THE SPECIFICATIONS AND INFORMATION REGARDING THE PRODUCTS IN THIS MANUAL ARE SUBJECT TO CHANGE WITHOUT NOTICE. ALL STATEMENTS, INFORMATION, AND RECOMMENDATIONS IN THIS MANUAL ARE BELIEVED TO BE ACCURATE BUT ARE PRESENTED WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED. USERS MUST TAKE FULL RESPONSIBILITY FOR THEIR APPLICATION OF ANY PRODUCTS.

THE SOFTWARE LICENSE AND LIMITED WARRANTY FOR THE ACCOMPANYING PRODUCT ARE SET FORTH IN THE INFORMATION PACKET THAT SHIPPED WITH THE PRODUCT AND ARE INCORPORATED HEREIN BY THIS REFERENCE. IF YOU ARE UNABLE TO LOCATE THE SOFTWARE LICENSE OR LIMITED WARRANTY, CONTACT YOUR CISCO REPRESENTATIVE FOR A COPY.

The following information is for FCC compliance of Class A devices: This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio-frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case users will be required to correct the interference at their own expense.

The following information is for FCC compliance of Class B devices: This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If the equipment causes interference to radio or television reception, which can be determined by turning the equipment off and on, users are encouraged to try to correct the interference by using one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

Modifications to this product not authorized by Cisco could void the FCC approval and negate your authority to operate the product.

The Cisco implementation of TCP header compression is an adaptation of a program developed by the University of California, Berkeley (UCB) as part of UCB's public domain version of the UNIX operating system. All rights reserved. Copyright © 1981, Regents of the University of California.

NOTWITHSTANDING ANY OTHER WARRANTY HEREIN, ALL DOCUMENT FILES AND SOFTWARE OF THESE SUPPLIERS ARE PROVIDED "AS IS" WITH ALL FAULTS. ## Preface

---

This section discusses the objectives, audience, conventions, and organization of the *N+1 High Availability Deployment Guide* and provides general information about Cisco IOS software documentation.

Cisco documentation and additional literature are available in a CD-ROM package, which ships with your product. The Documentation CD-ROM, a member of the Cisco Connection Family, is updated monthly. Therefore, it might be more up to date than printed documentation. To order additional copies of the Documentation CD-ROM, contact your local sales representative or call customer service. The CD-ROM package is available as a single package or as an annual subscription.

## Objectives

This guide provides information on the theory of operation and configuration for the Cisco Unified Wireless LAN controller (WLC) as it applies to N+1 High Availability (HA).

## Audience

This publication is intended primarily for users who configure and maintain routers, but are not necessarily familiar with tasks, the relationship between tasks, or the commands necessary to perform particular tasks to configure VoIP. In addition, this publication is intended for users with some familiarity with IP and telephony networks.

## Cisco IOS Software Documentation

In addition to the information provided in this publication, you might need to refer to the Cisco IOS documentation set. The Cisco IOS software documentation is divided into nine modules and two master indexes. Each module consists of two books: a configuration guide and a corresponding command reference. Chapters in a configuration guide describe protocols, configuration tasks, and Cisco IOS software functionality and contain comprehensive configuration examples. Chapters in a command reference provide complete command syntax information. Each configuration guide can be used in conjunction with its corresponding command reference.

# Organization

This chapter describes the contents of each chapter in this document.

**Table 1**      *Organization*

Chapter	Title	Description
Chapter 1	Introduction	N+1 HA feature set within the Cisco Unified Wireless Network (CUWN)
Chapter 2	N+1 HA Overview	High Availability architecture
Chapter 3	Licensing	High Availability licenses

# Command Syntax Conventions

[Table 2](#) describes the syntax used with the commands in this document.

