Preface

This guide describes how you can configure and maintain the Cisco Prime Infrastructure Release 2.0 using the command-line interface (CLI). Each topic provides a high-level summary of the tasks required for using the CLI for the in the Unified Network Solution that runs on supported appliances for small, medium, and large Cisco Prime Infrastructure deployments.

- Who Should Read This Guide, page ix
- How to Use This Guide, page ix
- How This Guide Is Organized, page x
- Document Conventions, page x
- Documentation Updates, page xi
- Related Documentation, page xi
- Obtaining Documentation and Submitting a Service Request, page xii

Who Should Read This Guide

The majority of the instructions in this guide are straightforward; however, a few are complex. Therefore, only experienced users should use these instructions.

Use this guide in conjunction with the documentation listed in Related Documentation, on page xi.

How to Use This Guide

We recommend that you use the information in this guide as follows:

- Read the document in its entirety. Subsequent sections build on information and recommendations discussed in previous sections.
- Use this document for all-inclusive information about the appliance.
- Do not vary the command-line conventions.

How This Guide Is Organized

The following table lists the major sections of this guide.

Chapter	Title	Description
Overview of the Cisco Prime Infrastructure Command-Line Interface	Overview of the Cisco Prime Infrastructure Command-Line Interface	Provides an overview of the CLI environment and command modes.
Using the Command-Line Interface	Using the Cisco Prime Infrastructure Command-Line Interface	Describes how you can access and administer using the CLI.
Command Reference	Cisco Prime Infrastructure Command Reference	Provides a complete description of all CLI commands.

Document Conventions

This guide uses the following conventions to convey instructions and information.

Convention	Description
bold font	Commands and keywords.
<i>italic</i> font	Variables for which you supply values.
[]	Keywords or arguments that appear within square brackets are optional.
$\{x \mid y \mid z\}$	A choice of required keywords appears in braces separated by vertical bars. You must select one.
courier font	Examples of information displayed on the screen.
bold courier font	Examples of information you must enter.
<>	Nonprinting characters (for example, passwords) appear in angle brackets.
[]	Default responses to system prompts appear in square brackets.

Documentation Updates

This table lists the documentation updation dates.

Date	Description
11/1/10	Cisco Network Control System (NCS) Release 1.0
05/31/12	Cisco Network Control System (NCS) Release 1.1
08/27/12	Cisco Prime Infrastructure Release 1.2
04/04/13	Cisco Prime Infrastructure Release 1.4

Related Documentation

The tables lists the Cisco Prime Infrastructure documents.

Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, submitting a service request, and gathering additional information, see the monthly What's New in Cisco Product Documentation, which also lists all new and revised Cisco technical documentation, at:

http://www.cisco.com/en/US/docs/general/whatsnew/whatsnew.html

Subscribe to the *What's New in Cisco Product Documentation* as a Really Simple Syndication (RSS) feed and set content to be delivered directly to your desktop using a reader application. The RSS feeds are a free service and Cisco currently supports RSS version 2.0.

Preface

Overview of the Cisco Prime Infrastructure Command-Line Interface

This chapter provides an overview of how to access the Cisco Prime Infrastructure command-line interface (CLI), the different command modes, and the commands that are available in each mode.

You can configure and monitor the through the web interface. You can also use the CLI to perform the configuration and monitoring tasks described in this guide.

- Accessing the Command Environment, page 1
- User Accounts and Modes in the CLI, page 2
- Command Modes in the CLI, page 6
- CLI Audit, page 14

Accessing the Command Environment

You can access the CLI through a secure shell (SSH) client or the console port using one of the following machines:

- Windows PC running Windows XP/Vista
- Apple Computer running Mac OS X 10.4 or later
- PC running Linux

User Accounts and Modes in the CLI

Two different types of accounts are available on the CLI:

- Admin (administrator)
- Operator (user)

When you power on the appliance for the first time, you are prompted to run the setup utility to configure the appliances. During this setup process, an administrator user account, also known as an Admin account, is created. After you enter the initial configuration information, the appliance automatically reboots and prompts you to enter the username and the password that you specified for the Admin account. You must use this Admin account to log in to the CLI for the first time.

An Admin can create and manage Operator (user) accounts (which have limited privileges and access to the server). An Admin account also provides the functionality that is needed to use the CLI.

To create more users (with admin and operator privileges) with SSH access to the CLI, you must enter the **username** command in configuration mode (see Command Modes in the CLI).

Table 3: Command Privileges lists the command privileges for each type of user account: Admin and Operator (user).

	User Account	
	Admin	Operator (User)
application commands	*	
backup	*	
backup-logs	*	
cdp run	*	
clock	*	
configure terminal	*	
copy commands	*	
debug	*

undebug	*	
write	*	

Logging in to the server places you in operator (user) mode or admin (EXEC) mode, which always requires a username and password for authentication.

You can tell which mode you are in by looking at the prompt. A right angle bracket (>) appears at the end of operator (user) mode prompt; a pound sign (#) appears at the end of admin mode prompt, regardless of the submode.

Command Modes in the CLI

This section describes the command modes supported in .

EXEC Commands

EXEC commands primarily include system-level commands such as **show** and **reload** (for example, application installation, application start and stop, copy files and installations, restore backups, and display information).

- Table 4: Summary of EXEC Commands describes the EXEC commands
- Table 5: Summary of show Commands describes the show commands in EXEC mode

For detailed information on EXEC commands, see Understanding Command Modes, page 2-5.

EXEC or System-Level Commands

Table 4: Summary of EXEC Commands describes EXEC mode commands.

Table 4: Summary of EXEC Commands

	Description
application install	Installs a specific application bundle.
application remove	Removes a specific application.
application start	Starts or enables a specific application.
application stop	Stops or disables a specific application.
application upgrade	Upgrades a specific application bundle.
backup	Performs a backup and places the backup in a repository.
backup-logs	Performs a backup of all of the logs on the to a remote location.
clock	Sets the system clock on the server.
configure	Enters configuration mode.
сору	Copies any file from a source to a destination.
debug	Displays any errors or events for various command situations; for example, backup and restore, configuration, copy, resource locking, file transfer, and user management.
delete	Deletes a file in the server.
dir	Lists the files in the server.
exit	Disconnects the encrypted session with a remote system. Exits from the current command mode to the previous command mode.
forceout	Forces the logout of all of the sessions of a specific server system user.
halt	Disables or shuts down the server.
help	Describes the help utility and how to use it in the server.
mkdir	Creates a new directory.
ncs	NCS-related commands used to start, stop and back up the server.
nslookup	Queries the IPv4 address or hostname of a remote system.

	Description	
patch	Installs System or Application patch.	
ping	Determines the IPv4 network connectivity to a remote system.	
ping6	Determines the IPv6 network connectivity to a remote system.	
reload	Reboots the server.	
restore	Restores a previous backup.	
rmdir	Removes an existing directory.	
root	Executes the root shell.	
root_enable	Activates the root command.	
show	Provides information about the server.	
ssh	Starts an encrypted session with a remote system.	
tech	Provides Cisco Technical Assistance Center (TAC) commands.	
telnet	Establishes a Telnet connection to a remote system.	
terminal length	Sets terminal line parameters.	
terminal session-timeout	Sets the inactivity timeout for all terminal sessions.	
terminal session-welcome	Sets the welcome message on the system for all terminal sessions.	
terminal terminal-type	Specifies the type of terminal connected to the current line of the current session.	
traceroute	Traces the route of a remote IP address.	
undebug	Disables the output (display of errors or events) of the debug command for various command situations; for example, backup and restore, configuration, copy, resource locking, file transfer, and user management.	
write	Erases the startup configuration that forces to run the setup utility and prompt the network configuration, copies the running configuration to the startup configuration, and displays the running configuration on the console.	

show Commands

The **show** commands are used to display the settings and are among the most useful commands. See Table 5: Summary of show Commands for a summary of the **show** commands. The **show** commands must be followed by a keyword; for example, **show application status**. Some **show** commands require an argument or variable after the keyword to function; for example, **show application version**.

Table 5: Summary of show Commands

	Description
application (requires keyword)	Displays information about the installed application; for example, status information or version information.
backup (requires keyword)	Displays information about the backup.
cdp (requires keyword)	Displays information about the enabled Cisco Discovery Protocol interfaces.
clock	Displays the day, date, time, time zone, and year of the system clock.
сри	Displays CPU information.
disks	Displays file-system information of the disks.
icmp-status	Displays the Internet Control Message Protocol (ICMP) echo response configuration information.
interface	Displays statistics for all of the interfaces configured on the .
inventory	Displays information about the hardware inventory, including the appliance model and serial number.
logging (requires keyword)	Displays the server logging information.
logins (requires keyword)	Displays the login history of the server.
memory	Displays memory usage by all running processes.
ntp	Displays the status of the Network Time Protocol (NTP) servers.
ports	Displays all of the processes listening on the active ports.
process	Displays information about the active processes of the server.
repository (requires keyword)	Displays the file contents of a specific repository.

	Description
restore (requires keyword)	Displays the restore history in the .
running-config	Displays the contents of the configuration file that currently runs in the .
startup-config	Displays the contents of the startup configuration in the .
tech-support	Displays system and configuration information that you can provide to the TAC when you report a problem.
terminal	Displays information about the terminal configuration parameter settings for the current terminal line.
timezone	Displays the current time zone in the .
timezones	Displays all of the time zones available for use in the .
udi	Displays information about the unique device identifier (UDI) of the .
uptime	Displays how long the system you are logged in to has been up and running.
users	Displays information about the system users.
version	Displays information about the currently loaded software version, along with hardware and device information.

Configuration Commands

Configuration commands include **interface** and **repository**. To access configuration mode, run the **configure** command in EXEC mode.

Some of the configuration commands require that you enter the configuration submode to complete the configuration.

Table 6: Summary of Configuration Commands describes the configuration commands.

Table 6: Summary	r of	Configuration	Commands
------------------	------	---------------	----------

	Description		
backup-staging-url	Specifies a Network File System (NFS) temporary space or staging area for the remote directory for backup and restore operations.		
cdp holdtime	Specifies the amount of time the receiving device should hold a Cisco Discovery Protocol packet from the server before discarding it.		
cdp run	Enables Cisco Discovery Protocol.		
cdp timer	Specifies how often the server sends Cisco Discovery Protocol updates.		
clock timezone	Sets the time zone for display purposes.		
do	 Executes an EXEC-level command from configuration mode or any configuration submode. Note To initiate, the do command precedes the EXEC command. 		
end	Returns to EXEC mode.		
exit	Exits configuration mode.		
hostname	Sets the hostname of the system.		
icmp echo	Configures the ICMP echo requests.		
interface	Configures an interface type and enters interface configuration mode.		
ipv6 address autoconfig	Enables IPv6 stateless autoconfiguration in interface configuration mode.		
ipv6 address dhcp	Enables IPv6 address DHCP in interface configuration mode.		
ip address	Sets the IP address and netmask for the Ethernet interface.		
	Note This is an interface configuration command.		
ip default-gateway	Defines or sets a default gateway with an IP address.		

	Description	
ip domain-name	Defines a default domain name that a server uses to complete hostnames.	
ip name-server	Sets the Domain Name System (DNS) servers for use during a DNS query.	
kron occurrence	Schedule one or more Command Scheduler commands to run at a specific date and time or a recurring level.	
kron policy-list	Specifies a name for a Command Scheduler policy.	
logging	Enables the system to forward logs to a remote system.	
logging loglevel	Configures the log level for the logging command.	
no	Disables or removes the function associated with the command.	
ntp	Synchronizes the software clock through the NTP server for the system.	
password-policy	Enables and configures the password policy.	
repository	Enters repository submode.	
service	Specifies the type of service to manage.	
snmp-server community	Sets up the community access string to permit access to the Simple Network Management Protocol (SNMP).	
snmp-server contact	Configures the SNMP contact the Management Information Base (MIB) value on the system.	
snmp-server host	Sends SNMP traps to a remote system.	
snmp-server location	Configures the SNMP location MIB value on the system.	
username	Adds a user to the system with a password and a privilege level.	

For detailed information on configuration mode and submode commands, see Understanding Command Modes, page 2-5.

CLI Audit

You must have administrator access to execute the configuration commands. Whenever an administrator logs in to configuration mode and executes a command that causes configurational changes in the server, the information related to those changes is logged in the operational logs.

Table 7: Configuration Mode Commands for the Operation Log describes configuration mode commands that generate operational logs.

	Description
clock	Sets the system clock on the server.
ip name-server	Sets the DNS servers for use during a DNS query.
hostname	Sets the hostname of the system.
ip address	Sets the IP address and netmask for the Ethernet interface.
ntp server	Allows synchronization of the software clock by the NTP server for the system.

Table 7: Configuration Mode Commands for the Operation Log

In addition to configuration mode commands, some commands in EXEC mode generate operational logs. Table 8: EXEC Mode Commands for the Operation Log describes EXEC mode commands that generate operational logs.

Table 8: EXEC Mode Commands for the Operation Log

	Description	
backup	Performs a backup and places the backup in a repository.	
restore	Restores from backup the file contents of a specific repository.	
backup-logs	Backs up system logs.	

Using the Command-Line Interface

This chapter provides helpful tips for understanding and configuring the Cisco Prime Infrastructure from the command-line interface (CLI). The can be deployed for small, medium, and large deployments and is available on different platforms and also as a software that can run on VMware.

- Before Accessing the CLI, page 15
- Running the Setup Utility to Configure the, page 15
- Accessing the CLI, page 17
- Understanding Command Modes, page 20
- Navigating the CLI Commands, page 26
- Where to Go Next, page 32

Before Accessing the CLI

Before logging in to the CLI, ensure that you have completed the installation tasks as specified in the *Cisco Prime Infrastructure 2.0 Quick Start Guide*.

Running the Setup Utility to Configure the

When you power on the appliances for the first time, you are prompted to run the setup utility to configure the appliances. Before you run the utility using the **setup** command, ensure that you have values for the following network configuration prompts:

- Hostname
- IP address
- Netmask
- Gateway
- Domain
- Nameserver

- Network Time Protocol (NTP) server (optional)
- User ID
- · Password

The following is a sample output from the **setup** command:

```
Please type 'setup' to configure the appliance
                 *****
localhost login: setup
Press 'Ctrl-C' to abort setup
Enter hostname[]: NCS
Enter IP address[]: 172.16.90.183
Enter IP default netmask[]: 255.255.255.0
Enter IP default gateway[]: 172.16.90.1
Enter default DNS domain[]: example.com
Enter primary nameserver[]: 172.16.168.183
Add/Edit another nameserver? Y/N : n
Enter primary NTP server[time.nist.gov]:
Add/Edit secondary NTP server? Y/N : n
Enter username[admin]:
Enter password:
Enter password again:
Bringing up network interface...
Pinging the gateway...
Pinging the primary nameserver...
Do not use 'Ctrl-C' from this point on...
Appliance is configured
```

After you enter the required information, the appliance automatically reboots and the following login prompt appears:

machine_name login: where *machine_name* identifies the hostname that you specified when you ran the **setup** command.

In this example, this prompt appears:

NCS login:

To log in, use the administrator user account (and the corresponding password) that you created during the setup process. You must also use this Admin account to log in to the CLI for the first time. After accessing the CLI as an administrator, you can create more users (with admin and operator privileges) with SSH access to the CLI by running the **username** command in configuration mode.

Note The administrator user account and the corresponding password (a CLI user account) that you created during the initial setup wizard can be used to manage the application using the CLI. The CLI user has privileges to start and stop the application software, backup and restore the application data, apply software patches and upgrades to the application software, view all of the system and the application logs, and reload or shut down the appliance. To protect the CLI user credentials, explicitly create users with access to the CLI.

Note

Any users that you create from the web interface cannot automatically log in to the CLI. You must explicitly create users with access to the CLI. To create these users, you must log in to the CLI using the Admin account that you created during setup; then, enter configuration mode, and run the **username** command.

Accessing the CLI

Before logging in to the CLI, ensure that you have completed the hardware installation and configuration process outlined in the Before Accessing the CLI, on page 15

To log in to the server and access the CLI, use an SSH secure shell client or the console port. You can log in from:

- A PC running Windows XP/Vista.
- A PC running Linux.
- An Apple computer running Mac OS X 10.4 or later.
- Any terminal device compatible with VT100 or ANSI characteristics. On the VT100-type and ANSI
 devices, you can use cursor-control and cursor-movement key. Keys include left arrow, up arrow, down
 arrow, right arrow, Delete, and Backspace. The CLI senses the use of the cursor-control keys and
 automatically uses the optimal device characteristics.

To exit the CLI, use the **exit** command from EXEC mode. If you are currently in one of the configuration modes and you want to exit the CLI, enter the **end**, **exit**, or press **Ctrl z** command to return to EXEC mode, and then enter the **exit** command.

Supported Hardware and Software Platforms

The following valid terminal types can access the :

- 1178
- 2621
- 5051
- 6053
- 8510
- altos5
- amiga
- ansi
- apollo
- Apple_Terminal
- att5425
- ibm327x
- kaypro
- vt100

You can also access the through an SSH client or the console port.

Opening the CLI with Secure Shell

Note

To access the CLI environment, use any SSH client that supports SSH v2.

The following example shows you how to log in with a Secure Shell (SSH) client (connecting to a wired WAN) via a PC by using Windows XP. Assuming that is preconfigured through the setup utility to accept an Admin (administrator) user, log in as Admin.

Step 1	Use any SSH client and start an SSH session.
	The SSH window appears.

- Step 2Press Enter or Spacebar to connect.The Connect to Remote Host window appears.
- Step 3 Enter a hostname, username, port number, and authentication method.In this example, you enter ncs for the hostname, admin for the username, and 22 for the port number; and, for the authentication method, choose Password from the drop-down list.
- Step 4Click Connect, or press Enter.The Enter Password window appears.
- Step 5Enter your assigned password for the administrator.
The SSH with the Add Profile window appears.
- **Step 6** (Optional) Enter a profile name in the text box and click **Add to Profile**.
- Step 7Click Close in the Add Profile window.
The command prompt appears. You can now enter CLI commands.

Opening the CLI Using a Local PC

If you need to configure locally (without connecting to a wired LAN), you can connect a PC to the console port on the appliance by using a null-modem cable.

The serial console connector (port) provides access to the CLI locally by connecting a terminal to the console port. The terminal is a PC running terminal-emulation software or an ASCII terminal. The console port (EIA/TIA-232 asynchronous) requires only a null-modem cable.

To connect a PC running terminal-emulation software to the console port, use a DB-9 female to DB-9 female null-modem cable.

To connect an ASCII terminal to the console port, use a DB-9 female to DB-25 male straight-through cable with a DB-25 female to DB-25 female gender changer.

The default parameters for the console port are 9600 baud, 8 data bits, no parity, 1 stop bit, and no hardware flow control.

If you are using a Cisco switch on the other side of the connection, set the switchport to duplex auto, speed auto (the default).

Step 1 Connect a null-modem cable to the console port on the Cisco ISE-3315 and to the COM port on your PC.

Step 2 Set up a terminal emulator to communicate with the . Use the following settings for the terminal emulator connection: 9600 baud, 8 data bits, no parity, 1 stop bit, and no flow control.

Step 3 When the terminal emulator activates, press **Enter**.

Step 4 At the console, enter your username, then press **Enter**.

Step 5Enter the password, then press Enter.When the CLI activates, you can enter CLI commands to configure the .

Understanding Command Modes

This section describes the command modes in detail.

EXEC Mode

When you start a session on the , you begin in admin or EXEC mode. From EXEC mode, you can enter configuration mode. Most of the EXEC commands (one-time commands), such as **show** commands, display the current configuration status. The admin or EXEC mode prompt consists of the device name or hostname before a pound sign (#), as shown:

ncs/admin# (Admin or EXEC mode)

Note

Throughout this guide, the server uses the name *ncs* in place of the hostname and *admin* of the server for the user account.

You can always tell when you are in EXEC mode or configuration mode by looking at the prompt.

• In EXEC mode, a pound sign (#) appears after the NCS server hostname and your username.

For example:

ncs/admin#

• In configuration mode, the 'config' keyword and a pound sign (#) appear after the hostname of the server and your username.

For example:

```
ncs/admin# configure
Enter configuration commands, one per line. End with CNTL/Z.
ncs/admin(config)# (configuration mode)
```

If you are familiar with UNIX, you can equate EXEC mode to *root* access. You could also equate it to the administrator level in Windows NT or the supervisor in NetWare. In this mode, you have permission to access everything in the server, including the configuration commands. However, you cannot enter configuration commands directly. Before you can change the actual configuration of the server, you must enter configuration mode by entering the **configure** or **configure terminal (conf t)** command. Enter this command only when in EXEC mode.

For example:

```
ncs/admin# conf t
Enter configuration commands, one per line. End with CNTL-Z.
ncs(config)# (configuration mode)
The configuration mode has several submodes; each has its own prompt. To enter these submodes, you must
first enter configuration mode by entering the configure terminal command.
```

To exit configuration mode, enter the **end**, **exit**, or **Ctrl-z** command. To exit EXEC mode, enter the **exit** command. To exit both configuration and EXEC modes, enter this sequence of commands:

```
ncs/admin(config)# exit
ncs/admin# exit
To obtain a listing of commands in EXEC mode, enter a question mark (?):
```

ncs/admin# ?

Configuration Mode

Use configuration mode to make changes to the existing configuration. When you save the configuration, these commands remain across server reboots, but only if you run either of these commands:

- copy running-config startup-config
- write memory

To enter configuration mode, run the **configure** or **configure terminal (conf t)** command in EXEC mode. When in configuration mode, the expects configuration commands.

For example:

```
ncs/admin# configure
Enter configuration commands, one per line. End with CNTL-Z.
ncs/admin(config)# (configuration mode)
From this level, you can enter commands directly into the configuration. To obtain a listing of commands in
this mode, enter a question mark (?):
```

ncs/admin(config)# ?

The configuration mode has several configuration submodes. Each of these submodes places you deeper in the prompt hierarchy. When you enter the **exit**, command the backs you out one level and returns you to the previous level. When you enter the **exit** command again, the backs you out to the EXEC level.

In configuration mode, you can alternatively press the **Ctrl-z** instead of entering the **end** or **exit** command.

Configuration Submodes

In the configuration submodes, you can enter commands for specific configurations. For example:

ncs/admin# config t
ncs/admin(config)# interface GigabitEthernet 0
ncs/admin(config-GigabitEthernet)#
To obtain a list of commands in this mode, enter a question mark (?):

ncs/admin(config-GigabitEthernet)# ?
Use the exit or end command to exit this prompt and return to the configuration prompt.

The following table lists the commands in the interface GigabitEthernet 0 configuration submode. Other configuration submodes exist including those specific to the **kron**, **repository**, and **password policy** commands.

	Comment
<pre>ncs/admin(config)# interface GigabitEthernet 0 ncs/admin(config-GigabitEthernet)# ? Configure ethernet interface: do</pre>	Enter the command that you want to configure for the interface. This example uses the interface GigabitEthernet command.
<pre>ip Configure IP reactives ipv6 Configure IPv6 features no Negate a command or set its defaults shutdown Shutdown the interface ncs/admin(config-GigabitEthernet)#</pre>	Enter ? to display what you must enter next on the command line. This example shows the available interface GigabitEthernet configuration submode commands.
<pre>ncs/admin(config-GigabitEthernet)# ip ? address Configure IP address ncs/admin(config-GigabitEthernet)# ip</pre>	Enter the command that you want to configure for the interface. This example uses the ip command.
	Enter ? to display what you must enter next on the command line. This example shows the available ip configuration submode commands.
<pre>ncs/admin(config-GigabitEthernet)# ip address ?</pre>	Enter the command that you want to configure for the interface. This example uses the ip addresss command.
	Enter ? to display what you must enter next on the command line. In this example, you must enter an IPv4 address.
	A carriage return <cr> does not appear; therefore, you must enter additional arguments to complete the command.</cr>
<pre>ncs/admin(config-GigabitEthernet)# ip address 172.16.0.1 ?</pre>	

Table 9: Command Options in the Interface GigabitEthernet 0 Configuration Submode
	Comment
	Enter the keyword or argument that you want to use. This example uses the 172.16.0.1 IP address.
	Enter ? to display what you must enter next on the command line. In this example, you must enter a network mask.
	A carriage return <cr> does not display; therefore, you must enter additional arguments to complete the command.</cr>
<pre>ncs/admin(config-GigabitEthernet)# ip address 172.16.0.1 255.255.255.224 ?</pre>	Enter the network mask. This example uses the 255.255.255.224 IP address. Enter ? to display what you
255.255.255.224 ?	must enter next on the command line. In this example, you can press Enter.
	A carriage return <cr> displays; you can press Enter to complete the command.</cr>

Navigating the CLI Commands

This section describes how to navigate the commands and modes on the

Getting Help

Use the question mark (?) and the arrow keys to help you enter commands:

• For a list of available commands, enter a question mark (?):

ncs/admin# ?

