Introduction

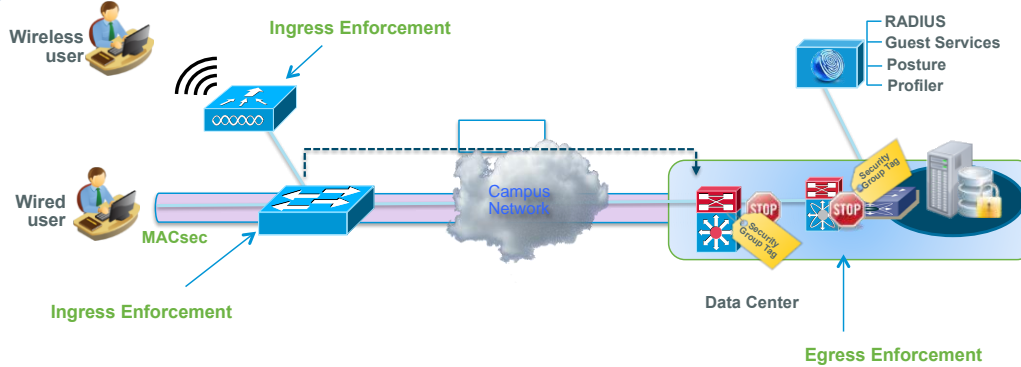

What Is the Cisco TrustSec System?

Cisco TrustSec®, a core component of the Cisco SecureX Architecture™, is an intelligent access control solution. TrustSec mitigates security risks by providing comprehensive visibility into who and what is connecting across the entire network infrastructure, and exceptional control over what and where they can go.

TrustSec builds on your existing identity-aware access layer infrastructure (switches, wireless controllers, and so on). The solution and all the components within the solution are thoroughly vetted and rigorously tested as an integrated system.

In addition to combining standards-based identity and enforcement models, such as IEEE 802.1X and VLAN control, the TrustSec system it also includes advanced identity and enforcement capabilities such as flexible authentication, Downloadable Access Control Lists (dACLs), Security Group Tagging (SGT), device profiling, posture assessments, and more.

Figure 1: TrustSec Architecture Overview

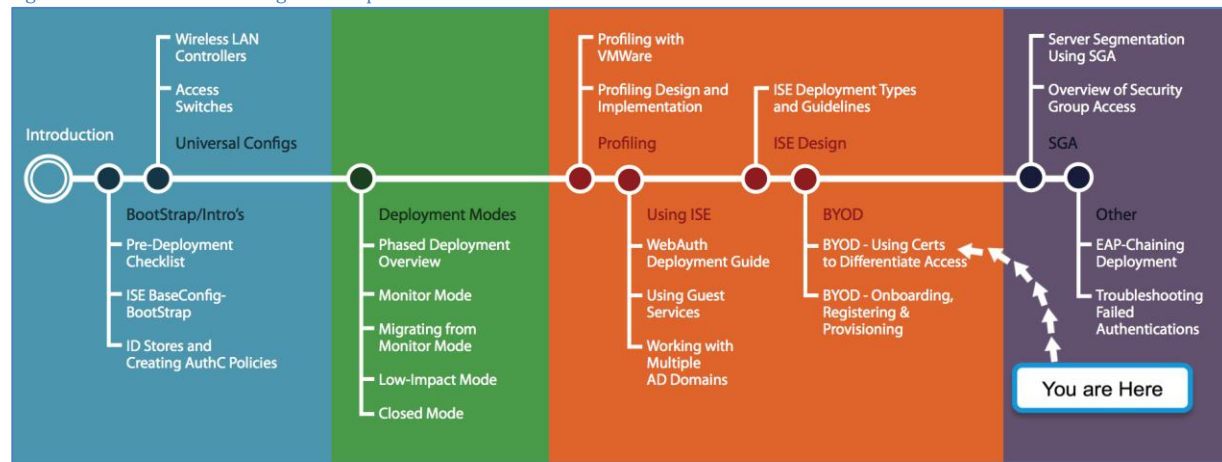

About the TrustSec How-To Guides

The TrustSec team is producing this series of How-To documents to describe best practices for TrustSec deployments. The documents in the series build on one another and guide the reader through a successful implementation of the TrustSec system. You can use these documents to follow the prescribed path to deploy the entire system, or simply pick the single use-case that meets your specific need.

Each guide in this series comes with a subway-style “You Are Here” map to help you identify the stage the document addresses and pinpoint where you are in the TrustSec deployment process (Figure 2).

Figure 2: How-To Guide Navigation Map

What does it mean to be ‘TrustSec Certified’?

Each TrustSec version number (for example, TrustSec Version 2.0, Version 2.1, and so on) is a certified design or architecture. All the technology making up the architecture has undergone thorough architectural design development and lab testing. For a How-To Guide to be marked “TrustSec certified,” all the elements discussed in the document must meet the following criteria:

- Products incorporated in the design must be generally available.
- Deployment, operation, and management of components within the system must exhibit repeatable processes.
- All configurations and products used in the design must have been fully tested as an integrated solution.

Many features may exist that could benefit your deployment, but if they were not part of the tested solution, they will not be marked as “TrustSec certified”. The TrustSec team strives to provide regular updates to these documents that will include new features as they become available, and are integrated into the TrustSec test plans, pilot deployments, and system revisions. (i.e., TrustSec 2.2 certification).

Additionally, many features and scenarios have been tested, but are not considered a best practice, and therefore are not included in these documents. As an example, certain IEEE 802.1X timers and local web authentication features are not included.

Note: Within this document, we describe the recommended method of deployment, and a few different options depending on the level of security needed in your environment. These methods are examples and step-by-step instructions for TrustSec deployment as prescribed by Cisco best practices to help ensure a successful project deployment.

Overview

This how-to guide addresses the use of certificates to identify corporate vs. non-corporate devices and how to apply different authorization policies based on this classification. This How-To Guide also covers how the system is setup for on-boarding which includes native supplicant provisioning, the type of certificates being pushed and what fields within the certificates can be used to write policy to differentiate access.

Digital Certificates

Although profiling can be used as a method of identifying and classifying endpoints, digital certificates may also be used to provide similar functionality. The use of Digital Certificates along with profiling can additively provide a more accurate mechanism for finger-printing endpoints

Digital signatures, enabled by public key cryptography, provide a way to authenticate devices and users. In public key cryptography, such as the RSA encryption system, each user has a key pair containing both a public and a private key. The keys act as complements, and anything encrypted with one of the keys can be decrypted with the other.

In simple terms, a signature is formed when data is encrypted with a private key. The signature is attached to the data and sent to the receiver. The receiver applies the public key of the sender to the data. If the signature sent with the data matches the result of applying the public key to the data, the validity of the message is established. This process relies on the receiver having a copy of the public key of the sender and a high degree of certainty that this key belongs to the sender, not to someone pretending to be the sender.

Certificate Provisioning

The Cisco Identity Services Engine supplicant provisioning supports the deployment of supplicant profiles. The provisioning of EAP-TLS profiles also includes the provisioning of digital certificates. In that case the Cisco Identity Services Engine Policy Services Node (PSN) acts as a Registration Authority for endpoints initiating SCEP requests.

Table 1 lists the supported platforms, certificate location after download and corresponding place to view or clear a certificate.

Table 1: Supported Platforms

Device	Certificate Store	Certificate Info	Version
iPhone/iPad/iPod	Device Certificate Store (configuration profiles)	Can be viewed through: Settings → General → Profile	5.0 and above
Android	Device Encrypted Certificate Store	Cannot be viewed. But it may be cleared from: Settings → Location & Security → Clear Storage (Clear all device certificates and passwords)	3.2 & above
Windows	User Certificate Store	Can be viewed by launching the Certificate Snap-In for MMC.	WindowsXP – SP3 Windows Vista – SP? Windows7 – all versions
MacOS-X	Keychains	Can be viewed by launching application → Utilities → Keychain Access	MacOS-X 10.6 and 10.7

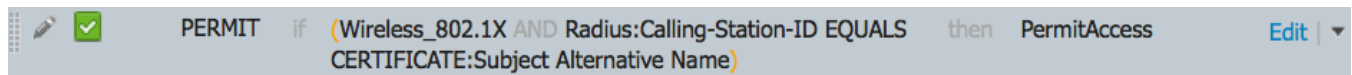

Note: MACOS-X 10.8 has the following Caveats

1. SPW (Supplicant MAC and is not getting installed when we select the option "MAC App Store and identified developers" in security & Privacy Preference Pane
2. Pop up is presented multiple times when installing SPW Profile/Certificate

The provisioned certificate will have the following attributes:

Common Name (CN) of the Subject:
User identity used for authentication

Subject Alternative Name: MAC address(es) of the endpoint.

Note: Within this document, we describe the recommended method of deployment, and a few different options depending on the level of security needed in your environment. These methods are examples and step-by-step instructions for Cisco TrustSec deployment as prescribed by best practices to ensure a successful project deployment.

Warning: The document has been designed to be followed from beginning to end – bypassing sections may have undesirable results.

Scenario Overview

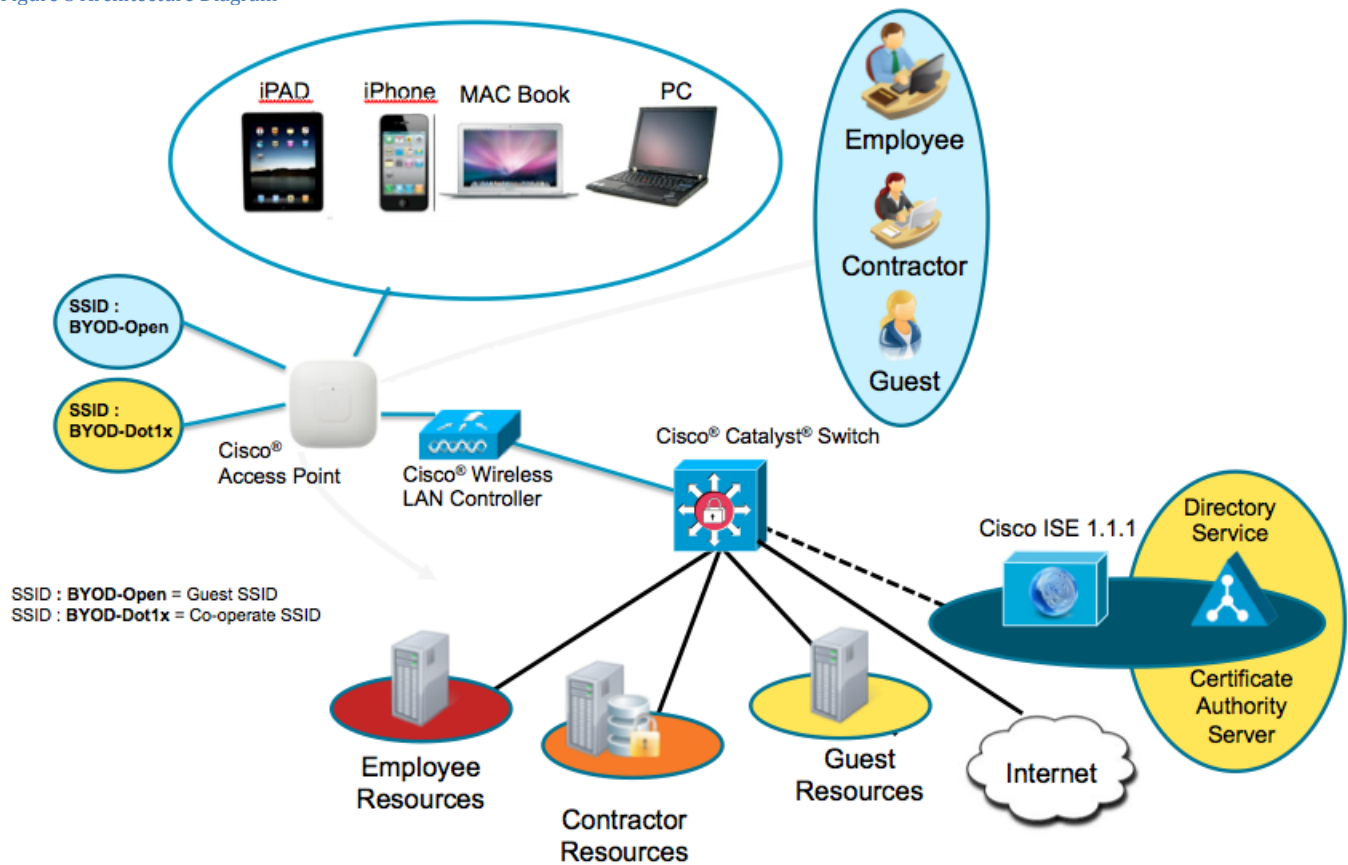

This document will discuss the self-service on-boarding of personal devices, where an employee will register a new device, and a certificate is automatically provisioned for that user & device and installed along with a supplicant profile that is pre-configured to use that certificate & connect the device to the corporate network. The Cisco ISE policy will also be configured to provide differentiated access to the user/device based on the certificate.