**Table 2**      *Command Syntax Guide*

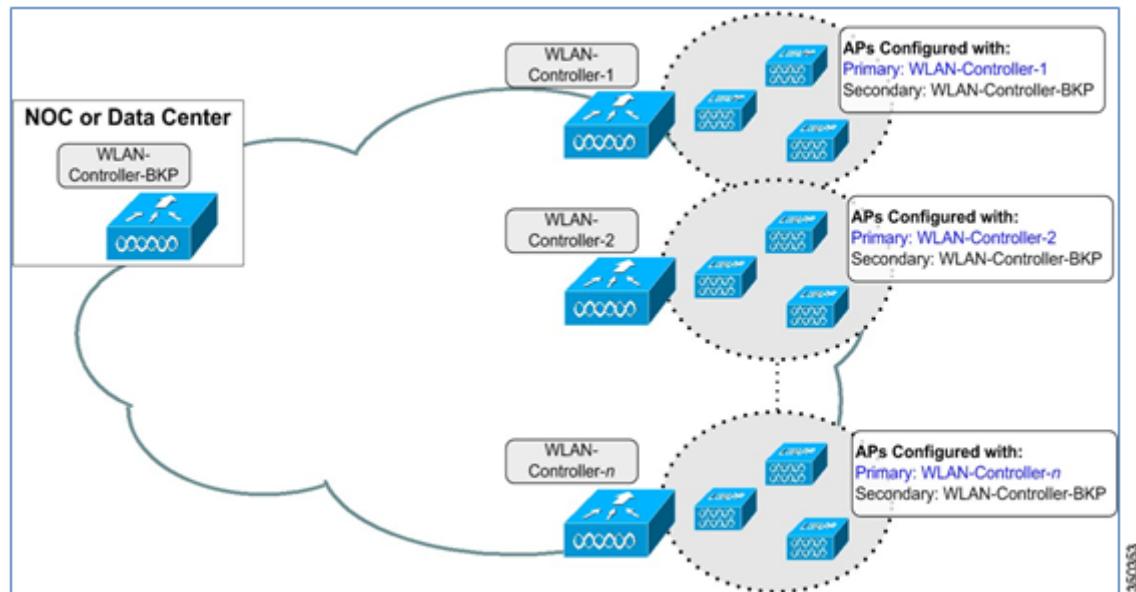

Convention	Description
<b>boldface</b>	Commands and keywords.
<i>italic</i>	Command input that is supplied by you.
[ ]	Keywords or arguments that appear within square brackets are optional.
{ x   x   x }	A choice of keywords (represented by x) appears in braces separated by vertical bars. You must select one.
^ or Ctrl	Represent the key labeled <i>Control</i> . For example, when you read ^D or <i>Ctrl-D</i> , you should hold down the Control key while you press the D key.
screen font	Examples of information displayed on the screen.
<b>boldface screen font</b>	Examples of information that you must enter.
< >	Nonprinting characters, such as passwords, appear in angled brackets.
[ ]	Default responses to system prompts appear in square brackets.

# Introduction

The N+1 HA feature set within the Cisco Unified Wireless Network (CUWN) framework allows a single WLC to be used as a backup WLC for N primary controllers. (See [Figure 1-1](#).) Earlier than release 7.4, the N+1 HA model requires a permanent AP count license on the backup controller. With Release 7.4 and later, an HA-SKU secondary controller can be used as the backup controller for multiple primary controllers. The overall goal for the addition of N+1 HA with HA-SKU is to reduce the total cost of ownership (TCO) for geographically separate HA deployments across the WAN link.

**Figure 1-1**      **N+1 HA Topology**

## Prerequisites

## Requirements

There are no specific requirements for this document.

## Components Used

The information in this document is based on these software and hardware versions:

- 5500, 7500, and 8500 Series WLCs; Wireless Services Module 2 (WiSM-2) WLCs
- 1130, 1240, 1250, 1040, 1140, 1260, 3500, and 3600 Series APs; 1520 or 1550 Series Mesh APs

The information in this document was created from the devices in a specific lab environment. All devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

## Conventions

Refer to [Cisco Technical Tips Conventions](#) for more information on document conventions.

