Introduction

The modern workplace continues to evolve, and improved mobility is essential. New bring your own device (BYOD) and virtual desktop infrastructure (VDI) initiatives try to meet the need for an increasingly agile, productive, and collaborative workforce. Most VDI adopters have found that deploying VDI at the branch or remote office is a challenge. When virtual desktops are centralized so that users access them across the WAN, the user experience is poor and business continuity must rely on the WAN. Cisco Office-in-a-Box offers a way to easily collapse enterprise branch office or retail store IT services into a single box. These services include VDI where the virtual desktops are hosted locally on a Cisco Unified Computing System (Cisco UCS) E-Series server. Cisco UCS E-Series servers provide the best user experience (LAN-based connectivity) and remove reliance on the WAN for business continuity.

This guide shows how to deploy a VMware Horizon View VDI solution to a Cisco Next-Generation WAN branch office. This guide explains the benefits, how to deploy the solution that combines the Cisco Integrated Services Router Generation 2 (ISR G2) platform with Cisco UCS E-Series servers, and where to find additional information to make the deployment a success.

What Problems Does Cisco Office-in-a-Box Solve?

For the mobile branch office or the standard branch office, bandwidth and latency requirements for VDI come at a premium cost. When you host end-user VDI virtual machines and applications on the local Cisco UCS E-Series server, all mission-critical applications run on site. When these applications run on site, we need not depend on the WAN to deliver critical services. Also, the user experience is greatly improved because access to the VDI session remains within the local office. Now with Horizon View Agent Direct-Connection branch user can access a virtual desktop directly, without a connection to the VMware Horizon View connection server. In the case of a data center to branch office deployment model, the administration of the VDI pool for the branch can be managed centrally through the VMware Horizon View Connection server, but users do not require network connectivity to the connection server to access their hosted desktops. The solution can be delivered within a single Cisco ISR G2 box, which greatly reduces the number of devices that must be at the branch office or retail store to deliver the required services. One box means that on-site management is simpler and the box can be managed remotely. Two deployment models are supported with VMware Horizon View 5.2. One model is fully distributed where the VDI management infrastructure and VDI sessions are hosted within the Cisco UCS E-Series server. The second model is central management with distributed VDI sessions where the VDI management infrastructure is centralized at the data center, but VDI sessions are distributed across branch offices hosted in Cisco UCS E-Series servers.

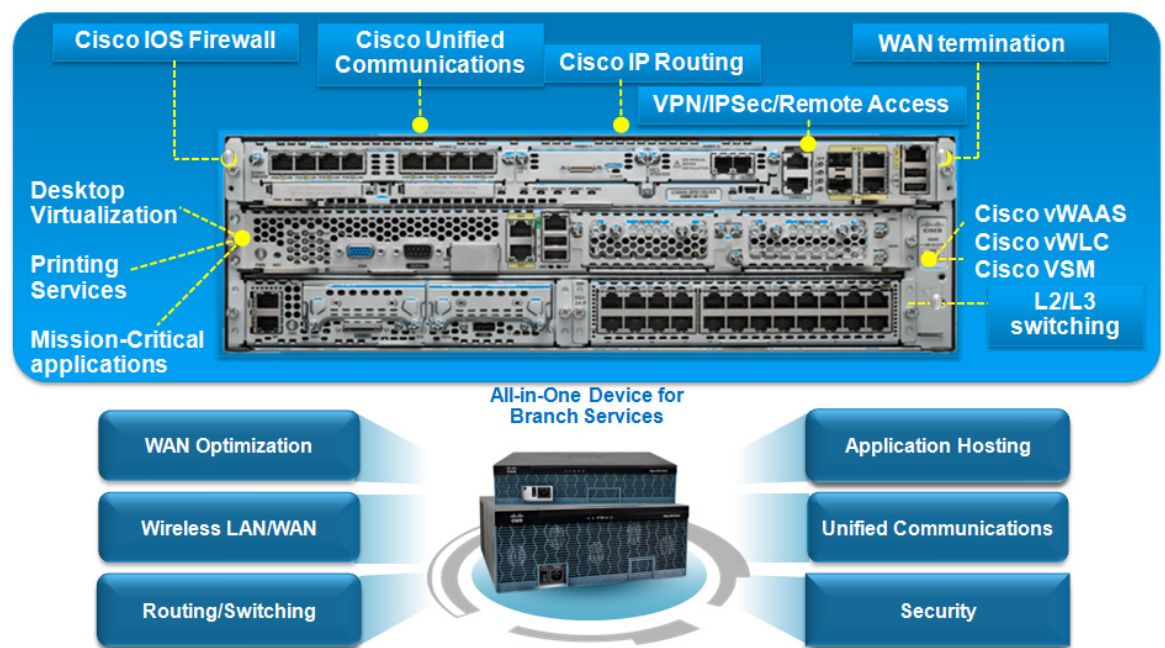

Which Organizations Benefit from Cisco Office-in-a-Box?

Cisco Office-in-a-Box can help organizations that are considering VDI to centralize desktop services. These organizations want to take advantage of the many benefits that VDI offers but do not want to upgrade their WAN to support VDI sessions across their WAN, or they do not want to rely on WAN connectivity for users to access mission-critical applications.

Cost Effectiveness of Cisco Office-in-a-Box

The Cisco Office-in-a-Box solution provides a way to collapse all services that businesses require into a single box, which results in easier management of services, a much smaller device footprint on site, and lower TCO. This product is part of a multiphased approach of the Cisco VDI Cloud connector strategy to address business continuity and end-user experience. The Cisco UCS E-Series servers and the Cisco ISR G2 are built for enterprise-grade performance with a service life expectancy longer than commercially available servers and routers. Also, the Cisco ISR G2 and Cisco UCS E-Series solutions are covered under one Cisco SMARTnet services contract, which provides expert technical support, flexible hardware coverage, and smart, proactive device diagnostics. Your IT staff has any-time access to Cisco engineers in the Technical Assistance Center (TAC) and an extensive range of resources, tools, and training.

Cisco Office-in-a-Box: How Does It Work?

The Cisco ISR G2 platform runs Cisco IOS® Software, which delivers an array of IT services such as these services:

- network routing
- IP PBX (Cisco Unified Communications Manager Express/Survivable Remote Site Telephony [Cisco Unified SRST])
- public-switched-telephone-network (PSTN) connectivity
- WAN acceleration (Cisco Wide Area Application Services [Cisco WAAS])
- remote access
- Network Address Translation (NAT)

- Cisco IOS firewall
- DHCP

The Cisco UCS E-Series x86 server modules can be inserted into Cisco ISR G2 platforms and can deliver additional services. (See the [Cisco UCS E-Series datasheet](#) for a platform compatibility matrix.) The Cisco UCS E-Series supports VMware ESXi 5.0 and 5.1, which allows you to virtualize multiple applications and services. One such service is the VMware Branch Office Desktop Solution. The Cisco UCS E160D server module can support up to 48 GB of memory, and it runs on a 6-core Intel processor with hyperthreading support, which makes it a 12-core server. Depending on the Cisco ISR G2 platform, you can insert more Cisco UCS E-Series modules if more computing power is necessary. Additional modules can expand the virtual desktop solution or add applications such as video surveillance, digital signage, or virtualized Cisco applications like vWAAS.

The Cisco ISR G2 motherboard and the Cisco UCS E-Series blades interconnect through a backplane 1 Gigabit Ethernet switch, which allows for virtual data traffic to traverse the router services and set policies. The Cisco ISR G2 supports 2 or 3 Gigabit Ethernet ports. One of these ports can be used to connect to an Internet telephony service provider (ITSP) connection to provide Internet connectivity to the virtual desktops and access to the Internet can be managed through policies set on the router. Also, firewall services can be turned on to prevent incoming attacks from the Internet.

A second Gigabit Ethernet port on the router can be used for management. The Cisco UCS E-Series server supports the Cisco Integrated Management Controller (a BMC feature) to allow configuration, administration, and monitoring of server resources via a web-based GUI. The Cisco UCS E-Series blades have been validated by VMware for their Branch Office Desktop through the Rapid Desktop deployment program. The VMware Rapid Desktop deployment solution allows easy deployment and configuration of a VMware Horizon View Branch Office Desktop Solution and delivers the benefits and services of Cisco ISR G2 technologies within a single box. (VMware Horizon View was formerly known as VMware View.)