To explain the scenario used in this document, let's follow an example of Native Supplicant Provisioning and Authorization of an iPad:

1. An employee connects to the corporate wireless SSID using their new iPad.
2. The iPad web browser will be redirected to a self-registration portal hosted on the Cisco ISE Policy Services Node (PSN).
3. The employee will enter their credentials into the web portal
4. The employee's credentials are authenticated against the corporate Active Directory or other corporate Identity Store.
5. The PSN will send down an Apple Over-the-Air (OTA) provisioning profile that will generate the Certificate Signing Request (CSR).
6. The iPad sends the CSR to the Policy Services Node which, acting as a Registration Authority, will proxy the request to the Active-Directory Certificate Authority (CA).
7. The Active Directory Certificate Authority will issue the certificate and send it back to the Cisco ISE Policy Services Node.
8. Using OTA, the Cisco ISE PSN sends a new profile to the iPad including the issued certificate embedded with the iPad's MAC address and employee's AD username as well as a Wi-Fi supplicant profile that enforces the use of EAP-TLS for 802.1X authentication.
9. Now the iPad is configured to associate to the corporate wireless network using EAP-TLS for authentication (incase if dual-SSID Employee would have to manually connect to the corporate SSID where as for single-SSID iPad would automatically reconnect using EAP-TLS), and the Cisco ISE authorization policy will use the attributes in the certificate to enforce network access (for example, provide limited access, since this is not a corporate asset).

Architecture/ Diagram

Figure 3 Architecture Diagram

Components

Table 2: Components Used in this Document

Component	Hardware	Features Tested	Cisco IOS® Software Release
The Cisco Identity Services Engine (ISE)	Any: 1121/3315, 3355, 3395, VMware	Integrated AAA, policy server, and services (guest, profiler, and posture)	ISE 1.1.1
Certificate Authority Server	Any per specification of Microsoft (Windows 2008 R2 Enterprise SP2)	SCEP, Certificate Authority Server	N/A
Wireless LAN Controller (WLC)	5500-series 2500-series WLSM-2	Profiling and Change of Authorization (CoA)	Unified Wireless 7.2.???
Apple iOS and Google Android	Apple & Google	N/A	Apple iOS 5.0 Google Android 2.3

Note: Wireless was tested with Central Switching mode only.

The Cisco Identity Services Engine Configuration

In this section we will go through steps that will be needed to implement the use case described in the How-To-Guide. This will include basic configuration like creating a user group to advance configurations like creating a supplicant profile for EAP-TLS and an Auth policy to check for Certificates.

Identify Users for BYOD Flow.

As part of user on-boarding (On-Boarding is a term that references the process of registering an asset and provisioning that assets supplicant to be able to access the corporate network), we can select identity stores to define resources to be forwarded to on-boarding (BYOD) flow. The following example illustrates users defined in local store in the Cisco Identity Services Engine as well as in Active Directory, which are part of the identity source sequence.

As part of the best-practice on-boarding procedure, we will use Active Directory as the identity-source to determine what group(s) of users are permitted to on-board their device(s). The following procedure illustrates users defined in the Cisco ISE local user-database as well as in Active Directory, which are part of the identity source sequence.

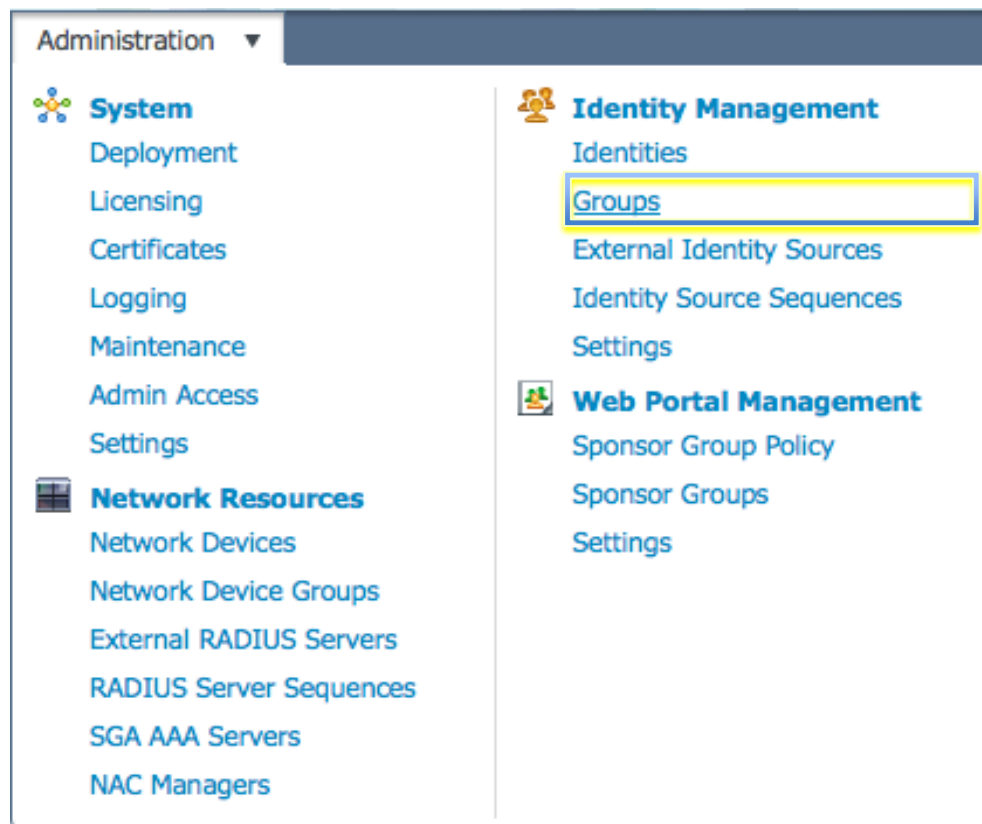

User Groups are a collection of individual users or endpoints that share a common set of privileges that allow them to access a specific set of Cisco ISE services and functionality. For example, if you belong to the Change User Password admin group, you can change administrative passwords for other users.

Procedure 1 Configure a user group

Step 1 Navigate to Administration → Identity Management → Groups

Step 2 Click on ADD.

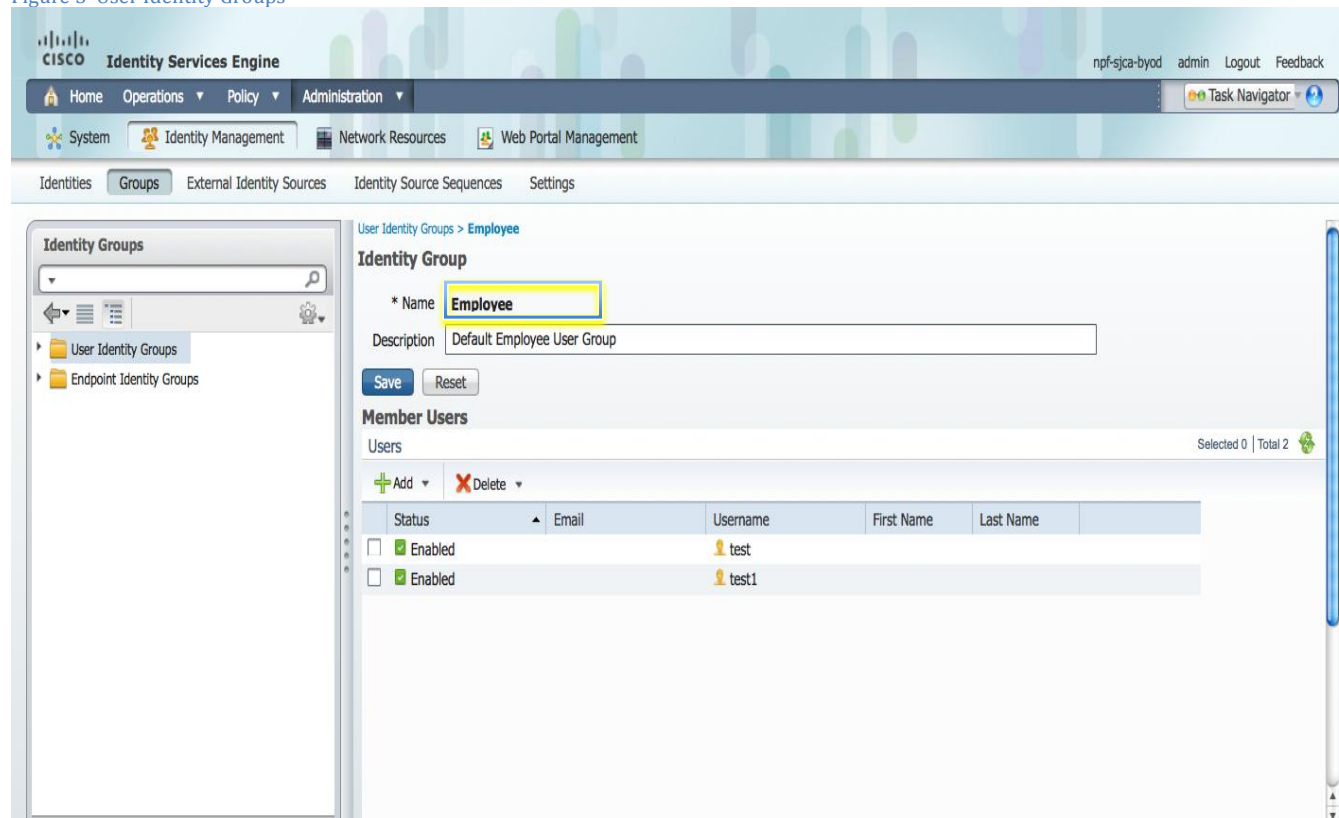

Figure 4 Identity Groups Navigation

Step 3 Create an Identity Group.

In this example we are naming our Identity Group: “Employee”

Figure 5 User Identity Groups

Procedure 2 Create a user in the Employee Group

Step 1 Navigate to Administration → Identity Management → Identities → Users

Step 2 Click on ADD

Create a Certificate Authentication Profile.