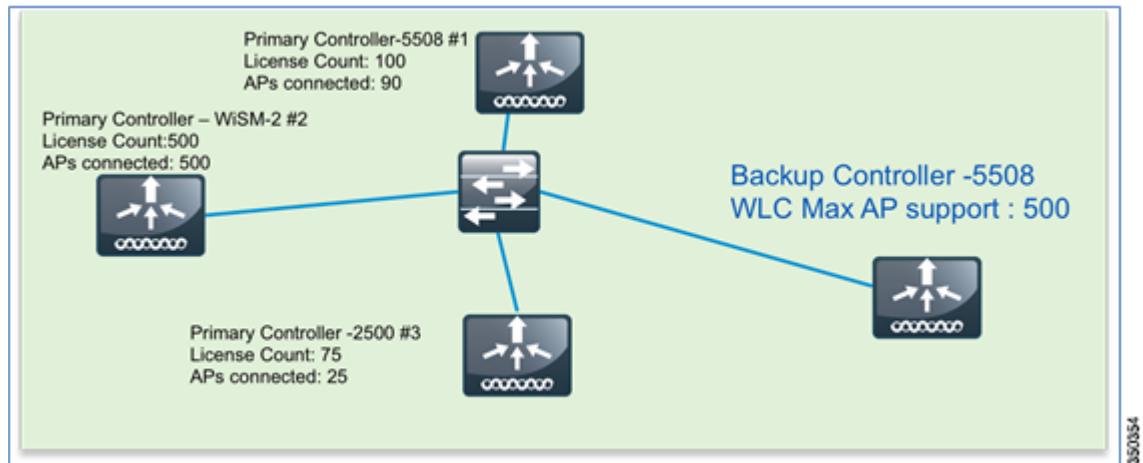

## N+1 High Availability Overview

### N+1 HA Overview

- The N+1 HA architecture provides redundancy for controllers across geographically separate data centers with low cost of deployment.
- A single backup controller can be used in order to provide backup for multiple primary WLCs, with consideration for appropriate compatibility in terms of AP mode. (See [Figure 2-1](#))
- These WLCs are independent of each other and do not share configuration or IP addresses on any of their interfaces. Each WLC needs to be managed separately by Cisco Prime, can run a different hardware and a different software version, and can be deployed in different datacenters across the WAN link.
- Access Point Stateful Switch Over (AP SSO) functionality is not supported for N+1 HA. The AP Control and Provisioning of Wireless Access Points (CAPWAP) state machine is restarted when the primary controller fails.
- When a primary WLC resumes operation, the APs fall back from the backup WLC to the primary WLC automatically if the AP fallback option is enabled.
- APs with high priority on the primary controller always connect first to the backup controller, even if they have to push out low priority APs.
- When using a permanent AP count license for the backup controller, the 90-day timer does not start when the APs join the backup controller.
- With Release 7.4, an HA-SKU secondary controller can be configured as a backup controller for N+1 HA. For example, the following can be used as an HA-SKU controller:
  - 5508 Series Standalone controller with 50 AP license
  - WiSM-2 Wireless LAN controller
  - 7500 Series Standalone controller
  - 8500 Series Standalone controller
- As soon as an AP joins the HA-SKU secondary controller, the 90-day timer starts, and the user sees a warning message after 90 days. In other words, an HA-SKU controller can be used as a secondary controller for 90 days without a warning message.

- The HA-SKU Unique Device Identifier (UDI) provides the capability of the maximum number of APs supported on that hardware. For instance, a 5508 HA- SKU controller provides support for 500 APs.
- The N+1 Secondary HA-SKU cannot be configured in combination with AP SSO. They are mutually exclusive.

**Figure 2-1** **N+1 HA**

## Supported Hardware

N+1 HA with HA-SKU is supported on the 5500, 7500, and 8500 Series of standalone controllers as well as the WiSM-2 WLCs.

## Configuration of N+1 HA with HA-SKU with the CLI

From the primary controller, configure the backup controller on the primary to point to the secondary controller. Use the config advanced backup-controller primary backup\_controller\_name backup\_controller\_IP\_address command. (See [Figure 2-2](#).)

**Figure 2-2** **Primary WLC (CLI)**

```
(5500) >config advanced backup-controller primary Secondary 9.5.56.2
Wireless
> DoS
(5500) >show advanced backup-controller

AP primary Backup Controller ..... Secondary 9.5.56.2
AP secondary Backup Controller ..... 0.0.0.0
350355
```

On the secondary controller, use the config redundancy unit secondary command to convert the secondary controller into an HA-SKU secondary controller.

In order to convert a controller to an HA-SKU secondary controller, it should have a minimum number of base AP count licenses; if that minimum is not met, an error message appears. (See [Figure 2-3](#)).

