

Bisync IP

Cisco SNA-to-IP Evolution

Empowering the Enterprise

- **New World networks will empower the enterprise if:**

Legacy equipment and protocols can be leveraged

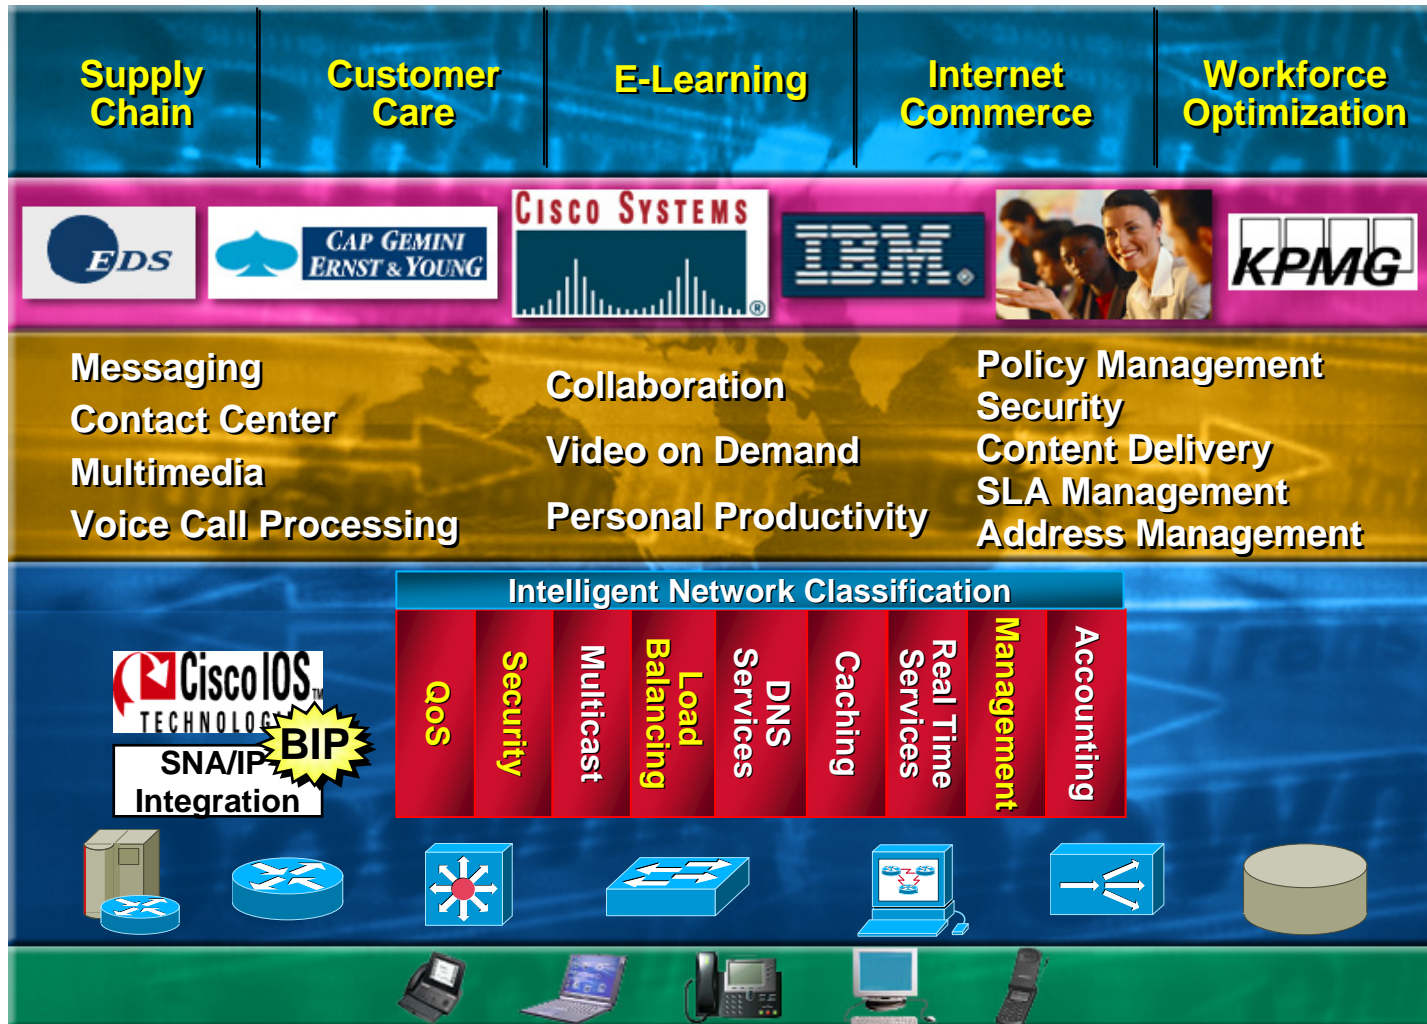

A smooth migration path to New World applications and technologies is provided

The New World network delivers outstanding network services

New World Network

- **IP-based applications on multiple server platforms**
- **Media-independent, high-speed campus switching**
- **Consolidated data/voice/video**
- **High-speed WAN connectivity**
- **“Thin” clients**