A third Gigabit Ethernet port on the router can be used for voice services. The Cisco ISR G2 supports Cisco Unified Communications Manager Express, which is an IP PBX application and supports Cisco IP phones or analog phones using Cisco analog voice/WAN interface card (VWIC) modules. For PSTN, access to the Cisco ISR G2 supports a variety of PSTN access VWIC modules (T1 PRI, T1 CAS, FXO, and BRI) and supports Session Initiation Protocol (SIP) trunking to SIP service providers.

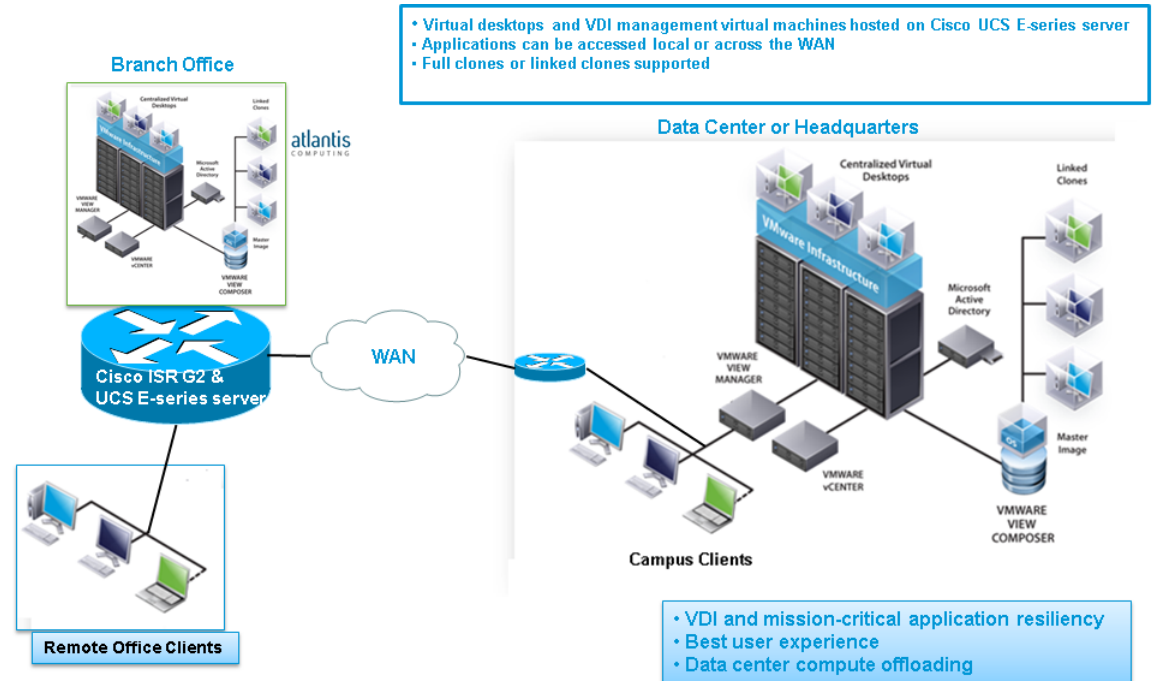

<http://www.cisco.com/en/US/products/sw/voicesw/ps4625/index.html>

Also, the Cisco ISR G2 platforms support Ethernet switch service modules that insert into a service module slot to provide network access to VDI clients and other network devices, such as IP phones. http://www.cisco.com/en/US/prod/collateral/routers/ps10536/data_sheet_c78-553980_ps10537_Products_Data_Sheet.html

Where Cisco Office-in-a-Box Fits in the Deployment

Cisco Office-in-a-Box with VMware Horizon View can be centrally managed or fully distributed depending on how an organization needs to manage their VDI solution and whether the remote offices are connected back to the headquarters data center.

Figure 1 shows a fully distributed VMware Horizon View solution.

Figure 1 Fully distributed VDI deployment

With a fully distributed VDI deployment, each remote office hosts a VMware Horizon View management infrastructure that consists of a VMware Horizon View connection server, Active Directory (AD) server, vCenter/View composer server, and SQL Express server. Table 1 lists virtual machine roles and configuration. Figure 2 shows the logical grouping of the required virtual machines.

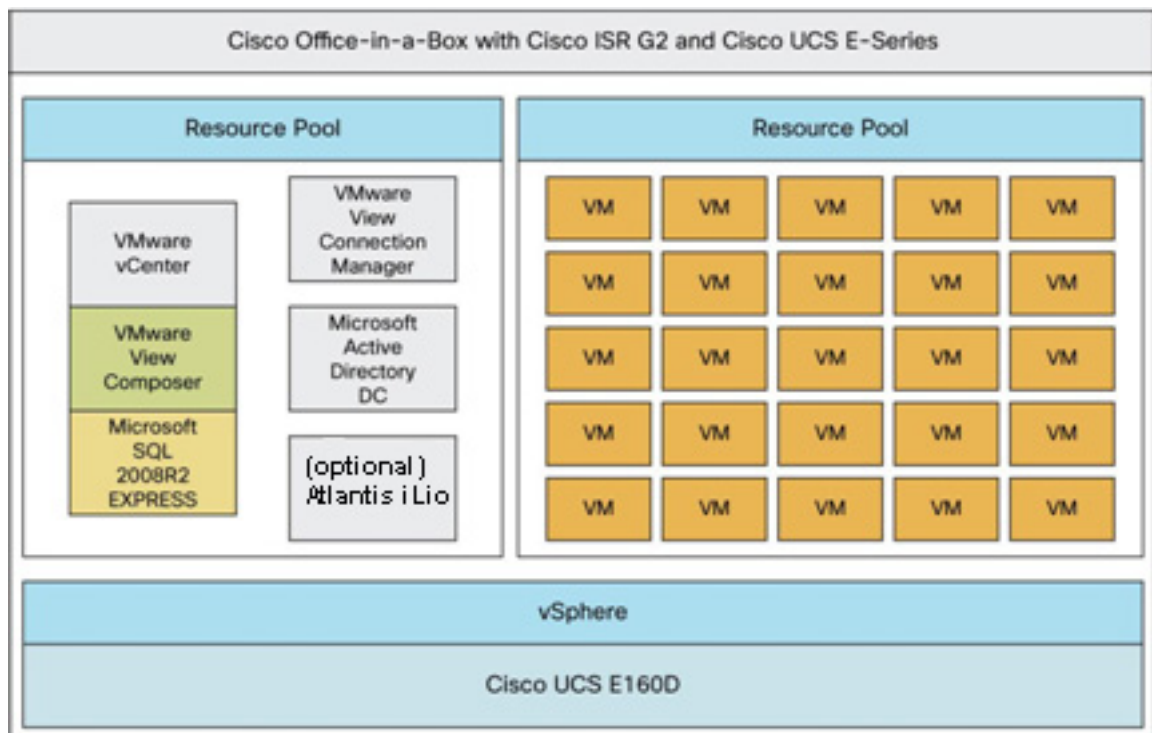

Table 1 Virtual Machine Roles and Configuration

Virtual Machine Role	Virtual Machine Specification	Notes
Microsoft Active Directory Domain Controller	1 virtual CPU (vCPU) with 2048 MB of RAM and Microsoft Windows Server 2008 R2 64-Bit Standard Edition	Microsoft Active Directory domain controller 1
VMware vCenter VMware Horizon View Composer Microsoft SQL Server 2008 R2 Express	2 vCPUs with 2048 MB of RAM and Microsoft Windows Server 2008 R2 64-Bit Standard Edition	VMware vCenter and Composer and Microsoft SQL services
View Connection Manager	2 vCPUs with 2048 MB of RAM and Microsoft Windows Server 2008 R2 64-Bit Standard Edition	VMware Horizon View Connection Manager 1
Atlantis ILIO	2 vCPUs (1 reserved) with 12GB of RAM	Atlantis ILIO storage optimization virtual machine
Virtual Desktop	1 vCPU with 1500 MB of RAM and Microsoft Windows 7	Virtual desktop virtual machine

**Note**

The CPU and RAM allocation for the virtual desktops is based on a medium workload profile. We recommend that performance testing be done based on applications that users will be running during normal peak business hours to identify virtual desktops resource allocation and virtual machine density per Cisco UCS E-Series server.