**Figure 2-3 Secondary WLC (CLI)**

```
(5500) >config redundancy unit secondary
Inorder to configure this controller secondary, Controller should at least have
a threshold base ap count. Please read the Documentation for further details
```

350356

On the CLI, use the show redundancy summary command to view the status of the primary and secondary controllers. (See [Figure 2-4](#) and [Figure 2-5](#).)

**Figure 2-4 Status of Primary WLC (CLI)**

```
(5500) >show redundancy summary
  Redundancy Mode = SSO DISABLED
  Local State = ACTIVE
  Peer State = N/A
  Access Points
    All APs      Unit = Primary
    Unit ID = 30:F7:0D:31:82:E0
  Redundancy State = N/A of APs
    Mobility MAC = 6C:20:56:64:B9:A0
    Dual-Band Radios
  Redundancy Management IP Address..... AP Router ..... 9.5.56.11 MAC
  Peer Redundancy Management IP Address..... 9.5.56.10

  Peer Redundancy Port IP Address..... 169.254.56.10
```

350357

**Figure 2-5 Status of HA-SKU Secondary WLC (CLI)**

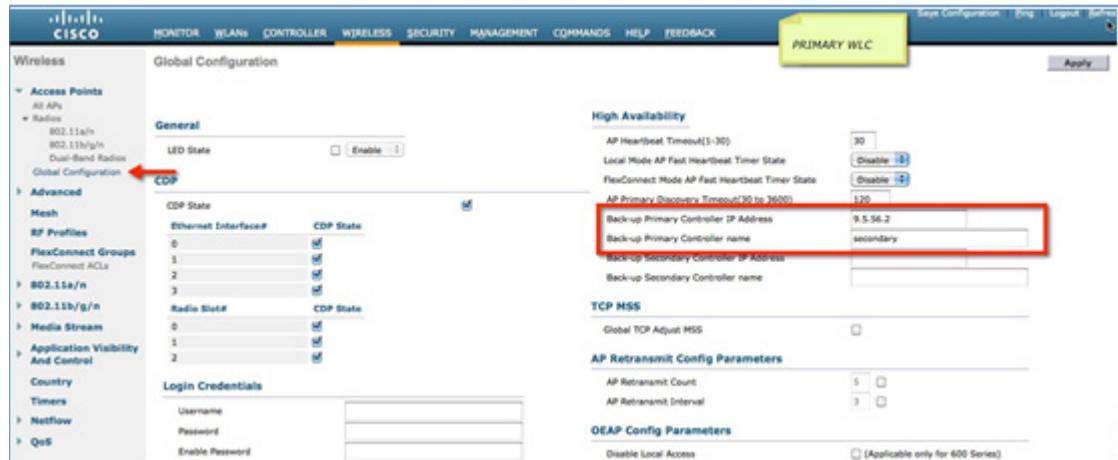

```
(5500) >show redundancy summary
  Redundancy Mode = SSO DISABLED
    Local State = ACTIVE
    Peer State = N/A
      Unit = Secondary - HA SKU
      Unit ID = 8C:20:56:64:B9:A0
  Redundancy State = N/A
    Mobility MAC = 6C:20:56:64:B9:A0

  Redundancy Management IP Address..... 9.5.56.10
  Peer Redundancy Management IP Address..... 9.5.56.11
  Redundancy Port IP Address..... 169.254.56.10
  Peer Redundancy Port IP Address..... 169.254.56.11
```

