
GigabitEthernet1 Status..................... DOWN
  POE Out................................... OFF
Battery..................................... N/A
```

Related Commands

show mesh stats

show mesh neigh

To display summary or detailed information about the mesh neighbors for a specific mesh access point, use the **show mesh neigh** command.

show mesh neigh {**detail** | **summary**} {*cisco_ap* | **all**}

Syntax Description

detail	Displays the channel and signal-to-noise ratio (SNR) details between the designated mesh access point and its neighbor.
summary	Displays the mesh neighbors for a designated mesh access point.
cisco_ap	Cisco lightweight access point name.
all	Displays all access points.

Note If an AP itself is configured with the **all**keyword, the **all**keyword access points take precedence over the AP that is named **all**.

Examples

This example shows how to display a neighbor summary of an access point:

```
> show mesh neigh summary RAP1
AP Name/Radio Mac Channel Rate  Link-Snr  Flags      State
----------------- ------- ----- -------- --------   --------
00:1D:71:0F:CA:00 157      54     6        0x0        BEACON
00:1E:14:48:25:00 157      24     1        0x0        BEACON
MAP1-BB00         157      54     41       0x11       CHILD BEACON
```

This example shows how to display the detailed neighbor statistics of an access point:

```
> show mesh neigh detail RAP1
AP MAC : 00:1E:BD:1A:1A:00 AP Name: HOR1522_MINE06_MAP_S_Dyke
backhaul rate 54
FLAGS : 860 BEACON
worstDv 255, Ant 0, channel 153, biters 0, ppiters 0
Numroutes 0, snr 0, snrUp 8, snrDown 8, linkSnr 8
adjustedEase 0, unadjustedEase 0
txParent 0, rxParent 0
poorSnr 0
lastUpdate 2483353214 (Sun Aug 4 23:51:58 1912)
parentChange 0
Per antenna smoothed snr values: 0 0 0 0
Vector through 00:1E:BD:1A:1A:00
```

The following table lists the output flags displayed for the **show mesh neigh detail** command.

Table 1: Output Flags for the show mesh neigh detail command

Output Flag	Description
AP MAC	MAC address of a mesh neighbor for a designated mesh access point.
AP Name	Name of the mesh access point.
FLAGS	Describes adjacency. The possible values are as follows: • UPDATED—Recently updated neighbor. • NEIGH—One of the top neighbors. • EXCLUDED—Neighbor is currently excluded. • WASEXCLUDED—Neighbor was recently removed from the exclusion list. • PERMSNR—Permanent SNR neighbor. • CHILD—A child neighbor. • PARENT—A parent neighbor. • NEEDUPDATE—Not a current neighbor and needs an update. • BEACON—Heard a beacon from this neighbor. • ETHER—Ethernet neighbor.
worstDv	Worst distance vector through the neighbor.
Ant	Antenna on which the route was received.
channel	Channel of the neighbor.
biters	Number of black list timeouts left.
ppiters	Number of potential parent timeouts left.
Numroutes	Number of distance routes.
snr	Signal to Noise Ratio.
snrUp	SNR of the link to the AP.
snrDown	SNR of the link from the AP.
linkSnr	Calculated SNR of the link.
adjustedEase	Ease to the root AP through this AP. It is based on the current SNR and threshold SNR values.
unadjustedEase	Ease to the root AP through this AP after applying correct for number of hops.

Output Flag	Description
txParent	Packets sent to this node while it was a parent.
rxparent	Packets received from this node while it was a parent.
poorSnr	Packets with poor SNR received from a node.
lastUpdate	Timestamp of the last received message for this neighbor
parentChange	When this node last became parent.
per antenna smoother SNR values	SNR value is populated only for antenna 0.

Related Commands

show mesh config

show mesh env

show mesh path

To display the channel and signal-to-noise ratio (SNR) details for a link between a mesh access point and its neighbor, use the **show mesh path** command.

show mesh path *cisco_ap*

Syntax Description

cisco_ap	Mesh access point name.

Command Default

None.

Examples

This example shows how to display channel and SNR details for a designated link path:

```
> show mesh path mesh-45-rap1
AP Name/Radio Mac Channel Rate  Link-Snr  Flags      State
----------------- ------- ----- -------- --------   --------
MAP1-BB00         157      54     32       0x0       UPDATED NEIGH PARENT BEACON
RAP1              157      54     37       0x0        BEACON
```

Related Commands

config mesh battery-state

config mesh client-access

config mesh range

config mesh linktest

show mesh stats

config mesh range

show mesh neigh

show mesh per-stats

To display the percentage of packet errors for packets transmitted by the neighbors of a specified mesh access point, use the **show mesh per-stats** command.

show mesh per-stats summary {*cisco_ap* | **all**}

Syntax Description

summary	Displays the packet error rate stats summary.
cisco_ap	Name of mesh access point.
all	Displays all mesh access points.

Note If an AP itself is configured with the **all**keyword, the **all**keyword access points take precedence over the AP that is named **all**.

Usage Guidelines

The packet error rate percentage equals 1, which is the number of successfully transmitted packets divided by the number of total packets transmitted.

Examples

This example shows how to display the percentage of packet errors for packets transmitted by the neighbors to a mesh access point:

```
> show mesh per-stats summary ap_12
Neighbor MAC Address 00:0B:85:5F:FA:F0
Total Packets transmitted:              104833
Total Packets transmitted successfully: 104833
Total Packets retried for transmission: 33028
RTS Attempts:                           0
RTS Success:                            0
Neighbor MAC Address:                   00:0B:85:80:ED:D0
Total Packets transmitted:              0
Total Packets transmitted successfully: 0
Total Packets retried for transmission: 0
Neighbor MAC Address:                   00:17:94:FE:C3:5F
Total Packets transmitted:              0
Total Packets transmitted successfully: 0
Total Packets retried for transmission: 0
RTS Attempts:                           0
RTS Success:                            0
```

Related Commands

config mesh linkdata

config mesh range

show mesh stats

show mesh neigh

show mesh config

show mesh public-safety

To display 4.8-GHz public safety settings, use the **show mesh public-safety** command.

show mesh public-safety

Syntax Description

This command has no arguments or keywords.

Command Default

None.

Examples

This example shows how to view 4.8-GHz public safety settings:

```
> show mesh public-safety
Global Public Safety status: disabled
```

Related Commands

config mesh public-safety

config mesh security

show mesh ap

show mesh security-stats

show mesh stats

show mesh queue-stats

To display the number of packets in a client access queue by type for a particular mesh access point, use the **show mesh queue-stats** command.

show mesh queue-stats {*cisco_ap* | **all**}

Note If an AP itself is configured with the **all**keyword, the **all**keyword access points take precedence over the AP that is named **all**.

Syntax Description

cisco_ap	Name of access point for which you want packet queue statistics.
all	Displays all access points.

Command Default

None.

Examples

This example shows how to display packet queue statistics for access point ap417:

```
> show mesh queue-stats ap417
Queue Type Overflows Peak length Average length
---------- --------- ----------- --------------
Silver     0         1           0.000
Gold       0         4           0.004
Platinum   0         4           0.001
Bronze     0         0           0.000
Management 0         0           0.000
```

Related Commands

config mesh client-access

config mesh multicast

show mesh client-access

show mesh config

show mesh stats

show mesh config

show mesh stats

show mgmtuser

show mesh security-stats

To display packet error statistics for a specific access point, use the **show mesh security-stats** command.

show mesh security-stats {*cisco_ap* | **all**}

Syntax Description

cisco_ap	Name of access point for which you want packet error statistics.
all	Displays all access points.

Note If an AP itself is configured with the **all**keyword, the **all**keyword access points take precedence over the AP that is named **all**.

Command Default

None.

Usage Guidelines

This command shows packet error statistics and a count of failures, timeouts, and successes with respect to associations and authentications as well as reassociations and reauthentications for the specified access point and its child.

Examples

This example shows how to display packet error statistics for access point ap417:

```
> show mesh security-stats ap417
AP MAC : 00:0B:85:5F:FA:F0
Packet/Error Statistics:
----------------------------
x Packets 14, Rx Packets 19, Rx Error Packets 0
Parent-Side Statistics:
-------------------------
Unknown Association Requests 0
Invalid Association Requests 0
Unknown Re-Authentication Requests 0
Invalid Re-Authentication Requests 0
Unknown Re-Association Requests 0
Invalid Re-Association Requests 0
Child-Side Statistics:
-------------------------
Association Failures 0
Association Timeouts 0
Association Successes 0
Authentication Failures 0
Authentication Timeouts 0
Authentication Successes 0
Re-Association Failures 0
Re-Association Timeouts 0
Re-Association Successes 0
Re-Authentication Failures 0
Re-Authentication Timeouts 0
Re-Authentication Successes 0
```

Related Commands

config mesh alarm

config mesh linkdata

config mesh security

show mesh stats

To display the mesh statistics for a Cisco lightweight access point, use the **show mesh stats** command.

show mesh stats *cisco_ap*

Syntax Description

cisco_ap	Cisco lightweight access point name.

Command Default

None.

Examples

This example shows how to display statistics of an access point:

```
> show mesh stats RAP_AP1
RAP in state Maint
rxNeighReq 759978, rxNeighRsp 568673
txNeighReq 115433, txNeighRsp 759978
rxNeighUpd 8266447 txNeighUpd 693062
tnextchan 0, nextant 0, downAnt 0, downChan 0, curAnts 0
tnextNeigh 0, malformedNeighPackets 244, poorNeighSnr 27901
blacklistPackets 0, insufficientMemory 0
authenticationFailures 0
Parent Changes 1, Neighbor Timeouts 16625
```

config mesh Commands

Use the **config mesh** commands to configure the mesh access points.

config mesh alarm

To configure alarm settings for outdoor mesh access points, use the **config mesh alarm** command.

config mesh alarm {**max-hop** | **max-children** | **low-snr** | **high-snr** | **association** | **parent-change count**} *value*

Syntax Description

max-hop	Sets the maximum number of hops before triggering an alarm for traffic over the mesh network. The range is from 1 to 16.
max-children	Sets the maximum number of mesh access points (MAPs) that can be assigned to a mesh router access point (RAP) before triggering an alarm. The range is from 1 to 16.
low-snr	Sets the low-end signal-to-noise ratio (SNR) value before triggering an alarm. The range is from 1 to 30.
high-snr	Sets the high-end SNR value before triggering an alarm. The range is from 1 to 30 (inclusive).
association	Sets the mesh alarm association count value before triggering an alarm. The range is from 1 to 30 (inclusive).
parent-change count	Sets the number of times a MAP can change its RAP association before triggering an alarm. The range is from 1 to 30 (inclusive).
value	Value above or below which an alarm is generated. The valid values vary for each command.

Command Default

See the "Syntax Description" section for command and argument value ranges.

Examples

This example shows how to set the maximum hops threshold to 8:

```
> config mesh alarm max-hop 8
```

This example shows how to set the upper SNR threshold to 25:

> **config mesh alarm high-snr 25**

config mesh astools

To globally enable or disable the anti-stranding feature for outdoor mesh access points, use the **config mesh astools** command.

config mesh astools {**enable** | **disable**}

Syntax Description

enable	Enables this feature for all outdoor mesh access points.
disable	Disables this feature for all outdoor mesh access points.

Command Default

None.

Examples

This example shows how to enable anti-stranding on all outdoor mesh access points:

```
> config mesh astools enable
```

config mesh backhaul rate-adapt

To globally configure the backhaul Tx rate adaptation (universal access) settings for indoor and outdoor mesh access points, use the **config mesh backhaul rate-adapt** command.

config mesh backhaul rate-adapt [**all** | **bronze** | **silver** | **gold** | **platinum**] {**enable** | **disable**}

Syntax Description

all	(Optional) Grants universal access privileges on mesh access points.
bronze	(Optional) Grants background-level client access privileges on mesh access points.
silver	(Optional) Grants best effort-level client access privileges on mesh access points.
gold	(Optional) Grants video-level client access privileges on mesh access points.
platinum	(Optional) Grants voice-level client access privileges on mesh access points.
enable	Enables this backhaul access level for mesh access points.
disable	Disables this backhaul access level for mesh access points.

Command Default

Disabled.

Usage Guidelines

To use this command, mesh backhaul with client access must be enabled by using the **config mesh client-access** command.

Note After this feature is enabled, all mesh access points reboot.

Examples

This example shows how to set the backhaul client access to the best-effort level:

```
> config mesh backhaul rate-adapt silver
```

Related Commands

config mesh backhaul slot

To configure the slot radio as a downlink backhaul, use the **config mesh backhaul slot** command.

config mesh backhaul slot *slot_id* {**enable** | **disable**} *cisco_ap*

Syntax Description

slot_id	Slot number between 0 and 2.
enable	Enables the entered slot radio as a downlink backhaul.
disable	Disables the entered slot radio as a downlink backhaul.
cisco_ap	Name of the Root AP of the sector on which the backhaul needs to be enabled or disabled.

Command Default

Disabled.

Usage Guidelines

For 2.4-GHz, only slot 0 and 1 are valid. If slot 0 is enabled, then slot 1 is automatically be disabled. If slot 0 is disabled, then slot 1 is automatically enabled. The **config mesh backhaul slot** command is applicable only to AP1522.

Examples

This example shows how to enable slot 1 as the preferred backhaul for the root AP myrootap1:

```
> config mesh backhaul slot 1 enable myrootap1
```

Related Commands

config mesh battery-state

To configure the battery state for Cisco Aironet 1520 series mesh access points, use the **config mesh battery-state** command.

config mesh battery-state {**enable** | **disable**} {**all** | *cisco_ap*}

Syntax Description

enable	Enables the battery-state for 1520 series mesh access points.
disable	Disables the battery-state for 1520 series mesh access points.
all	Applies this command to all mesh access points.
cisco_ap	Specific mesh access point.

Command Default

Disabled.

Examples

This example shows how to set the backhaul client access to the best-effort level:

```
> config mesh battery-state enable all
```

config mesh client-access

To enable or disable client access to the mesh backhaul on indoor and outdoor mesh access points, use the **config mesh client-access** command.

config mesh client-access {**enable** [**extended**] | **disable**}

Syntax Description

enable	Allows wireless client association over the mesh access point backhaul 802.11a radio.
extended	(Optional) Enables client access over both the backhaul radios for 1524 serial backhaul access points.
disable	Restricts the 802.11a radio to backhaul traffic, and allows client association only over the 802.11b/g radio.

Command Default

Disabled.

Usage Guidelines

Backhaul interfaces (802.11a radios) act as primary Ethernet interfaces. Backhauls function as trunks in the network and carry all VLAN traffic between the wireless and wired network. No configuration of primary Ethernet interfaces is required.

When this feature is enabled, Cisco Aironet 1520 series (152x) mesh access points allow wireless client association over the 802.11a radio, which implies that a 152x mesh access point can carry both backhaul traffic and 802.11a client traffic over the same 802.11a radio.

When this feature is disabled, the 152x carries backhaul traffic over the 802.11a radio and allows client association only over the 802.11b/g radio.

Examples

This example shows how to enable client access extended to allow a wireless client association over the 802.11a radio:

```
> config mesh client-access enable extended
Enabling client access on both backhaul slots
 Same BSSIDs will be used on both slots
 All Mesh AP will be rebooted
 Are you sure you want to start? (y/N)Y
```

This example shows how to restrict a wireless client association to the 802.11b/g radio:

```
> config mesh client-access disable
All Mesh AP will be rebooted
Are you sure you want to start? (Y/N) Y
Backhaul with client access is cancelled.
```

config mesh ethernet-bridging vlan-transparent

To configure how a mesh access point handles VLAN tags for Ethernet bridged traffic, use the **config mesh ethernet-bridging vlan-transparent** command.

config mesh ethernet-bridging vlan-transparent {**enable** | **disable**}

Syntax Description

enable	Bridges packets as if they are untagged.
disable	Drops all tagged packets.

Command Default

Enabled.

Usage Guidelines

VLAN transparent is enabled as a default to ensure a smooth software upgrade from 4.1.192.xxM releases to release 5.2. Release 4.1.192.xxM does not support VLAN tagging.

Examples

This example shows how to configure Ethernet packets as untagged:

```
> config mesh ethernet-bridging vlan-transparent enable
```

This example shows how to drop tagged Ethernet packets:

```
> config mesh ethernet-bridging vlan-transparent disable
```

config mesh full-sector-dfs

To globally enable or disable full-sector Dynamic Frequency Selection (DFS) on mesh access points, use the **config mesh full-sector-dfs** command.

config mesh full-sector-dfs {**enable** | **disable**}

Syntax Description

enable	Enables DFS for mesh access points.
disable	Disables DFS for mesh access points.

Command Default

None.

Usage Guidelines

This command instructs the mesh sector to make a coordinated channel change on the detection of a radar signal. For example, if a mesh access point (MAP) detects a radar signal, the MAP will notify the root access point (RAP), and the RAP will initiate a sector change.

All MAPs and the RAP that belong to that sector go to a new channel, which lowers the probability of MAPs stranding when radar is detected on the current backhaul channel, and no other valid parent is available as backup.

Each sector change causes the network to be silent for 60 seconds (as dictated by the DFS standard).

It is expected that after a half hour, the RAP will go back to the previously configured channel, which means that if radar is frequently observed on a RAP's channel, it is important that you configure a different channel for that RAP to exclude the radar affected channel at the controller.

Examples

This example shows to enable full-sector DFS on mesh access points:

```
> config mesh full-sector-dfs enable
```

config mesh linkdata

To enable external MAC filtering of access points, use the **config mesh linkdata** command.

config mesh linkdata *destination_ap_name*

Syntax Description

destination_ap_name	Destination access point name for MAC address filtering.

Command Default

Disabled.

Usage Guidelin

Note The **config mesh linktest** and **config mesh linkdata** commands are designed to be used together to verify information between a source and a destination access point. To get this information, first execute the **config mesh linktest** command with the access point that you want link data from in the *dest_ap* argument. When the command completes, enter the **config mesh linkdata** command and list the same destination access point, to display the link data will display (see example).

MAC filtering uses the local MAC filter on the controller by default.

When external MAC filter authorization is enabled, if the MAC address is not found in the local MAC filter, then the MAC address in the external RADIUS server is used.

MAC filtering protects your network against rogue mesh access points by preventing access points that are not defined on the external server from joining.

Before employing external authentication within the mesh network, the following configuration is required:

- The RADUIS server to be used as an AAA server must be configured on the controller.
- The controller must also be configured on the RADIUS server.
- The mesh access point configured for external authorization and authentication must be added to the user list of the RADIUS server.

Examples

This example shows how to enable external MAC address filtering on access point AP001d.710d.e300:

```
> config mesh linkdata MAP2-1-1522.7400 AP001d.710d.e300 18 100 1000 30
LinkTest started on source AP, test ID: 0
[00:1D:71:0E:74:00]->[00:1D:71:0D:E3:0F]
Test config:  1000 byte packets at 100  pps for 30 seconds, a-link rate 18 Mb/s

config mesh linktest

To verify client access between mesh access points, use the **config mesh linktest** command.

config mesh linktest *source_ap* {*dest_ap* | *dest_MAC*} *datarate packet_rate packet_size duration*

Syntax Description

source_ap	Source access point.
dest_ap	Destination access point.
dest_MAC	Destination MAC address.
datarate	• Data rate for 802.11a radios. Valid values are 6, 9, 11, 12, 18, 24, 36, 48 and 54 Mbps. • Data rate for 802.11b radios. Valid values are 6, 12, 18, 24, 36, 54, or 100 Mbps. • Data rate for 802.11n radios. Valid values are MCS rates between m0 to m15.
packet_rate	Number of packets per second. Valid range is 1 through 3000, but the recommended default is 100.
packet_size	(Optional) Packet size in bytes. If not specified, packet size defaults to 1500 bytes.
duration	(Optional) Duration of the test in seconds. Valid values are 10-300 seconds, inclusive. If not specified, duration defaults to 30 seconds.

Command Default

100 packets per second, 1500 bytes, 30 second duration.