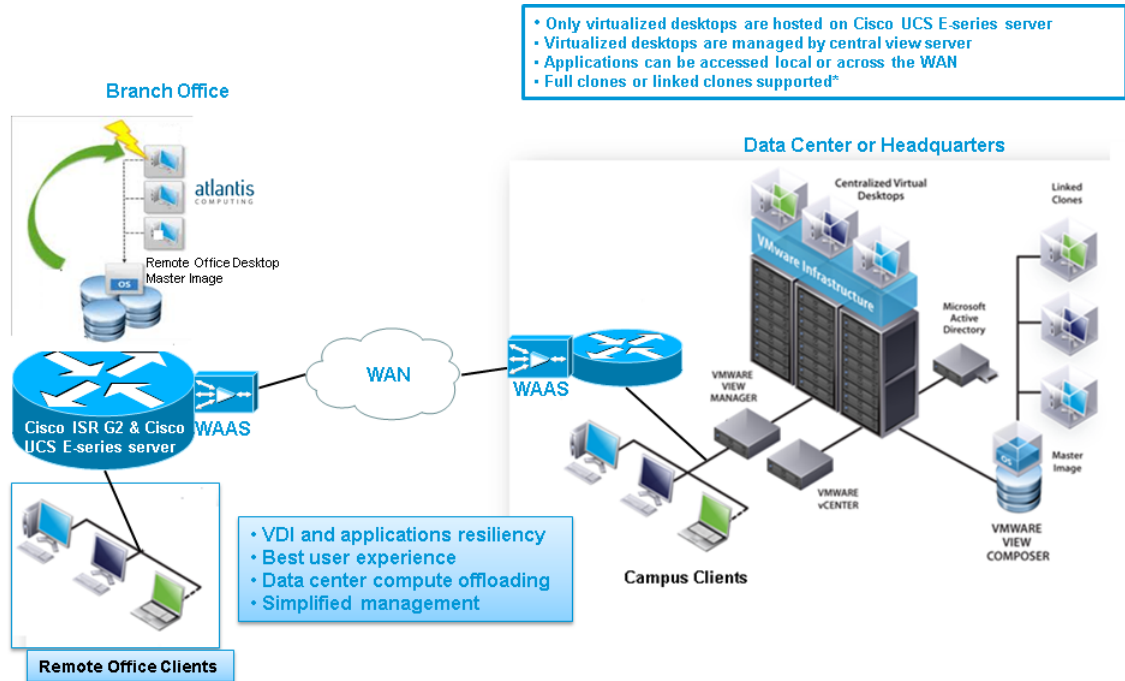

Figure 2 *Logical Design*

All virtual machines share the direct-attached storage (DAS) of the Cisco UCS E-Series blade.

Figure 3 shows a centralized VMware Horizon View management with distributed hosted virtual desktops.

Figure 3 Centralized VDI management with distributed VDI sessions

* WAAS is recommended for limited bandwidth/high-latency WAN links

With central VDI management, only the desktop master image (template or master VM/snapshot) must reside on the Cisco UCS E-Series DAS to create desktop pools on the Cisco UCS E-Series server. Create the desktop master image with Horizon View Agent Direct-Connection. for branch users to access their hosted virtual desktops directly and not depend on the WAN connection to reach the VMware Horizon View connection server to access the hosted virtual desktops. Persistent pools (full clones) and nonpersistent pools (linked clones) are supported. Use Cisco WAAS to provision nonpersistent (linked clones) pools. During the creation of a nonpersistent pool, VMware provisioning and management traffic that flows on TCP port 902 between the View composer server and the ESXi VDI hosting node (Cisco UCS E-Series server) contains large data blocks and is very chatty across the WAN. Cisco WAAS can optimize this traffic and ensure a successful pool creation.

A Cisco WAAS solution provides a 99% reduction ratio of TCP 902 provisioning traffic and increases the apparent bandwidth available for the branch, which allows users at the branch office to continue using the WAN. After a VMware Horizon View VDI pool is created, Cisco WAAS can continue to optimize the access of centrally based applications across the WAN, like backup and restore tools.

To optimize VMware management and provisioning traffic, use this Cisco WAAS sample configuration:

**Note**

This configuration must be applied at the data center Cisco WAAS and the branch Cisco WAAS appliances.

1. Create “class-map type” and label it “VMware”.

```
class-map type waas match-any Veritas-NetBackup
  match tcp destination port 13720
  match tcp destination port 13721
  match tcp destination port 13782
  match tcp destination port 13785
exit
class-map type waas match-any Vmware-VMConsole
  match tcp destination port 902
exit
class-map type waas match-any VoIP-Control
  match tcp destination port 1300
  match tcp destination port 2428
```

2. Enter the global policy map Cisco WAAS configuration.

```
policy-map type waas WAAS-GLOBAL
  class MAPI
    optimize full accelerate mapi application Email-and-Messaging
  exit
  class MS-AD-Replication
    optimize full application Replication
  exit
  class MS-Exchange-Directory-NSPI
```

3. Configure the class-map type “VMware” for full optimization.

```
class Vmware-VMConsole
  optimize full
exit
```

Figure 4 is an example of the optimization that is achieved when a linked-clone pool is created. Figure 5 shows the logical grouping of the virtual machines that are hosted on Cisco UCS E-Series server.