350358

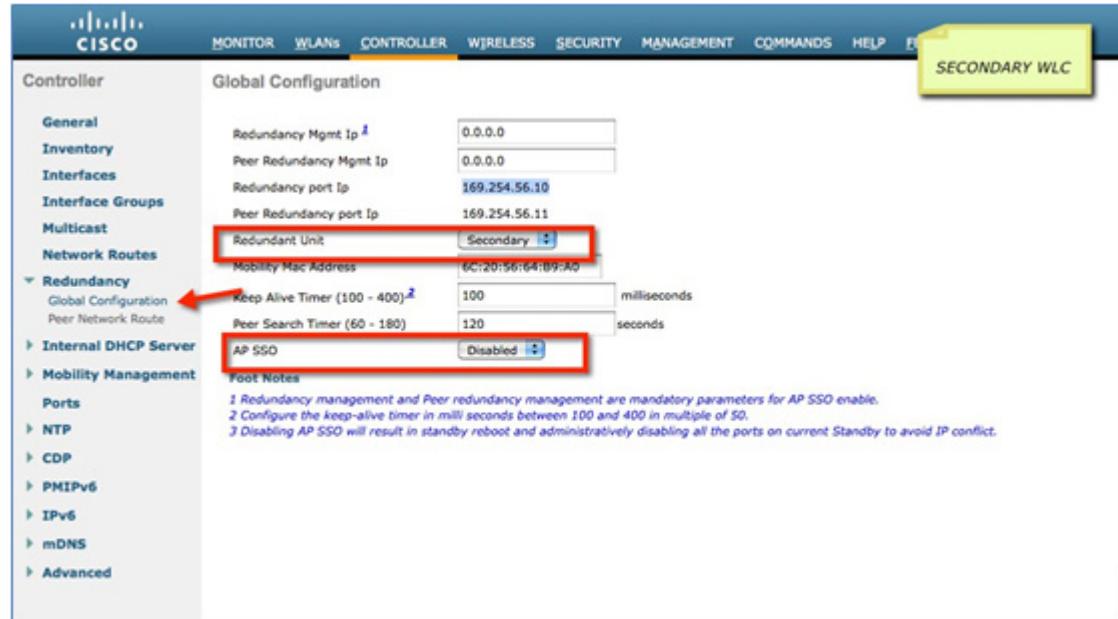

## Configuration of N+1 HA with HA-SKU with the GUI

From the primary controller, navigate to **Access Points > Global Configuration**, then configure the backup controller on the primary to point to the secondary controller. (See [Figure 2-6](#).)

**Figure 2-6 Primary WLC (GUI)**

35039

On the secondary controller, navigate to **Redundancy > Global Configuration**, then configure the secondary controller to convert it to an HA-SKU secondary controller. (See [Figure 2-7](#))

**Figure 2-7 HA-SKU Secondary WLC (GUI)**

35039

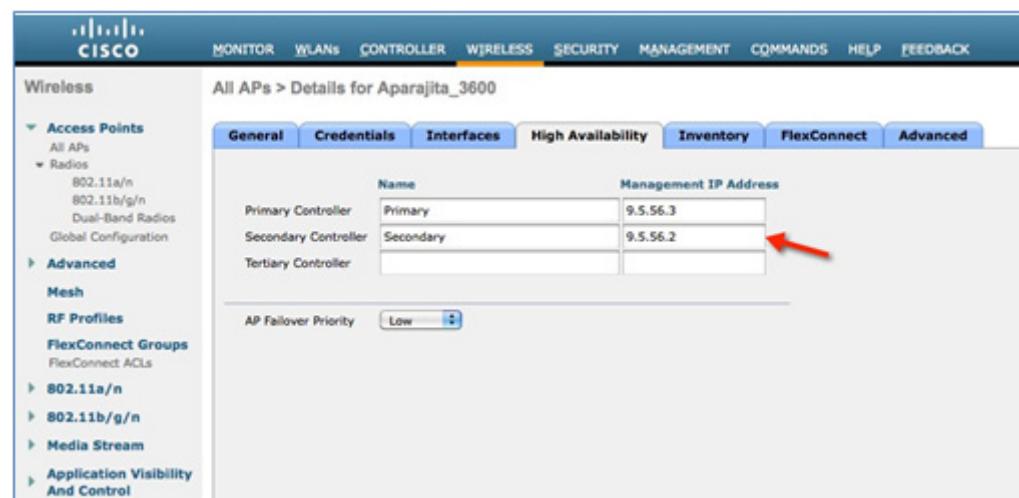

**Note** AP SSO must be disabled to configure the controller to be an N+1 HA-SKU secondary controller.

## Primary, Secondary, and Tertiary Redundancy with HA-SKU

An HA-SKU secondary controller can also be used as a primary, secondary, or tertiary controller. This can be configured under the AP specific configuration. (See [Figure 2-8](#).)

**Figure 2-8 Primary, Secondary, and Tertiary Configuration (GUI)**

The configuration on HA-SKU secondary controller is the same as shown previously.