Usage Guidelines

Note The **config mesh linktest** and **config mesh linkdata** commands are designed to be used together to verify information between a source and a destination access point. To get this information, first enter the **config mesh linktest** command with the access point that you want link data from in the *dest_ap* argument. When the command completes, enter the **config mesh linkdata** command and list the same destination access point, to display the link data.

The following warning message appears when you run a linktest that might oversubscribe the link:

Warning! Data Rate (100 Mbps) is not enough to perform this link test on packet size (2000bytes) and (1000) packets per second. This may cause AP to disconnect or reboot. Are you sure you want to continue?

Examples

This example shows how to verify client access between mesh access points *SB_MAP1* and *SB_RAP2* at *36 Mbps*, *20 fps*, *100 frame size*, and *15* second duration:

```
> config mesh linktest SB_MAP1 SB_RAP1 36 20 100 15
LinkTest started on source AP, test ID: 0
[00:1D:71:0E:85:00]->[00:1D:71:0E:D0:0F]
Test config:  100 byte packets at 20  pps for 15 seconds, a-link rate 36 Mb/s
In progress: | || || || || || |
LinkTest complete

```

The following table lists the output flags displayed for the **config mesh linktest** command.

Table 2: Output Flags for the Config Mesh Linktest Command

Output Flag	Description
txPkts	Number of packets sent by the source.
txBuffAllocErr	Number of linktest buffer allocation errors at the source (expected to be zero).
txQFullErrs	Number of linktest queue full errors at the source (expected to be zero).
Total rx pkts heard at destination	Number of linktest packets received at the destination (expected to be same as or close to the txPkts).
rx pkts decoded correctly	Number of linktest packets received and decoded correctly at the destination (expected to be same as close to txPkts).
err pkts: Total	Packet error statistics for linktest packets with errors.

Output Flag	Description
rx lost packets	Total number of linktest packets not received at the destination.
rx dup pkts	Total number of duplicate linktest packets received at the destination.
rx out of order	Total number of linktest packets received out of order at the destination.
avgNF	Average noise floor.
Noise Floor profile	Noise floor profile in dB and are negative numbers.
avgSNR	Average SNR values.
SNR profile [odb...60dB]	Histogram samples received between 0 to 60 dB. The different colums in the SNR profile is the number of packets falling under the bucket 0-3, 3-6, 6-9, up to 57-60.
avgRSSI	Average RSSI values. The average high and low RSSI values are positive numbers.
RSSI profile [-100dB...-40dB]	The RSSI profile in dB and are negative numbers.

config certificate lsc

show certificate lsc

config mesh multicast

To configure multicast mode settings to manage multicast transmissions within the mesh network, use the **config mesh multicast** command.

config mesh multicast {**regular** | **in** | **in-out**}

Syntax Description

regular	Multicasts the video across the entire mesh network and all its segments by bridging-enabled root access points (RAPs) and mesh access points (MAPs).
in	Forwards the multicast video received from the Ethernet by a MAP to the RAP's Ethernet network. No additional forwarding occurs, which ensures that non-LWAPP multicasts received by the RAP are not sent back to the MAP Ethernet networks within the mesh network (their point of origin), and MAP-to-MAP multicasts do not occur because they are filtered out
in-out	Configures the RAP and MAP to multicast, but each in a different manner: If multicast packets are received at a MAP over Ethernet, they are sent to the RAP; however, they are not sent to other MAP Ethernets, and the MAP-to-MAP packets are filtered out of the multicast. If multicast packets are received at a RAP over Ethernet, they are sent to all the MAPs and their respective Ethernet networks. See the Usage Guidelines section for more information.

Command Default

In-out mode.

Usage Guidelines

Multicast for mesh networks cannot be enabled using the controller GUI.

Mesh multicast modes determine how bridging-enabled access points mesh access points (MAPs) and root access points (RAPs) send multicasts among Ethernet LANs within a mesh network. Mesh multicast modes manage non-LWAPP multicast traffic only. LWAPP multicast traffic is governed by a different mechanism.

You can use the controller CLI to configure three mesh multicast modes to manage video camera broadcasts on all mesh access points. When enabled, these modes reduce unnecessary multicast transmissions within the mesh network and conserve backhaul bandwidth.

When using **in-out** mode, it is important to properly partition your network to ensure that a multicast sent by one RAP is not received by another RAP on the same Ethernet segment and then sent back into the network.