Figure 4 Example of optimization achieved with a linked-clone pool

```

Pool provisioning and management traffic

Figure 5 Cisco UCS E-Series Logical Design

At the branch, the Cisco UCS E-Series server hosts the master desktop image from where a pool of desktops would be provisioned using the central VMware Horizon View management tools. The VMware Horizon View management infrastructure is the same infrastructure used to provision and manage VDI pools that are based in the campus or data center.

Requirements, Solution, and Benefits

This sample of requirements, solutions, and benefits can help you decide to move forward with a Cisco Office-in-a-Box deployment.

Requirement: VDI solution for 10 to 25 users at the branch office or retail office

Solution: Cisco UCS E-Series with Cisco ISR G2 provides the network, compute and storage platform to locally host and manage VDI sessions without user-experience degradation due to WAN link traffic saturation or WAN outage.

Benefits:

- Mission-critical applications are not reliant on the WAN.
- Best VDI user experience because VDI sessions are local to the users.
- VDI data traffic can be managed so that packets traverse the router interfaces via backplane to apply security policies and determine how each virtual machine or user accesses applications.
- Single device to manage at each remote site with the ability to manage all onboard applications, unified communications, security, and network access remotely

Basic VDI Concepts - Understanding the Terminology

The concept of VDI technology is to abstract the operating system off of an end-user compute platform and host that operating system on a centralized compute server. The centralized compute server must have sufficient compute resources to host and run multiple instances of the operating system. (A virtual desktop instance is a single OS instance on the centralized server.) After the centralization of the operating system is achieved, end users are provided with the necessary software client to connect to their assigned virtual desktop instance over the network. When the desktop of an end user is centralized and the user can connect to that desktop across the network, the user can access the desktop from anywhere on any type of device. Also, the data that is running within the desktop is protected. The data is not stored on the local device, but it is stored safely on the central storage system that can be backed up and accessed at any time.

Deploying Cisco Office-in-a-Box

Cisco Office-in-a-Box relies on Cisco ISR and Cisco UCS E-Series service modules to deliver the necessary compute resources to host a VMware Horizon View VDI solution. Table 2 lists the required specifications of a 6-core Cisco UCS E-Series and a 4-core Cisco UCS E-Series service module to support a maximum of 25 VDI sessions and 15 VDI sessions, respectively.

Table 2 Cisco UCS E-Series Configuration for VDI

Feature	Cisco UCS E140D, Cisco UCS E140DP (4-core Double-wide)	Cisco UCS E160D, Cisco UCS E160DP (6-core Double-wide)
CPU	Intel Xeon E5-2418L 2.0-GHz quad-core processor	Intel Xeon E5-2418L 2.0-GHz quad-core processor
DRAM	48 GB RAM	48 GB RAM
Hard-disk drive (HDD)	Up to three (Cisco UCS E140D or E160D) or two (Cisco UCS E140DP or E160DP): <ul style="list-style-type: none"> 10,000-rpm SAS: 900 GB 10,000-rpm SAS SED: 600 GB SAS SSD SLC: 200 GB See Note	Up to three (Cisco UCS E140D or E160D) or two (Cisco UCS E140DP or E160DP): <ul style="list-style-type: none"> 10,000-rpm SAS: 900 GB 10,000-rpm SAS SED: 600 GB SAS SSD SLC: 200 GB See Note
Supported Cisco ISRs	<ul style="list-style-type: none"> Cisco UCS E140D and E140DP: Cisco 2921, 2951, 3925, 3925E, 3945, and 3945E 	<ul style="list-style-type: none"> Cisco UCS E160DP and E160DP: Cisco 3925, 3925E, 3945, and 3945E
PCIe	Cisco UCS E140DP and E160DP: Four 1 Gigabit Ethernet or one 10 Gigabit Ethernet and Fibre Channel over Ethernet (FCoE)	Cisco UCS E140DP and E160DP: Four 1 Gigabit Ethernet or one 10 Gigabit Ethernet and FCoE

The Cisco UCS E-Series storage configuration depends on how many VDI sessions you intend to host on the Cisco UCS E-Series server and the type of workload the branch users will be exercising on each virtual machine. A three-drive SAS (900 GB, 10K rpm) RAID 5 configuration was tested successfully for a 25 VDI session configuration at a medium workload profile. The medium workload profile consists

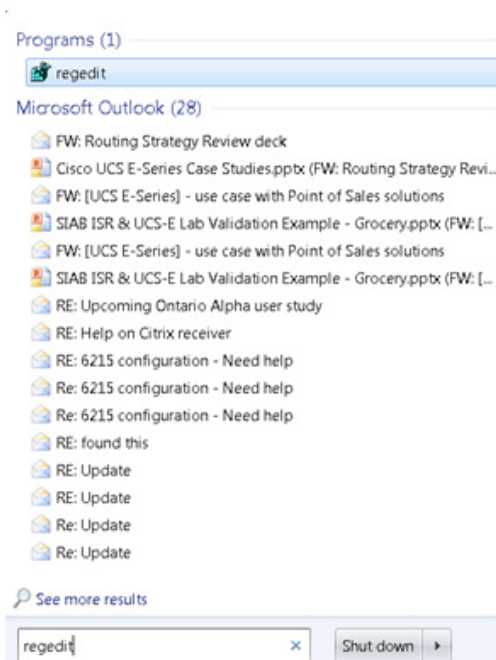