• To complete a command, enter a few known characters before ? (with no space):

ncs/admin# s?

• To display keywords and arguments for a command, enter ? at the prompt or after entering part of a command followed by a space:

ncs/admin# show ?

The displays a list and brief description of available keywords and arguments.

Note

The <cr> symbol in command help stands for "carriage return", which means to press the **Return** or the **Enter** key). The <cr> at the end of command help output indicates that you have the option to press **Enter** to complete the command and that the arguments and keywords in the list preceding the <cr> symbol are optional. The <cr> symbol by itself indicates that no more arguments or keywords are available, and that you must press **Enter** to complete the command.

• To redisplay a command that you previously entered, press the **Up Arrow** key. Continue to press the **Up Arrow** key to see more commands.

Using the No and Default Forms of Commands

Some EXEC or configuration commands have a **no** form. In general, use the **no** form to disable a function. Use the command without the **no** keyword to re-enable a disabled function or to enable a function disabled by default; for example, an IP address enabled by default. To disable the IP address, use the **no ip address** command; to re-enable the IP address, use the **ip address** command.

Configuration commands can also have a **default** form, which returns the command settings to the default values. Most commands disable by default, so in such cases using the **default** form has the same result as using the **no** form of the command. However, some commands are enabled by default and have variables set to certain default values. In these cases, the **default** form of the command enables the command and sets the variables to their default values.

See Command Reference, on page 33 for a description of the complete syntax of the configuration commands, and the **no** and **default** forms of a command.

Command-Line Conventions

Command-Line Editing Key Conventions

The provides a number of keyboard shortcuts that you can use to edit an entered line.

Tab

Press Tab to try to finish the current command.

If you press the **Tab** key:

- At the beginning of a line, the system lists all of the short-form options.
- When you enter a partial command, the system lists all of the short form options beginning with those characters.
- When only one possible option is available, the system fills in the option automatically.

Ctrl-c

Press **Ctrl-c** to abort the sequence. Pressing this key sequence breaks out of any executing command and returns to the previous mode.

Ctrl-z

Press Ctrl-z to exit configuration mode and return to previous configuration mode.

?

Enter a question mark (?) at the prompt to list the available commands.

Command Line Completion

Command-line completion makes the CLI more user-friendly. It saves you extra key strokes and helps out when you cannot remember the syntax of a command.

For example, for the show running-config command:

ncs/admin# show running-config
You can:

```
ncs/admin# sh run
```

The expands the command sh run to show running-config.

Another shortcut is to press the **Tab** key after you type **sh**; the Cisco NCS CLI fills in the rest of the command, in this case **show**.

If the Cisco NCS CLI does not understand a command, it repeats the entire command line and places a caret symbol (^) under the point at which it is unable to parse the command.

For example:

ncs/admin# show unning-configuration

% Invalid input detected at '^' marker.

The caret symbol ($^$) points to the first letter in the command line that the does not understand. Usually, this means that you need to provide additional arguments to complete the command or you mispelled the command. In this case, you omitted the "r" in the "unning" command. To fix the error, retype the command.

In another form of command-line completion, you can start a command by entering the first few characters, then pressing the **Tab** key. As long as you can match one command, the CLI will complete the command. For example, if you type **sh** and press **Tab**, the completes the **sh** with **show**. If does not complete the command, you can enter a few more letters and press **Tab** again.

Continuing Output at the --More-- Prompt

When working with the CLI, output often extends beyond the visible screen length. For cases where output continues beyond the bottom of the screen, such as with the output of many ? or **show** commands, the output pauses and a --More-- prompt appears at the bottom of the screen. To resume output, press **Return** to scroll down one line, or press the **spacebar** to display the next full screen of output.

 \mathcal{O} Tip

If the output pauses on your screen but you do not see the **--More--** prompt, try entering a smaller value for the screen length by using the **terminal length** EXEC command. Command output will not pause if you set the length value to zero (0).

Where to Go Next

Now that you are familiar with some of the CLI basics, you can begin to configure the by using the CLI. Remember that:

- You can use the question mark (?) and arrow keys to help you enter commands.
- Each command mode restricts you to a set of commands. If you have difficulty entering a command, check the prompt and then enter the question mark (?) to see a list of available commands.
- To disable a feature, enter the keyword **no** before the command; for example, **no ip address**.
- You must save your configuration changes so that you preserve them during a system reload or power outage.

Proceed to Command Reference, on page 33 for command listings, descriptions, syntax, usage guidelines, and sample output.

Command Reference

This appendix contains necessary information on disk space management for all types of Cisco Prime Infrastructure deployments and an alphabetical listing of the commands specific to the . The comprise the following modes:

- EXEC
 - ° System-level
 - ° Show
- Configuration
 - ° configuration submode

Use EXEC mode system-level config or configure command to access configuration mode.

Each of the commands in this appendix is followed by a brief description of its use, command syntax, any command defaults, command modes, usage guidelines, and one or more examples. Throughout this appendix, the server uses the name *ncs* in place of the server's hostname.

Note

If an error occurs in any command usage, use the debug command to determine the cause of the error.

- Disk Space Management in, page 33
- EXEC Commands, page 37
- show Commands, page 140
- Configuration Commands, page 182

Disk Space Management in

This section provides information on disk space in the appliances for all types of deployments. Each of the appliances has a different amount of disk space, and managing that disk space is important to enable you to use the efficiently.

Before proceeding to use the CLI commands, familiarize yourself with disk space management in the appliances. You can deploy the on appliances with small, medium and large form factors and VMware. Table 10: Appliances Configuration provides information on appliances on all of the form factors and the available disk space that you need to manage the .

Table 10: Appliances Configuration

Appliance Form Factor	Appliances	Hard Disk Configuration
Small	-	2 x 250 GB SATA HDD.
Medium	-	2 x 300 GB SAS RAID HDD.
Large	-	4 x 300 GB SAS RAID HDD.
VMware	NCS-DEMO-10 (to run a Demo/Evaluation)	30 GB
	L-NCS-1.0-K9 (to run the PxP production image)	60 GB
	L-NCS-1.0-K9 (to run M&T production image)	200 GB

Table 11: Disk Space on /var Partition lists the disk space that you may use on the /var partition that has a total of 6 GB of disk space. You may use 308 MB of the 6 GB of disk space for the operating system and the Cisco ADE OS 2.0 log files. You can then use the remaining 5.7 GB of disk space for a medium and large type deployment.

Table 11: Disk Space on /var Partition

Process	Files	Small	Medium and Large	VMware
Linux OS	System	-	258 MB	-
Cisco ADE OS 2.0	/var/log/ade/ADE.log	-	50 MB	-

All of the files that you create in the reside in the /opt partition. You must manage the disk space for the files that you create in the /opt partition so that the files increase in size within the limits that do not have an impact on other files and services in the system.

Table 12: Disk Space on /opt Partition lists the disk space that you may use on the /opt partition that has a total of 410 GB of disk space. You may use 161 GB of disk space and the remaining of 249 GB for a medium and large type deployment. The remaining 249 GB of disk space can be better utilized for the database growth after you consider the disk space required for backup, restore, and replication.

Process	Files		Medium and Large	VMware

EXEC Commands

This section lists each EXEC command and each command page includes a brief description of its use, command syntax, any command defaults, command modes, usage guidelines, and an example of the command and any related commands.

application install

Note	You are not allowed to run the application install command from the CLI under normal operations because the application is preinstalled with a Cisco IOS image on all supported appliances and VMware.		
	To install a specific application other than the , use the application install command in EXEC mode. To remove this function, use the application remove command.		
	application install application-bundle remote-repository-name		
Syntax Description	<i>application-bundle</i> Application bundle filename. Up to 255 alphanumeric characters.		
	<i>remote-repository-name</i> Remote repository name. Up to 255 alphanumeric characters.		
Command Default	No default behavior or values.		
Command Modes	EXEC		
Usage Guidelines	Installs the specified application bundle on the appliance. The application bundle file is pulled from the specified repository.		
If you enter the application install or application remove command when another installatoperation of an application is in progress, you will see the following warning message:			
	An existing application install, remove, or upgrade is in progress. Try again shortly.		
Examples	<pre>ncs/admin# application install ncs-appbundle-1.0.2.054.i386.tar.gz myrepository Do you want to save the current configuration ? (yes/no) [yes] ? y Please enter yes or no Do you want to save the current configuration ? (yes/no) [yes] ? yes Generating configuration Saved the running configuration to startup successfully Initiating Application installation Extracting NCS database content Starting NCS database processes Creating NCS M&T session directory Performing NCS database priming</pre>		
	Application successfully installed		
	ncs/admin# application install ncs-appbundle-1.0.2.054.i386.tar.gz myrepository Do you want to save the current configuration ? (yes/no) [yes] ? no Initiating Application installation Extracting NCS database content Starting NCS database processes Restarting NCSdatabase processes		

Creating NCS M&T session directory... Performing NCS database priming...

Application successfully installed

Related Commands

Command	Description
application remove	Removes or uninstalls an application.
application start	Starts or enables an application.
application stop	Stops or disables an application.
application upgrade	Upgrades an application bundle.
show application	Shows application information for the installed application packages on the system.

application remove

Note	You are not allowed to run the application remove command from the CLI to remove the application unless you are explicitly instructed to do so for an upgrade. To remove a specific application other than the , use the application remove command in EXEC mode. To remove this function, use the no form of this command.		
	application remove <i>app</i>	plication-name	
	no application remove	application-name	
Syntax Description	application-name	Application name. Up to 255 alphanumeric characters.	
Command Default	No default behavior or v	values.	
Command Modes	EXEC		
Usage Guidelines	Removes or uninstalls an application.		
Examples	ncs/admin# applicati Continue with applic	on remove ncs ation removal? [y/n] y	
	Application successf ncs/admin#	ully uninstalled	
Related Commands	Command	Description	
	application install	Installs an application bundle.	
	application start	Starts or enables an application.	
	application stop	Stops or disables an application.	
	application upgrade	Upgrades an application bundle.	
	show application	Shows application information for the installed application packages on the system.	

application reset-config

Note	This command is not currently supported by . To reset an application configuration to factory defaults, use the application reset-config command in EXEC mode.		
	application reset-config application-name		
Syntax Description	<i>application-name</i> Name of the application to reset its configuration to factory defaults. Up to 255 alphanumeric characters.		
Command Default	No default behavior or values.		
Command Modes	EXEC		
Usage Guidelines	You can use the application reset-config command to reset the configuration to factory defaults without reimaging the appliance or VMware.		
Examples	<pre>ncs/admin# application reset-config ncs Initialize your identity policy database to factory defaults? (y/n): y Reinitializing local policy database to factory default state Stopping NCS Monitoring & Troubleshooting Log Processor Stopping NCS Monitoring & Troubleshooting Alert Process Stopping NCS Monitoring & Troubleshooting Alert Process Stopping NCS Monitoring & Troubleshooting Session Database Stopping NCS Monitoring & Troubleshooting Session Database Stopping NCS database processes Extracting NCS database processes Restarting NCS database processes Creating NCS database processes Performing NCS database priming Application successfully reset configuration ncs/admin# application reset-config ncs Initialize your identity policy database to factory defaults? (y/n): n Existing policy database will be retained. Application successfully reset configuration ncs/admin#</pre>		

application start

To enable a specific application, use the **application start** command in EXEC mode. To remove this function, use the **no** form of this command.

application start application-name

	NCS M&T Session Dat. NCS Application Ser NCS M&T Log Collect	abase is already running, FID: 7851 ver process is already running, PID: 7935 or is already running, PID: 7955 or is already running, PID: 8005
Examples	ncs/admin# applicat	
	mmand to start the application. If you use this command to start the application, you dy running.	
Usage Guidelines	Enables an application.	
Command Modes	EXEC	
Command Default	No default behavior or	values.
Syntax Description	application-name	Name of the predefined application that you want to enable. Up to 255 alphanumeric characters.

Command	Description
application install	Installs an application bundle.
application remove	Removes or uninstalls an application.
application stop	Stops or disables an application.
application upgrade	Upgrades an application bundle.
show application	Shows application information for the installed application packages on the system.

application stop

To disable a specific application, use the **application stop** command in EXEC mode. To remove this function, use the **no** form of this command.

application stop application-name

Syntax Description	<i>application-name</i> Name of the predefined application that you want to disable. Up to alphanumeric characters.	255
Command Default	No default behavior or values.	
Command Modes	EXEC	
Usage Guidelines	Disables an application.	
Examples	<pre>ncs/admin# application stop NCS Stopping NCS Monitoring & Troubleshooting Log Processor Stopping NCS Monitoring & Troubleshooting Alert Process Stopping NCS Application Server Stopping NCS Monitoring & Troubleshooting Session Database Stopping NCS Database processes ncs/admin#</pre>	
Related Commands	Description	

ated Commands		Description
	application install	Installs an application bundle.
	application remove	Removes or uninstalls an application.
	application start	Starts or enables an application.
	application upgrade	Upgrades an application bundle.
	show application	Shows application information for the installed application packages on the system.

application upgrade

To upgrade a specific application bundle, use the **application upgrade** command in EXEC mode. To remove this function, use the **application remove** command.

application upgrade application-bundle remote-repository-name

Syntax Description	1: .: 1 11		
	application-bundle	Application name. Up to 255 alphanumeric characters.	
		Note Enter the application name as 'PI' in uppercase.	
	remote-repository-name	Remote repository name. Up to 255 alphanumeric characters.	
Command Default	No default behavior or valu	ues.	
Command Modes	EXEC		
Usage Guidelines	Upgrades an application bu	undle, and preserves any application configuration data.	
	If you enter the application upgrade command when another application upgrade operation is in progress, you will see the following warning message:		
	An existing application install, remove, or upgrade is in progress. Try again shortly.		
Caution	Do not enter the backup or restore commands when the upgrade is in progress. This action might cause the database to be corrupted.		
Examples	<pre>ncs/admin# application upgrade NCS-appbundle-1.0.2.054.i386.tar.gz myremoterepository Do you want to save the current configuration ? (yes/no) [yes] ? yes Generating configuration Saved the running configuration to startup successfully Initiating Application Upgrade ncs/admin# ncs/admin# ncs/admin# application upgrade NCS-appbundle-1.0.2.054.i386.tar.gz myremoterepository Do you want to save the current configuration ? (yes/no) [yes] ? no Initiating Application Upgrade ncs/admin#</pre>		
Related Commands	Command	Description	
	application install	Installs an application bundle.	

Command	Description	
application remove	Removes or uninstalls an application.	
application start	Starts or enables an application.	
application stop	Stops or disables an application.	
show application	Shows application information for the installed application packages on the system.	

backup

To perform a backup (including the and Cisco ADE OS data) and place the backup in a repository, use the **backup** command in EXEC mode. To perform a backup of only the application data without the Cisco ADE OS data, use the **application** command.

backup backup-name**repository** repository-name**application** application-name

Syntax Description	backup-name	Name of the backup file. Up to 100 alphanumeric characters.	
	repository-name		of the location where the files should be backed up to. Up to 80 umeric characters.
	application-name	Applic	ation name. Up to 255 alphanumeric characters.
		Note	Enter the application name as 'PI' in uppercase.
Command Default	No default behavior or	values.	
Command Modes	EXEC		
Usage Guidelines	Performs a backup of the and Cisco ADE OS data and places the backup in a repository.		
	To perform a backup of only the application data without the Cisco ADE OS data, use the application command.		
Examples		cs/admin# backup mybackup repository myrepository Creating backup with timestamped filename: mybackup-100805-1222.tar.gpg cs/admin#	
	ncs/admin# backup mybackup repository myrepository application NCS % Creating backup with timestamped filename: mybackup-100805-1240.tar.gpg ncs/admin#		
Related Commands	Command	I	Description
	backup-logs]	Backs up the system logs.
	delete]	Deletes a file from the server.

Lists a file from the server.

Reboots the system.

dir

reload

Command	Description	
repository	Enters the repository submode for configuration of backups.	
restore	Restores from backup the file contents of a specific repository.	
show backup history	Displays the backup history of the system.	
show repository	Displays the available backup files located on a specific repository.	

backup-logs

To back up system logs, use the **backup-logs** command in EXEC mode. To remove this function, use the **no** form of this command.

backup-logs backup-name repository-name

Syntax Description	backup-name	Name of one or more files to back up. Up to 100 alphanumeric characters.
	repository-name	Location where files should be backed up to. Up to 80 alphanumeric characters.
Command Default	No default behavior o	r values.
Command Modes	EXEC	
Usage Guidelines	Backs up system logs.	
Examples	ncc (admin# backup-	logo wykackym ronasitawy wyranasitawy

ncs/admin# backup-logs mybackup repository myrepository
% Creating log backup with timestamped filename: mybackup-100805-1754.tar.gz
ncs/admin#

Related Commands

Command	Description	
backup	Performs a backup (and Cisco ADE OS) and places the backup in a repository.	
restore	Restores from backup the file contents of a specific repository.	
repository	Enters the repository submode for configuration of backups.	
show backup history	Shows the backup history of the system.	
show repository	Shows the available backup files located on a specific repository.	

clock

To set the system clock, use the **clock** command in EXEC mode. To remove this function, use the **no** form of this command.

clock set [month day hh:min:ss yyyy]

Syntax Description	<i>month</i> Current month of the year by name. Up to three alphabetic characters. For example Jan for January.		
	day	Current day (by date) of the month. Value = 0 to 31 . Up to two numbers.	
	hh:mm:ss	Current time in hours (24-hour format), minutes, and seconds.	
	уууу	Current year (no abbreviation).	
Command Default	No default behavior or valu	les.	
Command Modes	EXEC		
Usage Guidelines	Sets the system clock. You must restart the server after you reset the clock for the change to take effect.		
Examples	ncs/admin# clock set May 5 18:07:20 2010 ncs/admin# show clock Thu May 5 18:07:26 UTC 2010 ncs/admin#		
Related Commands	Command	Description	
	show clock	Displays the time and date set on the system software clock.	

configure

To enter configuration mode, use the **configure** command in EXEC mode. If the **replace** option is used with this command, copies a remote configuration to the system which overwrites the existing configuration.

configure terminal

Syntax Description	terminal Exec	utes configuration commands from the terminal.	
Command Default	No default behavior or values.		
Command Modes	EXEC		
Heere Cuidelinee	TT (1. 1. (
Usage Guidelines	Use this command to enter configuration mode. Note that commands in this mode write to the running configuration file as soon as you enter them (press Enter).		
	To exit configuration mode and return to EXEC mode, enter end, exit, or pressCtrl-z.		
	To view the changes that you have made to the configuration, use the show running-config command in		
	EXEC mode.		
Examples	ncs/admin# configure		
	Enter configuration command	ls, one per line. End with CNTL/Z.	
	ncs/admin(config)#		
	ncs/admin# configure terminal Enter configuration commands, one per line. End with CNTL/Z.		
	ncs/admin(config)#		
Related Commands	Command	Description	
		· · ·	
	show running-config	Displays the contents of the currently running configuration file or the	
		configuration.	

Displays the contents of the startup configuration file or the configuration.

show startup-config

сору

To copy any file from a source to a destination, use the copy command in EXEC mode.

Syntax Description	running-config	Represents the current running configuration file.
	startup-config	Represents the configuration file used during initialization (startup).
	protocol	See Table 13: Protocol Prefix Keywords for protocol keyword options.
	hostname	Hostname of destination.
	location	Location of disk:/ <dirpath>.</dirpath>
	logs	The system log files.
	all	Copies all log files from the system to another location. All logs are packaged as ncslogs.tar.gz and transferred to the specified directory on the remote host.
	filename	Allows you to copy a single log file and transfer it to the specified directory on the remote host, with its original name.
	log_filename	Name of the log file, as displayed by the show logs command (up to 255 characters).
	mgmt	Copies the management debug logs and Tomcat logs from the system, bundles them as mgmtlogs.tar.gz, and transfers them to the specified directory on the remote host.
	runtime	Copies the runtime debug logs from the system, bundles them as runtimelogs.tar.gz, and transfers them to the specified directory on the remote host.

Command Default No default behavior or values.

Command Modes

EXEC

The fundamental function of the **copy** command allows you to copy a file (such as a system image or configuration file) from one location to another location. The source and destination for the file specified uses the file system, through which you can specify any supported local or remote file location. The file system being used (a local memory source or a remote system) dictates the syntax used in the command.

You can enter on the command line all of the necessary source and destination information and the username and password to use; or, you can enter the **copy** command and have the server prompt you for any missing information. You can enter up to a maximum of 2048 characters of source and destination URL information on the command line.

The copy command in the copies a configuration (running or startup).

The active configuration stores itself in the RAM. Every configuration command you enter resides in the running configuration. If you reboot your server, you lose the running configuration. If you make changes that you want to save, you must copy the running configuration to a safe location, such as a network server, or save it as the server startup configuration.

You cannot edit a startup configuration directly. All commands that you enter store themselves in the running configuration, which you can copy into the startup configuration.

In other words, when you boot a server, the startup configuration becomes the initial running configuration. As you modify the configuration, the two diverge: the startup configuration remains the same; the running configuration reflects the changes that you have made. If you want to make your changes permanent, you must save the running configuration to the startup configuration using the **write memory** command. The **write memory** command makes the current running configuration permanent.

Note If you do not save the running configuration, you will lose all your configuration changes during the next reboot of the server. You can also save a copy of the running and startup configurations using the following commands, to recover in case of loss of configuration:

copy startup-config location

copy running-config location

Note

The **copy** command is supported only for the local disk and not for a repository.

Aliases reduce the amount of typing that you need to do. For example, type **copy run start** (the abbreviated form of the **copy running-config startup-config** command).

The entire copying process might take several minutes and differs from protocol to protocol and from network to network.

Use the filename relative to the directory for file transfers.

Possible error is the standard FTP error message.