## Licensing

# Secondary Controller Running Permanent AP Count License

A secondary controller running a permanent AP count license provides support for the number of APs specified in the permanent license. For instance, a 5508 WLC running a 50 AP count license and configured as a secondary controller provides support for 50 APs. (See [Figure 3-1](#) and [Figure 3-2](#))

**Figure 3-1      Licenses on Secondary WLC (GUI)**

The screenshot shows the Cisco Wireless LAN Controller (WLC) Management interface. The top navigation bar includes links for MONITOR, WLANs, CONTROLLER, WIRELESS, SECURITY, MANAGEMENT, COMMANDS, HELP, and FEEDBACK. A yellow box highlights the 'SECONDARY WLC' tab in the top right corner. On the left, a sidebar menu lists various management options like Summary, SNMP, HTTP-HTTPS, Telnet-SSH, Serial Port, Local Management, Users, User Sessions, Logs, Mgmt Via Wireless, Software Activation (with sub-options for Licenses, License Usage, Commands, License Agent), and Tech Support. The main content area is titled 'Licenses' and displays a table with the following data:

License	Type	Time(expires)	Count	Priority	Status
base	permanent	No Expiry	N/A	Medium	Not in Use
base-ap-count	permanent	No Expiry	12	Medium	Inactive
base-ap-count	permanent	No Expiry	50	Medium	In Use
base-ap-count	evaluation	8 weeks, 4 days	500	None	Inactive

**Figure 3-2 License Capacity on Secondary WLC (GUI)**

The screenshot shows the Cisco WLC Management interface under the 'Management' tab. On the left, there's a navigation menu with options like Summary, SNMP, HTTP-HTTPS, Telnet-SSH, Serial Port, Local Management Users, User Sessions, Logs, Mgmt Via Wireless, Software Activation (with sub-options for Licenses, License Usage, Commands, and License Agent), and Tech Support. The main panel is titled 'License Capacity' and contains a table:

Counted Feature	Max Count	Current Count	Remaining Count
AP Count	50	0	50

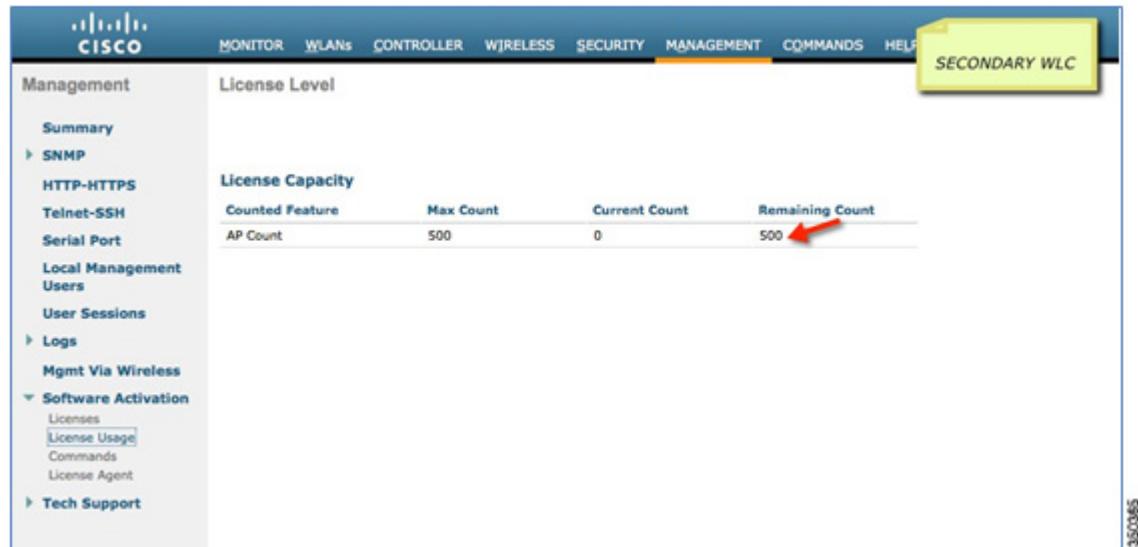

## HA-SKU Secondary Controller

A secondary controller running a minimum AP count license and configured as an HA- SKU controller provides the maximum AP capacity as supported by the hardware. For instance, a 5508 WLC running a 50 AP count license and configured as an HA-SKU secondary controller provides support for 500 APs. (See [Figure 3-3](#) and [Figure 3-4](#))