Certificate authentication profiles (CAPs) are used in authentication policies for certificate-based authentications. The CAP defines certain attributes in the certificate to view & use as an additional identity source. For example, if the username is in the CN= field of the certificate, you will create a CAP that examines the CN= field. That data may then be used and checked against other identity sources, such as Active Directory. The certificate authentication profile allow you to specify the following items:

The certificate field that should be used as the principal username

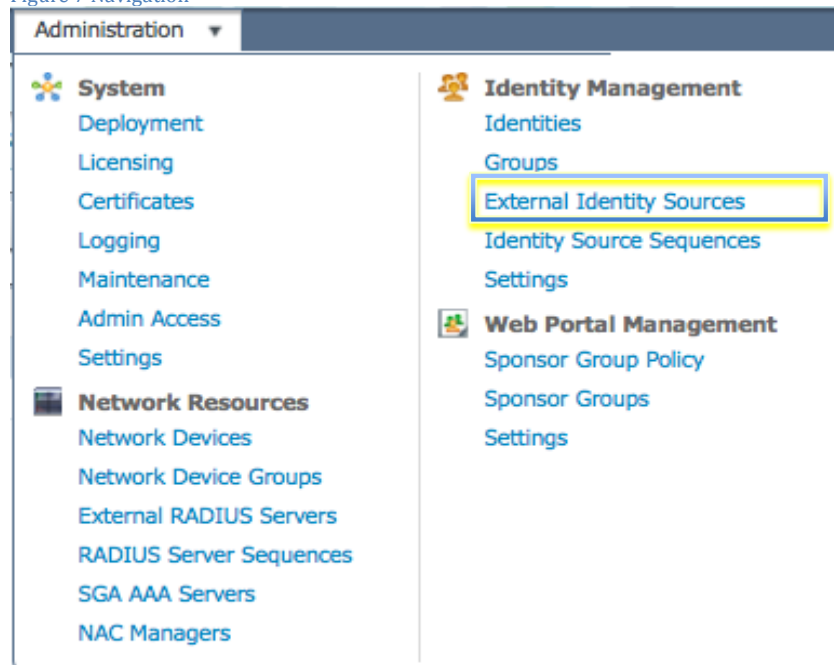

Whether a binary comparison of the certificate should be performed

Note: The Certificate Authentication Profiles page lists the profiles that you have added.

Procedure 1 Create a Certificate Authorization Profile

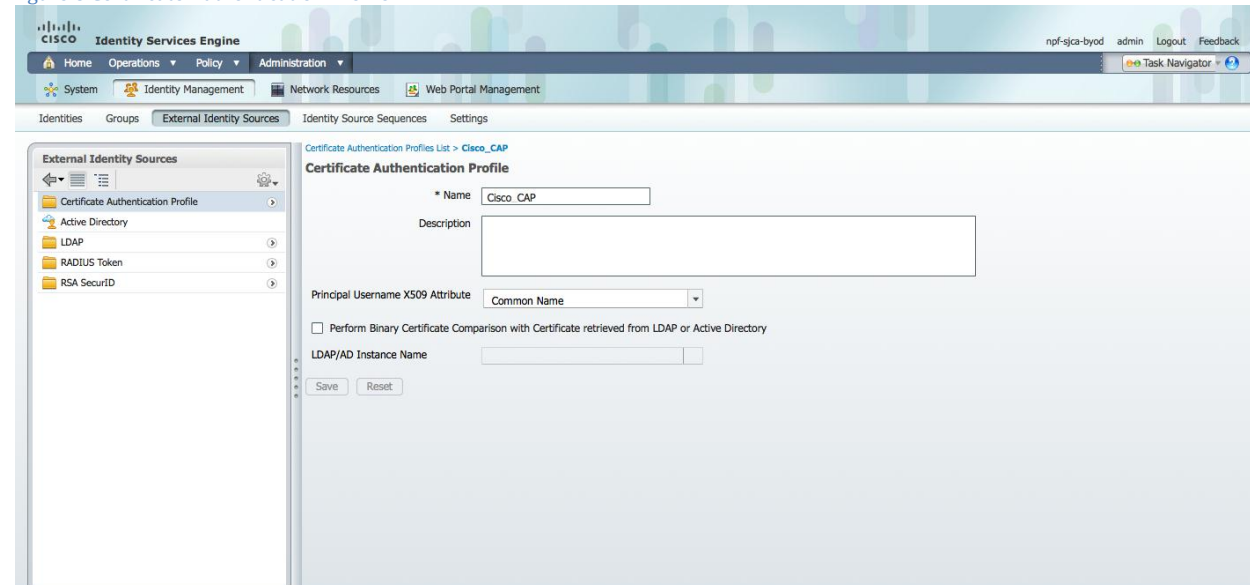

Step 1 Navigate to Administration → External Identity Sources → Certificate Authorization Profile

Figure 7 Navigation

Step 2 Click ADD and Name the profile, in this case its named as “Cisco_CAP”

Figure 8 Certificate Authentication Profile

Create an Identity Source Sequence.

Identity source sequences define the order in which the Cisco ISE will look for user credentials in the different databases. Cisco ISE supports the following databases: Internal Users, Internal Endpoints, Active Directory, LDAP, RSA, RADIUS Token Servers and Certificate Authentication Profiles.

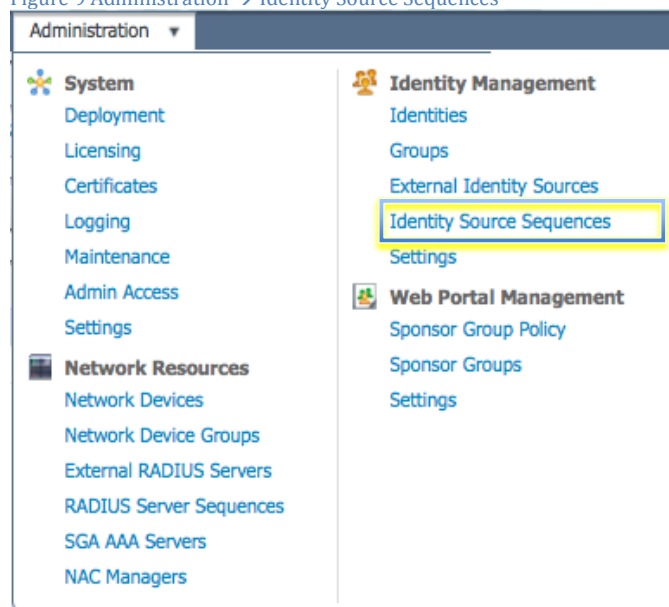

If your organization stores credentials in more than one of these identity stores, you can define an identity source sequence, which states the order in which you want the Cisco ISE to look for user information in these databases. Once a match is found, the Cisco ISE does not look any further, but evaluates the credentials and returns the authorization result to the Network Access Device. This policy is the first match policy.

Procedure 1 Create an Identity source sequence.

Step 1 Administration → Identity Source Sequence

Step 2 Click on ADD

Figure 9 Administration → Identity Source Sequences

Step 3 Name the sequence

In this example we are naming the sequence "Dot1x".

Step 4 Select the Certificate Authentication Profile created previously in the section named "Cisco_CAP".

Step 5 Select your Active Directory Server (AD1), Internal Endpoints and Internal Users in the **Authentication Search List**.

Figure 10 Identity Source Sequence

The screenshot displays the Cisco Identity Services Engine (ISE) Administration interface. The top navigation bar includes 'Home', 'Operations', 'Policy', and 'Administration'. The 'Administration' tab is active, showing sub-tabs for 'System', 'Identity Management', 'Network Resources', and 'Web Portal Management'. The 'Identity Source Sequences' sub-tab is selected, and the breadcrumb path is 'Identities > Groups > External Identity Sources > Identity Source Sequences > Settings'.

The main content area is titled 'Identity Source Sequence' and shows the configuration for a sequence named 'Dot1x'. The 'Name' field is 'Dot1x' and the 'Description' field is empty. The 'Certificate Based Authentication' section is expanded, showing a checked box for 'Select Certificate Authentication Profile' and a dropdown menu set to 'Cisco_CAP'. The 'Authentication Search List' section is expanded, showing a set of identity sources that will be accessed in sequence until first authentication succeeds. It contains two lists: 'Available' (Internal Endpoints) and 'Selected' (AD1, Internal Users). The 'Advanced Search List Settings' section is expanded, showing a radio button selected for 'Do not access other stores in the sequence and set the "AuthenticationStatus" attribute to "ProcessError"'. At the bottom, there are 'Save' and 'Reset' buttons.

Create a Client Provisioning Policy

The Cisco Identity Services Engine looks at various elements when classifying the type of login session through which users access the internal network. We can leverage Client Provisioning Policy to create supplicant profiles to configure end points (e.g iPhones, iPad's, Windows, MAC OSx ..)

With Native Supplicant Provisioning (NSP), the Cisco ISE will have different provisioning policies per operating system. Each policy will contain a "Native Supplicant Profile" which dictates whether to use PEAP or EAP-TLS, what wireless SSID to connect to, and more. Additionally the Client Provisioning Policy will reference which provisioning wizard to use.

Naturally, the supplicant one provision's for an iPad will differ from that of an Android device. To determine which package to provision to an endpoint, we leverage the Client Provisioning Policies in the Cisco ISE to bind the supplicant profile to the provisioning wizard, per operating system.

Procedure 1 Create a Native Supplicant Profile

Step 1 Go to **Policy** → **Policy Elements** → **Results**.

Step 2 Click on **Client Provisioning** → **Resources**

Step 3 Click **ADD**

Figure 9: Client Provisioning Resources Navigation

Procedure 2 Name the Native Supplicant Profile

Step 1 Select the Operating System

Note: We are able to configure one Supplicant Profile for all Operating Systems. However, we will be specifying different provisioning methods per operating-system later in this document.

Step 2 Select Connection Type, **Wired** and/or **Wireless**.

Step 3 Type your Corporate Wireless SSID, as configured on the Wireless LAN Controller.

Step 4 Select the Allowed Protocols, in this case “**TLS**” since it’s using certificates.

Step 5 Select Key Size. **1024**.

Figure 11 Native Supplicant Profile

The screenshot shows the Cisco Identity Services Engine (ISE) web interface. The top navigation bar includes 'Home', 'Operations', 'Policy', and 'Administration'. Below this, a secondary bar contains 'Authentication', 'Authorization', 'Profiling', 'Posture', 'Client Provisioning', 'Security Group Access', and 'Policy Elements'. The 'Results' tab is selected in the 'Policy Elements' section. On the left, a 'Results' sidebar shows a tree view with folders for 'Authentication', 'Authorization', 'Profiling', 'Posture', 'Client Provisioning', and 'Security Group Access'. Under 'Client Provisioning', the 'Resources' folder is expanded. The main content area is titled 'Native Supplicant Profile > EAP_TLS' and 'Native Supplicant Profile'. It contains the following fields:

- * Name: EAP_TLS
- Description: EAP_TLS
- * Operating System: ALL
- * Connection Type: ☐ Wired, ☒ Wireless
- * SSID: BYOD-Dot1x
- Security: WPA2 Enterprise
- * Allowed Protocol: TLS
- * Key Size: 1024

At the bottom of the form are 'Save' and 'Reset' buttons.

Procedure 3 Download supplicant wizards for Windows and MAC OSx

Step 1 Go to Policy → Policy Elements → Results → Client Provisioning → Resources

Step 2 On the right hand side, Click on ADD

Step 3 Choose “Agent resources from Cisco site”

In this example we have selected WinSPWizard 1.0.0.15 and MacOSXSPWizard 1.0.0.999

Figure 12 Native Supplicant Wizards A

Procedure 4 Create a Client Provisioning Policy for Apple iOS

Step 1 Go to Policy → Client Provisioning

Step 2 On the right hand, Click on Actions → Insert new Policy above

Figure 14 Client Provisioning Policy

Step 3 Create an Apple iOS CPP policy.

Figure 15 Apple iOS Client Provisioning Policy

Step 4 Create an Android CPP policy.

Figure 16 Android Provisioning Policy

Step 5 (Optional): Create a MAC OSX CPP policy.

Figure 17 MacOS-X Provisioning Policy

Step 6 (Optional): Create a Windows CPP policy.

Figure 18 Windows Client Provisioning Policy

Note: Please note that Windows and OSX have additional supplicant provisioning profiles, which are Java-based wizards to do the supplicant and certificate provision and are downloadable from cisco.com as part of updates.