Table 13: Protocol Prefix Keywords

Keyword	Destination	
ftp	URL for FTP network server. The syntax for this alias:	
	ftp://location/directory	
sftp	URL for an SFTP network server. The syntax for this alias:	
	sftp://location/directory	

Keyward	Destination
tftp	URL for a TFTP network server. The syntax for this alias:
	tftp://location/directory

Examples

ncs/admin# copy run start Generating configuration... ncs/admin# ncs/admin# copy running-config startup-config Generating configuration... ncs/admin# ncs/admin# copy start run ncs/admin# ncs/admin# copy startup-config running-config ncs/admin# ncs/admin# copy logs disk:/ Collecting logs... ncs/admin# This command is used to copy the certificate file from pnp to ftp.

```
ncs/admin# copy server.key /localdisk/tftp
copy server.crt /localdisk/tftp
copy ncs_server_certificate /localdisk/tftp
```

Examples

This command is used to copy the certificate from ftp tp pnp.

```
copy tftp://<PI Server IP Address>/server.key disk:/
copy tftp://<PI Server IP Address>/server.crt disk:/
copy tftp://<PI Server IP Address>/ncs_server_certificate.crt disk:/
```

Related Commands	Command	Description
	application install	Starts or stops a instance.
	backup	Performs a backup (and Cisco ADE OS) and places the backup in a repository.
	delete	Deletes a file from the server.
	dir	Lists a file from the server.
	reload	Reboots the system.
	restore	Restores from backup the file contents of a specific repository.
	show application	Shows application status and version information.
	show version	Displays information about the software version of the system.

debug

To display errors or events for command situations, use the **debug** command in EXEC mode.

debug{all | application | backup-restore | cdp | config | icmp | copy | locks | logging | snmp | system | transfer | user | utils}

Syntax Description	all	Enables all debugging.
	application	Application files.
		• <i>all</i> —Enables all application debug output. Set level between 0 and 7, with 0 being severe and 7 being all.
		• <i>install</i> —Enables application install debug output. Set level between 0 and 7, with 0 being severe and 7 being all.
		• <i>operation</i> —Enables application operation debug output. Set level between 0 and 7, with 0 being severe and 7 being all.
		• <i>uninstall</i> —Enables application uninstall debug output. Set level between 0 and 7, with 0 being severe and 7 being all.
	backup-restore	Backs up and restores files.
		• <i>all</i> —Enables all debug output for backup-restore. Set level between 0 and 7, with 0 being severe and 7 being all.
		• <i>backup</i> —Enables backup debug output for backup-restore. Set level between 0 and 7, with 0 being severe and 7 being all.
		• <i>backup-logs</i> —Enables backup-logs debug output for backup-restore. Set level between 0 and 7, with 0 being severe and 7 being all.
		• <i>history</i> —Enables history debug output for backup-restore. Set level between 0 and 7, with 0 being severe and 7 being all.
		• <i>restore</i> —Enables restore debug output for backup-restore. Set level between 0 and 7, with 0 being severe and 7 being all.
	cdp	Cisco Discovery Protocol configuration files.
		• <i>all</i> —Enables all Cisco Discovery Protocol configuration debug output. Set level between 0 and 7, with 0 being severe and 7 being all.
		• <i>config</i> —Enables configuration debug output for Cisco Discovery Protocol. Set level between 0 and 7, with 0 being severe and 7 being all.
		• <i>infra</i> —Enables infrastructure debug output for Cisco Discovery Protocol. Set level between 0 and 7, with 0 being severe and 7 being all.

config	Configuration files.			
	• <i>all</i> —Enables all configuration debug output. Set level between 0 and 7, with 0 being severe and 7 being all.			
	 <i>backup</i>—Enables backup configuration debug output. Set level between 0 and 7, with 0 being severe and 7 being all. <i>clock</i>—Enables clock configuration debug output. Set level between 0 and 7, with 0 being severe and 7 being all. <i>infra</i>—Enables configuration infrastructure debug output. Set level between 0 and 7, with 0 being severe and 7 being all. 			
	• <i>kron</i> —Enables command scheduler configuration debug output. Set level between 0 and 7, with 0 being severe and 7 being all.			
	 <i>network</i>—Enables network configuration debug output. Set level between 0 and 7, with 0 being severe and 7 being all. <i>repository</i>—Enables repository configuration debug output. Set level between 0 and 7, with 0 being severe and 7 being all. <i>service</i>—Enables service configuration debug output. Set level between 0 and 7, with 0 being severe and 7 being all. 			
icmp	Internet Control Message Protocol (ICMP) echo response configuration.			
	<i>all</i> —Enable all debug output for ICMP echo response configuration. Set level between 0 and 7, with 0 being severe and 7 being all.			
сору	Copy commands. Set level between 0 and 7, with 0 being severe and 7 being			
locks	Resource locking.			
	• <i>all</i> —Enables all resource locking debug output. Set level between 0 and 7, with 0 being severe and 7 being all.			
	• <i>file</i> —Enables file locking debug output. Set level between 0 and 7, with 0 being severe and 7 being all.			
logging	Logging configuration files.			
	<i>all</i> —Enables all logging configuration debug output. Set level between 0 and 7, with 0 being severe and 7 being all.			
snmp	SNMP configuration files.			
	<i>all</i> —Enables all SNMP configuration debug output. Set level between 0 and 7, with 0 being severe and 7 being all.			

	system	System files.	
		• <i>all</i> —Enables all system files debug output. Set level between 0 and 7, with 0 being severe and 7 being all.	
		• <i>id</i> —Enables system ID debug output. Set level between 0 and 7, with 0 being severe and 7 being all.	
		• <i>info</i> —Enables system info debug output. Set level between 0 and 7, with 0 being severe and 7 being all.	
		• <i>init</i> —Enables system init debug output. Set level between 0 and 7, with 0 being severe and 7 being all.	
	transfer	File transfer. Set level between 0 and 7, with 0 being severe and 7 being all.	
	user	User management.	
		• <i>all</i> —Enables all user management debug output. Set level between 0 and 7, with 0 being severe and 7 being all.	
		• <i>password-policy</i> —Enables user management debug output for password-policy. Set level between 0 and 7, with 0 being severe and 7 being all.	
	utils	Utilities configuration files.	
		<i>all</i> —Enables all utilities configuration debug output. Set level between 0 and 7, with 0 being severe and 7 being all.	
Command Default	No default behavior or va	alues.	
Command Modes	EXEC		
Usage Guidelines	Use the debug command to identify various failures within the server; for example, setup failures or configuration failures.		
Examples	ncs/admin# debug all ncs/admin# mkdir disk:/1 ncs/admin# 6 [15347]: utils: vsh_root_stubs.c[2742] [admin]: mkdir operation success		
		:/1 _root_stubs.c[2601] [admin]: Invoked Remove Directory disk:/1 command _root_stubs.c[2663] [admin]: Remove Directory operation success	
	ncs/admin# undebug al ncs/admin#	1	

Related Commands

(Command	Description	
ι	undebug	Disables the output (display of errors or events) of the debug command for various command situations.	

delete

To delete a file from the server, use the **delete** command in EXEC mode. To remove this function, use the **no** form of this command.

delete *filename* [*disk:/path*]

Syntax Description	filename	Filename. Up to 80 alphanumeric characters.	
	disk:/path	Location.	
Command Default	No default behavior or values.		
Command Modes	EXEC		
Usage Guidelines	If you attempt to delete the configuration file or image, the system prompts you to confirm the deletion. Also, if you attempt to delete the last valid system image, the system prompts you to confirm the deletion.		
Examples	ncs/admin# delete disk:/hs_err_pid19962.log ncs/admin#		
Related Commands	Command	Description	
	dir	Lists all of the files on the server.	

dir

dir

To list a file from the server, use the **dir** command in EXEC mode. To remove this function, use the **no** form of this command. dir [word][recursive] **Syntax Description** Directory name. Up to 80 alphanumeric characters. Requires disk:/ preceding the word directory name. recursive Lists a local directory or filename recursively. **Command Default** No default behavior or values. **Command Modes** EXEC **Examples** ncs/admin# dir Directory of disk:/ 2034113 Aug 05 2010 19:58:39 ADElogs.tar.gz 4096 Jun 10 2010 02:34:03 activemg-data/ 4096 Aug 04 2010 23:14:53 logs/ lost+found/ 16384 Jun 09 2010 02:59:34 2996022 Aug 05 2010 19:11:16 mybackup-100805-1910.tar.gz 4096 Aug 04 2010 23:15:20 target/ 4096 Aug 05 2010 12:25:55 temp/ Usage for disk: filesystem 8076189696 bytes total used 6371618816 bytes free 15234142208 bytes available ncs/admin# ncs/admin# dir disk:/logs 0 Aug 05 2010 11:53:52 usermgmt.log Usage for disk: filesystem 8076189696 bytes total used 6371618816 bytes free 15234142208 bytes available ncs/admin# ncs/admin# dir recursive Directory of disk:/ 2034113 Aug 05 2010 19:58:39 ADElogs.tar.gz mybackup-100805-1910.tar.gz 2996022 Aug 05 2010 19:11:16 4096 Aug 04 2010 23:14:53 logs/ 4096 Aug 05 2010 12:25:55 temp/ 4096 Jun 10 2010 02:34:03 activemq-data/ 4096 Aug 04 2010 23:15:20 target/ 16384 Jun 09 2010 02:59:34 lost+found/

Related Commands

dir

ls	Command	Description
	delete	Deletes a file from the server.

exit

	To close an active terminal session by logging out of the server or to move up one mode level from configuration mode, use the exit command in EXEC mode.	
	exit	
Syntax Description	This command has no arguments	s or keywords.
Command Default	No default behavior or values.	
Command Modes	EXEC	
Usage Guidelines	Use the exit command in EXEC mode to exit an active session (log out of the server) or to move up from configuration mode.	
Examples	ncs/admin# exit	
Related Commands Command Description		Description

Command	Description
end	Exits configuration mode.
exit	Exits configuration mode or EXEC mode.
Ctrl-z	Exits configuration mode.

forceout

To force users out of an active terminal session by logging them out of the server, use the **forceout** command in EXEC mode.

forceout username

Syntax Description *username*

The name of the user. Up to 31 alphanumeric characters.

Command Default No default behavior or values.

Command Modes EXEC

Examples

ncs/admin# forceout user1
ncs/admin#

halt

	To shut down and power off the system, use the halt command in EXEC mode.
	halt
	This command has no arguments or keywords.
Command Default	No default behavior or values.
Command Modes	EXEC
Usage Guidelines	Before you enter the halt command, ensure that the is not performing any backup, restore, installation, upgrade, or remove operation. If you enter the halt command while the is performing any of these operations, you will get one of the following warning messages:
	WARNING: A backup or restore is currently in progress! Continue with halt?
	WARNING: An install/upgrade/remove is currently in progress! Continue with halt? If you get any of these warnings, enter YEs to halt the operation, or enter NO to cancel the halt.
	If no processes are running when you use the halt command or if you enter Yes in response to the warning message displayed, the asks you to respond to the following option:
	Do you want to save the current configuration ? Enter YES to save the existing configuration. The displays the following message:
	Saved the running configuration to startup successfully
Examples	ncs/admin# halt ncs/admin#

	ncs password root password	Changes the root password.

ncs password root password

To change the root password, use the ncs password root password command in EXEC mode.

ncs passwod root password password

Syntax Description	password	The modified password. The password cannot contain 'cisco' or 'ocsic', or any variant obtained by changing the capitalization of letters therein or by substituting '1', ' ', or '!' for i, '0' for 'o', or '\$' for 's'.
Command Default	No default behavior or val	ues.
Command Modes	EXEC	
Examples	This example shows how t	to migrate archived files to server:
	<pre>> ncs password root pa Loading USER - root Validating new passwor Resetting password Resetting password CO EXECUTION STATUS : Suc</pre>	d MPLETED.

Command	Description
ncs start	Start the sever.
ncs stop	Stops the server.
ncs status	Displays the current status of the server.
ncs password ftpuser password	Changes the FTP username and password.

ncs ha authkey

To enter the authentication key for high availability (HA), use the ncs ha authkey command in EXEC mode.

ncs ha authkey authorization key

Syntax Description	authorization key	The authorization key for high availability. Up to 255 alphanumeric characters.	
Command Default	No default behavior or valu	Jes.	
Command Modes	EXEC		
Usage Guidelines	The ncs ha authkey comm	hand changes the authorization for the health monitor.	
Examples	This example shows how to set up the authorization key for high availability: ncs ha authkey ciscol23		
Related Commands	Command Description		

commands	Command	Description
	ncs ha remove	Removes the high availability configuration settings from .
	ncs ha status	Provides the current status of high availability.

ncs ha remove

To remove the high availability configuration settings from, use the ncs ha remove command in EXEC mode.

ncs ha remove

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values.

Command Modes EXEC

Usage Guidelines The **ncs ha remove** command removes the high availability configuration settings from . If you enter this command, you will see the following confirmation message:

High availability configuration will be removed. Do you wish to continue? $(\rm Y/N)$

Related Commands	Command	Description
	ncs ha authkey	Allows you to enter the authentication key for high availability in . This command also changes the authorization for the health monitor.
	ncs ha status	Provides the current status of high availability.

ncs ha status

To display the current status of high availability (HA), use the **ncs ha status** command in EXEC mode.

ncs ha status

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values.
- Command Modes EXEC

Usage Guidelines Displays the current status of HA. If you enter the ncs ha status command when HA is not configured, you will see the following response: [State] Stand Alone

S	Command	Description
	ncs ha authkey	Allows you to enter the authentication key for high availability in . This command also changes the authorization for the health monitor.
	ncs ha remove	Removes the high availability configuration.

ncs key genkey

To generate a new RSA key and self-signed certificate, use the **ncs key genkey** command. You can use this command in the following ways:

ncs key genkey

ncs key genkey -newdn

ncs key genkey -csr csrfilename

ncs key genkey -csr csrfilename repository repositoryname

Syntax Description	genkey	Generates a new RSA key and self-signed certificate. You can use the following options with this command:
		-csr: Generate Certificate Signing Request(CSR) file
		-newdn : Generate new RSA key and self-signed certificate with domain information
		<cr>: Carriage return.</cr>
	-newdn	Generates a new RSA key and self-signed cert with domain information. You can use the following options with this command:
		-csr: Generate Certificate Signing Request(CSR) file
		<cr>: Carriage return.</cr>
	-csr	Generates new CSR certificate file. You can use the following option with this command:
		<word></word> : Type in certificate file name (Max Size - 80)
	csrfilename	CSR filename.
	repository	Repository command. This option is available when you use the -csr option.
	repositoryname	Location where the files should be backed up to. Up to 80 alphanumeric characters.

Command Default No default behavior or values.

Command Modes EXEC

Examples

This example shows how to generate new rsa key and certificate files in the Prime Infrastructure server:

```
>ncs key genkey -newdn -csr csrfile.cert repository ncs-sftp-repo
Generating RSA key
INFO: no staging url defined, using local space. rval:2
```

Related Commands

Command	Description
ncs key importcacert	Applies a CA certificate to the trust store in Prime Infrastructure.
ncs key listcacerts	Lists all of the CA certificates that exist in the Prime Infrastructure trust store.
ncs key deletecacert	Deletes a CA certificates that exist in the Prime Infrastructure trust store.
ncs key importsignedcert	Applies an RSA key and signed certificate to Prime Infrastructure.
ncs key importkey	Applies an RSA key and certificate to Prime Infrastructure.

Note

After entering this command, enter the **ncs stop** and **ncs start** command to restart the Prime Infrastructure server to make changes take effect.

ncs key importcacert

To apply a CA certificate to a trust store in , use the ncs key importcacert command in the EXEC mode.

ncs key importcacert aliasname ca-cert-filename repository repositoryname

Syntax Description	1 aliasname	A short name given for this CA certificate.
	ca-cert-filename	CA certificate file name.
	repository	Repository command.
	repositoryname	The repository name configured in where the ca-cert-filename is hosted.
Command Default	No default behavior or	r values.
Command Modes	EXEC	
Examples	This example shows h	ow to apply the CA certificate file to a trust store in the server:
	> ncs key importcac	cert alias1 cacertfile repository ncs-sftp-repo
Not	After applying this conchanges take effect.	mmand, enter the ncs stop and ncs start command to restart the server to make the

	ncs key importcacert	Applies a CA certificate to the trust store in .

ncs key deletecacert

To delete CA certificates that exist in trust store, use the ncs key deletecacert command in the EXEC mode.

ncs key deletecacert aliasname

Syntax Description	aliasname	The short or alias name of the CA certificate which needs to be deleted from the trust store.
Command Default	No default behavior or value	Jes.
Command Modes	EXEC	
Examples	This example shows how t	o delete CA certificates that exist in the trust store:
	> ncs key deletecacer Deleting certificate :	t certumtrustednetworkca from trust store

Command	Description
ncs key genkey Generates a new RSA key and self-signed certificate.	
ncs key importkey	Applies an RSA key and signed certificate to .
ncs key listcacerts	Lists all of the CA certificates that exist in the trust store.
ncs key importsignedcert	Applies an RSA key and signed certificate to .
ncs key importcacert	Applies a CA certificate to the trust store in .

ncs key importsignedcert

To apply an RSA key and signed certificate, use the ncs key importsignedcert command EXEC mode.

ncs key importsignedcert signed-cert-filename repository repositoryname

Control Description		
Syntax Description	signed-cert-filename	Signed certificate filename.
	repository	Repository command
	repositoryname	The repository name configured in where the key-file and cert-file is hosted.
Command Default	No default behavior or va	alues.
Command Modes	EXEC	
Examples	This example shows how	to apply signed certificate files to the server:
	<pre>> ncs key importsinge</pre>	dcert signed-certfile repository ncs-sftp-repo
Note	After applying this comn changes take effect.	nand, enter the ncs stop and the ncs start command to restart the server to make

Command	Description
ncs key genkey	Generates a new RSA key and self-signed certificate.
ncs key importkey	Applies an RSA key and signed certificate to .
ncs key deletecacert	Deletes CA certificates that exist in the trust store.
ncs key listcacerts	Lists all of the CA certificates that exist in the trust store.
ncs key importcacert	Applies a CA certificate to the trust store in .

ncs cleanup

 To free up and reclaim the disk space, use the ncs cleanup command in EXEC mode.

 ncs cleanup

 Syntax Description

 This command has no arguments or keywords.

 Command Default

 No default behavior or values.

 Command Modes

 EXEC

 Usage Guidelines

 When does not have enough disk space, an alarm is raised to free up and reclaim the disk space. If you enter the ncs cleanup command, you will see the following confirmation message: Do you want to delete all the files in the local disk partition? (Y/N)

ncs db sql

	To run the SQL query from the terminal, use the ncs db sql command in EXEC mode.		
	ncs db sql query_string		
Syntax Description	<i>query_string</i> Enter the sql query string enclosed in double quotes.		
Command Default	No default behavior or values.		
Command Modes	EXEC		
Usage Guidelines	The database server should be in running state to successfully execute this command.		
Examples	This example shows how to run a DB sql query on the server:		
	ncs/admin# ncs db sql "select count(*) from clientcount" COUNT(*)		
	75 ncs/admin#		

ncs db reinitdb

To reinitialize the Prime Infratsructure database, use the **ncs db reinitdb** command in EXEC mode. This command removes all data present in the database.

ncs db reinitdb

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values.

Command Modes EXEC

Usage Guidelines You can use this command if the database becomes unstable or unusable, or if you want to remove the old data and start with a clean database.

Examples This example shows how to run a DB sql query on the server:

admin# ncs db reinitdb -All data will be lost. Do you wish to continue? (y/n) y -Creating a new, empty database. This may take 10 to 20 minutes -Database re-initialization completed admin#

nslookup

•	To look up the hostname of a remote system on the server, use the nslookup command in EXEC mode.
	nslookup word
Syntax Description	word IPv4 address or hostname of a remote system. Up to 64 alphanumeric characters.
Command Default	No default behavior or values.
Command Modes	EXEC
Examples	ncs/admin# nslookup 209.165.200.225 Trying "209.165.200.225.in-addr.arpa" Received 127 bytes from 172.16.168.183#53 in 1 ms Trying "209.165.200.225.in-addr.arpa" Host 209.165.200.225.in-addr.arpa. not found: 3(NXDOMAIN) Received 127 bytes from 172.16.168.183#53 in 1 ms

	Received 119 bytes from 172.16.168.183#53 in 28 ms
	ncs/admin#

patch install			
	To install a patch bu	ndle of the application, use the patch command in EXEC mode.	
	patch install patch-bundle repository		
Syntax Description	patch-bundle	The patch bundle file name. Up to 255 alphanumeric characters.	
	repository	Repository name. Up to 255 alphanumeric characters.	
Command Default	No default behavior	or values.	
Command Modes	EXEC		
Usage Guidelines	The patch install command installs a patch bundle of the application only on a specific node where you run the patch install command from the CLI.		
•		tall a patch that is an older version of the existing patch, then you receive the following	
	% Patch to be ins	stalled is an older version than currently installed version.	
Note	Policy Administration	oyment environment, install the patch bundle of the application from the primary on Point (PAP) node in the Administration user interface so that the patch bundle nstalled on all of the secondary nodes.	
Examples	Do you want to sa Generating config Saved the running	<pre>install ncs-appbundle-1.0.2.054-3.i386.tar.gz myrepository we the current configuration ? (yes/no) [yes] ? yes guration g configuration to startup successfully ation Patch installation</pre>	
	Patch successfull ncs/admin#		
	Do you want to sa	<pre>install ncs-appbundle-1.0.2.054-3.i386.tar.gz myrepository we the current configuration ? (yes/no) [yes] ? no ation Patch installation</pre>	
	Patch successfull ncs/admin#	y installed	
	Do you want to sa Generating config Saved the running	<pre>install ncs-appbundle-1.0.2.054-2.i386.tar.gz disk we the current configuration ? (yes/no) [yes] ? yes puration g configuration to startup successfully cation Patch installation</pre>	

 $\ensuremath{\$}$ Patch to be installed is an older version than currently installed version. ncs/admin#

Related Commands

	Description
patch remove	Removes a specific patch bundle version of the application.
show version	Displays information about the currently loaded software version, along with hardware and device information.

patch remove

To remove a specific patch bundle version of the application, use the **patch remove** command in EXEC mode.

patch remove word word

Syntax Description	word	The name of the application for which the patch is to be removed. Up to 255 alphanumeric characters.	
	word	The patch version number to be removed. Up to 255 alphanumeric characters.	
Command Default	No default behavior	or values.	
Command Modes	EXEC		
Usage Guidelines	Removes a specific p	Removes a specific patch bundle of the application.	
	If you attempt to rem	nove a patch that is not installed, then you receive the following error message:	
Note	In a distributed deployment environment, remove the patch bundle of the application from the Policy Administration Point (PAP) node in the Administration user interface so that the patch automatically gets uninstalled from all of the secondary nodes.		
	% Patch is not ins	stalled	
Examples	ncs/admin# patch n Continue with appl	remove ncs 3 lication patch uninstall? [y/n] y	
	Application patch ncs/admin#	successfully uninstalled	
	ncs/admin# patch n Continue with app]	remove ncs 3 lication patch uninstall? [y/n] y	
	% Patch is not ins ncs/admin#	stalled	

Command	Description
patch install	Installs a specific patch bundle of the application.
show version	Displays information about the currently loaded software version, along with hardware and device information.