**Figure 3-3 Licenses on HA-SKU Secondary WLC (GUI)**

The screenshot shows the Cisco WLC Management interface under the 'Management' tab. The left navigation menu is identical to Figure 3-2. The main panel is titled 'Licenses' and contains a table:

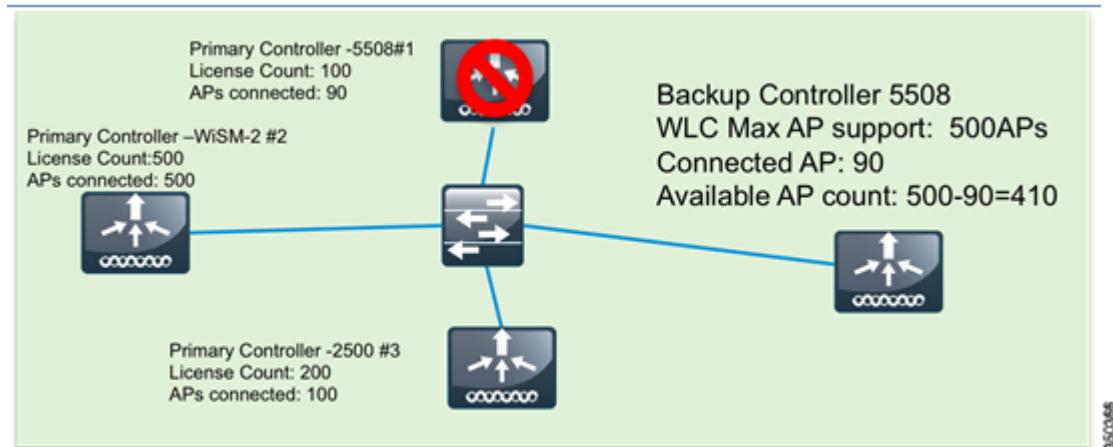

License	Type	Time(expires)	Count	Priority	Status
base	permanent	No Expiry	NA	Medium	Not in Use
base-ap-count	permanent	No Expiry	12	Medium	Inactive
base-ap-count	permanent	No Expiry	50	Medium	In Use
base-ap-count	evaluation	8 weeks, 4 days	500	None	Inactive

**Figure 3-4 License Capacity on HA-SKU Secondary WLC (GUI)**

## Failover Process

In the N+1 HA redundancy model, one WLC serves as the backup controller for N primary controllers. When any of the primary WLCs fail, the APs connected to that controller fall back to the backup controller. The AP has to restart its CAPWAP state machine and go through a complete discovery phase before it joins the backup controller. The available AP count on the backup controller is reduced by the number of APs that fall back from the primary WLC to the backup WLC.

For example, when the primary controller supporting 90 APs fails, these APs fall back to the backup controller that has a maximum AP support of 500. The backup WLC is left with an available AP count of  $500 - 90 = 410$  APs. (See [Figure 3-5](#).)

**Figure 3-5 N+1 HA Failover**

This is explained further in the following examples.

## **AP Connected to Primary WLC Running 12 AP Permanent Count License**

To see the license capacity, navigate to **Software Activation > License Usage**. (See Figure 3-6)

**Figure 3-6 License Capacity on Primary WLC (GUI)**

Management				
License Level				
License Capacity				
Counted Feature	Max Count	Current Count	Remaining Count	
AP Count	12	1	11	

On the CLI, use the show license capacity command. (See Figure 3-7.)

**Figure 3-7 License Capacity on Primary WLC (CLI)**

```
(5500) >show ap uptime

(5500) >show license capacity  
+ QoS  
  
Licensed Feature Max Count Current Count Remaining Count  
-----  
AP Count 12 1 11
```

## **AP Failover to Secondary Controller**

With Release 7.4, the secondary controller can either be a permanent AP count controller or an HA-SKU controller.

## Secondary Controller Running Permanent AP Count License

In this example, the secondary controller is running a 50 AP permanent license and has a maximum AP capacity of 50. (See [Figure 3-8](#) and [Figure 3-9](#).)