Note If 802.11b clients need to receive CAPWAP multicasts, then multicast must be enabled globally on the controller as well as on the mesh network (by using the **config network multicast global** command). If multicast does not need to extend to 802.11b clients beyond the mesh network, you should disable the global multicast parameter.

Examples

This example shows how to multicast video across the entire mesh network and all its segments by bridging-enabled RAPs and MAPs:

```
> config mesh multicast regular
```

config mesh parent preferred

To configure a preferred parent for a mesh access point, use the **config mesh parent preferred** command.

config mesh parent preferred *cisco_ap* {*mac_address* | **none**}

Syntax Description

cisco_ap	Name of the child access point.
mac_address	MAC address of the preferred parent.
none	Clears the configured parent.

Command Default

None.

Usage Guidelines

A child AP selects the preferred parent based on the following conditions:

- The preferred parent is the best parent.
- The preferred parent has a link SNR of at least 20 dB (other parents, however good, are ignored).
- The preferred parent has a link SNR in the range of 12 dB and 20 dB, but no other parent is significantly better (that is, the SNR is more than 20 percent better). For an SNR lower than 12 dB, the configuration is ignored.
- The preferred parent is not blacklisted.
- The preferred parent is not in silent mode because of dynamic frequency selection (DFS).
- The preferred parent is in the same bridge group name (BGN). If the configured preferred parent is not in the same BGN and no other parent is available, the child joins the parent AP using the default BGN.

Examples

This example shows how to configure a preferred parent with the MAC address 00:21:1b:ea:36:60 for a mesh access point myap1:

```
> config mesh parent preferred myap1 00:21:1b:ea:36:60
```

This example shows how to clear a preferred parent with the MAC address 00:21:1b:ea:36:60 for a mesh access point myap1, by using the keyword none:

```
> config mesh parent preferred myap1 00:21:1b:ea:36:60 none
```

config mesh public-safety

To enable or disable the 4.9-GHz public safety band for mesh access points, use the **config mesh public-safety** command.

config mesh public-safety {**enable** | **disable**} {**all** | *cisco_ap*}

Syntax Description

enable	Enables the 4.9-GHz public safety band.
disable	Disables the 4.9-GHz public safety band.
all	Applies the command to all mesh access points.
cisco_ap	Specific mesh access point.

Command Default

Disabled.

Usage Guidelines

4.9 GHz is a licensed frequency band restricted to public-safety personnel.

Examples

This example shows how to enable the 4.9-GHz public safety band for all mesh access points:

```
> config mesh public-safety enable all
4.9GHz is a licensed frequency band in -A domain for public-safety usage
 Are you sure you want to continue? (y/N) y
```

config mesh radius-server

To enable or disable external authentication for mesh access points, use the **config mesh radius-server** command.

config mesh radius-server *index* {**enable** | **disable**}

Syntax Description

index	RADIUS authentication method. Options are as follows: • Enter **eap** to designate Extensible Authentication Protocol (EAP) for the mesh RADIUS server setting. • Enter **psk** to designate Preshared Keys (PSKs) for the mesh RADIUS server setting.
enable	Enables the external authentication for mesh access points.
disable	Disables the external authentication for mesh access points.

Command Default

EAP is enabled by default.

Examples

This example shows how to enable external authentication for mesh access points:

```
> config mesh radius-server eap enable
```

config mesh range

To globally set the maximum range between outdoor mesh root access points (RAPs) and mesh access points (MAPs), use the **config mesh range** command.

config mesh range [*distance*]

Syntax Description

distance	(Optional) Maximum operating range (150 to 132000 ft) of the mesh access point.

Command Default

12,000 feet.

Usage Guidelines

After this command is enabled, all outdoor mesh access points reboot. This command does not affect indoor access points.