OL-27654-01

ping

To diagnose the basic IPv4 network connectivity to a remote system, use the **ping** command in EXEC mode.

ping {ip-address | hostname} [Dfdf][packetsizepacketsize][pingcountpingcount]

Syntax Description	<i>ip-address</i> IP	address of the system to ping. Up to 32 alphanumeric characters.	
	<i>hostname</i> Ho	stname of the system to ping. Up to 32 alphanumeric characters.	
	df Spe	ecification for packet fragmentation.	
		ecifies the value as 1 to prohibit packet fragmentation, or 2 to fragment the ekets locally, or 3 to not set df.	
	packetsize Siz	e of the ping packet.	
	packetsize Spe	ecifies the size of the ping packet; the value can be between 0 and 65507.	
	pingcount Nu	mber of ping echo requests.	
	pingcount Spe	ecifies the number of ping echo requests; the value can be between 1 and 10.	
Command Default Command Modes	No default behavior or values.		
Usage Guidelines	The ping command sends an echo request packet to an address, then awaits a reply. The ping output can help you evaluate path-to-host reliability, delays over the path, and whether you can reach a host.		
Examples	ncs/admin# ping 172.16.0.1 df 2 packetsize 10 pingcount 2 PING 172.16.0.1 (172.16.0.1) 10(38) bytes of data. 18 bytes from 172.16.0.1: icmp_seq=0 ttl=40 time=306 ms 18 bytes from 172.16.0.1: icmp_seq=1 ttl=40 time=300 ms		
	172.16.0.1 ping statistics 2 packets transmitted, 2 received, 0% packet loss, time 1001ms rtt min/avg/max/mdev = 300.302/303.557/306.812/3.255 ms, pipe 2 ncs/admin#		
Related Commands	Command	Description	
	ping6	Pings a remote IPv6 address.	

ping6

To diagnose the basic IPv6 network connectivity to a remote system, use the **ping6** command in EXEC mode.

ping6 {ip-address | hostname} [GigabitEthernetpacketsizepacketsize][pingcountpingcount]

Syntax Description	ip-address	IP address of the system to ping. Up to 64 alphanumeric characters.	
	hostname	Hostname of the system to ping. Up to 64 alphanumeric characters.	
	GigabitEthernet	Selects the ethernet interface.	
	packetsize	Size of the ping packet.	
	packetsize	Specifies the size of the ping packet; the value can be between 0 and 65507.	
	pingcount	Number of ping echo requests.	
	pingcount	Specifies the number of ping echo requests; the value can be between 1 and 10.	
Command Default	No default behavior or values.		
Command Modes	EXEC		
Usage Guidelines	The IPv6 ping6 command sends an echo request packet to an address, then awaits a reply. The ping output can help you evaluate path-to-host reliability, delays over the path, and whether you can reach a host. The IPv6 ping6 command is similar to the existing IPv4 ping command that does not support the IPv4 ping fragmentation (df in IPv4) options, but allows an optional specification of an interface. The interface option is primarily useful for pinning with link-local addresses that are interface-specific. The packetsize and pingcount options work identically the same as they do with the IPv4 command.		
Examples	PING 3ffe:302:11:2:20 3ffe:302:11:2:20c:29 64 bytes from 3ffe:30 64 bytes from 3ffe:30 64 bytes from 3ffe:30	<pre>hcs/admin# ping6 3ffe:302:11:2:20c:29ff:feaf:da05 VING 3ffe:302:11:2:20c:29ff:feaf:da05(3ffe:302:11:2:20c:29ff:feaf:da05) from 8ffe:302:11:2:20c:29ff:feaf:da05 eth0: 56 data bytes 64 bytes from 3ffe:302:11:2:20c:29ff:feaf:da05: icmp_seq=0 ttl=64 time=0.599 ms 54 bytes from 3ffe:302:11:2:20c:29ff:feaf:da05: icmp_seq=1 ttl=64 time=0.150 ms 54 bytes from 3ffe:302:11:2:20c:29ff:feaf:da05: icmp_seq=2 ttl=64 time=0.070 ms 54 bytes from 3ffe:302:11:2:20c:29ff:feaf:da05: icmp_seq=3 ttl=64 time=0.065 ms</pre>	
	3ffe:302:11:2:20c:29ff:feaf:da05 ping statistics 4 packets transmitted, 4 received, 0% packet loss, time 3118ms rtt min/avg/max/mdev = 0.065/0.221/0.599/0.220 ms, pipe 2		
	ncs/admin#		
	ncs/admin# ping6 3ffe 2	e:302:11:2:20c:29ff:feaf:da05 GigabitEthernet 0 packetsize 10 pingcount	

PING 3ffe:302:11:2:20c:29ff:feaf:da05(3ffe:302:11:2:20c:29ff:feaf:da05) from 3ffe:302:11:2:20c:29ff:feaf:da05 eth0: 10 data bytes 18 bytes from 3ffe:302:11:2:20c:29ff:feaf:da05: icmp_seq=0 ttl=64 time=0.073 ms 18 bytes from 3ffe:302:11:2:20c:29ff:feaf:da05: icmp_seq=1 ttl=64 time=0.073 ms --- 3ffe:302:11:2:20c:29ff:feaf:da05 ping statistics ---2 packets transmitted, 2 received, 0% packet loss, time 1040ms rtt min/avg/max/mdev = 0.073/0.073/0.073/0.000 ms, pipe 2

ncs/admin#

	Description	
ping	Pings a remote IP address.	

reload

	To reload the operating system, use the reload command in EXEC mode.		
	reload		
Syntax Description	This command has no arguments or keywords.		
Command Default	The command has no default behavior or values.		
Command Modes	EXEC		
Usage Guidelines	The reload command reboots the system. Use the reload command after you enter configuration information into a file and save the running-configuration to the persistent startup-configuration on the CLI and save any settings in the web Administration user interface session.		
	Before you enter the reload command, ensure that the is not performing any backup, restore, installation, upgrade, or remove operation. If the performs any of these operations and you enter the reload command, you will notice any of the following warning messages:		
	WARNING: A backup or restore is currently in progress! Continue with reload?		
	WARNING: An install/upgrade/remove is currently in progress! Continue with reload? If you get any of these warnings, enter YES to halt the operation, or enter NO to cancel the halt.		
	If no processes are running when you use the reload command or you enter YES in response to the warning message displayed, the asks you to respond to the following option:		
	Do you want to save the current configuration ? Enter YES to save the existing configuration. The displays the following message:		
	Saved the running configuration to startup successfully		
Examples	<pre>ncs/admin# reload Do you want to save the current configuration ? (yes/no) [yes] ? yes Generating configuration Saved the running configuration to startup successfully Continue with reboot? [y/n] y Broadcast message from root (pts/0) (Fri Aug 7 13:26:46 2010): The system is going down for reboot NOW! ncs/admin#</pre>		
Related Commands	Command	Description	
	halt	Disables the system.	
restore

To perform a restore of a previous backup, use the **restore** command in EXEC mode. Use the following command to restore data related to the application and Cisco ADE OS: **restore** filename **repository** repository-name Use the following command to restore data related only to the application:

 $restore \ file name repository repository-name application application$

Syntax Description	<i>filename</i> Name of the backed-up file that resides in the repository. Up to 120 alph characters.		of the backed-up file that resides in the repository. Up to 120 alphanumeric ters.
		Note	You must add the .tar.gpg extension after the filename (for example, myfile.tar.gpg).
	repository	The rep	pository keyword.
	repository-name	Name	of the repository you want to restore from backup.
	application	The ap	plication keyword.
	application name	The name of the application data to be restored. Up to 255 alphanumeric characters.	
		Note	Enter the application name as 'PI' in upper case.
Command Default	No default behavior or v	values.	
Command Modes	EXEC		
Usage Guidelines	A restore operation restores data related to the as well as the Cisco ADE OS. To perform a restore of a pre backup of the application data of the only, add the application command to the restore command in E mode. To remove this function, use the no form of this command.		he only, add the application command to the restore command in EXEC
	When you use these two	command	ds in the , the server restarts automatically.
Examples	ncs/admin# restore mybackup-100818-1502.tar.gpg repository myrepository Restore may require a reboot to successfully complete. Continue? (yes/no) [yes] ? yes Stopping NCS Monitoring & Troubleshooting Log Processor Stopping NCS Monitoring & Troubleshooting Log Collector Stopping NCS Monitoring & Troubleshooting Alert Process Stopping NCS Monitoring & Troubleshooting Session Database Stopping NCS Application Server Stopping NCS Database processes Starting NCS Database processes Starting NCS Application Server Starting NCS Monitoring & Troubleshooting Session Database		

```
Starting NCS Monitoring & Troubleshooting Log Collector...
Starting NCS Monitoring & Troubleshooting Log Processor...
Starting NCS Monitoring & Troubleshooting Alert Process...
Note: NCS Processes are initializing. Use 'show application status NCS'
      CLI to verify all processes are in running state.
Broadcast message from root (pts/0) (Wed Aug 18 15:34:58 2010):
The system is going down for reboot NOW!
ncs/admin# Last login: Wed Aug 18 14:00:27 2010 from 10.77.137.60

Related Commands

Command	Description
dir	Displays a list of files on the server.
mkdir	Creates a new directory.

root

This command has no arguments or keywords.

To execute the root shell, use the **root** command in EXEC mode.

Note	

For developer use only, not for end users.

root

Syntax Description This command has no arguments or keywords.

Command Default No default behavior or values.

Command Modes EXEC

Usage Guidelines Requires installation of the root_enable application or patch. The **root** command prompts for the password used with root_enable and puts you in a bash shell with root privileges.

There are no defaults for the password.

If the password is already set, the **root_enable** command generates the following error message:

% Error : root patch password already set If the password is not set, the root command generates the following error message:

% Error : root patch password not set.

Note

This command and the **root_enable** command can only be used on the locally hard-wired console port via Telnet. If you try to access this port over a LAN via SSH or Telnet, the commands are disallowed and the following message appears: % Error : root patch only available on a console port.

Examples

The following example illustrates the use of the **root** command:

```
ncs/admin# root
% Error : root patch password not set
```

Related Commands

ands	Command	Description
	root_enable	Activates the root command.

root_disable

•	To disable the root user restoring admin shell access, use the root_disable command in the EXEC mode.		
Note	For developer use only, not for end users.		
	root_disable		
Syntax Description	This command has no arguments or keywords.		
Command Default	No default behavior or values.		
Command Modes	EXEC		
Usage Guidelin			
Note	This command and the root_enable command can only be used on the locally hard-wired console port via Telnet. If you try to access this port over a LAN via SSH or Telnet, the commands are disallowed and the following message appears: % Error : root patch only available on a console port.		
Examples	The following example illustrates the use of the root_disable command:		
		,	
Related Commands	Command	Description	
	root_enable	Executes the root shell.	

root_enable

To activate the root command, use the root_enable command in the EXEC mode.

Note	For developer use only, not for end users.		
	root_enable		
Syntax Description This command has no arguments or keywords.			
Command Default	No default behavior or values.		
Command Modes	EXEC		
Usage Guidelines	Requires installation of the root_enable application or patch. The root command prompts for the password used with root_enable and puts you in a bash shell with root privileges.		
	There are no defaults for the password.		
	If the password is already set, the	e root_enable command generates the following error message:	
	% Error : root patch passwo: If the password is not set, the roo	rd already set of command generates the following error message:	
	% Error : root patch passwo	rd not set	
Note	This command and the root command can only be used on the locally hard-wired console port via Telnet. If you try to access this port over a LAN via SSH or Telnet, the commands are disallowed and the following message appears: % Error : root patch only available on a console port.		
Examples The following example illustrates the use of the root_enable command:		s the use of the root_enable command:	
	<pre>ncs/admin# root_enable % Error : root patch passwo;</pre>	rd already set	
Related Commands			
	Command	Description	
	root	Executes the root shell.	

show

To show the running system information, use the **show** command in EXEC mode. The **show** commands are used to display the settings and are among the most useful commands.

The commands in Table A-6 require the **show** command to be followed by a keyword; for example, **show application status**. Some **show** commands require an argument or variable after the keyword to function; for example, **show application version**.

For detailed information on all of the show commands, see show Commands.

show keyword

Syntax Description

Table 14: Summary of show Commands

Command(1)	Description	
application (requires keyword)(2)	Displays information about the installed application; for example, status or version.	
backup (requires keyword)	Displays information about the backup.	
cdp (requires keyword)	Displays information about the enabled Cisco Discovery Protocol interfaces.	
clock	Displays the day, date, time, time zone, and year of the system clock.	
сри	Displays CPU information.	
disks	Displays file-system information of the disks.	
interface	Displays statistics for all of the interfaces configured on the Cisco ADE OS.	
logging (requires keyword)	Displays system logging information.	
logins (requires keyword)	Displays login history.	
memory	Displays memory usage by all running processes.	
ntp	Displays the status of the Network Time Protocol (NTP).	
ports	Displays all of the processes listening on the active ports.	
process	Displays information about the active processes of the server.	

Command(1)	Description
repository	Displays the file contents of a specific repository.
(requires keyword)	
restore	Displays restore history on the server.
(requires keyword)	
running-config	Displays the contents of the currently running configuration file on the server.
startup-config	Displays the contents of the startup configuration on the server.
tech-support	Displays system and configuration information that you can provide to the TAC when you report a problem.
terminal	Displays information about the terminal configuration parameter settings for the current terminal line.
timezone	Displays the time zone of the server.
timezones	Displays all of the time zones available for use on the server.
udi	Displays information about the unique device identifier (UDI) of the .
uptime	Displays how long the system you are logged in to has been up and running.
users	Displays information for currently logged in users.
version	Displays information about the installed application version.
<u>12</u>	

1 (1) The commands in this table require that the show command precedes a keyword; for example, show application.

2 (2) Some show commands require an argument or variable after the keyword to function; for example, show application version. This show command displays the version of the application installed on the system (see show application).

Command Default	No default behavior or values.
Command Modes	EXEC
Usage Guidelines	All show commands require at least one keyword to function.
Examples	ncs/admin# show application <name> <description></description></name>

<name> <Description> ncs Cisco Network Control System ncs/admin#

ssh

To start an encrypted session with a remote system, use the ssh command in EXEC mode.

An Admin or Operator (user) can use this command (see Table 3: Command Privileges).

ssh [ip-address | hostname] usernameport[number]version[1|2] delete hostkeyword

Syntax Description	ip-address	IP address of the remote system. Up to 64 alphanumeric characters.
	hostname	Hostname of the remote system. Up to 64 alphanumeric characters.
	username	Username of the user logging in through SSH.
	<pre>port [number]</pre>	(Optional) Indicates the port number of the remote host. From 0 to 65,535. Default 22.
	version [1 2]	(Optional) Indicates the version number. Default 2.
	delete hostkey	Deletes the SSH fingerprint of a specific host.
	word	IPv4 address or hostname of a remote system. Up to 64 alphanumeric characters.
Command Default	Disabled.	
Command Modes	EXEC (Admin or Op	erator).
Usage Guidelines	The ssh command enables a system to make a secure, encrypted connection to another remote system or server. This connection provides functionality similar to that of an outbound Telnet connection except that the connection is encrypted. With authentication and encryption, the SSH client allows for secure communication over an insecure network.	
Examples	ncs/admin# ssh ncs admin@ncs1's passv Last login: Wed Ju ncs1/admin#	
	ncs/admin# ssh del ncs/admin#	lete host ncs

tech dumptcp

To dump a Transmission Control Protocol (TCP) package to the console, use the **tech dumptcp** command in EXEC mode.

tech dumptcp gigabit-ethernet

Syntax Description	gigabit-ethernet Gigabit Ethernet interface number 0 to 1.
Command Default	Disabled.
Command Modes	EXEC
Examples	ncs/admin# tech dumptcp 0
	140816:141088(272) ack 1921 win 14144
	08:26:12.034630 IP NCS.cisco.com.ssh > dhcp-64-102-82-153.cisco.com.2221: P 141088:141248(160)
	ack 1921 win 14144 08:26:12.034635 IP dhcp-64-102-82-153.cisco.com.2221 > NCS.cisco.com.ssh: . ack 139632 win

	1000 packets captured
	1000 packets received by filter
	0 packets dropped by kernel
	ncs/admin#

telnet

To log in to a host that supports Telnet, use the telnet command in operator (user) or EXEC mode.

telnet [ip-address | hostname] port number

Syntax Description	ip-address	IP address of the remote system. Up to 64 alphanumeric characters.
	hostname	Hostname of the remote system. Up to 64 alphanumeric characters.
	port number	(Optional) Indicates the port number of the remote host. From 0 to 65,535.

Command Default No default behavior or values.

Command Modes EXEC

Examples

ncs/admin# **telnet 172.16.0.11 port 23** ncs.cisco.com login: **admin** password: Last login: Mon Jul 2 08:45:24 on ttyS0 ncs/admin#

terminal length

To set the number of lines on the current terminal screen for the current session, use the **terminal length** command in EXEC mode.

terminal length integer

Syntax Description	integer	Number of lines on the screen. Contains between 0 to 511 lines, inclusive. A value of zero (0) disables pausing between screens of output.
Command Default	24 lines.	
Command Modes	EXEC	
Usage Guidelines	The system uses the length	value to determine when to pause during multiple-screen output.
Examples	ncs/admin# terminal le ncs/admin#	ngth 0

terminal session-timeout

To set the inactivity timeout for all sessions, use the terminal session-timeout command in EXEC mode.

terminal session-timeout minutes

Syntax Description		the number of minutes for the inactivity timeout. From 0 to 525,600. Zero disables the timeout.
Command Default	30 minutes.	
Command Modes	EXEC	
Usage Guidelines	Setting the terminal session-tin	neout command to zero (0) results in no timeout being set.
Examples	ncs/admin# terminal session ncs/admin#	-timeout 40
Related Commands	Command	Description
	terminal session-welcome	Sets a welcome message on the system for all users who log in to the

system.

terminal session-welcome

To set a welcome message on the system for all users who log in to the system, use the **terminal session-welcome** command in EXEC mode.

terminal session-welcome string

terminal session-timeout

Syntax Description	string	Welcome message. Up to 2,048 alphanumeric characters.
Command Default	No default behavior or values.	
Command Modes	EXEC	
Usage Guidelines	Specify a message using up to 20	048 characters.
Examples	ncs/admin# terminal session ncs/admin#	-welcome Welcome
Related Commands	Command	Description

Sets the inactivity timeout for all sessions.

terminal terminal-type

To specify the type of terminal connected to the current line for the current session, use the **terminal terminal-type** command in EXEC mode.

terminal terminal-type type

Syntax Description	<i>type</i> Defines the terminal name and type, and permits terminal negotiation by hosts that provide that type of service. Up to 80 alphanumeric characters.
Command Default	VT100.
Command Modes	EXEC
Usage Guidelines	Indicate the terminal type if it is different from the default of VT100.
Examples	ncs/admin# terminal terminal-type vt220 ncs/admin#

traceroute

To discover the routes that packets take when traveling to their destination address, use the **traceroute** command in EXEC mode.

traceroute [ip-address | hostname]

Syntax Description	ip-address	IP address of the remote system. Up to 32 alphanumeric characters.
	hostname	Hostname of the remote system. Up to 32 alphanumeric characters.
Command Default	No default behavior	or values.

Command Modes EXEC

Examples

ncs/admin# traceroute 172.16.0.11
traceroute to 172.16.0.11 (172.16.0.11), 30 hops max, 38 byte packets
1 172.16.0.11 0.067 ms 0.036 ms 0.032 ms

ncs/admin#

undebug

To disable debugging functions, use the **undebug** command in EXEC mode.

undebug {*all* | *application* | *backup-restore* | *cdp* | *config* | *copy* | *icmp* | *locks* | *logging* | *snmp* | *system* | *transfer* | *user* | *utils*}

Syntax Description	all	Disables all debugging.
	application	Application files.
		• <i>all</i> —Disables all application debug output.
		• <i>install</i> —Disables application install debug output.
		• operation—Disables application operation debug output.
		• <i>uninstall</i> —Disables application uninstall debug output.
	backup-restore	Backs up and restores files.
		• <i>all</i> —Disables all debug output for backup-restore.
		• <i>backup</i> —Disables backup debug output for backup-restore.
		• backup-logs—Disables backup-logs debug output for backup-restore.
		• <i>history</i> —Disables history debug output for backup-restore.
		• restore—Disables restore debug output for backup-restore.
	cdp	Cisco Discovery Protocol configuration files.
		• all—Disables all Cisco Discovery Protocol configuration debug output.
		• config—Disables configuration debug output for Cisco Discovery Protocol.
		• <i>infra</i> —Disables infrastructure debug output for Cisco Discovery Protocol.

1

config	Configuration files.
	• <i>all</i> —Disables all configuration debug output.
	• <i>backup</i> —Disables backup configuration debug output.
	• <i>clock</i> —Disables clock configuration debug output.
	• <i>infra</i> —Disables configuration infrastructure debug output.
	• kron—Disables command scheduler configuration debug output.
	• network—Disables network configuration debug output.
	• repository—Disables repository configuration debug output.
	• <i>service</i> —Disables service configuration debug output.
сору	Copy commands.
icmp	ICMP echo response configuration.
	<i>all</i> —Disable all debug output for ICMP echo response configuration. Set level between 0 and 7, with 0 being severe and 7 being all.
locks	Resource locking.
	• all—Disables all resource locking debug output.
	• <i>file</i> —Disables file locking debug output.
logging	Logging configuration files.
	all—Disables all debug output for logging configuration.
snmp	SNMP configuration files.
	all—Disables all debug output for SNMP configuration.
system	System files.
	• all—Disables all system files debug output.
	• <i>id</i> —Disables system ID debug output.
	• <i>info</i> —Disables system info debug output.
	• <i>init</i> —Disables system init debug output.
transfer	File transfer.
user	User management.
	• all—Disables all user management debug output.
	 password-policy—Disables user management debug output for password-policy.

debug

		ties configuration files. -Disables all utilities configuration debug output.
Command Default	No default behavior or values.	
Command Modes	EXEC	
Examples	ncs/admin# undebug all ncs/admin#	
Related Commands	Command	Description

Displays errors or events for command situations.

write

To copy, display, or erase server configurations, use the **write** command with the appropriate argument in EXEC mode.

write {erase | memory | terminal}

Syntax Description	erase	Erases the startup configuration.
	memory	Copies the running configuration to the startup configuration.
	terminal	Copies the running configuration to console.
Command Default	No default behavior of	r values.
Command Modes	EXEC	
Examples	The following is an ex	ample of the write command with the memory keyword:
	ncs/admin# write me Generating configu ncs/admin# The following is an ex	
	ncs/admin# write te	erminal

Cisco Plug and Play Gateway Commands

This section lists the **pnp** commands along with a brief description of their use, command defaults, command modes, command syntax, usage guidelines, command examples, and related commands, where applicable.

Prime Infrastructure Integrated Server Commands

This section lists the **ncs pnp gateway commands** along with a brief description of its use, command defaults, command modes, command syntax, usage guidelines, command examples, and related commands, where applicable.

ncs pnp-gateway

To enable or disable the local Cisco Plug and Play Gateway on the Prime Infrastructure Integrated Server and modify or view the properties of the software image on the Cisco Plug and Play Gateway, use the **ncs pnp-gateway** command in privileged EXEC mode.

ncs pnp-gateway {enable | disable | modify | property}

Syntax Description	enable	Enables the Cisco Plug and Play Gateway.
	disable	Disables the Cisco Plug and Play Gateway.
	modify	Enables the modification of the Cisco Plug and Play Gateway image's properties. The properties that can be modified are: activation timeout value, distribution timeout value, and transfer timeout value.
	property	Enables viewing of the properties pertaining to the software image on the Cisco Plug and Play Gateway.

Command Modes Privileged EXEC

Command History	Release	Modification		
	Cisco Prime Infrastructure 2.0	This command was introduced.		
Examples	The following is sample output from the	e ncs pnp-gateway command:		
	admin# ncs pnp-gateway?			
	disable PNP Gateway Disable Co enable PNP Gateway Enable co modify Modify PnP Gateway pr property Show PnP properties an	nmand operties and variables		
Examples	The following is sample output from the	e ncs pnp-gateway disable command:		
	ncs pnp-gateway disable			
	Disabling Plug and Play Gateway Plug and Play Gateway is successfu server	 lly disabled. Please restart Prime Infrastructure on this		
Examples	The following is a sample output of the ncs pnp-gateway enable	ncs pnp-gateway enable command:		
	Enabling Plug and Play Gateway			

Plug and Play Gateway is successfully enabled. Please restart Prime Infrastructure on this server. **Examples** The following is a sample output of the ncs pnp-gateway modify command: ncs pnp-gateway modify bgl-dt-ncs-vm6-70/ayyanna# ncs pnp-gateway modify image ? activation-timeout Activation timeout for PnP image upgrade job distribution-timeout Distribution timeout for PnP image upgrade job Transfer timeout for PnP image upgrade job transfer-timeout bgl-dt-ncs-vm6-70/ayyanna# ncs pnp-gateway modify image activation-timeout ? <60-1048576> Type the image activation timeout value (seconds) **Examples** The following is a sample output of the **ncs pnp-gateway property image** command: admin# ncs pnp-gateway property image PnP Gateway Image Transfer Timeout = 2400 PnP Gateway Image Distribution Timeout = 2200 PnP Gateway Image Activation Timeout = 1600

Prime Infrastructure PnP Gateway Standalone Server Command

This section lists the **pnp gateway standalone server commands** along with a brief description of their use, command defaults, command modes, command syntax, usage guidelines, command examples, and related commands, where applicable.

pnp backup

	To create a backup of the Cisco Plug and Play optimized EXEC mode.	Gateway configuration, use the pnp backup command in		
	pnp backup			
Command Modes	Privileged EXEC			
Command History	Release	Modification		
	Cisco Prime Infrastructure 1.2	This command was introduced.		
	Cisco Prime Infrastructure 2.0	This command was modified.		
Examples	the <i>/localdisk/ directory</i> on the Linux file system The following is sample output from the pnp b			
Examples				
	admin# pnp backup			
	The backup file created : /localdisk/20130130220403.pnp_backup.tar.gz The following table describes the significant field shown in the display.			
	Table 15: pnp backup Field Description			
	Field	Description		
	20130130220403.pnp_backup.tar.gz	The backup file created in the above example, where		

2013 is the year, 01 is the month, 30 is the date, 22 is the hour, 04 is the minute, and 03 is the second at

which the backup file was created.

pnp modify image

To modify the properties of the Cisco Plug and Play Gateway software image in the Prime Infrastructure Plug and Play Standalone Gateway, use the **pnp modify image** command in privileged EXEC mode.

pnp modify image {activation-timeout | distribution-timeout | transfer-timeout |
transfer-timeout}timeout-value

Syntax Description	activation timeout value	Activation timeout value, in seconds, for the Cisco Plug and Play Gateway software image upgrade job. The range is from 60 to 1048576. The default is 600.
	distribution timeout value	Distribution timeout value, in seconds, for the Cisco Plug and Play Gateway software image upgrade job. The valid range is from 60 to 1048576. The default is 1200.
	transfer timeout value	Transfer timeout value, in seconds, for the Cisco Plug and Play Gateway software image upgrade job. The valid range is from 60 to 1048576. The default is 1200.

Command Modes Privileged EXEC

Command History				
Commanu mistory	Release		Modification	
	Cisco Prime Infrastructure	1.2	This command was introduced.	
	Cisco Prime Infrastructure	2.0	This command was modified.	
Usage Guidelines	• •	ateway does not have to be reading will take effect for the next	started for the timeout value to take effect. The t software image.	
Examples	The following is sample output from the pnp modify image command:			
	admin# pnp modify image	a ?		
	activation-timeout Activation timeout for PnP image upgrade job distribution-timeout Distribution timeout for PnP image upgrade job transfer-timeout Transfer timeout for PnP image upgrade job			
	admin# pnp modify image Done	activation-timeout 1200		
	admin# pnp modify image Done	e distribution-timeout 240	00	

 $\texttt{admin} \texttt{\# pnp modify image transfer-timeout 2200} \\ \texttt{Done}$

pnp modify log-level

To modify the log-level settings of the Cisco Plug and Play Gateway, use the **pnp modify log-level** command in privileged EXEC mode.

The Cisco Plug and Play Gateway supports these log levels: debug, error, fatal, info, trace, and warn.

pnp modify log-level {fatal | error | warn | info | debug | trace}

Syntax Description	fatal	Enchlos the collection of fotal lovel los massa	2 02	
,	fatal Enables the collection of fatal-level log messages.			
	error	Enables the collection of fatal-level and error-	level log messages.	
	warn	Enables the collection of fatal-level, error-level	el, and warn-level log messages.	
	info	Enables the collection of fatal-level, error-level log messages.	el, warn-level, and information-level	
	debug	Enables the collection of fatal-level, error-leved debug-level log messages.	el, warn-level, information-level, and	
	trace	Enables the collection of fatal-level, error-leved debug-level, and trace-level log messages.	el, warn-level, information-level,	
Command Default Command Modes	By default, the Privileged EXE	Cisco Plug and Play Gateway logs the error-level log n	nessages.	
Command History	Release		Modification	
	Cisco Prime In	nfrastructure 1.2	This command was introduced.	
	Cisco Prime In	nfrastructure 2.0	This command was modified.	
Usage Guidelines		ify log-level command can be used to dynamically chan rt the Cisco Plug and Play Gateway, it will reset to the		

Examples The following is sample output from the **pnp modify log-level** command:

admin# pnp modify log-level ?

debug Log level: Debug error Log level: Error fatal Log level: Fatal

info trace warn	e Lo	g level g level g level	l: Tra	ce	
admin# admin# admin# admin# admin#	pnp pnp pnp pnp	modify modify modify modify	log-1 log-1 log-1 log-1	evel evel evel evel	error fatal info trace

pnp restore				
	To restore the configuration settings from an existing backup of the Cisco Plug and Play Gateway, use the pnp restore command in privileged EXEC mode.			
	To force a restore of the Cisco Plug and Play Gateway settings either when the pnp setup command is in operation or another instance of the pnp restore command is already running, use the pnp restore force command in privileged EXEC mode.			
	pnp restore backup file	ename		
	pnp restore force			
Syntax Description	<i>backup filename</i> Name of the Cisco Plug and Play Gateway backup file whose server s must be restored.		teway backup file whose server settings	
	force	Forces a restore of the Cisco Plug an	d Play Gateway settings.	
Command History	Release		Modification	
Command History	Release		Modification	
	Cisco Prime Infrastruct	ure 1.2	This command was introduced.	
	Cisco Prime Infrastruct	ure 2.0	This command was modified.	
Usage Guidelines	there is more than one ba	restore command, the server reads the back ackup file in the <i>/localdisk/ directory</i> , a list of the backup file that is to be used for the backup file that is to be used for the backup file that is to be used for the backup file that is the backup file that backup file that is the backup file that backup file t	of the available backup files is displayed.	
•	e	Play Gateway settings have been restored, ynanges or \mathbf{n} to cancel the restore operation.	you are prompted to commit the changes.	
Note	You must restart the Cisco Plug and Play Gateway for changes to take effect.			
Note	For information on how	to copy files to the local disk, see copy, on	page 51 command.	

Use the **pnp restore force** command when you have to force a restore operation. This condition is normally seen when different instances of the **restore** command is already running or when the **pnp setup** command is in operation. The **pnp restore force** command forces the restore operation using an existing backup file.

Examples The following is a sample output of the **pnp restore** command:

admin# pnp restore

Commit changes and restart (y/n): y

pnp setup

To set up the Cisco Plug and Play Gateway information, use the **pnp setup** command in privileged EXEC mode.

To forcefully execute a setup operation of the Cisco Plug and Play Gateway when other commands are running and the **pnp setup** command cannot be used for setting up the server, use the **pnp setup force** command in privileged EXEC mode.

Note	The pnp setup command can be executed only if Prime Infrastructure and the Cisco Plug and Play Gateway are running on different servers.			
	pnp setup			
	pnp setup force			
Syntax Description	force Executes a setup	operation of the Cisco Plug and Play Gateway forcefully.		
Command Modes	Privileged EXEC			
Command History	Release	Modification		
	Cisco Prime Infrastructure 1.2	This command was introduced.		
	Cisco Prime Infrastructure 2.0	This command was modified.		
Usage Guidelines	The setup.log file is available in the <i>var/K</i>	ickStart/install/ directory.		
Examples	The following is sample output from the pnp setup command:			
	<pre>admin# pnp setup #################################</pre>			
	Automatic download of SSL Certificate is possible if Prime Infrastructure Server is up and running.			
	Automatically download the certificate for server 10.104.105.70 (y/n) [y] $% \left[\left(\frac{1}{2} \right) \right]$			

The maximum number of Event Gateways allowed is '10' for both plain text and ssl combined. The Event Gateway ports 11011 and 11012 are reserved for port automatic allocation. These ports are not counted while taking the maximum number of ports. Each Event Gateway can serves up to a maximum of 1000 devices. Enter number of Event Gateways that will be started with crypto operation: [5] The maximum number of plain text event gateways ports possible is 5. Enter number of Event Gateways that will be started with plaintext operation: [5] The CNS Event command configures how the managed devices should connect to this particular Plug and Play Gateway. The command entered in the following line should match what's configured on the devices WITHOUT the port number and keyword 'encrypt' if cryptographic is enabled. For example, if the following CLI is configured on devices "cns event bgl-dt-ncs-vm64-228 encrypt 11012 keepalive 120 2 reconnect 10", then `encrypt 11012` should be removed and the below line should be entered : "cns event bgl-dt-ncs-vm64-228 keepalive 120 2 reconnect 10" Another example, if this is a backup Plug and Play Gateway and the following CLI is configured on devices "cns event bgl-dt-ncs-vm64-228 11011 source Vlan1 backup", then `11011` should be removed and the below line should be entered : "cns event bgl-dt-ncs-vm64-228 source Vlan1 backup" Unable to enter a correct CLI could cause the managed devices not be able to connect to this Plug and Play Gateway. For details, please refer to Installation and Configuration Guide. Enter CNS Event command: [cns event bgl-dt-ncs-vm64-228 keepalive 120 2 reconnect 10] Commit changes (y/n): y Attempting to disable the local Plug and Play Gateway in Prime Infrastructure Machine 10.104.105.70 Enter the username to login to the Prime Infrastructure Machine: [admin] ayyanna Enter the password to login to the Prime Infrastructure Machine: Operation Successful. Plug and Play Gateway is successfully disabled. Setup is in progress..... Stop Plug and Play Gateway server Done. Plug and Play Gateway setup completed Start Plug and Play Gateway server.... Done. Plug and Play Gateway server started! ***** Disabling the local Plug and Play Gateway on Prime Infrastructure server is successful. Please restart the Prime Infrastructure server. ***** bgl-dt-ncs-vm64-228/admin# Note For more information on how to copy files from the local disk, see copy, on page 51 command.

Command Reference Guide for Cisco Prime Infrastructure, Release 1.2

pnp setup advanced

	To change port level settings, use the pnp setup advanced command in the privileged EXEC mode. To forcefully execute a setup operation of the Cisco Plug and Play Gateway when other commands are running and the pnp setup advanced command cannot be used for setting up the server, use the pnp setup advanced force command in privileged EXEC mode.			
	pnp setup advanced			
	pnp setup advanced forc	e		
Syntax Description	force	Executes a setup operat	ion of the Cisco Plug and Play Gate	eway forcefully.
Command Modes	Privileged EXEC (#)			
Command History	Release		Modification	
	Cisco Prime Infrastructur	re 2.0	This command was introduced.	
Usage Guidelines Examples		output of the pnp setup	advanced command:	
	Enter Plug and Play Gateway Setup (setup log /var/KickStart/install/setup.log) For detail information about the parameters in this setup, refer to Plug and Play Gateway Admin Guide. ####################################			
	Enter the fully qualif Enter Prime Infrastruc Enter Prime Infrastruc Enable self certificat	Fied host name of Plu cture IP Address: [10 cture Event Port Para ce for server bgl-dt-		
		nload of SSL Certific ructure Server is up		
		SL encryption to secu	server 10.104.105.70 (y/n) [re Plug and Play Gateway Web 43]	
		text operation and Play Gateway and	device(s) increases security :	risk.
	Enable clear text oper Enter Tomcat internal Enter Tomcat shutdown	port number: [8009]	CNS Agent and Plug and Play (Gateway (y/n) [y]

The maximum number of Event Gateways allowed is '10' for both plain text and ssl combined. The Event Gateway ports 11011 and 11012 are reserved for port automatic allocation. These ports are not counted while taking the maximum number of ports.

Each Event Gateway can serves up to a maximum of 1000 devices.

Enter number of Event Gateways that will be started with crypto operation: [5] Enter port number for http web access: [80]

The maximum number of plain text event gateways ports possible is 5.

Enter number of Event Gateways that will be started with plaintext operation: [5]

The CNS Event command configures how the managed devices should connect to this particular Plug and Play Gateway. The command entered in the following

line should match what's configured on the devices WITHOUT the port number and keyword 'encrypt' if cryptographic is enabled.

For example, if the following CLI is configured on devices "cns event bgl-dt-ncs-vm64-228 encrypt 11012 keepalive 120 2 reconnect 10", then `encrypt 11012` should be removed and the below line should be entered : "cns event bgl-dt-ncs-vm64-228 keepalive 120 2 reconnect 10"

Another example, if this is a backup Plug and Play Gateway and the following CLI

is

configured on devices
"cns event bgl-dt-ncs-vm64-228 11011 source Vlan1 backup", then `11011`
should be removed and the below line should be entered :
"cns event bgl-dt-ncs-vm64-228 source Vlan1 backup"

Unable to enter a correct CLI could cause the managed devices not be able to connect to this Plug and Play Gateway. For details, please refer to Installation and Configuration Guide.

Enter CNS Event command: [cns event bgl-dt-ncs-vm64-228 keepalive 120 2 reconnect 10]

Enter IP address for CNS Gateway to listen to. Enter 1 to have CNSGateway listens to all IP addresses. IP addresses:[1] Enter Plug and Play Gateway Event Port Parameter: [62616] Enter base directory for Plug and Play Gateway log : [/var/log]

Data directory contains Template and Image files

Enter data directory for Plug and Play Gateway : [/var/KickStart]

Commit changes (y/n): y Attempting to disable the local Plug and Play Gateway in Prime Infrastructure Machine 10.104.105.70 Enter the username to login to the Prime Infrastructure Machine: [admin] ayyanna Enter the password to login to the Prime Infrastructure Machine: Plug and Play Gateway is already disabled Setup is in progress..... Stop Plug and Play Gateway server Done. Plug and Play Gateway setup completed Start Plug and Play Gateway server.... Done. Plug and Play Gateway server started! admin#

To start the Cisco Plug and Play Gateway and display the status me use the pnp start command in privileged EXEC mode.	essages in detail during the startup process,
pnp start	
Privileged EXEC	
Release	Modification
Cisco Prime Infrastructure 1.2	This command was introduced.
Cisco Prime Infrastructure 2.0	This command was modified.
Before you execute the pnp start command, stop the Cisco Plug on stopping the Cisco Plug and Play gateway, refer to the section p	
The following is sample output from the php start command:	
admin# pnp start	
<pre>httpd is stopped Monitoring process started. Plug and Play Gateway start Started Event Manager process Starting tomcat Starting httpd: Starting CNS Gateway: Start of Plug and Play Gateway Completed!! admin#</pre>	[OK]
	<pre>use the pnp start command in privileged EXEC mode. pnp start Privileged EXEC Release Cisco Prime Infrastructure 1.2 Cisco Prime Infrastructure 2.0 Before you execute the pnp start command, stop the Cisco Plug on stopping the Cisco Plug and Play gateway, refer to the section p The following is sample output from the pnp start command: admin# pnp start httpd is stopped Monitoring process started. Plug and Play Gateway start Starting the command start completed!! Starting CNS Gateway: Start of Plug and Play Gateway Completed!!</pre>
pnp status

To determine the status of the individual tasks and services that are currently running on the Cisco Plug and Play Gateway, use the **pnpstatus** command in privileged EXEC mode.

pnp status

Command Modes Privileged EXEC

Command History

Release	Modification
Cisco Prime Infrastructure 1.2	This command was introduced.
Cisco Prime Infrastructure 2.0	This command was modified.

Usage Guidelines This command can also be used to determine whether the tasks that are running on the Cisco Plug and Play Gateway are secure or nonsecure, and whether the services are up and running or down, along with their port and PID number, where applicable.

Examples

The following is sample output from the **pnp status** command:

admin# pnp status SERVICE	MODE	STATUS ADDITIONAL INFO
System		UP
Event Messaging Bus CNS Gateway Dispatcher CNS Gateway CNS Gateway	PLAIN TEXT SSL SSL	<pre> UP pid: 3839 UP pid: 4216, port: 11011 UP pid: 4245, port: 11013 UP pid: 4279, port: 11015 UP pid: 4279, port: 11015 UP pid: 4313, port: 11017 UP pid: 4404, port: 11019 UP pid: 4442, port: 11014 UP pid: 4645, port: 11014 UP pid: 4645, port: 11014 UP pid: 4645, port: 11016 UP pid: 4881, port: 11016 UP pid: 4921, port: 11020 UP pid: 4955, port: 11022 UP UP UP UP </pre>
Image Web Service Config Web Service Resource Web Service Prime Infrastructure Broker	PLAIN TEXT PLAIN TEXT PLAIN TEXT SSL	UP UP UP UP port: 61617,connection:1

pnp stop

To stop the Cisco Plug and Play Gateway and display detailed messages during the stop process, use the **pnp stop** command in privileged EXEC mode.

pnp stop

Command Modes Privileged EXEC

Command History

Release	Modification
Cisco Prime Infrastructure 1.2	This command was introduced.
Cisco Prime Infrastructure 2.0	This command was modified.

Examples

The following is sample output from the **pnp stop** command:

admin# pnp stop