of a basic Microsoft Office suite, printing, PDF reading, web-browsing, Microsoft Exchange email, and creating and saving documents. The medium workload profile does not include video or high graphics applications, which is part of the expert user workload profile.

Managing Horizon View Agent Direct-Connection on the Branch Hosted Virtual Desktop Master Image

The Horizon View Agent Direct-Connection software is installed with the VMware Horizon View agent 5.3 software. Depending on the release date of your VMware View agent 5.3 software, the Horizon View Agent Direct-Connection plug-in may be a separate install file. The VMware Horizon View agent software is installed to the hosted virtual desktop master image that will be used to create the VDI pool on the Cisco UCS E-series server.. The difference in the Horizon View Agent Direct-Connection software, compared to older VMware view agent software, is the ability to allow VMware View clients to directly connect to the hosted virtual desktop without having to authenticate with the VMware Horizon View connection server first. A VMware View client device can point directly to the hosted virtual desktop IP address or FQDN and log in to the hosted virtual desktop using Microsoft Windows local credentials or cached credentials. The ability to fall back or always directly connect to the locally hosted virtual desktop allows VMware VDI users to access their virtual desktops even if the WAN connection is down and the VMware Horizon View connection server is not reachable. The branch users are always able to connect to their desktop no matter the state of the WAN connection. The status and management of the remote hosted virtual desktops resumes at the central VMware Horizon view connection server once the WAN connection is back up.

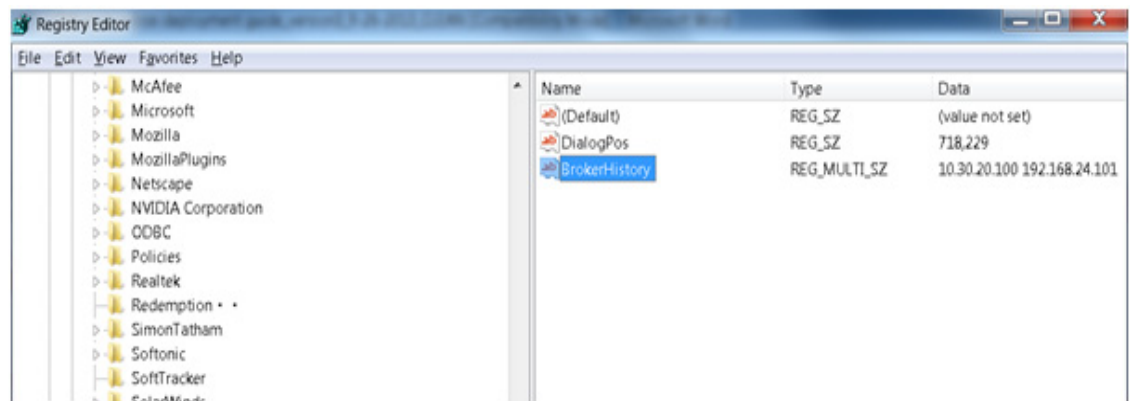

In order to automate the process of selecting either the VMware Horizon view connection server across the WAN or the user assigned virtual desktop that is locally running in Cisco UCS E-series, the VMware View client software can be modified to present the alternative authentication server addresses. Below is an example of how to configure VMware Horizon view client software registry in a Windows 7 thick-client or Windows embedded Thin-Client in order to list the VMware Horizon view connection server address and the locally assigned VMware Horizon view hosted virtual desktop address.

Open "regedit" using the Windows start menu.

If in your environment you have VMware soft View Clients installed either on full-blown Windows or on Thin Client with Windows embedded, you may use the registry key "BrokerHistory" to add multiple existing connections brokers.

You can create the key under [HKEY_CURRENT_USER\Software\VMware, Inc.\VMware VDM\Client]. However, because this is a USER registry key you will need to merge the registry changes during logon time through scripts or GPO.

After creating this key the VMware view client automatically lists the available servers for login.

Atlantis ILIO Deployment Option

For high-density virtual desktop deployments or expert user workload profiles (with high I/O operations per second [IOPS] workloads), we recommend that you install Atlantis ILIO technology on the Cisco UCS E-Series server to boost IOPS performance using SAS 10K RPM hard drives. Atlantis ILIO has the following benefits:

- Deploy up to 35 high-performance virtual desktops on a single Cisco E-Series server module.
- Lower the cost per virtual desktop using Atlantis ILIO with SAS disks.
- Deliver a better-than-PC user experience.

For more Atlantis ILIO information, see: <http://www.atlantiscomputing.com/products/>

Installing Cisco Office-in-a-Box

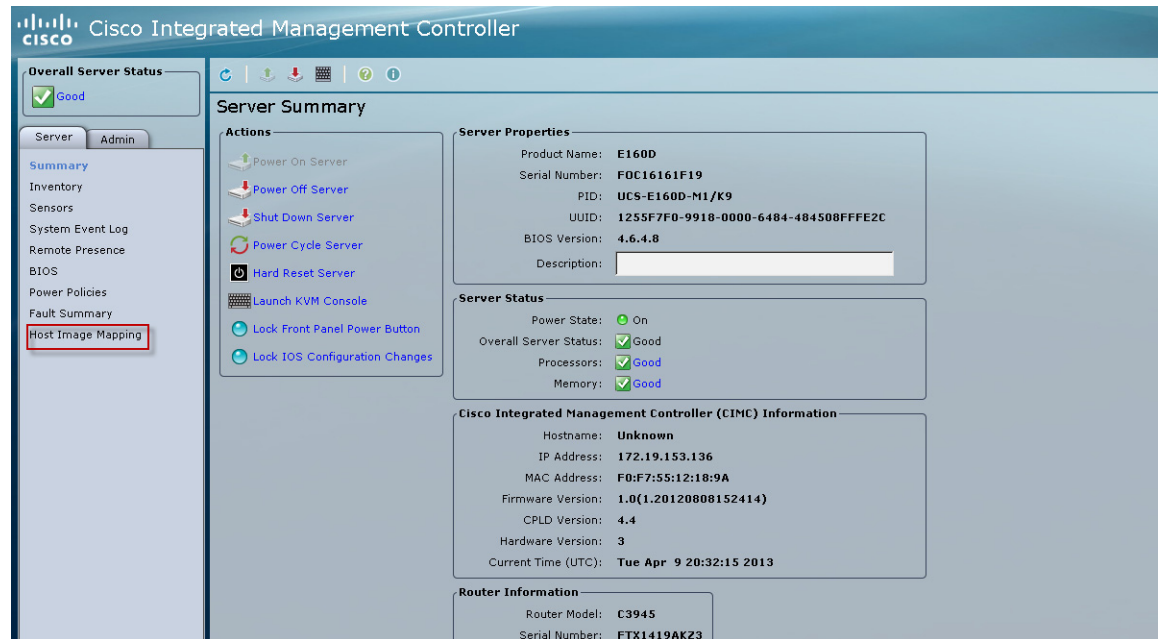

First, an administrator must install VMware ESXi on the Cisco UCS E-Series service module. The Cisco UCS E-Series management tool, the Cisco Integrated Management Controller, has multiple options on how to install an operating system on to the server. This procedure explains how to mount an ESXi image on the available SD card using the “host image mapping” capability on the Cisco UCS E-Series server and how to start the installation of ESXi off of the mounted image. An FTP or HTTP server is required to host the ESXi install files in bootable ISO format.

1. Log into the Cisco Integrated Management Controller.

The default username and password is “admin” and “password”.

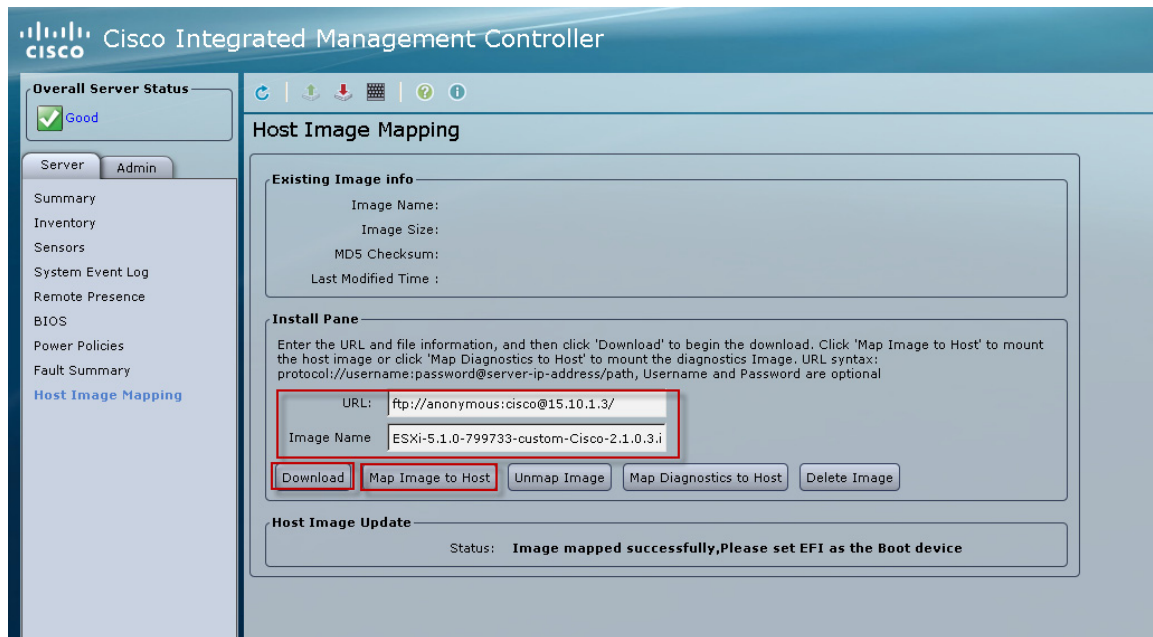

2. In the Server tab, click **Host Image Mapping**.

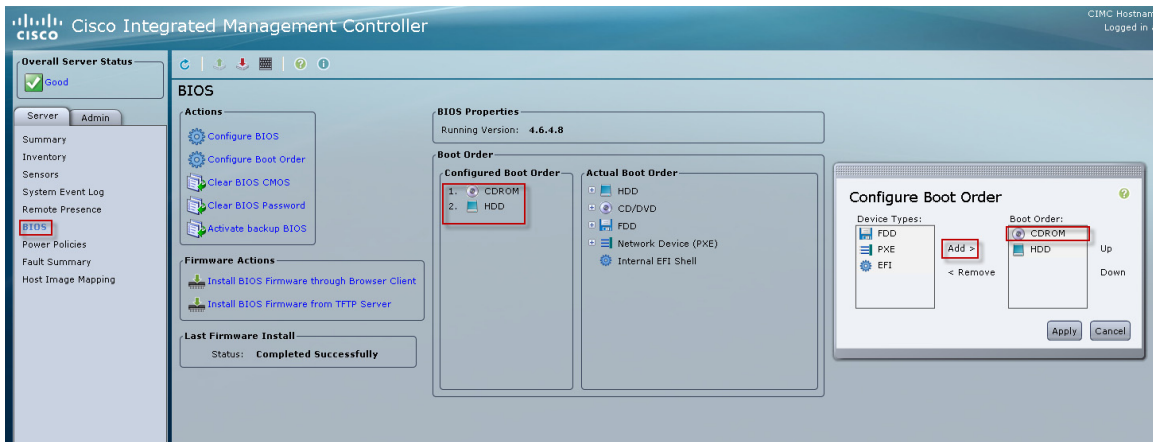