Cisco AVVID Architecture

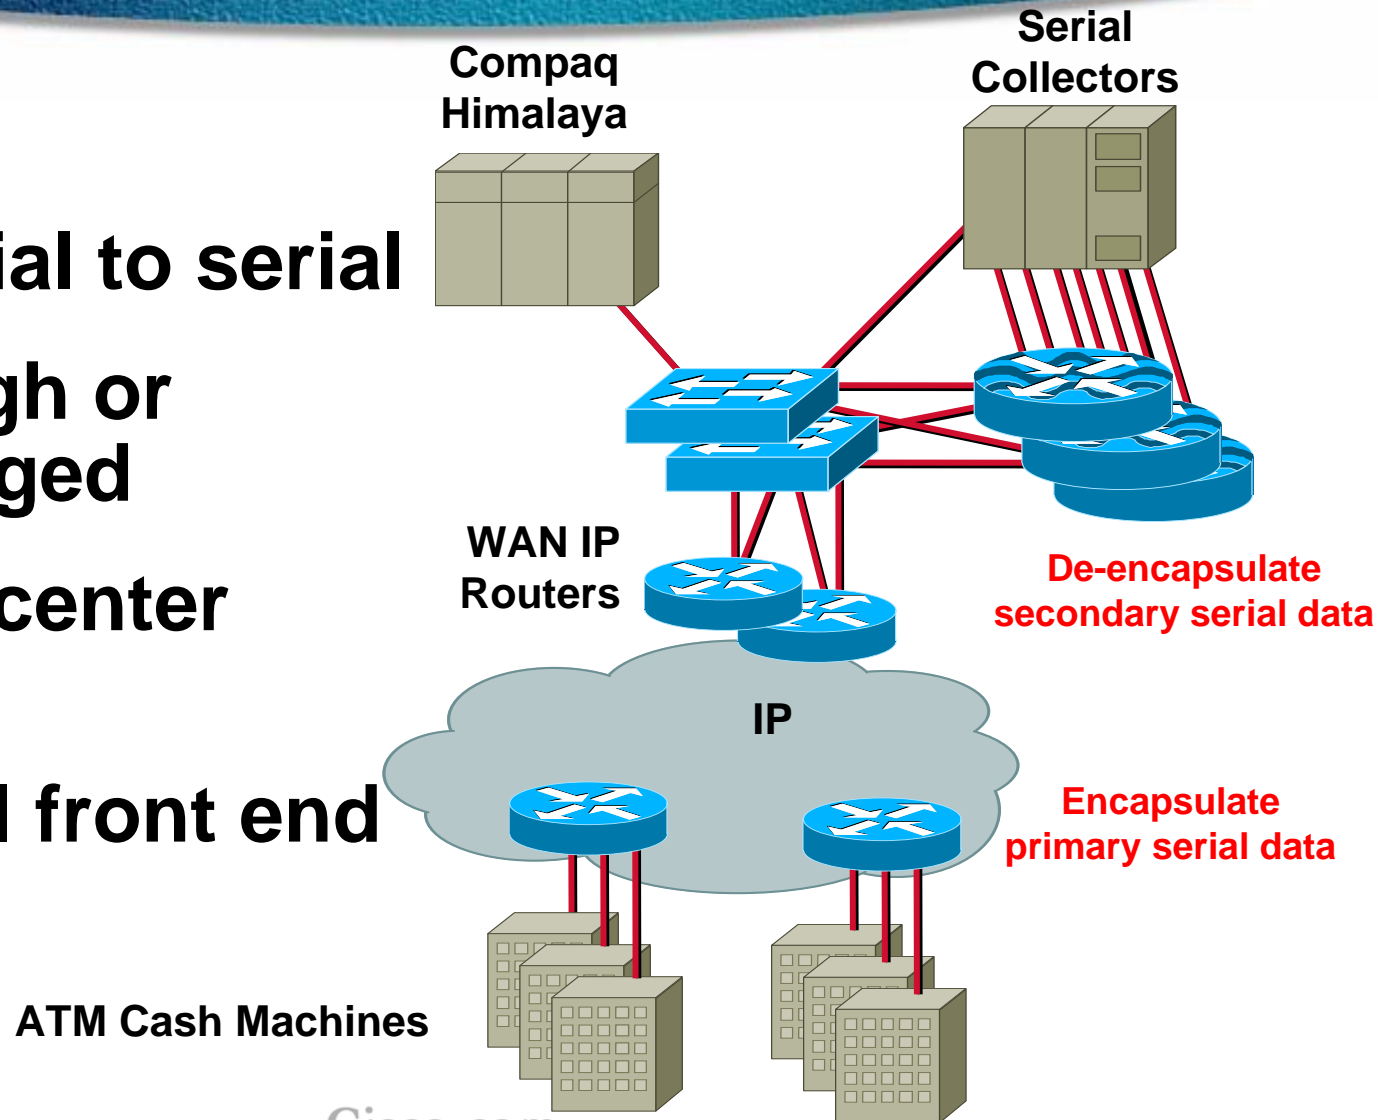

Why BIP?

- **More than 20,000 Bisync cash machines**
- **Many connect to BASE24 on Tandem computers**
- **New ATMs use TCP, connect to same application**
- **Serial connections to Tandem increasing in cost**
- **Vendors exiting legacy/serial markets**
Fewer options, higher costs, increased risk

Today's Solution: Bisync to the Switch

- Tunnel serial to serial
- Passthrough or acknowledged
- Extra data center routers
- Extra serial front end

BIP Solution: IP to the Host

- Convert serial header to TCP/IP header
- Cash machines controlled by routers
- No extra data center routers
- No serial front end
- IP directly in to host

ATM Cash Machines

BIP Solution

Existing Bisync Devices

Setup Using Cisco Routers

Cisco Bisync Support with BIP

BIP Solution Benefits

- **No need to replace existing Bisync ATMs**
- **Reduced cost by eliminating**
 - Serial connections to the host**
 - Expensive front-end serial processors to the host**
 - Head-end router in data center that previously did Bisync**
- **Dynamic nature of IP routing leading to improved network performance**