```
start status stop
bgl-dt-ncs-vm64-228/admin# pnp stop
Plug and Play Gateway is being shut down.... Please wait!!!
Stopping monitoring process ...
Stopping CNS Gateway Processes:
Stopping tomcat...
Stopping httpd:
OK [ OK ]
Stopping Event Manager Processes :
Stop of Plug and Play Gateway Completed!!
admin#
```

pnp tech

To view the environment variables of the Cisco Plug and Play Gateway process, use the **pnp tech** command in privileged EXEC mode.

pnp tech

Command Modes Privileged EXEC

Command History

Release	Modification
Cisco Prime Infrastructure 1.2	This command was introduced.
Cisco Prime Infrastructure 2.0	This command was modified.

Examples

pnp tech log			
	To create a system-monitoring log file for the Cisco Plug and Play Gateway, use the pnp tech log comman in privileged EXEC mode.		
	pnp tech log		
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	Cisco Prime Infrastructure 1.2	This command was introduced.	
	Cisco Prime Infrastructure 2.0	This command was modified.	
Usage Guidelines	The pnp tech log command creates a system-monitoring .pnp_systemmonitor.tar.gz.	g log file in a compressed tar format with the extension	
Examples	The following is sample output from the pnp tech log	command:	
	admin# pnp tech log		
	The System Status file created : /localdisk/20 admin#	121003032209.pnp_systemmonitor.tar.gz	
Note	For more information on how to copy files from the lo	cal disk, see copy, on page 51 command.	

show Commands

This section lists **show** commands. Each command includes a brief description of its use, any command defaults, command modes, usage guidelines, an example of the command syntax and any related commands.

show application

To show application information of the installed application packages on the system, use the **show application** command in EXEC mode.

show application [status | version [app_name]]

Syntax Description	statusDisplays the status of the installed application.	
	Displays the application version for an installed application—the .	
	app_name	Name of the installed application.

Table 16: Output Modifier Variables for Count or Last

1	Output modifier variables:	
	• begin—Matched pattern. Up to 80 alphanumeric characters.	
	• <i>count</i> —Counts the number of lines in the output. Add number after the word <i>count</i> .	
	—Output modifier variables.	
	• end—Ends with line that matches. Up to 80 alphanumeric characters.	
	• exclude—Excludes lines that match. Up to 80 alphanumeric characters.	
	• <i>include</i> —Includes lines that match. Up to 80 alphanumeric characters.	
	• <i>last</i> —Displays last few lines of output. Add number after the word <i>last</i> . Up to 80 lines to display. Default 10.	
	—Output modifier variables (see Table A-8).	

Command Default No default behavior or values.

Command Modes EXEC

Examples Example 1

ncs/admin# show application <name> <Description> ncs Cisco Network Control System ncs/admin#

Example 2

ncs/admin# show application version NCS

```
Cisco Network Control System
                                                                  _____
Version : 1.0.2.051
Build Date : Mon Aug 2 00:34:25 2010
Install Date : Thu Aug 5 17:48:49 2010
```

ncs/admin# Example 3

ncs/admin# show application status NCS

```
NCS Database listener is running, PID: 21096
NCS Database is running, number of processes: 27
NCS Application Server is running, PID: 21432
NCS M&T Session Database is running, PID: 21365
NCS M&T Log Collector is running, PID: 21468
NCS M&T Log Processor is running, PID: 21494
NCS M&T Alert Process is running, PID: 21524
```

ncs/admin#

	Description	
application install	Installs an application bundle.	
application remove	Removes or uninstalls an application.	
application start	Starts or enables an application.	
application stop	Stops or disables an application.	
application upgrade	Upgrades an application bundle.	

show backup history

To display the backup history of the system, use the **show backup history** command in EXEC mode.

show backup history

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values.

Command Modes EXEC

Examples Example 1

ncs/admin# show backup history
Wed Aug 18 12:55:21 UTC 2010: backup logs logs-0718.tar.gz to repository fileserver007:
success
Wed Aug 18 12:55:53 UTC 2010: backup full-0718.tar.gpg to repository fileserver007: success
ncs/admin#
Example 2

ncs/admin# show backup history
backup history is empty
ncs/admin#

Command	Description
backup	Performs a backup (and Cisco ADE OS) and places the backup in a repository.
restore	Restores from backup the file contents of a specific repository.
repository	Enters the repository submode for configuration of backups.
show repository	Displays the available backup files located on a specific repository.

show cdp

To display information about the enabled Cisco Discovery Protocol interfaces, use the **show cdp** command in EXEC mode.

show cdp {all | neighbors}

Syntax Description	all	All Shows all of the enabled Cisco Discovery Protocol interfaces.		
neighbors		Shows the Cisco Discovery Protocol neighbors.		

Command Default No default behavior or values.

```
Command Modes EXEC
```

Examples Example 1

```
ncs/admin# show cdp all
CDP protocol is enabled ...
broadcasting interval is every 60 seconds.
time-to-live of cdp packets is 180 seconds.
CDP is enabled on port GigabitEthernet0.
ncs/admin#
```

Example 2

	<pre>/admin# show cdp neighbo Neighbor : 000c297840e5 Local Interface Device Type Port Address</pre>	::	GigabitEthernet0
CDP	Neighbor : isexp-esw5 Local Interface Device Type Port Address	: :	GigabitEthernet0 cisco WS-C3560E-24TD GigabitEthernet0/5 172.23.90.45
CDP	Neighbor : 000c29e29926 Local Interface Device Type Port Address	: : :	
CDP	21	: : :	GigabitEthernet0 L-NCS-1.0-50 eth0 172.23.90.111

ncs/admin#

Command	Description
cdp holdtime	Specifies the length of time that the receiving device should hold a Cisco Discovery Protocol packet from your router before discarding it.
cdp run	Enables the Cisco Discovery Protocol.
cdp timer	Specifies how often the server sends Cisco Discovery Protocol updates.

show clock

To display the day, month, date, time, time zone, and year of the system software clock, use the **show clock** command in EXEC mode.

show clock

Syntax Description This command has no arguments or keywords.

ncs/admin# show clock Fri Aug 6 10:46:39 UTC 2010

Command Default No default behavior or values.

ncs/admin#

Command Modes EXEC

Examples

Note The **show clock** output in the previous example includes Coordinated Universal Time (UTC) or Greenwich Mean Time (GMT), Great Britain, or Zulu time (see Tables Table 19: Common Time Zones, Table 20: Australia Time Zones, and Table 21: Asia Time Zones on pages A-84 and A-85 for sample time zones).

Related Commands	Command	Description
	clock	Sets the system clock for display purposes.

show cpu

To display CPU information, use the **show cpu** command in EXEC mode. **show cpu** [statistics] [|] [|]

Syntax Description	statistics	Displays CPU statistics.
		Output modifier variables:
		• begin—Matched pattern. Up to 80 alphanumeric characters.
		• <i>count</i> —Counts the number of lines in the output. Add number after the word <i>count</i> .
		—Output modifier variables (see Table A-9).
		• end—Ends with line that matches. Up to 80 alphanumeric characters.
		• exclude—Excludes lines that match. Up to 80 alphanumeric characters.
		• <i>include</i> —Includes lines that match. Up to 80 alphanumeric characters.
		• <i>last</i> —Displays last few lines of output. Add number after the word <i>last</i> . Up to 80 lines to display. Default 10.
		—Output modifier variables (see Table A-9).

Command Default	No default behavior or values.
Command Modes	EXEC
Examples	Example 1
	ncs/admin# show cpu
	processor : 0 model : Intel(R) Xeon(R) CPU E5320 @ 1.86GHz speed(MHz): 1861.914 cache size: 4096 KB
	ncs/admin# Example 2
	<pre>ncs/admin# show cpu statistics user time: 265175 kernel time: 166835 idle time: 5356204 i/o wait time: 162676 irq time: 4055 ncs/admin#</pre>

Command	Description
show disks	Displays the system information of all disks.
show memory	Displays the amount of system memory that each system process uses.

show disks

To display the disks file-system information, use the **show disks** command in EXEC mode. **show disks** [|] [|]

Syntax Description	Ou	tput modifier variables:
		• begin—Matched pattern. Up to 80 alphanumeric characters.
		• <i>count</i> —Counts the number of lines in the output. Add number after the word <i>count</i> .
		-Output modifier variables (see Table A-10).
		• end—Ends with line that matches. Up to 80 alphanumeric characters.
		• <i>exclude</i> —Excludes lines that match. Up to 80 alphanumeric characters.
		• <i>include</i> —Includes lines that match. Up to 80 alphanumeric characters.
		• <i>last</i> —Displays last few lines of output. Add number after the word <i>last</i> . Up to 80 lines to display. Default 10.
		-Output modifier variables (see Table A-10).
Command Modes	EXEC	
Command Modes Usage Guidelines		
	Only platforms that have a us	k file system support the show disks command.
Examples	ncs/admin# show disks	
	temp. space 2% used (1782) disk: 3% used (143280 of 2	
	Internal filesystems: all internal filesystem	s have sufficient free space
	ncs/admin#	
Deleted Common de		
Related Commands	Command	Description

ıds	Command	Description
	show cpu	Displays CPU information.
	show memory	Displays the amount of system memory that each system process uses.

show icmp-status

To display the Internet Control Message Protocol echo response configuration information, use the **show icmp_status** command in EXEC mode.

show icmp_status {> file | |}

Syntax Description	>	Output direction.
	file	Name of file to redirect standard output (stdout).
		Output modifier commands:
		• begin—Matched pattern. Up to 80 alphanumeric characters.
		• <i>count</i> —Counts the number of lines in the output. Add number after the word count.
		° —Output modifier commands (see Table A-11).
		• end—Ends with line that matches. Up to 80 alphanumeric characters.
		• exclude—Excludes lines that match. Up to 80 alphanumeric characters.
		• <i>include</i> —Includes lines that match. Up to 80 alphanumeric characters.
		• last—Displays last few lines of output. Add number after the word last. Up to 80 lines to display. Default 10.
		° —Output modifier commands (see Table A-11).
Command Default	No default behavior o	or values.
Command Modes	EXEC	
Examples	Example 1	
	ncs/admin# show ic icmp echo response ncs/admin# Example 2	
	ncs/admin# show ic icmp echo response ncs/admin#	

Command	Description
icmp echo	Configures the Internet Control Message Protocol (ICMP) echo requests.

show interface

To display the usability status of interfaces configured for IP, use the **show interface** command in EXEC mode.

show interface [GigabitEthernet] |

Syntax Description	GigabitEthernet	Shows the Gigabit Ethernet interface. Either 0 or 1.
		Output modifier variables:
		• begin—Matched pattern. Up to 80 alphanumeric characters.
		• <i>count</i> —Counts the number of lines in the interface. Add number after the word <i>count</i> .
		• end—Ends with line that matches. Up to 80 alphanumeric characters.
		• exclude—Excludse lines that match. Up to 80 alphanumeric characters.
		• <i>include</i> —Includes lines that match. Up to 80 alphanumeric characters.
		• <i>last</i> —Displays last few lines of output. Add number after the word <i>last</i> . Up to 80 lines to display. Default 10.
Command Default	No default behavior or	values.
Command Modes	EXEC	
Usage Guidelines	The first internet addres you need to have IPv6 I link local address that do	GigabitEthernet 0 output, you can find that the interface has three IPv6 addresses. Is (starting with 3ffe) is the result of using stateless autoconfiguration. For this to work, route advertisement enabled on that subnet. The next address (starting with fe80) is a oes not have any scope outside the host. You always see a link local address regardless irration or DHCPv6 configuration. The last address (starting with 2001) is the result DHCP server.
Examples	Example 1	
	inet addr inet6 addr UP BROADCZ RX packets TX packets collisions RX bytes:6	erface D:Ethernet HWaddr 00:0C:29:6A:88:C4 :172.23.90.113 Bcast:172.23.90.255 Mask:255.255.255.0 c: fe80::20c:29ff:fe6a:88c4/64 Scope:Link AST RUNNING MULTICAST MTU:1500 Metric:1 s:48536 errors:0 dropped:0 overruns:0 frame:0 s:14152 errors:0 dropped:0 overruns:0 carrier:0 s:0 txqueuelen:1000 6507290 (6.2 MiB) TX bytes:12443568 (11.8 MiB) :59 Base address:0x2000