The Host Image Mapping screen opens.

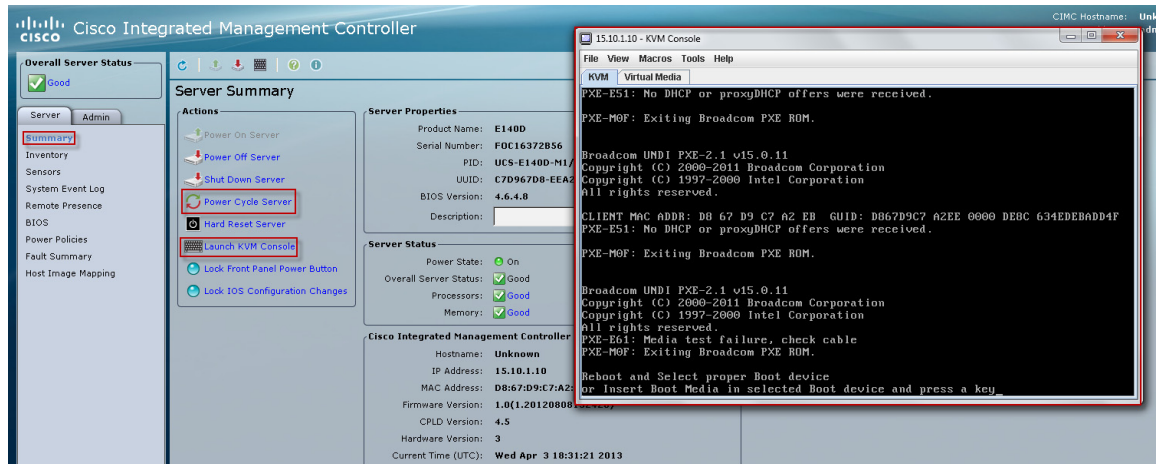

3. In the URL field, enter the full image name including the extension. Click **Download**. When the download is complete, click **Map Image to Host**.

4. In the Server tab, click **BIOS** and update the boot order so that CDROM is the highest priority. (Host image map acts as a virtual CDROM when it is mounted.)

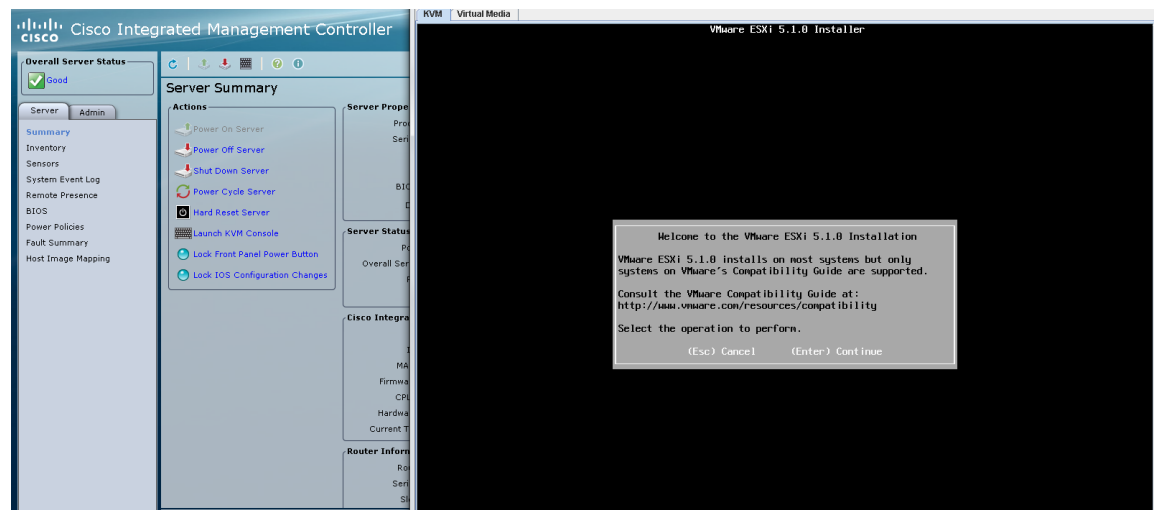

5. Launch the KVM console for the server and reload server. From the Server tab, click **Summary > Launch KVM Console > Power Cycle Server**.

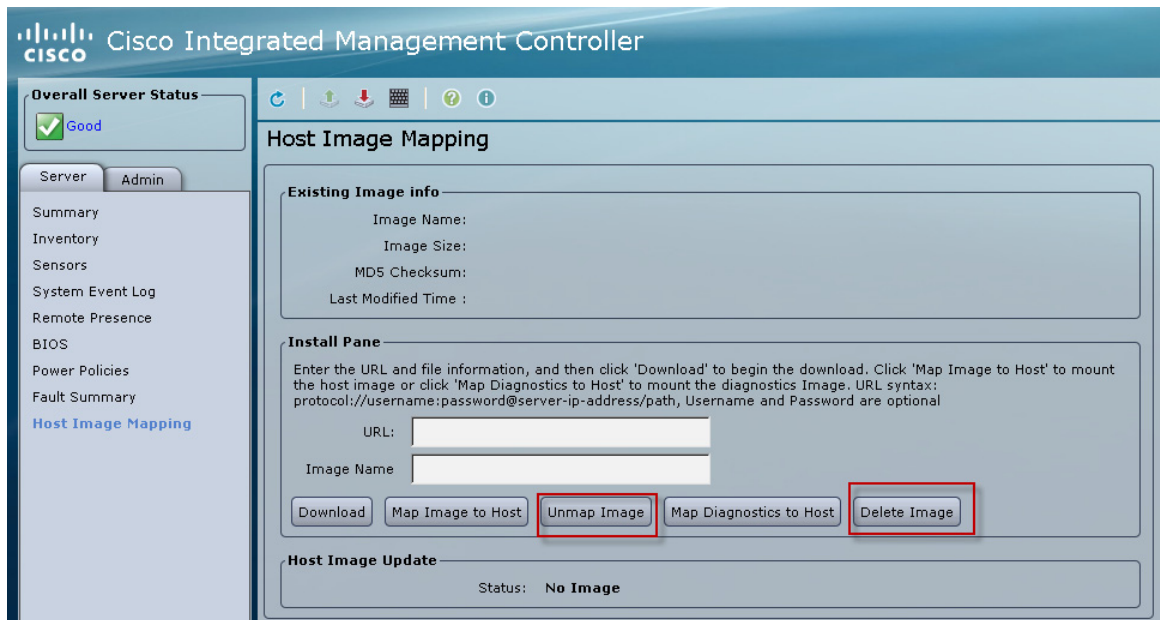

The server boots from the VMware ESXi bootable image.

6. Follow the VMware ESXi installation wizard.

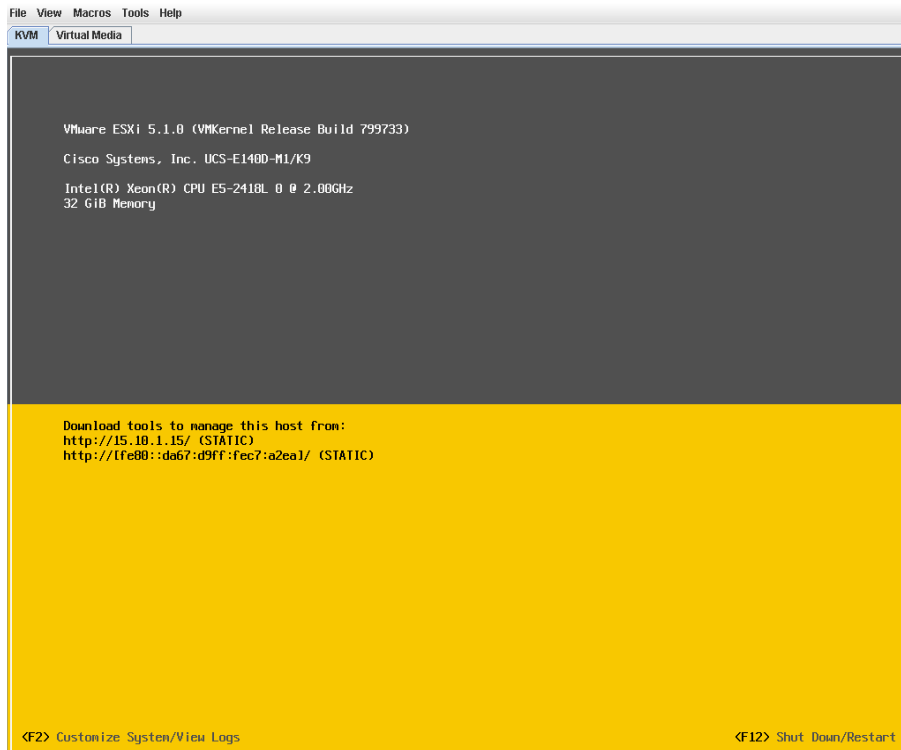

- After ESXi installation is complete, unmap the ESXi boot image from the server to prevent a new fresh install. Click **Unmap Image**. (Deleting the image is optional.)

The VMware ESXi install is complete.

- Reload the router and configure VMware ESXi for network access.

To install VMware Horizon View using the fully distributed model, VMware offers the VMware Rapid Desktop Appliance solution that enables quick and easy provisioning of the entire VDI solution on a partner certified solution. The Cisco UCS E-Series server has been validated by VMware and is available using VMware Horizon View 5.1 or 5.2. The Cisco UCS E-Series node requires VMware vSphere/ESXi 5.0 or higher.

VMware Rapid Desktop Program Validation

- Validation testing was performed on a Cisco UCSE-160D with SSD drives
- The Cisco UCS E-series server hosted VDI infrastructure and desktop components
- For the validated design 25 virtual desktops were deployed and tested with a heavy knowledge worker profile
- This design also applies to a deployment of up to 50 desktops in a branch or remote office scenario
- Test tools used for validation were VMware

For information on the VMware Rapid Desktop Appliance solution, see:

<http://www.vmware.com/solutions/desktop/rapid-desktop.html>

To install a VMware Horizon View solution with central management and distributed VDI sessions, VMware Horizon View 5.2 must be installed at the headquarters or data center site. For installation guide and system requirements, see:

<http://pubs.vmware.com/view-52/topic/com.vmware.ICbase/PDF/horizon-view-52-installation.pdf>

The Cisco UCS E-Series server requires VMware vSphere/ESXi 5.1 and the server must be added as a host to the data center vCenter. We recommend that each Cisco UCS E-Series server be staged at headquarters with the appropriate VMware ESXi install and desktop master image (virtual machine template) that will be used for VDI pool creation. Staging the Cisco UCS E-Series server prevents the need for transferring large files across the WAN.

After the Cisco UCS E-Series server is installed and running at the remote office with connectivity back to the data center, the administrator adds the Cisco UCS E-Series VMware ESXi host to vCenter so that the Cisco UCS E-Series server can participate as a resource platform for desktop pool creation. Using the VMware Horizon View management application, an administrator creates a desktop pool by selecting the desktop master image hosted on the Cisco UCS E-Series server as the template for the pool. Then the administrator selects the Cisco UCS E-Series compute resource as the hosting node for the pool. The pool can be created as full clones of the master image or as linked clones. In VMware Horizon View, full clone pools deliver persistent desktop pools where each individual desktop virtual machine is dedicated to an entitled user. Linked-clone pools deliver nonpersistent desktop pools where a group of

users are entitled to the pool of linked-clones desktops and are connected to any desktop that is available in the pool. With linked clones, no user data or personalization of the desktop is saved after a user logs out of the VDI session.

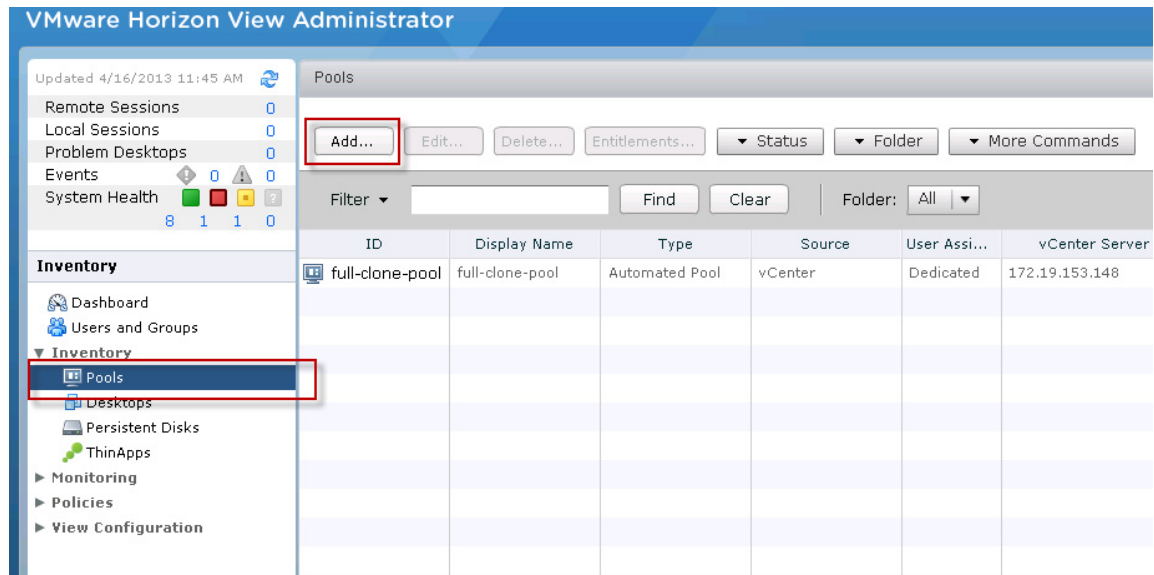

To create a VDI pool using VMware Horizon View management console, follow these steps:
(This example shows linked clones.)

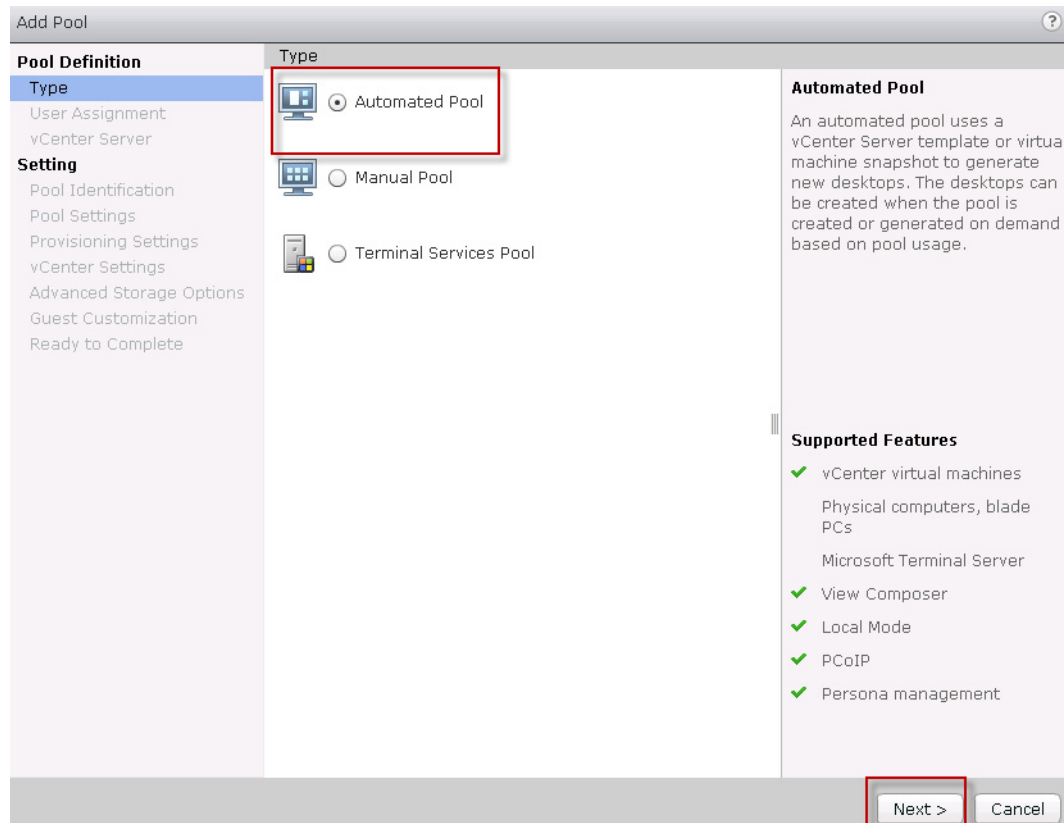

Note

If you plan to test with Atlantis ILIO, first install Atlantis ILIO on your Cisco UCS E-Series server. See [“Atlantis ILIO Installation and Configuration”](#) section on page -31.

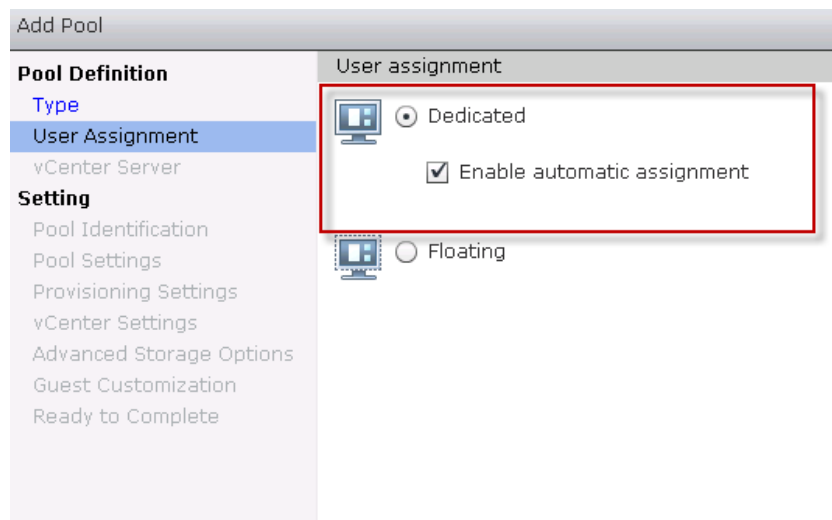

1. Log into the VMware Horizon View management console, and click **Pools** and **Add**.

2. Click **Type**, select **Automated Pool**, and click **Next**.