Prepare the WLC for BYOD Onboarding

Procedure 1 Configure an Access Control List for Wireless LAN Controller

In this procedure, we will create multiple ACLs in the Wireless LAN Controller, which would be used later in the policy to redirect clients selected for BYOD supplicant and certificate provisioning.

The Cisco Identity Services Engine IP address = 10.35.50.165

Internal Corporate Networks = 192.168.0.0, 172.16.0.0 (to redirect)

Step 1 Create an ACL named “NSP-ACL” similar to the one depicted below.

Figure 19 ACL for re-directing client to BYOD Flow

Access Control Lists > Edit

< Back
Add New Rule

Access List Name NSP-ACL

Deny Counters 0

Seq	Action	Source IP/Mask	Destination IP/Mask	Protocol	Source Port	Dest Port	DSCP	Direction	Number of Hits	
1	Permit	0.0.0.0 /	0.0.0.0 /	Any	Any	Any	Any	Outbound	0	
		0.0.0.0	0.0.0.0							
2	Permit	0.0.0.0 /	0.0.0.0 /	ICMP	Any	Any	Any	Inbound	0	
		0.0.0.0	0.0.0.0							
3	Permit	0.0.0.0 /	10.35.50.165 /	Any	Any	Any	Any	Inbound	0	
		0.0.0.0	255.255.255.255							
4	Permit	0.0.0.0 /	0.0.0.0 /	UDP	Any	DNS	Any	Inbound	0	
		0.0.0.0	0.0.0.0							
5	Permit	0.0.0.0 /	0.0.0.0 /	UDP	Any	DHCP Server	Any	Inbound	0	
		0.0.0.0	0.0.0.0							
6	Deny	0.0.0.0 /	192.168.0.0 /	Any	Any	Any	Any	Inbound	0	
		0.0.0.0	255.255.0.0							
7	Deny	0.0.0.0 /	172.16.0.0 /	Any	Any	Any	Any	Inbound	0	
		0.0.0.0	255.240.0.0							
8	Deny	0.0.0.0 /	10.0.0.0 /	Any	Any	Any	Any	Inbound	0	
		0.0.0.0	255.0.0.0							
9	Permit	0.0.0.0 /	0.0.0.0 /	Any	Any	Any	Any	Any	0	
		0.0.0.0	0.0.0.0							

Explanation of the **NSP-ACL** in Figure 17 is as follows

1. Allow all traffic “outbound” from Server to Client
2. Allow ICMP traffic “inbound” from Client to Server for trouble shooting, it is optional
3. Allow all traffic “inbound” from Client to Server to ISE for Web Portal and supplicant and Certificate provisioning flows
4. Allow DNS traffic “inbound” from Client to Server for name resolution.
5. Allow DHCP traffic “inbound” from Client to Server for IP addresses.
6. Deny all traffic “inbound” from Client to Server to corporate resources for redirection to ISE (As per company policy)
7. Deny all traffic “inbound” from Client to Server to corporate resources for redirection to ISE (As per company policy)
8. Deny all traffic “inbound” from Client to Server to corporate resources for redirection to ISE (As per company policy)
9. Permit all the rest of traffic (Optional)

Step 2 Create an ACL named “**BLACKLIST-ACL**” in the Wireless LAN Controller, which would be used in the policy later to restrict access to blacklisted devices.

Figure 20 Blacklist ACL

Access Control Lists > Edit [< Back](#) [Add New Rule](#)

5	Deny	0.0.0.0 / 0.0.0.0	0.0.0.0 / 0.0.0.0	Any	Any	Any	Any	Any	0	<input checked="" type="checkbox"/>

Explanation of the **BLACKLIST-ACL** in Figure 18 is as follows

1. Allow all traffic “outbound” from Server to Client
2. Allow ICMP traffic “inbound” from Client to Server for trouble shooting, it is optional
3. Allow all traffic “inbound” from Client to Server to ISE for Blacklist Web Portal page
4. Allow DNS traffic “inbound” from Client to Server for name resolution.
5. Deny all the rest of traffic.

Step 3 Create an ACL named “**NSP-ACL-Google**” in the Wireless LAN Controller, which would be used in the policy later for provisioning Android devices.

Figure 21 ACL for Google Access

Access Control Lists > Edit

General

Access List Name: NSP-ACL-Google

Deny Counters: 0

Seq	Action	Source IP/Mask	Destination IP/Mask	Protocol	Source Port	Dest Port	DSCP	Direction	Number of Hits	
1	Permit	0.0.0.0 / 0.0.0.0	10.35.50.165 / 255.255.255.255	Any	Any	Any	Any	Inbound	110	<input checked="" type="checkbox"/>
2	Permit	10.35.50.165 / 255.255.255.255	0.0.0.0 / 0.0.0.0	Any	Any	Any	Any	Outbound	114	<input checked="" type="checkbox"/>
3	Deny	0.0.0.0 / 0.0.0.0	10.0.0.0 / 255.0.0.0	Any	Any	Any	Any	Inbound	5	<input checked="" type="checkbox"/>
4	Deny	0.0.0.0 / 0.0.0.0	192.168.0.0 / 255.255.0.0	Any	Any	Any	Any	Inbound	0	<input checked="" type="checkbox"/>
5	Deny	0.0.0.0 / 0.0.0.0	172.16.0.0 / 255.240.0.0	Any	Any	Any	Any	Inbound	0	<input checked="" type="checkbox"/>
6	Deny	0.0.0.0 / 0.0.0.0	171.71.181.0 / 255.255.255.0	Any	Any	Any	Any	Inbound	0	<input checked="" type="checkbox"/>
7	Permit	0.0.0.0 / 0.0.0.0	0.0.0.0 / 0.0.0.0	Any	Any	Any	Any	Any	3449	<input checked="" type="checkbox"/>

Explanation of the **NSP-ACL-Google** in above Figure as follows

1. Allow all traffic “Inbound” to ISE (this step is optional).

2. Allow all traffic “Outbound” from ISE (this step is optional).
3. Deny all traffic “inbound” to corporate internal subnet (can be configured per company policy)
4. Deny all traffic “inbound” to corporate internal subnet (can be configured per company policy)
5. Deny all traffic “inbound” to corporate internal subnet (can be configured per company policy)
6. Permit all the rest of traffic (This could be limited to Google Play subnet only but please note that Google Play subnets could be different per location).

Note: Please review Appendix B for more information on how to allow play.google.com ONLY. If required, additional lines could be added for troubleshooting e.g. ICMP.

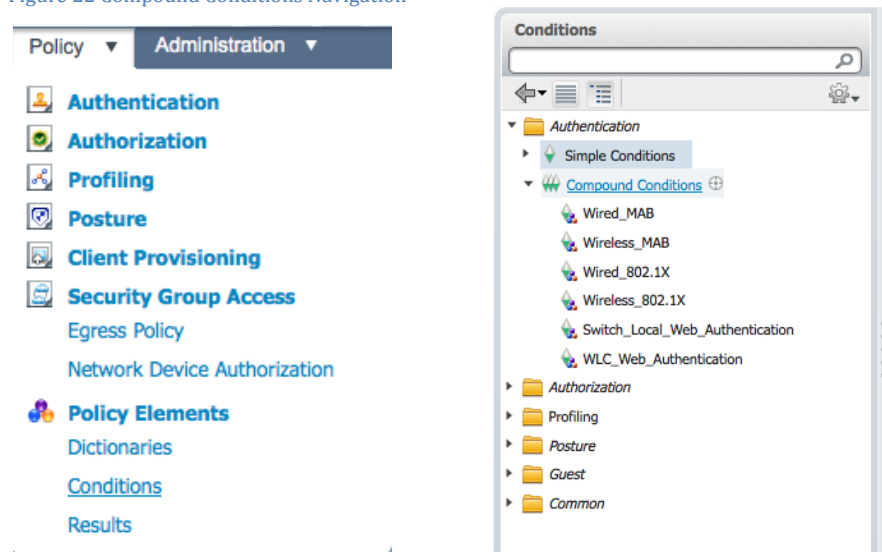

Configure an Authentication Policy

Procedure 1 Compound **Authentication** policy configuration.

Review Compound Authentication Conditions, which would be later, used in the policy configurations. We are reviewing these built-in policies to ensure they exist and have not been modified, as they will be referenced in our new policies.

Step 1 Click Policy → Conditions → Authentication → Compound Conditions

Figure 22 Compound Conditions Navigation

Step 2 Review a compound condition named “**Wireless_MAB**”

“Radius:Service-Type Equals Call Check AND Radius:NAS-Port-Type Equals Wireless - IEEE 802.11”

Figure 23 Wireless MAB

Authentication Compound Condition List > **Wireless_MAB**

Authentication Compound Conditions

* Name:

Description:

Condition Name	Expression	AND
<input type="text" value="Radius:Service-Type"/>	<input type="text" value="Equals"/> <input type="text" value="Call Check"/>	<input type="text" value="AND"/>
<input type="text" value="Radius:NAS-Port-Type"/>	<input type="text" value="Equals"/> <input type="text" value="Wireless - I"/>	<input type="text" value="AND"/>

Step 3 Review a compound condition named “Wired_MAB”

“Radius:Service-Type Equals Call Check AND Radius:NAS-Port-Type Equals Ethernet”

Figure 24 Wired MAB

Authentication Compound Condition List > **Wired_MAB**

Authentication Compound Conditions

* Name:

Description:

Condition Name	Expression	AND
<input type="text" value=""/>	Radius:Service-Type  Equals <input type="text" value="Call Check"/>	AND
<input type="text" value=""/>	Radius:NAS-Port-Type  Equals <input type="text" value="Ethernet"/>	

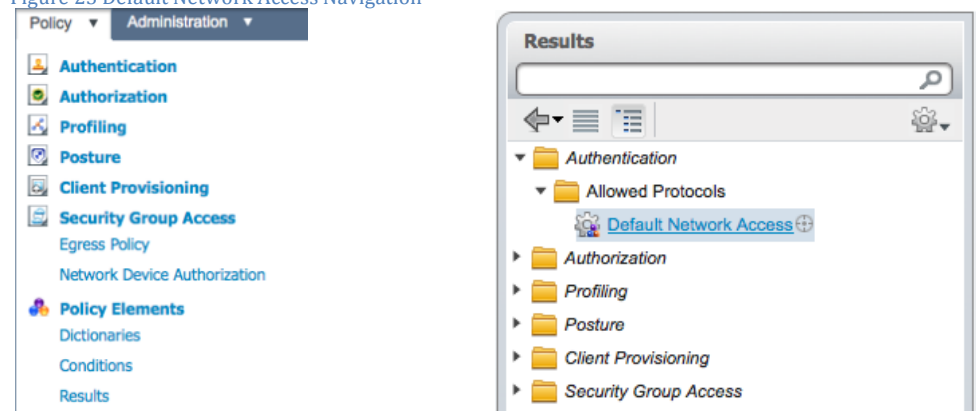

Procedure 2 Verify Default Network Access Result

This procedure describes the current protocol settings under “**Default Network Access**”.