```

Command	Description
interface	Configures an interface type and enters the interface configuration submode.
ipv6 address autoconfig	Enables IPv6 stateless autoconfiguration on an interface.
ipv6 address dhcp	Enables IPv6 address DHCP on an interface.

show inventory

To display information about the hardware inventory, including the appliance model and serial number, use the **show inventory** command in EXEC mode.

show inventory |

Syntax Description	Output modifier variables:
	• <i>begin</i> —Matched pattern. Up to 80 alphanumeric characters.
	• <i>count</i> —Counts the number of lines in the interface. Add number after the word <i>count</i> .
	• end—Ends with line that matches. Up to 80 alphanumeric characters.
	• exclude—Excludse lines that match. Up to 80 alphanumeric characters.
	• <i>include</i> —Includes lines that match. Up to 80 alphanumeric characters.
	• <i>last</i> —Displays last few lines of output. Add number after the word <i>last</i> . Up to 80 lines to display. Default 10.
Command Default	No default behavior or values.
Command Modes	EXEC
Examples	ncs/admin# show inventory
	<pre>NAME: "L-NCS-1.0-50 chassis", DESCR: "L-NCS-1.0-50 chassis" PID: L-NCS-1.0-50 , VID: V01 , SN: H8JESGOFHGG Total RAM Memory: 1035164 kB CPU Core Count: 1 CPU 0: Model Info: Intel(R) Xeon(R) CPU E5320 @ 1.86GHz Hard Disk Count(*): 1 Disk 0: Device Name: /dev/sda Disk 0: Geometry: 255 heads 63 sectors/track 7832 cylinders NIC Count: 1 NIC 0: Device Name: eth0 NIC 0: HW Address: 00:0C:29:6A:88:C4 NIC 0: Driver Descr: eth0: registered as PCnet/PCI II 79C970A (*) Hard Disk Count may be Logical. ncs/admin#</pre>

show logging

To display the state of system logging (syslog) and the contents of the standard system logging buffer, use the **show logging** command in EXEC mode.

show logging {application [application-name]} {internal} {system} |

Syntax Description	application	Displays application logs.
	application-name	Application name. Up to 255 alphanumeric characters.
		• <i>tail</i> —Tail system syslog messages.
		• count—Tail last count messages. From 0 to 4,294,967,295.
		-Output modifier variables (see below).
	internal	Displays the syslogs configuration.
	system	Displays the system syslogs.
		Output modifier variables:
		• begin—Matched pattern. Up to 80 alphanumeric characters.
		• <i>count</i> —Counts the number of lines in the interface. Add number after the word <i>count</i> .
		• end—Ends with line that matches. Up to 80 alphanumeric characters.
		• exclude—Excludes lines that match. Up to 80 alphanumeric characters.
		• <i>include</i> —Includes lines that match. Up to 80 alphanumeric characters.
		• <i>last</i> —Displays last few lines of output. Add number after the word <i>last</i> . Up to 80 lines to display. Default 10.

Command Default	No default behavior or values.
Command Modes	EXEC
Usage Guidelines	This command displays the state of syslog error and event logging, including host addresses, and for which, logging destinations (console, monitor, buffer, or host) logging is enabled.
Examples	Example 1
	ncs/admin# show logging system

ADEOS Platform log: _____ Aug 5 10:44:32 localhost debugd[1943]: [16618]: config:network: main.c[252] [setup]: Setup is complete Aug 5 10:45:02 localhost debugd[1943]: [17291]: application:install cars install.c[242] [setup]: Install initiated with bundle - ncs.tar.gz, - SystemDefaultPkgRepos repo · Aug 5 10:45:02 localhost debugd[1943]: [17291]: application:install cars_install.c[256] [setup]: Stage area - /storeddata/Installing/.1281030 302 5 10:45:02 localhost debugd[1943]: [17291]: application:install cars install.c[260] Auq [setup]: Getting bundle to local machine Aug 5 10:45:03 localhost debugd[1943]: [17291]: transfer: cars xfer.c[58] [setup]: local copy in of ncs.tar.gz requested Aug 5 10:45:46 localhost debugd[1943]: [17291]: application:install cars install.c[269] [setup]: Got bundle at - /storeddata/Installing/.1281 030302/ncs.tar.gz Aug 5 10:45:46 localhost debugd[1943]: [17291]: application:install cars install.c[279] [setup]: Unbundling package ncs.tar.gz Aug 5 10:47:06 localhost debugd[1943]: [17291]: application:install cars install.c[291] [setup]: Unbundling done. Example 3

ncs/admin# show logging internal

log server: localhost Global loglevel: 6 Status: Disabled ncs/admin#

show logins

To display the state of system logins, use the show logins command in EXEC mode. show logins cli **Syntax Description** Lists the cli login history. cli **Command Default** No default behavior or values. **Command Modes** EXEC **Usage Guidelines** Requires the cli keyword; otherwise, an error occurs. Examples ncs/admin# show logins cli 6 09:45 pts/0 10.77.137.60 Fri Aug admin still logged in pts/0 . Fri Aug 10.77.137.60 6 08:56 - 09:30 (00:33) admin pts/0 10.77.137.60 6 07:17 - 08:43 (01:26) admin Fri Aug system boot 2.6.18-164.el5PA Thu Aug reboot 5 18:17 (17:49) admin tty1 Thu Aug 5 18:15 - down (00:00)system boot 2.6.18-164.el5PA Thu Aug reboot 5 18:09 (00:06)5 17:43 - 18:07 setup Thu Aug (00:24)tty1 system boot 2.6.18-164.el5PA Thu Aug 5 16:05 reboot (02:02) wtmp begins Thu Aug 5 16:05:36 2010 ncs/admin#

show memory

To display the memory usage of all of the running processes, use the **show memory** command in EXEC mode.

show memory

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values.

Command Modes EXEC

Examples

S			
	ncs/admin# show	memory	
	total memory:	1035164	kВ
	free memory:	27128	kВ
	cached:	358888	kВ
	swap-cached:	142164	kВ

ncs/admin#

show ntp

To show the status of the NTP associations, use the show ntp command in EXEC mode.

show ntp

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values.

Command Modes EXEC

Examples

ncs/admin# show ntp
Primary NTP : cd-ncs-ntp.cisco.com

synchronised to NTP server (10.56.60.29) at stratum 3 time correct to within 99 ms polling server every 1024 s

remote	refid	st	t v	when	poll	reach	delay	offset	jitter
127.127.1.0 *10.56.60.29	.LOCL. 64.103.34.15	± 0	-	00	01	0.1.1	0.000 270.657	0.000	0.001 14.345

Warning: Output results may conflict during periods of changing synchronization. ncs/admin# ncs/admin# show ntp % no NTP servers configured ncs/admin#

Command	Description
ntp server	Allows synchronization of the software clock by the NTP server for the system.

show ports

To display information about all of the processes listening on active ports, use the **show ports** command in EXEC mode.

show ports [|] [|]

Syntax Description	Output modifier variables:
	• begin—Matched pattern. Up to 80 alphanumeric characters.
	• <i>count</i> —Counts the number of lines in the interface. Add number after the word <i>count</i> .
	—Output modifier variables (see Table A-12).
	• end—Ends with line that matches. Up to 80 alphanumeric characters.
	• exclude—Excludes lines that match. Up to 80 alphanumeric characters.
	• <i>include</i> —Includes lines that match. Up to 80 alphanumeric characters.
	• <i>last</i> —Displays last few lines of output. Add number after the word <i>last</i> . Up to 80 lines to display. Default 10.
	—Output modifier variables (see Table A-12).

Command Default	No default behavior or values.
Command Modes	EXEC
Usage Guidelines	When you run the show ports command, the port must have an associated active session.
Examples	<pre>ncs/admin# show ports Process : timestensubd (21372) tcp: 127.0.0.1:11298 Process : timestenorad (21609) tcp: 127.0.0.1:51715 udp: ::1:28314, ::1:59055, ::1:45113, ::1:49082, ::1:64737, ::1:62570, ::1:19577, ::1:29821 Process : ttcserver (21382) tcp: 127.0.0.1:16612, 0.0.0.0:53385 Process : timestenrepd (21579) tcp: 127.0.0.1:62504, 0.0.0.0:18047 udp: ::1:51436 Process : timestend (21365) tcp: 0.0.0.0:53384 Process : timestend (2387) tcp: 0.0.0.0:873 udp: 0.0.0.0:873</pre>

show process

To display information about active processes, use the **show process** command in the EXEC mode. **show process**

Syntax Description	(Optional) Output modifier variables:
	• <i>begin</i> —Matched pattern. Up to 80 alphanumeric characters.
	• <i>count</i> —Counst the number of lines in the interface. Add number after the word <i>count</i> .
	• end—Ends with line that matches. Up to 80 alphanumeric characters.
	• exclude—Excludes lines that match. Up to 80 alphanumeric characters.
	• <i>include</i> —Includes lines that match. Up to 80 alphanumeric characters.
	• <i>last</i> —Displays last few lines of output. Add number after the word <i>last</i> . Up to 80 lines to display. Default 10.
Command Default	No default behavior or values.
Command Modes	EXEC

Examples	
Exampleo	ncs/admin# show process USER PID TIME TT COMMAND

Table 17: Show Process Field Descriptions

Field	Description
USER	Logged-in user.
PID	Process ID.
TIME	The time that the command was last used.
TT	Terminal that controls the process.
COMMAND	Type of process or command used.

show repository

To display the file contents of the repository, use the **show repository** command in EXEC mode. **show repository** repository-name

 Syntax Description
 repository-name
 Name of the repository whose contents you want to view. Up to 30 alphanumeric characters.

Command Default No default behavior or values.

Command Modes EXEC

Examples

ncs/admin# **show repository myrepository** back1.tar.gpg back2.tar.gpg ncs/admin#

Command	Description
backup	Performs a backup (and Cisco ADE OS) and places the backup in a repository.
restore	Restores from backup the file contents of a specific repository.
repository	Enters the repository submode for configuration of backups.
show backup history	Displays the backup history of the system.

show restore

To display the restore history, use the **show restore** command in EXEC mode. **show restore** {**history**}

Syntax Description	history Displays the restore history.
Command Default	No default behavior or values.
Command Modes	EXEC
Examples	Example 1 ncs/admin# show restore history ncs/admin# Example 2 ncs/admin# show restore history restore history is empty ncs/admin#

Command	Description
backup	Performs a backup (and Cisco ADE OS) and places the backup in a repository.
restore	Restores from backup the file contents of a specific repository.
repository	Enters the repository submode for configuration of backups.
show backup history	Displays the backup history of the system.

show running-config

To display the contents of the currently running configuration file or the configuration, use the **show running-config** command in EXEC mode.

showrunning-config

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** The show running-config command displays all of the configuration information.

```
Command Modes EXEC
```

Examples

```
ncs/admin# show running-config
Generating configuration...
hostname ncs
ip domain-name cisco.com
interface GigabitEthernet 0
  ip address 172.23.90.113 255.255.255.0
  ipv6 address autoconfig

Command	Description	
configure	Enters configuration mode.	
show startup-config	Displays the contents of the startup configuration file or the configuration.	

show startup-config

To display the contents of the startup configuration file or the configuration, use the **show startup-config** command in EXEC mode.

showstartup-config

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** The show startup-config command displays all of the startup configuration information.

```
Command Modes EXEC
```

Examples

```
ncs/admin# show startup-config
hostname ncs
ip domain-name cisco.com
interface GigabitEthernet 0
  ip address 172.23.90.113 255.255.255.0

cdp run GigabitEthernet 0
icmp echo on
ncs/admin#
```

Command	Description	
configure	Enters configuration mode.	
show running-config	Displays the contents of the currently running configuration file or the configuration.	

show tech-support

To display technical support information, including email, use the **show tech-support** command in EXEC mode.

show tech-support file [word]

Syntax Description	file Saves any technical support data as a file in the local disk.						
	word Filename to save. Up to 80 alphanumeric characters.						
Command Default	Passwords and other security information do not appear in the output.						
Command Modes	EXEC						
Usage Guidelines	The show tech-support command is useful for collecting a large amount of information about your server for troubleshooting purposes. You can then provide output to technical support representatives when reporting a problem.						
Examples	ncs/admin# show tech-support ####################################						

	Checking dmidecode Serial Number(s)						
	None VMware-56 4d 14 cb 54 3d 44 5d-49 ee c4 ad a5 6a 88 c4

ncs/admin#

Command	Description		
show interface	Displays the usability status of the interfaces.		
show process	Displays information about active processes.		
show running-config	Displays the contents of the current running configuration.		

show terminal

To obtain information about the terminal configuration parameter settings, use the **show terminal** command in EXEC mode.

show terminal

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values.

Command Modes EXEC

Examples

ncs/admin# show terminal TTY: /dev/pts/0 Type: "vt100" Length: 27 lines, Width: 80 columns Session Timeout: 30 minutes ncs/admin# show terminal, on page 174 describes the fields of the show terminal output.

Table 18: Show Terminal Field Descriptions

Field	Description		
TTY: /dev/pts/0	Displays standard output to type of terminal.		
Type: "vt100"	Type of current terminal used.		
Length: 24 lines	Length of the terminal display.		
Width: 80 columns	Width of the terminal display, in character columns.		
Session Timeout: 30 minutes	Length of time, in minutes, for a session, after which the connection closes.		

show timezone

To display the time zone set on the system, use the **show timezone** command in EXEC mode.

show timezone

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values.

Command Modes EXEC

Examples

ncs/admin# show timezone
UTC
ncs/admin#

Command	Description	
clock timezone	Sets the time zone on the system.	
show timezones	Displays the time zones available on the system.	

show timezo	1162			
	To obtain a list of time zones from which you can select, use the show timezones command in EXEC mode.			
	show timezones			
Syntax Description	This command has no arguments or keywords.			
Command Default	No default behavior or values.			
Command Modes	EXEC			
Usage Guidelines	See the clock timezone command, for examples of the time zones available for the server.			
Examples	<pre>ncs/admin# show timezones Africa/Blantyre Africa/Dar_es_Salaam Africa/Dakar Africa/Asmara Africa/Asmara Africa/Asmara Africa/Asmara Africa/Accra Africa/Accra Africa/Tunis Africa/Tunis Africa/Tunis Africa/Tunis Africa/Tunis Africa/Johannesburg Africa/Johannesburg Africa/Johannesburg Africa/Johannesburg Africa/Johannesburg Africa/Johannesburg Africa/Johannesburg Africa/Johannesburg Africa/Bayubura Africa/Bayubura Africa/Bayubura Africa/Bayubura Africa/Bayubura Africa/Bayubura Africa/Bajul Africa/Bajul Africa/Bayubura Africa/Bayubura Africa/Bayubura Africa/Bayubura Africa/Bayubura Africa/Bayubura Africa/Bayubura Africa/Bayubura Africa/Bayubura Africa/Bayubura Africa/Bayubura Africa/Bayubura Africa/Bayubura Africa/Bayubura Africa/Bayubura Africa/Bayuba Africa/Bababa Africa/Bababa Africa/Bamako Africa/Freetown More-</pre>			

ncs/admin#

(press Spacebar to continue)

Command	Description	
show timezone	Displays the time zone set on the system.	
clock timezone	Sets the time zone on the system.	

show udi

To display information about the UDI of the Cisco ISE 3315 appliance, use the **show udi** command in EXEC mode.

show udi

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values.

Command Modes EXEC

Examples Example 1

ncs/admin# **show udi** SPID: L-NCS-1.0-50 VPID: V01 Serial: LAB12345678

ncs/admin#

The following output appears when you run the show udi command on VM ware servers.

Example 2

ncs/admin# **show udi** SPID: L-NCS-1.0-50 VPID: V01 Serial: 5C79C84ML9H

ncs/admin#

show uptime

To display the length of time that you have been logged in to the server, use the **show uptime** command in EXEC mode.

show uptime |

Syntax Description	(Optional) Output modifier variables:
	• begin—Matched pattern. Up to 80 alphanumeric characters.
	• <i>count</i> —Counts the number of lines in the output. Add number after the word <i>count</i> .
	• end—Ends with line that matches. Up to 80 alphanumeric characters.
	• exclude—Excludes lines that match. Up to 80 alphanumeric characters.
	• <i>include</i> —Includse lines that match. Up to 80 alphanumeric characters.
	• <i>last</i> —Displays last few lines of output. Add number after the word <i>last</i> . Up to 80 lines to display. Default 10.

Command Default	No default behavior or values.		
Command Modes	EXEC		

Examples

ncs/admin# **show uptime** 3 day(s), 18:55:02 ncs/admin#

show users

To display the list of users logged in to the server, use the **show users** command in EXEC mode.

show users

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values.

Command Modes EXEC

Examples

S.	ncs/admin# show USERNAME		HOST	TTY	LOGIN DATETIME
	admin	Admin	10.77.137.60	pts/0	Fri Aug 6 09:45:47 2010
	ncs/admin#				

show version

To display information about the software version of the system, use the **show version** command in EXEC mode.

show version

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** No default behavior or values.

Command Modes EXEC

Usage Guidelines This command displays version information about the Cisco ADE-OS software running on the server, and displays the version.

Examples

ncs/admin# show version Cisco Application Deployment Engine OS Release: 2.0 ADE-OS Build Version: 2.0.0.568 ADE-OS System Architecture: i386 Copyright (c) 2005-2010 by Cisco Systems, Inc. All rights reserved. Hostname: pmbudev-vm3 Version information of installed applications Cisco Prime Network Control System _____ Version : 1.0.2.051 Vendor : Wireless Networking Business Unit ncs/admin#

Configuration Commands

This section lists the **configuration commands** along with a brief description of their use, command defaults, command syntax, command modes, usage guidelines, command examples, and related commands, where applicable.

Configuration commands include interface and repository.

Note Some of the configuration commands require you to enter the configuration submode to complete the command configuration.

To access configuration mode, you must use the configure command in EXEC mode.

backup-staging-url

To allow you to configure a Network File System (NFS) location that the backup and restore operations will use as a staging area to package and unpackage backup files, use the **backup-staging-url** command in configuration mode.

backup-staging-url word

Syntax Description	word	NFS URL for staging area. Up to 2048 alphanumeric characters. Use nfs: // <i>server:path</i> (1).			
Command Default	No default behavior or va	alues.			
Command Modes	Configuration				
Usage Guidelines	The URL is NFS only. T	he format of the command is backup-staging-url nfs: //server:path.			
Caution	Ensure that you secure you address of the server.	our NFS server in such a way that the directory can be accessed only by the IP			
Examples	ncs/admin(config)# ba ncs/admin(config)#	ckup-staging-url nfs://loc-filer02a:/vol/local1/private1/jdoe			

cdp holdtime

To specify the amount of time for which the receiving device should hold a Cisco Discovery Protocol packet from the server before discarding it, use the **cdp holdtime** command in configuration mode. To revert to the default setting, use the **no** form of this command.

[no] cdp holdtime seconds

cdp timer

Syntax Description	seconds	Specifies the hold time, in seconds. Value from 10 to 255 seconds.
Command Default	180 seconds	
Command Modes	Configuration	
Usage Guidelines		otocol packets transmit with a time to live, or hold time, value. The receiving device will iscovery Protocol information in the Cisco Discovery Protocol packet after the hold time
	The cdp holdtime	command takes only one argument; otherwise, an error occurs.
Examples	ncs/admin(config ncs/admin(config)# cdp holdtime 60)#
Related Commands		Description

cdp run	Enables the Cisco Discovery Protocol.

Specifies how often the server sends Cisco Discovery Protocol updates.

cdp run

	To enable the Cisco Discovery Protocol, use the cdp run command in configuration mode. To disable the Cisco Discovery Protocol, use the no form of this command.		
	[no] cdp run [GigabitEthernet]		
Syntax Description	GigabitEthernet	Specifies the Gigabit Ethernet interface on which to enable the Cisco Discovery Protocol.	
Command Default	No default behavior or va	lues.	
Command Modes	Configuration		
Usage Guidelines	The command has one optional argument, which is an interface name. Without an optional interface name, the command enables the Cisco Discovery Protocol on all interfaces.		
Note		hand is on interfaces that are already up and running. When you are bringing up to Discovery Protocol first; then, start the Cisco Discovery Protocol again.	
Examples	ncs/admin(config)# cdp run GigabitEthernet 0 ncs/admin(config)#		
Related Commands		Description	
	cdp holdtime	Specifies the length of time that the receiving device should hold a Cisco Discovery Protocol packet from the server before discarding it.	
	cdp timer	Specifies how often the server sends Cisco Discovery Protocol updates.	

cdp timer

To specify how often the server sends Cisco Discovery Protocol updates, use the **cdp timer** command in configuration mode. To revert to the default setting, use the **no** form of this command.

[no] cdp timer seconds

Syntax Description	seconds	Specifies how often, in seconds, the server sends Cisco Discovery Protocol updates. Value from 5 to 254 seconds.
Command Default	60 seconds	
Command Modes	Configuration	
Usage Guidelines	•	col packets transmit with a time to live, or hold time, value. The receiving device will overy Protocol information in the Cisco Discovery Protocol packet after the hold time
	The cdp timer comma	nd takes only one argument; otherwise, an error occurs.
Examples	ncs/admin(config)# ncs/admin(config)#	cdp timer 60
Related Commands		Description

	Description
cdp holdtime	Specifies the amount of time that the receiving device should hold a Cisco Discovery Protocol packet from the server before discarding it.
cdp run	Enables the Cisco Discovery Protocol.

clock timezone

To set the time zone, use the **clock timezone** command in configuration mode. To disable this function, use the **no** form of this command.

clock timezone timezone

Syntax Description	timezone	Name of the time zone visible when in standard time. Up to 64 alphanumeric characters.
Command Default	UTC	
Command Modes	Configuration	
Usage Guidelines		ps time in Coordinated Universal Time (UTC). If you do not know your specific he region, country, and city (see Tables clock timezone, Table 20: Australia Time

Zones, and Table 21: Asia Time Zones for sample time zones to enter on your system).

Table 19: Common Time Zones

Acronym or name	Time Zone Name
Europe	
GMT, GMT0, GMT-0, GMT+0, UTC, Greenwich, Universal, Zulu	Greenwich Mean Time, as UTC
GB	British
GB-Eire, Eire	Irish
WET	Western Europe Time, as UTC
СЕТ	Central Europe Time, as UTC + 1 hour
EET	Eastern Europe Time, as UTC + 2 hours
United States and Canad	la
EST, EST5EDT	Eastern Standard Time, as UTC -5 hours
CST, CST6CDT	Central Standard Time, as UTC -6 hours

Acronym or name	Time Zone Name
MST, MST7MDT	Mountain Standard Time, as UTC -7 hours
PST, PST8PDT	Pacific Standard Time, as UTC -8 hours
HST	Hawaiian Standard Time, as UTC -10 hours

Table 20: Australia Time Zones

AustraliaFootnote.			
ACTFootnote.	Adelaide	Brisbane	Broken_Hill
Canberra	Currie	Darwin	Hobart
Lord_Howe	Lindeman	LHIFootnote.	Melbourne
North	NSWFootnote.	Perth	Queensland
South	Sydney	Tasmania	Victoria
West	Yancowinna		

<u>3456</u>

3 (1) Enter the country and city together with a forward slash (/) between them; for example, Australia/Currie.
4 (2) ACT = Australian Capital Territory
5 (3) LHI = Lord Howe Island

 $6 \quad (4) \text{ NSW} = \text{New South Wales}$

Table 21: Asia Time Zones

AsiaFootnote.			
AdenFootnote.	Almaty	Amman	Anadyr
Aqtau	Aqtobe	Ashgabat	Ashkhabad
Baghdad	Bahrain	Baku	Bangkok
Beirut	Bishkek	Brunei	Calcutta
Choibalsan	Chongqing	Columbo	Damascus
Dhakar	Dili	Dubai	Dushanbe

AsiaFootnote.			
Gaza	Harbin	Hong_Kong	Hovd
Irkutsk	Istanbul	Jakarta	Jayapura
Jerusalem	Kabul	Kamchatka	Karachi
Kashgar	Katmandu	Kuala_Lumpur	Kuching
Kuwait	Krasnoyarsk		

<u>78</u>

⁷ (1) The Asia time zone includes cities from East Asia, Southern Southeast Asia, West Asia, and Central Asia.

8 (2) Enter the region and city or country together separated by a forward slash (/); for example, Asia/Aden.

Note

Several more time zones are available to you. On your server, enter the **show timezones** command. A list of all of the time zones available in the server appears. Choose the most appropriate one for your time zone.

Examples

ncs/admin(config)# clock timezone EST ncs/admin(config)# exit ncs/admin# show timezone EST ncs/admin#

	Description
show timezones	Displays a list of available time zones on the system.
show timezone	Displays the current time zone set on the system.

do

do

To execute an EXEC-level command from configuration mode or any configuration submode, use the **do** command in any configuration mode.

do

Syntax Description This command has no arguments or keywords.

Table 22: Command Options for the Do Command

	Description	
application install	Installs a specific application.	
application removeRemoves a specific application.		
application startStarts or enables a specific application		
application stopStops or disables a specific application.		
application upgradeUpgrades a specific application.		
backup	Performs a backup (and Cisco ADE OS) and places the backup in a repository.	
backup-logs	Performs a backup of all of the logs on the server to a remote location.	
clock	Sets the system clock on the server.	
configure Enters configuration mode.		
сору	Copies any file from a source to a destination.	
debug	Displays any errors or events for various command situations; for example, backup and restore, configuration, copy, resource locking, file transfer, and user management.	
delete	Deletes a file on the server.	
dir	Lists files on the server.	
forceout	Forces the logout of all of the sessions of a specific node user.	
halt	Disables or shuts down the server.	
help	Describes the help utility and how to use it on the server.	
mkdir	Creates a new directory.	

ч	-
u	U
	-

	Description	
nslookup	Queries the IPv4 address or hostname of a remote system.	
patch	Install System or Application patch.	
рер	Configures the Inline PEP node.	
ping	Determines the IPv4 network activity on a remote system.	
ping6	Determines the IPv6 network activity on a IPv6 remote system.	
reload	Reboots the server.	
restore	Performs a restore and retrieves the backup out of a repository.	
rmdir	Removes an existing directory.	
show	Provides information about the server.	
ssh	Starts an encrypted session with a remote system.	
tech	Provides Technical Assistance Center (TAC) commands.	
telnet	Establishes a Telnet connection to a remote system.	
terminal length	Sets terminal line parameters.	
terminal session-timeout	Sets the inactivity timeout for all terminal sessions.	
terminal session-welcome	Sets the welcome message on the system for all terminal sessions.	
terminal terminal-type	Specifies the type of terminal connected to the current line of the current session.	
traceroute	Traces the route of a remote IP address.	
undebug	Disables the output (display of errors or events) of the debug command for various command situations; for example, backup and restore, configuration, copy, resource locking, file transfer, and user management.	
write	Erases the startup configuration that forces the setup utility to run and prompts the network configuration, copies the running configuration to the startup configuration, and displays the running configuration on the console.	

Command Default No default behavior or values.

do

Command Modes Configuration

Use this command to execute EXEC commands (such as **show**, **clear**, and **debug** commands) while configuring your server. After the EXEC command executes, the system will return to the configuration mode that you were using.

Examples