3. Click **User Assignment**, select **Dedicated** and **Enable automatic assignment**, and click **Next**.

4. Click **vCenter Server** and select **View Composer linked clones**.

Pool Identification

ID: linkclone-pool

Display name: linkclone-pool

View folder: /

Description:

ID

The pool ID is the unique name used to identify this pool.

Display Name

The display name is the name that users will see when they connect to View Client. If the display name is left blank, the ID will be used.

View Folder

View folders can organize the pools in your organization. They can also be used for delegated administration.

Description

This description is only shown on the Settings tab for a pool within View Administrator.

Advanced Storage Options

Based on your resource selection, the following features are recommended. Options that are not supported by the selected hardware are disabled.

☒ Use View Storage Accelerator

Disk Types: OS disks

Regenerate storage accelerator after: 7 Days

☐ Other Options

☐ Use native NFS snapshots (VAAI) Tech Preview ?

☐ Reclaim VM disk space ?

Initiate reclamation when unused space on VM exceeds: 0 GB

Blackout Times

Storage accelerator regeneration and VM disk space reclamation do not occur during blackout times. The same blackout policy applies to both operations.

Add... Edit... Remove

Day	Time

View Storage Accelerator

vSphere 5.x hosts can be configured to improve performance by caching certain pool data. Enable this option to use View Storage Accelerator for this pool. View Storage Accelerator is most useful for shared disks that are read frequently, such as View Composer OS disks.

Native NFS Snapshots (VAAI)

VAAI (vStorage API for Array Integration) is a hardware feature of certain storage arrays. It uses native snapshotting technology to provide linked clone functionality. Choose this option only if you have appropriate hardware devices.

Disk Space Reclamation

Atlantis ILIO Installation and Configuration

A preconfigured Atlantis ILIO installation for deployment on the Cisco UCS E-Series server is being developed and will be available soon.

To install and configure Atlantis ILIO, follow these steps:

1. Import the Atlantis ILIO Persistent VDI v3.2 Open Virtualization Format (OVF).
2. Configure the Atlantis ILIO virtual machine with these configuration settings:

Storage Utilized for Atlantis ILIO Appliance(First Virtual Disk)	5 GB
Storage Allocated by Atlantis ILIO for the Desktops (Second Virtual Disk)	All available storage from local disks (3x 900GB SAS disk in RAID-5) (See Cisco UCS E-Series datasheet for available SAS drive configurations.)
Memory Allocated for the Appliance	8 GB
vCPUs Allocated	2 vCPU, with reservation of one vCPU

3. Power on the Atlantis ILIO virtual machine and log in on the console (username: poweruser, password: poweruser).
4. Use the in-console setup wizard to set up networking, hostname, timezone, etc:
 - a. Use DHCP or static for the first interface.
 - b. Enter the hostname for this virtual machine.
 - c. Enter the correct timezone.
 - d. Configure keymap. (Select **Don't touch keymap** unless you know what you are doing.)
 - e. Before you press Next, press **Ctrl-C**. The advanced configuration file for Atlantis ILIO opens. Use the editor to change **VMDATA_CACHE_ON: True** to **VMDATA_CACHE_ON: False**. Press **Ctrl-X** to save the file to /etc/ilio/config.yml. Select **yes** to overwrite.
 - f. Continue with the configuration wizard. Select **Persistent** as the deployment option, **Local Disk** as the Storage Type, and **/dev/sdb** as the datadisk.

You might get a message that says that the resources might not be sufficient. Ignore the message and continue the set up.

5. Select **NFS** as the datastore type to mount to ESXi.
6. Create a datastore in vSphere on the Cisco UCS E-Series server using the IP address information from step 4a. The mount path is /exports/ILIO_VirtualDesktops.
7. Use your standard virtual desktop provisioning tools to provision virtual desktops in the Atlantis ILIO datastore.

Atlantis ILIO Test Results

Iometer

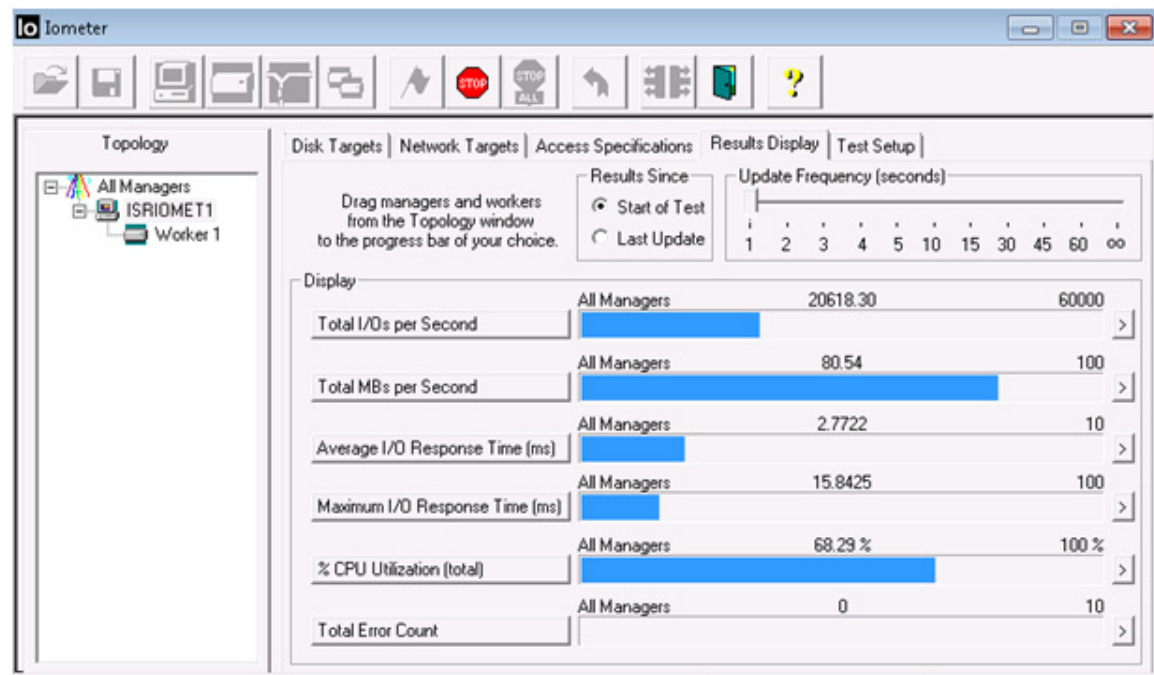

Iometer is an I/O subsystem measurement and characterization tool for single and clustered systems. Iometer was developed by the Intel Corporation and announced at the Intel Developers Forum (IDF) on February 17, 1998. Since then it has been widely adopted within the industry.