Step 1 Click Policy → Policy Elements → Results

Step 2 Click Authentication → Allowed Protocols → Default Network Access

Figure 25 Default Network Access Navigation

Note: Please verify protocol settings as per the following screen shot since we will be using the pre-built Default Network Access object for allowed protocols... Please ensure your default object has not been changed and configuration matches the following screenshot

Figure 26 Default Network Access Policy
Allowed Protocols Services List > [Default Network Access](#)

Allowed Protocols

Name: Default Network Access

Description: Default Allowed Protocol Service

▼ Allowed Protocols

☒ Process Host Lookup

Authentication Protocols

▼ ☒ Allow PAP/ASCII

☐ Detect PAP as Host Lookup

☐ Allow CHAP

☐ Allow MS-CHAPv1

☐ Allow MS-CHAPv2

▼ ☒ Allow EAP-MD5

☐ Detect EAP-MD5 as Host Lookup

☒ Allow EAP-TLS

☐ Allow LEAP

▼ ☒ Allow PEAP

PEAP Inner Methods

☒ Allow EAP-MS-CHAPv2

☒ Allow Password Change Retries: 1 (Valid Range 0 to 3)

☒ Allow EAP-GTC

☒ Allow Password Change Retries: 1 (Valid Range 0 to 3)

☒ Allow EAP-TLS

▼ ☒ Allow EAP-FAST

▼ ☒ Allow EAP-FAST

EAP-FAST Inner Methods

☒ Allow EAP-MS-CHAPv2

☒ Allow Password Change Retries: 3 (Valid Range 1 to 3)

☒ Allow EAP-GTC

☒ Allow Password Change Retries: 3 (Valid Range 1 to 3)

☒ Allow EAP-TLS

☒ Use PACs ☐ Don't Use PACs

Tunnel PAC Time To Live: 90 Days

Proactive PAC update will occur after 90 % of PAC Time To Live has expired

☒ Allow Anonymous In-Band PAC Provisioning

☒ Allow Authenticated In-Band PAC Provisioning

☒ Server Returns Access Accept After Authenticated Provisioning

☐ Accept Client Certificate For Provisioning

☒ Allow Machine Authentication

Machine PAC Time To Live: 1 Weeks

☒ Enable Stateless Session Resume

Authorization PAC Time To Live: 1 Hours

☐ Enable EAP Chaining

☐ Preferred EAP Protocol: LEAP

Step 3 Review Authentication Policy Configuration, following screenshot is full policy view for reference, individual policies will be configured in subsequent steps

Figure 27 Authentication Policy Configuration

Authentication Policy

Define the Authentication Policy by selecting the protocols that ISE should use to communicate with the network devices, and the identity sources that it should use for authentication.

Policy Type: ☐ Simple ☒ Rule-Based

1. ☒ MAB : If Wired_MAB... allow protocols Allowed Protocol : Default Network and... Actions

2. ☒ Default : use Dot1x Actions

3. ☒ Dot1X : If Wired_802.1X... allow protocols Allowed Protocol : Default Network and... Actions

4. ☒ Default : use Dot1x Actions

5. ☒ Default Rule (If no match) : allow protocols Allowed Protocol : Default Network and use identity source : Internal Users Actions

Step 4 Authentication policy for MAB, please add conditions (**Wired_MAB** OR **Wireless_MAB**)

Figure 28 MAC Authentication Bypass Policy

Step 5 Authentication policy for **Dot1x**, please add conditions (**Wired_802.1X** OR **Wireless_802.1X**)

Figure 29 802.1X Policy

Step 6 Default Authentication policy.

Figure 30 Default Authentication Policy

Procedure 3 Configure an Authorization policy named “CWA”

Step 1 Click Policy → Policy Elements → Results.

Step 2 Choose Authorization → Authorization Profiles

Step 3 Click “ADD”

Figure 31 Authorization Profiles Navigation

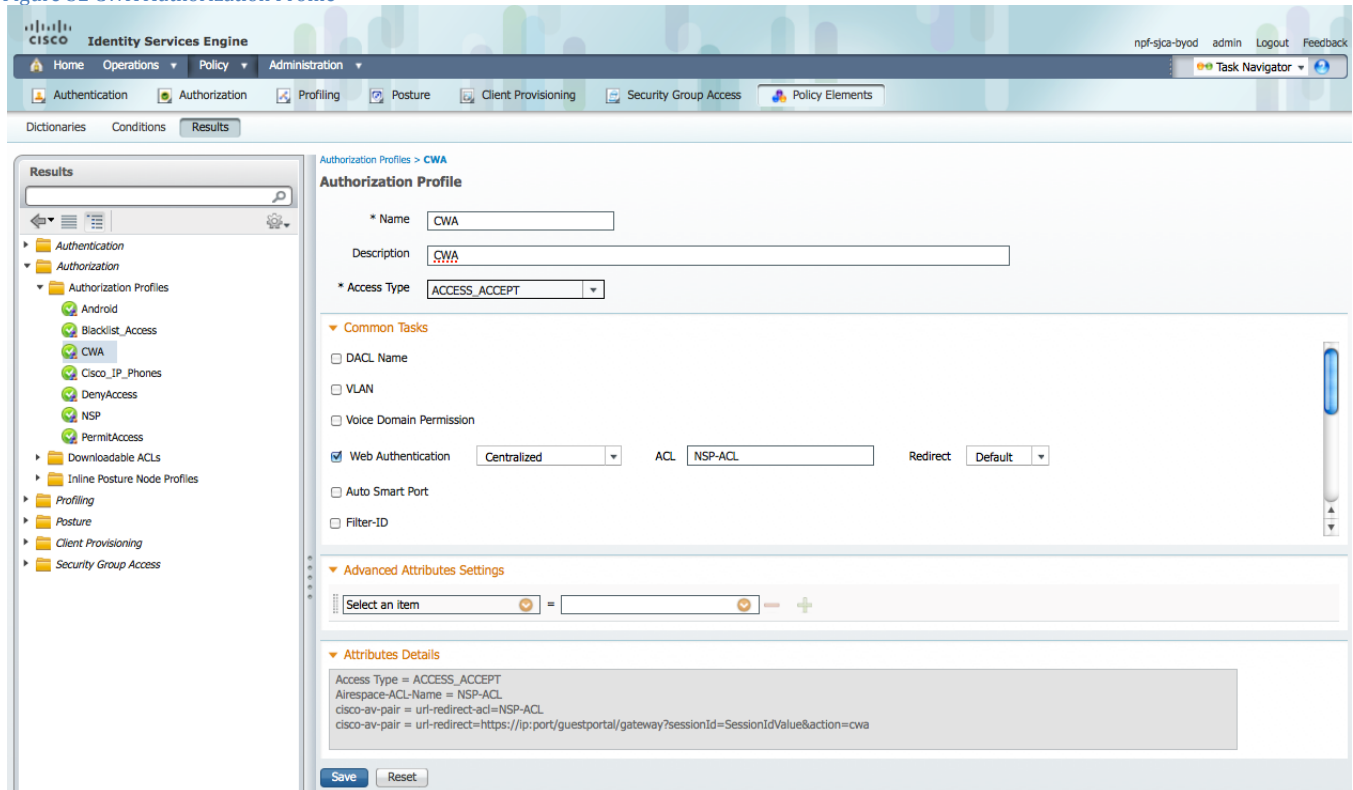

Step 4 Add an Authorization Profile named “CWA”.

Central web authentication (CWA) offers the possibility to have a central device acting as web portal (here, the Cisco Identity Services Engine). In Central web-authentication client is shifted to layer 2 along with mac/dot1x authentication, the Cisco Identity Services Engine then returns a special attributes indicating to the switch that a web redirection has to happen. Globally, if the MAC address of the client station is not known by the radius server (but other criteria can also be used), the server returns redirection attributes and the switch authorizes the station (via MAB) but places an access-list to redirect the web traffic to the portal.

Once the user logs in on the guest portal, it is possible via Change of Authorization (CoA) to bounce the switchport so that a new layer 2 MAB authentication occurs. The ISE can then remember it was a webauth user and apply layer 2 attributes (like dynamic VLAN assignment) to the user. An activeX component can also force the client PC to refresh its IP address.

Figure 32 CWA Authorization Profile

Step 5 Add an Authorization Profile named “CWA_GooglePlay”.

This profile will be used by Android devices to allow access to Google Play for downloading “Cisco Network Setup Assistant”.

Figure 33 CWA Authorization Profile for Android to Access Google

Procedure 5 Add the Authorization Policies

Step 1 Click Policy → Authorization

Step 2 Click “Insert New Rule Below”

Figure 37 Insert New Rule

Please add the following Authorization Policy

Black List Default = This is the Default Authorization rule for blacklisting the devices, it could be customized as per company policy where devices could either be redirected to a restricted web page or even not allowed to be on the network once blacklisted.

Profiled Cisco IP Phones = Default Authorization rule for Cisco IP Phones.

Corp_Owned = This Authorization Rule is added for devices which would by-pass BYOD supplicant and certificate provisioning flows when they are classified as corporate assets "**Corp_Assets**" and coming over Corporate Wireless SSID using 802.1x using protocol MSCHAPV2.

Android_SingleSSID = This Authorization Rule is added for Android devices since they require to download the Cisco Network Setup Assistant to complete the provisioning. The rule is specific to Single SSID setup. Once the Android device hits the "Register" button during device registration, ISE sends a Re-Auth COA to the controller. When the Android connects back to the network the session ID remains same since COA issued from ISE was Ra-Auth and NOT Session Terminate. ISE then applies the NSP_Google permission to continue with the provisioning process

Android_DualSSID = This Authorization Rule is added for Android devices since they require to download the Cisco Network Setup Assistant to complete the provisioning. The rule is specific to Dual SSID setup. Once the Android device hits the "Register" button during device registration, ISE sends a Re-Auth COA to the controller. When the Android connects back to the network the session ID remains same since COA issued from ISE was Ra-Auth and NOT Session Terminate. ISE then applies the NSP_Google permission to continue with the provisioning process

CWA = Authorization rule added for Central Web Authentication.

NSP = This Authorization Rule is added for devices which will go through the BYOD supplicant and certificate provisioning flows when coming over Corporate Wireless SSID using 802.1x using protocol MSCHAPV2.

PERMIT = Devices which have completed BYOD Supplicant and Certificate provisioning, with a certificate using EAP-TLS for authentication and coming over Corporate Wireless SSID will fall under this Authorization Policy.

Default = Default Authorization Policy set as Deny Access.

Figure 38 Authorization Policy

Simple Certificate Enrollment Protocol (SCEP) Setup

In this procedure we will configure SCEP profile that is used for certificate provisioning on the clients. The process of enrollment requires a certificate authority (CA) to issue the certificates using the Simple Certificate Enrollment Protocol (SCEP). ISE acts as a Registration Authority (RA) and communicates with the CA to provision certificates on the clients.

Procedure 1 Add a SCEP CA Profile

Step 1 Click Administration → Certificates → SCEP CA Profiles

Figure 39 Navigation to SCEP CA Profiles

Step 2 Click Add

Step 3 Add SCEP CA profile

CA Server IP = 172.21.77.24.

Figure 40 SCEP CA Profile

Certificate Request Agent Certificate **NSP-1-CA-SERVER-MSCEP-RA**

You are done!

Please see the TrustSec [How-To Guide titled "On-boarding"](#) for more information.

Appendix A: Configuring SCEP Server

This section walks through step-by-step process for configuring Microsoft 2008 R2 Enterprise SP2 as a SCEP server, the following tasks are required for SCEP setup

Setup SCEP Server

Procedure 1 Microsoft 2008 R2 Enterprise SP2 setup for SCEP Server.

Step 1 Install Windows Server 2008 R2 Enterprise server.

Step 2 After the installation completes, run Microsoft updates to get all the necessary updates.

Step 3 Activate windows license.

Step 4 Run dcpromo in command prompt window. This will install Active Directory Domain Services to the server.

Step 5 Go through the installation of the Active Directory Domain Services.

- a. Select 'advanced' mode checkbox.
- b. Create a new domain in a forest
- c. Insert name for the forest root domain.
- d. Install DNS server
- e. Wait for Active Domain Services to complete installing.
- f. Server will reboot.