```
ncs/admin(config)# do show run
Generating configuration...
hostname ncs
ip domain-name cisco.com
interface GigabitEthernet 0
  ip address 172.23.90.113 255.255.255.0
  ipv6 address autoconfig
ip name-server 172.16.168.183
ip default-gateway 172.23.90.1
clock timezone EST
ntp server time.nist.gov
username admin password hash $1$JbbHvKVG$xMZ/XL4tH15Knf.FfcZZr. role admin
service sshd
backup-staging-url nfs://loc-filer02a:/vol/local1/private1/jdoe
password-policy
  lower-case-required
  upper-case-required
  digit-required
 no-username
  disable-cisco-passwords
 min-password-length 6
logging localhost
logging loglevel 6
1
--More--
```

ncs/admin(config)#

end

	To end the current configuration mode.	session and return to EXEC mode, use the end command in configuration
	end	
Syntax Description	This command has no arguments	s or keywords.
Command Default	No default behavior or values.	
Command Modes	Configuration	
Usage Guidelines	This command brings you back to EXEC mode regardless of what configuration mode or submode you are in.	
	Use this command when you fini verification steps.	sh configuring the system and you want to return to EXEC mode to perform
Examples	ncs/admin(config)# end ncs/admin#	
Related Commands	Command	Description

Command	Description
exit	Exits configuration mode.
exit (EXEC)	Closes the active terminal session by logging out of the server.

exit

	To exit any configuration mode to the next-highest mode in the CLI mode hierarchy, use the exit command in configuration mode.
	exit
Syntax Description	This command has no arguments or keywords.
Command Default	No default behavior or values.
Command Modes	Configuration
Usage Guidelines	The exit command is used in the server to exit the current command mode to the next highest command mode in the CLI mode hierarchy.
	For example, use the exit command in configuration mode to return to EXEC mode. Use the exit command in the configuration submodes to return to configuration mode. At the highest level, EXEC mode, the exit command exits the EXEC mode and disconnects from the server (see exit, for a description of the exit (EXEC) command).
Examples	ncs/admin(config)# exit ncs/admin#

Related Commands	Command

Command	Description
end	Exits configuration mode.
exit (EXEC)	Closes the active terminal session by logging out of the server.

hostname

To set the hostname of the system, use the hostname command in configuration mode. To delete the hostname from the system, use the no form of this command, which resets the system to localhost.	
[no] hostname word	
word	Name of the host. Contains at least 2 to 64 alphanumeric characters and an underscore (_). The hostname must begin with a character that is not a space.
No default behavior or va	alues.
Configuration	
A single instance type of command, hostname only occurs once in the configuration of the system. The hostname must contain one argument; otherwise, an error occurs.	
<pre>Examples ncs/admin(config)# hostname ncs-1 Changing the hostname or IP may result in undesired side effects, such as installed application(s) being restarted. Are you sure you want to proceed? [y/n] y Stopping NCS Monitoring & Troubleshooting Log Processor Stopping NCS Monitoring & Troubleshooting Log Processor Stopping NCS Monitoring & Troubleshooting Alert Process Stopping NCS Monitoring & Troubleshooting Session Database Stopping NCS Database processes Starting NCS Database processes Starting NCS Monitoring & Troubleshooting Log Collector Starting NCS Monitoring & Troubleshooting Log Processes Starting NCS Monitoring & Troubleshooting Log Collector Starting NCS Monitoring & Troubleshooting Log Collector Starting NCS Monitoring & Troubleshooting Log Processes Note: NCS Processes are initializing. Use 'show application status ncs' Cli to verify all processes are in running state. ncs-1/adminf show application status ncs NCS Application Server is still initializing. NCS Application Server is still initializing. NCS MGT Log Collector is running, PID: 11140 NCS MGT Log Collector is running, PID: 1155 NCS MGT Alert Process is running, PID: 11623 ncs-1/adminf</pre>	
	from the system, use the [no] hostname word word No default behavior or va Configuration A single instance type of hostname must contain o ncs/admin(config) # ho Changing the hostname such as installed app Are you sure you want Stopping NCS Monitori Stopping NCS Monitori Starting NCS

icmp echo

To configure the Internet Control Message Protocol (ICMP) echo responses, use the icmp echo command in configuration mode.

icmp echo {off | on}

Syntax Description	off	Disables ICMP echo response.
	on	Enables ICMP echo response.

Command Default The system behaves as if the ICMP echo response is on (enabled).

Command Modes Configuration

Examples

ncs/admin(config)# icmp echo off ncs/admin(config)#

Related Commands	Command	Description

Command	Description
show icmp-status	Display ICMP echo response configuration information.

interface

To configure an interface type and enter interface configuration mode, use the **interface** command in configuration mode.

VMware virtual machine may have a number of interfaces available. This depends on how many network interfaces (NIC) are added to the virtual machine.

interface GigabitEthernet ip-address

Syntax Description	GigabitEthernet	Configures the Gigabit Ethernet interface.
	0 - 3	Number of the Gigabit Ethernet port to configure.

After you enter the Gigabit Ethernet port number in the **interface** command, you enter config-GigabitEthernet configuration submode (see the following Syntax Description).

do	EXEC command. Allows you to perform any EXEC commands in this mode (see do).
end	Exits config-GigabitEthernet submode and returns you to EXEC mode.
exit	Exits the config-GigabitEthernet configuration submode.
ip	Sets IP address and netmask for the Ethernet interface (see ip address).
ipv6	Configures the IPv6 autoconfiguration address and IPv6 address from DHCPv6 server. (see ipv6 address autoconfig and ipv6 address dhcp).
no	 Negates the command in this mode. Two keywords are available: ip—Sets the IP address and netmask for the interface. shutdown—Shuts down the interface.
shutdown	Shuts down the interface (see shutdown).

Command Default No default behavior or values.

Command Modes Configuration

Usage Guidelines You can use the **interface** command to configure subinterfaces to support various requirements.

Examples

ncs/admin(config)# interface GigabitEthernet 0
ncs/admin(config-GigabitEthernet)#

Command	Description
show interface	Displays information about the system interfaces.
ip address (interface configuration mode)	Sets the IP address and netmask for the interface.
shutdown (interface configuration mode)	Shuts down the interface (see shutdown).

ipv6 address autoconfig

To enable IPv6 stateless autoconfiguration, use the **ipv6 address autoconfig** command in configuration mode. To remove the address from the interface, use the **no** form of this command.

[no] ipv6 address autoconfig [default]0

Syntax Description	default	(Optional) If a default router is selected on this interface, the default keyword causes a default route to be installed using that default router.	
		The default keyword can be specified only on one interface.	
Command Default	No default behavio	or or values.	
Command Modes	Configuration		
Usage Guidelines	IPv6 stateless autoconfiguration has the security downfall of having predictable IP addresses. This downfall is resolved with privacy extensions. You can verify that the privacy extensions feature is enabled using the show command.		
		configuration is enabled by default in Linux. Cisco ADE 2.0 shows the IPv6 address in the running configuration for any interface that is enabled.	
Examples	Example 1		
	ncs/admin(config ncs/admin(config ncs/admin(config ncs/admin#	<pre>igure terminal tion commands, one per line. End with CNTL/Z. g)# interface GigabitEthernet 0 g)# (config-GigabitEthernet)# ipv6 address autoconfig g)# (config-GigabitEthernet)# end nfiguration is enabled, the running configuration shows the interface settings similar to the</pre>	
	You can use the sh 2, you can see that using the stateless advertisement enab	2.23.90.116 255.255.255.0	

not have any scope outside the host. You will always see a link local address regardless of the IPv6 autoconfiguration or DHCPv6 configuration. The last address (starting with 2001) is obtained from a IPv6 DHCP server.

Example 2

```
ncs/admin# show interface GigabitEthernet 0
eth0 Link encap:Ethernet HWaddr 00:0C:29:AF:DA:05
inet addr:172.23.90.116 Bcast:172.23.90.255 Mask:255.255.255.0
inet6 addr: 3ffe:302:11:2:20c:29ff:feaf:da05/64 Scope:Global
inet6 addr: fe80::20c:29ff:feaf:da05/64 Scope:Link
inet6 addr: 2001:558:ff10:870:8000:29ff:fe36:200/64 Scope:Global
UP BROADCAST RUNNING MULTICAST MTU:1500 Metric:1
RX packets:77848 errors:0 dropped:0 overruns:0 frame:0
TX packets:23131 errors:0 dropped:0 overruns:0 carrier:0
collisions:0 txqueulen:1000
RX bytes:10699801 (10.2 MiB) TX bytes:3448374 (3.2 MiB)
Interrupt:59 Base address:0x2000
```

ncs/admin#

To verify that the privacy extensions feature is enabled, you can use the **show interface GigabitEthernet 0** command. You can see two autoconfiguration addresses: one address is without the privacy extensions, and the other is with the privacy extensions.

In the example 3 below, the MAC is 3ffe:302:11:2:20c:29ff:feaf:da05/64 and the non-RFC3041 address contains the MAC, and the privacy-extension address is 302:11:2:9d65:e608:59a9:d4b9/64.

The output appears similar to the following:

Example 3

```
ncs/admin# show interface GigabitEthernet 0
eth0 Link encap:Ethernet HWaddr 00:0C:29:AF:DA:05
inet addr:172.23.90.116 Bcast:172.23.90.255 Mask:255.255.255.0
inet6 addr: 3ffe:302:11:2:9d65:e608:59a9:d4b9/64 Scope:Global
inet6 addr: fe80::20c:29ff:feaf:da05/64 Scope:Global
inet6 addr: fe80::20c:29ff:feaf:da05/64 Scope:Link
UP BROADCAST RUNNING MULTICAST MTU:1500 Metric:1
RX packets:60606 errors:0 dropped:0 overruns:0 frame:0
TX packets:2771 errors:0 dropped:0 overruns:0 carrier:0
collisions:0 txqueuelen:1000
RX bytes:9430102 (8.9 MiB) TX bytes:466204 (455.2 KiB)
Interrupt:59 Base address:0x2000
```

ncs/admin#

Command	Description
show interface	Displays information about the system interfaces.
ip address (interface configuration mode)	Sets the IP address and netmask for the interface.
shutdown (interface configuration mode)	Shuts down the interface (see shutdown).
ipv6 address dhcp	Enables IPv6 address DHCP on an interface.
show running-config	Displays the contents of the currently running configuration file or the configuration.

ipv6 address dhcp

To enable IPv6 address DHCP, use the **ipv6 address dhcp** command in configuration mode. To remove the address from the interface, use the **no** form of this command.

[no] ipv6 address dhcp [rapid-commit] 0

Syntax Description	[rapid-commit]	(Optional) Allows the two-message exchange method for address assignment.
	0	Gigabit Ethernet port number to be configured.
Command Default	No default behavior o	r values.
Command Modes	Configuration	
Usage Guidelines	None.	
Examples	ncs/admin(config)# ncs/admin(config-G ncs/admin(config-G ncs/admin# When IPv6 DHCPv6 i ! interface GigabitE	<pre>n commands, one per line. End with CNTL/Z. interface GigabitEthernet 0 igabitEthernet)# ipv6 address dhcp igabitEthernet)# end s enabled, the running configuration shows the interface settings similar to the following: thernet 0 3.90.116 255.255.255.0</pre>
Note	have both IPv6 stateled the show interface to When both the IPv6 sta shows the interface se	toconfiguration and IPv6 address DHCP are not mutually exclusive. It is possible to ess autoconfiguration and IPv6 address DHCP on the same interface. You can use o display what IPv6 addresses are in use for a particular interface. ateless autoconfiguration and IPv6 address DHCP are enabled, the running configuration ettings similar to the following:

Command	Description
show interface	Displays information about the system interfaces.
ip address (interface configuration mode)	Sets the IP address and netmask for the interface.
shutdown (interface configuration mode)	Shuts down the interface (see shutdown).
ipv6 address autoconfig	Enables IPv6 stateless autoconfiguration on an interface.
show running-config	Displays the contents of the currently running configuration file or the configuration.

ip address

To set the IP address and netmask for the Ethernet interface, use the **ip address** command in interface configuration mode. To remove an IP address or disable IP processing, use the **no** form of this command.

[no] ip address ip-address netmask

Note

You can configure the same IP address on multiple interfaces. You might want to do this to limit the configuration steps that are needed to switch from using one interface to another.

Suntax Description		
Syntax Description	ip-address	IPv4 version IP address.
	netmask	Mask of the associated IP subnet.
Command Default	Enabled.	
Command Modes	Interface configuration	
Usage Guidelines	Requires exactly one ac	ldress and one netmask; otherwise, an error occurs.
Examples	<pre>ncs/admin(config)# interface GigabitEthernet 1 ncs/admin(config-GigabitEthernet)# ip address 209.165.200.227 255.255.255.224 Changing the hostname or IP may result in undesired side effects, such as installed application(s) being restarted. To verify that NCS processes are running, use the 'show application status ncs' command. ncs/admin(config-GigabitEthernet)#</pre>	

Related	Commands

Command	Description
shutdown (interface configuration mode)	Disables an interface (see shutdown).
ip default-gateway	Sets the IP address of the default gateway of an interface.
show interface	Displays information about the system IP interfaces.
interface	Configures an interface type and enters the interface mode.

ip default-gateway

To define or set a default gateway with an IP address, use the **ip default-gateway** command in configuration mode. To disable this function, use the **no** form of this command.

Sets the IP address and netmask for the Ethernet interface.

[no] ip default-gateway ip-address

ip address (interface

configuration mode)

Syntax Description	ip-address	IP address of the default gateway.	
Command Default	Disabled.		
Command Modes	Configuration		
Usage Guidelines	If you enter more than one argument or no arguments at all, an error occurs.		
Examples	ncs/admin(config)# ip default-gateway 209.165.202.129 ncs/admin(config)#		
Related Commands	Command	Description	
ip domain-name

To define a default domain name that the server uses to complete hostnames, use the **ip domain-name** command in configuration mode. To disable this function, use the **no** form of this command.

[no] ip domain-name word

Syntax Description	word Default domain name used to complete the hostnames. Contains at least 2 to 64 alphanumeric characters.	
Command Default	Enabled.	
Command Modes	Configuration	
Usage Guidelines	If you enter more or fewer arguments, an error occurs.	
Examples	<pre>ncs/admin(config)# ip domain-name cisco.com ncs/admin(config)#</pre>	
Related Commands	Description	

	Description
ip name-server	Sets the DNS servers for use during a DNS query.

ip name-server

To set the Domain Name Server (DNS) servers for use during a DNS query, use the ip name-server command in configuration mode. You can configure one to three DNS servers. To disable this function, use the no form of this command.

Note Using the **no** form of this command removes all of the name servers from the configuration. Using the **no** form of this command and one of the IP names removes only that IP name server. [no] ip name-server *ip-address* [*ip-address**]} **Syntax Description** ip-address Address of a name server. (Optional) IP addresses of additional name servers. ip-address* You can configure a maximum of three name Note servers. **Command Default** No default behavior or values. **Command Modes** Configuration **Usage Guidelines** The first name server that is added with the **ip name-server** command occupies the first position and the system uses that server first to resolve the IP addresses. You can add name servers to the system one at a time or all at once, until you reach the maximum (3). If you already configured the system with three name servers, you must remove at least one server to add additional name servers. To place a name server in the first position so that the subsystem uses it first, you must remove all name servers with the no form of this command before you proceed. **Examples** ncs/admin(config)# ip name-server 209.165.201.1 To verify that NCS processes are running, use the 'show application status ncs' command.

ncs/admin(config)# You can choose not to restart the server; nevertheless, the changes will take effect.

Related Commands	Command	Description
	ip domain-name	Defines a default domain name that the server uses to complete hostnames.

ip route

To configure the static routes, use the **ip route** command in configuration mode. To remove static routes, use the **no** form of this command.

ip route prefix mask gateway ip-address

no ip route prefix mask

Syntax Description	prefix	IP route prefix for the destination.
	mask	Prefix mask for the destination.
	gateway	Route-specific gateway
	ip-address	IP address of the next hop that can be used to reach that network.
Command Default	No default behavio	or or values.

Configuration.

- **Usage Guidelines** Static routes are manually configured, which makes them inflexible (they cannot dynamically adapt to network topology changes), but extremely stable. Static routes optimize bandwidth utilization, because no routing updates need to be sent to maintain them. They also make it easy to enforce routing policy.
- Examples ncs/admin(config)# ip route 192.168.0.0 255.255.0.0 gateway 172.23.90.2 ncs/admin(config)#

kron occurrence

To schedule one or more Command Scheduler commands to run at a specific date and time or a recurring level, use the **kron occurrence** command in configuration mode. To delete this schedule, use the **no** form of this command.

[no] kron {occurrence} occurrence-name

occurrence-name

Syntax Description

Name of the occurrence. Up to 80 alphanumeric characters. (See the following note and Syntax Description.)

After you enter the *occurrence-name* in the **kron occurrence** command, you enter the config-occurrence configuration submode (see the following syntax description).

at	Identifies that the occurrence is to run at a specified calendar date and time. Usage: at [<i>hh:mm</i>] [<i>day-of-week</i> <i>day-of-month</i> <i>month day-of-month</i>].
do	EXEC command. Allows you to perform any EXEC commands in this mode (see do).
end	Exits the kron-occurrence configuration submode and returns you to EXEC mode.
exit	Exits the kron-occurrence configuration mode.
no	 Negates the command in this mode. Three keywords are available: at—Usage: at [<i>hh:mm</i>] [<i>day-of-week</i> <i>day-of-month</i> <i>month day-of-month</i>]. policy-list—Specifies a policy list to be run by the occurrence. Up to 80 alphanumeric characters. recurring—Execution of the policy lists should be repeated.
policy-list	Specifies a Command Scheduler policy list to be run by the occurrence.
recurring	Identifies that the occurrences run on a recurring basis.

Command Default No default behavior or values.

Command Modes Configuration

OL-27654-01

Usage Guidelines

Use the **kron occurrence** and **policy-list** commands to schedule one or more policy lists to run at the same time or interval.

Use the **kron policy-list** command in conjunction with the **cli** command to create a Command Scheduler policy that contains the EXEC CLI commands to be scheduled to run on the server at a specified time. See the kron policy-list command.