Examples

This example shows how to set the range between an outdoor mesh RAP and a MAP:

```
> config mesh range 300
Command not applicable for indoor mesh. All outdoor Mesh APs will be rebooted
Are you sure you want to start? (y/N) y
```

config mesh secondary-backhaul

To configure a secondary backhaul on the mesh network, use the **config mesh secondary-backhaul** command.

config mesh secondary-backhaul {**enable** [**force-same-secondary-channel**] | **disable** [**rll-retransmit** | **rll-transmit**]}

Syntax Description

enable	Enables the secondary backhaul configuration.
force-same-secondary-channel	(Optional) Enables secondary-backhaul mesh capability. Forces all access points rooted at the first hop node to have the same secondary channel and ignores the automatic or manual channel assignments for the mesh access points (MAPs) at the second hop and beyond.
disable	Specifies the secondary backhaul configuration is disabled.
rll-transmit	(Optional) Uses reliable link layer (RLL) at the second hop and beyond.
rll-retransmit	(Optional) Extends the number of RLL retry attempts in an effort to improve reliability.

Command Default

None.

Usage Guidelines

Note The secondary backhaul access feature is not supported by Cisco 1520 and 1524 indoor mesh access points in the 5.2 release.

This command uses a secondary backhaul radio as a temporary path for traffic that cannot be sent on the primary backhaul due to intermittent interference.

Examples

This example shows ho to enable a secondary backhaul radio and force all access points rooted at the first hop node to have the same secondary channel:

```
> config mesh secondary-backhaul enable force-same-secondary-channel
```

config mesh security

To configure the security settings for mesh networks, use the **config mesh security** command.

config mesh security {{{**rad-mac-filter** | **force-ext-auth**} {**enable** | **disable**}} | **eap** | **psk**}

Syntax Description

rad-mac-filter	Enables a RADIUS MAC address filter for the mesh security setting.
force-ext-auth	Disables forced external authentication for the mesh security setting.
enable	Enables the setting.
disable	Disables the setting.
eap	Designates the Extensible Authentication Protocol (EAP) for the mesh security setting.
psk	Designates preshared keys (PSKs) for the mesh security setting.

Command Default

EAP.

Examples

This example shows how to configure EAP as the security option for all mesh access points:

```
> config mesh security eap
```

This example shows how to configure PSK as the security option for all mesh access points:

```
> config mesh security psk
```

config mesh slot-bias

To enable or disable slot bias for serial backhaul mesh access points, use the **config mesh slot-bias** command.

config mesh slot-bias {**enable** | **disable**}

Syntax Description

enable	Enables slot bias for serial backhaul mesh APs.
disable	Disables slot bias for serial backhaul mesh APs.

Command Default

By default, slot bias is in enabled state.

Usage Guidelines

Follow these guidelines when using this command:

- The **config mesh slot-bias** command is a global command and therefore applicable to all 1524SB APs associated with the same controller.
- Slot bias is applicable only when both slot 1 and slot 2 are available. If a slot radio does not have a channel that is available because of dynamic frequency selection (DFS), the other slot takes up both the uplink and downlink roles.
- If slot 2 is not available because of hardware issues, slot bias functions normally. Corrective action should be taken by disabling the slot bias or fixing the antenna.

Examples

This example shows how to disable slot bias for serial backhaul mesh APs:

```
> config mesh slot-bias disable
```

config lsc mesh

To enable the locally significant certificate (LSC) on mesh access points, use the **config lsc mesh** command.

config lsc mesh {**enable** | **disable**}

Syntax Description

enable	Enables LSC on mesh access points.
disable	Disabes LSC on mesh access points.

Command Default None.

Examples This example shows how to enable LSC on mesh access point:

```
> config lsc mesh enable
```

debug Commands

This section describes the controller **debug** commands to troubleshoot Mesh access points.

Caution Debug commands are reserved for use only under the direction of Cisco personnel. Do not use these commands without direction from Cisco-certified staff.

debug mesh security

To configure the debugging of mesh security problems, use the **debug mesh security** command.

debug mesh security {**all** | **events** | **errors**} {**enable** | **disable**}

Syntax Description

all	Configures the debugging of all mesh security messages.
events	Configures the debugging of mesh security event messages.
errors	Configures the debugging of mesh security error messages.
enable	Enables the debugging of mesh security error messages.
disable	Disables the debugging of mesh security error messages.

Command Default

None.

Examples

This example shows how to enable the debugging of mesh security error messages:

```
> debug mesh security errors enable
```