Step 6 Add Administrator or SCEP_User to IIS_IUSRS group

Procedure 2 Install a Role: Active Directory Certificate Services

Step 1 AD CS: Click Next

- a. Role Services:
 - i. Certification Authority
 - ii. Certification Authority Web Enrollment
- b. Setup Type: Select "Enterprise"
- c. CA Type: Root CA
- d. Private Key: Create a new private key
 - i. Cryptography: Default value, but select SHA256 for the hash algorithm
 - ii. CA Name: leave it as default
 - iii. Validity Period: leave it as default
- e. Certificate Database: leave it as default

Step 2 Web Server (IIS): Click Next

- a. Role Services: leave it as default, click Next

Step 3 Confirmation: Click Install

Procedure 3 Add Role Services

Step 1 From Server Manager → Roles → Active Directory Certificate Services:

Step 2 Select “Network Device Enrollment Service”

Step 3 Select “Certificate Enrollment Web Service”

User Account

Specify user account (Select User). This may be the administrator account or a SCEP service account (the one added to IIS_USERS group)

Step 4 RA Information – leave it as default

Step 5 Cryptography – leave as default

Step 6 CA for CES – leave as default

Step 7 Authentication Type – leave as default

Step 8 Service Account – leave as default and choose the administrator account

Step 9 Server Authentication Certificate

Step 10 Choose an existing certificate for SSL encryption – select the certificate with ‘Client Authentication’ as Intended Purpose.

Step 11 Web Server (IIS) – Click Next

Step 12 Role Servers – leave as default

Step 13 Confirmation: Click Install

Procedure 4 Modify the Registry

Step 1 Type regedit from the ‘Start’ menu

Step 2 In the registry editor, go to: HKEY_LOCAL_MACHINE → Software → Microsoft → Cryptography → MSCEP

Step 3 Click the key labeled: Enforce Password

Step 4 Modify EnforcePassword from value 1 to 0.

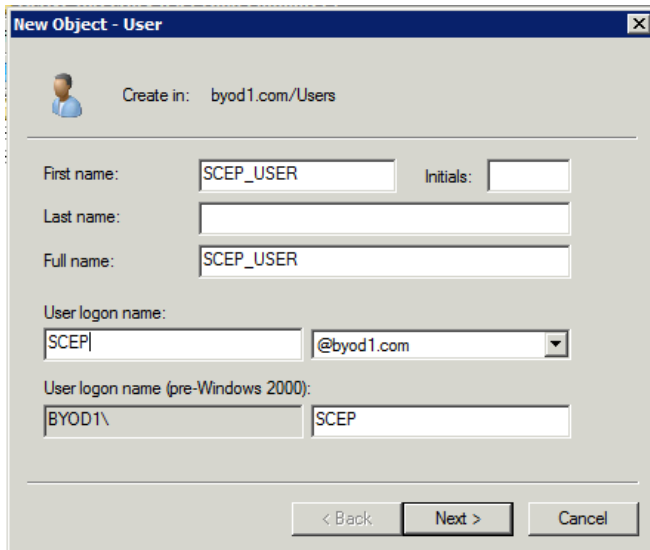

Step 5 Restart the server.

Configuring SCEP Enrollment.

Procedure 1 Create a SCEP Service Account

Once CA server and services are installed, configure the server to do SCEP enrollment.

Step 1 Create a new account.

New Object - User

Create in: byod1.com/Users

First name: SCEP_USER Initials:

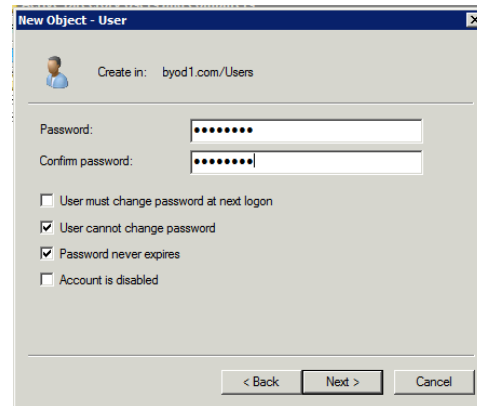

Last name:

Full name: SCEP_USER

User login name: SCEP @byod1.com

User login name (pre-Windows 2000): BYOD1\SCEP

< Back Next > Cancel

New Object - User

Create in: byod1.com/Users

Password:

Confirm password:

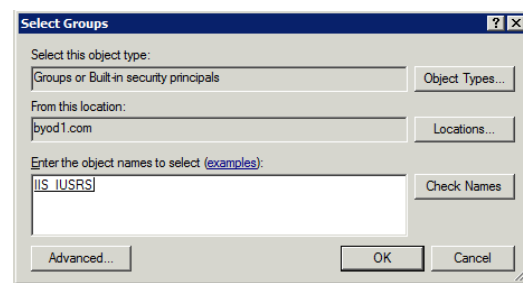

☐ User must change password at next login

☒ User cannot change password

☒ Password never expires

☐ Account is disabled

< Back Next > Cancel

Select Groups

Select this object type: Groups or Built-in security principals

From this location: byod1.com

Enter the object names to select (examples): IIS_IUSRS

Check Names

Advanced... OK Cancel

Reference: <http://technet.microsoft.com/en-us/library/ff955646%28v=ws.10%29.aspx>

Procedure 2 Create and save an MMC for working with Certificates

Step 1 Start → Run → mmc

Step 2 Add Snap-in for Certificate Templates, Certificates (Local Computer), Certification Authority (Local) and Enterprise PKI.

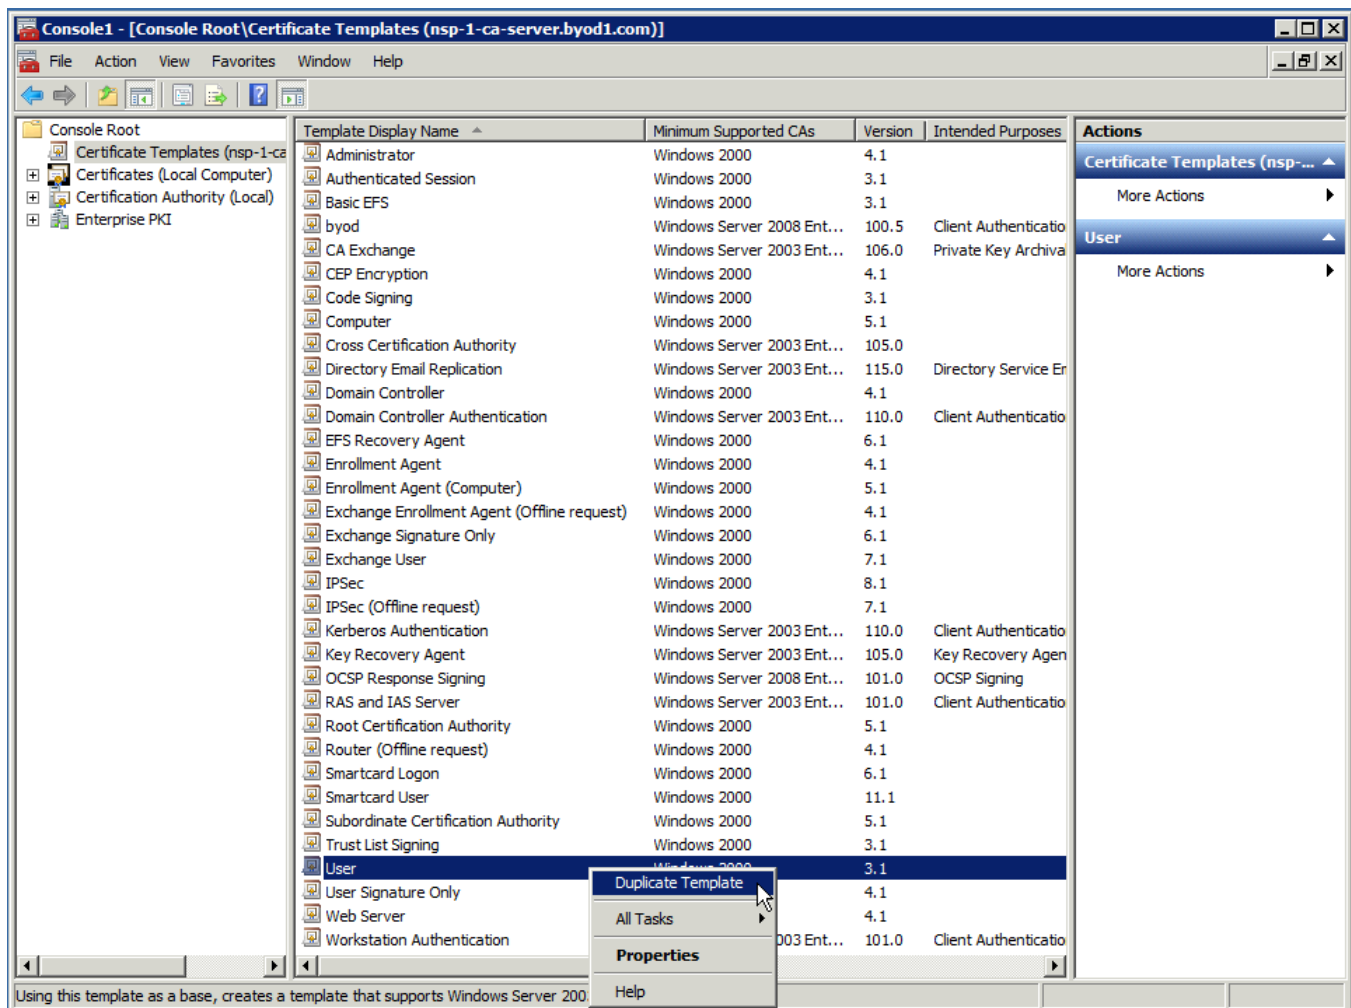

Step 3 When done click 'Ok'. (Snapshot shown below).

Step 4 Save the mmc console. So it can be accessed easily at a later time.

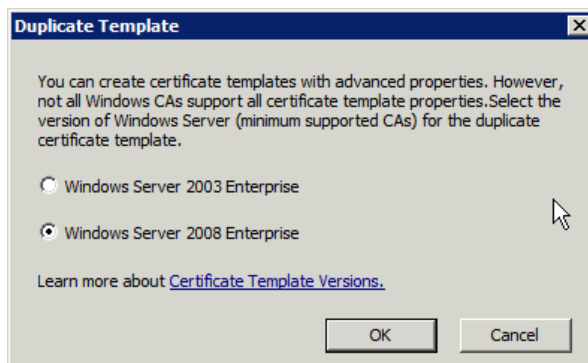

Procedure 3 Create a New Certificate Template

Step 1 Select Certificate Templates and duplicate 'User' template.

Step 2 Select “Windows Server 2008 Enterprise” (in this document example, could also use Windows Server 2003 Enterprise).

Step 3 Click OK.

Step 4 Give it a template name (in this example its called “byod”).

Step 1 Publish the cert in Active Directory, which will sync it to all Domain Controllers.

The screenshot shows the 'byod Properties' dialog box with the 'General' tab selected. The 'Template display name' is 'byod' and the 'Template name' is 'byod Template'. The 'Minimum Supported CAs' is 'Windows Server 2008 Enterprise'. The 'Validity period' is set to '1 years' and the 'Renewal period' is '6 weeks'. The 'Publish certificate in Active Directory' checkbox is checked. The 'Do not automatically reenroll if a duplicate certificate exists in Active Directory' checkbox is unchecked. The 'For automatic renewal of smart card certificates, use the existing key if a new key cannot be created' checkbox is unchecked. The 'OK', 'Cancel', 'Apply', and 'Help' buttons are at the bottom.

This tab states that certificate will be used for signing & encrypting.

Step 1 Please **uncheck** “allow private key to be exported” to mark it as “non-exportable” if required.

Step 2 Certificates will be requested through the BYOD provisioning flow that would be automated processes therefore please ensure “**enroll subject without requiring any user input**”.