**Figure 3-8 License Capacity of 50 on Secondary WLC (GUI)**

Counted Feature	Max Count	Current Count	Remaining Count
AP Count	50	0	50

**Figure 3-9 License Capacity of 50 on Secondary WLC (CLI)**

```
(5500) >show license capacity

Licensed Feature      Max Count      Current Count      Remaining Count
-----
AP Count              50                      0                  50

(5500) >show license in-use

StoreIndex: 2  Feature: base-ap-count          Version: 1.0
License Type: Permanent
License State: Active, In Use
License Count: 50 /50 (Active/In-use) ←
License Priority: Medium
```

When the AP connected to the primary controller fails over to the secondary controller, the available AP license count is reduced from 50 to 49. (See [Figure 3-10](#).)

**Figure 3-10 License Capacity Reduced to 49 on Secondary WLC (GUI)**

The screenshot shows the Cisco Wireless LAN Controller (WLC) Management interface. The top navigation bar includes MONITOR, WLANS, CONTROLLER, WIRELESS, SECURITY, MANAGEMENT, and COMMANDS. The MANAGEMENT tab is selected. A yellow callout box labeled "SECONDARY WLC" points to the top right corner of the interface. The left sidebar has a tree view with nodes like Management, Summary, SNMP, HTTP-HTTPS, Telnet-SSH, Serial Port, Local Management Users, User Sessions, Logs, Mgmt Via Wireless, Software Activation (with sub-nodes Licenses, License Usage, Commands, License Agent), and Tech Support. The main content area is titled "License Capacity" and displays a table:

Counted Feature	Max Count	Current Count	Remaining Count
AP Count	50	1	49

On the CLI, use the show ap uptime and show license capacity commands to verify the change in license count. (See Figure 3-11.)

**Figure 3-11 License Capacity Reduced to 49 on Secondary WLC (CLI)**

```
(5500) >show ap uptime [REDACTED]

-----  -----
AP Count          50            1                  49
```

## HA-SKU as Secondary Controller

With Release 7.4, an HA-SKU controller can be used as a secondary controller. In this example, the secondary controller is running a 50 AP permanent license and is configured to be an HA-SKU controller. Therefore it has a maximum AP capacity of 500. (See [Figure 3-12](#) and [Figure 3-13](#).)

**Figure 3-12 License Capacity of 500 on HA-SKU Secondary WLC (GUI)**

Counted Feature	Max Count	Current Count	Remaining Count
AP Count	500	0	500

**Figure 3-13 License Capacity of 500 on HA-SKU Secondary WLC (CLI)**

```
(5500) >show license in-use
  802.11b/g/n
StoreIndex: 2  Feature: base-ap-count Version: 1.0
  Media   License Type: Permanent

  AP Count              500                  0                  500
```

When the AP connected to the primary controller fails over to the secondary controller, the available AP license count is reduced from 500 to 499. (See [Figure 3-14](#).)

**Figure 3-14 License Capacity Reduced to 499 on HA-SKU Secondary WLC (GUI)**

Counted Feature	Max Count	Current Count	Remaining Count
AP Count	500	1	499

On the CLI, use the show ap uptime and show license capacity commands to verify the change in license count. (See Figure 3-15)

**Figure 3-15 License Capacity Reduced to 499 on HA-SKU Secondary WLC (CLI)**

```
(5500) >show ap uptime
AP Name / Ethernet MAC AP Up Time Association Up Time
----- -----

> Netflow

(5500) >show license capacity

Licensed Feature Max Count Current Count Remaining Count
----- -----
AP Count 500 1 499
```

Ninety days after the first AP joins the HA-SKU secondary controller, warning messages, as shown below, begin to appear on the console of the controller.

```
(Cisco Controller) >
=====
Dear Administrator,
Your Licenses are not sufficient to be able to serve AP's that your are serving
as of now. It is Cisco's (magnanimous) policy to allow the Controllers in HA-Mode
to serve APs without actually having AP Count Licenses for 90 days.
But then, You seem to have already used it for 91 days, Which is Illegal.

Please treat this as a very important - and contact Cisco as early as possible
=====

350377

## Upgrade/Downgrade

Each of the controllers in the N+1 HA model needs to be upgraded or downgraded independently. However, when an AP fails over to a WLC running a version other than that on the primary, the corresponding image is downloaded to the AP. This adds to the failover time.

## Limitations

The AP SSO must be disabled to use the HA-SKU secondary as a backup for N primary controllers.

**■ Failover Process**