```
Examples
```

Note

When you run the **kron** command, backup bundles are created with a unique name (by adding a time stamp) to ensure that the files do not overwrite each other.

Example 1:Weekly Backup

```
ncs/admin(config)# kron occurrence WeeklyBackup
ncs/admin(config-Occurrence)# at 14:35 Monday
ncs/admin(config-Occurrence)# policy-list SchedBackupPolicy
ncs/admin(config-Occurrence)# recurring
ncs/admin(config-Occurrence)# exit
ncs/admin(config)#
Example 2: Daily Backup
```

```
ncs/admin(config)# kron occurrence DailyBackup
ncs/admin(config-Occurrence)# at 02:00
ncs/admin(config-Occurrence)# exit
ncs/admin(config)#
```

Command	Description
kron policy-list	Specifies a name for a Command Scheduler policy.

kron policy-list

To specify a name for a Command Scheduler policy and enter the kron-Policy List configuration submode, use the **kron policy-list** command in configuration mode. To delete a Command Scheduler policy, use the **no** form of this command.

[no] kron {policy-list} list-name

Syntax Description	policy-list	Specifies a name for Command Scheduler policies.
	list-name	Name of the policy list. Up to 80 alphanumeric characters.

After you enter the *list-name* in the **kron policy-list** command, you enter the config-Policy List configuration submode (see the following Syntax Description).

cli	Command to be executed by the scheduler. Up to 80 alphanumeric characters.
do	EXEC command. Allows you to perform any EXEC commands in this mode (see the do) command.
end	Exits from the config-policy list configuration submode and returns you to EXEC mode.
exit	Exits this submode.
no	Negates the command in this mode. One keyword is available: • cli—Command to be executed by the scheduler.

Command Default No default behavior or values.

Command Modes Configuration

Usage Guidelines Use the **kron policy-list** command in conjunction with the **cli** command to create a Command Scheduler policy that contains the EXEC CLI commands to be scheduled to run on the server at a specified time. Use the **kron occurrence** and **policy list** commands to schedule one or more policy lists to run at the same time or interval. See the **ip route** command.

Examples

ncs/admin(config)# kron policy-list SchedBackupMonday

ncs/admin(config-Policy List)# cli backup SchedBackupMonday repository SchedBackupRepo ncs/admin(config-Policy List)# exit ncs/admin(config)#

Related Commands

Command	Description
	Specifies schedule parameters for a Command Scheduler occurrence and enters config-Occurrence configuration mode.

logging

To enable the system to forward logs to a remote system or to configure the log level, use the **logging** command in configuration mode. To disable this function, use the **no** form of this command.

[no] logging {ip-address | hostname} {loglevel level}

Syntax Description	ip-address	IP address of remote system to which you forward logs. Up to 32 alphanumeric characters.
	hostname	Hostname of remote system to which you forward logs. Up to 32 alphanumeric characters.
	loglevel	The command to configure the log level for the logging command.
	level	Number of the desired priority level at which you set the log messages. Priority levels are (enter the number for the keyword):
		• 0-emerg—Emergencies: System unusable.
		• 1-alert—Alerts: Immediate action needed.
		• 2-crit—Critical: Critical conditions.
		• 3-err—Error: Error conditions.
		• 4-warn—Warning: Warning conditions.
		• 5-notif—Notifications: Normal but significant conditions.
		• 6-inform—(Default) Informational messages.
		• 7-debug—Debugging messages.
Command Default	No default behavior o	r values.
Command Modes	Configuration	
Usage Guidelines	This command require or more of these argur	es an IP address or hostname or the loglevel keyword; an error occurs if you enter two ments.
Examples	Example 1	
	ncs/admin(config)# ncs/admin(config)#	logging 209.165.200.225

Example 2

ncs/admin(config) # logging loglevel 0
ncs/admin(config) #

Related Commands

Command	Description
show logging	Displays the list of logs for the system.

ntp server

To allow for software clock synchronization by the NTP server for the system, use the **ntp server** command in configuration mode. Allows up to three servers. To disable this capability, use the **no** form of this command.

[no] ntp server {*ip-address* | *hostname*} [*ip-address* | *hostname*] [*ip-address* | *hostname*]

```
Syntax Description
                       ip-address | hostname
                                                 IP address or hostname of the server providing the clock synchronization.
                                                 Arguments are limited to 255 alphanumeric characters.
Command Default
                      No servers are configured by default.
Command Modes
                      Configuration
Usage Guidelines
                      Use this command if you want to allow the system to synchronize with a specified server.
                      To terminate NTP service on a device, you must enter the no ntp command without keywords or arguments.
                      For example, if you previously entered the ntp server command and you now want to remove not only the
                      server synchronization capability, but all NTP functions from the device, use the no ntp command without
                      any keywords. This command ensures that all NTP functions are disabled and that the NTP service also
                      terminates.
               Note
                       This command gives conflicting information during the sync process. The sync process can take up to 20
                       minutes to complete.
```

Examples

```
ncs/admin(config) # ntp server ncs ncs1 ncs2
ncs/admin(config)#
ncs/admin# show ntp

Related Commands

Command	Description
show ntp	Displays the status information about the NTP associations.

password-policy

To enable or configure the passwords on the system, use the **password-policy** command in configuration mode. To disable this function, use the **no** form of this command.

[no] password-policy option

Note

The **password-policy** command requires a policy option (see Syntax Description). You must enter the **password-expiration-enabled** command before the other password-expiration commands.

Syntax Description

Different command options.

option

After you enter the **password-policy** command, you can enter config-password-policy configuration submode.

digit-required	Requires a digit in the password.	
disable-repeat-characters	Disables the ability of the password to contain more than four identical characters.	
disable-cisco-password	Disables the ability to use the word Cisco or any combination as the password.	
do	EXEC command.	
end	Exits from configure mode.	
exit	Exits from this submode.	
lower-case-required	Requires a lowercase letter in the password.	
min-password-length	Specifies a minimum number of characters for a valid password. Integer length from 0 to 4,294,967,295.	
no	Negates a command or set its defaults.	
no-previous-password	Prevents users from reusing a part of their previous password.	
no-username	Prohibits users from reusing their username as a part of a password.	
password-expiration-days	Number of days until a password expires. Integer length from 0 to 80.	

password-expiration-enabled	Enables password expiration.	
	Note You must enter the password-expiration-enabled command before the other password-expiration commands.	
password-expiration-warning	Number of days before expiration that warnings of impending expiration begin. Integer length from 0 to 4,294,967,295.	
password-lock-enabled	Locks a password after several failures.	
password-lock-retry-count	Number of failed attempts before password locks. Integer length from 0 to 4,294,967,295.	
upper-case-required	Requires an uppercase letter in the password.	
special-required	Requires a special character in the password.	

Command Default No default behavior or values.

Command Modes Configuration

Examples

ncs/admin(config)# password-policy ncs/admin(config-password-policy)# password-expiration-days 30 ncs/admin(config-password-policy)# exit ncs/admin(config)#

repository

To enter the repository submode for configuration of backups, use the **repository** command in configuration mode.

repository repository-name

repository-name

Syntax Description

Name of repository. Up to 80 alphanumeric characters.

After you enter the name of the repository in the **repository** command, you enter repository configuration submode.

do	EXEC command.	
end	Exits repository config submode and returns you to EXEC mode.	
exit	Exits this mode.	
no	Negates the command in this mode.	
	Two keywords are available:	
	• url—Repository URL.	
	• user—Repository username and password for access.	
url	URL of the repository. Up to 80 alphanumeric characters (see Table A-20).	
user	Configure the username and password for access. Up to 30 alphanumeric characters.	

Table 23: URL Keywords

Keyword	Source of Destination	
word	Enter the repository URL, including server and path info. Up to 80 alphanumeric characters.	
cdrom:	Local CD-ROM drive (read only).	

Keyword	Source of Destination	
disk:	Local storage.	
	You can enter the show repository <i>repository_name</i> command to view all of the files in the local repository.	
	Note All local repositories are created on the /localdisk partition. When you specidisk:/ in the repository URL, the system creates directories in a path that is relative to /localdisk. For example, if you entered disk:/backup , the director is created at /localdisk/backup.	
ftp:	Source or destination URL for an FTP network server. Use url ftp://server/path(1).	
nfs:	Source or destination URL for an NFS network server. Use url nfs://server:path1.	
sftp:	Source or destination URL for an SFTP network server. Use url sftp://server/path1.	
tftp:	Source or destination URL for a TFTP network server. Use url tftp://server/path1.	
	Note You cannot use a TFTP repository for performing a upgrade.	

Command Default No default behavior or values.

Command Modes Configuration

Examples Example 1

```
ncs/admin# configure termainal
ncs/admin(config)# repository myrepository
ncs/admin(config-Repository)# url sftp://example.com/repository/system1
ncs/admin(config-Repository)# user abcd password example
ncs/admin(config-Repository)# exit
ncs/admin(config)# exit
ncs/admin(config)# exit
ncs/admin#
```

```
ncs/admin# configure termainal
ncs/admin(config)# repository myrepository
ncs/admin(config-Repository)# url disk:/
ncs/admin(config-Repository)# user xyz password plain example
ncs/admin(config-Repository)# exit
ncs/admin(config)# exit
ncs/admin#
```

Related Commands

ıds	Command	Description
	backup	Performs a backup (and Cisco ADE OS) and places the backup in a

show repository	Displays the available backup files located on a specific repository.	

service

	To specify a service to manage, use the service command in configuration mode. To disable this function, use the no form of this command.	
	[no] service sshd	
Syntax Description	sshd Secure Shell Daemon. The daemon program for SSH.	
Command Default	No default behavior or values.	
Command Modes	Configuration	
Examples	ncs/admin(config)# service sshd ncs/admin(config)#	

shutdown

To shut down an interface, use the **shutdown** command in interface configuration mode. To disable this function, use the no form of this command. [no] shutdown **Syntax Description** This command has no arguments or keywords. **Command Default** No default behavior or values. **Command Modes** Interface **Usage Guidelines** When you shut down an interface using this command, you lose connectivity to the Cisco ISE-3315 appliance through that interface (even though the appliance is still powered on). However, if you have configured the second interface on the appliance with a different IP and have not shut down that interface, you can access the appliance through that second interface. To shut down an interface, you can also modify the ifcfg-eth[0,1] file, which is located at /etc/sysconfig/network-scripts, using the ONBOOT parameter: • Disable an interface: set ONBOOT="no" • Enable an interface: set ONBOOT="yes" You can also use the **no shutdown** command to enable an interface. Examples ncs/admin(config)# interface GigabitEthernet 0 ncs/admin(config-GigabitEthernet)# shutdown **Related Commands** Command Description interface Configures an interface type and enters interface mode. ip address (interface Sets the IP address and netmask for the Ethernet interface. configuration mode) show interface Displays information about the system IP interfaces. ip default-gateway Sets the IP address of the default gateway of an interface.

snmp-server community

To set up the community access string to permit access to the Simple Network Management Protocol (SNMP), use the **snmp-server community** command in configuration mode. To disable this function, use the **no** form of this command.

[no] snmp-server community word ro

Syntax Description	word	Accessing string that functions much like a password and allows access to SNMP. No blank spaces allowed. Up to 255 alphanumeric characters.
	ro	Specifies read-only access.
Command Default	No default behavior or v	ralues.
Command Modes	Configuration	
Usage Guidelines	The snmp-server community command requires a community string and the ro argument; otherwise, an error occurs.	
Examples	ncs/admin(config)# snmp-server community new ro ncs/admin(config)#	
Related Commands	Command	Description
	snmp-server host	Sends trans to a remote system

Commanu	Description
snmp-server host	Sends traps to a remote system.
snmp-server location	Configures the SNMP location MIB value on the system.
snmp-server contact	Configures the SNMP contact MIB value on the system.

snmp-server contact

To configure the SNMP contact Management Information Base (MIB) value on the system, use the **snmp-server contact** command in configuration mode. To remove the system contact information, use the **no** form of this command.

[no] snmp-server contact word

Syntax Description		String that describes the system contact information of the node. Up to 255 alphanumeric characters.
Command Default	No default behavior or valu	es.
Command Modes	Configuration	
Usage Guidelines	None.	
Examples	ncs/admin(config)# snmp ncs/admin(config)#	-server contact Abcd
Related Commands	Command	Description
	snmp-server host	Sends traps to a remote system.
	snmp-server community	Sets up the community access string to permit access to the SNMP.
	snmp-server location	Configures the SNMP location MIB value on the system.

snmp-server host

To send SNMP traps to a remote user, use the **snmp-server host** command in configuration mode. To remove trap forwarding, use the **no** form of this command.

[no] snmp-server host {*ip-address* | *hostname*} version {1 | 2c} *community*

Syntax Description	ip-address	IP address of the SNMP notification host. Up to 32 alphanumeric characters.
	hostname	Name of the SNMP notification host. Up to 32 alphanumeric characters.
	version {1 2c}	(Optional) Version of the SNMP used to send the traps. Default = 1.
		If you use the version keyword, specify one of the following keywords:
		• 1—SNMPv1.
		• 2c—SNMPv2C.
	community	Password-like community string that is sent with the notification operation.
Command Default	Disabled.	
Command Modes	Configuration	
Usage Guidelines	The command takes arguments as listed; otherwise, an error occurs.	
Examples	<pre>ncs/admin(config)# snmp-server community new ro ncs/admin(config)# snmp-server host 209.165.202.129 version 1 password ncs/admin(config)#</pre>	
Related Commands	Command	Description
	snmp-server community	Sets up the community access string to permit access to SNMP.

snmp-server location	Configures the SNMP location MIB value on the system.
snmp-server contact	Configures the SNMP contact MIB value on the system.

snmp-server location

To configure the SNMP location MIB value on the system, use the **snmp-server location** command in configuration mode. To remove the system location information, use the **no** form of this command.

[no] snmp-server location word

snmp-server contact

Syntax Description		ring that describes the physical location information of the system. Up to 255 phanumeric characters.	
Command Default	No default behavior or values		
Command Modes	Configuration		
Usage Guidelines	We recommend that you use underscores (_) or hyphens (-) between the terms within the <i>word</i> string. If you use spaces between terms within the <i>word</i> string, you must enclose the string in quotation marks (").		
Examples	Example 1		
	<pre>ncs/admin(config)# snmp-server location Building_3/Room_214 ncs/admin(config)# Example 2 ncs/admin(config)# snmp-server location "Building 3/Room 214" ncs/admin(config)#</pre>		
Related Commands	Command	Description	
	snmp-server host	Sends traps to a remote system.	
	snmp-server community	Sets up the community access string to permit access to SNMP.	

Configures the SNMP location MIB value on the system.

username

To add a user who can access the Cisco ISE-3315 using SSH, use the **username** command in configuration mode. If the user already exists, the password, the privilege level, or both change with this command. To delete the user from the system, use the **no** form of this command.

[no] username username password {hash | plain} password role {admin | user] [disabled [email email-address]] [email email-address]

For an existing user, use the following command option:

username username password role {admin | user} password

Syntax Description	username	You should enter only one word which can include hyphen (-), underscore (_) and period (.).
		Note Only alphanumeric characters are allowed at an initial setup.
	password	The command to use specify password and user role.
	password	Password character length up to 40 alphanumeric characters. You must specify the password for all new users.
	hash plain	Type of password. Up to 34 alphanumeric characters.
	role admin user	Sets the privilege level for the user.
	disabled	Disables the user according to the user's email address.
	email email-address	The user's email address. For example, user1@example.com.
Command Default	The initial user during s	etup.
Command Modes	Configuration	

Usage Guidelines The **username** command requires that the username and password keywords precede the hash | plain and the admin | user options.

Examples Example 1

L'ampie i

ncs/admin(config)# username admin password hash ###### role admin ncs/admin(config)#

Example 2

ncs/admin(config)# username admin password plain Secr3tp@swd role admin ncs/admin(config)#

Example 3

ncs/admin(config)# username admin password plain Secr3tp@swd role admin email admin123@example.com ncs/admin(config)#

Related Commands

	Description
password-policy	Enables and configures the password policy.
show users	Displays a list of users and their privilege level. It also displays a list of logged-in users.

1

Glossary

A

ADE

Application Deployment Engine

С

CDP

Cisco Discovery Protocol. A proprietary tool that network administrators use to access a summary of protocol and address information about other devices that are directly connected to the device initiating the command

CDP runs over the data-link layer connecting the physical media to the upper-layer protocols. Because CDP operates at this level, two or more CDP devices that support different network layer protocols (for example, IP and Novell IPX) can learn about each other.

Physical media supporting the Subnetwork Access Protocol (SNAP) encapsulation connect CDP devices. These can include all LANs, Frame Relay, and other WANs, and ATM networks.

Cisco Discovery Protocol

See CDP

CLI

Command-line interface. An interface through which the user can interact with the software operating system by entering commands and optional arguments.

client

Node or software program that requests services from a server. For example, the Secure Shell (SSH) client.

See also server.

command-line interface

See CLI

OL-27654-01

community string

A text string that acts as a password, which is used to authenticate messages sent between a management station and an IP Transfer Point (ITP) containing a SNMP agent. The community string sends in every packet between the manager and the agent.

D

DNS

Domain Name System. DNS associates various sorts of information with so-called domain names; most importantly, it serves as the "phone book" for the Internet: it translates human-readable computer hostnames into the IP addresses that networking equipment needs for delivering information. It also stores other information, such as the list of mail exchange servers that accept e-mail for a given domain. In providing a worldwide keyword-based redirection service, the DNS is an essential component of contemporary Internet use.

DNS name

Initial name of a node.

domain name

The style of identifier—a sequence of case-insensitive ASCII labels separated by dots (.) (for example, example.com.)—defined for subtrees in the Internet DNS [R1034] and used in other Internet identifiers, such as hostnames, mailbox names, and URLs.

Domain Name System

See DNS

F

FTP

File Transfer Protocol. Application protocol, part of the TCP/IP protocol stack, used for transferring files between network nodes. FTP is defined in RFC 959.

H

host

Computer system on a network. Similar to the term node; except, that host usually implies a computer system, whereas node generally applies to any network system, including access servers and ITPs.

host name

The name of the operating system's server or computer that contains the major program files.

I IP

Internet Protocol. Network layer protocol in the TCP/IP stack offering a connectionless internetwork service. IP provides features for addressing, type-of-service specification, fragmentation and reassembly, and security. Documented in RFC 791.

IP address

32-bit address assigned to hosts by using TCP/IP. An IP address belongs to one of five classes (A, B, C, D, or E) and written as 4 octets separated by periods (.) (dotted-decimal format). Each address consists of a network number, an optional subnetwork number, and a host number. For routing, the network and subnetwork numbers stay together, while the host number addresses an individual host within the network or subnetwork. A subnet mask extracts network and subnetwork information from the IP address.

Μ

MIB

Management Information Base. A directory listing information used and maintained by a network's management protocol, such as SNMP.

N

name server

A name server is a computer server that implements a name-service protocol. It will normally map a computer-usable identifier of a host to a human-usable identifier for that host.

Network Time Protocol

See NTP.

NTP

Network Time Protocol. A protocol for synchronizing the clocks of computer systems over packet-switched, variable-latency data networks. NTP uses User Datagram Protocol (UDP) port 123 as its transport layer. NTP is designed particularly to resist the effects of variable latency (jitter).

NTP is one of the oldest Internet protocols still in use (since before 1985). NTP was originally designed by Dave Mills of the University of Delaware, who still maintains it, along with a team of volunteers.

NTP is not related to the much simpler DAYTIME (RFC 867) and TIME (RFC 868) protocols.

NFS

Network File System. NFS allows a system to share directories and files with others over a network. By using NFS, users and programs can access files on remote systems almost as if they were local files. In , the NFS must be open shared which basically mean that it should not need any credentials.

Р

Port

In IP terminology, an upper-layer process that receives information from lower layers. Each numbered port associates with a specific process. For example, SMTP associates with port 25.

S

Secure Shell

See SSH.

server

An application or device that performs services for connected clients as part of a client-server architecture. A server application, as defined by RFC 2616 (HTTP/1.1), is "an application program that accepts connections in order to service requests by sending back responses." Server computers are devices designed to run such an application or applications, often for extended periods of time, with minimal human direction. Examples of servers include web servers, e-mail servers, and file servers.

See also client.

Simple Network Management Protocol

See SNMP.

SSH

Secure Shell. A network protocol in which data is exchanged over a secure channel between two computers. Encryption provides confidentiality and integrity of data. SSH uses public-key cryptography to authenticate the remote computer and allow the remote computer to authenticate the user.

SSH is typically used to log in to a remote machine and execute commands; but, it also supports tunneling, forwarding arbitrary TCP ports, and X Window System (X11) connections. It can transfer files by using the associated SSH File Transfer Protocol (SFTP) or Secure Copy (SCP) protocols.

An SSH server, by default, listens on the standard TCP port 22. An SSH client program is typically used for establishing connections to an sshd daemon accepting remote connections. Both are commonly present on most modern operating systems. Proprietary, freeware, and open-source versions of various levels of complexity and completeness exist.

SNMP

Simple Network Management Protocol. Network management protocol used almost exclusively in TCP/IP networks. SNMP provides a means to monitor and control network devices, and to manage configurations, statistics collection, performance, and security.

SNMPv1

SNMPv1 is a simple request/response protocol. In the SNMPv1 framework, the network-management system installed a request, and managed devices return responses.

SNMPv2C

The second release of SNMP, described in RFC 1902. It provides additions to data types, counter size, and protocol operations. SNMPv2C support includes a bulk-retrieval mechanism and more detailed error message reporting to management stations. The bulk-retrieval mechanism supports the retrieval of tables and large quantities of information, minimizing the number of round-trip transmissions required. SNMPv2C improved error-handling support includes expanded error codes that distinguish different kinds of error conditions; these conditions are reported through a single error code in SNMPv1. Error return codes now report the error type. Three kinds of exceptions are also reported: No such object, No such instance, and End of MIB view.

Т

ТСР

Transmission Control Protocol. Connection-oriented transport-layer protocol that provides reliable full-duplex data transmission. Part of the TCP/IP protocol stack.

Telnet

Telnet (TELetype NETwork). A network protocol used on the Internet or LAN connections. It was developed in 1969 beginning with RFC 0015 and standardized as IETF STD 8, one of the first Internet standards.

The term Telnet also refers to software that implements the client part of the protocol. Telnet clients have been available on most UNIX systems for many years and are available for virtually all platforms. Most network equipment and operating systems with a TCP/IP stack support some kind of Telnet service server for their remote configuration (including ones based on Windows NT). Recently, Secure Shell has begun to dominate remote access for UNIX-based machines.

Most often, a user telnets to a UNIX-like server system or a simple network device such as a switch. For example, you might "telnet in from home to check your e-mail at work." In doing so, you would be using a Telnet client to connect from your computer to one of your servers. Once the connection is established, you would then log in with your account information and execute the operating system commands remotely on that computer, such as ls or cd.

TFTP

Trivial File Transfer Protocol. Simplified version of FTP that allows files to be transferred from one computer to another over a network.

Transmission Control Protocol

See TCP.

Trivial File Transfer Protocol

See TFTP.

U UDI

Unique Device Identifier. Each identifiable product is an entity, as defined by the Entity MIB (RFC 2737) and its supporting documents. Some entities, such as a chassis, will have subentities like slots. An Ethernet switch might be a member of a super entity like a stack. Most Cisco entities that are orderable products will leave the factory with an assigned UDI. The UDI information is printed on a label that is affixed to the physical hardware device, and it is also stored electronically on the device in order to facilitate remote retrieval.

A UDI consists of the following elements: product identifier (PID), version identifier (VID), and serial number (SN).

The PID is the name by which the product can be ordered; it has been historically called the "Product Name" or "Part Number." You use this identifier to order an exact replacement part.

The VID is the version of the product. Whenever a product is revised, the VID is incremented, according to a rigorous process derived from Telcordia GR-209-CORE, an industry guideline that governs product change notices.

The SN is the vendor-unique serialization of the product. Each manufactured product carries a unique serial number assigned at the factory, which cannot be changed in the field. This number identifies an individual, specific instance of a product.

Unique Device Identifier

See UDI.