The screenshot shows the 'byod Properties' dialog box with the 'Request Handling' tab selected. The 'Purpose' dropdown menu is set to 'Signature and encryption'. Below this, there are four checkboxes: 'Delete revoked or expired certificates (do not archive)' (unchecked), 'Include symmetric algorithms allowed by the subject' (checked), 'Archive subject's encryption private key' (unchecked), and 'Use advanced Symmetric algorithm to send the key to the CA' (unchecked). Further down, the 'Allow private key to be exported' checkbox is unchecked. At the bottom, under the heading 'Do the following when the subject is enrolled and when the private key associated with this certificate is used:', there are three radio buttons: 'Enroll subject without requiring any user input' (selected), 'Prompt the user during enrollment' (unchecked), and 'Prompt the user during enrollment and require user input when the private key is used' (unchecked). The dialog box has standard 'OK', 'Cancel', 'Apply', and 'Help' buttons at the bottom.

Step 1 Select “Supply in Request”.

This is necessary since the certificate is not being created by an Active Directory member, but through SCEP instead.

The screenshot shows the 'byod Properties' dialog box with the 'Subject Name' tab selected. The 'Supply in the request' radio button is selected. Below it, there is an unchecked checkbox for 'Use subject information from existing certificates for autoenrollment renewal requests.' The 'Build from this Active Directory information' radio button is also selected, and its associated section is expanded. This section contains a 'Subject name format' dropdown menu set to 'None', an unchecked checkbox for 'Include e-mail name in subject name', and a group box titled 'Include this information in alternate subject name:' containing four unchecked checkboxes: 'E-mail name', 'DNS name', 'User principal name (UPN)', and 'Service principal name (SPN)'. At the bottom of the dialog are 'OK', 'Cancel', 'Apply', and 'Help' buttons.

Step 1 Select “Requests can use any provider available on the subject’s computer”

byod Properties [?] [X]

Superseded Templates Extensions **Security** Server

General **Request Handling**

Cryptography Subject Name Issuance Requirements

Algorithm name: RSA

Minimum key size: 1024

Choose which cryptographic providers can be used for requests

☒ Requests can use any provider available on the subject's computer

☐ Requests must use one of the following providers:

Providers:

☐ Microsoft Software Key Storage Provider

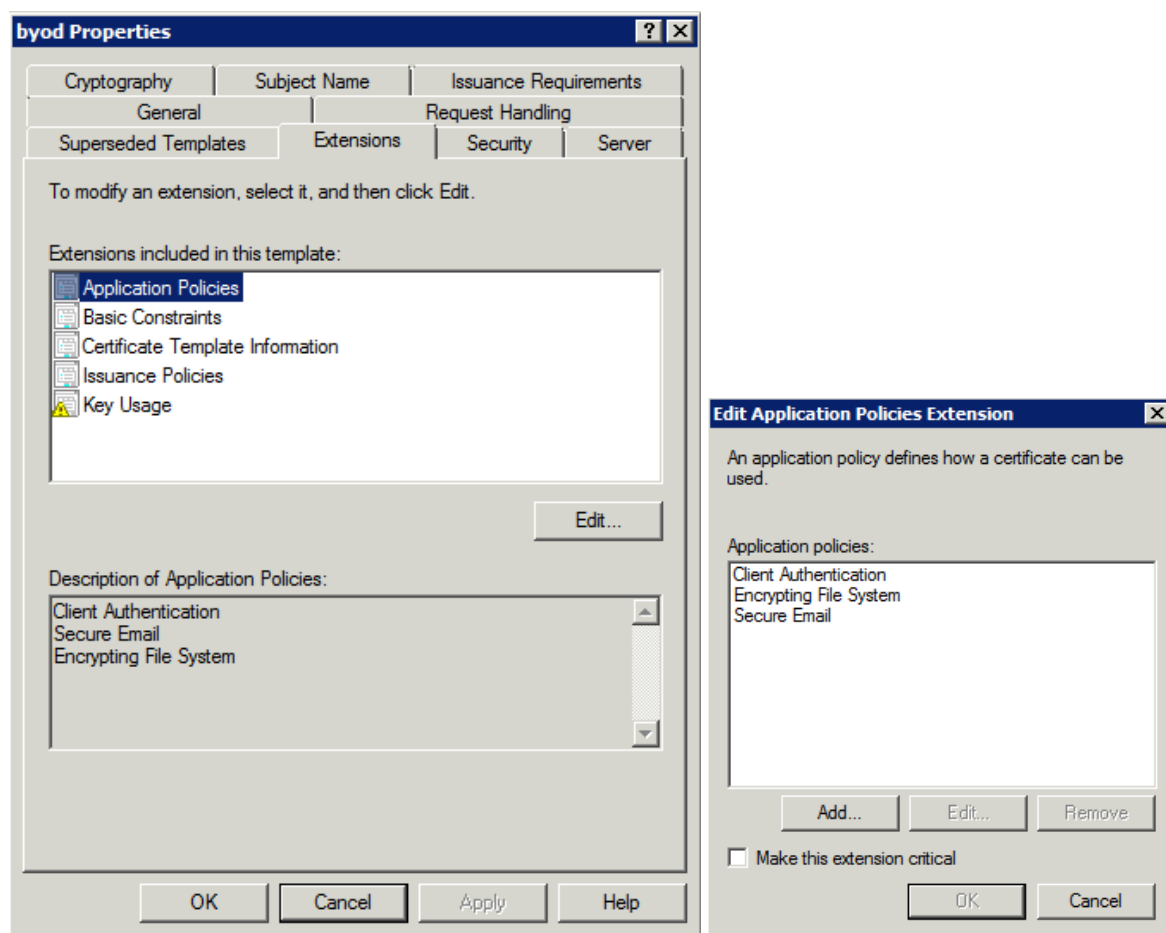

Request hash: SHA1

☐ Use alternate signature format.
For more information about restrictions and compatibility click [here](#).

OK Cancel Apply Help

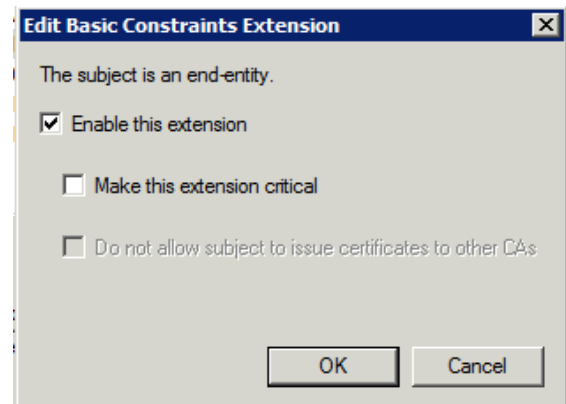

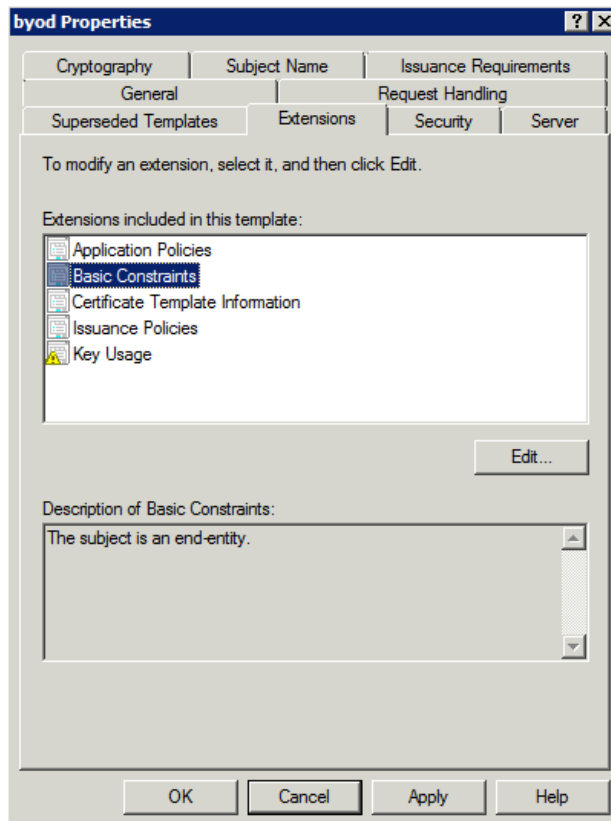

Step 1 Applications Policies:

If the description of the Application Policies do not show what is in the snapshot, you can click "Edit" and "Add" the Application Policies.

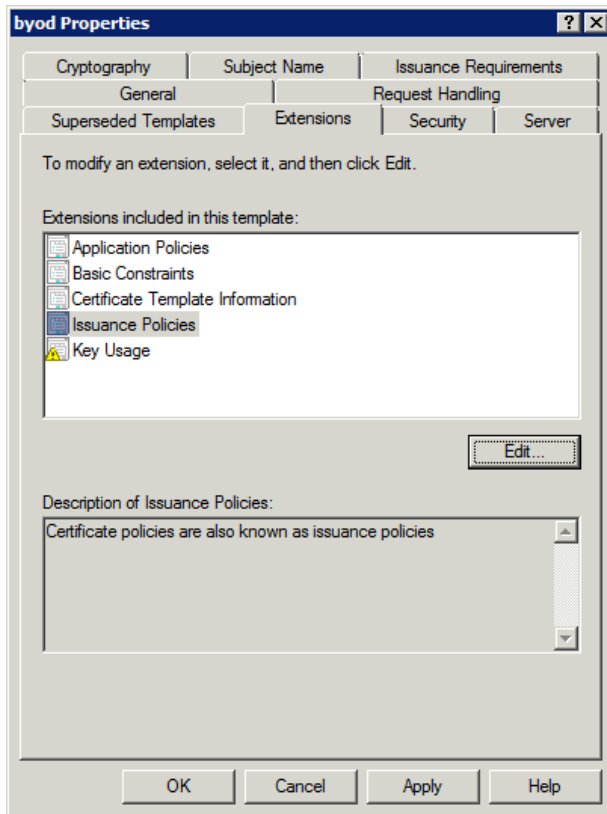

Step 2 Basic Constraints

This Sets the certificate to belong to an endpoint, and not a subsequent signer

Step 3 Issuance Policies

Issuance Policies must be configured, to allow the CA to actually issue the certificate. Please select "All issuance policies"

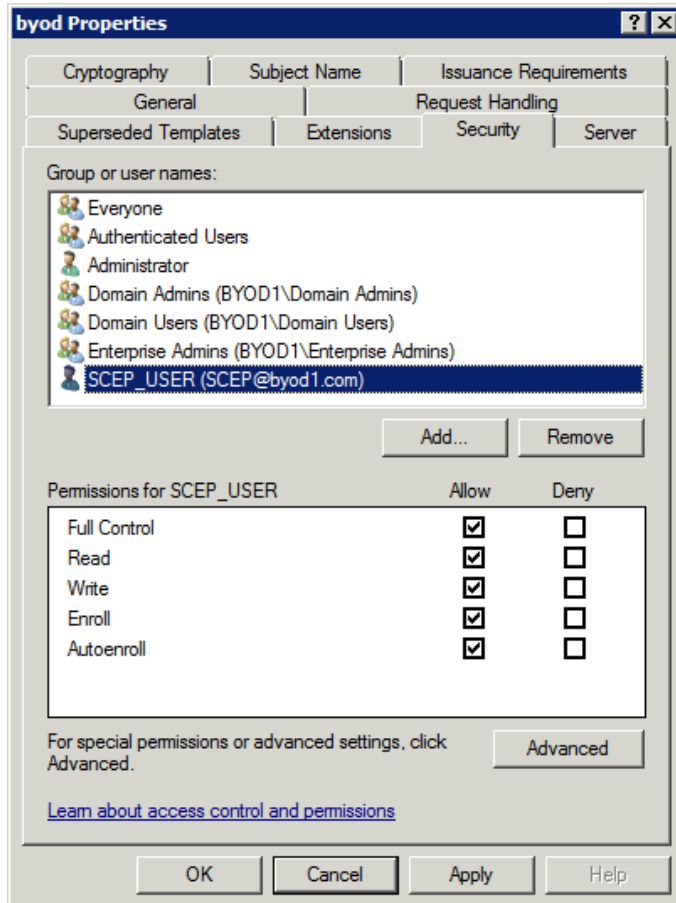

Procedure 9 Security Tab

In this section we will add the “**Service Account User**” to have Full Control the Certificate Template. The account was created in previous step that the SCEP service is running-as.