Meanwhile, Intel has discontinued work on Iometer and it was given to the Open Source Development Lab (OSDL). In November 2001, a project was registered at SourceForge.net and an initial drop was provided. In February 2003, the project was relaunched and is driven by an international group of individuals who are continuously improving, porting, and extending the product. Table 3 lists Iometer test specifications and Figure 6 shows an Iometer test on Atlantis ILIO.

Table 3 *Iometer Specifications Used for Testing*

Iometer VDI Workload	Parameter
Transfer Size	4 K
Writes - Reads Ratio	80 - 20
Random - Sequential Ratio	80 - 20
Size of the Test Disk	10 GB
Number of Outstanding IOs	64

Figure 6 *Iometer test on Atlantis ILIO*

Login VSI

Overall desktop performance was determined by using Login VSI 3.6 with the medium no flash workload to measure response times. The Login VSI medium workload includes Word, Outlook, Excel, PowerPoint, Internet Explorer, Bullzip PDF, and 7zip. When you use the Login VSI Pro product, you can choose to test VDI deployments with a various preconfigured workloads or a custom workload.

Atlantis Computing considers Login VSI medium to be a lighter workload with fewer IOPS per desktop than a typical production VDI environment. Therefore, Atlantis Computing recommends that you create a custom workload that closely emulates the production VDI environment with the actual image that will be used in the VDI deployment.

Summary of the Login VSI medium workload:

- Use Outlook to browse 10 messages.
- Use Internet Explorer and leave one instance open (BBC.co.uk), and browse to one instance.
- Browse to Wired.com and Lonelyplanet.com.
- Use one instance of Word to measure response time and one instance to review and edit a document.
- Use Bullzip PDF Printer and Acrobat Reader to print the Word document to PDF.
- Use Excel to open a very large randomized sheet.
- Use PowerPoint to review and edit a presentation.
- Use the command-line version of 7-zip to zip the output of the session.

For more information, visit <http://www.LoginVSI.com/workloads>

Login VSI Test Configuration

In this test, Login VSI 3.6 Dynamic with a 30-second logon interval was used to establish the maximum density. Login VSI Dynamic works by taking a baseline of the first 15 Login VSI sessions (1,858 ms in our test). Then it uses a calculation to determine when the dynamic response time threshold is reached, which represents the maximum density that the server can support with acceptable user experience. (In this test, VSI_{max} was not reached, which indicates that the system was not yet CPU or storage starved).

At the point where the response time hits 4000ms, Login VSI determines that you have reached the Login VSI Max or the maximum number of desktops that can be supported by on that particular server.

Test Parameter Configuration

The Microsoft Windows Base Template that is used for the testing has these characteristics:

OS	Windows 7
Format of the Virtual Machine	VMWare ESX-based virtual machine
Virtual Hard Disk Size	70 GB thick provisioned, used space 33.59 GB
RAM Used	1024 MB
CPUs	1 vCPU

The Atlantis ILIO Virtual Appliance uses these host resources:

Storage Utilized for Atlantis ILIO Appliance	5 GB
Storage Allocated by Atlantis ILIO for the Desktops	60 GB (accommodates 35 Windows 7 VMs)
Memory Allocated for the Appliance	10 GB
CPU Allocated	2 vCPU (1.999 GHz)

Test Results

The blue line in the following chart shows the average response time across all of the virtual desktops. The tested configuration supported 35 virtual desktops without reaching the VSIMax score. The response time performance was well under the threshold of 4000 ms, with an average of less than 2000 ms for the entire test run. Therefore, the maximum density for the tested architecture is more than 35 desktops when more memory is available.

The user experience stayed very consistent, even when the session density increased.

Additionally, boot time testing of a single virtual desktop showed a consistent boot time to login prompt between 15 and 20 seconds, which is faster than most physical PCs.

Conclusion

The Cisco Office-in-a-Box solution with VMware Horizon View delivers a branch-office desktop solution that saves OpEx, TCO, space and delivers the best user experience. By converging all IT services in a single box, the small office or retail store also saves on energy consumption and becomes simpler to manage.

For More Information

Read more about Cisco Office-in-a-Box and the Cisco UCS E-Series server at www.cisco.com/go/ucse or contact your local representative.