Step 1 Click Add

Step 2 SCEP_USER

Assign the new Template for Issuance

At this point we have completed the duplicate template process, next we have to choose it as one to be issued.

Procedure 1 Assign the new Template for Issuance

Step 1 Server Manager → Roles → AD Certificate Authority → <your CA--> → Certificate Templates

Step 2 Right-Click

Step 3 New → Certificate Template to Issue

Step 4 Choose your new Certificate Template

Step 5 Choose the template you created from previous steps.

You should be able to see template shown on the right hand side pane after this step is completed.

Procedure 2 Modify the Default Certificate that is Issued

The default Certificate Template for SCEP to issue, is an IPSEC template. This must be changed to use the new User-Template:

Step 1 Run Regedit

Step 2 HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Cryptography\MSCEP.

Step 3 Modify the **EncryptionTemplate**, **GeneralPurposeTemplate**, and **SignatureTemplate** to the name of the template you created above. Make sure the name is spelt the same way you have created.

Procedure 3 Set the EnforcePassword to zero and disable the “UseSinglePassword” setting:

Step 1 Run Regedit

Step 2 HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Cryptography\MSCEP\UseSinglePassword.

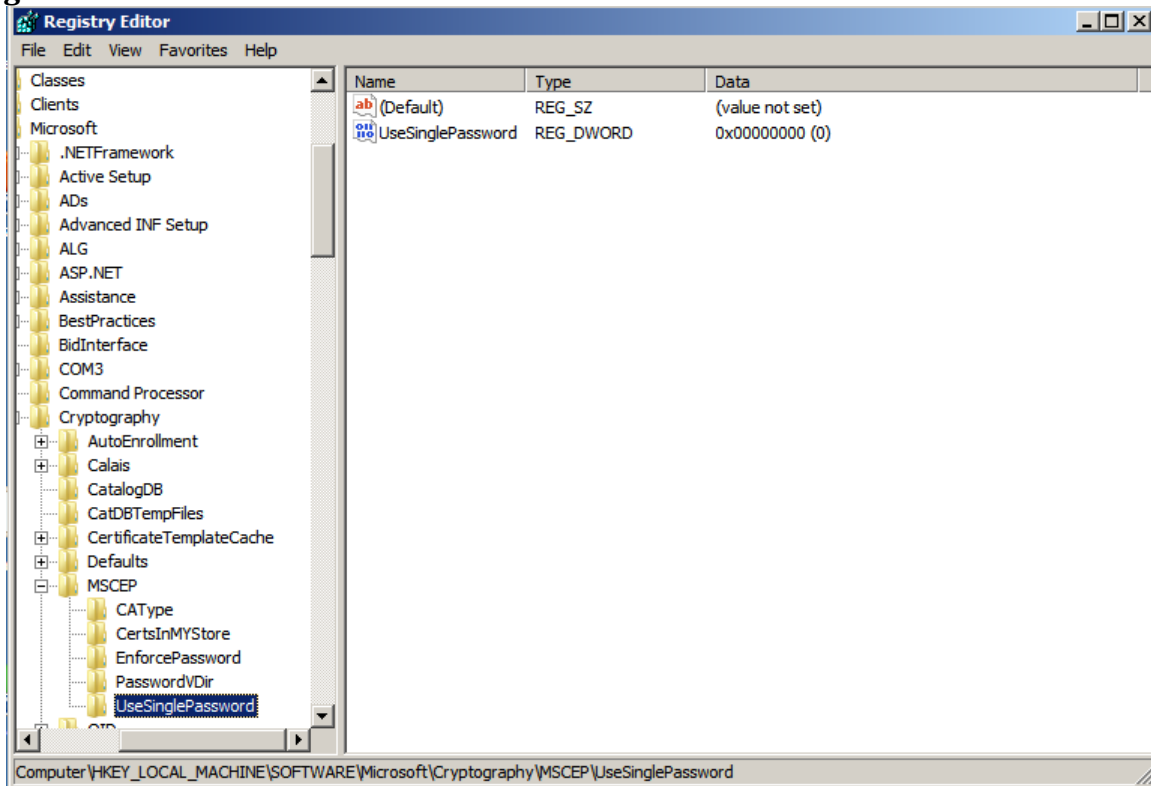

Step 3 Change the value to 0 UseSinglePassword is set to zero ‘0’.

Step 4 HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Cryptography\MSCEP\ EnforcePassword.

Step 5 Change the value to 0 EnforcePassword is set to zero ‘0’.

UseSinglePassword:

Step 6 Save the mmc console that you created from above if you have not done so yet.

Step 7 Restart the entire server.

 You are done!

Appendix B: Android and Play.Google.Com

Why Android is Different

Android devices need to be treated differently than iOS Devices and/or Windows. This is partially because no two Android devices are exactly the same, but also because of the requirement to use a supplicant provisioning App to configure the Supplicant and Certificate for Android.

By default, the Android devices will not accept the App from just any source; it must come from a trusted App Store, such as “play.google.com”. While it is possible to configure the Cisco ISE to host the Supplicant Provisioning Wizard (SPW) App, the end-users’ Android devices will not be configured trust the Cisco ISE as an App Store. Therefore, unlike: Windows, MAC, and iOS; Android devices must have access to the internet to participate in BYOD and Native Supplicant Provisioning.

During the TrustSec testing, it was discovered that in many cases Google Play uses TCP and UDP ports 5228. However, this was not enough for all tested Android devices to work. Internet searches (see Appendix C: References) yielded that port 8880 may need to be opened as well. Depending on the Android’s configuration the end-user may be prompted for either “Internet” or “Play Store” options.

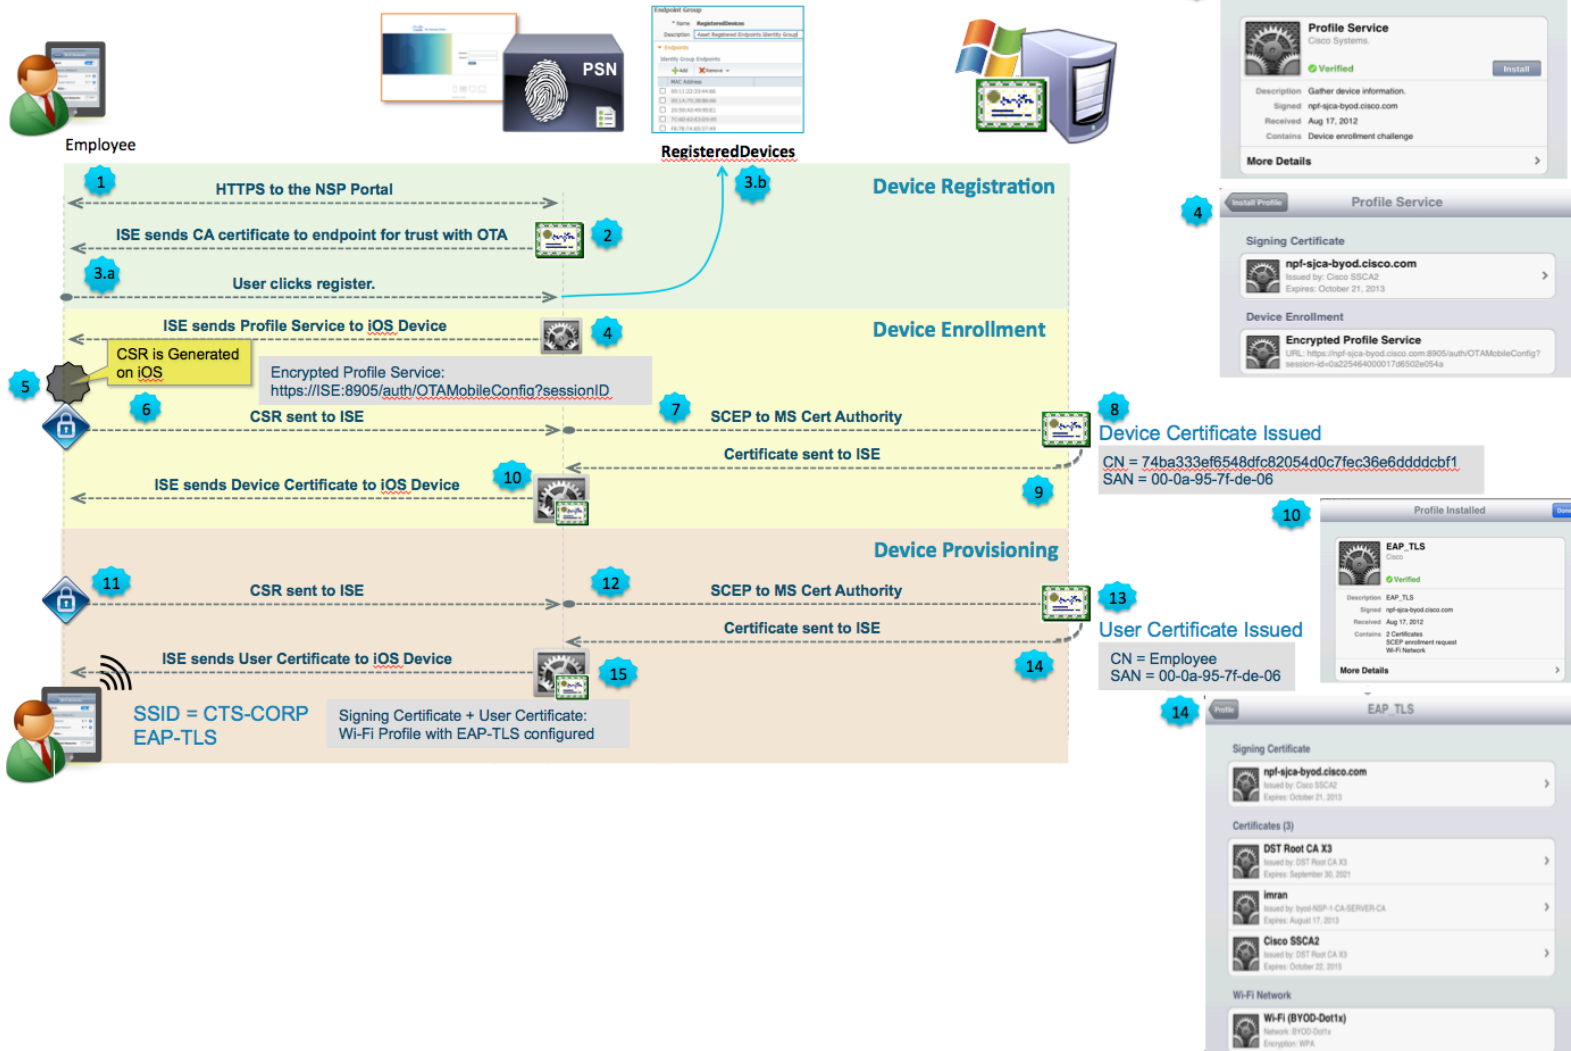

What worked in the testing lab:

Android Option	Network Range to Open	TCP & UDP Ports
Google Play option	74.125.00/16 173.194.0.0/16	TCP/UDP:5228 TCP/UDP:8889
Internet Option	74.125.00/16 173.194.0.0/16	UDP: 5228 TCP: All Ports

Appendix C: BYOD flows

This section goes through BYOD flows for iOS and Android Devices

iOS use-case

NSP (Android use-case)
